policy-id *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	QoS network policy ID
Context	**configure** qos network *string* policy-id *number*
Tree	policy-id
Description	This command specifies the QoS network policy ID and uniquely identifies the policy on the router. Network **policy-id 1** exists as the default policy that is applied to all network interfaces by default. The network policy-id 1 cannot be modified or deleted. It defines the default DSCP-to-FC mapping and MPLS EXP-to-FC mapping for the ingress. For the egress, it defines forwarding classes that represent individual queues and the packet marking criteria. Network **policy-id 1** exists as the default policy that is applied to all network ports by default. This default policy cannot be modified or deleted. It defines the default DSCP-to-FC mapping and default unicast meters for ingress IP traffic. For the egress, it defines the forwarding class to dot1p and DSCP values and the packet marking criteria. If a new network policy is created (for instance, **policy-id 3**), only the default action and egress forwarding class parameters are identical to the default policy. A new network policy does not contain the default DSCP-to-FC and MPLS-EXP-to-FC mapping for network QoS policy of type **ip-interface** or the DSCP-to-FC mapping (for network QoS policy of type **port**). The default network policy can be copied to create a new network policy that includes the default ingress DSCP-to-FC and MPLS EXP-to-FC mapping (as appropriate).

arbiter-name *string*

Synopsis	Arbiter name
Context	**configure** qos policer-control-policy *string* tier *number* arbiter *string* arbiter-parent arbiter-name *string*
Tree	arbiter-name
Description	This command specifies the arbiter name. In tier 1, the arbiter name is not allowed and only the system reversed name "root" is accepted. The specified arbiter name must exist within the policer control policy at tier 1 or the parent command fails. When a tiered arbiter is acting as a parent for another tiered arbiter, the parent arbiter cannot be removed from the policy. The child arbiter receives all bandwidth directly from its parent arbiter (that receives bandwidth from the root arbiter).
String Length	1 to 32
Introduced	16.0.R3
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

level *number*

Synopsis	Level the child arbiter uses on its parent
Context	**configure** qos policer-control-policy *string* tier *number* arbiter *string* arbiter-parent level *number*
Tree	level
Range	1 to 8
Default	1
Introduced	16.0.R3
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

weight *number*

Synopsis	Weight attribute at parent level applied to children
Context	**configure** qos policer-control-policy *string* tier *number* arbiter *string* arbiter-parent weight *number*
Tree	weight
Description	This command defines how multiple children at the same parent strict level compete when insufficient bandwidth exists on the parent for that level. Each child's weight is divided by the sum of the active children's weights and the result is multiplied by the available bandwidth. If a child cannot receive its entire weighted fair share of bandwidth due to a defined child rate limit, the remainder of its bandwidth is distributed between the other children based on their weights.

monitor-threshold *number*

Synopsis	Congestion monitoring threshold
Context	**configure** qos port-scheduler-policy *string* group *string* monitor-threshold *number*
Tree	monitor-threshold
Description	This command defines the congestion monitoring threshold for the desired monitoring entity under the port scheduler for per aggregate port scheduler rate, per individual level, and per group that is aggregating multiple levels. The congestion threshold is specified as a percentage of the configured PIR for the entity for which congestion monitoring is desired. For example, if the configured PIR for level 1 is 100000 kb/s, and the monitoring threshold is set to 90%, an event where the offered rate is greater than 90,000 kb/s is recorded. This event is shown as part of the cumulative count of congestion threshold exceeds since the last clearing of the counters.
Range	0 to 100
Default	0
Introduced	16.0.R1

cir-non-profiling *boolean*

Synopsis	Prevent profile modification of CIR dependent packet
Context	**configure** qos queue-group-templates ingress queue-group *string* queue *number* cir-non-profiling *boolean*
Tree	cir-non-profiling
Description	When configured to **true**, the system prevents the modification of the profile of a packet-dependent queue rate compared to its configured CIR. The CIR continues to be used to affect the scheduling priority of a queue. This command is only supported on hardware that is FP4-based and later and is ignored when the related policy is applied to FP3-based hardware.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command should not be configured under an ingress queue group template queue associated with a LAG which spans FP4-based and later and FP3-based hardware as the resulting operation could be different depending on which hardware type the traffic ingresses.

Default	false
Introduced	16.0.R2
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

cir-level *number*

Synopsis	Port priority level for within-CIR offered load
Context	**configure** qos sap-egress *string* policer *number* port-parent cir-level *number*
Tree	cir-level

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command defines the port priority that the policer uses to receive bandwidth for its within-CIR offered load. If this command is set to the default value, the policer does not receive bandwidth during the port schedulers with-CIR pass and the **cir-weight** command is ignored.
Range	0 to 8
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

cir-weight *number*

Synopsis	Weight to use in the within-CIR port priority level
Context	**configure** qos sap-egress *string* policer *number* port-parent cir-weight *number*
Tree	cir-weight
Description	This command defines the weight that the policer uses at the within-CIR port priority level. All CIR weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Each individual active weight is then divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. When this command is set to the default value, the policer receives bandwidth only after other children with a non-zero weight at this level have been serviced.
Range	0 to 100
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

level *number*

Synopsis	Port priority level for above-CIR behavior
Context	**configure** qos sap-egress *string* policer *number* port-parent level *number*
Tree	level
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

© 2023 Nokia.

weight *number*

Synopsis	Weight to use in the above-CIR port priority level
Context	**configure** qos sap-egress *string* policer *number* port-parent weight *number*
Tree	weight
Description	This command defines the weight that the policer uses at the above-CIR port priority level. All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Each individual active weight is then divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. When this command is set to a value of 0, the policer receives bandwidth only after other children with a non-zero weight at this level.
Range	0 to 100
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

profile-capped *boolean*

scheduler-parent

Synopsis	Enable the **scheduler-parent** context
Context	**configure** qos sap-egress *string* policer *number* scheduler-parent
Tree	scheduler-parent
Notes	The following elements are part of a choice: **port-parent** or **scheduler-parent**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

cir-level *number*

Synopsis	Port priority level for within-CIR offered load
Context	**configure** qos sap-egress *string* policer *number* scheduler-parent cir-level *number*
Tree	cir-level
Description	This command defines the hierarchy priority level when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If this command is set to the default value, the policer does not receive bandwidth during the schedulers within-CIR pass and the **cir-weight** command is ignored.
Range	0 to 8
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

cir-weight *number*

Synopsis	Weight to use in the within-CIR port priority level
Context	**configure** qos sap-egress *string* policer *number* scheduler-parent cir-weight *number*
Tree	cir-weight
Description	The command defines the relative weight of the policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent scheduler name at the within-CIR priority level. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. When this command is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level have been serviced.
Range	0 to 100
Default	1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

level *number*

Synopsis	Priority level for bandwidth on the parent scheduler
Context	**configure** qos sap-egress *string* policer *number* scheduler-parent level *number*
Tree	level
Description	This command defines the priority level when compared with other policers, queues, and schedulers when competing for bandwidth on the parent scheduler. Children of the parent scheduler with a lower priority do not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

scheduler-name *string*

Synopsis	Scheduler name
Context	**configure** qos sap-egress *string* policer *number* scheduler-parent scheduler-name *string*
Tree	scheduler-name
String Length	1 to 32
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

weight *number*

Synopsis	Policer weight at the above-CIR priority level
Context	**configure** qos sap-egress *string* policer *number* scheduler-parent weight *number*
Tree	weight
Range	0 to 100
Default	1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

stat-mode *keyword*

Synopsis	Mode of statistics collected by the policer
Context	**configure** qos sap-egress *string* policer *number* stat-mode *keyword*
Tree	stat-mode
Options	no-stats, minimal, offered-profile-no-cir, offered-total-cir, offered-profile-cir, offered-limited-capped-cir, offered-profile-capped-cir, offered-total-cir-exceed, offered-four-profile-no-cir, offered-total-cir-four-profile
Default	minimal
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

policers-hqos-manageable *boolean*

Synopsis	Manage policers through the Hierarchical QoS process
Context	**configure** qos sap-egress *string* policers-hqos-manageable *boolean*
Tree	policers-hqos-manageable
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

policy-id *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Egress SAP QoS policy ID
Context	**configure** qos sap-egress *string* policy-id *number*

arbiter-name *string*

Synopsis	Arbiter name
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer arbiter-parent arbiter-name *string*
Tree	arbiter-name
String Length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

level *number*

Synopsis	Level of priority while feeding to the parent
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer arbiter-parent level *number*
Tree	level
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

weight *number*

Synopsis	Weight to be used by the arbiter for feeding this policer

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer arbiter-parent weight *number*
Tree	weight
Range	1 to 100
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cbs *(number | keyword)*

Synopsis	Exceed threshold of the CIR leaky bucket of the policer
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer cbs *(number | keyword)*
Tree	cbs
Range	0 to 268435456
Units	bytes
Options	auto
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mbs *(number | keyword)*

Synopsis	High priority 'violate' threshold of PIR leaky bucket of this policer
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer mbs *(number | keyword)*
Tree	mbs
Range	0 to 268435456
Units	bytes
Options	auto
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.

packet-byte-offset *number*

Synopsis	Packet size modification for policing information
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer packet-byte-offset *number*
Tree	packet-byte-offset
Range	-64 to 31
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

policer-id-range

Synopsis	Enable the **policer-id-range** context
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer policer-id-range
Tree	policer-id-range
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the dynamic policer ID range
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer policer-id-range end *number*
Tree	end
Range	1 to 63
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the dynamic policer ID range
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer policer-id-range start *number*
Tree	start
Range	1 to 63

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stat-mode *keyword*

Synopsis	Mode of statistics collected by the policer
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-policer stat-mode *keyword*
Tree	stat-mode
Options	no-stats, minimal, offered-profile-no-cir, offered-total-cir, offered-profile-cir, offered-limited-capped-cir, offered-profile-capped-cir
Default	minimal
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dynamic-queue

Synopsis	Enter the **dynamic-queue** context
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue
Tree	dynamic-queue
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cbs *(number | keyword)*

Synopsis	Reserved buffer space for the queue
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue cbs *(number | keyword)*
Tree	cbs
Range	0 to 1048576
Units	kilobytes
Options	auto
Default	auto
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.

mbs *(number | keyword)*

Synopsis	Buffer space allowed for the queue
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue mbs *(number | keyword)*
Tree	mbs
Range	0 to 1073741824
Units	bytes
Options	auto
Default	auto
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

packet-byte-offset *number*

Synopsis	Packet byte offset for addition of policing information
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue packet-byte-offset *number*
Tree	packet-byte-offset
Range	-64 to 31
Default	0
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

port-parent

Synopsis	Enable the **port-parent** context
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue port-parent
Tree	port-parent
Notes	The following elements are part of a choice: **port-parent** or **scheduler-parent**.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cir-level *number*

Synopsis	Port priority queue uses to receive scheduler bandwidth

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue port-parent cir-level *number*
Tree	cir-level
Range	0 to 8
Default	0
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cir-weight *number*

Synopsis	Weight queue uses to receive scheduler bandwidth
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue port-parent cir-weight *number*
Tree	cir-weight
Range	0 to 100
Default	0
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

level *number*

Synopsis	Port priority queue uses to receive scheduler bandwidth
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue port-parent level *number*
Tree	level
Range	1 to 8
Default	1
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

weight *number*

Synopsis	Weight queue uses to receive bandwidth from scheduler
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue port-parent weight *number*
Tree	weight

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	0 to 100
Default	1
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

queue-id-range

Synopsis	Enable the **queue-id-range** context
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue queue-id-range
Tree	queue-id-range
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the dynamic queue range
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue queue-id-range end *number*
Tree	end
Range	1 to 8
Notes	This element is mandatory.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of dynamic queue range
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue queue-id-range start *number*
Tree	start
Range	1 to 8
Notes	This element is mandatory.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Use subject to Terms available at: www.nokia.com/terms.

scheduler-parent

Synopsis	Enable the **scheduler-parent** context
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue scheduler-parent
Tree	scheduler-parent
Notes	The following elements are part of a choice: **port-parent** or **scheduler-parent**.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cir-level *number*

Synopsis	Priority level while feeding to the parent
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue scheduler-parent cir-level *number*
Tree	cir-level
Range	0 to 8
Default	0
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cir-weight *number*

Synopsis	Weight used by the scheduler to which the queue feeds
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue scheduler-parent cir-weight *number*
Tree	cir-weight
Range	0 to 100
Default	1
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

level *number*

Synopsis	Priority level while feeding to the parent
Context	**configure** qos sap-egress *string* subscriber-mgmt dynamic-queue scheduler-parent level *number*
Tree	level

© 2023 Nokia.

multicast-policer *number*

Synopsis	Policer ID for multicast traffic in forwarding class
Context	**configure** qos sap-ingress *string* fc *string* multicast-policer *number*
Tree	multicast-policer
Range	1 to 63
Notes	The following elements are part of a choice: (**fp-redirect-group-multicast-policer** and **multicast-policer**), **multicast-queue**, or **multicast-queue-group-queue**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

multicast-queue *reference*

Synopsis	Broadcast queue to assign for packets in this forwarding class
Context	**configure** qos sap-ingress *string* fc *string* multicast-queue *reference*
Tree	multicast-queue
Reference	**configure** qos sap-ingress *string* queue *number*
Notes	The following elements are part of a choice: (**fp-redirect-group-multicast-policer** and **multicast-policer**), **multicast-queue**, or **multicast-queue-group-queue**.
Introduced	16.0.R1
Platforms	All

multicast-queue-group-queue

Synopsis	Enable the **multicast-queue-group-queue** context
Context	**configure** qos sap-ingress *string* fc *string* multicast-queue-group-queue
Tree	multicast-queue-group-queue
Notes	The following elements are part of a choice: (**fp-redirect-group-multicast-policer** and **multicast-policer**), **multicast-queue**, or **multicast-queue-group-queue**.
Introduced	16.0.R1

Platforms	All

queue *reference*

Synopsis	Broadcast queue for packets in the forwarding class
Context	**configure** qos sap-ingress *string* fc *string* multicast-queue-group-queue queue *reference*
Tree	queue
Reference	**configure** qos queue-group-templates ingress queue-group *string* queue *number*
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

queue-group-name *reference*

Synopsis	Queue group name to forward traffic
Context	**configure** qos sap-ingress *string* fc *string* multicast-queue-group-queue queue-group-name *reference*
Tree	queue-group-name
Reference	**configure** qos queue-group-templates ingress queue-group *string*
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

out-remark

Synopsis	Enter the **out-remark** context
Context	**configure** qos sap-ingress *string* fc *string* out-remark
Tree	out-remark
Introduced	16.0.R1
Platforms	All

dscp *keyword*

Synopsis	DSCP to override DSCP bits of the matching packet

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos sap-ingress *string* fc *string* out-remark dscp *keyword*
Tree	dscp
Options	be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63
Notes	The following elements are part of a choice: **dscp** or **prec**.
Introduced	16.0.R1
Platforms	All

prec *number*

Synopsis	Value to override precedence bits of matching packet
Context	**configure** qos sap-ingress *string* fc *string* out-remark prec *number*
Tree	prec
Range	0 to 7
Notes	The following elements are part of a choice: **dscp** or **prec**.
Introduced	16.0.R1
Platforms	All

policer *number*

Synopsis	Policer ID for unicast traffic in the forwarding class
Context	**configure** qos sap-ingress *string* fc *string* policer *number*
Tree	policer
Range	1 to 63
Notes	The following elements are part of a choice: (**fp-redirect-group-policer** and **policer**), **queue**, or **queue-group-queue**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

profile *keyword*

Synopsis	Packets profile associated with the forwarding class
Context	**configure** qos sap-ingress *string* fc *string* profile *keyword*

scheduler-parent

Synopsis	Enter the **scheduler-parent** context
Context	**configure** qos sap-ingress *string* policer *number* scheduler-parent
Tree	scheduler-parent
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

cir-level *number*

Synopsis	Port priority level for within-CIR offered load
Context	**configure** qos sap-ingress *string* policer *number* scheduler-parent cir-level *number*
Tree	cir-level
Description	This command defines the hierarchy priority level when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If this command is set to the default value, the policer does not receive bandwidth during the within-CIR pass of the scheduler and the **cir-weight** command is ignored.
Range	0 to 8
Default	0
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

cir-weight *number*

Synopsis	Weight to use in the within-CIR port priority level

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos sap-ingress *string* policer *number* scheduler-parent cir-weight *number*
Tree	cir-weight
Description	The command defines the relative weight of the policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent scheduler name at the within-CIR priority level. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. When this command is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level have been serviced.
Range	0 to 100
Default	1
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

level *number*

Synopsis	Priority level for bandwidth on the parent scheduler
Context	**configure** qos sap-ingress *string* policer *number* scheduler-parent level *number*
Tree	level
Description	This command defines the priority level when compared with other policers, queues, and schedulers when competing for bandwidth on the parent scheduler. Children of the parent scheduler with a lower priority do not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.
Range	1 to 8
Default	1
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

scheduler-name *string*

Synopsis	Scheduler name
Context	**configure** qos sap-ingress *string* policer *number* scheduler-parent scheduler-name *string*
Tree	scheduler-name
String Length	1 to 32

© 2023 Nokia.

Context	**configure** qos scheduler-policy *string* tier *number* scheduler *string*
Tree	scheduler
Introduced	16.0.R1
Platforms	All

[**scheduler-name**] *string*

Synopsis	Scheduler name
Context	**configure** qos scheduler-policy *string* tier *number* scheduler *string*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context will not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

String Length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1

3.38 redundancy commands

```
configure
   –  redundancy
      –  apply-groups reference
      –  apply-groups-exclude reference
      –  bgp-evpn
         –  ethernet-segment
            –  activation-timer number
            –  apply-groups reference
            –  apply-groups-exclude reference
            –  boot-timer number
      –  bgp-mh
         –  apply-groups reference
         –  apply-groups-exclude reference
         –  site
            –  activation-timer number
            –  boot-timer number
            –  min-down-timer number
      –  cert-sync boolean
      –  mgmt-ethernet
         –  revert number
      –  multi-chassis
         –  ipsec-domain number
            –  admin-state keyword
            –  apply-groups reference
            –  apply-groups-exclude reference
            –  designated-role keyword
            –  priority number
            –  revertive boolean
            –  tunnel-group reference
         –  options
            –  sub-mgmt
               –  apply-groups reference
               –  apply-groups-exclude reference
               –  dhcp-leasetime-threshold number
         –  peer (ipv4-address-no-zone | ipv6-address-no-zone)
            –  admin-state keyword
            –  apply-groups reference
            –  apply-groups-exclude reference
            –  authentication-key string
            –  description string
            –  mc-endpoint
               –  admin-state keyword
               –  apply-groups reference
               –  apply-groups-exclude reference
               –  bfd boolean
               –  boot-timer number
               –  hold-on-neighbor-failure number
               –  keep-alive-interval number
               –  passive-mode boolean
               –  system-priority number
            –  mc-ipsec
               –  apply-groups reference
               –  apply-groups-exclude reference
               –  bfd-liveness boolean
               –  discovery-interval
                  –  boot number
                  –  interval-secs number
               –  domain reference
                  –  admin-state keyword
```

Platforms All

boot-timer *number*

Synopsis Time before BGP EVPN multi-homing DF election algorithm

Context **configure** redundancy bgp-evpn ethernet-segment boot-timer *number*

Tree boot-timer

Description This command allows the necessary time for the control plane protocols to come up upon PE boot-up before bringing up the ESs and running the DF algorithm.

The following considerations apply to this command:

- The **boot-timer** command must provide enough time to allow the IOMs and BGP sessions to come up before exchanging ES routes and running the DF election for each EVI or ISID.
- The boot-timer is synchronized across CPMs and is relative to the system up time; it is not changed or reset upon CPM switchover.
- The boot-timer is never interrupted (the **es-activation-timer**, however, can be interrupted if there is a new event triggering the DF election).
- The boot-timer runs per EVI or ISID on the ESs in the system. If the system up time (time the system has been up since the last reboot) is less than the **boot-timer** value, the system does not run the DF election for any EVI or ISID. When the **boot-timer** value expires, the DF election runs, and if the system is elected DF for the EVI or ISID, the **es-activation-timer** is triggered.
- The system does not advertise ES routes until the boot timer expires, which guarantees that the peer ES PEs only run the DF election when the PE is ready to become the DF, if required.

Range 0 to 1800

Units seconds

Default 10

Introduced 16.0.R1

Platforms All

bgp-mh

Synopsis Enter the **bgp-mh** context

Context **configure** redundancy bgp-mh

site

Synopsis	Enter the **site** context
Context	**configure** redundancy bgp-mh site
Tree	site
Introduced	16.0.R1
Platforms	All

activation-timer *number*

Synopsis	Time to wait for BGP updates from remote PEs
Context	**configure** redundancy bgp-mh site activation-timer *number*
Tree	activation-timer
Range	0 to 100
Units	seconds
Default	2
Introduced	16.0.R1
Platforms	All

boot-timer *number*

Synopsis	Wait time after reboot to run the DF election algorithm
Context	**configure** redundancy bgp-mh site boot-timer *number*
Tree	boot-timer
Range	0 to 600
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	All

min-down-timer *number*

Synopsis	Min downtime for BGP multi-homing site after transition
Context	**configure** redundancy bgp-mh site min-down-timer *number*
Tree	min-down-timer

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down. This timer is optimized in the following circumstances: • If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used. • If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used. • If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.
Range	1 to 100
Units	seconds
Introduced	16.0.R1
Platforms	All

cert-sync *boolean*

Synopsis	Automatically synchronize certificate files
Context	**configure** redundancy cert-sync *boolean*
Tree	cert-sync
Default	true
Introduced	16.0.R1
Platforms	All

mgmt-ethernet

Synopsis	Enable the **mgmt-ethernet** context
Context	**configure** redundancy mgmt-ethernet
Tree	mgmt-ethernet
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

© 2023 Nokia.

revert *number*

Synopsis	Time before reverting standby CPM management Ethernet port to active CPM
Context	**configure** redundancy mgmt-ethernet revert *number*
Tree	revert
Range	1 to 300
Units	seconds
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

multi-chassis

Synopsis	Enter the **multi-chassis** context
Context	**configure** redundancy multi-chassis
Tree	multi-chassis
Description	Commands in this context configure the attributes of multi-chassis redundancy.
Introduced	16.0.R1
Platforms	All

ipsec-domain [id] *number*

Synopsis	Enter the **ipsec-domain** list instance
Context	**configure** redundancy multi-chassis ipsec-domain *number*
Tree	ipsec-domain
Description	Commands in this context configure an IPsec domain used for N:M IPsec redundancy.
Max. Instances	64
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**id**] *number*

Synopsis	IPsec domain ID
Context	**configure** redundancy multi-chassis ipsec-domain *number*
Tree	ipsec-domain

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	1 to 255
Notes	This element is part of a list key.
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the IPsec domain
Context	**configure** redundancy multi-chassis ipsec-domain *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

designated-role *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Designated role for the IPsec domain
Context	**configure** redundancy multi-chassis ipsec-domain *number* designated-role *keyword*
Tree	designated-role
Description	This command configures the designated role of the tunnel group in the IPsec domain.
Options	standby, active
Default	standby
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

priority *number*

Synopsis	Priority for the IPsec domain
Context	**configure** redundancy multi-chassis ipsec-domain *number* priority *number*
Tree	priority

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the priority for the tunnel group in the IPsec domain. The node with the higher priority is more likely to be elected as active within the domain.
Range	0 to 255
Default	100
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

revertive *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable revertive behavior for the tunnel group
Context	**configure** redundancy multi-chassis ipsec-domain *number* revertive *boolean*
Tree	revertive
Description	When configured to **true**, the router enables the revertive behavior of the tunnel group, which allows a router in an N:M domain to automatically take over as the active router in the domain when it becomes eligible to do so. When configured to **false**, the revertive behavior of the tunnel group is disabled.
Default	false
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-group *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Tunnel group ID for an IPsec domain
Context	**configure** redundancy multi-chassis ipsec-domain *number* tunnel-group *reference*
Tree	tunnel-group
Description	This command specifies the tunnel group ID for the IPsec domain.
Reference	**configure** isa tunnel-group *number*
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

options

Synopsis	Enter the **options** context
Context	**configure** redundancy multi-chassis options
Tree	options
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-mgmt

Synopsis	Enter the **sub-mgmt** context
Context	**configure** redundancy multi-chassis options sub-mgmt
Tree	sub-mgmt
Description	Commands in this context configure subscriber management options for multi-chassis redundancy.
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp-leasetime-threshold *number*

Synopsis	DHCP lease threshold to skip MCS synchronization
Context	**configure** redundancy multi-chassis options sub-mgmt dhcp-leasetime-threshold *number*
Tree	dhcp-leasetime-threshold
Description	This command configures the DHCP lease time threshold to skip MCS synchronization.DHCP leases for the **sub-mgmt** MCS applications are eligible to skip synchronization if the committed lease time is less than the active threshold on a multi-chassis peer. The active threshold is the minimum value of the thresholds configured on the nodes at each end of a multi-chassis peer. The threshold is inactive when it is unconfigured on at least one end of the multi-chassis peer.
Range	0 to 86400
Units	seconds
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **peer** list instance
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Description	This command configures the IP address of the peer in a redundant multi-chassis setup, and enters the context for further application-specific configuration options.
Max. Instances	20
Introduced	16.0.R1
Platforms	All

[**ip-address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Peer IP address
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the MC redundancy peer
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

authentication-key *string*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Authentication key used between the node and MC peer
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* authentication-key *string*
Tree	authentication-key
String Length	1 to 54
Introduced	16.0.R1
Platforms	All

description *string*

Synopsis	Text description
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* description *string*
Tree	description
String Length	1 to 80
Introduced	16.0.R1
Platforms	All

mc-endpoint

Synopsis	Enable the **mc-endpoint** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint
Tree	mc-endpoint
Introduced	22.10.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the MC-EP
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint admin-state *keyword*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Options	enable, disable
Default	disable
Introduced	22.10.R1
Platforms	All

bfd *boolean*

Synopsis	Enable BFD detection for the MC-EP peering tunnel
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint bfd *boolean*
Tree	bfd
Description	When configured to **true**, the system uses Bidirectional Forwarding Detection (BFD) to control the state of the associated protocol interface, where the state of the protocol interface is tied to the state of the BFD session between the local and remote nodes. The BFD settings are configured in the IP interface contexts.
Default	false
Introduced	22.10.R1
Platforms	All

boot-timer *number*

Synopsis	Time to attempt connection before declaring failure
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint boot-timer *number*
Tree	boot-timer
Description	This command configures the time interval to attempt connection that applies after the node reboots. This command specifies the time the multi-chassis endpoint (MC-EP) protocol takes to establish a connection before declaring a connection failure with the remote peer. When the time interval expires, all configured MC-EPs revert to single chassis behavior, activating the best local pseudowire.
Range	1 to 600
Units	seconds
Default	300
Introduced	22.10.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hold-on-neighbor-failure *number*

Synopsis	Number of keepalive intervals to wait for packets
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* mc-endpoint hold-on-neighbor-failure *number*
Tree	hold-on-neighbor-failure
Description	This command configures the number of keepalive intervals that the local node waits for packets from the MC-EP peer before declaring a connection failure. When the number of intervals is reached, all configured MC-EPs revert to single chassis behavior, activating the best local pseudowire.
Range	2 to 25
Default	3
Introduced	22.10.R1
Platforms	All

keep-alive-interval *number*

Synopsis	Interval for exchange of keepalive messages
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* mc-endpoint keep-alive-interval *number*
Tree	keep-alive-interval
Description	This command configures the interval for which keepalive messages are exchanged between two systems participating as MC-EP when BFD is not active. The fast keepalive messages are used to detect remote node failure.
Range	5 to 500
Default	10
Introduced	22.10.R1
Platforms	All

passive-mode *boolean*

Synopsis	Enable passive mode for the MC-EP tunnel
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* mc-endpoint passive-mode *boolean*
Tree	passive-mode
Description	When configured to **true**, the system enables passive mode behavior for the MC-EP protocol. Assuming the remote pair is configured with regular MC-EP in passive mode, the MC-EP pair remains dormant until two of the pseudowires in an MC-EP are activated by the remote PEs.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When one pseudowire is active, the dormant MC-EP pair becomes active. The regular mechanism to select the best pseudowire between the active pair is initiated, and the system blocks the Rx and Tx directions of the other pseudowire.

Default false

Introduced 22.10.R1

Platforms All

system-priority *number*

Synopsis System priority of the MC-EP

Context **configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint system-priority *number*

Tree system-priority

Description This command configures the system priority of the MC-EP. The peer configured with the lower value is selected as the master. If the system priority values are equal, the peer with the higher system ID (chassis MAC address) becomes the master.

Range 0 to 255

Default 0

Introduced 22.10.R1

Platforms All

mc-ipsec

Synopsis Enable the **mc-ipsec** context

Context **configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ipsec

Tree mc-ipsec

Description This command enables the context to configure multi-chassis peer parameters.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

bfd-liveness *boolean*

Synopsis Enable BFD

Context **configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ipsec bfd-liveness *boolean*

Tree bfd-liveness

src-mac *(keyword | ring-node-mac-address)*

Synopsis	Source MAC address for the access node connection
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ring ring *string* ring-node *string* src-mac *(keyword | ring-node-mac-address)*
Tree	src-mac
Options	system-mac-address
Default	system-mac-address
Introduced	16.0.R1
Platforms	All

vlan *string*

Synopsis	VLAN ID for access node connection
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ring ring *string* ring-node *string* vlan *string*
Tree	vlan
String Length	1 to 11
Introduced	16.0.R1
Platforms	All

srrp-instance [id] *number*

Synopsis	Add a list entry for **srrp-instance**
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ring ring *string* srrp-instance *number*
Tree	srrp-instance
Max. Instances	2
Introduced	16.0.R1
Platforms	All

[**id**] *number*

Synopsis	SRRP instance ID
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ring ring *string* srrp-instance *number*

nat

Synopsis	Enable the **nat** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync nat
Tree	nat
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-group [id] *reference*

Synopsis	Enter the **nat-group** list instance
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync nat nat-group *reference*
Tree	nat-group
Description	Commands in this context configure multi-chassis synchronization (MCS) for a NAT group. NAT group health information is exchanged between the pair of redundant NAT nodes. The system elects one of the nodes as the active node for the NAT group and the other node becomes the standby node.
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[id] *reference*

Synopsis	NAT group ID
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync nat nat-group *reference*
Tree	nat-group
Reference	**configure** isa nat-group *number*
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sync-tag *string*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	NAT group synchronization tag
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync nat nat-group *reference* sync-tag *string*
Tree	sync-tag
Description	This command configures the synchronization tag for the NAT group. The tag must match the synchronization tag for the NAT group on the peering node.
String Length	1 to 32
Notes	This element is mandatory.
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pim-snooping

Synopsis	Enter the **pim-snooping** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync pim-snooping
Tree	pim-snooping
Introduced	16.0.R1
Platforms	All

saps *boolean*

Synopsis	Synchronize PIM snooping data with the multi-chassis peer on SDP endpoints
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync pim-snooping saps *boolean*
Tree	saps
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.

Tree	application
Description	Commands in this context configure the MCS application for transport encryption. The application-id configures an application and a keychain defines the key used for the encryption.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**application-id**] *keyword*

Synopsis	Application using transport encryption
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync transport-encryption application *keyword*
Tree	application
Description	This command configures an MCS application for the transport encryption method.

Options	igmp, igmp-snooping, sub-mgmt-ipoe, srrp, mc-ring, mld-snooping, dhcp-server, sub-host-trk, sub-mgmt-pppoe, ipsec, mld, python, l2tp, diam-proxy, pim-snpg-sap, pim-snpg-sdp, diam-node, nat
Notes	This element is part of a list key.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keychain *reference*

Synopsis	Keychain containing the authentication keys
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync transport-encryption application *keyword* keychain *reference*
Tree	keychain
Description	This command specifies a keychain that contains authentication keys for the application.
Reference	**configure** system security keychains keychain *string*
Notes	This element is mandatory.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-group [tunnel-group-id] *number*

Synopsis	Enter the **tunnel-group** list instance
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync tunnel-group *number*
Tree	tunnel-group
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**tunnel-group-id**] *number*

Synopsis	Multi-active tunnel group ID
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync tunnel-group *number*
Tree	tunnel-group
Range	1 to 64
Notes	This element is part of a list key.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sync-tag *string*

Synopsis	Tag to synchronize the tunnel group with the MC peer
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync tunnel-group *number* sync-tag *string*
Tree	sync-tag
String Length	1 to 32
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rollback-sync *keyword*

Synopsis	Parameters for redundancy rollback synchronization
Context	**configure** redundancy rollback-sync *keyword*
Tree	rollback-sync
Options	rollback-single, rollback-all
Introduced	16.0.R1
Platforms	All

srrp

Synopsis	Enter the **srrp** context
Context	**configure** redundancy srrp
Tree	srrp
Description	Commands in this context configure system parameters for BNG CUPS inter-UPF resiliency.
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

auto-srrp-id-range

Synopsis	Enable the **auto-srrp-id-range** context

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** redundancy srrp auto-srrp-id-range
Tree	auto-srrp-id-range
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the ID range
Context	**configure** redundancy srrp auto-srrp-id-range end *number*
Tree	end
Range	2 to 4294967295
Default	4294967295
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the ID range
Context	**configure** redundancy srrp auto-srrp-id-range start *number*
Tree	start
Range	1 to 4294967294
Default	2147483648
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

switchover-exec *string*

Synopsis	CLI script file executed after a redundancy switchover
Context	**configure** redundancy switchover-exec *string*
Tree	switchover-exec
Description	This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by manual action. The CLI script file can contain commands for environment settings, classic CLI debug configuration (excluding mirroring settings), and other commands not maintained by the configuration redundancy.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	The following commands are not supported in the switchover-exec file: **clear**, **configure**, **candidate**, **oam**, **tools**, **oam**, **ping**, **traceroute**, **mstat**, **mtrace**, and **mrinfo**.
String Length	1 to 100
Introduced	16.0.R1
Platforms	All

synchronize *keyword*

Synopsis	Parameters for redundancy synchronization
Context	**configure** redundancy synchronize *keyword*
Tree	synchronize
Options	off, config, boot-env
Introduced	16.0.R1
Platforms	All

3.39 router commands

```
configure
   –  router string
      –  aggregates
         –  aggregate (ipv4-prefix | ipv6-prefix)
            –  aggregator
               –  address string
               –  as-number number
            –  apply-groups reference
            –  apply-groups-exclude reference
            –  as-set boolean
            –  blackhole
               –  generate-icmp boolean
            –  community string
            –  description string
            –  discard-component-communities boolean
            –  indirect (ipv4-address-no-zone | ipv6-address-no-zone)
            –  local-preference number
            –  policy reference
            –  summary-only boolean
            –  tunnel-group number
         –  apply-groups reference
         –  apply-groups-exclude reference
      –  allow-bgp-to-igp-export boolean
      –  allow-icmp-redirect boolean
      –  allow-icmp6-redirect boolean
      –  apply-groups reference
      –  apply-groups-exclude reference
      –  autonomous-system number
      –  bfd
         –  seamless-bfd
            –  peer (ipv4-address-no-zone | ipv6-address-no-zone)
               –  apply-groups reference
               –  apply-groups-exclude reference
               –  discriminator number
      –  bgp
         –  add-paths
            –  evpn
               –  receive boolean
               –  send (number | keyword)
            –  ipv4
               –  receive boolean
               –  send (number | keyword)
            –  ipv6
               –  receive boolean
               –  send (number | keyword)
            –  label-ipv4
               –  receive boolean
               –  send (number | keyword)
            –  label-ipv6
               –  receive boolean
               –  send (number | keyword)
            –  mcast-vpn-ipv4
               –  receive boolean
               –  send number
            –  mcast-vpn-ipv6
               –  receive boolean
               –  send number
            –  mvpn-ipv4
               –  receive boolean
```

3.39.1 router command descriptions

router [router-name] *string*

Synopsis	Enter the **router** list instance
Context	**configure** router *string*
Tree	router
Max. Instances	4
Introduced	16.0.R1
Platforms	All

[**router-name**] *string*

Synopsis	Administrative router name
Context	**configure** router *string*
Tree	router
String Length	1 to 64
Notes	This element is part of a list key.
Introduced	16.0.R2
Platforms	All

aggregates

Synopsis	Enter the **aggregates** context
Context	**configure** router *string* aggregates
Tree	aggregates
Introduced	16.0.R1
Platforms	All

aggregate [ip-prefix] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Enter the **aggregate** list instance
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)*
Tree	aggregate

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context add aggregate routes to the routing table when there are one or more component routes. A component route is any route installed in the forwarding table that is a more-specific match of the aggregate. The use of aggregate routes can lead to smaller routing table sizes by reducing the number of routes that need to be advertised to neighbor routes.
Introduced	16.0.R1
Platforms	All

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Destination IP address prefix of the aggregate route
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)*
Tree	aggregate
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

aggregator

Synopsis	Enter the **aggregator** context
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* aggregator
Tree	aggregator
Description	Commands in this context configure the BGP AGGREGATOR path attribute for the aggregate route.
Introduced	16.0.R1
Platforms	All

address *string*

Synopsis	Aggregator IP address
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* aggregator address *string*
Tree	address
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

as-number *number*

Synopsis	Aggregator AS number
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* aggregator as-number *number*
Tree	as-number
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

as-set *boolean*

Synopsis	Use AS_SET path segment type for the aggregate route
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* as-set *boolean*
Tree	as-set
Description	When configured to **true**, the AS_PATH attribute of the aggregate contains an AS_SET containing all AS numbers from the contributing routes. This can increase the amount of churn due to best-path changes. When configured to **false**, the AS_PATH attribute contains no AS_SET and will be originated by the ESR.
Default	false
Introduced	16.0.R1
Platforms	All

blackhole

Synopsis	Enable the **blackhole** context
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* blackhole
Tree	blackhole
Notes	The following elements are part of a choice: **blackhole** or **indirect**.
Introduced	16.0.R1
Platforms	All

generate-icmp *boolean*

Synopsis	Send ICMP unreachable messages for aggregate routes

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* blackhole generate-icmp *boolean*
Tree	generate-icmp
Description	When configured to **true**, ICMP unreachable messages are sent when packets match an aggregate route in the FIB with a black-hole next-hop. When configured to **false**, ICMP unreachable messages are not generated.
Default	false
Introduced	16.0.R2
Platforms	All

community *string*

Synopsis	Community name that is added to the aggregate route
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* community *string*
Tree	community
Description	This command associates a BGP community with the aggregate route. The community name can be matched in route policies and is automatically added to BGP routes exported from the aggregate route.
String Length	1 to 72
Max. Instances	12
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

description *string*

Synopsis	Text description
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* description *string*
Tree	description
String Length	1 to 80
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

discard-component-communities *boolean*

Synopsis	Advertise aggregate with aggregate route community set
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* discard-component-communities *boolean*
Tree	discard-component-communities
Default	false
Introduced	19.7.R1
Platforms	All

indirect *(ipv4-address-no-zone \| ipv6-address-no-zone)*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Address of the indirect next hop
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	indirect
Description	This command programs aggregate routes into the forwarding table with an indirect next hop. If a packet matches the aggregate route but not a contributing route, it is forwarded toward the indirect next hop rather than being discarded.
Notes	The following elements are part of a choice: **blackhole** or **indirect**.
Introduced	16.0.R1
Platforms	All

local-preference *number*

Synopsis	Local preference used when aggregate route is exported
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* local-preference *number*
Tree	local-preference
Description	This command configures the local preference value to use when the aggregate route is exported rather than using any of the local preference values assigned for any of the contributing routes.
Range	0 to 4294967295
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

policy *reference*

Synopsis	Policy name for the aggregated route
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* policy *reference*
Tree	policy
Description	This command associates an aggregate route with a policy reference. The aggregated route is activated only when there is at least one eligible active route in the sub-trees below it that is accepted by the policy evaluation. There is no evaluation into any sub-tree that starts with another active aggregate route. Eligible routes exclude host routes and LDP shortcut routes. If an aggregate route has no policy, or the reference is to an empty policy, this configuration is treated as equivalent to a policy with one rule that accepts all routes.
Reference	**configure** policy-options policy-statement *string*
Introduced	20.10.R1
Platforms	All

summary-only *boolean*

Synopsis	Advertise the aggregate route only
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* summary-only *boolean*
Tree	summary-only
Description	When configured to **true**, the router suppresses the advertisement of more specific component routes for the aggregate. When configured to **false**, the router advertises both the aggregate route and its contributing routes.
Default	false
Introduced	16.0.R1
Platforms	All

tunnel-group *number*

Synopsis	Tunnel group from which to associate the MC IPSec state
Context	**configure** router *string* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* tunnel-group *number*
Tree	tunnel-group

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command adds the MC-IPsec state of the specific tunnel-group to the aggregate route.
Range	1 to 64
Introduced	20.7.R1
Platforms	All

allow-bgp-to-igp-export *boolean*

Synopsis	Enable the distribution of BGP routes into the IGP
Context	**configure** router *string* allow-bgp-to-igp-export *boolean*
Tree	allow-bgp-to-igp-export
Description	When configured to **true**, the router can export base BGP RTM routes into the IGP routing instance within the base router. This command applies to already exported BGP prefixes and to newly received BGP prefixes.
Default	true
Introduced	23.7.R1
Platforms	All

allow-icmp-redirect *boolean*

Synopsis	Allow ICMP redirects on the management interface
Context	**configure** router *string* allow-icmp-redirect *boolean*
Tree	allow-icmp-redirect
Description	When configured to **true**, ICMP redirect messages can be received on the management interface. When configured to **false**, all received ICMP redirect messages are dropped. This command cannot be configured on a non-management interface.
Default	false
Introduced	16.0.R1
Platforms	All

allow-icmp6-redirect *boolean*

Synopsis	Allow IPv6 ICMP redirects on the management interface
Context	**configure** router *string* allow-icmp6-redirect *boolean*
Tree	allow-icmp6-redirect

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, IPv6 ICMP redirect messages can be received on the management interface. When configured to **false**, all received IPv6 ICMP redirect messages are dropped. This command cannot be configured on a non-management interface.
Default	false
Introduced	16.0.R1
Platforms	All

autonomous-system *number*

Synopsis	AS number advertised to peers for this router
Context	**configure** router *string* autonomous-system *number*
Tree	autonomous-system
Description	This command configures the autonomous system (AS) number for the router. This value must be set before BGP can be activated. If the AS number is changed on a router with an active BGP instance, the new AS number is not used until the BGP instance is restarted.
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

bfd

Synopsis	Enter the **bfd** context
Context	**configure** router *string* bfd
Tree	bfd
Introduced	19.7.R1
Platforms	All

seamless-bfd

Synopsis	Enter the **seamless-bfd** context
Context	**configure** router *string* bfd seamless-bfd
Tree	seamless-bfd
Introduced	19.7.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

peer [address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **peer** list instance
Context	**configure** router *string* bfd seamless-bfd peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Max. Instances	8000
Introduced	19.7.R1
Platforms	All

[**address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Address of the remote node
Context	**configure** router *string* bfd seamless-bfd peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Notes	This element is part of a list key.
Introduced	19.7.R1
Platforms	All

discriminator *number*

Synopsis	Discriminator of the remote node
Context	**configure** router *string* bfd seamless-bfd peer *(ipv4-address-no-zone | ipv6-address-no-zone)* discriminator *number*
Tree	discriminator
Range	1 to 4294967295
Introduced	19.7.R1
Platforms	All

bgp

Synopsis	Enable the **bgp** context
Context	**configure** router *string* bgp
Tree	bgp

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

add-paths

Synopsis	Enable the **add-paths** context
Context	**configure** router *string* bgp add-paths
Tree	add-paths
Description	Commands in this context configure add-paths support for the specified address families of the BGP instance. The BGP add-paths capability allows the router to send or receive multiple paths per prefix to and from a peer.
Introduced	16.0.R1
Platforms	All

evpn

Synopsis	Enter the **evpn** context
Context	**configure** router *string* bgp add-paths evpn
Tree	evpn
Description	Commands in this context configure the Add-Paths capability for EVPN routes. By default, Add-Paths is not enabled for EVPN routes.
Introduced	21.10.R1
Platforms	All

receive *boolean*

Synopsis	Receive multiple EVPN paths per prefix from a peer
Context	**configure** router *string* bgp add-paths evpn receive *boolean*
Tree	receive
Default	false
Introduced	21.10.R1
Platforms	All

send *(number | keyword)*

Synopsis	Maximum number of EVPN paths to send

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* bgp add-paths evpn send *(number | keyword)*
Tree	send
Range	1 to 16
Options	multipaths – Number of best multipaths for each NLRI
Introduced	21.10.R1
Platforms	All

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** router *string* bgp add-paths ipv4
Tree	ipv4
Description	Commands in this context configure add-paths support for the IPv4 unicast address family.
Introduced	16.0.R1
Platforms	All

receive *boolean*

Synopsis	Receive multiple routes per unlabeled IPv4 prefix
Context	**configure** router *string* bgp add-paths ipv4 receive *boolean*
Tree	receive
Description	When configured to **true**, this command allows multiple unlabeled IPv4 unicast routes per prefix to be received from a peer. When configured to **false**, the ADD-PATH receive capability is not enabled.
Default	false
Introduced	16.0.R1
Platforms	All

send *(number | keyword)*

Synopsis	Maximum paths per unlabeled IPv4 unicast prefix
Context	**configure** router *string* bgp add-paths ipv4 send *(number | keyword)*
Tree	send
Description	This command configures the maximum number of paths per unlabeled IPv4 unicast prefix that are allowed to be advertised to ADD-PATH peers. The actual number of

send *(number | keyword)*

Synopsis	Maximum paths advertised per VPN-IPv6 prefix
Context	**configure** router *string* bgp add-paths vpn-ipv6 send *(number | keyword)*
Tree	send
Description	This command configures the maximum number of paths that are allowed to be advertised to add-paths peers per VPN-IPv6 prefix. The actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules. When not configured, add-paths send capability is not enabled for VPN-IPv6 routes.
Range	1 to 16
Options	multipaths – Number of best multipaths for each NLRI
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the BGP instance
Context	**configure** router *string* bgp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

advertise-external

Synopsis	Enter the **advertise-external** context
Context	**configure** router *string* bgp advertise-external
Tree	advertise-external
Description	Commands in this context allow BGP to advertise its best external route to a destination for specified address families even when its best overall route is an internal route.
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4 *boolean*

Synopsis	Enable support for unlabeled unicast IPv4 routes
Context	**configure** router *string* bgp advertise-external ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	16.0.R1
Platforms	All

ipv6 *boolean*

Synopsis	Enable support for unlabeled unicast IPv6 routes
Context	**configure** router *string* bgp advertise-external ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	16.0.R1
Platforms	All

label-ipv4 *boolean*

Synopsis	Enable support for labeled-unicast IPv4 routes
Context	**configure** router *string* bgp advertise-external label-ipv4 *boolean*
Tree	label-ipv4
Default	false
Introduced	16.0.R1
Platforms	All

label-ipv6 *boolean*

Synopsis	Enable support for labeled-unicast IPv6 routes
Context	**configure** router *string* bgp advertise-external label-ipv6 *boolean*
Tree	label-ipv6
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

advertise-inactive *boolean*

Synopsis	Advertise inactive BGP routes to peers
Context	**configure** router *string* bgp advertise-inactive *boolean*
Tree	advertise-inactive
Description	When configured to **true**, this command allows any inactive BGP route to be advertised, even though it is not the used route. When configured to **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.
Default	false
Introduced	16.0.R1
Platforms	All

advertise-ipv6-next-hops

Synopsis	Enter the **advertise-ipv6-next-hops** context
Context	**configure** router *string* bgp advertise-ipv6-next-hops
Tree	advertise-ipv6-next-hops
Introduced	16.0.R1
Platforms	All

evpn *boolean*

Synopsis	Advertise EVPN route with IPv6 next-hop address
Context	**configure** router *string* bgp advertise-ipv6-next-hops evpn *boolean*
Tree	evpn
Description	When configured to **true**, EVPN routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, EVPN routes are advertised with IPv4 next-hop addresses to IPv6 transport peers.
Default	false
Introduced	19.5.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4 *boolean*

Synopsis	Advertise IPv4 route with IPv6 next-hop address
Context	**configure** router *string* bgp advertise-ipv6-next-hops ipv4 *boolean*
Tree	ipv4
Description	When configured to **true**, IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop. When configured to **false**, IPv4 routes are advertised with IPv4 next-hop addresses to IPv6 transport peers. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.
Default	false
Introduced	19.5.R1
Platforms	All

label-ipv4 *boolean*

Synopsis	Advertise label IPv4 route with IPv6 next-hop address
Context	**configure** router *string* bgp advertise-ipv6-next-hops label-ipv4 *boolean*
Tree	label-ipv4
Description	When configured to **true**, label IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop. When configured to **false**, label IPv4 routes are advertised with the system IPv4 address as the next hop to IPv6 transport peers. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.
Default	false
Introduced	16.0.R1
Platforms	All

label-ipv6 *boolean*

Synopsis	Advertise label IPv6 route with IPv6 next-hop address
Context	**configure** router *string* bgp advertise-ipv6-next-hops label-ipv6 *boolean*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	label-ipv6
Description	When configured to **true**, label IPv6 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, label IPv6 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop, encoded as an IPv4-mapped IPv6 address.
Default	false
Introduced	16.0.R1
Platforms	All

vpn-ipv4 *boolean*

Synopsis	Advertise VPN IPv4 route with IPv6 next-hop address
Context	**configure** router *string* bgp advertise-ipv6-next-hops vpn-ipv4 *boolean*
Tree	vpn-ipv4
Description	When configured to **true**, VPN IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop. When configured to **false**, VPN IPv4 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.
Default	false
Introduced	16.0.R1
Platforms	All

vpn-ipv6 *boolean*

Synopsis	Advertise VPN IPv6 route with IPv6 next-hop address
Context	**configure** router *string* bgp advertise-ipv6-next-hops vpn-ipv6 *boolean*
Tree	vpn-ipv6
Description	When configured to **true**, VPN IPv6 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, VPN IPv6 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop, encoded as an IPv4-mapped IPv6 address.
Default	false

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

aggregator-id-zero *boolean*

Synopsis	Set router ID in the BGP AGGREGATOR attribute to 0
Context	**configure** router *string* bgp aggregator-id-zero *boolean*
Tree	aggregator-id-zero
Description	When configured to **true**, the router ID in the BGP AGGREGATOR path attribute is set to 0 when BGP aggregates routes. This prevents different routers within an AS from creating aggregate routes for the same prefix with different path attributes. When configured to **false**, the AS number and router ID are added to the AGGREGATOR path attribute.
Default	false
Introduced	16.0.R1
Platforms	All

asn-4-byte *boolean*

Synopsis	Advertise support for 4-byte ASNs
Context	**configure** router *string* bgp asn-4-byte *boolean*
Tree	asn-4-byte
Default	true
Introduced	16.0.R1
Platforms	All

authentication-key *string*

Synopsis	BGP authentication key for all peers
Context	**configure** router *string* bgp authentication-key *string*
Tree	authentication-key
Description	This command configures the authentication key used to protect all sessions. The stored format of the authentication key is based on the **configure system security hash-control management-interface md-cli hash-algorithm** setting.
String Length	1 to 370
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

authentication-keychain *reference*

Synopsis	TCP authentication keychain for the session
Context	**configure** router *string* bgp authentication-keychain *reference*
Tree	authentication-keychain
Description	This command associates the keychain to be used to authenticate the BGP session. The keychain allows the rollover of authentication keys during the lifetime of a session.
Reference	**configure** system security keychains keychain *string*
Introduced	16.0.R3
Platforms	All

backup-path

Synopsis	Enter the **backup-path** context
Context	**configure** router *string* bgp backup-path
Tree	backup-path
Description	Commands in this context enable the use of a backup path for specified BGP-learned prefixes belonging to the base router. Multiple paths must be received for a prefix in order to take advantage of this feature. When a prefix has a backup path and its primary paths fail, the affected traffic is rapidly diverted to the backup path without waiting for control plane re-convergence to occur. When many prefixes share the same primary paths and in some cases, the same backup path, the time to divert failover traffic to the backup path is independent of the number of prefixes. By default, IPv4 and IPv6 prefixes do not have a backup path installed in the IOM.
Introduced	16.0.R1
Platforms	All

ipv4 *boolean*

Synopsis	Enable support for unlabeled unicast IPv4 routes
Context	**configure** router *string* bgp backup-path ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6 *boolean*

Synopsis	Enable support for unlabeled unicast IPv6 routes
Context	**configure** router *string* bgp backup-path ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	16.0.R1
Platforms	All

label-ipv4 *boolean*

Synopsis	Enable support for labeled-unicast IPv4 routes
Context	**configure** router *string* bgp backup-path label-ipv4 *boolean*
Tree	label-ipv4
Default	false
Introduced	16.0.R1
Platforms	All

label-ipv6 *boolean*

Synopsis	Enable support for labeled-unicast IPv6 routes
Context	**configure** router *string* bgp backup-path label-ipv6 *boolean*
Tree	label-ipv6
Default	false
Introduced	16.0.R1
Platforms	All

best-path-selection

Synopsis	Enter the **best-path-selection** context
Context	**configure** router *string* bgp best-path-selection
Tree	best-path-selection
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.

always-compare-med

Synopsis	Enter the **always-compare-med** context
Context	**configure** router *string* bgp best-path-selection always-compare-med
Tree	always-compare-med
Description	Commands in this context determine how the BGP decision process is affected by the MED path attribute.
Introduced	16.0.R1
Platforms	All

med-value *keyword*

Synopsis	Action for a missing MED attribute
Context	**configure** router *string* bgp best-path-selection always-compare-med med-value *keyword*
Tree	med-value
Options	off, missing-med-zero, missing-med-infinity, on
Default	off
Introduced	16.0.R1
Platforms	All

strict-as *boolean*

Synopsis	Compare MED only for routes from same neighbor AS
Context	**configure** router *string* bgp best-path-selection always-compare-med strict-as *boolean*
Tree	strict-as
Description	When configured to **true**, the route selection process can compare the MED path attribute between routes only if they come from the same neighbor AS. When configured to **false**, the route selection process can compare the MED path attribute between routes even if they come from different neighbor ASs.
Default	true
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

as-path-ignore

Synopsis	Enter the **as-path-ignore** context
Context	**configure** router *string* bgp best-path-selection as-path-ignore
Tree	as-path-ignore
Description	Commands in this context determine whether the AS path length is considered in the selection process for routes of the specified address families.
Introduced	16.0.R1
Platforms	All

ipv4 *boolean*

Synopsis	Ignore AS path length for unlabeled unicast IPv4 routes
Context	**configure** router *string* bgp best-path-selection as-path-ignore ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	16.0.R1
Platforms	All

compare-origin-validation-state *boolean*

Synopsis	Compare RPKI origin validation state of usable routes
Context	**configure** router *string* bgp best-path-selection compare-origin-validation-state *boolean*
Tree	compare-origin-validation-state
Description	When configured to **true**, the RPKI origin validation state is compared between BGP routes, where a Valid state is preferred over a Not-Found state, and a Not-Found state is preferred over an Invalid state. When configured to **false**, the RPKI origin validate state comparison is not performed as part of the BGP route selection process.
Default	false
Introduced	16.0.R1
Platforms	All

d-path-length-ignore *boolean*

Synopsis	Enable D-PATH length ignore
Context	**configure** router *string* bgp best-path-selection d-path-length-ignore *boolean*
Tree	d-path-length-ignore
Description	When configured to **true**, this command, enables the router to ignore the D-PATH domain segment length during best-path selection. At the base router level (or VPRN BGP level for PE-CE routers), this command allows BGP to ignore the D-PATH domain segment length for best-path selection purposes. BGP ignores the D-PATH length when comparing two VPN routes or two IFL routes within the same RD. However, these VPN/IFL routes are processed in the main-BGP instance. At the VPRN router level, this command allows the VPRN RTM to ignore the D-PATH domain segment length for best-path selection purposes (for routes in VPRN). The user can control whether the RTM considers the D-PATH length when comparing two VPN routes with different RDs. Best-path selection for EVPN-IFF routes against other owners (for example, EVPN-IFL or IPVPN) still relies on RTM preference. When EVPN-IFF RTM preference matches the RTM preference of another BGP owner, the existing RTM selection applies and D-PATH is not considered, irrespective of the **d-path-length-ignore** configuration. When configured to **false**, this command disables the ability to ignore the D-PATH domain segment length.
Default	false
Introduced	21.10.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

deterministic-med *boolean*

Synopsis	Group paths based on AS before MED attribute comparison
Context	**configure** router *string* bgp best-path-selection deterministic-med *boolean*
Tree	deterministic-med
Description	When configured to **true**, BGP groups paths from the same AS that are equal up to the MED attribute comparison and then compares the best path from each group to select the overall best path. This process ensures that the best-path selection process is deterministic in all cases. When configured to **false**, paths are not grouped and the overall best-path selection can depend on the order of route arrival.
Default	false
Introduced	16.0.R1
Platforms	All

ebgp-ibgp-equal

Synopsis	Enter the **ebgp-ibgp-equal** context
Context	**configure** router *string* bgp best-path-selection ebgp-ibgp-equal
Tree	ebgp-ibgp-equal
Description	Commands in this context allow BGP to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled) for the specified address families. The result is a form of EIBGP load-balancing in a multipath scenario. This behavior can be applied selectively to certain address families. By default, the BGP decision process prefers an EBGP learned route over an IBGP learned route.
Introduced	16.0.R1
Platforms	All

evpn *boolean*

Synopsis	Consider EBGP and IBGP EVPN routes equal
Context	**configure** router *string* bgp best-path-selection ebgp-ibgp-equal evpn *boolean*
Tree	evpn
Default	false
Introduced	22.7.R1

ignore-nh-metric *boolean*

Synopsis	Ignore next-hop distance in best path selection
Context	**configure** router *string* bgp best-path-selection ignore-nh-metric *boolean*
Tree	ignore-nh-metric
Description	When configured to **true**, BGP ignores the resolved distance to the BGP next hop in its route selection process. When configured to **false**, BGP factors the distance to the next hop into its decision process when it compares two BGP routes with the same NLRI learned from base router BGP peers (in the **router** context) or IP prefix learned from VPRN BGP peers (in the **vprn** context).
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ignore-router-id

Synopsis	Enable the **ignore-router-id** context
Context	**configure** router *string* bgp best-path-selection ignore-router-id
Tree	ignore-router-id
Description	Commands in this context determine whether the BGP selection process ignores the BGP identifier (router ID) comparison of two EBGP paths from different EBGP peers when determining the best path for the specified address families. By default, BGP selects the path with the lower router ID when it compares two paths from EBGP peers.
Introduced	16.0.R1
Platforms	All

include-internal

Synopsis	Enter the **include-internal** context
Context	**configure** router *string* bgp best-path-selection ignore-router-id include-internal
Tree	include-internal
Description	Commands in this context specify the internal address families for which the router ID values are ignored, even when comparing two IBGP paths or an EBGP and an IBGP path.
Introduced	16.0.R1
Platforms	All

mvpn-ipv4 *boolean*

Synopsis	Ignore the router IDs of MVPN-IPv4 routes
Context	**configure** router *string* bgp best-path-selection ignore-router-id include-internal mvpn-ipv4 *boolean*
Tree	mvpn-ipv4
Default	false
Introduced	16.0.R1

Context	**configure** router *string* bgp best-path-selection ignore-router-id include-internal mvpn-ipv6 *boolean*
Tree	mvpn-ipv6
Default	false
Introduced	16.0.R1
Platforms	All

origin-invalid-unusable *boolean*

Synopsis	Deem invalid routes unusable for best-path selection
Context	**configure** router *string* bgp best-path-selection origin-invalid-unusable *boolean*
Tree	origin-invalid-unusable
Description	When configured to **true**, routes that have an RPKI origin validation state of Invalid are considered unusable by the best-path selection algorithm. These routes cannot be used for forwarding and cannot be advertised to BGP peers. When configured to **false**, routes with an RPKI origin validation state of Invalid are compared to other usable routes for the same prefix according to the BGP decision process.
Default	false
Introduced	16.0.R1
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD
Context	**configure** router *string* bgp bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, BFD is enabled on all BGP sessions, subject to the association of those BGP sessions with IP interfaces that have BFD configurations. When configured to **false**, BFD is not enabled globally for all BGP sessions.
Default	false
Introduced	16.0.R1
Platforms	All

bfd-strict-mode

Synopsis	Enter the **bfd-strict-mode** context

© 2023 Nokia.

Context	**configure** router *string* bgp bfd-strict-mode
Tree	bfd-strict-mode
Introduced	23.7.R1
Platforms	All

advertise

Synopsis	Enable the **advertise** context
Context	**configure** router *string* bgp bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**. • The interface associated with the peer has a valid BFD configuration. When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state. When unconfigured, BGP does not advertise the Strict-BFD capability to peers.
Introduced	23.7.R1
Platforms	All

holdtime *number*

Synopsis	Maximum time BGP waits for the BFD session to come up
Context	**configure** router *string* bgp bfd-strict-mode advertise holdtime *number*
Tree	holdtime
Description	This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.
Range	1 to 65535
Units	seconds
Default	30
Introduced	23.7.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

next-hop-reachability *boolean*

Synopsis Consider next hop unreachable if BFD session is down

Context **configure** router *string* bgp bfd-strict-mode next-hop-reachability *boolean*

Tree next-hop-reachability

Description When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met:

- The BFD session to the peer is in a down state.
- There is a valid interface BFD configuration that applies to the peer.
- There is a valid BFD liveness configuration that applies to the peer.

The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address.

Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer.

The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent.

Configuring this command to **true** only affects routes belonging to the following address families:

- IPv4
- IPv6
- IPv4 VPN
- IPv6 VPN
- labeled unicast IPv4
- labeled unicast IPv6
- EVPN
- IPv4 multicast
- IPv6 multicast
- IPv4 VPN multicast
- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Default false

Introduced 23.7.R1

Platforms All

bgp-tunnel-metric

Synopsis	Enter the **bgp-tunnel-metric** context
Context	**configure** router *string* bgp bgp-tunnel-metric
Tree	bgp-tunnel-metric
Description	Commands in this context control the tunnel table metrics associated with BGP label unicast routes.
Introduced	20.5.R1
Platforms	All

prefer-aigp *boolean*

Synopsis	Use the AIGP attribute as tunnel metric when present
Context	**configure** router *string* bgp bgp-tunnel-metric prefer-aigp *boolean*
Tree	prefer-aigp
Description	When configured to **true**, the TTM metric is based on the AIGP metric if the route has the path attribute. When the BGP-LU route is selected for installation in TTM and it is not matched by a BGP import policy entry that overrides the BGP tunnel metric action, the TTM metric of the tunnel is set to the AIGP metric value of the BGP-LU route plus the resolved cost to the BGP next-hop of the route; otherwise, the metric is set to the value in the **value** setting. When configured to **false**, the AIGP attribute is ignored for purposes to TTM metric derivation.
Default	false
Introduced	20.5.R1
Platforms	All

prefer-med *boolean*

Synopsis	Use the MED attribute as tunnel metric when present
Context	**configure** router *string* bgp bgp-tunnel-metric prefer-med *boolean*
Tree	prefer-med
Description	When configured to **true**, the TTM metric is based on the MED metric value of the BGP-LU route. When a BGP-LU route is selected for installation in TTM and is not matched by a BGP import policy entry that overrides the BGP tunnel metric action, the TTM metric of the tunnel is set to the MED metric value of the BGP-LU route with the resolved cost to the BGP next hop of the route added to it. Otherwise, the metric is set to the value configured using the **value** command. When configured to **false**, the MED attribute is ignored for TTM metric derivation.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note: prefer-aigp takes precedence over this command if the received BGP-LU has both attributes.

Default false

Introduced 23.3.R1

Platforms All

value *number*

Synopsis BGP tunnel metric value

Context **configure** router *string* bgp bgp-tunnel-metric value *number*

Tree value

Description This command configures a BGP tunnel metric for label IPv4 routes that do not have their metric set by more specific means.

If a BGP-LU route is selected for installation in the TTM and there is no tunnel metric policy action that applies to the route, the TTM metric of the associated tunnel is set to this value if either:

- **prefer-aigp** is set to **false**
- **prefer-aigp** is set to **true** but the BGP-LU route does not have an AIGP attribute

Range 0 to 4294967295

Default 1000

Introduced 20.5.R1

Platforms All

bgp-tunnel-preference *number*

Synopsis BGP tunnel table preference

Context **configure** router *string* bgp bgp-tunnel-preference *number*

Tree bgp-tunnel-preference

Description This command configures the tunnel table preference for BGP-LU tunnel type.

The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it.

Range 1 to 255

Default 12

Introduced	21.10.R1
Platforms	All

block-prefix-sid *boolean*

Synopsis	Block the prefix SID attribute
Context	**configure** router *string* bgp block-prefix-sid *boolean*
Tree	block-prefix-sid
Description	When configured to **true**, all prefix SID attributes are removed from label IPv4 and label IPv6 routes when they are exchanged with EBGP and IBGP peers covered by the scope of the command. Locally-imposed prefix SID attributes are also removed. When configured to **false**, all prefix SID attributes associated with label IPv4 and label IPv6 routes are propagated without restriction. A change of this configuration causes the affected BGP sessions to flap.
Default	false
Introduced	19.10.R1
Platforms	All

client-reflect *boolean*

Synopsis	Allow client reflection of routes by route reflector
Context	**configure** router *string* bgp client-reflect *boolean*
Tree	client-reflect
Description	When configured to **true**, routes received from neighbors considered to be RR clients are reflected to other peers as expected. When configured to **false**, routes received from neighbors considered to be RR clients are not reflected to other clients.
Default	true
Introduced	16.0.R1
Platforms	All

cluster

Synopsis	Enter the **cluster** context
Context	**configure** router *string* bgp cluster
Tree	cluster
Introduced	16.0.R1

Platforms	All

allow-local-fallback *boolean*

Synopsis	Allow fallback to RR topology location for ORR
Context	**configure** router *string* bgp cluster allow-local-fallback *boolean*
Tree	allow-local-fallback
Description	When configured to **true**, this command allows the RR to advertise the best BGP path from its own topology location when there are no reachable routes from the client's ORR location. The ORR location must be specified before this command can be set to **true**. When configured to **false**, no route is advertised to the clients when there are no reachable routes from the client's ORR location.
Default	false
Introduced	16.0.R1
Platforms	All

cluster-id *string*

Synopsis	Route reflector cluster ID
Context	**configure** router *string* bgp cluster cluster-id *string*
Tree	cluster-id
Description	The command specifies the cluster ID to associate with the routing instance, effectively making all IBGP peers of the routing instance RR clients.
Introduced	16.0.R1
Platforms	All

orr-location *number*

Synopsis	Optimal route reflection location for the cluster
Context	**configure** router *string* bgp cluster orr-location *number*
Tree	orr-location
Description	This command configures an ORR location ID. If a cluster ID is also specified, the clients in that cluster receive routes optimal for that specific location. With optimal route reflection, the best path advertised to a client takes location ID into account. If the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF, OSPFv3, IS-IS, or BGP-LS information in the TE DB.

damp-peer-oscillations

Synopsis	Enable the **damp-peer-oscillations** context
Context	**configure** router *string* bgp damp-peer-oscillations
Tree	damp-peer-oscillations

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context support the DampPeerOscillations FSM behavior described in section 8.1 of RFC 4271, *A Border Gateway Protocol 4 (BGP-4)*. When unconfigured, the router does not perform peer oscillation damping and immediately transitions out of the idle state after every reset.
Introduced	16.0.R1
Platforms	All

error-interval *number*

Synopsis	Time after a reset that the session must be error-free
Context	**configure** router *string* bgp damp-peer-oscillations error-interval *number*
Tree	error-interval
Description	This command sets the interval of time after a reset, during which the session must be error-free in order to reset the penalty counter and return the idle hold time to the initial wait time.
Range	0 to 2048
Default	30
Introduced	16.0.R1
Platforms	All

idle-hold-time

Synopsis	Enter the **idle-hold-time** context
Context	**configure** router *string* bgp damp-peer-oscillations idle-hold-time
Tree	idle-hold-time
Description	Commands in this context configure how long a BGP peer session remains in the idle state after some type of error causes the session to reset. In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur in a short time period after each session reset cause longer and longer hold times in the idle state.
Introduced	16.0.R1
Platforms	All

initial-wait *number*

Synopsis	Time session remains in idle state after stabilization
Context	**configure** router *string* bgp damp-peer-oscillations idle-hold-time initial-wait *number*

Platforms	All

max-wait *number*

Synopsis	Maximum session idle time after repeated instability
Context	**configure** router *string* bgp damp-peer-oscillations idle-hold-time max-wait *number*
Tree	max-wait
Range	1 to 2048
Default	60
Introduced	16.0.R1
Platforms	All

second-wait *number*

Synopsis	Time that doubles after each session failure
Context	**configure** router *string* bgp damp-peer-oscillations idle-hold-time second-wait *number*
Tree	second-wait
Description	This command defines the hold time that doubles after each repeated session failure that occurs in a short span of time.
Range	1 to 2048
Default	5
Introduced	16.0.R1
Platforms	All

damping *boolean*

Synopsis	Use BGP route damping to reduce route flap
Context	**configure** router *string* bgp damping *boolean*
Tree	damping
Description	When configured to **true**, this command enables route damping to reduce the number of update messages sent between BGP peers and reduce the load on peers without affecting the route convergence time for stable routes.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Route damping is controlled by profiles set in route policies. If no profile is specified in the route policy, the default damping profile is used with the following parameters:

- Half-life: 15 minutes
- Max-suppress: 60 minutes
- Suppress-threshold: 3000
- Reuse-threshold: 750

When configured to **false**, BGP route damping for learned routes is disabled.

Default	false
Introduced	16.0.R1
Platforms	All

def-recv-evpn-encap *keyword*

Synopsis	Default EVPN encapsulation type
Context	**configure** router *string* bgp def-recv-evpn-encap *keyword*
Tree	def-recv-evpn-encap
Description	This command specifies the encapsulation type that BGP uses when an EVPN route is received without the Encapsulation Extended Community.
Options	mpls, vxlan
Default	mpls
Introduced	16.0.R1

Context	**configure** router *string* bgp ebgp-default-reject-policy import *boolean*
Tree	import
Default	true
Introduced	19.5.R1
Platforms	All

egress-peer-engineering

Synopsis	Enable the **egress-peer-engineering** context
Context	**configure** router *string* bgp egress-peer-engineering
Tree	egress-peer-engineering
Introduced	21.7.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of BGP egress engineering
Context	**configure** router *string* bgp egress-peer-engineering admin-state *keyword*
Tree	admin-state

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command administratively enables or disables egress engineering for the BGP. If enabled, peer node SIDs and peer adjacency SIDs are advertised in BGP-LS.
Options	enable, disable
Default	disable
Introduced	21.7.R1
Platforms	All

enforce-first-as *boolean*

Synopsis	Enforce the configured peer AS value in received routes
Context	**configure** router *string* bgp enforce-first-as *boolean*
Tree	enforce-first-as
Description	When configured to **true** for an EBGP session, all routes received from an EBGP peer are checked to ensure that the most recent ASN in the AS_PATH attribute of each route matches the configured AS of the session. If there is not a match, the session is reset (if the **update-fault-tolerance** command in the **error-handling** context is set to **false**) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is set to **true**). This command does not flap an established session because it applies only to routes received after the command is issued. When configured to **false**, received routes are not checked for compliance with the rule.
Default	false
Introduced	16.0.R1
Platforms	All

error-handling

Synopsis	Enter the **error-handling** context
Context	**configure** router *string* bgp error-handling
Tree	error-handling
Introduced	16.0.R1
Platforms	All

update-fault-tolerance *boolean*

Synopsis	Tolerate non-critical errors in UPDATE messages
Context	**configure** router *string* bgp error-handling update-fault-tolerance *boolean*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	update-fault-tolerance
Description	When configured to **true**, non-critical errors are handled with treat-as-withdraw, attribute-discard, and other non-disruptive approaches that do not cause a session reset. Critical errors still trigger a session reset. When configured to **false**, most errors trigger a session reset.
Default	false
Introduced	16.0.R1
Platforms	All

export

Synopsis	Enable the **export** context
Context	**configure** router *string* bgp export
Tree	export
Description	Commands in this context specify route policies that control the handling of outbound routes transmitted to all peers. Route policies are configured in the **configure policy-options** context. When no export policies are specified in this context, BGP-learned routes are advertised by default and non-BGP routes are not advertised.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	List of export policy names
Context	**configure** router *string* bgp export policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of outbound routes transmitted to certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route. Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). When no export policies are specified, BGP-learned routes are advertised by default and non-BGP routes are not advertised.
String Length	1 to 255

extended-nh-encoding

Synopsis	Enter the **extended-nh-encoding** context
Context	**configure** router *string* bgp extended-nh-encoding
Tree	extended-nh-encoding
Description	Commands in this context specify the IPv4-related address families that can receive IPv6 next hops from peers. The peers should not send such routes unless the peers receive notification of this capability. If the router receives an enabled address family route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed. This causes either a session reset or treat-as-withdraw behavior depending on the error handling settings.
Introduced	16.0.R1
Platforms	All

ipv4 *boolean*

Synopsis	Advertise encoding capability for IPv4 routes

fast-external-failover *boolean*

Synopsis	Drop external BGP session immediately when link fails

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* bgp fast-external-failover *boolean*
Tree	fast-external-failover
Description	When configured to **true**, the router drops an external BGP session to a single-hop neighbor immediately when the local interface goes down. When configured to **false**, the BGP session remains up until the hold time expires.
Default	true
Introduced	16.0.R1
Platforms	All

flowspec

Synopsis	Enter the **flowspec** context
Context	**configure** router *string* bgp flowspec
Tree	flowspec
Introduced	16.0.R1
Platforms	All

validate-dest-prefix *boolean*

Synopsis	Validate destination prefix in FlowSpec-IPv4/IPv6 route
Context	**configure** router *string* bgp flowspec validate-dest-prefix *boolean*
Tree	validate-dest-prefix
Description	When configured to **true**, this command enables validation of received IPv4 and IPv6 FlowSpec routes that contain a destination-prefix subcomponent. A FlowSpec route with a destination-prefix subcomponent is considered invalid if both of the following are true: • it was originated outside the local AS of the receiving BGP router • the neighbor AS of the FlowSpec route does not match the neighbor AS of the best match BGP (unicast) route for the destination prefix or the neighbor AS of any longer match BGP (unicast) route for the destination prefix An invalid route is retained in the BGP but it is not used for filtering traffic or propagated to other BGP routers. When configured to **false**, destination-prefix validation is disabled.
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

validate-redirect-ip *boolean*

Synopsis	Validate the redirect-to-IPv4 action in FlowSpec route
Context	**configure** router *string* bgp flowspec validate-redirect-ip *boolean*
Tree	validate-redirect-ip
Description	When configured to **true**, this command enables procedures to validate the redirect-to-IPv4 action attached to FlowSpec-IPv4 routes that are received by the BGP instance. A FlowSpec-IPv4 route is considered invalid and is not installed as a filter rule if the FlowSpec-IPv4 route is deemed to have originated from a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a FlowSpec route is determined from its AS path. When configured to **false**, the validation check is disabled.
Default	false
Introduced	16.0.R1
Platforms	All

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** router *string* bgp graceful-restart
Tree	graceful-restart
Description	Commands in this context configure BGP graceful restart helper procedures for address families included in the GR capabilities of both peers.
Introduced	16.0.R1
Platforms	All

gr-notification *boolean*

Synopsis	Perform Graceful Restart procedures
Context	**configure** router *string* bgp graceful-restart gr-notification *boolean*
Tree	gr-notification
Description	When configured to **true**, the Graceful Restart capability sent by the router indicates support for NOTIFICATION messages. If the peer also supports this capability, the session is restarted gracefully (while preserving forwarding) if either peer sends a NOTIFICATION message due to some type of event or error. When configured to **false**, NOTIFICATION messages are not supported.
Default	false

Introduced	16.0.R1
Platforms	All

long-lived

Synopsis	Enable the **long-lived** context
Context	**configure** router *string* bgp graceful-restart long-lived
Tree	long-lived
Description	Commands in this context configure the BGP Long-Lived Graceful-Restart (LLGR) procedures. LLGR, known informally as BGP persistence, is an extension of BGP GR that allows a session to stay down for a longer period of time. During this time, learned routes are marked and re-advertised as stale but they can continue to be used as routes of last resort. The LLGR handling of a session failure can be invoked immediately or it can be delayed until the end of the traditional GR restart window.
Introduced	16.0.R1
Platforms	All

advertise-stale-to-all-neighbors *boolean*

Synopsis	Advertise stale routes to all BGP peers
Context	**configure** router *string* bgp graceful-restart long-lived advertise-stale-to-all-neighbors *boolean*
Tree	advertise-stale-to-all-neighbors
Default	false
Introduced	16.0.R1
Platforms	All

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** router *string* bgp graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	16.0.R1
Platforms	All

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time
Context	**configure** router *string* bgp graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time
Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.
Range	0 to 4095
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

helper-override-stale-time *number*

Synopsis	Locally-configured stale routes override time
Context	**configure** router *string* bgp graceful-restart long-lived helper-override-stale-time *number*
Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability. This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.
Range	0 to 16777215
Introduced	16.0.R1
Platforms	All

without-no-export *boolean*

Synopsis	Advertise LLGR stale routes to non-LLGR peers
Context	**configure** router *string* bgp graceful-restart long-lived without-no-export *boolean*
Tree	without-no-export
Description	When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0. When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0 and a NO_EXPORT standard community is automatically added to the routes.
Default	false
Introduced	16.0.R1
Platforms	All

restart-time *number*

advertise-inactive *boolean*

Synopsis	Advertise an inactive BGP route to peers
Context	**configure** router *string* bgp group *string* advertise-inactive *boolean*
Tree	advertise-inactive
Description	When configured to **true**, this command allows an inactive BGP route to be advertised, even though it is not the most preferred route. The effect of the command on advertised unlabeled, labeled, and multicast IPv4 and IPv6 routes depends on several factors. • If the active route for the IP prefix is a BGP route, that route is advertised. • If the active route is a non-BGP route and there are valid inactive BGP routes to the same destination, the best valid inactive route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session. • If the active route is a non-BGP route and there are no valid BGP routes to the same destination, no route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.
Introduced	16.0.R1
Platforms	All

advertise-ipv6-next-hops

Synopsis	Enable the **advertise-ipv6-next-hops** context
Context	**configure** router *string* bgp group *string* advertise-ipv6-next-hops
Tree	advertise-ipv6-next-hops

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context allow specified IP family routes to be advertised to IPv6 transport peers with a true IPv6 address when originated or when a configured or automatic next-hop-self action is applied. When unconfigured, command settings are inherited from a higher level BGP configuration.
Introduced	16.0.R1
Platforms	All

evpn *boolean*

Synopsis	Advertise EVPN route with IPv6 next-hop address
Context	**configure** router *string* bgp group *string* advertise-ipv6-next-hops evpn *boolean*
Tree	evpn
Description	When configured to **true**, EVPN routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, EVPN routes are advertised with IPv4 next-hop addresses to IPv6 transport peers.
Default	false
Introduced	19.5.R1
Platforms	All

ipv4 *boolean*

Synopsis	Advertise IPv4 route with IPv6 next-hop address
Context	**configure** router *string* bgp group *string* advertise-ipv6-next-hops ipv4 *boolean*
Tree	ipv4
Description	When configured to **true**, IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop. When configured to **false**, IPv4 routes are advertised with IPv4 next-hop addresses to IPv6 transport peers. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.
Default	false
Introduced	19.5.R1
Platforms	All

vpn-ipv6 *boolean*

Synopsis	Advertise VPN IPv6 route with IPv6 next-hop address
Context	**configure** router *string* bgp group *string* advertise-ipv6-next-hops vpn-ipv6 *boolean*
Tree	vpn-ipv6
Description	When configured to **true**, VPN IPv6 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, VPN IPv6 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop, encoded as an IPv4-mapped IPv6 address.
Default	false
Introduced	16.0.R1
Platforms	All

aggregator-id-zero *boolean*

Synopsis	Set router ID in the BGP AGGREGATOR attribute to zero
Context	**configure** router *string* bgp group *string* aggregator-id-zero *boolean*
Tree	aggregator-id-zero
Introduced	16.0.R1
Platforms	All

aigp *boolean*

Synopsis	Add AIGP attribute to advertised routes

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* bgp group *string* aigp *boolean*
Tree	aigp
Description	When configured to **true**, this command enables Accumulated IGP (AIGP) path attribute support with one or more BGP peers. BGP path selection among routes with an associated AIGP metric is based on the end-to-end IGP metrics of the different BGP paths, even when these BGP paths span more than one AS and IGP instance. When configured to **false**, the AIGP attribute is removed from advertised routes, if present, and is ignored in received routes.
Default	false
Introduced	16.0.R1
Platforms	All

as-override *boolean*

Synopsis	Replace the peer ASN with the local ASN in AS Path
Context	**configure** router *string* bgp group *string* as-override *boolean*
Tree	as-override
Description	When configured to **true**, the advertising router's local AS replaces all occurrences of the peer AS in the AS_PATH attribute. This command should be used with caution, as it breaks BGP's loop detection mechanism. When configured to **false**, no AS override is performed.
Default	false
Introduced	19.7.R1
Platforms	All

asn-4-byte *boolean*

Synopsis	Advertise the use of 4-byte ASNs
Context	**configure** router *string* bgp group *string* asn-4-byte *boolean*
Tree	asn-4-byte
Description	When this command inherits a value of **true**, the use of 4-byte ASNs is supported. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **true**. When configured to **false**, this command disables the use of 4-byte ASNs.
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

authentication-key *string*

Synopsis	BGP authentication key for peers in the group
Context	**configure** router *string* bgp group *string* authentication-key *string*
Tree	authentication-key
Description	This command configures the authentication key that must be configured on both peers. The stored format of the authentication key is based on the **configure system security hash-control management-interface md-cli hash-algorithm** setting**.**
String Length	1 to 370
Introduced	16.0.R1
Platforms	All

authentication-keychain *reference*

Synopsis	TCP authentication keychain for the session
Context	**configure** router *string* bgp group *string* authentication-keychain *reference*
Tree	authentication-keychain
Description	This command associates the keychain to be used to authenticate the BGP session. The keychain allows the rollover of authentication keys during the lifetime of a session.
Reference	**configure** system security keychains keychain *string*
Introduced	16.0.R3
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD
Context	**configure** router *string* bgp group *string* bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, BFD is enabled on a given protocol interface where the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, BFD is removed from the associated protocol adjacency.
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

bfd-strict-mode

Synopsis	Enter the **bfd-strict-mode** context
Context	**configure** router *string* bgp group *string* bfd-strict-mode
Tree	bfd-strict-mode
Introduced	23.7.R1
Platforms	All

advertise

Synopsis	Enable the **advertise** context
Context	**configure** router *string* bgp group *string* bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**. • The interface associated with the peer has a valid BFD configuration. When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state. When unconfigured, BGP does not advertise the Strict-BFD capability to peers.
Introduced	23.7.R1
Platforms	All

holdtime *number*

Synopsis	Maximum time BGP waits for the BFD session to come up
Context	**configure** router *string* bgp group *string* bfd-strict-mode advertise holdtime *number*
Tree	holdtime
Description	This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.
Range	1 to 65535
Units	seconds

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	30
Introduced	23.7.R1
Platforms	All

next-hop-reachability *boolean*

Synopsis	Consider next hop unreachable if BFD session is down
Context	**configure** router *string* bgp group *string* bfd-strict-mode next-hop-reachability *boolean*
Tree	next-hop-reachability
Description	When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met: • The BFD session to the peer is in a down state. • There is a valid interface BFD configuration that applies to the peer. • There is a valid BFD liveness configuration that applies to the peer. The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address. Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer. The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent. Configuring this command to **true** only affects routes belonging to the following address families: • IPv4 • IPv6 • IPv4 VPN • IPv6 VPN • labeled unicast IPv4 • labeled unicast IPv6 • EVPN • IPv4 multicast • IPv6 multicast • IPv4 VPN multicast • IPv6 VPN multicast When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Use subject to Terms available at: www.nokia.com/terms.

Introduced	23.7.R1
Platforms	All

block-prefix-sid *boolean*

Synopsis	Block the prefix SID attribute
Context	**configure** router *string* bgp group *string* block-prefix-sid *boolean*
Tree	block-prefix-sid
Description	When configured to **true**, all prefix SID attributes are removed from all routes exchanged between EBGP and IBGP peers covered by the scope of the command. Locally-imposed prefix SID attributes are also removed. When configured to **false**, all prefix SID attributes are propagated without restriction. A change of this configuration causes the affected BGP sessions to flap.
Default	false
Introduced	19.10.R1
Platforms	All

capability-negotiation *boolean*

Synopsis	Enable capability negotiation
Context	**configure** router *string* bgp group *string* capability-negotiation *boolean*
Tree	capability-negotiation
Description	When configured to **true**, this command enables the exchange of capabilities. When configured to **false** and the peering is flapped, new capabilities are not negotiated and strictly IPv4 exchanges are supported with the peer.
Default	true
Introduced	16.0.R1
Platforms	All

client-reflect *boolean*

Synopsis	Allow cluster RR to advertise routes to its clients
Context	**configure** router *string* bgp group *string* client-reflect *boolean*
Tree	client-reflect
Description	When unconfigured, this command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **true**.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the command inherits a value of **true**, client reflection of routes is enabled.

When configured to **false**, this command disables client reflection of routes.

Introduced 16.0.R1

Platforms All

cluster

orr-location *number*

Synopsis	Optimal route reflection location for the cluster
Context	**configure** router *string* bgp group *string* cluster orr-location *number*
Tree	orr-location
Description	This command configures an ORR location ID. If a cluster ID is also specified, the clients in that cluster receive routes optimal for that specific location. With optimal route reflection, the best path advertised to a client takes location ID into account. If the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs are calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF, OSPFv3, IS-IS, or BGP-LS information in the TE DB.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

connect-retry *number*

damp-peer-oscillations

Synopsis	Enable the **damp-peer-oscillations** context
Context	**configure** router *string* bgp group *string* damp-peer-oscillations
Tree	damp-peer-oscillations
Description	Commands in this context specify how long a BGP peer session remains in the idle state after an error causes the session to reset. In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur a short time after each session reset cause longer and longer hold times in the idle state. When unconfigured, command settings are inherited from the global-level configuration.
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

error-interval *number*

Synopsis	Time after a reset that the session must be error-free
Context	**configure** router *string* bgp group *string* damp-peer-oscillations error-interval *number*
Tree	error-interval
Description	This command sets the interval of time after a reset, during which the session must be error-free in order to reset the penalty counter and return the idle hold time to the initial wait time.
Range	0 to 2048
Default	30
Introduced	16.0.R1
Platforms	All

Introduced	16.0.R1
Platforms	All

interface [interface-name] *string*

Synopsis	Enter the **interface** list instance
Context	**configure** router *string* bgp group *string* dynamic-neighbor interface *string*
Tree	interface
Description	Commands in this context configure an unnumbered base router network interface for dynamic neighbors. If this interface connects to a network with other BGP routers, sessions with the other routers can be set up automatically without explicitly configuring them as BGP neighbors. The interface must be IPv6 enabled, but because the interface is considered unnumbered, it does not require an IPv4 address or a global-unicast IPv6 address. The sessions are set up using IPv6 link-local addresses. The BGP unnumbered feature supports all address families that allow IPv6 link-local BGP next-hop addresses. This includes IPv4 with the use of RFC 8950 extensions. When an interface is added to the list of dynamic-neighbor interfaces, an outgoing connection attempt is initiated toward any directly connected router on the interface that announces itself using an ICMPv6 router advertisement message. The session attempt is unsuccessful if the peer type is not EBGP, the reported AS number of the peer does not match one of the allowed values, or the maximum session limit of the interface would be exceeded.

update-fault-tolerance *boolean*

Synopsis	Tolerate non-critical errors in UPDATE messages
Context	**configure** router *string* bgp group *string* error-handling update-fault-tolerance *boolean*
Tree	update-fault-tolerance
Description	When configured to **true**, non-critical errors are handled with treat-as-withdraw, attribute-discard, and other non-disruptive approaches that do not cause a session reset. Critical errors still trigger a session reset. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, all errors trigger a session reset.
Introduced	16.0.R1
Platforms	All

export

Synopsis	Enable the **export** context
Context	**configure** router *string* bgp group *string* export
Tree	export
Description	Commands in this context specify route policies that control the handling of outbound routes transmitted to certain peers. Route policies are configured in the **configure policy-options** context. When this context is unconfigured, the policy association for the group is inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	BGP export policy name
Context	**configure** router *string* bgp group *string* export policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of outbound routes transmitted to certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or"start@variable@".
String Length	1 to 255
Max. Instances	15
Min. Instances	1
Notes	This element is ordered by the user.
Introduced	16.0.R1

extended-nh-encoding

Synopsis	Enable the **extended-nh-encoding** context
Context	**configure** router *string* bgp group *string* extended-nh-encoding
Tree	extended-nh-encoding
Description	Commands in this context specify the address families enabled to advertise the capability to receive label IPv4 routes, VPN IPv4 routes, or IPv6 next hops from peers. The peers should not send such routes unless notification has been received of this capability. If the router receives an enabled address family route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed. This causes either a session reset or treat-as-withdraw behavior depending on the error handling settings. When the context is unconfigured, command settings are inherited from the higher level BGP configuration.
Introduced	16.0.R1
Platforms	All

Description	When configured to **true**, the Graceful Restart capability sent by the router indicates support for NOTIFICATION messages. If the peer also supports this capability, the

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

session is restarted gracefully (while preserving forwarding) if either peer sends a NOTIFICATION message due to some type of event or error.

When configured to **false**, NOTIFICATION messages are not supported.

Default false

Introduced 16.0.R1

Platforms All

long-lived

Synopsis Enable the **long-lived** context

Context **configure** router *string* bgp group *string* graceful-restart long-lived

Tree long-lived

Description Commands in this context configure the BGP Long-Lived Graceful-Restart (LLGR) procedures.

LLGR, known informally as BGP persistence, is an extension of BGP GR that allows a session to stay down for a longer period of time. During this time, learned routes are marked and re-advertised as stale but they can continue to be used as routes of last resort.

The LLGR handling of a session failure can be invoked immediately or it can be delayed until the end of the traditional GR restart window.

Introduced 16.0.R1

Platforms All

advertise-stale-to-all-neighbors *boolean*

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** router *string* bgp group *string* graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	16.0.R1
Platforms	All

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time
Context	**configure** router *string* bgp group *string* graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time
Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.
Range	0 to 4095
Introduced	16.0.R1
Platforms	All

helper-override-stale-time *number*

Synopsis	Locally-configured stale routes override time
Context	**configure** router *string* bgp group *string* graceful-restart long-lived helper-override-stale-time *number*
Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability. This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.
Range	0 to 16777215
Introduced	16.0.R1
Platforms	All

without-no-export *boolean*

Synopsis	Advertise LLGR stale routes to non-LLGR peers
Context	**configure** router *string* bgp group *string* graceful-restart long-lived without-no-export *boolean*
Tree	without-no-export
Description	When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0 and a NO_EXPORT standard community is automatically added to the routes.

Default	false
Introduced	16.0.R1
Platforms	All

restart-time *number*

Synopsis	Restart time advertised by GR capability
Context	**configure** router *string* bgp group *string* graceful-restart restart-time *number*
Tree	restart-time
Range	0 to 4095
Default	300
Introduced	16.0.R1
Platforms	All

minimum-hold-time *number*

Synopsis	Minimum hold time between successive messages
Context	**configure** router *string* bgp group *string* hold-time minimum-hold-time *number*
Tree	minimum-hold-time
Description	This command specifies the minimum hold time that is accepted for the session. If a peer proposes a hold time lower than this value, the session attempt is rejected. When unconfigured, the command value is inherited from the BGP global-level setting.
Range	0 | 3 to 65536
Default	0
Introduced	16.0.R1
Platforms	All

seconds *number*

Synopsis	Maximum time BGP waits between successive messages
Context	**configure** router *string* bgp group *string* hold-time seconds *number*
Tree	seconds
Description	This command configures the maximum time BGP waits between successive messages (either keepalive or update) from its peer before closing the connection. Although the implementation allows setting the keepalive timer at the BGP group level times separately, the configured keepalive timer is overridden by this value under the following circumstances. • If the specified hold time is less than the configured keepalive time, the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed. • If the hold time is set to zero, the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. The connection with the peer is up permanently and no keepalive packets are sent to the peer. When unconfigured, the command setting is inherited from the BGP global-level configuration.
Range	0 | 3 to 65535
Introduced	16.0.R1
Platforms	All

import

Synopsis	Enable the **import** context

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* bgp group *string* import
Tree	import
Description	Commands in this context specify route policies that control the handling of inbound routes received from certain peers. Route policies are configured in the **configure policy-options** context. When this context is unconfigured, the policy association for the group is inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	BGP import policy name
Context	**configure** router *string* bgp group *string* import policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of inbound routes received from certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route. Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or"start@variable@".
String Length	1 to 255
Max. Instances	15
Min. Instances	1
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

initial-send-delay-zero *boolean*

Synopsis	Send BGP updates as soon as the session comes up
Context	**configure** router *string* bgp group *string* initial-send-delay-zero *boolean*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	initial-send-delay-zero
Description	When configured to **true**, BGP updates are sent as soon as the session comes up. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, BGP waits to send UPDATE messages for the minimum route advertisement time after a session is established.
Introduced	16.0.R1
Platforms	All

keepalive *number*

Synopsis	Time after which the BGP KEEPALIVE message is sent
Context	**configure** router *string* bgp group *string* keepalive *number*
Tree	keepalive
Description	This command configures the BGP keepalive timer value. A keepalive message is sent every time this timer expires. This value is generally one-third of the hold time interval configured in the **hold-time seconds** context. Although the implementation allows this keepalive value and the hold time interval to be independently set, under the following circumstances, the configured keepalive value is overridden by the hold time interval value: • If the specified keepalive value is greater than the configured hold time, the specified keepalive value is ignored and the timer value is set to one third of the current hold time value. • If the specified hold time interval is less than the configured keepalive value, the keepalive value is reset to one third of the specified hold time interval. • If the hold time interval is set to zero, the configured keepalive value is ignored. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer. When unconfigured, the command inherits the BGP global-level setting.
Range	0 to 21845
Introduced	16.0.R1
Platforms	All

label-preference *number*

Context	**configure** router *string* bgp group *string* outbound-route-filtering
Tree	outbound-route-filtering
Description	Commands in this context configure the send and receive capabilities for Outbound Route Filtering (ORF). When this context is unconfigured, the group command settings are inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

extended-community

Synopsis	Enable the **extended-community** context
Context	**configure** router *string* bgp group *string* outbound-route-filtering extended-community
Tree	extended-community

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the ORF send and receive capabilities based on Extended Communities. When this context is unconfigured, the command settings are inherited from the global-level configuration.
Introduced	16.0.R1
Platforms	All

accept-orf *boolean*

Synopsis	Negotiate with peer to accept BGP ORF filters
Context	**configure** router *string* bgp group *string* outbound-route-filtering extended-community accept-orf *boolean*
Tree	accept-orf
Description	When configured to **true**, the receive capability in the BGP ORF is negotiated with a peer and ORF filters can be accepted from peers. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the accept capability in the BGP ORF is removed and any existing ORF filters that are currently in place are cleared.
Introduced	16.0.R1
Platforms	All

send-orf

Synopsis	Enable the **send-orf** context
Context	**configure** router *string* bgp group *string* outbound-route-filtering extended-community send-orf
Tree	send-orf
Description	Commands in this context allow BGP to negotiate the send capability in the ORF negotiation with a peer. The send capability also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD. When this context is unconfigured, the command settings are inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

passive *boolean*

Synopsis	Enable passive mode for BGP communication
Context	**configure** router *string* bgp group *string* passive *boolean*
Tree	passive
Default	false
Introduced	16.0.R1
Platforms	All

path-mtu-discovery *boolean*

Synopsis	Enable Path MTU Discovery
Context	**configure** router *string* bgp group *string* path-mtu-discovery *boolean*
Tree	path-mtu-discovery
Description	When configured to **true**, Path MTU Discovery (PMTUD) is enabled for the associated TCP connections.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When set to **true**, PMTUD is activated toward an IPv4 BGP neighbor and the Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, this device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value so that the IP MTU constraint can be accommodated.

When configured to **false** and there is no TCP MSS configuration that can be associated with a BGP neighbor (in either the BGP configuration or the first hop IP interface configuration), the router advertises a value of only 1024 bytes as the TCP MSS option value, limiting received TCP segments to that size.

Introduced 16.0.R1

Platforms All

peer-as *number*

Synopsis Peer AS number

Context **configure** router *string* bgp group *string* peer-as *number*

Tree peer-as

Range 1 to 4294967295

Introduced 16.0.R1

Platforms All

peer-ip-tracking *boolean*

Synopsis Enable BGP peer tracking

Context **configure** router *string* bgp group *string* peer-ip-tracking *boolean*

Tree peer-ip-tracking

Description When configured to **true**, this command enables BGP peer tracking.

Peer tracking should be used with caution. Peer tracking can tear a session down even if the loss of connectivity turns out to be short-lived (for example, while the IGP protocol is re-converging). Next-hop tracking, which is always enabled, handles temporary connectivity issues more effectively.

When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, peer tracking is disabled.

Introduced 16.0.R1

hold-excess *number*

Synopsis	Percentage of maximum routes to install in route table
Context	**configure** router *string* bgp group *string* prefix-limit *keyword* hold-excess *number*
Tree	hold-excess

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description This command specifies the percentage of maximum routes that are allowed to be installed in the route table for the configured address family. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding and advertisement to other peers. If the **post-import** command is configured to **true**, only routes not rejected by import policies count toward the limit.

A BGP route in an overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route.

This command is mutually exclusive with the **idle-timeou**t and l**og-only** commands.

Range 1 to 100

Introduced 23.7.R1

Platforms All

idle-timeout *number*

Synopsis Time BGP peering remains idle before reconnecting

Context **configure** router *string* bgp group *string* prefix-limit *keyword* idle-timeout *number*

Tree idle-timeout

Description This command configures the time in minutes before a BGP peer is automatically re-established after reaching the prefix limit.

When unconfigured, the BGP peer stays down until the operator performs a reset. This command and **log-only** cannot be configured simultaneously.

Range 1 to 1024

Introduced 16.0.R1

Platforms All

log-only *boolean*

Synopsis Send warning message at threshold instead of take-down

Context **configure** router *string* bgp group *string* prefix-limit *keyword* log-only *boolean*

Tree log-only

Description When configured to **true**, the router disables the BGP session from being taken down upon reaching the prefix limit. Instead, only a warning message is sent when the limit is reached. A warning message is also sent when the configured threshold percentage of the limit is reached.

This command and **idle-timeout** cannot be configured simultaneously.

When configured to **false**, the router generates a log event and takes the BGP session down upon reaching the prefix limit.

Default false

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** router *string* bgp group *string* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon. This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP. Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the use of split-horizon is disabled.
Introduced	16.0.R1
Platforms	All

tcp-mss *(number | keyword)*

Synopsis	TCP maximum segment size override
Context	**configure** router *string* bgp group *string* tcp-mss *(number | keyword)*
Tree	tcp-mss
Description	This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command). The configured value controls two properties of the TCP connection as follows: TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router. TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.
Range	384 to 9746
Options	ip-stack
Introduced	21.2.R1
Platforms	All

third-party-nexthop *boolean*

Synopsis	Apply third-party next-hop processing to EBGP peers
Context	**configure** router *string* bgp group *string* third-party-nexthop *boolean*
Tree	third-party-nexthop
Description	When configured to **true**, this command enables the router to send third-party next hop to EBGP peers in the same subnet as the source peer. The address family of the transport must match the address family of the route. When an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next hop is left unchanged.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, third-party next-hop processing is disabled and the next hop carries the IP address of the interface used to establish the TCP connection to the peer.

Introduced 16.0.R1

Platforms All

ttl-security *number*

Synopsis Minimum TTL value for an incoming BGP packet

Context **configure** router *string* bgp group *string* ttl-security *number*

Tree ttl-security

Description This command controls the label allocation behavior for labeled unicast IPv6 routes. The label options are **explicit-null** and **normal**.

Introduced 20.10.R1

Platforms All

explicit-null *boolean*

Synopsis Apply advertised label and associated programming rules

Context **configure** router *string* bgp label-allocation label-ipv6 explicit-null *boolean*

Tree explicit-null

Description When configured to **true**, this command uses the advertised label and associated programming rules on this instance of BGP. The following applies:

- The router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising. It sets the BGP label value to IPv6 explicit null (value 2), forcing a POP behavior for received packets.
- The received label-unicast IPv6 routes never create tunnels in TTM that can be used to resolve other BGP routes (with an IPv6 next-hop).
- A received label-unicast IPv6 route can be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP).

When configured to **false**, advertised label IPv6 programming rules are not used. The following applies

- When the router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising, it sets the BGP label value to a proper value in the dynamic label range and programs a POP or SWAP operation for that label, depending on the origin of the route and various import policy actions that could apply to the route.
- Received label-unicast IPv6 routes that have a prefix length of 128 bits are automatically installed in TTM so that they can be used to resolve other (non-labeled-unicast) BGP routes (with an IPv6 next-hop).
- A received label-unicast IPv6 route cannot be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP).
- The label-ipv6 routes used for ECMP toward an IPv6 destination cannot be a mix of routes with regular label values and routes with special (IPv6 explicit null) label values.

	Changes in the value of this leaf do not cause the BGP sessions of the base router to reset.
Default	true
Introduced	20.10.R1
Platforms	All

label-preference *number*

Synopsis	Route preference for routes from labeled-unicast peers
Context	**configure** router *string* bgp label-preference *number*
Tree	label-preference
Range	1 to 255
Default	170
Introduced	16.0.R1
Platforms	All

link-state-route-export *boolean*

Synopsis	Allow the export of the TED NLRI database
Context	**configure** router *string* bgp link-state-route-export *boolean*
Tree	link-state-route-export
Description	When configured to **true**, this command allows BGP to export link-state information to BGP neighbors. When configured to **false**, link-state information is not exported.
Default	false
Introduced	16.0.R1
Platforms	All

link-state-route-import *boolean*

Synopsis	Allow the import of the TED NLRI database
Context	**configure** router *string* bgp link-state-route-import *boolean*
Tree	link-state-route-import
Description	When configured to **true**, this command enables the import of link-state information into the BGP-LS address family for advertisement to other BGP neighbors. When configured to **false**, this command disables the import of link-state information.

Range	1 to 64
Introduced	19.5.R1
Platforms	All

ibgp *number*

Synopsis	Maximum multipaths when best path is IBGP learned route
Context	**configure** router *string* bgp multipath family *keyword* ibgp *number*
Tree	ibgp
Description	This command configures the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route. The limit configured using this command overrides the limit configured in the **max-paths** command. If the best path is an IBGP learned route and this command is set to 1, multipaths are disabled.
Range	1 to 64
Introduced	19.5.R1
Platforms	All

max-paths *number*

Synopsis	Maximum number of multipaths per prefix or NLRI
Context	**configure** router *string* bgp multipath family *keyword* max-paths *number*
Tree	max-paths
Description	This command configures the maximum number of multipaths per prefix or NLRI for the IP family option specified using the **family** command. Consider the following when configuring this command: • If the best path is an EBGP-learned route and the **ebgp** command is configured, the limit configured in the **ebgp** command overrides the limit configured in this command. • If the best path is an IBGP-learned route and the **ibgp** command is configured, the limit configured in the **ibgp** command overrides the limit configured in this command. • If the best path is an EBGP-learned route and the **ebgp** command is not configured, and this command is configured to 1, multipaths are disabled. • If the best path is an IBGP-learned route and the **ibgp** command is not configured, and this command is configured to 1, multipaths are disabled.
Range	1 to 64
Introduced	19.5.R1
Platforms	All

Description	When configured to **true**, this command allows multiple multicast VPN routes per IPv6 prefix to be received from a peer. When configured to **false**, the ADD-PATH receive capability is not enabled.
Default	false
Introduced	16.0.R1
Platforms	All

send *number*

Synopsis	Maximum paths per multicast VPN IPv6 prefix
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths mvpn-ipv6 send *number*
Tree	send
Description	This command configures the maximum number of paths that are allowed to be advertised to add-paths peers per multicast VPN IPv6 prefix. The actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules. When not configured, ADD-PATH send capability is not enabled for multicast VPN IPv6 routes.
Range	1 to 16
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the BGP neighbor
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

advertise-inactive *boolean*

Synopsis	Advertise an inactive BGP route to peers
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-inactive *boolean*
Tree	advertise-inactive
Description	When configured to **true**, this command allows an inactive BGP route to be advertised, even though it is not the most preferred route. The effect of the command on advertised unlabeled, labeled, and multicast IPv4 and IPv6 routes depends on several factors. • If the active route for the IP prefix is a BGP route, that route is advertised. • If the active route is a non-BGP route and there are valid inactive BGP routes to the same destination, the best valid inactive route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session. • If the active route is a non-BGP route and there are no valid BGP routes to the same destination, no route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.
Introduced	16.0.R1
Platforms	All

advertise-ipv6-next-hops

Synopsis	Enable the **advertise-ipv6-next-hops** context
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ipv6-next-hops

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	advertise-ipv6-next-hops
Description	Commands in this context allow specified IP family routes to be advertised to IPv6 transport peers with a true IPv6 address when originated or when a configured or automatic next-hop-self action is applied. When unconfigured, command settings are inherited from a higher level BGP configuration.
Introduced	16.0.R1
Platforms	All

evpn *boolean*

Synopsis	Advertise EVPN route with IPv6 next-hop address
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ipv6-next-hops evpn *boolean*
Tree	evpn
Description	When configured to **true**, EVPN routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, EVPN routes are advertised with IPv4 next-hop addresses to IPv6 transport peers.
Default	false
Introduced	19.5.R1
Platforms	All

ipv4 *boolean*

Synopsis	Advertise IPv4 route with IPv6 next-hop address
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ipv6-next-hops ipv4 *boolean*
Tree	ipv4
Description	When configured to **true**, IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop. When configured to **false**, IPv4 routes are advertised with IPv4 next-hop addresses to IPv6 transport peers. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.
Default	false

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	19.5.R1
Platforms	All

label-ipv4 *boolean*

Synopsis	Advertise label IPv4 route with IPv6 next-hop address
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ipv6-next-hops label-ipv4 *boolean*
Tree	label-ipv4
Description	When configured to **true**, label IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop. When configured to **false**, label IPv4 routes are advertised with the system IPv4 address as the next hop to IPv6 transport peers. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.
Default	false
Introduced	16.0.R1
Platforms	All

label-ipv6 *boolean*

Synopsis	Advertise label IPv6 route with IPv6 next-hop address
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ipv6-next-hops label-ipv6 *boolean*
Tree	label-ipv6
Description	When configured to **true**, label IPv6 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, label IPv6 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop, encoded as an IPv4-mapped IPv6 address.
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vpn-ipv4 *boolean*

Synopsis	Advertise VPN IPv4 route with IPv6 next-hop address
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ipv6-next-hops vpn-ipv4 *boolean*
Tree	vpn-ipv4
Description	When configured to **true**, VPN IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop. When configured to **false**, VPN IPv4 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.
Default	false
Introduced	16.0.R1
Platforms	All

vpn-ipv6 *boolean*

Synopsis	Advertise VPN IPv6 route with IPv6 next-hop address
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ipv6-next-hops vpn-ipv6 *boolean*
Tree	vpn-ipv6
Description	When configured to **true**, VPN IPv6 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, VPN IPv6 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop, encoded as an IPv4-mapped IPv6 address.
Default	false
Introduced	16.0.R1
Platforms	All

advertise-ldp-prefix *boolean*

Synopsis	Advertise active /32 LDP FEC prefixes to BGP peers
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-ldp-prefix *boolean*
Tree	advertise-ldp-prefix

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	All

aggregator-id-zero *boolean*

Synopsis	Set router ID in the BGP AGGREGATOR attribute to zero
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* aggregator-id-zero *boolean*
Tree	aggregator-id-zero
Introduced	16.0.R1
Platforms	All

aigp *boolean*

Synopsis	Add AIGP attribute to advertised routes
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* aigp *boolean*
Tree	aigp
Description	When configured to **true**, this command enables Accumulated IGP (AIGP) path attribute support with one or more BGP peers. BGP path selection among routes with an associated AIGP metric is based on the end-to-end IGP metrics of the different BGP paths, even when these BGP paths span more than one AS and IGP instance. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the AIGP attribute is removed from advertised routes, if present, and is ignored in received routes.
Introduced	16.0.R1
Platforms	All

as-override *boolean*

Synopsis	Replace the peer's ASN with the local ASN in AS Path
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* as-override *boolean*
Tree	as-override
Description	When configured to **true**, the advertising router's local AS replaces all occurrences of the peer AS in the AS_PATH attribute.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command should be used with caution, as it breaks BGP's loop detection mechanism.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). This command cannot be explicitly configured to **false**.

When configured to **false**, no AS override is performed.

Introduced 19.7.R1

Platforms All

asn-4-byte *boolean*

Synopsis Advertise the use of 4-byte ASNs

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* asn-4-byte *boolean*

Tree asn-4-byte

Introduced 16.0.R1

Platforms All

authentication-key *string*

Synopsis BGP authentication key

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* authentication-key *string*

Tree authentication-key

String Length 1 to 370

Introduced 16.0.R1

Platforms All

authentication-keychain *reference*

Synopsis TCP authentication keychain for the session

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* authentication-keychain *reference*

Tree authentication-keychain

Description This command associates the keychain to be used to authenticate the BGP session. The keychain allows the rollover of authentication keys during the lifetime of a session.

Reference **configure** system security keychains keychain *string*

Introduced 16.0.R3

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms All

bfd-liveness *boolean*

Synopsis Enable BFD

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-liveness *boolean*

Tree bfd-liveness

Description When configured to **true**, BFD is enabled on a given protocol interface where the state of the protocol interface is tied to the state of the BFD session between the local node and the remote node.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, BFD is removed from the associated protocol adjacency.

Introduced 16.0.R1

Platforms All

bfd-strict-mode

Synopsis Enter the **bfd-strict-mode** context

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode

Tree bfd-strict-mode

Introduced 23.7.R1

Platforms All

advertise

Synopsis Enable the **advertise** context

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode advertise

Tree advertise

Description Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements:

- The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**.
- The interface associated with the peer has a valid BFD configuration.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state.

When unconfigured, BGP does not advertise the Strict-BFD capability to peers.

Introduced 23.7.R1

Platforms All

holdtime *number*

Synopsis Maximum time BGP waits for the BFD session to come up

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode advertise holdtime *number*

Tree holdtime

Description This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.

Range 1 to 65535

Units seconds

Default 30

Introduced 23.7.R1

Platforms All

next-hop-reachability *boolean*

Synopsis Consider next hop unreachable if BFD session is down

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode next-hop-reachability *boolean*

Tree next-hop-reachability

Description When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met:

- The BFD session to the peer is in a down state.
- There is a valid interface BFD configuration that applies to the peer.
- There is a valid BFD liveness configuration that applies to the peer.

The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer.The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent.

Configuring this command to **true** only affects routes belonging to the following address families:

- IPv4
- IPv6
- IPv4 VPN
- IPv6 VPN
- labeled unicast IPv4
- labeled unicast IPv6
- EVPN
- IPv4 multicast
- IPv6 multicast
- IPv4 VPN multicast
- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Introduced 23.7.R1

Platforms All

block-prefix-sid *boolean*

Synopsis Block the prefix SID attribute

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* block-prefix-sid *boolean*

Tree block-prefix-sid

Description When configured to **true**, all prefix SID attributes are removed from all routes exchanged between EBGP and IBGP peers covered by the scope of the command. Locally-imposed prefix SID attributes are also removed.

When configured to **false**, all prefix SID attributes are propagated without restriction.

A change of this configuration causes the affected BGP sessions to flap.

Default false

Introduced 19.10.R1

Platforms All

Introduced	16.0.R1
Platforms	All

orr-location *number*

Synopsis	Optimal route reflection location for the cluster
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* cluster orr-location *number*
Tree	orr-location
Description	This command configures an ORR location ID. If a cluster ID is also specified, the clients in that cluster receive routes optimal for that specific location. With optimal route reflection, the best path advertised to a client takes location ID into account. If the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF, OSPFv3, IS-IS, or BGP-LS information in the TE DB.
Range	1 to 255
Introduced	16.0.R1

Use subject to Terms available at: www.nokia.com/terms.

Options	enable, disable
Default	disable
Introduced	21.7.R1
Platforms	All

egress-peer-engineering-label-unicast *boolean*

Synopsis	Generate EPE label-unicast routes for neighbor
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* egress-peer-engineering-label-unicast *boolean*
Tree	egress-peer-engineering-label-unicast
Description	When configured to **true**, BGP generates a label-unicast route for the /32 or /128 prefix that corresponds to the BGP neighbor address. This route can be advertised to other routers to recursively resolve unlabeled BGP routes for AS external destinations. This supports the Egress Peer Engineering (EPE) use case.
Default	false
Introduced	22.2.R1
Platforms	All

enforce-first-as *boolean*

Synopsis	Enforce the configured peer AS value in received routes
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* enforce-first-as *boolean*
Tree	enforce-first-as
Description	When configured to **true** for an EBGP session, all routes received from an EBGP peer are checked to ensure that the most recent ASN in the AS_PATH attribute of each route matches the configured AS of the session. If there is not a match, the session is reset (if the **update-fault-tolerance** command in the **error-handling** context is set to **false**) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is set to **true**). This command does not flap an established session because it applies only to routes received after the command is issued. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, received routes are not checked for compliance with the rule.
Introduced	16.0.R1
Platforms	All

error-handling

Synopsis	Enter the **error-handling** context
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* error-handling
Tree	error-handling
Introduced	16.0.R1
Platforms	All

update-fault-tolerance *boolean*

Synopsis	Tolerate non-critical errors in UPDATE messages
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* error-handling update-fault-tolerance *boolean*
Tree	update-fault-tolerance
Description	When configured to **true**, non-critical errors are handled with treat-as-withdraw, attribute-discard, and other non-disruptive approaches that do not cause a session reset. Critical errors still trigger a session reset. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, all errors trigger a session reset.
Introduced	16.0.R1
Platforms	All

export

Synopsis	Enable the **export** context
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* export
Tree	export
Description	Commands in this context specify route policies that control the handling of outbound routes transmitted to certain peers. Route policies are configured in the **configure policy-options** context. When this context is unconfigured, the policy association for the group is inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	BGP export policy name
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* export policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of outbound routes transmitted to certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route. Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or"start@variable@".
String Length	1 to 255
Max. Instances	15
Min. Instances	1
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

extended-nh-encoding

Synopsis	Enable the **extended-nh-encoding** context
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* extended-nh-encoding
Tree	extended-nh-encoding
Description	Commands in this context specify the address families enabled to advertise the capability to receive label IPv4 routes, VPN IPv4 routes, or IPv6 next hops from peers. The peers should not send such routes unless notification has been received of this capability. If the router receives an enabled address family route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed. This causes either a session reset or treat-as-withdraw behavior depending on the error handling settings. When the context is unconfigured, command settings are inherited from the higher level BGP configuration.

Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* fast-external-failover *boolean*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	fast-external-failover
Description	When this command inherits a value of **true**, the router drops an external BGP session on a single-hop route immediately when the local interface goes down. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **true**. When configured to **false**, the BGP session remains up until the hold time expires.
Introduced	16.0.R1
Platforms	All

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart
Tree	graceful-restart
Description	Commands in this context configure BGP graceful restart helper procedures for address families included in the GR capabilities of both peers. When this context is unconfigured, the command settings are inherited from the BGP group-level configuration.
Introduced	16.0.R1
Platforms	All

gr-notification *boolean*

Synopsis	Perform graceful restart procedures after NOTIFICATION
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart gr-notification *boolean*
Tree	gr-notification
Description	When configured to **true**, the Graceful Restart capability sent by the router indicates support for NOTIFICATION messages. If the peer also supports this capability, the session is restarted gracefully (while preserving forwarding) if either peer sends a NOTIFICATION message due to some type of event or error. When configured to **false**, NOTIFICATION messages are not supported.
Default	false
Introduced	16.0.R1
Platforms	All

long-lived

Synopsis	Enable the **long-lived** context
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived
Tree	long-lived
Description	Commands in this context configure the BGP Long-Lived Graceful-Restart (LLGR) procedures. LLGR, known informally as BGP persistence, is an extension of BGP GR that allows a session to stay down for a longer period of time. During this time, learned routes are marked and re-advertised as stale but they can continue to be used as routes of last resort. The LLGR handling of a session failure can be invoked immediately or it can be delayed until the end of the traditional GR restart window.
Introduced	16.0.R1
Platforms	All

Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived family *keyword* helper-override-stale-time *number*
Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability. This is a family-specific override value.
Range	0 to 16777216
Default	16777216
Introduced	16.0.R1
Platforms	All

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	16.0.R1
Platforms	All

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.
Range	0 to 4095
Introduced	16.0.R1
Platforms	All

helper-override-stale-time *number*

Synopsis	Locally-configured stale routes override time
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived helper-override-stale-time *number*
Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability. This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.
Range	0 to 16777215
Introduced	16.0.R1
Platforms	All

without-no-export *boolean*

Synopsis	Advertise LLGR stale routes to non-LLGR peers
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived without-no-export *boolean*
Tree	without-no-export
Description	When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0. When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0 and a NO_EXPORT standard community is automatically added to the routes.
Default	false

seconds *number*

Synopsis	Maximum hold time between successive messages
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* hold-time seconds *number*
Tree	seconds
Description	The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection. Even though the implementation allows setting the keepalive timer at the BGP neighbor level times separately, the configured keepalive timer is overridden by this value under the following circumstances: • If the specified hold time is less than the configured keepalive time, then the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the hold time is set to zero, the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

When unconfigured, the command setting is inherited from the BGP group-level configuration.

Range	0 | 3 to 65535
Introduced	16.0.R1
Platforms	All

import

Synopsis	Enable the **import** context
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* import
Tree	import
Description	Commands in this context specify route policies that control the handling of inbound routes received from certain peers. Route policies are configured in the **configure policy-options** context. When this context is unconfigured, the policy association is inherited from the BGP group-level configuration.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	Names of the BGP import policies
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* import policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of inbound routes received from certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route. Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or"start@variable@".

initial-send-delay-zero *boolean*

Synopsis	Send BGP updates as soon as the session comes up
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* initial-send-delay-zero *boolean*
Tree	initial-send-delay-zero
Description	When configured to **true**, BGP updates are sent as soon as the session comes up. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, BGP waits to send UPDATE messages for the minimum route advertisement time after a session is established.
Introduced	16.0.R1
Platforms	All

keepalive *number*

Introduced 19.5.R1

Platforms All

next-hop-self *boolean*

Synopsis Advertise routes with local address as next-hop address

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* next-hop-self *boolean*

Tree next-hop-self

Description When configured to **true**, this command configures BGP to advertise routes to members of a group using a local address of the BGP instance as the BGP next-hop address.

Note that this command is set without exception, regardless of the route source (EBGP or IBGP) or its family. When used with VPN-IPv4 and VPN-IPv6 routes, the **configure router bgp rr-vpn-forwarding** command should also be configured.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, protocol standard behavior is applied to determine whether to set **next-hop-self** in advertised routes.

Introduced 16.0.R1

Platforms All

next-hop-unchanged

Synopsis Enable the **next-hop-unchanged** context

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* next-hop-unchanged

Tree next-hop-unchanged

Description Commands in this context specify the IP address families where the next hop remains unchanged when sending BGP routes to peers of the neighbor.

Description Commands in this context configure the ORF send and receive capabilities based on Extended Communities.

When this context is unconfigured, the command settings are inherited from the group-level configuration.

Introduced 16.0.R1

Platforms All

accept-orf *boolean*

Synopsis Negotiate with peer to accept BGP ORF filters

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* outbound-route-filtering extended-community accept-orf *boolean*

Tree accept-orf

Description When configured to **true**, the receive capability in the BGP ORF is negotiated with a peer and ORF filters can be accepted from peers.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, the accept capability in the BGP ORF is removed and any existing ORF filters that are currently in place are cleared.

Introduced 16.0.R1

Platforms All

send-orf

Synopsis Enable the **send-orf** context

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* outbound-route-filtering extended-community send-orf

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	send-orf
Description	Commands in this context allow BGP to negotiate the send capability in the ORF negotiation with a peer. The send capability also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD. When this context is unconfigured, the command settings are inherited from the BGP group-level configuration.
Introduced	16.0.R1
Platforms	All

route-target [community-name] *string*

Synopsis	Add a list entry for **route-target**
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* outbound-route-filtering extended-community send-orf route-target *string*

Platforms All

path-mtu-discovery *boolean*

Synopsis Enable path MTU discovery

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-mtu-discovery *boolean*

Tree path-mtu-discovery

Description When configured to **true**, Path MTU Discovery (PMTUD) is enabled for the associated TCP connections.

When set to **true**, PMTUD is activated toward an IPv4 BGP neighbor and the Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, this device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value so that the IP MTU constraint can be accommodated.

When PMTUD is configured to **false** and there is no TCP MSS configuration that can be associated with a BGP neighbor (in either the BGP configuration or the first hop IP interface configuration), the router advertises a value of only 1024 bytes as the TCP MSS option value, limiting received TCP segments to that size.

Introduced 16.0.R1

Platforms All

peer-as *number*

Synopsis Peer AS number

Context **configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* peer-as *number*

Tree peer-as

Description This command configures the autonomous system number for the peer. The peer AS number must be configured for each configured peer.

For EBGP peers, the peer AS number configured must be different from the autonomous system number configured for this router under the global level since the peer will be in a different autonomous system than this router.

For IBGP peers, the peer AS number must be the same as the autonomous system number of this router configured under the global level.

Options	static, dynamic, dynamic-if-remote, dynamic-if-local
Default	static
Introduced	16.0.R1
Platforms	All

peer-ip-tracking *boolean*

Synopsis	Enable BGP peer tracking
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* peer-ip-tracking *boolean*
Tree	peer-ip-tracking
Description	When configured to **true**, this command enables BGP peer tracking. Peer tracking should be used with caution. Peer tracking can tear a session down even if the loss of connectivity turns out to be short-lived (for example, while the IGP protocol is re-converging). Next-hop tracking, which is always enabled, handles temporary connectivity issues more effectively. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, peer tracking is disabled.
Introduced	16.0.R1
Platforms	All

preference *number*

Synopsis	Route preference for routes learned from all peers
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* preference *number*
Tree	preference
Description	This command configures the route preference for routes learned from the configured peers.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The lower the preference value, the higher the chance of the route being the active route. The router assigns BGP routes the highest default preference as compared to routes that are direct, static or learned via MPLS or OSPF.

When unconfigured, the command setting is inherited from the group-level configuration.

Range	1 to 255
Introduced	16.0.R1

Tree	hold-excess

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the percentage of maximum routes that are allowed to be installed in the route table for the configured address family. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding and advertisement to other peers. If the **post-import** command is configured to **true**, only routes not rejected by import policies count toward the limit. A BGP route in an overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route. This command is mutually exclusive with the **idle-timeout** and **log-only** commands.
Range	1 to 100
Introduced	23.7.R1
Platforms	All

idle-timeout *number*

Synopsis	Time which BGP peering remains idle before reconnecting
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword* idle-timeout *number*
Tree	idle-timeout
Description	This command defines the idle time after an administrative take-down before BGP re-establishes a session and reconnects to a peer. When unconfigured, the command inherits the value from the group-level configuration.
Range	1 to 1024
Introduced	16.0.R1
Platforms	All

log-only *boolean*

Synopsis	Send warning message at threshold instead of take-down

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon. This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP. Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the use of split-horizon is disabled.
Introduced	16.0.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

tcp-mss *(number | keyword)*

Synopsis	TCP maximum segment size override
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* tcp-mss *(number | keyword)*
Tree	tcp-mss
Description	This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command). The configured value controls two properties of the TCP connection as follows: TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router. TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.
Range	384 to 9746
Options	ip-stack
Introduced	21.2.R1
Platforms	All

third-party-nexthop *boolean*

Synopsis	Apply third-party next-hop processing to EBGP peers
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* third-party-nexthop *boolean*
Tree	third-party-nexthop
Introduced	16.0.R1
Platforms	All

ttl-security *number*

Synopsis	Minimum TTL value for an incoming BGP packet
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* ttl-security *number*
Tree	ttl-security
Description	This command configures the minimum TTL value that BGP will accept from an incoming packet. A packet with a TTL value less than the minimum configured TTL value is discarded.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured, the command inherits the value of the group-level setting.

Range	1 to 255

Introduced	16.0.R1
Platforms	All

vpn-apply-export *boolean*

Synopsis	Apply base-instance BGP export policies to VPN routes
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* vpn-apply-export *boolean*
Tree	vpn-apply-export
Description	When configured to **true**, base-instance BGP export route policies are applied to VPN-IPv4/6, MVPN-IPv4/6, L2-VPN, MDT-SAFI, MCAST-VPN-IPv4, and EVPN routes. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the export policies are not applied.
Introduced	16.0.R1
Platforms	All

vpn-apply-import *boolean*

Synopsis	Apply base-instance BGP import policies to VPN routes
Context	**configure** router *string* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* vpn-apply-import *boolean*
Tree	vpn-apply-import
Description	When configured to **true**, base-instance BGP import route policies are applied to VPN-IPv4/6, MVPN-IPv4/6, L2-VPN, MDT-SAFI, MCAST-VPN-IPv4, and EVPN routes.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, the import policies are not applied.

Introduced 16.0.R1

Platforms All

neighbor-trust

Synopsis Enter the **neighbor-trust** context

Context **configure** router *string* bgp neighbor-trust

Tree neighbor-trust

Description Commands in this context enable a label security feature at an inter-AS boundary for the specified IP families.

This label security feature allows the configuration of a router, acting in a PE or in an ASBR role, to accept packets of VPN-IP or EVPN prefixes only from direct EBGP neighbors to which it advertised a service label.

The untrusted state identifies the participating interfaces. The router supports a maximum of 15 network interfaces that can participate in this feature.

At a high level, BGP tracks each direct EBGP neighbor over an untrusted interface and to which it sent a prefix label. For each of those prefixes, BGP programs a bit map in the ILM record that indicates, on a per-untrusted interface basis, whether the matching received packets must be forwarded or dropped.

Introduced 16.0.R4

Platforms All

evpn *boolean*

Synopsis Enable inter-AS label security for the EVPN family

Context **configure** router *string* bgp neighbor-trust evpn *boolean*

allow-unresolved-leaking *boolean*

Synopsis	Allow unresolved BGP routes to be leaked to VPRN routes
Context	**configure** router *string* bgp next-hop-resolution allow-unresolved-leaking *boolean*
Tree	allow-unresolved-leaking
Description	When configured to **true**, this command instructs BGP in the base router instance to allow its routes to be leaked to other (VPRN) BGP instances even if the routes to be leaked do not have a BGP next-hop that can be resolved by the base instance. When configured to **false**, VPRN cannot import a route.
Default	false
Introduced	19.10.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

labeled-routes

Synopsis	Enter the **labeled-routes** context
Context	**configure** router *string* bgp next-hop-resolution labeled-routes
Tree	labeled-routes
Introduced	16.0.R1
Platforms	All

allow-static *boolean*

Synopsis	Allow static routes to resolve BGP next-hop
Context	**configure** router *string* bgp next-hop-resolution labeled-routes allow-static *boolean*
Tree	allow-static
Description	When configured to **true**, the BGP next-hop of label-IPv4, label-IPv6, VPN-IPv4, and VPN-IPv6 routes received from any EBGP or IBGP peer can be resolved using static routes, except for static default routes (0/0 and ::/0). A static route is less preferred than a local or interface route for resolving the BGP next-hop of labeled route but is more preferred than other IGP routes or tunnels. When configured to **false**, BGP next-hop resolution using static routes is not allowed. A label-IPv4 or label-IPv6 route can be resolved by a static blackhole route, even when this command is configured to **false**, but only if the static blackhole route is the longest prefix match (LPM) static route for the BGP next-hop address.
Default	false
Introduced	16.0.R1
Platforms	All

rr-use-route-table *boolean*

Synopsis	Use RTM to resolve BGP next-hop if TTM resolution fails
Context	**configure** router *string* bgp next-hop-resolution labeled-routes rr-use-route-table *boolean*
Tree	rr-use-route-table
Description	When configured to **true**, this command enables BGP to perform a lookup of IGP routes in the route table to resolve the BGP next-hop of label-IPv4 and label-IPv6 routes. This is useful for a Route Reflector (RR) that does not participate in tunnel signaling protocols such as LDP and RSVP and therefore, does not have tunnels to resolve the BGP next-hops of label-unicast routes. Disable route table installation (via the **route-table-install** command) before setting this command to **true**; otherwise, forwarding of label routes resolved in this way will be incorrect.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, RTM next-hop resolution is not enabled.

Default	false
Introduced	16.0.R1
Platforms	All

transport-tunnel

Synopsis	Enter the **transport-tunnel** context
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel
Tree	transport-tunnel
Description	Commands in this context configure options for the next-hop resolution of BGP labeled routes (VPN-IP and labeled-unicast) using tunnels in TTM.
Introduced	16.0.R1
Platforms	All

family [family-type] *keyword*

allow-flex-algo-fallback *boolean*

Synopsis	Enable flexible algorithm fallback
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* allow-flex-algo-fallback *boolean*
Tree	allow-flex-algo-fallback
Description	When configured to **true**, a BGP router with a Flex-Algorithm action configured (via the **configure policy-options policy-statement entry action flex-algo** command) can resolve to a tunnel with algorithm 0 if no target Flex-Algorithm tunnel is available**.** When configured to **false**, the BGP router can resolve only to the intended Flex-Algorithm tunnel, which may cause traffic loss if no corresponding Flex-Algorithm tunnel is available.
Default	false
Introduced	20.10.R1
Platforms	All

enforce-strict-tunnel-tagging *boolean*

Synopsis	Consider only LSPs with an admin-tag for next hop
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* enforce-strict-tunnel-tagging *boolean*
Tree	enforce-strict-tunnel-tagging
Description	When configured to **true**, the system only considers LSPs marked with an administrative tag for next-hop resolution. Untagged LSPs are not considered. When configured to **false**, matching admin-tagged RSVP or SR-TE LSPs are used in preference to other LSP types, whether tagged or untagged. If no eligible RSVP or SR-TE LSP exists, the system falls back to using tagged LSPs that are not explicitly excluded by a route admin tag policy and untagged LSPs of other types.
Default	false
Introduced	16.0.R1
Platforms	All

resolution *keyword*

Synopsis	Resolution mode for binding BGP routes to tunnel types
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution *keyword*
Tree	resolution
Options	none, filter, any

© 2023 Nokia.

Default	filter
Introduced	16.0.R1
Platforms	All

resolution-filter

Synopsis	Enter the **resolution-filter** context
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter
Tree	resolution-filter
Introduced	16.0.R1
Platforms	All

bgp *boolean*

Synopsis	Use BGP tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter bgp *boolean*
Tree	bgp
Description	When configured to **true**, this command enables the selection of BGP tunneling for next-hop resolution and specifies the IPv4 tunnels created by receiving BGP label-unicast IPv4 routes for /32 IPv4 prefixes. When configured to **false**, BGP tunneling for next-hop resolution is not enabled.
Introduced	16.0.R1
Platforms	All

ldp *boolean*

Synopsis	Use LDP tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter ldp *boolean*
Tree	ldp
Description	When configured to **true**, this command enables the selection of LDP tunneling for next-hop resolution and specifies the LDP tunnels in the tunnel table corresponding to /32 IPv4 FECs and /128 IPv6 FECs. When configured to **false**, LDP tunneling for next-hop resolution is not enabled.
Default	true

Introduced	16.0.R1
Platforms	All

mpls-fwd-policy *boolean*

Synopsis	Use MPLS forwarding policy for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter mpls-fwd-policy *boolean*
Tree	mpls-fwd-policy
Default	false
Introduced	16.0.R4
Platforms	All

rib-api *boolean*

Synopsis	Use RIB API gRPC service for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter rib-api *boolean*
Tree	rib-api
Default	false
Introduced	16.0.R4
Platforms	All

rsvp *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter rsvp *boolean*
Tree	rsvp
Description	When configured to **true**, this command enables the selection of RSVP tunneling for next-hop resolution and specifies RSVP tunnels in a tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID. When configured to **false**, this command disables the selection of RSVP tunneling for next-hop resolution.
Default	false

© 2023 Nokia.

Introduced	16.0.R1
Platforms	All

sr-isis *boolean*

Synopsis	Use IS-IS SR tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter sr-isis *boolean*
Tree	sr-isis
Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by an IS-IS instance in the TTM for next-hop resolution of BGP routes and labeled routes. This command allows BGP to use the segment-routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or, in case of a tie, the lowest numbered IS-IS instance. When configured to **false**, the SR tunnel type programmed by an IS-IS instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

sr-ospf *boolean*

Synopsis	Use OSPF SR tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter sr-ospf *boolean*
Tree	sr-ospf
Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by an OSPF instance in the TTM for next-hop resolution of BGP routes and labeled routes. This command allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference OSPF instance or, in case of a tie, the lowest numbered OSPF instance. When configured to **false**, the SR tunnel type programmed by an OSPF instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-ospf3 *boolean*

Synopsis	Use OSPFv3 SR tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter sr-ospf3 *boolean*
Tree	sr-ospf3
Description	When configured to **true**, this command enables the selection of the IPv6 Segment Routing (SR) tunnel type programmed by an OSPFv3 instance in the TTMv6 for next-hop resolution of BGP routes and labeled routes. This command allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference OSPFv3 instance or, in case of a tie, the lowest numbered OSPFv3 instance. When configured to **false**, the SR tunnel type programmed by an OSPFv3 instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R6
Platforms	All

sr-policy *boolean*

Synopsis	Use SR policies for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter sr-policy *boolean*
Tree	sr-policy
Description	When configured to **true**, this command enables the use of segment routing policies to resolve the BGP next hop of certain BGP routes (depending on the context). The segment routing policies that are considered are statically configured in the local router or learned by BGP routes (AFI 1/SAFI 73). For a BGP route to be resolved by an SR policy, the highest numbered color extended community attached to BGP route must match the color of the SR policy. Next hop resolution of VPN-IP routes by SR policies is not supported. When configured to **false**, segment routing policies are not enabled for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-te *boolean*

Synopsis	Use SR-TE tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter sr-te *boolean*
Tree	sr-te
Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by a traffic engineered (TE) instance in the TTM for next-hop resolution. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID. When configured to **false**, the SR tunnel type programmed by a TE instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

udp *boolean*

Synopsis	Use MPLS over UDP tunneling for next-hop resolution

Tree	udp
Default	false
Introduced	16.0.R1
Platforms	All

use-bgp-routes

Synopsis	Enter the **use-bgp-routes** context
Context	**configure** router *string* bgp next-hop-resolution labeled-routes use-bgp-routes
Tree	use-bgp-routes
Introduced	21.2.R1
Platforms	All

label-ipv6-explicit-null *boolean*

Synopsis	Use BGP routes to resolve address family routes

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* bgp next-hop-resolution labeled-routes use-bgp-routes label-ipv6-explicit-null *boolean*
Tree	label-ipv6-explicit-null
Description	When configured to **true**, a labeled IPv6 route with the explicit-null label can be resolved by other routes, and also by unlabeled IPv4 routes and unlabeled IPv6 routes that are resolved by static routes, interface routes, or tunnels. Up to four levels of recursive resolution are supported when the top route is a labeled IPv6 route with an explicit-null label. When disabled, a labeled IPv6 route cannot be resolved by other labeled IPv6 routes. A labeled IPv6 route with a regular label (not explicit-null) is never resolved by other labeled IPv6 routes.
Default	false
Introduced	21.2.R1
Platforms	All

policy *reference*

Synopsis	Policy that filters routes for BGP next-hop resolution

sr-isis *boolean*

Synopsis	Use IS-IS SR tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-isis *boolean*
Tree	sr-isis
Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by an IS-IS instance in the TTM for next-hop resolution of BGP routes and labeled routes. This command allows BGP to use the segment-routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or, in case of a tie, the lowest numbered IS-IS instance. When configured to **false**, the SR tunnel type programmed by an IS-IS instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

sr-ospf *boolean*

Synopsis	Use OSPF SR tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-ospf *boolean*
Tree	sr-ospf
Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by an OSPF instance in the TTM for next-hop resolution of BGP routes and labeled routes. This command allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference OSPF instance or, in case of a tie, the lowest numbered OSPF instance. When configured to **false**, the SR tunnel type programmed by an OSPF instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

sr-ospf3 *boolean*

Synopsis	Use OSPFv3 SR tunneling for next-hop resolution

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-ospf3 *boolean*
Tree	sr-ospf3
Description	When configured to **true**, this command enables the selection of the IPv6 Segment Routing (SR) tunnel type programmed by an OSPFv3 instance in the TTMv6 for next-hop resolution of BGP routes and labeled routes. This command allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference OSPFv3 instance or, in case of a tie, the lowest numbered OSPFv3 instance. When configured to **false**, the SR tunnel type programmed by an OSPFv3 instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R6
Platforms	All

sr-policy *boolean*

Synopsis	Use SR policies for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-policy *boolean*
Tree	sr-policy
Description	When configured to **true**, this command enables the use of segment routing policies to resolve the BGP next hop of certain BGP routes (depending on the context). The segment routing policies that are considered are statically configured in the local router or learned by BGP routes (AFI 1/SAFI 73). For a BGP route to be resolved by an SR policy, the highest numbered color extended community attached to BGP route must match the color of the SR policy. When configured to **false**, segment routing policies are not enabled for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

sr-te *boolean*

Synopsis	Use SR-TE tunneling for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-te *boolean*
Tree	sr-te

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by a traffic engineered (TE) instance in the TTM for next-hop resolution. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID. When configured to **false**, the SR tunnel type programmed by a TE instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

use-bgp-routes *boolean*

Synopsis	Use BGP routes to resolve BGP next hops
Context	**configure** router *string* bgp next-hop-resolution use-bgp-routes *boolean*
Tree	use-bgp-routes
Description	This command enables the use of BGP routes to resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface. A VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route. This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN).
Default	false
Introduced	16.0.R1
Platforms	All

use-leaked-routes

Synopsis	Enter the **use-leaked-routes** context
Context	**configure** router *string* bgp next-hop-resolution use-leaked-routes
Tree	use-leaked-routes
Introduced	23.7.R1
Platforms	All

static *boolean*

Synopsis	Use leaked static routes to resolve BGP next hop

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* bgp next-hop-resolution use-leaked-routes static *boolean*
Tree	static
Description	When configured to **true**, the router allows any non-leaked unlabeled unicast IPv4 or IPv6 route in the BGP RIB to be resolved by a leaked static route with direct next hops. A BGP route resolved this way cannot resolve other routes (including BGP routes) and cannot be redistributed into non-BGP protocols, such as IGP. When configured to **false**, the router prevents the use of leaked static routes to resolve BGP routes.
Default	false
Introduced	23.7.R1
Platforms	All

vpn-family-policy *reference*

Synopsis	Policy to filter routes for next-hop resolution
Context	**configure** router *string* bgp next-hop-resolution vpn-family-policy *reference*
Tree	vpn-family-policy
Reference	**configure** policy-options policy-statement *string*
Introduced	20.5.R1

weighted-ecmp *boolean*

Synopsis	Use weighted ECMP for next-hop tunnel selection for 6PE
Context	**configure** router *string* bgp next-hop-resolution weighted-ecmp *boolean*
Tree	weighted-ecmp
Description	When configured to **true**, this command enables weighted ECMP for next-hop tunnel selection for 6PE. When weighted ECMP is enabled, the RSVP-TE tunnel used to forward 6PE packets to the ECMP next hop that is chosen according to the outcome of the hash on the packet at the normalized load-balancing weight of the tunnel. When configured to **false**, weighted ECMP is disabled for next-hop tunnel selection for 6PE.
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

optimal-route-reflection

Synopsis	Enter the **optimal-route-reflection** context
Context	**configure** router *string* bgp optimal-route-reflection
Tree	optimal-route-reflection
Introduced	16.0.R1
Platforms	All

location [location-id] *number*

Synopsis	Enter the **location** list instance
Context	**configure** router *string* bgp optimal-route-reflection location *number*
Tree	location
Description	Commands in this context configure the location ID for the route reflector. A BGP neighbor can be associated with a location if it is a route-reflector client. Up to three IPv4 addresses and three IPv6 addresses can be specified per location. If the TE DB is unable find a node in its topology database that matches a primary address of the location, it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address. The IP addresses specified for a location should be topologically “close” to a set of clients that should all receive the same optimal path for that location.
Introduced	16.0.R1
Platforms	All

[location-id] *number*

Synopsis	Optimal route reflection location ID
Context	**configure** router *string* bgp optimal-route-reflection location *number*
Tree	location
Range	1 to 255
Notes	This element is part of a list key.

Tree	extended-community
Description	Commands in this context configure the ORF send and receive capabilities based on Extended Communities. When this context is unconfigured, the ORF capabilities for Extended Communities is not enabled.
Introduced	16.0.R1
Platforms	All

accept-orf *boolean*

Synopsis	Negotiate with peer to accept BGP ORF filters
Context	**configure** router *string* bgp outbound-route-filtering extended-community accept-orf *boolean*
Tree	accept-orf
Description	When configured to **true**, the receive capability in the BGP ORF is negotiated with a peer and ORF filters can be accepted from peers. When configured to **false**, the accept capability in the BGP ORF is removed and any existing ORF filters that are currently in place are cleared.
Default	false
Introduced	16.0.R1
Platforms	All

send-orf

Synopsis	Enable the **send-orf** context
Context	**configure** router *string* bgp outbound-route-filtering extended-community send-orf
Tree	send-orf
Description	Commands in this context allow BGP to negotiate the send capability in the ORF negotiation with a peer. The send capability also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD. When this context in unconfigured, ORF send capability is not enabled.
Introduced	16.0.R1
Platforms	All

Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

override-tunnel-elc *boolean*

Synopsis	Enable entropy label capability on BGP tunnels
Context	**configure** router *string* bgp override-tunnel-elc *boolean*
Tree	override-tunnel-elc
Description	When configured to **true**, this command renders all far ends for BGP tunnels as entropy-label-capable, regardless of any received capability signaling. This ensures that the entropy label will be inserted on BGP tunnels in the absence of capability signaling support by the far end. This is a system-wide configuration, since efficient entropy label operation requires that all LSRs in a network support entropy labels. This command should be used with care, particularly in inter-AS use cases, as entropy label capability may differ between domains. When configured to **false**, this command disables all far ends for BGP tunnels as entropy-label-capable.
Default	false
Introduced	16.0.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

path-mtu-discovery *boolean*

Synopsis	Enable Path MTU Discovery
Context	**configure** router *string* bgp path-mtu-discovery *boolean*
Tree	path-mtu-discovery
Description	When configured to **true**, Path MTU Discovery (PMTUD) is activated toward an IPv4 BGP neighbor. The Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, the device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value to accomodate the IP MTU constraint. When configured to **false**, PMTUD is disabled and there is no TCP MSS configuration to associate with a BGP neighbor (in either the BGP configuration or the first-hop IP interface configuration). The router advertises a TCP MSS option of only 1024 bytes, limiting the received TCP segments to that size.
Default	false
Introduced	16.0.R1
Platforms	All

peer-ip-tracking *boolean*

Synopsis	Enable BGP peer tracking
Context	**configure** router *string* bgp peer-ip-tracking *boolean*
Tree	peer-ip-tracking
Default	false
Introduced	16.0.R1
Platforms	All

peer-tracking-policy *reference*

Synopsis	Policy for BGP peer tracking on router instance
Context	**configure** router *string* bgp peer-tracking-policy *reference*
Tree	peer-tracking-policy
Description	This command specifies the name of a policy statement to use with the BGP peer-tracking function on BGP sessions where peer tracking is enabled. When unconfigured, the default peer-tracking policy allows any type of route to match the neighbor IP address except aggregate routes and LDP shortcut routes.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Peer tracking should be used with caution. The peer-tracking policy should only permit one of direct-interface or direct routes to be advertised to a BGP peer. Advertising both routes causes the best route to oscillate.

Reference **configure** policy-options policy-statement *string*

Introduced 16.0.R1

Platforms All

preference *number*

Synopsis Route preference for routes learned from all peers

Context **configure** router *string* bgp preference *number*

Tree preference

Description This command configures the route preference for routes learned from the configured peers.

The lower the preference value, the higher the chance of the route being the active route. The router assigns BGP routes the highest default preference as compared to routes that are direct, static or learned via MPLS or OSPF.

Range 1 to 255

Default 170

Introduced 16.0.R1

Platforms All

purge-timer *number*

Synopsis Maximum time before stale routes are purged

Context **configure** router *string* bgp purge-timer *number*

Tree purge-timer

Description This command configures the maximum time before stale routes are purged.

When a route refresh request is sent to a peer for VPN-IP routes received from that peer (in the RIB-IN), the routes are set to stale and the purge timer is started. If the routes are not updated (refreshed) before the purge timer expires, the routes are removed.

Range 1 to 60

policy-name *reference*

Synopsis	Name of policy that controls route importation into RIB
Context	**configure** router *string* bgp rib-management ipv4 route-table-import policy-name *reference*
Tree	policy-name
Description	This command specifies the name of a policy that controls the importation of active routes from the IP route table into one of the BGP RIBs. When this command is configured, routes dropped or rejected by the policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next hops of routes in that RIB. If the active route for a prefix is rejected by the policy, the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used. Aggregate routes are always imported into each RIB, independent of the specified policy. Route modifications specified in the actions of the policy are ignored and have no effect on the imported routes. When unconfigured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

router-id *string*

Synopsis Router ID for the BGP instance in the AS

Context **configure** router *string* bgp router-id *string*

Tree router-id

Description This command specifies the router ID to be used with the BGP instance.

Changing the BGP router ID on an active BGP instance causes the BGP instance to restart with the new router ID.

When an SR OS is configured with an IPv6-only BOF and no IPv4 system interface address, explicitly-defined IPv4 router IDs are required for BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

Introduced 16.0.R1

Platforms All

rr-vpn-forwarding *boolean*

Synopsis Allow route reflector to forward VPN-IP routes

Context **configure** router *string* bgp rr-vpn-forwarding *boolean*

Tree rr-vpn-forwarding

Description When configured to **true**, the route reflector resolves VPN-IPv4 and VPN-IPv6 routes, sets itself as the next hop, and generates new labels for all the resolved routes.

During this process, all received VPN-IP routes, regardless of route target, are imported into the dummy VRF, where the BGP next hops are resolved. The routes are resolved to

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

next-hop-self, and BGP allocates new VPRN service-label values for the routes, which are then advertised to peers.

The **transport-tunnel** command under the **configure router bgp next-hop-resolution labeled-routes** context determines what types of tunnels are eligible to resolve the next hops. If a received VPN-IP route from IBGP peer X is resolved and selected as the best path so that it can be re-advertised to an IBGP peer Y, and the BGP next-hop is modified toward peer Y (by using the **next-hop-self** command in Y's group or neighbor context or by using a next-hop action in an export policy applied to Y), BGP allocates a new VPRN service label value for the route, signals that new label value to Y, and programs the IOM to do the corresponding label swap operation. The supported combinations of X and Y are outlined below:

- from X (client) to Y (client)
- from X (client) to Y (non-client)
- from X (non-client) to Y (client)

When configured to **false**, the routes are re-advertised without signaling new VPRN labels, even if the BGP next hop is changed.

Nokia recommends setting this command to **false** for scaling and convergence reasons.

Use subject to Terms available at: www.nokia.com/terms.

Tree	family
Options	ipv4, ipv6
Notes	This element is part of a list key.
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

add-srv6-tlvs

Synopsis	Enable the **add-srv6-tlvs** context
Context	**configure** router *string* bgp segment-routing-v6 family *keyword* add-srv6-tlvs
Tree	add-srv6-tlvs
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator-name *reference*

Synopsis	SRv6 locator name
Context	**configure** router *string* bgp segment-routing-v6 family *keyword* add-srv6-tlvs locator-name *reference*
Tree	locator-name
Reference	**configure** router *string* segment-routing segment-routing-v6 base-routing-instance locator *reference*
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

micro-segment-locator-name *reference*

Synopsis	Micro-segment SRv6 locator name
Context	**configure** router *string* bgp segment-routing-v6 family *keyword* add-srv6-tlvs micro-segment-locator-name *reference*
Tree	micro-segment-locator-name
Description	This command adds a prefix SID attribute containing an SRv6 TLV to routes that belong to the family and that are redistributed from another protocol to BGP. This command also adds a prefix SID attribute with SRv6 TLV to BGP routes that are received from other peers without the SRv6 TLV and that are propagated to other peers with next-hop-self applied.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Reference	**configure** router *string* segment-routing segment-routing-v6 base-routing-instance micro-segment-locator *reference*
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

ignore-received-srv6-tlvs *boolean*

Synopsis	Ignore SRv6 TLVs for received routes
Context	**configure** router *string* bgp segment-routing-v6 family *keyword* ignore-received-srv6-tlvs *boolean*
Tree	ignore-received-srv6-tlvs
Description	When configured to **true**, if a route of the family is received with a prefix SID attribute carrying an SRv6 TLV, the SRv6 TLV is ignored and the route resolution is based on the BGP next-hop only. When configured to **false**, if a route of the family is received with a prefix SID attribute carrying an SRv6 TLV, the SRv6 TLV is processed. Such a route is resolved only if its BGP next-hop is reachable and the locator prefix is reachable. The datapath programming and IGP cost to reach the next-hop (used by the BGP decision process) is based on the route to the locator prefix.
Default	true
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

resolution *keyword*

Synopsis	Resolution options for routes
Context	**configure** router *string* bgp segment-routing-v6 family *keyword* resolution *keyword*
Tree	resolution
Options	route-table, tunnel-table, fallback-tunnel-to-route-table
Default	route-table
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

source-address *string*

Synopsis	Source address used in SRv6 packet
Context	**configure** router *string* bgp segment-routing-v6 source-address *string*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	source-address
Description	When configured, this command specifies the source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet. When not configured, the source IPv6 address is inherited from the configuration of the global default address in the **router "base" segment-routing segment-routing-v6 source-address** context. A source IPv6 address must be configured in this context or in the base router context. The system does not check if the address entered is a valid local address.
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

selective-label-ip *keyword*

Synopsis	Label IP routes installed for local use on NHS router
Context	**configure** router *string* bgp selective-label-ip *keyword*
Tree	selective-label-ip
Description	This command enables selective installation of labeled unicast routes for resolution by local services and IP shortcuts on a labeled unicast Next-hop=self router. This command is supported for labeled unicast for both IPv4 and IPv6 routes. The **no-install** option installs labeled IP routes that are required by services. This option conserves labeled route table space in addition to RTM table space on BGP-LU next-hop-self route reflectors. The **route-table-install-only** option ensures that the labeled unicast routes are installed in the RTM in full. When **no-install** is specified, the download of labeled unicast routes for NHLFE resolution by services continues.
Options	no-install, route-table-install-only
Introduced	22.10.R1
Platforms	All

selective-label-ip-prioritization *boolean*

Synopsis	Enable BGP selective prioritization for labeled routes
Context	**configure** router *string* bgp selective-label-ip-prioritization *boolean*
Tree	selective-label-ip-prioritization
Description	When this command is set to **true**, every labeled IPv4 and IPv6 route that is received and potentially usable by a local service is automatically prioritized for fast control plane reconvergence. When the reachability of a BGP next-hop changes, the labeled IPv4 and IPv6 routes are updated into the route table first, along with other routes manually tagged as high priority by import policies. A /32 or /128 labeled unicast route (and associated BGP-LU tunnel) is determined to be potentially usable by a local service if one of the following conditions applies:

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- the route matches the far-end address of a user-provisioned SDP of a Layer 2 service and the SDP is configured to use BGP tunnels as transport
- the route matches the BGP next-hop address of a BGP-EVPN or IP VPN route, and this VPN route is either imported into a local service or readvertised by the router acting as a next-hop-self route reflector or a model-B ASBR

When this command is set to **false,** selective-label IP prioritization for BGP is not used.

Default	false
Introduced	21.10.R1
Platforms	All

selective-label-ipv4-install *boolean*

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** router *string* bgp split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon. This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP. Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary. When configured to **false**, the use of split-horizon is disabled.
Default	false
Introduced	16.0.R1
Platforms	All

sr-policy-import *boolean*

Synopsis	Import all segment routing policies into the BGP RIB

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* bgp sr-policy-import *boolean*
Tree	sr-policy-import
Description	When configured to **true**, statically-configured non-local segment routing policies from the segment routing database are imported into the BGP RIB so that they can be advertised as originated routes toward BGP peers supporting segment routing policies (**sr-policy-ipv4** IP family type). When configured to **false**, the SR policies are not imported into the BGP RIB.
Default	false
Introduced	16.0.R1
Platforms	All

subconfed-vpn-forwarding *boolean*

Synopsis	Allow subconfed route resolution, next hop and labels
Context	**configure** router *string* bgp subconfed-vpn-forwarding *boolean*
Tree	subconfed-vpn-forwarding
Description	When this is set to **true**, the base router BGP instance retains all received VPN-IPv4 and VPN-IPv6 routes, including those with route targets not matching any VRF import policy of any locally configured VPRN. In addition, when the base router BGP is configured to apply a **next-hop-self** command to a peer of any type (EBGP, IBGP, or confed-EBGP), VPN-IPv4 and VPN-IPv6 routes are advertised to the peer with a new BGP label, next hop, and label-swap forwarding entry. These behaviors described above are applied when the **enable-inter-as-vpn** or **enable-rr-vpn-forwarding** commands are enabled in the **configure router bgp context**, in the same BGP instance. This applies regardless of whether the base router has a confederation configuration. When this command is set to **false**, subconfederation VPN forwarding is not used.
Default	false
Introduced	21.10.R1
Platforms	All

tcp-mss *number*

Synopsis	TCP maximum segment size override
Context	**configure** router *string* bgp tcp-mss *number*
Tree	tcp-mss
Description	This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command). The configured value controls two properties of the TCP connection as follows:

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router.

TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

Range	384 to 9746
Introduced	21.2.R1
Platforms	All

third-party-nexthop *boolean*

Synopsis	Apply third-party next-hop processing to EBGP peers
Context	**configure** router *string* bgp third-party-nexthop *boolean*
Tree	third-party-nexthop
Description	When configured to **true**, this command enables the router to send third-party next hop to EBGP peers in the same subnet as the source peer. The address family of the transport must match the address family of the route. When an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next hop is left unchanged. When configured to **false**, third-party next-hop processing is disabled and the next hop carries the IP address of the interface used to establish the TCP connection to the peer.
Default	false
Introduced	16.0.R1
Platforms	All

vpn-apply-export *boolean*

Synopsis	Apply base-instance BGP export policies to VPN routes
Context	**configure** router *string* bgp vpn-apply-export *boolean*
Tree	vpn-apply-export
Description	When configured to **true**, base-instance BGP export route policies are applied to VPN-IPv4/6, MVPN-IPv4/6, L2-VPN, MDT-SAFI, MCAST-VPN-IPv4, and EVPN routes. When configured to **false**, the export policies are not applied.

maximum-client-lead-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	**configure** router *string* dhcp-server dhcpv4 *string* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.
Range	600 to 86399
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** router *string* dhcp-server dhcpv4 *string* failover partner-down-delay *number*
Tree	partner-down-delay
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds
Default	86399

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer [address] *reference*

Synopsis	Enter the **peer** list instance
Context	**configure** router *string* dhcp-server dhcpv4 *string* failover peer *reference*
Tree	peer
Description	Commands in this context define the peer-related parameters for DHCP failover. DHCP leases can be synchronized at the level of the DHCP server or pool. The pair of synchronizing servers or pools is identified by a tag. The synchronization information is carried over the Multi-Chassis Synchronization (MCS) link between the two peers. The MCS link is a logical IP or MPLS link. MCS runs over TCP port 45067, using either data traffic or keepalives to detect failure on the communication link between the two nodes. In the absence of any MCS data traffic for more than 0.5 seconds, MCS sends its own keepalive to the peer. If a reply is not received within 3 seconds, MCS declares its operational state as down and the DB sync state as out-of-sync. MCS consequently notifies its clients, including the DHCP server. It can take up to 3 seconds before the DHCP client realizes that the inter-chassis link has failed. The link failure does not necessarily imply the same failed state for the access links. It is possible, although unlikely, that both access links are operational while the inter-chassis communication link is broken. In this case, the two redundant nodes can become isolated from each other in the network. For this reason, it is important that the MCS link be highly redundant.
Max. Instances	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

startup-wait-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Time between initialization and assuming active role
Context	**configure** router *string* dhcp-server dhcpv4 *string* failover startup-wait-time *number*
Tree	startup-wait-time
Description	This command configures a delay that avoids transient issues during the initialization process. During startup wait time, each failover peer waits after the initialization process before assuming the active role for the prefix designated as local or remote.
Range	60 to 3600
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

force-renews *boolean*

Synopsis	Send FORCERENEW messages to force renewals of leases

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* dhcp-server dhcpv4 *string* force-renews *boolean*
Tree	force-renews
Description	When configured to **true**, FORCERENEW messages are enabled for DHCP.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lease-hold

Synopsis	Enter the **lease-hold** context
Context	**configure** router *string* dhcp-server dhcpv4 *string* lease-hold
Tree	lease-hold
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

additional-scenarios

Synopsis	Enter the **additional-scenarios** context
Context	**configure** router *string* dhcp-server dhcpv4 *string* lease-hold additional-scenarios
Tree	additional-scenarios
Description	Commands in this context configure additional types of leases or triggers that cause the system to hold up leases.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

internal-lease-ipsec *boolean*

Synopsis	Apply the lease hold timer to local IPsec clients
Context	**configure** router *string* dhcp-server dhcpv4 *string* lease-hold additional-scenarios internal-lease-ipsec *boolean*
Tree	internal-lease-ipsec
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.

solicited-release *boolean*

Synopsis	Apply lease hold timer for solicited releases
Context	**configure** router *string* dhcp-server dhcpv4 *string* lease-hold additional-scenarios solicited-release *boolean*
Tree	solicited-release
Description	This command enables the server to hold up a lease even for a solicited release, for example, when the server receives a normal DHCP release message.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

time *number*

Synopsis	Lease hold time
Context	**configure** router *string* dhcp-server dhcpv4 *string* lease-hold time *number*
Tree	time
Range	1 to 631152000
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pool [pool-name] *string*

Synopsis	Enter the **pool** list instance
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string*
Tree	pool
Description	Commands in this context configure a DHCP address pool on the router.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**pool-name**] *string*

Synopsis	DHCP server pool name
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string*
Tree	pool

String Length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *string*

Synopsis	Text description
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* description *string*
Tree	description
String Length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

failover

Synopsis	Enter the **failover** context
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* failover
Tree	failover
Description	Commands in this context define DHCP failover where two DHCP servers manage the same pool of addresses, enabling them to share the load to assign leases for pool and provide backup for each in the event of network outages.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the failover mechanism
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* failover admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ignore-mclt-on-takeover *boolean*

Synopsis	Ignore maximum client lead during takeover from partner
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* failover ignore-mclt-on-takeover *boolean*
Tree	ignore-mclt-on-takeover
Description	When configured to **true**, the remote IP address range can be taken over immediately when the intercommunication link enters the PARTNER-DOWN state, without having to wait for the MCLT to expire. When configured to **false**, the DHCP lease time for new clients is restricted to the MCLT during a failure. For existing clients, the lease time is gradually reduced over time to the MCLT by consecutive DHCP renewals.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-client-lead-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.
Range	600 to 86399
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* failover partner-down-delay *number*
Tree	partner-down-delay
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds
Default	86399
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer [address] *reference*

Synopsis	Enter the **peer** list instance
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* failover peer *reference*
Tree	peer
Description	Commands in this context configure peer-related parameters for DHCP failover. DHCP leases can be synchronized at the level of the DHCP server or pool. The pair of synchronizing servers or pools is identified by a tag. The synchronization information is carried over the Multi-Chassis Synchronization (MCS) link between the two peers. The MCS link is a logical IP or MPLS link. MCS runs over TCP port 45067, using either data traffic or keepalives to detect failure on the communication link between the two nodes. In the absence of any MCS data traffic for more than 0.5 seconds, MCS sends its own keepalive to the peer. If a reply is not received within 3 seconds, MCS declares its operational state as down and the DB sync state as out-of-sync. MCS consequently notifies its clients, including the DHCP server. It can take up to 3 seconds before the DHCP client realizes that the inter-chassis link has failed. The link failure does not necessarily imply the same failed state for the access links. It is possible, although unlikely, that both access links are operational while the inter-chassis communication link is broken. In this case, the two redundant nodes can become

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	isolated from each other in the network. For this reason, it is important that the MCS link be highly redundant.
Max. Instances	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**address**] *reference*

Description	This command specifies the end of a range of IP addresses that are excluded from the pool of IP addresses in this subnet.
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-declined *number*

Synopsis	Maximum number of declined addresses allowed
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* subnet *string* maximum-declined *number*
Tree	maximum-declined
Max. Range	0 to 4294967295
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

minimum-free

Synopsis	Enter the **minimum-free** context
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* subnet *string* minimum-free
Tree	minimum-free
Description	Commands in this context specify the minimum number of free addresses in this pool.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

absolute *number*

Synopsis	Minimum number of free addresses in this pool or subnet

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* subnet *string* minimum-free absolute *number*
Tree	absolute
Range	0 to 255
Default	1
Notes	The following elements are part of a choice: **absolute** or **percent**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

event-when-depleted *boolean*

Synopsis	Generate notification when addresses are depleted
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* subnet *string* minimum-free event-when-depleted *boolean*
Tree	event-when-depleted
Description	When configured to **true**, a system-generated event is generated when all available addresses in the pool or subnet of a local DHCP server are depleted. When configured to **false**, no action is taken when all available addresses in the pool or subnet of a local DHCP server are depleted.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

percent *number*

Synopsis	Minimum free addresses as a percentage
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* subnet *string* minimum-free percent *number*
Tree	percent
Range	0 to 100
Default	1
Notes	The following elements are part of a choice: **absolute** or **percent**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Tree	ipv4-address
Max. Instances	4
Notes	The following elements are part of a mandatory choice: **ascii-string**, **duration**, **empty**, **hex-string**, **ipv4-address**, or **netbios-node-type**. This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

netbios-node-type *keyword*

Synopsis	DHCP option specified as a NetBIOS node type
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool *string* subnet *string* options option *(number | keyword)* netbios-node-type *keyword*
Tree	netbios-node-type
Options	b-node, p-node, m-node, h-node
Notes	The following elements are part of a mandatory choice: **ascii-string**, **duration**, **empty**, **hex-string**, **ipv4-address**, or **netbios-node-type**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pool-selection

Synopsis	Enter the **pool-selection** context
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool-selection
Tree	pool-selection

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

use-gi-address

Synopsis	Enable the **use-gi-address** context
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool-selection use-gi-address
Tree	use-gi-address
Description	Commands in this context configure gateway interface (GI) address matching. When configured, the pool can be used for address matching even if a subnet is not found. If the local user database name is not used, addresses are provided only by GI. If a user must be blocked from getting an address, the server maps to a local user database and configures the user with no address. A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface, the pool can provide IP addresses from any of the subnets included when the GI is matched to one of its subnets. This allows a pool to be created that represents a sub-net.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

scope *keyword*

Synopsis	GI address-matching scope
Context	**configure** router *string* dhcp-server dhcpv4 *string* pool-selection use-gi-address scope *keyword*
Tree	scope
Options	subnet, pool

Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preferred-lifetime *number*

Synopsis	Time this lease remains preferred
Context	**configure** router *string* dhcp-server dhcpv6 *string* defaults preferred-lifetime *number*
Tree	preferred-lifetime
Description	This command configures the preferred lifetime of the IPv6 lease address or prefix. When the preferred lifetime expires, any derived addresses are deprecated. The preferred lifetime must be less than or equal to the valid lifetime. Each address or prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).
Range	300 to 315446399
Units	seconds
Default	3600
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rebind-time *number*

Synopsis	Rebind time for the lease
Context	**configure** router *string* dhcp-server dhcpv6 *string* defaults rebind-time *number*
Tree	rebind-time

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the rebind time, known as T2, at which the client contacts the addressing authority to extend the lifetimes of its leases. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew or reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses or prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured rebind timer value should always be less than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 1209600
Units	seconds
Default	2880
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

renew-time *number*

Synopsis	Renew time for the lease
Context	**configure** router *string* dhcp-server dhcpv6 *string* defaults renew-time *number*
Tree	renew-time
Description	This command configures the renew time, known as T1, at which the client makes a transition to the lease-renewal state. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew/reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured renew timer value should always be shorter than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 604800
Units	seconds
Default	1800
Introduced	16.0.R4

valid-lifetime *number*

Synopsis	Time for the lease to remain valid
Context	**configure** router *string* dhcp-server dhcpv6 *string* defaults valid-lifetime *number*
Tree	valid-lifetime
Description	This command configures a valid lifetime for a DHCPv6 lease address or prefix. The valid lifetime is the length of time an address and prefix remains in the valid state. The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address and prefix becomes invalid and must not be used in communications. RFC 2461 recommends a default value of 30 days. Each address and prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address and prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).
Range	300 to 315446399
Units	seconds
Default	86400
Introduced	16.0.R4

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** router *string* dhcp-server dhcpv6 *string* failover partner-down-delay *number*
Tree	partner-down-delay
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds
Default	86399
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Synopsis	Time between initialization and assuming active role
Context	**configure** router *string* dhcp-server dhcpv6 *string* failover startup-wait-time *number*
Tree	startup-wait-time
Description	This command configures a delay that avoids transient issues during the initialization process. During startup wait time, each failover peer waits after the initialization process before assuming the active role for the prefix designated as local or remote.
Range	60 to 3600
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ignore-rapid-commit *boolean*

Synopsis	Ignore Rapid Commit option
Context	**configure** router *string* dhcp-server dhcpv6 *string* ignore-rapid-commit *boolean*
Tree	ignore-rapid-commit
Description	When configured to **true**, the server ignores the Rapid Commit option sent by the client and uses the regular message exchange.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interface-id-mapping *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Map hosts within interface-to-prefix combinations
Context	**configure** router *string* dhcp-server dhcpv6 *string* interface-id-mapping *boolean*
Tree	interface-id-mapping
Description	When configured to **true**, this command specifies an interface-mapping method that uses a combination of unique /64 prefixes and interface IDs. A /64 prefix is allocated to each interface ID, and all clients with the same interface ID are assigned an address from the prefix. This method is used for bridging clients in the same local loop and SAP, so that sharing the prefix allows communication to stay local. For SLAAC-based

Description	When configured to **true**, the remote IP address range can be taken over immediately when the intercommunication link enters the PARTNER-DOWN state, without having to wait for the MCLT to expire. When configured to **false**, the DHCP lease time for new clients is restricted to the MCLT during a failure. For existing clients, the lease time is gradually reduced over time to the MCLT by consecutive DHCP renewals.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-client-lead-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	**configure** router *string* dhcp-server dhcpv6 *string* pool *string* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.
Range	600 to 86399
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preferred-lifetime *number*

Synopsis	Time this lease remains preferred
Context	**configure** router *string* dhcp-server dhcpv6 *string* pool *string* prefix *string* preferred-lifetime *number*
Tree	preferred-lifetime
Description	This command configures the preferred lifetime of the IPv6 lease address or prefix. When the preferred lifetime expires, any derived addresses are deprecated. The preferred lifetime must be less than or equal to the valid lifetime. Each address or prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	to use the address/prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).
Range	300 to 315446399
Units	seconds
Default	3600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rebind-time *number*

Synopsis	Rebind time for the lease
Context	**configure** router *string* dhcp-server dhcpv6 *string* pool *string* prefix *string* rebind-time *number*
Tree	rebind-time
Description	This command configures the rebind time, known as T2, at which the client contacts the addressing authority to extend the lifetimes of its leases. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew or reply message exchange to extend the lifetimes of any addresses in the IA.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The client includes an IA option with all addresses or prefixes currently assigned to the IA in its renew message.

Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured rebind timer value should always be less than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.

Range	0 to 1209600
Units	seconds
Default	2880
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

renew-time *number*

Synopsis	Renew time for the lease
Context	**configure** router *string* dhcp-server dhcpv6 *string* pool *string* prefix *string* renew-time *number*
Tree	renew-time
Description	This command configures the renew time, known as T1, at which the client makes a transition to the lease-renewal state. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew/reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured renew timer value should always be shorter than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.

valid-lifetime *number*

Synopsis	Time for the lease to remain valid
Context	**configure** router *string* dhcp-server dhcpv6 *string* pool *string* prefix *string* valid-lifetime *number*
Tree	valid-lifetime
Description	This command configures a valid lifetime for a DHCPv6 lease address or prefix. The valid lifetime is the length of time an address and prefix remains in the valid state. The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address and prefix becomes invalid and must not be used in communications. RFC 2461 recommends a default value of 30 days. Each address and prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address and prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).
Range	300 to 315446399
Units	seconds
Default	86400

ecmp *number*

Synopsis	Maximum equal-cost routes for routing table instance
Context	**configure** router *string* ecmp *number*
Tree	ecmp
Description	This command configures ECMP and defines the number of routes for path sharing. ECMP can be used only for routes learned with the same preference and the same protocol. If available ECMP routes at the best preference exceed the maximum ECMP routes allowed, the system selects the route using the following criteria: **1.** The system selects the lowest next hop router ID. **2.** If the next hop goes to the same neighbor, the system selects the next hop with the lowest interface index.
Range	1 to 64
Default	1
Introduced	16.0.R1
Platforms	All

entropy-label *boolean*

Synopsis	Use entropy label
Context	**configure** router *string* entropy-label *boolean*
Tree	entropy-label
Description	When configured to **true**, this command enables the use of entropy labels. The entropy label and indicator (EL/ELI) are inserted on relevant packets. Applicable packets are those for which at least one LSP in the stack at the far end has advertised the entropy-label capability. These LSPs are in LDP or RSVP tunnels used by an IGP

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

or BGP shortcut. If the tunnel is of type RSVP, the entropy-label capability must also be enabled under the **configure router mpls** or **configure router mpls lsp** context.

This command also results in other traffic that is forwarded over an LDP or RSVP LSP for which this router is the LER, and for which there is no explicit service endpoint on this router, to have the EL/ELI enabled, subject to the LSP far-end advertising entropy-label-capability. An example of such traffic includes packets arriving on a stitched LDP LSP forwarded over an RSVP LSP.

The entropy label and the hash label features are mutually exclusive. The entropy label cannot be configured on a spoke SDP or service where the hash label feature has already been configured.

When configured to **false**, the use of entropy labels is disabled.

Default	false
Introduced	16.0.R1
Platforms	All

flowspec

Synopsis	Enter the **flowspec** context
Context	**configure** router *string* flowspec
Tree	flowspec
Description	This command configures the maximum number of flowspec routes, or rules, that can be entered in the auto-created embedded filter, fSpec-X. Flowspec filter entries are placed in an ingress IP filter policy in this router from the filter range between the configured offset plus 1 (embedding offset plus 1) and the value of this command (embedding offset plus **ip-filter-max-size** or **ipv6-filter-max-size**). The sum of the maximum-size value and the highest offset in any IP filter that embeds flowspec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143. The maximum size can be adjusted up or down at any time. If the current number of flowspec rules is greater than the new maximum, the extra rules are removed

immediately but retained in the BGP RIB. If the limit is increased, new rules are embedded only as they are received in new BGP updates.

Introduced 16.0.R1

Platforms All

filter-cam-type *keyword*

Synopsis Filter policy type for FlowSpec embedding

Context **configure** router *string* flowspec filter-cam-type *keyword*

Tree filter-cam-type

Description This command specifies the filter type that is required to embed FlowSpec entries. The filter type defines the match criteria that are available in the filter policy.

Options normal, packet-length

Default normal

Introduced 20.7.R1

Platforms All

ip-filter-max-size *number*

Synopsis Maximum number of flowspec rule entries in IPv4 filter

Context **configure** router *string* flowspec ip-filter-max-size *number*

Tree ip-filter-max-size

Description This command configures the maximum number of IPv4 flowspec routes, or rules, that can be entered in the auto-created embedded filter, fSpec-X. Flowspec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between the embedding offset and (offset + ip-filter-max-size – 1).

The sum of the maximum-size value and the highest offset in any IPv4 filter that embeds IPv4 flowspec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The maximum size can be adjusted up or down at any time. If the current number of IPv4 flowspec rules is greater than the new maximum, the extra rules are removed immediately but retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received in new BGP updates.

Range 0 to 262143

Default 512

Introduced 16.0.R1

ipv6-filter-max-size *number*

Synopsis	Maximum number of flowspec rule entries in IPv6 filter
Context	**configure** router *string* flowspec ipv6-filter-max-size *number*
Tree	ipv6-filter-max-size
Description	This command configures the maximum number of IPv6 flowspec routes or rules that can be embedded into an ingress IPv6 filter policy for a specified routing instance. Flowspec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between the embedding offset and (offset + ip-filter-max-size – 1). The sum of the maximum-size value and the highest offset in any IPv6 filter that embeds IPv6 flowspec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143. The maximum size can be adjusted up or down at any time. If the current number of IPv6 flowspec rules is greater than the new maximum, the extra rules are removed immediately but retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received in new BGP updates.

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** router *string* igmp forwarding-group-interface forwarding-service *string* group-interface-name *reference* mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).
Reference	**configure** mcac policy *string*
Introduced	21.7.R1

Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

import-policy *reference*

Synopsis	Import policy that filters IGMP packets
Context	**configure** router *string* igmp group-interface *reference* import-policy *reference*
Tree	import-policy
Description	This command configures the IGMP import policy, or filter, for an interface subscriber or a group interface. An IGMP filter is also known as a black or white list, and it is defined as a router policy option. When redirection is applied, only the import policy from the subscriber is in effect. The import policy under the group interface is applicable only for IGMP states received directly on the SAP (AN in IGMP proxy mode).
Reference	**configure** policy-options policy-statement *string*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-number-group-sources *number*

Synopsis	Maximum number of group sources for this interface
Context	**configure** router *string* igmp group-interface *reference* maximum-number-group-sources *number*
Tree	maximum-number-group-sources
Description	This command configures the maximum number of group sources for which IGMP or MLD can have local receiver information based on received IGMP or MLD reports on this interface. When this configuration is changed dynamically to a lower value than the currently accepted number of group sources, the group sources that are already accepted are not deleted. Only new group sources are not allowed.
Range	1 to 32000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).
Reference	**configure** mcac policy *string*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subnet-check *boolean*

Synopsis	Allow subnet checking
Context	**configure** router *string* igmp interface *string* subnet-check *boolean*
Tree	subnet-check
Default	true
Introduced	16.0.R1
Platforms	All

version *keyword*

Synopsis	IGMP protocol version
Context	**configure** router *string* igmp interface *string* version *keyword*
Tree	version
Options	1, 2, 3
Default	3
Introduced	16.0.R1
Platforms	All

query-interval *number*

Synopsis	Time between two consecutive host-query messages
Context	**configure** router *string* igmp query-interval *number*
Tree	query-interval
Description	This command configures the timing of the host-query messages that solicit group membership information. The messages are sent to the all-systems multicast group address, 224.0.0.1.
Range	2 to 1024
Units	seconds
Default	125
Introduced	16.0.R1
Platforms	All

query-last-member-interval *number*

Synopsis	Time between group-specific query messages

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* igmp query-last-member-interval *number*
Tree	query-last-member-interval
Description	This command configures the timing of the query-message interval, defining the interval for leave-group messages among others. The lower the interval that is configured, the faster the detection of the loss of the last member of a group.
Range	1 to 1023
Units	seconds
Default	1
Introduced	16.0.R1
Platforms	All

query-response-interval *number*

Synopsis	Time to wait for a response to the host-query messages
Context	**configure** router *string* igmp query-response-interval *number*
Tree	query-response-interval
Range	1 to 1023
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	All

robust-count *number*

Synopsis	Number of retries after expected message loss
Context	**configure** router *string* igmp robust-count *number*
Tree	robust-count
Description	This command configures the level of expected packet loss on a subnet. If a subnet anticipates losses, this value can be increased.
Range	2 to 10
Default	2
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ssm-translate

Synopsis	Enter the **ssm-translate** context
Context	**configure** router *string* igmp ssm-translate
Tree	ssm-translate
Description	Commands in this context configure a group range that is translated to SSM (S,G) entries. If a static entry needs to be created, it is translated from an IGMPv1 or v2 request to an SSM join message.
Introduced	16.0.R1
Platforms	All

group-range start *string* end *string*

Synopsis	Enter the **group-range** list instance
Context	**configure** router *string* igmp ssm-translate group-range start *string* end *string*
Tree	group-range
Description	Commands in this context configure the range of IP addresses that is translated to SSM (S,G) entries.
Introduced	16.0.R1
Platforms	All

start *string*

Synopsis	Lower bound of the IP address group range
Context	**configure** router *string* igmp ssm-translate group-range start *string* end *string*
Tree	group-range
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

end *string*

Synopsis	Upper bound of the IP address group range
Context	**configure** router *string* igmp ssm-translate group-range start *string* end *string*
Tree	group-range
Notes	This element is part of a list key.

Platforms	All

static

Synopsis	Enter the **static** context
Context	**configure** router *string* igmp tunnel-interface ldp-p2mp-root *reference* sender-address *reference* static
Tree	static
Description	Commands in this context configure static multicast receiver hosts on a tunnel interface associated with an RSVP P2MP LSP. When a static IGMP group is configured, data is forwarded to an interface without receiving membership reports from host members.
Introduced	16.0.R1
Platforms	All

group [group-address] *string*

Synopsis	Enter the **group** list instance
Context	**configure** router *string* igmp tunnel-interface ldp-p2mp-root *reference* sender-address *reference* static group *string*
Tree	group
Description	Commands in this context configure a static multicast group as either a starg (*,G), or one or more SSM (S,G) records. Static multicast group joins can be assigned to a tunnel interface associated with an RSVP P2MP LSP. A given <*,G> or <S,G> can only be associated with a single tunnel interface. A multicast packet which is received on an interface and which succeeds the RPF check for the source address will be replicated and forwarded to all OIFs which correspond to the branches of the P2MP LSP. The packet is sent on each OIF with the label stack indicated in the NHLFE of this OIF. The packets will also be replicated and forwarded natively on all OIFs which have received IGMP or PIM joins for this <S,G>. The multicast packet can be received over a PIM or IGMP interface which can be an IES interface, a spoke SDP terminated IES interface, or a network interface.
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**group-address**] *string*

Synopsis	Group address of static IGMP multicast channel
Context	**configure** router *string* igmp tunnel-interface ldp-p2mp-root *reference* sender-address *reference* static group *string*
Tree	group
Description	This command configures an address that receives data on an interface. The IP address must be unique for each static group.
Notes	This element is part of a list key.

Platforms	All

[**interface-name**] *string*

Synopsis	Router interface name
Context	**configure** router *string* interface *string*
Tree	interface
Description	This command specifies the name of the router interface. When a user enters a new name, the system creates a new logical interface and the context changes to that interface for more command processing. When an existing interface name is entered, the user enters the router interface context for editing and configuration. Nokia recommends using names that are meaningful and unique to remove ambiguity when displaying the state associated with IP interfaces either via show commands or model-driven interfaces. See "Router configuration overview" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about the interface name.
String Length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

dist-cpu-protection *reference*

Synopsis	DCP policy name for interface
Context	**configure** router *string* interface *string* dist-cpu-protection *reference*
Tree	dist-cpu-protection
Description	This command configures a Distributed CPU Protection (DCP) policy for the associated IP interface or SAP. The user can only assign a valid created DCP policy to a SAP or network interface (this rule does not apply to templates such as an MSAP policy). If the operator does not assign a DCP policy to a router interface, the system uses the default network DCP policy. See "Distributed CPU protection" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
Reference	**configure** system security dist-cpu-protection policy *string*
Introduced	16.0.R1
Platforms	All

egress

Synopsis	Enter the **egress** context
Context	**configure** router *string* interface *string* egress
Tree	egress
Description	Commands in this context configure egress network filter policies for the IP interface. The system does not filter unless an operator defines a filter.
Introduced	16.0.R1

Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-padding-size *number*
Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV, is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.
Range	3 to 1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-tlv-ignore *keyword*

Synopsis	TLV to ignore on reception
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-tlv-ignore *keyword*
Tree	ccm-tlv-ignore
Description	This command configures the receiving MEP to ignore the specified TLVs in the CCM PDU. The ignored TLVs are reported as absent and have no impact on the MEP state machine. When unconfigured, the MEP processes all the recognized TLVs.
Options	interface-status, port-status

© 2023 Nokia.

Max. Instances	2
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-fc-stats

Synopsis	Enter the **collect-lmm-fc-stats** context
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-fc-stats
Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection. The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively. This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. Instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fc-in-profile *keyword*

Synopsis	Forwarding class name for profile-aware counter
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-fc-stats fc-in-profile *keyword*
Tree	fc-in-profile
Description	This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. Instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-stats *boolean*

Synopsis	Collect statistics for loss measurement message tests
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-stats *boolean*
Tree	collect-lmm-stats
Description	When configured to **true**, the router instantiates the statistical counter to transmit and receive packets for the LAG facility MEP bindings. The **show eth-cfm collect-lmm-stats** command displays entities that have been enabled to collect transit and receive counters. When configured to **false**, the router does not instantiate the counter and the LMM PDU associated with the MEP does not populate the counters in the packet.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2023 Nokia.

description *string*

Synopsis	Text description
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* description *string*
Tree	description
String Length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-test

Synopsis	Enable the **eth-test** context
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test
Tree	eth-test
Description	Commands in this context configure information used by the Ethernet Test (ETH-TST) packet. The commands must be configured on both the sender and the receiver nodes. The test packets are used with the **oam eth-cfm eth-test** command.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

bit-error-threshold *number*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test bit-error-threshold *number*
Tree	bit-error-threshold
Range	0 to 11840
Units	bit errors
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

test-pattern

Synopsis	Enter the **test-pattern** context

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern
Tree	test-pattern
Description	Commands in this context specify the test pattern for the ETH-TST frames. The pattern does not have to be the same on the sender and the receiver.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

crc-tlv *boolean*

Synopsis	Generate a CRC checksum
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern crc-tlv *boolean*
Tree	crc-tlv
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pattern *keyword*

Synopsis	Test pattern for Ethernet Test frames
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern pattern *keyword*
Tree	pattern
Description	This command specifies the test pattern of the Ethernet Test (ETH-TST) frames. This does not have to be configured the same on the sender and the receiver.
Options	all-zeros, all-ones
Default	all-zeros
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

facility-fault *boolean*

Synopsis	Allow the facility MEP to generate a network action
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* facility-fault *boolean*
Tree	facility-fault

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the system facility MEP responds to a fault with a network-actionable function instead of just reporting the defect condition. When configured to **false**, the system monitors transmissions and reports fault conditions.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

grace

Synopsis	Enter the **grace** context
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace
Tree	grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function and the ITU-T Y.1731 Ethernet Expected Default (ETH-ED) function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-ed

Synopsis	Enter the **eth-ed** context
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed
Tree	eth-ed
Description	Commands in this context configure the ITU-T Y.1731 ETH-ED function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

max-rx-defect-window *number*

Synopsis	Maximum received ETH-ED expected defect window duration
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed max-rx-defect-window *number*
Tree	max-rx-defect-window
Range	1 to 86400
Units	seconds

© 2023 Nokia.

eth-vsm-grace

Synopsis	Enter the **eth-vsm-grace** context
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace
Tree	eth-vsm-grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-eth-vsm-grace *boolean*

Synopsis	Receive and process Nokia ETH-CFM Grace PDU on the MEP
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace rx-eth-vsm-grace *boolean*
Tree	rx-eth-vsm-grace
Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. When configured to **false**, the router disables the Nokia Grace function.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED).

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.

Default true

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lbm-svc-act-responder *boolean*

Synopsis Process service activation streams in ETH-CFM LBM

Context **configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* lbm-svc-act-responder *boolean*

Tree lbm-svc-act-responder

Description When configured to **true**, the router enables the MEP to process service activation streams encapsulated in ETH-CFM LBM frames that are directed to it.

When configured to **false**, this command reverts to MEP LBM standard processing.

There is interaction between this command and the **tools perform service id loopback eth** command. Nokia recommends that either the **lbm-svc act-responder** or the **tools perform service id loopback eth** command be used within a service. If both commands must be configured, and the target reflection point is the MAC Swap Loopback function, the inbound stream of data must not include ETH-CFM traffic that is equal to or lower than the domain level of any configured MEP that would otherwise extract and process the ETH-CFM message.

See "Promiscuous ETH-LBM mode of operation" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Services Overview Guide* for more information.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect *keyword*

Synopsis Lowest priority defect for fault alarm generation

Context **configure** router *string* interface *string* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*

Tree low-priority-defect

Description This command specifies the lowest priority defect that generates a fault alarm and also configures the fault state of the MEP that causes a network reaction.

Options all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon

Default mac-rem-err-xcon

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Description	This command specifies the unicast destination address to be associated with the IPv6 TWAMP Light measurement packet. Globally routable and Link Local addressing is supported.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source *string*

Synopsis	TWAMP Light measurement packets source IPv6 address
Context	**configure** router *string* interface *string* if-attribute delay dynamic twamp-light ipv6 source *string*
Tree	source
Description	This command specifies the unicast source address to be associated with the IPv6 TWAMP Light measurement packet. Globally routable and Link Local addressing is supported.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

static *number*

Synopsis	Unidirectional link delay static information
Context	**configure** router *string* interface *string* if-attribute delay static *number*
Tree	static
Description	This command configures the unidirectional link delay. By default there is no configured delay, and the link delay metric TLV is pruned in the IGP.
Range	1 to 16777214
Units	microseconds
Introduced	20.7.R1
Platforms	All

srlg-group [name] *reference*

Synopsis	Add a list entry for **srlg-group**
Context	**configure** router *string* interface *string* if-attribute srlg-group *reference*
Tree	srlg-group
Description	Commands in this context add a list entry for a Shared Risk Link Group (SRLG) that can be associated with an IP or MPLS interface to tag IP or MPLS interfaces that share a

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

specific outcome with the same identifier. For example, an SRLG group identifier could represent all links that use separate fibers but are carried in the same fiber conduit.

The name and identifier of each SRLG group must be configured locally on each router before the user configures the SRLG membership of an interface. A maximum of 1024 SRLGs can be configured per system. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to an interface.

See "Shared Risk Link Groups" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide* for more information about SRLGs.

Introduced	16.0.R1
Platforms	All

[**name**] *reference*

Synopsis	SRLG name
Context	**configure** router *string* interface *string* if-attribute srlg-group *reference*
Tree	srlg-group
Reference	**configure** routing-options if-attribute srlg-group *string*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

ingress

Synopsis	Enter the **ingress** context
Context	**configure** router *string* interface *string* ingress
Tree	ingress
Description	Commands in this context configure ingress network filter policies for the IP interface. If an ingress filter is not defined, the system performs no filtering.
Introduced	16.0.R1
Platforms	All

destination-class-lookup *boolean*

Synopsis	Enable BGP destination class lookup
Context	**configure** router *string* interface *string* ingress destination-class-lookup *boolean*
Tree	destination-class-lookup

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router performs a destination class lookup. This command is supported on FP3-based cards and later and is used in combination with the **destination-class** match criterion for an IP filter policy to filter egress traffic based on BGP destination classes. When configured to **false**, destination class lookup is not enabled.
Default	false
Introduced	20.7.R1
Platforms	All

filter

Synopsis	Enter the **filter** context
Context	**configure** router *string* interface *string* ingress filter
Tree	filter
Description	Commands in this context associate an IP filter policy with an IP interface. Filter policies control packet forwarding and dropping based on IP match criteria.
Introduced	16.0.R1
Platforms	All

ip *reference*

Synopsis	IPv4 filter policy name
Context	**configure** router *string* interface *string* ingress filter ip *reference*
Tree	ip

policy-accounting *reference*

Synopsis	Policy accounting template applied to the interface
Context	**configure** router *string* interface *string* ingress policy-accounting *reference*
Tree	policy-accounting
Reference	**configure** routing-options policy-accounting policy-acct-template *string*
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

ingress-stats *boolean*

Synopsis	Collect ingress statistics
Context	**configure** router *string* interface *string* ingress-stats *boolean*
Tree	ingress-stats
Description	When configured to **true**, the router configures the collection of IPv4 and IPv6 offered packets and octets. This only applies to IP statistics, not to uRPF statistics. Octet statistics for IPv4 and IPv6 bytes at IP interfaces include the Layer 2 frame overhead. When configured to **false**, the router does not collect the statistics.
Default	false
Introduced	16.0.R1
Platforms	All

ip-mtu *number*

Synopsis	Interface IP MTU
Context	**configure** router *string* interface *string* ip-mtu *number*
Tree	ip-mtu
Description	This command configures the IP maximum transmit unit (packet) for the associated router IP interface. The operational IP MTU used for the interface is based on the configured IP MTU and the port MTU of the port bound to this interface; that is, the operational MTU is set to the lesser of the values configured by this command and the port MTU value less the Ethernet header size. If the interface supports IPv6 packets, this command must be set to at least 1280, in accordance with RFC 2460 *Internet Protocol, Version 6 (IPv6) Specification*.
Range	512 to 9786

Introduced	22.7.R1
Platforms	VSR

strict-match *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	**configure** router *string* interface *string* ipsec ipsec-tunnel *string* security-policy strict-match *boolean*
Tree	strict-match
Description	When configured to **true**, this command enables strict match of the security policy entry. When a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry. If there is no match, the setup fails, and TS_UNACCEPTABLE is sent. If there is a match, but there is an existing CHILD_SA for the matched security policy, the setup fails, and NO_PROPOSAL_CHOSEN is sent. If there is a match, and there is not a CHILD_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD_SA is created.
Default	false
Introduced	22.7.R1
Platforms	VSR

ipv6-exception *reference*

Synopsis	IPv6 filter exception used to bypass encryption
Context	**configure** router *string* interface *string* ipsec ipv6-exception *reference*
Tree	ipv6-exception
Description	This command specifies the IPv6 filter exception for an IPsec-secured IPv6 interface. When an IPv6 filter exception is added, clear text packets that match the exception criteria in the IPv6 filter exception can ingress the interface, even when IPsec is enabled on the interface.

Default	100
Introduced	16.0.R1
Platforms	All

transmit-interval *number*

Synopsis	BFD transmit interval over this interface
Context	**configure** router *string* interface *string* ipv4 bfd transmit-interval *number*
Tree	transmit-interval
Description	This command configures the transmit intervals. On the 7750 SR, this command can only be configured to a value less than 100 when the **type** command is configured to **cpm-np**.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	16.0.R1
Platforms	All

type *keyword*

Synopsis	Local termination point for the BFD session
Context	**configure** router *string* interface *string* ipv4 bfd type *keyword*
Tree	type
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: • **auto** (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the **cpm-np**. • **cpm-np** – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems. • **fp** – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.
Options	cpm-np, auto, fp
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com/terms.

relay-plain-bootp *boolean*

Synopsis	Relay plain BOOTP messages
Context	**configure** router *string* interface *string* ipv4 dhcp relay-plain-bootp *boolean*
Tree	relay-plain-bootp
Description	When configured to **true**, the system relays plain BOOTP messages. When configured to **false**, the system considers the plain BOOTP packets as malformed DHCP packets; therefore, the system does not relay the messages.
Default	false
Introduced	16.0.R1
Platforms	All

release-include-gi-address *boolean*

Synopsis	Include gateway IP address in DHCP Release messages
Context	**configure** router *string* interface *string* ipv4 dhcp release-include-gi-address *boolean*
Tree	release-include-gi-address
Default	false
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server *string*

Synopsis	IP addresses for DHCP server requests
Context	**configure** router *string* interface *string* ipv4 dhcp server *string*
Tree	server
Description	This command configures a list of servers that this interface forwards requests to. The operator can enter the list of servers as either IP addresses or fully qualified domain names. The operator must specify at least one server specified for DHCP relay to work. If there are multiple servers, the system forwards the request to all the servers in the list.
Max. Instances	8
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

src-ip-addr *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	**configure** router *string* interface *string* ipv4 dhcp src-ip-addr *keyword*
Tree	src-ip-addr
Options	auto, gi-address
Default	auto
Introduced	16.0.R1
Platforms	All

trusted *boolean*

Synopsis	Relay untrusted packets
Context	**configure** router *string* interface *string* ipv4 dhcp trusted *boolean*
Tree	trusted
Description	When configured to **true**, the router enables the trusted mode on the interface. When enabled, the relay agent changes the existing GI address (of the request) to the ingress interface, and forwards the request. A DHCP request that contains a GI address of 0.0.0.0 and an Option 82 field in the packet is discarded unless it arrives on a trusted circuit. This behavior only applies if the Relay Agent Information Option action is to keep the existing information. When the Option 82 field is replaced by the relay agent, the original Option 82 information is lost, and there is no reason to enable the trusted option.
Default	false
Introduced	16.0.R1
Platforms	All

icmp

Synopsis	Enter the **icmp** context
Context	**configure** router *string* interface *string* ipv4 icmp
Tree	icmp
Description	Commands in this context configure Internet Control Message Protocol (ICMP) parameters on a network IP interface.
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mask-reply *boolean*

Synopsis	Allow responses to ICMP mask requests on the interface
Context	**configure** router *string* interface *string* ipv4 icmp mask-reply *boolean*
Tree	mask-reply
Default	true
Introduced	16.0.R1
Platforms	All

param-problem

Synopsis	Enter the **param-problem** context
Context	**configure** router *string* interface *string* ipv4 icmp param-problem
Tree	param-problem
Description	Commands in this context specify the settings for ICMP Parameter Problem messages generated by the interface.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of sent Parameter Problem messages
Context	**configure** router *string* interface *string* ipv4 icmp param-problem admin-state *keyword*

neighbor-discovery

Synopsis	Enter the **neighbor-discovery** context
Context	**configure** router *string* interface *string* ipv4 neighbor-discovery
Tree	neighbor-discovery
Introduced	16.0.R1
Platforms	All

learn-unsolicited *boolean*

Synopsis	Learn new entries from any received NA message
Context	**configure** router *string* interface *string* ipv4 neighbor-discovery learn-unsolicited *boolean*
Tree	learn-unsolicited
Description	When configured to **true**, the router can learn neighbor entries from received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited (S) flag set. The command can be enabled for global addresses, link-local addresses, or for both.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router follows standard behavior for learning neighbor entries.

- If an unsolicited NA (regardless of the S flag) is received from a neighbor that is not yet in the Neighbor Discovery (ND) cache, the NA is ignored.
- If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the STALE state.

Default false

Introduced 16.0.R1

Platforms All

limit

Synopsis Enter the **limit** context

Context **configure** router *string* interface *string* ipv4 neighbor-discovery limit

Tree limit

Description Commands in this context configure the maximum number of dynamic neighbor entries that can be learned on the interface

When the number of entries reaches the threshold (the configured percentage) of this limit, the system sends an SNMP trap.

When the limit is exceeded, the system learns no new entries until an entry expires and traffic to these destinations is dropped. Already learned entries are refreshed.

Introduced 16.0.R1

Platforms All

log-only *boolean*

Synopsis Generate log entries only if limit is reached

Context **configure** router *string* interface *string* ipv4 neighbor-discovery limit log-only *boolean*

Tree log-only

Default false

Introduced 16.0.R1

Platforms All

max-entries *number*

Synopsis Maximum number of entries learned on an IP interface

threshold *number*

Synopsis	Threshold value that triggers a warning message
Context	**configure** router *string* interface *string* ipv4 neighbor-discovery limit threshold *number*
Tree	threshold
Range	1 to 100
Units	percent
Default	90
Introduced	16.0.R1
Platforms	All

local-proxy-arp *boolean*

Synopsis	Enable local proxy ARP on interface
Context	**configure** router *string* interface *string* ipv4 neighbor-discovery local-proxy-arp *boolean*
Tree	local-proxy-arp
Description	When configured to **true**, the router enables local proxy ARP on the interface. When configured to **false**, the router does not respond to ARP requests for addresses on the same subnet.
Introduced	16.0.R1
Platforms	All

proactive-refresh *boolean*

Synopsis	Send a single refresh message before entry timeout
Context	**configure** router *string* interface *string* ipv4 neighbor-discovery proactive-refresh *boolean*
Tree	proactive-refresh
Description	When configured to **true**, the router always sends a refresh message 30 seconds before the timeout of the entry (a single refresh message with no retries).

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router marks an entry as stale 30 seconds before age-out, and the router only sends an ARP request to refresh the entry if the IOM receives traffic that uses it. Then, the IOM asks the ARP application to send a refresh message. With ARP proactive refresh enabled, the ARP module sends a refresh message regardless of the IOM receiving traffic.

Default	false
Introduced	16.0.R1
Platforms	All

proxy-arp-policy *reference*

Synopsis	Proxy ARP policy name
Context	**configure** router *string* interface *string* ipv4 neighbor-discovery proxy-arp-policy *reference*

Context	**configure** router *string* interface *string* ipv4 vrrp *number*
Tree	vrrp
Range	1 to 255
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** router *string* interface *string* ipv4 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated.

An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.

Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

authentication-key *string*

Synopsis	Password for simple text authentication
Context	**configure** router *string* interface *string* ipv4 vrrp *number* authentication-key *string*
Tree	authentication-key
Description	This command optionally assigns a simple text password authentication key to generate master VRRP advertisement messages and validate received VRRP advertisement messages. If this command is re-executed with a different password key defined, the new key immediately replaces the old key. This command may be executed at any time.
String Length	1 to 38
Introduced	16.0.R1
Platforms	All

backup *string*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** router *string* interface *string* ipv4 vrrp *number* backup *string*
Tree	backup
Description	This command associates virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instances create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is advertising to backup virtual routers receiving the messages. The specified *unicast-ipv4-address* must be equal to one of the existing IP addresses in the parental IP interface (primary or secondary) or this command fails.

See "Owner and non-owner VRRP" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about owner and non-owner virtual router instances.

Max. Instances	16
Introduced	16.0.R1
Platforms	All

bfd-liveness

Synopsis	Enable the **bfd-liveness** context
Context	**configure** router *string* interface *string* ipv4 vrrp *number* bfd-liveness
Tree	bfd-liveness
Description	Commands in this context assign a Bidirectional Forwarding Detection (BFD) session to a specific VRRP or SRRP instance. This BFD session provides a heartbeat mechanism that speeds up the transition of the standby VRRP router to an active state. If the associated BFD session fails, the VRRP routers immediately send a VRRP advertisement message. In addition, the standby VRRP routers transition to a master state to speed up convergence. The VRRP election process takes place based on the advertisement messages sent by all VRRP routers. Only one BFD session can be assigned to any VRRP or SRRP instance, but multiple SRRP or VRRP sessions can use the same BFD session.
Introduced	16.0.R1
Platforms	All

mac *string*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** router *string* interface *string* ipv4 vrrp *number* mac *string*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address. Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC. An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.
Introduced	16.0.R1
Platforms	All

master-int-inherit *boolean*

Synopsis	Allow master instance to dictate the master down timer
Context	**configure** router *string* interface *string* ipv4 vrrp *number* master-int-inherit *boolean*
Tree	master-int-inherit
Description	When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 16.0.R1

Platforms All

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

Context **configure** router *string* interface *string* ipv4 vrrp *number* message-interval *number*

Tree message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

The usage of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

monitor-oper-group *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	VRRP instance to follow a specified operational group
Context	**configure** router *string* interface *string* ipv4 vrrp *number* monitor-oper-group *reference*
Tree	monitor-oper-group
Description	This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router, the operational group is up and the operational group is down for all other VRRP states.
Reference	**configure** service oper-group *string*
Introduced	22.2.R1
Platforms	All

ntp-reply *boolean*

Synopsis	Allow processing of NTP requests
Context	**configure** router *string* interface *string* ipv4 vrrp *number* ntp-reply *boolean*
Tree	ntp-reply
Description	When configured to **true**, the router redirects NTP requests to the VRRP virtual IP address. This behavior only applies to the router acting as the master VRRP router. When configured to **false**, the router does not process NTP requests.
Default	false
Introduced	20.2.R1
Platforms	All

oper-group *reference*

Synopsis	Operational group name associated with the VRRP
Context	**configure** router *string* interface *string* ipv4 vrrp *number* oper-group *reference*
Tree	oper-group
Description	This command configures an operational group to associate with the VRRP. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

router (MR), the operational group is up. The operational group is down for all other VRRP states.

Reference	**configure** service oper-group *string*
Introduced	16.0.R1
Platforms	All

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** router *string* interface *string* ipv4 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1
Platforms	All

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** router *string* interface *string* ipv4 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down).

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.

Default false

Introduced 16.0.R1

Platforms All

ping-reply *boolean*

Synopsis Allow non-owner master to reply to ICMP echo requests

Context **configure** router *string* interface *string* ipv4 vrrp *number* ping-reply *boolean*

Tree ping-reply

Description When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address).

When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.

Default false

Introduced 16.0.R1

Platforms All

policy *reference*

Synopsis VRRP priority control policy

Context **configure** router *string* interface *string* ipv4 vrrp *number* policy *reference*

Tree policy

Description This command configures a VRRP priority control policy to associate with the virtual router instance.

VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis.

An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.

For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.

Reference **configure** vrrp policy *number*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

preempt *boolean*

Synopsis	Allow the VRRP to override an existing non-owner master
Context	**configure** router *string* interface *string* ipv4 vrrp *number* preempt *boolean*
Tree	preempt
Description	When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router. When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.
Default	true
Introduced	16.0.R1
Platforms	All

priority *number*

Synopsis	Base priority for the VRRP
Context	**configure** router *string* interface *string* ipv4 vrrp *number* priority *number*
Tree	priority
Description	This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process. The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

ssh-reply *boolean*

Synopsis	Allow the non-owner master to reply to SSH requests
Context	**configure** router *string* interface *string* ipv4 vrrp *number* ssh-reply *boolean*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ssh-reply
Description	When configured to **true**, the router allows the non-owner master to reply to SSH requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the SSH request. SSH cannot be disabled at the management security level (either on the parental IP interface or on the SSH source host address). When configure to **false**, SSH requests to non-owner master virtual IP addresses are silently discarded.
Default	false
Introduced	16.0.R1
Platforms	All

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** router *string* interface *string* ipv4 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	16.0.R1
Platforms	All

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** router *string* interface *string* ipv4 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** router *string* interface *string* ipv4 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	16.0.R1
Platforms	All

ipv6

Synopsis	Enable the **ipv6** context
Context	**configure** router *string* interface *string* ipv6
Tree	ipv6
Introduced	16.0.R1
Platforms	All

address [ipv6-address] *string*

Synopsis	Enter the **address** list instance
Context	**configure** router *string* interface *string* ipv6 address *string*
Tree	address
Description	Commands in this context assign an IPv6 address to the interface. A global IPv6 address and *prefix-length* combined create a locally configured interface IPv6 prefix and subnet. The defined global IP prefix must be unique within the context of a routing instance. It cannot overlap with any other existing global IP prefix defined on another IP interface within the same routing context. This overlap restriction is not applicable for IPv6 host addresses configured on loopback interfaces. For example, an IPv6 loopback host address configured on a loopback interface may overlap with another prefix subnet configured on another IP interface within the same routing context.
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

duplicate-address-detection *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Enable Duplicate Address Detection
Context	**configure** router *string* interface *string* ipv6 address *string* duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD). When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.
Default	true
Introduced	16.0.R1
Platforms	All

eui-64 *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Form IPv6 address from prefix and 64-bit interface ID
Context	**configure** router *string* interface *string* ipv6 address *string* eui-64 *boolean*
Tree	eui-64

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router forms a complete IPv6 address from the supplied prefix and 64-bit interface identifier. The 64-bit interface identifier is derived from the MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, use the base MAC address of the chassis.
Default	false
Introduced	16.0.R1
Platforms	All

prefix-length *number*

Synopsis	IPv6 address prefix length
Context	**configure** router *string* interface *string* ipv6 address *string* prefix-length *number*
Tree	prefix-length
Range	4 to 128
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

primary-preference *number*

Synopsis	Index assigned to the IPv6 address of the interface
Context	**configure** router *string* interface *string* ipv6 address *string* primary-preference *number*
Tree	primary-preference
Description	This command assigns a primary preference index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications that require a fixed address of the interface, such as LDP and Segment Routing. In cases where a fixed address is required when originating packets from the interface, the IPv6 address with the lowest primary preference index is selected. If the selected address is removed, the next IPv6 address with the next lowest primary preference index is selected. If this index is not specified for the IPv6 address, the system assigns the next available index value to the address. The address index space is unique across all addresses of a given interface.

type *keyword*

Synopsis	Local termination point for the BFD session
Context	**configure** router *string* interface *string* ipv6 bfd type *keyword*
Tree	type
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: • **auto** (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the **cpm-np**. • **cpm-np** – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems. • **fp** – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.
Options	cpm-np, auto, fp
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

duplicate-address-detection *boolean*

Synopsis	Enable Duplicate Address Detection
Context	**configure** router *string* interface *string* ipv6 duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD) on the interface. When configured to **false**, the router disables DAD on a per-interface basis. This prevents the router from performing a DAD check on the interface. All IPv6 addresses on an interface with DAD disabled, immediately enter a preferred state, without checking for uniqueness on the interface. This is useful for interfaces that enter a looped state during troubleshooting and are operationally disabled when the loop is detected, requiring manual intervention to clear the DAD violation.

Use subject to Terms available at: www.nokia.com/terms.

Default	true
Introduced	16.0.R1
Platforms	All

forward-ipv4-packets *boolean*

Synopsis	Forward unencapsulated IPv4 packets
Context	**configure** router *string* interface *string* ipv6 forward-ipv4-packets *boolean*
Tree	forward-ipv4-packets
Description	When configured to **true**, the router can use an IPv6-only interface, with no configured IPv4 addresses, to forward IPv4 packets that originate or terminate locally. The interface reports that its IPv4 operational state is up if its IPv6 operational state is up. Not all protocols observe the interface as up from an IPv4 perspective. This command mostly supports BGP routing use cases; see RFC 5549 for details. When configured to **false**, the router prevents IPv4 packets from being forwarded if there are no configured IPv4 subnets.
Default	false
Introduced	19.5.R1
Platforms	All

link-local-address

Synopsis	Enter the **link-local-address** context
Context	**configure** router *string* interface *string* ipv6 link-local-address
Tree	link-local-address
Description	Commands in this context configure the IPv6 link-local address that is used as a virtual SRRP IPv6 address by the master SRRP node. This address is sent in the Router Advertisements initiated by the master SRRP node. Clients use this address as IPv6 default-gateway. Both SRRP nodes, master and backup, must be configured with the same link-local address. Only one link-local address is allowed per interface. **Caution**: Removing a manually configured link-local address may impact routing protocols or static routes that have a dependency on that address. Nokia does not recommend removing a link-local address when there are active IPv6 subscriber hosts on an IES or VPRN interface.
Introduced	16.0.R1
Platforms	All

address *string*

Synopsis	IPv6 link-local address
Context	**configure** router *string* interface *string* ipv6 link-local-address address *string*
Tree	address
Introduced	16.0.R1

duplicate-address-detection *boolean*

Synopsis	Enable Duplicate Address Detection
Context	**configure** router *string* interface *string* ipv6 link-local-address duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD) on the interface. When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.
Default	true
Introduced	16.0.R1
Platforms	All

local-dhcp-server *reference*

Synopsis	DHCP server for the interface
Context	**configure** router *string* interface *string* ipv6 local-dhcp-server *reference*
Tree	local-dhcp-server
Description	This command instantiates a local DHCP server. A local DHCP server can serve multiple interfaces but is limited to the routing context in which it was created.
Reference	**configure** router *string* dhcp-server dhcpv6 *string*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

neighbor-discovery

Synopsis	Enter the **neighbor-discovery** context
Context	**configure** router *string* interface *string* ipv6 neighbor-discovery
Tree	neighbor-discovery
Introduced	16.0.R1
Platforms	All

learn-unsolicited *keyword*

Synopsis	Type of entries learned from unsolicited NA messages

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* interface *string* ipv6 neighbor-discovery learn-unsolicited *keyword*
Tree	learn-unsolicited
Description	This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited flag set. When unconfigured, the router follows standard RFC 4861 behavior for learning of neighbor entries. The neighbor is put in the stale state. This is the standard RFC behavior.
Options	global, link-local, both
Introduced	16.0.R1
Platforms	All

limit

Synopsis	Enter the **limit** context
Context	**configure** router *string* interface *string* ipv6 neighbor-discovery limit
Tree	limit
Description	Commands in this context configure the maximum amount of dynamic IPv6 neighbor entries that can be learned on an IP interface. When the number of dynamic neighbor entries reaches the configured percentage of this limit the system sends an SNMP trap. When the limit is exceeded, no new entries are learned until an entry expires and traffic to these destinations is dropped. Entries that have already been learned are refreshed.
Introduced	16.0.R1
Platforms	All

log-only *boolean*

Synopsis	Generate log entries when limit is reached
Context	**configure** router *string* interface *string* ipv6 neighbor-discovery limit log-only *boolean*
Tree	log-only
Description	When configured to **true**, the router sends the warning message at the specified threshold percentage or upon exceeding the specified limit. Entries that exceed the limit are learned. When configured to **false**, the router does not send the warning message.
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-entries *number*

Synopsis	Maximum number of entries learned on an IP interface
Context	**configure** router *string* interface *string* ipv6 neighbor-discovery limit max-entries *number*
Tree	max-entries
Description	This command configures the maximum number of entries that can be learned on an IP interface. When unconfigured, no maximum limit is imposed.
Range	0 to 102400
Introduced	16.0.R1
Platforms	All

threshold *number*

Synopsis	Threshold percentage that triggers a warning message

Platforms	All

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** router *string* interface *string* ipv6 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.

Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

backup *string*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** router *string* interface *string* ipv6 vrrp *number* backup *string*
Tree	backup
Description	This command associates router IPv6 virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instance create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance. For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. The specified IPv6 address must be equal to one of the existing parental IP addresses in the parental IP interface (primary or secondary) or this command fails. See "Owner and non-owner VRRP" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about owner and non-owner virtual router instances.
Max. Instances	4
Introduced	16.0.R1
Platforms	All

bfd-liveness

Synopsis	Enable the **bfd-liveness** context
Context	**configure** router *string* interface *string* ipv6 vrrp *number* bfd-liveness
Tree	bfd-liveness

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context assign a bidirectional forwarding detect (BFD) session to a specific VRRP or SRRP instance. This BFD session provides a heartbeat mechanism for use in speeding up the transition of the standby VRRP router to an active state. If the associated BFD session fails, the VRRP routers immediately send a VRRP Advertisement message. In addition, the standby VRRP routers transition to a Master state to speed convergence. The normal VRRP election process takes place based on the Advertisement messages sent by all VRRP routers. There can be only one BFD session assigned to any specific VRRP or SRRP instance, but there can be multiple SRRP or VRRP sessions using the same BFD session.
Introduced	16.0.R1

mac *string*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** router *string* interface *string* ipv6 vrrp *number* mac *string*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC.

An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.

Introduced 16.0.R1

Platforms All

master-int-inherit *boolean*

Synopsis Allow master instance to dictate the master down timer

Context **configure** router *string* interface *string* ipv6 vrrp *number* master-int-inherit *boolean*

Tree master-int-inherit

Description When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 16.0.R1

Platforms All

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

Context **configure** router *string* interface *string* ipv6 vrrp *number* message-interval *number*

Tree message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

The use of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as the master.

- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

Range	10 to 4095
Units	centiseconds

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** router *string* interface *string* ipv6 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** router *string* interface *string* ipv6 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down). When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.
Default	false
Introduced	16.0.R1
Platforms	All

ping-reply *boolean*

Synopsis	Allow non-owner master to reply to ICMP echo requests
Context	**configure** router *string* interface *string* ipv6 vrrp *number* ping-reply *boolean*
Tree	ping-reply
Description	When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address). When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.
Default	false
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policy *reference*

Synopsis	VRRP priority control policy
Context	**configure** router *string* interface *string* ipv6 vrrp *number* policy *reference*
Tree	policy
Description	This command configures a VRRP priority control policy to associate with the virtual router instance. VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis. An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value. For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.
Reference	**configure** vrrp policy *number*
Introduced	16.0.R1
Platforms	All

preempt *boolean*

Synopsis	Allow the VRRP to override an existing non-owner master
Context	**configure** router *string* interface *string* ipv6 vrrp *number* preempt *boolean*
Tree	preempt
Description	When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router. When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.
Default	true
Introduced	16.0.R1
Platforms	All

priority *number*

Synopsis	Base priority for the VRRP
Context	**configure** router *string* interface *string* ipv6 vrrp *number* priority *number*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	priority
Description	This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process. The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** router *string* interface *string* ipv6 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	16.0.R1
Platforms	All

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** router *string* interface *string* ipv6 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	16.0.R1
Platforms	All

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** router *string* interface *string* ipv6 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	16.0.R1
Platforms	All

lag

Synopsis	Enter the **lag** context
Context	**configure** router *string* interface *string* lag
Tree	lag
Introduced	16.0.R1
Platforms	All

link-map-profile *number*

Synopsis	LAG link map profile for a SAP or network interface
Context	**configure** router *string* interface *string* lag link-map-profile *number*
Tree	link-map-profile
Description	This command assigns a preconfigured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. After an operator assigns a LAG link map profile, the system rehashes the SAP or network interface egress traffic over the LAG as required by the new configuration. If the LAG link map profile for a SAP or network interface is deleted, the system reverts back to per-flow hashing.
Range	1 to 64
Introduced	16.0.R1
Platforms	All

per-link-hash

Synopsis	Enter the **per-link-hash** context
Context	**configure** router *string* interface *string* lag per-link-hash
Tree	per-link-hash
Introduced	16.0.R1
Platforms	All

class *number*

Synopsis	Class used on LAG egress using weighted per-link-hash
Context	**configure** router *string* interface *string* lag per-link-hash class *number*
Tree	class
Range	1 to 3
Default	1
Introduced	16.0.R1
Platforms	All

weight *number*

Synopsis	Weight used on LAG egress using weighted per-link-hash
Context	**configure** router *string* interface *string* lag per-link-hash weight *number*
Tree	weight
Range	1 to 1024
Default	1
Introduced	16.0.R1
Platforms	All

ldp-sync-timer

Synopsis	Enter the **ldp-sync-timer** context
Context	**configure** router *string* interface *string* ldp-sync-timer
Tree	ldp-sync-timer
Description	Commands in this context set associated parameters for the synchronization of an IGP and LDP.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

end-of-lib *boolean*

Synopsis	Terminate LDP synchronization timer
Context	**configure** router *string* interface *string* ldp-sync-timer end-of-lib *boolean*
Tree	end-of-lib
Description	This command configures the system to terminate the LDP synchronization timer early for a specific session to an LDP peer, if the IGP interface receives LDP End-of-LIB Typed Wildcard FEC messages for every FEC type negotiated.
Default	false
Introduced	16.0.R1
Platforms	All

seconds *number*

Synopsis	Time interval for the LDP synchronization timer
Context	**configure** router *string* interface *string* ldp-sync-timer seconds *number*
Tree	seconds
Range	1 to 1800
Introduced	16.0.R1
Platforms	All

load-balancing

Synopsis	Enter the **load-balancing** context
Context	**configure** router *string* interface *string* load-balancing
Tree	load-balancing
Description	Commands in this context configure interface per-flow load-balancing options that apply to traffic that enters this interface and that egresses over a LAG or ECMP. This is a per-interface setting. Load-balancing options enabled on the interface level overwrite options that can also be enabled on the system level.
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

flow-label-load-balancing *boolean*

Synopsis	Enable flow label load balancing
Context	**configure** router *string* interface *string* load-balancing flow-label-load-balancing *boolean*
Tree	flow-label-load-balancing
Description	When configured to **true**, the router enables load balancing in ECMP and LAG based on the output of a hash performed on the triplet (SA, DA, flow label) in the header of an IPv6 packet received on an IES, VPRN, R-VPLS, CSC, or network interface. When configured to **false**, the router disables load balancing in ECMP and LAG.
Default	false
Introduced	21.5.R1
Platforms	All

ip-load-balancing *keyword*

Synopsis	IP load-balancing algorithm
Context	**configure** router *string* interface *string* load-balancing ip-load-balancing *keyword*
Tree	ip-load-balancing
Description	This command specifies whether to include the source address, destination address, or both in LAG or ECMP hash on IP interfaces. Additionally, when the **l4-load-balancing** command is enabled, this command also includes the source or destination port in the hash inputs.
Options	both, destination, source, inner-ip
Default	both
Introduced	16.0.R3
Platforms	All

lsr-load-balancing *keyword*

Synopsis	LSR load-balancing algorithm
Context	**configure** router *string* interface *string* load-balancing lsr-load-balancing *keyword*
Tree	lsr-load-balancing
Description	This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per-interface setting.
Options	lbl-only, lbl-ip, ip-only, eth-encap-ip, lbl-ip-l4-teid
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

spi-load-balancing *boolean*

Synopsis	Enable SPI use in hashing
Context	**configure** router *string* interface *string* load-balancing spi-load-balancing *boolean*
Tree	spi-load-balancing
Description	When configured to **true**, the router uses the Security Parameter Index (SPI) in hashing for ESP and AH encrypted IPv4 and IPv6 traffic. This is a per-interface setting.
Default	false
Introduced	16.0.R1
Platforms	All

teid-load-balancing *boolean*

Synopsis	Enable use of TEID in hashing
Context	**configure** router *string* interface *string* load-balancing teid-load-balancing *boolean*
Tree	teid-load-balancing
Default	false
Introduced	16.0.R1
Platforms	All

loopback

Synopsis	Use interface as a loopback interface
Context	**configure** router *string* interface *string* loopback
Tree	loopback
Description	When configured, this interface is used as a loopback interface. This command and the **vas-if-type** command are mutually exclusive.
Notes	The following elements are part of a choice: **loopback** or **port**.
Introduced	16.0.R1
Platforms	All

mac *string*

Synopsis	MAC address of the interface
Context	**configure** router *string* interface *string* mac *string*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	mac
Description	This command assigns a specific MAC address to an IP interface. Only one MAC address can be assigned to an IP interface. When multiple **mac** commands are entered, the last command overwrites the previous command.
Introduced	16.0.R1
Platforms	All

mac-accounting *boolean*

Synopsis	Enable MAC accounting functionality
Context	**configure** router *string* interface *string* mac-accounting *boolean*
Tree	mac-accounting
Description	When configured to **true**, the router enables MAC accounting functionality.
Default	false
Introduced	16.0.R1
Platforms	All

network-domains

Synopsis	Enter the **network-domains** context
Context	**configure** router *string* interface *string* network-domains
Tree	network-domains
Introduced	16.0.R4
Platforms	All

network-domain [domain-name] *reference*

Synopsis	Add a list entry for **network-domain**
Context	**configure** router *string* interface *string* network-domains network-domain *reference*
Tree	network-domain
Description	Commands in this context assign an interface to a network domain. The router then takes the network domain into account during SAP ingress queue allocation for VPLS SAP. The network domain association can only be done in the base routing context. An operator can associate a network domain with an interface without a physical port being specified, but the configuration has no effect until a corresponding port, or LAG, is defined.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	Single interfaces can be associated with multiple network domains.
Max. Instances	5
Introduced	16.0.R4
Platforms	All

[**domain-name**] *reference*

Synopsis	Network domain name
Context	**configure** router *string* interface *string* network-domains network-domain *reference*
Tree	network-domain
Reference	**configure** router *string* network-domains network-domain *string*
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

port *(port-and-encap | keyword)*

Synopsis	Port to bind to this interface
Context	**configure** router *string* interface *string* port *(port-and-encap | keyword)*
Tree	port
Description	This command creates an association between a logical IP interface and a physical port. An operator can also associate an interface with the system (loopback address).
String Length	1 to 45
Options	system
Notes	The following elements are part of a choice: **loopback** or **port**.
Introduced	16.0.R1
Platforms	All

ptp-hw-assist

Synopsis	Enter the **ptp-hw-assist** context
Context	**configure** router *string* interface *string* ptp-hw-assist
Tree	ptp-hw-assist
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the PTP time stamping assist
Context	**configure** router *string* interface *string* ptp-hw-assist admin-state *keyword*
Tree	admin-state
Description	This command controls the administrative state of port-based time stamping assist of PTP packets at the physical interface.This capability is supported on specific hardware. The command may be blocked if not all hardware has the required level of support. Only one interface per physical port can have ptp-hw-assist enabled. This feature cannot be enabled if the physical port supporting the interface is configured as a PTP port.
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

qos

Synopsis	Enter the **qos** context
Context	**configure** router *string* interface *string* qos
Tree	qos
Description	Commands in this context associate a network QoS policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.
Introduced	16.0.R1
Platforms	All

egress-instance *number*

Synopsis	Port egress queue group instance for this interface
Context	**configure** router *string* interface *string* qos egress-instance *number*
Tree	egress-instance
Description	This command specifies which instance to associate with this specific network IP interface since multiple instances of the same egress queue-group can be applied to the same port.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	1 to 65535
Introduced	16.0.R1
Platforms	All

egress-port-redirect-group *reference*

Synopsis	QoS queue group name
Context	**configure** router *string* interface *string* qos egress-port-redirect-group *reference*
Tree	egress-port-redirect-group
Description	This command configures the egress queue group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified queue group name must exist as an egress queue group applied to the egress context of the port associated with the IP interface.
Reference	**configure** qos queue-group-templates egress queue-group *string*
Introduced	16.0.R1
Platforms	All

ingress-fp-redirect-group *reference*

Synopsis	Forwarding plane queue group policy for the interface
Context	**configure** router *string* interface *string* qos ingress-fp-redirect-group *reference*
Tree	ingress-fp-redirect-group
Description	This command configures the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified queue group name must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.
Reference	**configure** qos queue-group-templates ingress queue-group *string*
Introduced	16.0.R1
Platforms	All

ingress-instance *number*

Synopsis	Forwarding plane ingress queue group for this interface
Context	**configure** router *string* interface *string* qos ingress-instance *number*
Tree	ingress-instance

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures which instance to associate with this specific network IP interface. An operator can apply multiple instances of the same ingress queue group to the same forwarding plane.
Range	1 to 65535
Introduced	16.0.R1
Platforms	All

network-policy *reference*

Synopsis	Network policy name associated with a network interface
Context	**configure** router *string* interface *string* qos network-policy *reference*
Tree	network-policy
Description	This command associates an existing network policy name with the IP interface.
Reference	**configure** qos network *string*
Introduced	16.0.R1
Platforms	All

strip-label *boolean*

Synopsis	Strip all MPLS labels before PBR processing
Context	**configure** router *string* interface *string* strip-label *boolean*
Tree	strip-label
Description	When configured to **true**, the router forces packets to be stripped of all (maximum 5) MPLS labels before the packets are handed over for possible filter (PBR) processing. This command is supported on: • optical ports for the 7750 SR and 7450 ESS • IOM3 XP cards for the 7750 SR and 7450 ESS • null/dot1q encaps • network ports • IPv4 • IPv6
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tos-marking-state *keyword*

Synopsis	TOS marking state
Context	**configure** router *string* interface *string* tos-marking-state *keyword*
Tree	tos-marking-state
Description	This command configures the ToS marking state. This command is used to alter the default trusted state to a non-trusted state. When configured to **trusted** or default, the ToS field is not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interfaces as untrusted. When configured to **untrusted**, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking defintions on each network interface.
Options	trusted, untrusted
Default	trusted
Introduced	16.0.R1
Platforms	All

untrusted

Synopsis	Enable the **untrusted** context
Context	**configure** router *string* interface *string* untrusted
Tree	untrusted
Description	Commands in this context configure the untrusted state for a network IP interface. The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature. The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface.
Introduced	16.0.R4
Platforms	All

default-forwarding *keyword*

Synopsis	Default action for selective ILM
Context	**configure** router *string* interface *string* untrusted default-forwarding *keyword*
Tree	default-forwarding

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description This command specifies the default forwarding behavior of labeled packets received on this interface.

This command sets the default behavior for an untrusted interface in the datapath and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding away from the default for those VPRN ILMs.

When the default behavior is to forward packets, the router checks labeled packets in the normal way against the table of programmed ILMs to decide if packets are dropped or forwarded in a GRT, a VRF, or a L2 service context.

When the specified behavior is to drop packets, all labeled packets received on the interface are automatically dropped.

Options forward, drop

Default forward

Introduced 16.0.R4

Platforms All

urpf-selected-vprns *boolean*

Synopsis Enable uRPF checking of incoming traffic on interface

Context **configure** router *string* interface *string* urpf-selected-vprns *boolean*

Tree urpf-selected-vprns

Description When configured to **true**, the router performs uRPF checks of incoming traffic on the network interface for the following:

- Packets associated with the global routing table (base router) context
- Packets associated with VPRNs that have enabled the uRPF check using the **configure service vprn network ingress urpf-check** command

When configured to **false**, the router performs uRPF checks for all ingress traffic on the network interface (associated with the base router and all VPRNs) based on the IPv4 and IPv6 **urpf-check** command configuration options of the network interface.

Default false

Introduced 16.0.R1

Platforms All

vas-if-type *keyword*

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** router *string* isis *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS. If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied. Routing policies are created in the **configure router policy-options** context.
Reference	**configure** policy-options policy-statement *string*
Max. Instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R1

Introduced	20.7.R1
Platforms	All

advertise *reference*

Synopsis	Flexible Algorithm Definition advertisement
Context	**configure** router *string* isis *number* flexible-algorithms flex-algo *number* advertise *reference*
Tree	advertise
Description	This command enables the advertisement of a locally configured Flexible Algorithm Definition (FAD). The winning FAD that a router uses must be consistent with the winning FAD on all other routers, which avoids routing loops and traffic blackholing. The winning FAD is selected using a tiebreaker algorithm that first selects the highest advertised FAD priority followed by the highest system ID.
Reference	**configure** routing-options flexible-algorithm-definitions flex-algo *string*
Introduced	20.7.R1
Platforms	All

allow-sr-over-srte *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable SR over SR-TE LSPs
Context	**configure** router *string* isis *number* igp-shortcut allow-sr-over-srte *boolean*
Tree	allow-sr-over-srte

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router only allows SR-MPLS SRv4 and SRv6 IGP shortcuts to use SR-TE LSPs with **allow-sr-over-srte** explicitly enabled with an adjacency SID as top SID in the SR-TE LSP. IPv4 and IPv6 addresses can use all available SR-TE LSPs as IGP shortcuts regardless of the explicit **allow-sr-over-srte** configuration. Under ECMP, when this command is configured to **true**, preference is given to the SR-TE LSPs with **allow-sr-over-srte** explicitly configured over the LSPs that do not have **allow-sr-over-srte** configured.
Default	false
Introduced	23.3.R1
Platforms	All

multi-homed-prefix

Synopsis Enable the **multi-homed-prefix** context

Context **configure** router *string* isis *number* loopfree-alternate multi-homed-prefix

Tree multi-homed-prefix

Description Commands in this context enable multihomed prefix LFA for IS-IS routes (IP FRR), SR-ISIS tunnels, and SRv6-ISIS tunnels.

This feature uses the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes.

This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of intra-area anycast prefixes.

The computed IP next hop-based backup path is added to IS-IS routes of external /32 prefixes or /128 prefixes and intra-area /32 or /128 anycast prefixes in the RTM if the prefix is not protected by the base LFA or if the user set leaf preference command option is configured to all. The user must enable the **configure routing-options ip-fast-reroute** command to have these backup paths programmed into the FIB in the datapath.

The computed IP next hop or repair tunnel-based backup path is also programmed for:

- SR-ISIS node SID tunnels of external /32 IPv4 prefixes and /128 IPv6 prefixes, and node SID tunnels of intra-area /32 IPv4 anycast prefixes and /128 anycast IPv6 prefixes, in both algorithm 0 and flexible-algorithms
- SRv6-ISIS locator routes and tunnels of external prefixes and of intra-area anycast prefixes of any size, in both algorithm 0 and flexible algorithm numbers.

As a result, an SR-TE LSP, an SR-MPLS policy, or an SRv6 policy which uses an SR-ISIS SID or an SRv6-ISIS SID of those same prefixes in its configured or computed SID list benefits from the multihomed prefix LFA protection.

Once the IP next-hop based multihomed prefix LFA is enabled, the extensions to compute an SR-TE repair tunnel for the multihomed prefix LFA in the case of SR-ISIS and SRv6-ISIS are automatically enabled if the user also enabled TI-LFA or Remote LFA. The computation reuses the SID list of the primary path or of the TI-LFA or Remote LFA backup path of the alternate ABR or ASBR or alternate owner router.

overload-fib-error-notify-only

Synopsis	Enable the **overload-fib-error-notify-only** context
Context	**configure** router *string* isis *number* overload-fib-error-notify-only
Tree	overload-fib-error-notify-only
Description	Commands in this context configure the IS-IS router to send a notification when an overload condition occurs while programming the FIB, instead of advertising the overload condition of the router in the IS-IS LSP. **Note**: Nokia recommends being careful using this command. When you configure the router not to advertise the IS-IS overload state in the IS-IS LSP, other routers are not instructed to take the overloaded router out of the IS-IS forwarding topology and this will cause suboptimal forwarding and non-deterministic behavior on the overloaded router. To avoid changing the default IS-IS overflow behavior, leave this command disabled. When this command is configured, the IS-IS router enters a suboptimal state where it sends only a notification trap; transit traffic can still use the router in this state.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The IS-IS router tracks the segment routing prefix SIDs where FIB programming failed. With the **retry** command configured, the router retries programming the segment routing prefix SIDs in the FIB using this tracked information.

When this command is not configured, during normal operation, the system may force the router to enter an overload state because of a lack of FIB resources. In this state, the router is used to terminate traffic and is not used to transit traffic.

Introduced 23.7.R1

Platforms All

retry *number*

Synopsis Time to retry programming failed entries in the FIB

Context **configure** router *string* isis *number* overload-fib-error-notify-only retry *number*

Tree retry

Description This command configures the time the router uses to retry programming the failed entries in the FIB.

The **overload-fib-error-notify-only** command must be configured to use the retry timer. The removal of the **overload-fib-error-notify-only** configuration causes the system to program the failed entries in the FIB by triggering an immediate SPF.

Range 10 to 1800

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time
Context	**configure** router *string* isis *number* segment-routing adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.

- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

tunnel-table-pref *number*

Synopsis	Preference of SR tunnels created by the IGP instance
Context	**configure** router *string* isis *number* segment-routing tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available. The segment routing module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs. The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**). The global default TTM preference for the tunnel types is as follows: • ROUTE_PREF_RSVP 7 • ROUTE_PREF_SR_TE 8 • ROUTE_PREF_LDP 9 • ROUTE_PREF_OSPF_TTM 10 • ROUTE_PREF_ISIS_TTM 11 • ROUTE_PREF_BGP_TTM 12 • ROUTE_PREF_GRE 255 The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on lowest IGP instance-id. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time
Context	**configure** router *string* isis *number* segment-routing-v6 adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command specifies the length of time the system holds the SRv6 adjacency route and tunnel entries programmed in datapath while the adjacency is down.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its SRv6 End.X SID sub-TLV
- The adjacency SID hold timer starts.
- The route table, FIB, and tunnel table entries are kept for as long as the adjacency SID hold timer is running. This is allows packets to flow over the LFA backup path, if the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of a SRv6 policy after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change when a new LFA SPF is run while the adjacency SID hold timer is running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the SID value returned into the locator subnet where it was drawn from. Users of the adjacency (for example, SRv6 policy) are also

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

informed. When the adjacency is subsequently restored, it gets assigned its allocated static SID value or a new dynamic SID value.

- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by tunnel of the local adjacency SID and of all remote locator routes that resolve to a next hop over this adjacency.

Each IS-IS instance runs a single timer per adjacency that IPv4 SR-MPLS, IPv6 SR-MPLS, and SRv6 adjacency SIDs share. When you enable both SR-MPLS (**configure router isis segment-routing**) and SRv6 (**configure router isis segment-routing-v6**) in the IS-IS instance, the system programs the higher of the two timer values for all SIDs on the adjacency.

Context	**configure** router *string* isis *number* segment-routing-v6 locator *reference* level *keyword* metric *number*
Tree	metric
Range	1 to 16777215
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

level-capability *keyword*

Synopsis	IS-IS routing level capability
Context	**configure** router *string* isis *number* segment-routing-v6 locator *reference* level-capability *keyword*
Tree	level-capability
Description	This command configures the routing level capability for an instance of the IS-IS routing process. The level capability configured on the instance must match the level capability on the interface to form an adjacency.
Options	1, 2, 1/2
Default	1/2
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

multi-topology

Synopsis	Enter the **multi-topology** context
Context	**configure** router *string* isis *number* segment-routing-v6 locator *reference* multi-topology
Tree	multi-topology
Description	Commands in this context enable the use of a local SRv6 locator in an IS-IS IPv6 topology. A user can enable one or more locators in an IS-IS instance. Each locator can be enabled in a single topology of an IS-IS instance, topology 0 (MT0) or topology 2 (MT2). A local locator can be used in multiple IS-IS instances, but can only be assigned to at most one IPv6 topology independently within each IS-IS instance. Use the **configure router isis segment-routing-v6 admin-state** command to enable the processing of local and remote IPv6 prefixes and SRv6 locators in MT0 and MT2. In addition, to enable SRv6 forwarding in the MT0, MT2, or both topologies, set the **configure router isis ipv6-routing** command to **native**, the **configure router isis multi-topology ipv6-unicast** command to **true**, or both.
Introduced	22.5.R1

group [tunnel-group-name] *string*

Synopsis	Enter the **group** list instance
Context	**configure** router *string* l2tp group *string*
Tree	group
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**tunnel-group-name**] *string*

Synopsis	Tunnel group name
Context	**configure** router *string* l2tp group *string*
Tree	group
String Length	1 to 63
Notes	This element is part of a list key.

© 2023 Nokia.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the L2TP tunnel group
Context	**configure** router *string* l2tp group *string* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

avp-hiding *keyword*

Synopsis	The AVP hiding algorithm
Context	**configure** router *string* l2tp group *string* avp-hiding *keyword*
Tree	avp-hiding
Options	never, sensitive, always
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

challenge *keyword*

Synopsis	Enable use of challenge-response authentication
Context	**configure** router *string* l2tp group *string* challenge *keyword*
Tree	challenge
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *string*

Synopsis	Text description
Context	**configure** router *string* l2tp group *string* description *string*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	description
String Length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

destruct-timeout *number*

Synopsis	Destruction timeout
Context	**configure** router *string* l2tp group *string* destruct-timeout *number*
Tree	destruct-timeout
Range	60 to 86400
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ethernet-tunnel

Synopsis	Enter the **ethernet-tunnel** context
Context	**configure** router *string* l2tp group *string* ethernet-tunnel
Tree	ethernet-tunnel
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

reconnect-timeout *(number | keyword)*

Synopsis	Timeout for a session setup retry at group level
Context	**configure** router *string* l2tp group *string* ethernet-tunnel reconnect-timeout *(number | keyword)*
Tree	reconnect-timeout
Range	10 to 3600
Units	seconds
Options	infinite
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.

failover

Synopsis	Enter the **failover** context
Context	**configure** router *string* l2tp group *string* failover
Tree	failover
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-method *keyword*

Synopsis	Recovery method of the sequence numbers after failover
Context	**configure** router *string* l2tp group *string* failover recovery-method *keyword*
Tree	recovery-method
Options	mcs, recovery-tunnel
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-time *number*

Synopsis	Time requested from the L2TP peer before assuming failover as failed
Context	**configure** router *string* l2tp group *string* failover recovery-time *number*
Tree	recovery-time
Range	0 to 900
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hello-interval *(number | keyword)*

Synopsis	Hello interval
Context	**configure** router *string* l2tp group *string* hello-interval *(number | keyword)*
Tree	hello-interval
Range	10 to 3600
Units	seconds
Options	infinite
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

idle-timeout *(number | keyword)*

Synopsis	Idle timeout
Context	**configure** router *string* l2tp group *string* idle-timeout *(number | keyword)*
Tree	idle-timeout
Range	0 to 3600
Units	seconds
Options	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tpv3

Synopsis	Enter the **l2tpv3** context
Context	**configure** router *string* l2tp group *string* l2tpv3
Tree	l2tpv3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cookie-length *(number | keyword)*

Synopsis	Cookie field length
Context	**configure** router *string* l2tp group *string* l2tpv3 cookie-length *(number | keyword)*
Tree	cookie-length
Range	4 | 8
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

digest-type *keyword*

Synopsis	Hashing algorithm that calculates the message digest
Context	**configure** router *string* l2tp group *string* l2tpv3 digest-type *keyword*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	digest-type
Options	none, md5, sha1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nonce-length *number*

Synopsis	Length for the local L2TPv3 nonce (random number)
Context	**configure** router *string* l2tp group *string* l2tpv3 nonce-length *number*
Tree	nonce-length
Range	0 | 16 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *string*

Synopsis	L2TPv3 password
Context	**configure** router *string* l2tp group *string* l2tpv3 password *string*
Tree	password
String Length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

private-tcp-mss-adjust *(number | keyword)*

Synopsis	TCP maximum segment size (MSS) on private network
Context	**configure** router *string* l2tp group *string* l2tpv3 private-tcp-mss-adjust *(number | keyword)*
Tree	private-tcp-mss-adjust
Range	512 to 9000
Units	octets
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.

public-tcp-mss-adjust *(number | keyword)*

Synopsis	TCP Maximum Segment Size (MSS) on public network
Context	**configure** router *string* l2tp group *string* l2tpv3 public-tcp-mss-adjust *(number | keyword)*
Tree	public-tcp-mss-adjust
Range	512 to 9000
Units	octets
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pw-cap-list

Synopsis	Enter the **pw-cap-list** context
Context	**configure** router *string* l2tp group *string* l2tpv3 pw-cap-list
Tree	pw-cap-list
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ethernet *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Advertise Ethernet pseudowire type
Context	**configure** router *string* l2tp group *string* l2tpv3 pw-cap-list ethernet *boolean*
Tree	ethernet
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ethernet-vlan *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Advertise Ethernet VLAN pseudowire type
Context	**configure** router *string* l2tp group *string* l2tpv3 pw-cap-list ethernet-vlan *boolean*
Tree	ethernet-vlan
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rem-router-id *string*

Synopsis	Filter on remote router ID
Context	**configure** router *string* l2tp group *string* l2tpv3 rem-router-id *string*
Tree	rem-router-id
Default	0.0.0.0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-password-change *boolean*

Synopsis	Enable tracking of password changes
Context	**configure** router *string* l2tp group *string* l2tpv3 track-password-change *boolean*
Tree	track-password-change
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lac

Synopsis	Enter the **lac** context
Context	**configure** router *string* l2tp group *string* lac
Tree	lac
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

df-bit *keyword*

Synopsis	DF (do not fragment) bit in data traffic transmitted as LAC
Context	**configure** router *string* l2tp group *string* lac df-bit *keyword*
Tree	df-bit
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lns

Synopsis	Enter the **lns** context
Context	**configure** router *string* l2tp group *string* lns
Tree	lns
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lns-group *reference*

Synopsis	ISA LNS group
Context	**configure** router *string* l2tp group *string* lns lns-group *reference*
Tree	lns-group
Reference	**configure** isa lns-group *number*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

load-balance-method *keyword*

Synopsis	New sessions for L2TP ISA MDA
Context	**configure** router *string* l2tp group *string* lns load-balance-method *keyword*
Tree	load-balance-method
Options	per-session, per-tunnel
Default	per-session

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mlppp

Synopsis	Enter the **mlppp** context
Context	**configure** router *string* l2tp group *string* lns mlppp
Tree	mlppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

admin-state *keyword*

Synopsis	Administrative state of MLPPP in the L2TP tunnel group
Context	**configure** router *string* l2tp group *string* lns mlppp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

endpoint

Synopsis	Enter the **endpoint** context
Context	**configure** router *string* l2tp group *string* lns mlppp endpoint
Tree	endpoint
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ip *(ipv4-address | keyword)*

Synopsis	Endpoint ID as an IP address
Context	**configure** router *string* l2tp group *string* lns mlppp endpoint ip *(ipv4-address | keyword)*
Tree	ip
Options	system

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

mac *(mac-address | keyword)*

Synopsis	Endpoint ID as a MAC address
Context	**configure** router *string* l2tp group *string* lns mlppp endpoint mac *(mac-address | keyword)*
Tree	mac
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

interleave *boolean*

Synopsis	Enable link fragmentation and interleaving
Context	**configure** router *string* l2tp group *string* lns mlppp interleave *boolean*
Tree	interleave
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-fragment-delay *(number | keyword)*

Synopsis	Maximum fragment delay caused by transmission on a link
Context	**configure** router *string* l2tp group *string* lns mlppp max-fragment-delay *(number | keyword)*
Tree	max-fragment-delay
Range	5 to 1000
Units	milliseconds
Options	no-fragmentation
Default	no-fragmentation
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-links *number*

Synopsis	Maximum MLPPP links
Context	**configure** router *string* l2tp group *string* lns mlppp max-links *number*
Tree	max-links
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

reassembly-timeout *number*

Synopsis	Reassembly timeout
Context	**configure** router *string* l2tp group *string* lns mlppp reassembly-timeout *number*
Tree	reassembly-timeout
Range	100 | 1000
Units	milliseconds
Default	1000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

short-sequence-numbers *boolean*

Synopsis	Request a peer to send short sequence numbers
Context	**configure** router *string* l2tp group *string* lns mlppp short-sequence-numbers *boolean*
Tree	short-sequence-numbers
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ppp

Synopsis	Enter the **ppp** context

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* l2tp group *string* lns ppp
Tree	ppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication *keyword*

Synopsis	PPP authentication protocol to negotiate
Context	**configure** router *string* l2tp group *string* lns ppp authentication *keyword*
Tree	authentication
Options	pap, chap, pref-chap, pref-pap
Default	pref-chap
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication-policy *string*

Synopsis	Authentication policy when a DHCP message is received
Context	**configure** router *string* l2tp group *string* lns ppp authentication-policy *string*
Tree	authentication-policy
String Length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

chap-challenge-length

Synopsis	Enter the **chap-challenge-length** context
Context	**configure** router *string* l2tp group *string* lns ppp chap-challenge-length
Tree	chap-challenge-length
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the PPP CHAP challenge length

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* l2tp group *string* lns ppp chap-challenge-length end *number*
Tree	end
Range	8 to 64
Units	octets
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the PPP CHAP challenge length
Context	**configure** router *string* l2tp group *string* lns ppp chap-challenge-length start *number*
Tree	start
Range	8 to 64
Units	octets
Default	32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-group-interface

Synopsis	Enter the **default-group-interface** context
Context	**configure** router *string* l2tp group *string* lns ppp default-group-interface
Tree	default-group-interface
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface *string*

Synopsis	Group interface
Context	**configure** router *string* l2tp group *string* lns ppp default-group-interface interface *string*
Tree	interface
String Length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

service-name *string*

Synopsis	Administrative service name
Context	**configure** router *string* l2tp group *string* lns ppp default-group-interface service-name *string*
Tree	service-name
String Length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipcp-subnet-negotiation *boolean*

Synopsis	Allow IPCP subnet negotiation for PPPoE hosts
Context	**configure** router *string* l2tp group *string* lns ppp ipcp-subnet-negotiation *boolean*
Tree	ipcp-subnet-negotiation
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keepalive

Synopsis	Enter the **keepalive** context
Context	**configure** router *string* l2tp group *string* lns ppp keepalive
Tree	keepalive
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interval *number*

Synopsis	PPP keepalive interval
Context	**configure** router *string* l2tp group *string* lns ppp keepalive interval *number*
Tree	interval
Range	10 to 300
Units	seconds
Default	30

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

multiplier *number*

Synopsis	PPP keepalive multiplier
Context	**configure** router *string* l2tp group *string* lns ppp keepalive multiplier *number*
Tree	multiplier
Range	1 to 5
Default	3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lcp-force-ack-accm *boolean*

Synopsis	Force acknowledgement of the LCP Asynchronous Control Character Map (ACCM) option
Context	**configure** router *string* l2tp group *string* lns ppp lcp-force-ack-accm *boolean*
Tree	lcp-force-ack-accm
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lcp-ignore-magic-numbers *boolean*

Synopsis	Check magic number in echo request and reply messages
Context	**configure** router *string* l2tp group *string* lns ppp lcp-ignore-magic-numbers *boolean*
Tree	lcp-ignore-magic-numbers
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu *number*

Synopsis	Maximum PPP MTU size
Context	**configure** router *string* l2tp group *string* lns ppp mtu *number*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	mtu
Range	512 to 9212
Units	octets
Default	1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-authentication *boolean*

Synopsis	Use authentication AVPs that are received from LAC
Context	**configure** router *string* l2tp group *string* lns ppp proxy-authentication *boolean*
Tree	proxy-authentication
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-lcp *boolean*

Synopsis	Proxy LCP AVPs that are received from LAC
Context	**configure** router *string* l2tp group *string* lns ppp proxy-lcp *boolean*
Tree	proxy-lcp
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reject-disabled-ncp *boolean*

Synopsis	Force LCP Protocol Reject for IPv6CP Configure Request
Context	**configure** router *string* l2tp group *string* lns ppp reject-disabled-ncp *boolean*
Tree	reject-disabled-ncp
Default	false
Introduced	16.0.R6
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

user-db *string*

Synopsis	Local user database for PPP PAP and CHAP authentication
Context	**configure** router *string* l2tp group *string* lns ppp user-db *string*
Tree	user-db
String Length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-address *string*

Synopsis	Local address
Context	**configure** router *string* l2tp group *string* local-address *string*
Tree	local-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-name *string*

Synopsis	Local host name used to distinguish tunnels
Context	**configure** router *string* l2tp group *string* local-name *string*
Tree	local-name
String Length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels
Context	**configure** router *string* l2tp group *string* max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-retries-not-estab *number*

Synopsis	Maximum retries for unestablished tunnels
Context	**configure** router *string* l2tp group *string* max-retries-not-estab *number*
Tree	max-retries-not-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *string*

Synopsis	Password between L2TP LAC and LNS
Context	**configure** router *string* l2tp group *string* password *string*
Tree	password
String Length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

protocol *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Protocol version
Context	**configure** router *string* l2tp group *string* protocol *keyword*
Tree	protocol
Options	v2, v3, v3draft
Default	v2
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy *reference*

Synopsis	RADIUS accounting policy
Context	**configure** router *string* l2tp group *string* radius-accounting-policy *reference*
Tree	radius-accounting-policy

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Reference	**configure** aaa radius l2tp-accounting-policy *string*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

receive-window-size *number*

Synopsis	L2TP receive window size
Context	**configure** router *string* l2tp group *string* receive-window-size *number*
Tree	receive-window-size
Range	4 to 1024
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-assign-method *keyword*

Synopsis	Session assignment method
Context	**configure** router *string* l2tp group *string* session-assign-method *keyword*
Tree	session-assign-method
Options	existing-first, weighted, weighted-random
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit *(number | keyword)*

Synopsis	Session limit
Context	**configure** router *string* l2tp group *string* session-limit *(number | keyword)*
Tree	session-limit
Range	1 to 250000
Options	unlimited
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel [tunnel-name] *string*

Synopsis	Enter the **tunnel** list instance

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* l2tp group *string* tunnel *string*
Tree	tunnel
Max. Instances	31
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**tunnel-name**] *string*

Synopsis	Tunnel name
Context	**configure** router *string* l2tp group *string* tunnel *string*
Tree	tunnel
String Length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the L2TP tunnel
Context	**configure** router *string* l2tp group *string* tunnel *string* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

auto-establish *boolean*

Synopsis	Allow the tunnel to be automatically set up by the system
Context	**configure** router *string* l2tp group *string* tunnel *string* auto-establish *boolean*
Tree	auto-establish
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

avp-hiding *keyword*

Synopsis	The AVP hiding algorithm
Context	**configure** router *string* l2tp group *string* tunnel *string* avp-hiding *keyword*
Tree	avp-hiding
Options	never, sensitive, always
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

challenge *keyword*

Synopsis	Enable use of challenge-response authentication
Context	**configure** router *string* l2tp group *string* tunnel *string* challenge *keyword*
Tree	challenge
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *string*

Synopsis	Text description
Context	**configure** router *string* l2tp group *string* tunnel *string* description *string*
Tree	description
String Length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

destruct-timeout *number*

Synopsis	Destruction timeout
Context	**configure** router *string* l2tp group *string* tunnel *string* destruct-timeout *number*
Tree	destruct-timeout
Range	60 to 86400
Units	seconds
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

failover

Synopsis	Enter the **failover** context
Context	**configure** router *string* l2tp group *string* tunnel *string* failover
Tree	failover
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-method *keyword*

Synopsis	Recovery method of the sequence numbers after failover
Context	**configure** router *string* l2tp group *string* tunnel *string* failover recovery-method *keyword*
Tree	recovery-method
Options	mcs, recovery-tunnel
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-time *number*

Synopsis	Time requested from the L2TP peer before assuming failover as failed
Context	**configure** router *string* l2tp group *string* tunnel *string* failover recovery-time *number*
Tree	recovery-time
Range	0 to 900
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hello-interval *(number | keyword)*

Synopsis	Hello interval
Context	**configure** router *string* l2tp group *string* tunnel *string* hello-interval *(number | keyword)*
Tree	hello-interval
Range	10 to 3600

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	seconds
Options	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

idle-timeout *(number | keyword)*

Synopsis	Idle timeout
Context	**configure** router *string* l2tp group *string* tunnel *string* idle-timeout *(number | keyword)*
Tree	idle-timeout
Range	0 to 3600
Units	seconds
Options	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tpv3

Synopsis	Enter the **l2tpv3** context
Context	**configure** router *string* l2tp group *string* tunnel *string* l2tpv3
Tree	l2tpv3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

private-tcp-mss-adjust *(number | keyword)*

Synopsis	TCP maximum segment size (MSS) on private network
Context	**configure** router *string* l2tp group *string* tunnel *string* l2tpv3 private-tcp-mss-adjust *(number | keyword)*
Tree	private-tcp-mss-adjust
Range	512 to 9000
Units	octets
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

public-tcp-mss-adjust *(number | keyword)*

Synopsis	TCP maximum segment size (MSS) on public network
Context	**configure** router *string* l2tp group *string* tunnel *string* l2tpv3 public-tcp-mss-adjust *(number | keyword)*
Tree	public-tcp-mss-adjust
Range	512 to 9000
Units	octets
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lac

Synopsis	Enter the **lac** context
Context	**configure** router *string* l2tp group *string* tunnel *string* lac
Tree	lac
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

df-bit *keyword*

Synopsis	DF (do not fragment) bit in data traffic transmitted as LAC
Context	**configure** router *string* l2tp group *string* tunnel *string* lac df-bit *keyword*
Tree	df-bit
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lns

Synopsis	Enter the **lns** context
Context	**configure** router *string* l2tp group *string* tunnel *string* lns
Tree	lns
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lns-group *reference*

Synopsis	ISA LNS group
Context	**configure** router *string* l2tp group *string* tunnel *string* lns lns-group *reference*
Tree	lns-group
Reference	**configure** isa lns-group *number*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

load-balance-method *keyword*

Synopsis	New sessions for L2TP ISA MDA
Context	**configure** router *string* l2tp group *string* tunnel *string* lns load-balance-method *keyword*
Tree	load-balance-method
Options	per-session, per-tunnel
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mlppp

Synopsis	Enter the **mlppp** context
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp
Tree	mlppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

admin-state *keyword*

Synopsis	Administrative state of MLPPP in the L2TP tunnel
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

endpoint

Synopsis	Enter the **endpoint** context
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp endpoint
Tree	endpoint
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ip *(ipv4-address | keyword)*

Synopsis	Endpoint ID as an IP address
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp endpoint ip *(ipv4-address | keyword)*
Tree	ip
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

mac *(mac-address | keyword)*

Synopsis	Endpoint ID as a MAC address
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp endpoint mac *(mac-address | keyword)*
Tree	mac
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

interleave *keyword*

Synopsis	Use of Link fragmentation and interleaving
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp interleave *keyword*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	interleave
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-fragment-delay *number*

Synopsis	Maximum fragment delay caused by transmission on a link
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp max-fragment-delay *number*
Tree	max-fragment-delay
Range	5 to 1000
Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-links *number*

Synopsis	Maximum MLPPP links
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp max-links *number*
Tree	max-links
Range	1 to 8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

reassembly-timeout *number*

Synopsis	Reassembly timeout
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp reassembly-timeout *number*
Tree	reassembly-timeout
Range	100 | 1000
Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

short-sequence-numbers *keyword*

Synopsis	Request a peer to send short sequence numbers
Context	**configure** router *string* l2tp group *string* tunnel *string* lns mlppp short-sequence-numbers *keyword*
Tree	short-sequence-numbers
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ppp

Synopsis	Enter the **ppp** context
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp
Tree	ppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication *keyword*

Synopsis	PPP authentication protocol to negotiate
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp authentication *keyword*
Tree	authentication
Options	pap, chap, pref-chap, pref-pap
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication-policy *string*

Synopsis	Authentication policy when a DHCP message is received
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp authentication-policy *string*
Tree	authentication-policy
String Length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

chap-challenge-length

Synopsis	Enter the **chap-challenge-length** context
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp chap-challenge-length
Tree	chap-challenge-length
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the PPP CHAP challenge length
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp chap-challenge-length end *number*
Tree	end
Range	8 to 64
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the PPP CHAP challenge length
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp chap-challenge-length start *number*
Tree	start
Range	8 to 64
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-group-interface

Synopsis	Enter the **default-group-interface** context
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp default-group-interface
Tree	default-group-interface
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface *string*

Synopsis	Group interface
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp default-group-interface interface *string*
Tree	interface
String Length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

service-name *string*

Synopsis	Administrative service name
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp default-group-interface service-name *string*
Tree	service-name
String Length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipcp-subnet-negotiation *keyword*

Synopsis	Use of IPCP subnet negotiation for PPPoE hosts
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp ipcp-subnet-negotiation *keyword*
Tree	ipcp-subnet-negotiation
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keepalive

Synopsis	Enter the **keepalive** context
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp keepalive

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	keepalive
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interval *number*

Synopsis	PPP keepalive interval
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp keepalive interval *number*
Tree	interval
Range	10 to 300
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

multiplier *number*

Synopsis	PPP keepalive multiplier
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp keepalive multiplier *number*
Tree	multiplier
Range	1 to 5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lcp-force-ack-accm *keyword*

Synopsis	Forced acknowledgement of the LCP Asynchronous Control Character Map (ACCM) option
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp lcp-force-ack-accm *keyword*
Tree	lcp-force-ack-accm
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

lcp-ignore-magic-numbers *keyword*

Synopsis	Magic-Number field in LCP Echo-Request and LCP Echo-Reply messages that are checked
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp lcp-ignore-magic-numbers *keyword*
Tree	lcp-ignore-magic-numbers
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu *number*

Synopsis	Maximum PPP MTU size
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp mtu *number*
Tree	mtu
Range	512 to 9212
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-authentication *keyword*

Synopsis	Authentication AVPs that are received from LAC
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp proxy-authentication *keyword*
Tree	proxy-authentication
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-lcp *keyword*

Synopsis	Use the Proxy LCP AVPs that are received from the LAC
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp proxy-lcp *keyword*
Tree	proxy-lcp
Options	false, true

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reject-disabled-ncp *keyword*

Synopsis	Force LCP Project Reject for IPv6CP Configure Request
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp reject-disabled-ncp *keyword*
Tree	reject-disabled-ncp
Options	false, true
Introduced	16.0.R6
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

user-db *string*

Synopsis	Local user database for PPP PAP and CHAP authentication
Context	**configure** router *string* l2tp group *string* tunnel *string* lns ppp user-db *string*
Tree	user-db
String Length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-address *string*

Synopsis	Local address
Context	**configure** router *string* l2tp group *string* tunnel *string* local-address *string*
Tree	local-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-name *string*

Synopsis	Local host name used to distinguish tunnels
Context	**configure** router *string* l2tp group *string* tunnel *string* local-name *string*
Tree	local-name
String Length	1 to 64

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels
Context	**configure** router *string* l2tp group *string* tunnel *string* max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-not-estab *number*

Synopsis	Maximum retries for unestablished tunnels
Context	**configure** router *string* l2tp group *string* tunnel *string* max-retries-not-estab *number*
Tree	max-retries-not-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *string*

Synopsis	Password between L2TP LAC and LNS
Context	**configure** router *string* l2tp group *string* tunnel *string* password *string*
Tree	password
String Length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer *string*

Synopsis	Peer address
Context	**configure** router *string* l2tp group *string* tunnel *string* peer *string*
Tree	peer

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference *number*

Synopsis	Tunnel preference number with its group
Context	**configure** router *string* l2tp group *string* tunnel *string* preference *number*
Tree	preference
Range	0 to 16777215
Default	50
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy *reference*

Synopsis	RADIUS accounting policy
Context	**configure** router *string* l2tp group *string* tunnel *string* radius-accounting-policy *reference*
Tree	radius-accounting-policy
Reference	**configure** aaa radius l2tp-accounting-policy *string*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

receive-window-size *number*

Synopsis	L2TP receive window size
Context	**configure** router *string* l2tp group *string* tunnel *string* receive-window-size *number*
Tree	receive-window-size
Range	4 to 1024
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

remote-name *string*

Synopsis	Remote tunnel host name
Context	**configure** router *string* l2tp group *string* tunnel *string* remote-name *string*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	remote-name
String Length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit *(number | keyword)*

Synopsis	L2TP session limit for each tunnel of this router
Context	**configure** router *string* l2tp group *string* tunnel *string* session-limit *(number | keyword)*
Tree	session-limit
Range	1 to 65534
Options	unlimited
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group-session-limit *number*

Synopsis	L2TP session limit for each group of this router
Context	**configure** router *string* l2tp group-session-limit *number*
Tree	group-session-limit
Range	1 to 250000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hello-interval *(number | keyword)*

Synopsis	Hello interval
Context	**configure** router *string* l2tp hello-interval *(number | keyword)*
Tree	hello-interval
Range	10 to 3600
Units	seconds
Options	infinite
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.

idle-timeout *(number | keyword)*

Synopsis	Idle timeout
Context	**configure** router *string* l2tp idle-timeout *(number | keyword)*
Tree	idle-timeout
Range	0 to 3600
Units	seconds
Options	infinite
Default	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ignore-avps

Synopsis	Enter the **ignore-avps** context
Context	**configure** router *string* l2tp ignore-avps
Tree	ignore-avps
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sequencing-required *boolean*

Synopsis	Ignore Sequencing Required AVP
Context	**configure** router *string* l2tp ignore-avps sequencing-required *boolean*
Tree	sequencing-required
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tpv3

Synopsis	Enter the **l2tpv3** context
Context	**configure** router *string* l2tp l2tpv3
Tree	l2tpv3
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cookie-length *number*

Synopsis	Cookie field length
Context	**configure** router *string* l2tp l2tpv3 cookie-length *number*
Tree	cookie-length
Range	4 | 8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

digest-type *keyword*

Synopsis	Hashing algorithm that calculates the message digest
Context	**configure** router *string* l2tp l2tpv3 digest-type *keyword*
Tree	digest-type
Options	md5, sha1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nonce-length *number*

Synopsis	Length of the local L2TPv3 nonce (random number)
Context	**configure** router *string* l2tp l2tpv3 nonce-length *number*
Tree	nonce-length
Range	0 | 16 to 64
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *string*

Synopsis	L2TPv3 password
Context	**configure** router *string* l2tp l2tpv3 password *string*
Tree	password

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String Length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

private-tcp-mss-adjust *number*

Synopsis	TCP maximum segment size (MSS) on private network
Context	**configure** router *string* l2tp l2tpv3 private-tcp-mss-adjust *number*
Tree	private-tcp-mss-adjust
Range	512 to 9000
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

public-tcp-mss-adjust *number*

Synopsis	TCP maximum segment size (MSS) on public network
Context	**configure** router *string* l2tp l2tpv3 public-tcp-mss-adjust *number*
Tree	public-tcp-mss-adjust
Range	512 to 9000
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

transport-type

Synopsis	Enter the **transport-type** context
Context	**configure** router *string* l2tp l2tpv3 transport-type
Tree	transport-type
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip *boolean*

Synopsis	Use IP as the transport type for the L2TPv3 tunnel

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* l2tp l2tpv3 transport-type ip *boolean*
Tree	ip
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lac

Synopsis	Enter the **lac** context
Context	**configure** router *string* l2tp lac
Tree	lac
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

calling-number-format *string*

Synopsis	Calling Number AVP for L2TP control messages
Context	**configure** router *string* l2tp lac calling-number-format *string*
Tree	calling-number-format
String Length	1 to 255
Default	%S %s
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cisco-nas-port

Synopsis	Enter the **cisco-nas-port** context
Context	**configure** router *string* l2tp lac cisco-nas-port
Tree	cisco-nas-port
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ethernet *string*

Synopsis	L2TP Cisco NAS port AVP with binary patterns for Ethernet

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* l2tp lac cisco-nas-port ethernet *string*
Tree	ethernet
String Length	1 to 255
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

df-bit *boolean*

Synopsis	Send all L2TP packets with DF bit set to 1
Context	**configure** router *string* l2tp lac df-bit *boolean*
Tree	df-bit
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-address *string*

Synopsis	Local address
Context	**configure** router *string* l2tp local-address *string*
Tree	local-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-name *string*

Synopsis	Local host name
Context	**configure** router *string* l2tp local-name *string*
Tree	local-name
String Length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* l2tp max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-not-estab *number*

Synopsis	Maximum retries for unestablished tunnels
Context	**configure** router *string* l2tp max-retries-not-estab *number*
Tree	max-retries-not-estab
Range	2 to 7
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

next-attempt *keyword*

Synopsis	Tunnel that is selected when previous session setup failed
Context	**configure** router *string* l2tp next-attempt *keyword*
Tree	next-attempt
Options	same-preference-level, next-preference-level
Default	next-preference-level
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *string*

Synopsis	L2TP password
Context	**configure** router *string* l2tp password *string*
Tree	password
String Length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

peer-address-change-policy *keyword*

Synopsis	Reaction for L2TP response from a different address
Context	**configure** router *string* l2tp peer-address-change-policy *keyword*
Tree	peer-address-change-policy
Options	accept, ignore, reject
Default	reject
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy *reference*

Synopsis	RADIUS accounting policy
Context	**configure** router *string* l2tp radius-accounting-policy *reference*
Tree	radius-accounting-policy
Reference	**configure** aaa radius l2tp-accounting-policy *string*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

receive-window-size *number*

Synopsis	L2TP receive window size
Context	**configure** router *string* l2tp receive-window-size *number*
Tree	receive-window-size
Range	4 to 1024
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

replace-result-code

Synopsis	Enter the **replace-result-code** context
Context	**configure** router *string* l2tp replace-result-code
Tree	replace-result-code
Introduced	16.0.R1

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-invalid-dst *boolean*

Synopsis	Replace result code with general error code
Context	**configure** router *string* l2tp replace-result-code cdn-invalid-dst *boolean*
Tree	cdn-invalid-dst
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-permanent-no-facilities *boolean*

Synopsis	Replace result code with general error
Context	**configure** router *string* l2tp replace-result-code cdn-permanent-no-facilities *boolean*
Tree	cdn-permanent-no-facilities
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-temporary-no-facilities *boolean*

Synopsis	Replace result code with general error
Context	**configure** router *string* l2tp replace-result-code cdn-temporary-no-facilities *boolean*
Tree	cdn-temporary-no-facilities
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rtm-debounce-time *(number | keyword)*

Synopsis	Debounce timer that declares L2TP action for route table management events
Context	**configure** router *string* l2tp rtm-debounce-time *(number | keyword)*
Tree	rtm-debounce-time
Range	0 to 5000

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	milliseconds
Options	infinite
Default	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-assign-method *keyword*

Synopsis	Session assignment method
Context	**configure** router *string* l2tp session-assign-method *keyword*
Tree	session-assign-method
Options	existing-first, weighted, weighted-random
Default	existing-first
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit *number*

Synopsis	L2TP session limit of this router
Context	**configure** router *string* l2tp session-limit *number*
Tree	session-limit
Range	1 to 250000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel-selection-blacklist

Synopsis	Enter the **tunnel-selection-blacklist** context
Context	**configure** router *string* l2tp tunnel-selection-blacklist
Tree	tunnel-selection-blacklist
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

add-tunnel-on

Synopsis	Enter the **add-tunnel-on** context
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on
Tree	add-tunnel-on
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

address-change-timeout *boolean*

Synopsis	Enable a timed-out tunnel to be forced to the denylist
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on address-change-timeout *boolean*
Tree	address-change-timeout
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-err-code *boolean*

Synopsis	Add to deny if CDN is received with code: General error
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on cdn-err-code *boolean*
Tree	cdn-err-code
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-invalid-dst *boolean*

Synopsis	Force tunnel to the denylist in case of Result Codes 6
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on cdn-invalid-dst *boolean*
Tree	cdn-invalid-dst
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

cdn-permanent-no-facilities *boolean*

Synopsis	Force tunnel to the denylist in case of Result Codes 5
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on cdn-permanent-no-facilities *boolean*
Tree	cdn-permanent-no-facilities
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-temporary-no-facilities *boolean*

Synopsis	Force tunnel to the denylist in case of Result Codes 4
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on cdn-temporary-no-facilities *boolean*
Tree	cdn-temporary-no-facilities
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stop-ccn-err-code *boolean*

Synopsis	Add to denylist if received with general error code
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on stop-ccn-err-code *boolean*
Tree	stop-ccn-err-code
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stop-ccn-other *boolean*

Synopsis	Add to denylist if StopCCN received with general error
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on stop-ccn-other *boolean*
Tree	stop-ccn-other

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tx-cdn-not-established-in-time *boolean*

Synopsis	Add to denylist if CDN transmitted with result code
Context	**configure** router *string* l2tp tunnel-selection-blacklist add-tunnel-on tx-cdn-not-established-in-time *boolean*
Tree	tx-cdn-not-established-in-time
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-list-length *(number | keyword)*

Synopsis	Number of tunnels or peers in the denylist
Context	**configure** router *string* l2tp tunnel-selection-blacklist max-list-length *(number | keyword)*
Tree	max-list-length
Range	1 to 65535
Options	infinite
Default	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-time *number*

Synopsis	Time that a tunnel or peer can remain in the denylist
Context	**configure** router *string* l2tp tunnel-selection-blacklist max-time *number*
Tree	max-time
Range	1 to 60
Units	minutes
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

timeout-action *keyword*

Synopsis	Action when a tunnel or peer exceeds time in denylist
Context	**configure** router *string* l2tp tunnel-selection-blacklist timeout-action *keyword*
Tree	timeout-action
Options	remove-from-blacklist, try-one-session
Default	remove-from-blacklist
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel-session-limit *number*

Synopsis	L2TP session limit for each tunnel of this router
Context	**configure** router *string* l2tp tunnel-session-limit *number*
Tree	tunnel-session-limit
Range	1 to 65534
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ldp

Synopsis	Enable the **ldp** context
Context	**configure** router *string* ldp
Tree	ldp
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of LDP
Context	**configure** router *string* ldp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1

fast-reroute

Synopsis	Enable the **fast-reroute** context
Context	**configure** router *string* ldp fast-reroute
Tree	fast-reroute
Introduced	16.0.R1
Platforms	All

backup-sr-tunnel *boolean*

Synopsis	Use SR tunnel as a remote LFA backup tunnel next-hop by an LDP FEC
Context	**configure** router *string* ldp fast-reroute backup-sr-tunnel *boolean*
Tree	backup-sr-tunnel
Default	false
Introduced	16.0.R1
Platforms	All

fec-originate [fec-prefix] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Enter the **fec-originate** list instance
Context	**configure** router *string* ldp fec-originate *(ipv4-prefix | ipv6-prefix)*
Tree	fec-originate
Introduced	16.0.R1
Platforms	All

[**fec-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Static FEC IP prefix
Context	**configure** router *string* ldp fec-originate *(ipv4-prefix | ipv6-prefix)*
Tree	fec-originate
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

advertised-label *number*

Synopsis	Label that is advertised to upstream peer
Context	**configure** router *string* ldp fec-originate *(ipv4-prefix | ipv6-prefix)* advertised-label *number*
Tree	advertised-label
Range	32 to 1048575
Introduced	16.0.R1
Platforms	All

interface *string*

Synopsis	Interface name for this static FEC prefix
Context	**configure** router *string* ldp fec-originate *(ipv4-prefix | ipv6-prefix)* interface *string*
Tree	interface
String Length	0 to 32
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

next-hop *(ipv4-address-no-zone \| ipv6-address-no-zone)*

Synopsis	IP address of the next hop
Context	**configure** router *string* ldp fec-originate *(ipv4-prefix | ipv6-prefix)* next-hop *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	next-hop
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

pop *boolean*

Synopsis	Pop the label and transmit without the label
Context	**configure** router *string* ldp fec-originate *(ipv4-prefix | ipv6-prefix)* pop *boolean*
Tree	pop

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

swap-label *number*

Synopsis	Value mapped to egress label associated with next-hop entry that LSR uses to swap incoming label
Context	**configure** router *string* ldp fec-originate *(ipv4-prefix | ipv6-prefix)* swap-label *number*
Tree	swap-label
Range	6 to 1048575
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

generate-basic-fec-only *boolean*

Synopsis	Enable mLDP to generate a basic FEC
Context	**configure** router *string* ldp generate-basic-fec-only *boolean*
Tree	generate-basic-fec-only
Default	false
Introduced	16.0.R1
Platforms	All

graceful-restart

Synopsis	Enter the **graceful-restart** context
Context	**configure** router *string* ldp graceful-restart
Tree	graceful-restart
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

helper-mode *boolean*

Synopsis	Enable graceful restart helper
Context	**configure** router *string* ldp graceful-restart helper-mode *boolean*
Tree	helper-mode
Default	false
Introduced	16.0.R1
Platforms	All

maximum-recovery-time *number*

Synopsis	Value for the local maximum recovery time
Context	**configure** router *string* ldp graceful-restart maximum-recovery-time *number*
Tree	maximum-recovery-time
Range	15 to 1800
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	All

neighbor-liveness-time *number*

Synopsis	Value for the neighbor liveness timer
Context	**configure** router *string* ldp graceful-restart neighbor-liveness-time *number*
Tree	neighbor-liveness-time
Range	5 to 300
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	All

implicit-null-label *boolean*

Synopsis	Signal the implicit null label value for all LDP FECs for which the node is the egress LER
Context	**configure** router *string* ldp implicit-null-label *boolean*
Tree	implicit-null-label

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	All

import-mcast-policy *reference*

Synopsis	Import policy for mLDP FECs arriving on the node
Context	**configure** router *string* ldp import-mcast-policy *reference*
Tree	import-mcast-policy
Reference	**configure** policy-options policy-statement *string*
Max. Instances	5
Notes	This element is ordered by the user.
Introduced	19.5.R1
Platforms	All

import-pmsi-routes

Synopsis	Enter the **import-pmsi-routes** context
Context	**configure** router *string* ldp import-pmsi-routes
Tree	import-pmsi-routes
Introduced	19.5.R1
Platforms	All

mvpn *boolean*

Synopsis	Import BGP MVPN inter-AS routes
Context	**configure** router *string* ldp import-pmsi-routes mvpn *boolean*
Tree	mvpn
Default	false
Introduced	19.5.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mvpn-no-export-community *boolean*

Synopsis	Import BGP MVPN intra-AS routes
Context	**configure** router *string* ldp import-pmsi-routes mvpn-no-export-community *boolean*
Tree	mvpn-no-export-community
Default	false
Introduced	19.5.R1
Platforms	All

import-policy *reference*

Synopsis	Import policies to filter LDP label bindings received from LDP peers
Context	**configure** router *string* ldp import-policy *reference*
Tree	import-policy
Reference	**configure** policy-options policy-statement *string*
Max. Instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

import-tunnel-table *reference*

Synopsis	Tunnel table import policies for non-host prefixes
Context	**configure** router *string* ldp import-tunnel-table *reference*
Tree	import-tunnel-table
Reference	**configure** policy-options policy-statement *string*
Max. Instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

interface-parameters

Synopsis	Enter the **interface-parameters** context

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* ldp interface-parameters
Tree	interface-parameters
Introduced	16.0.R1
Platforms	All

interface [ip-int-name] *reference*

Synopsis	Enter the **interface** list instance
Context	**configure** router *string* ldp interface-parameters interface *reference*
Tree	interface
Introduced	16.0.R1
Platforms	All

[**ip-int-name**] *reference*

Synopsis	Interface name
Context	**configure** router *string* ldp interface-parameters interface *reference*
Tree	interface
Reference	**configure** router *string* interface *string*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the LDP interface
Context	**configure** router *string* ldp interface-parameters interface *reference* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.

bfd-liveness

Synopsis	Enter the **bfd-liveness** context
Context	**configure** router *string* ldp interface-parameters interface *reference* bfd-liveness
Tree	bfd-liveness
Introduced	16.0.R1
Platforms	All

ipv4 *boolean*

Synopsis	Allow BFD tracking of IPv4 LDP Session for interface
Context	**configure** router *string* ldp interface-parameters interface *reference* bfd-liveness ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	16.0.R1
Platforms	All

ipv6 *boolean*

Synopsis	Allow BFD tracking of IPv6 LDP session for interface
Context	**configure** router *string* ldp interface-parameters interface *reference* bfd-liveness ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	16.0.R1
Platforms	All

ipv4

Synopsis	Enable the **ipv4** context
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4
Tree	ipv4
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the LDP interface
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

fec-type-capability

Synopsis	Enter the **fec-type-capability** context
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 fec-type-capability
Tree	fec-type-capability
Introduced	16.0.R1
Platforms	All

p2mp-ipv4 *boolean*

Synopsis	Enable IPv4 P2MP FEC capability
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 fec-type-capability p2mp-ipv4 *boolean*
Tree	p2mp-ipv4
Default	true
Introduced	16.0.R1
Platforms	All

p2mp-ipv6 *boolean*

Synopsis	Enable IPv6 P2MP FEC capability
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 fec-type-capability p2mp-ipv6 *boolean*
Tree	p2mp-ipv6
Default	true

© 2023 Nokia.

Introduced	16.0.R1
Platforms	All

prefix-ipv4 *boolean*

Synopsis	Enable IPv4 prefix FEC capability
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 fec-type-capability prefix-ipv4 *boolean*
Tree	prefix-ipv4
Default	true
Introduced	16.0.R1
Platforms	All

prefix-ipv6 *boolean*

Synopsis	Enable IPv6 prefix FEC capability
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 fec-type-capability prefix-ipv6 *boolean*
Tree	prefix-ipv6
Default	true
Introduced	16.0.R1
Platforms	All

hello

Synopsis	Enable the **hello** context
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 hello
Tree	hello
Introduced	16.0.R1
Platforms	All

factor *number*

Synopsis	Factor value for Hello
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 hello factor *number*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	factor
Range	1 to 255
Introduced	16.0.R1
Platforms	All

timeout *number*

Synopsis	Timeout value for Hello
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 hello timeout *number*
Tree	timeout
Range	3 to 65535
Units	seconds
Introduced	16.0.R1
Platforms	All

keepalive

Synopsis	Enable the **keepalive** context
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 keepalive
Tree	keepalive
Introduced	16.0.R1
Platforms	All

factor *number*

Synopsis	Factor value for keepalive
Context	**configure** router *string* ldp interface-parameters interface *reference* ipv4 keepalive factor *number*
Tree	factor
Range	1 to 255
Introduced	16.0.R1
Platforms	All

Platforms	All

ipv6 *boolean*

Synopsis	Forward IPv6 packets by using LDP shortcuts
Context	**configure** router *string* ldp ldp-shortcut ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	16.0.R1
Platforms	All

legacy-ipv4-lsr-interop *boolean*

Synopsis	Allow interoperability with legacy IPv4 LSR implementations
Context	**configure** router *string* ldp legacy-ipv4-lsr-interop *boolean*
Tree	legacy-ipv4-lsr-interop
Default	false
Introduced	16.0.R1
Platforms	All

lsp-bfd [prefix-list] *reference*

Synopsis	Enter the **lsp-bfd** list instance
Context	**configure** router *string* ldp lsp-bfd *reference*
Tree	lsp-bfd
Max. Instances	16
Introduced	16.0.R1
Platforms	All

[**prefix-list**] *reference*

Synopsis	Name of a router policy options prefix list
Context	**configure** router *string* ldp lsp-bfd *reference*
Tree	lsp-bfd

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Reference	**configure** policy-options prefix-list *string*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD on LDP LSPs with FECs that match the prefix list
Context	**configure** router *string* ldp lsp-bfd *reference* bfd-liveness *boolean*
Tree	bfd-liveness
Default	false
Introduced	16.0.R1
Platforms	All

bfd-template *reference*

Synopsis	BFD template to apply to BFD sessions associated with the prefix list
Context	**configure** router *string* ldp lsp-bfd *reference* bfd-template *reference*
Tree	bfd-template
Reference	**configure** bfd bfd-template *string*
Introduced	16.0.R1
Platforms	All

failure-action *keyword*

Synopsis	Reaction to BFD session failure for the prefix list
Context	**configure** router *string* ldp lsp-bfd *reference* failure-action *keyword*
Tree	failure-action
Options	down
Introduced	16.0.R1
Platforms	All

lsp-ping-interval *(number | keyword)*

Synopsis	LSP ping transmit interval for periodic verification

© 2023 Nokia.

Context	**configure** router *string* ldp lsp-bfd *reference* lsp-ping-interval *(number | keyword)*
Tree	lsp-ping-interval
Range	60 to 300
Units	seconds
Options	none
Default	60
Introduced	16.0.R1
Platforms	All

priority *number*

Synopsis	Prefix list to control the search order
Context	**configure** router *string* ldp lsp-bfd *reference* priority *number*
Tree	priority
Range	1 to 99
Default	1
Introduced	16.0.R1
Platforms	All

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source address in LSP ping packets and BFD control packets associated with prefix list
Context	**configure** router *string* ldp lsp-bfd *reference* source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Introduced	16.0.R1
Platforms	All

max-ecmp-routes *number*

Synopsis	Maximum ECMP value for LDP
Context	**configure** router *string* ldp max-ecmp-routes *number*
Tree	max-ecmp-routes
Description	This command sets the maximum number of ECMP routes that LDP may use to resolve the next hop for a FEC as permitted by the RTM or TTM.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The system-wide maximum number of ECMP routes is set by the **configure router ecmp** command; therefore, the operational maximum number used by LDP is set to the lesser of the values configured by this command and the **configure router ecmp** command.

Range	1 to 64
Default	32
Introduced	19.10.R1
Platforms	All

mcast-upstream-asbr-frr *boolean*

Synopsis	Enable ASBR MoFRR to allow local leaf to perform MoFRR for multiple ASBRs
Context	**configure** router *string* ldp mcast-upstream-asbr-frr *boolean*
Tree	mcast-upstream-asbr-frr
Default	false
Introduced	16.0.R1
Platforms	All

mcast-upstream-frr *boolean*

Synopsis	Use fast upstream switchover for mLDP FECs
Context	**configure** router *string* ldp mcast-upstream-frr *boolean*
Tree	mcast-upstream-frr
Default	false
Introduced	16.0.R1
Platforms	All

mp-mbb-time *number*

Synopsis	MP MBB time
Context	**configure** router *string* ldp mp-mbb-time *number*
Tree	mp-mbb-time
Range	0 to 10
Units	seconds
Default	3
Introduced	16.0.R1

Platforms	All

prefer-mcast-tunnel-in-tunnel *boolean*

Synopsis	Use T-LDP session to the peer for FEC resolution
Context	**configure** router *string* ldp prefer-mcast-tunnel-in-tunnel *boolean*
Tree	prefer-mcast-tunnel-in-tunnel
Default	true
Introduced	21.2.R1
Platforms	All

prefer-protocol-stitching *boolean*

Synopsis	Stitch LDP ILM to SR NHLFE even if LDP NHLFE exists
Context	**configure** router *string* ldp prefer-protocol-stitching *boolean*
Tree	prefer-protocol-stitching
Description	When configured to **true**, an LDP ILM stitches to an SR NHLFE, even if an LDP NHLFE exists. When configured to **false**, the stitching preference of an LDP ILM is to an LDP NHLFE.
Default	false
Introduced	21.7.R1
Platforms	All

prefer-tunnel-in-tunnel *boolean*

Synopsis	Preference tunnel-in-tunnel over a simple LDP tunnel
Context	**configure** router *string* ldp prefer-tunnel-in-tunnel *boolean*
Tree	prefer-tunnel-in-tunnel
Default	true
Introduced	16.0.R1
Platforms	All

resolve-root-using *keyword*

Synopsis	Resolution route table for multicast FECs

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* ldp resolve-root-using *keyword*
Tree	resolve-root-using
Options	ucast-rtm, mcast-rtm
Default	ucast-rtm
Introduced	16.0.R1
Platforms	All

session-parameters

Synopsis	Enter the **session-parameters** context
Context	**configure** router *string* ldp session-parameters
Tree	session-parameters
Introduced	16.0.R1

tcp-session-parameters

Synopsis	Enter the **tcp-session-parameters** context
Context	**configure** router *string* ldp tcp-session-parameters
Tree	tcp-session-parameters
Introduced	16.0.R1
Platforms	All

authentication-key *string*

Synopsis	Authentication key between LDP peers
Context	**configure** router *string* ldp tcp-session-parameters authentication-key *string*
Tree	authentication-key
Description	This command specifies the authentication key used to establish a session between LDP peers. Authentication uses the MD-5 message-based digest. The peer address used in authentication must be the TCP session transport address. If one or more transport addresses used in the Hello adjacencies to the same peer LSR are different from the LSR ID value, the user must add each transport address to the authentication key configuration as a separate peer. As a result, when the TCP connection is bootstrapped by a specific Hello adjacency, the authentication can operate over that TCP connection by using its specific transport address. The per-peer authentication configuration takes precedence over global authentication configuration, and authentication keychain configuration takes precedence over authentication key configuration.
String Length	1 to 370
Introduced	21.2.R1
Platforms	All

authentication-keychain *reference*

Synopsis	Authentication keychain to use for the TCP session
Context	**configure** router *string* ldp tcp-session-parameters authentication-keychain *reference*
Tree	authentication-keychain
Description	This command configures the authentication keychain to use for the TCP session. The per-peer authentication configuration takes precedence over the global authentication configuration.
Reference	**configure** system security keychains keychain *string*
Introduced	21.2.R1

tunnel-table-pref *number*

Synopsis	Tunnel table preference value for address FECs
Context	**configure** router *string* ldp tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the tunnel table preference for an LDP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	9
Introduced	21.10.R1
Platforms	All

weighted-ecmp *boolean*

Synopsis	Allow weighted ECMP load-balancing
Context	**configure** router *string* ldp weighted-ecmp *boolean*
Tree	weighted-ecmp
Description	When configured to **true**, the system allows weighted ECMP on LDP using RSVP LSPs or SR-TE LSPs. LDP labeled packets are sprayed across the RSVP or SR-TE LSP ECMP set in proportion to the configured load-balancing weight of LSPs. When configured to **false**, the system removes weighted ECMP load-balancing.
Default	false
Introduced	16.0.R1

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** router *string* mld forwarding-group-interface forwarding-service *string* group-interface-name *reference* mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface when redirection is configured
- subscriber level and group-interface level when redirection is unconfigured

In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).

Tree	maximum-number-group-sources

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the maximum number of group sources for which IGMP or MLD can have local receiver information based on received IGMP or MLD reports on this interface. When this configuration is changed dynamically to a lower value than the currently accepted number of group sources, the group sources that are already accepted are not deleted. Only new group sources are not allowed.
Range	1 to 32000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** router *string* mld group-interface *reference* mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).
Reference	**configure** mcac policy *string*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Synopsis	Collection intervals in a sample interval
Context	**configure** router *string* mpls auto-bandwidth-multipliers adjust-multiplier *number*
Tree	adjust-multiplier
Range	1 to 16383
Default	288
Introduced	16.0.R1
Platforms	All

sample-multiplier *number*

Synopsis	Collection intervals in a sample interval
Context	**configure** router *string* mpls auto-bandwidth-multipliers sample-multiplier *number*
Tree	sample-multiplier
Range	1 to 511
Default	1
Introduced	16.0.R1
Platforms	All

auto-lsp [template-name] *reference*

Synopsis	Enter the **auto-lsp** list instance
Context	**configure** router *string* mpls auto-lsp *reference*
Tree	auto-lsp
Max. Instances	500
Introduced	16.0.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**template-name**] *reference*

Synopsis	LSP template name
Context	**configure** router *string* mpls auto-lsp *reference*
Tree	auto-lsp
Reference	**configure** router *string* mpls lsp-template *string*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

one-hop *boolean*

Synopsis	Enable one-hop point-to-point LSP automatic signaling
Context	**configure** router *string* mpls auto-lsp *reference* one-hop *boolean*
Tree	one-hop
Description	This command enables the automatic signaling of one-hop point-to-point LSPs.
Default	false
Notes	The following elements are part of a choice: **one-hop** or **policy**.
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	Peer prefix policy name
Context	**configure** router *string* mpls auto-lsp *reference* policy *reference*
Tree	policy
Reference	**configure** policy-options policy-statement *string*
Max. Instances	5
Notes	The following elements are part of a choice: **one-hop** or **policy**. This element is ordered by the user.

aux-stats

Synopsis	Enable the **aux-stats** context
Context	**configure** router *string* mpls aux-stats
Tree	aux-stats
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-s, 7950 XRS, VSR

sr *boolean*

Synopsis	Traffic type count in MPLS statistics table
Context	**configure** router *string* mpls aux-stats sr *boolean*
Tree	sr
Description	This command configures the type of traffic to count in the auxiliary MPLS statistics table. It refers to any type of segment routing traffic (SR-OSPF, SR-ISIS, SR-TE, and so on).
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-s, 7950 XRS, VSR

bypass-resignal-timer *number*

Synopsis	Resignal timer for bypass
Context	**configure** router *string* mpls bypass-resignal-timer *number*
Tree	bypass-resignal-timer
Range	1 to 10080
Units	minutes
Introduced	16.0.R1
Platforms	All

class-forwarding-policy [policy-name] *string*

Synopsis	Enter the **class-forwarding-policy** list instance
Context	**configure** router *string* mpls class-forwarding-policy *string*
Tree	class-forwarding-policy
Max. Instances	15

interface [interface-name] *reference*

Synopsis	Enter the **interface** list instance
Context	**configure** router *string* mpls interface *reference*
Tree	interface
Description	Commands in this context configure the attributes for MPLS protocol support on an IP interface. MPLS commands are not executed on an IP interface where MPLS is not enabled. An MPLS interface must be explicitly enabled (admin-state enabled). The MPLS interface must be admin-state disabled to delete the interface definition. A corresponding RSVP interface must also be configured. The MPLS interface cannot be deleted without also deleting the RSVP interface.
Introduced	16.0.R1
Platforms	All

Introduced	16.0.R1
Platforms	All

admin-group *reference*

Synopsis	Administrative groups supported by the interface
Context	**configure** router *string* mpls interface *reference* admin-group *reference*
Tree	admin-group
Description	This command specifies the administrative groups that the interface supports. This information is advertised as part of OSPF and IS-IS to help CSPF compute constrained LSPs that must include or exclude certain administrative groups. An MPLS interface is assumed to belong to all the administrative groups unless this command is issued under the interface configuration. With this command configured, the interface is assumed to belong to only the groups specifically configured in this command. Only the administrative groups bound to an MPLS interface are advertised in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.
Reference	**configure** routing-options if-attribute admin-group *string*

failure-action *keyword*

Synopsis	Action when LSP BFD fails on the RSVP SR-TE LSP
Context	**configure** router *string* mpls lsp *string* bfd failure-action *keyword*
Tree	failure-action
Description	The command specifies the action when LSP BFD fails on an RSVP, SR-TE, or LDP LSP. Regardless of the failure action specified, when the BFD session goes down on the LSP, the system generates an SNMP trap.
Options	none, down, failover, failover-or-down
Default	none
Introduced	16.0.R1
Platforms	All

lsp-ping-interval *(number | keyword)*

Synopsis	Interval for periodic LSP ping for BFD bootstrapping
Context	**configure** router *string* mpls lsp *string* bfd lsp-ping-interval *(number | keyword)*
Tree	lsp-ping-interval
Range	60 to 300
Units	seconds
Options	none
Default	60
Introduced	16.0.R1
Platforms	All

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *string* mpls lsp *string* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.

Range 32 to 1048512

Introduced 22.2.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis Time to wait for BFD to become operationally available

Context **configure** router *string* mpls lsp *string* bfd wait-for-up-timer *number*

Tree wait-for-up-timer

Description This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs.

For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer.

For RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up
- the initial administrative state of the LSP
- the retry signaling of non-standby secondary paths

Range 1 to 60

Units seconds

Default 4

Introduced 19.7.R1

Platforms All

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *string* mpls lsp *string* primary *reference* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048512
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *string* mpls lsp *string* primary *reference* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs. For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer. For RSVP-TE LSPs, the timer controls the following:

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- a path undergoing MBB when BFD is up
- the initial administrative state of the LSP
- the retry signaling of non-standby secondary paths

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *string* mpls lsp *string* secondary *reference* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.

Range	32 to 1048512
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *string* mpls lsp *string* secondary *reference* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs. For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer. For RSVP-TE LSPs, the timer controls the following: • a path undergoing MBB when BFD is up • the initial administrative state of the LSP • the retry signaling of non-standby secondary paths
Range	1 to 60
Units	seconds
Default	4
Introduced	19.7.R1

Platforms	All

lsp-self-ping

Synopsis	Enter the **lsp-self-ping** context
Context	**configure** router *string* mpls lsp-self-ping
Tree	lsp-self-ping
Description	Commands in this context configure LSP Self Ping parameters. LSP Self Ping checks that the datapath of an RSVP LSP has been programmed by all LSRs along its path before switching the traffic to it. If enabled, LSP Self Ping packets are sent periodically at a configurable interval following the receipt of the RESV message for an RSVP LSP path following an MBB or other event where the active path changes while the previous active path stayed up. The router will not switch traffic to the new path until an LSP Self Ping reply is received from the far-end LER. When configured under the MPLS context, LSP Self Ping is enabled for all RSVP LSPs, unless it is explicitly disabled for a given LSP.
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval *number*

Synopsis	MPLS periodic LSP Self Ping interval
Context	**configure** router *string* mpls lsp-self-ping interval *number*
Tree	interval
Description	This command configures the interval at which LSP Self Ping packets are periodically sent on a candidate path of an RSVP LSP. This value is used for all LSPs that have LSP Self Ping enabled.
Range	1 to 10

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	seconds
Default	1
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rsvp-te *boolean*

Synopsis	Activate LSP Self Ping on RSVP-TE LSPs
Context	**configure** router *string* mpls lsp-self-ping rsvp-te *boolean*
Tree	rsvp-te
Description	When configured to **true**, this command enables LSP Self Ping on all RSVP-TE LSPs, unless an individual LSP has this explicitly disabled under the **configure router mpls lsp lsp-self-ping** command or in the LSP template. When configured to **false**, this command disables LSP Self Ping on all RSVP-TE LSPs.
Default	false
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

timeout *number*

Synopsis	MPLS LSP Self Ping timeout
Context	**configure** router *string* mpls lsp-self-ping timeout *number*
Tree	timeout
Description	This command configures a timeout value for the LSP Self Ping timer. The LSP Self Ping timer starts when the RESV message is received for an LSP. The system periodically sends LSP Self Ping packets until the timer expires or the first LSP Self Ping reply is received, whichever comes first. If the timer expires before an LSP Self Ping packet is received, the configured timeout action is performed.
Range	3 to 3600
Units	seconds
Default	300
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Introduced	16.0.R1
Platforms	All

return-path-label *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	S-BFD return-path label
Context	**configure** router *string* mpls lsp-template *string* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.

Range	32 to 1048512
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *string* mpls lsp-template *string* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs. For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer. For RSVP-TE LSPs, the timer controls the following: • a path undergoing MBB when BFD is up • the initial administrative state of the LSP • the retry signaling of non-standby secondary paths
Range	1 to 60
Units	seconds
Default	4
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-stats *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Collect LSP statistics
Context	**configure** router *string* mpls lsp-template *string* egress-statistics collect-stats *boolean*
Tree	collect-stats
Description	When configured to **true**, this command enables LSP statistics collection. When you apply accounting policies, the forwarding engine collects data in the appropriate records and by default the CPU obtains and writes the results to the designated billing file. When configured to **false**, the forwarding engine still accumulates statistics. However, the CPU does not write them to the billing file. If you subsequently re-enable this command, the counters written to the billing file include all the traffic collected while the command was disabled.
Default	false
Introduced	16.0.R1
Platforms	All

path-computation-method *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Path computation method
Context	**configure** router *string* mpls lsp-template *string* path-computation-method *keyword*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	path-computation-method
Description	This command configures the path computation method of an RSVP-TE or SR-TE LSP. If this command is not configured to one of the supported options, the default path computation method is used depending on the type of LSP; the hop-to-label translation is used for the SR-TE LSP template and the IGP-based path is used for the RSVP-TE-LSP. See "SR-TE LSP path computation using hop-to-label translation" in the *7750 Service Router and 7950 Extensible Routing System Segment Routing nad PCE User Guide* for more information.
Options	local-cspf, pce
Introduced	19.7.R1
Platforms	All

resignal-on-igp-overload *boolean*

Synopsis	Resignal all RSVP-TE LSPs upon IGP overload
Context	**configure** router *string* mpls resignal-on-igp-overload *boolean*
Tree	resignal-on-igp-overload
Description	When configured to **true**, the receipt of the IS-IS overload bit in the TE-DB triggers the immediate resignaling of all RSVP-TE LSPs. MPLS forces the expiry of the resignal timer and the TE-DB computes a new CSPF for each RSVP-TE LSP active path. The re-optimization causes the immediate transition of RSVP-TE LSP paths away from the IS-IS node in overload using the MBB operation. This command cannot be configured to **true** when the **retry-on-igp-overloa**d command is configured to **true**. When configured to **false**, the default behavior is maintained where MBB re-optimization occurs only when a timer-based resignal is performed or a manual resignal is executed.
Default	false
Introduced	20.10.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

resignal-on-igp-event *boolean*

Synopsis	Re-optimize SR-TE LSPs upon IGP link events
Context	**configure** router *string* mpls sr-te-resignal resignal-on-igp-event *boolean*
Tree	resignal-on-igp-event
Description	When configured to **true**, the system signals the re-optimization of all SR-TE LSPs when one or more IGP link down events are received in the TE-DB. The triggered behavior is identical to the timer-based or resignal behavior or the manual-based resignal behavior used with a delay option. MPLS forces the expiry of the resignal timer and all active paths of all SR-TE LSPs are re-evaluated. When configured to **false**, re-optimization is not triggered by IGP events.
Default	false
Introduced	19.10.R1
Platforms	All

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

resignal-on-igp-overload *boolean*

Synopsis	Enable resignaling of SR-TE LSPs upon IGP overload
Context	**configure** router *string* mpls sr-te-resignal resignal-on-igp-overload *boolean*
Tree	resignal-on-igp-overload
Description	When configured to **true**, the system enables ad-hoc re-optimzation of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router. When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up. The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the **configure router mpls sr-te-resignal resignal-timer** command to configure the resignal timer for the SR-TE application. When configured to **false**, MPLS does not act immediately on an IS-IS overload bit from a remote router. MPLS acts on it at the next timer-based or manual re-optimization of the SR-TE LSPs.
Default	false
Introduced	23.3.R1
Platforms	All

resignal-timer *number*

Context	**configure** router *string* mpls static-lsp-fast-retry *number*
Tree	static-lsp-fast-retry
Range	1 to 30
Units	seconds
Default	30
Introduced	16.0.R1
Platforms	All

strict-ero-nhop-direct-resolution *boolean*

Synopsis	Resolves RSVP-TE LSP ERO to local and host routes only
Context	**configure** router *string* mpls strict-ero-nhop-direct-resolution *boolean*
Tree	strict-ero-nhop-direct-resolution
Description	When configured to **true**, the router enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table. This command applies to an ERO when all of the following conditions are met:

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- the ERO next hop is an IPv4 address
- the ERO object is a strict hop
- the IPv4 address matches the primary subnet of a local numbered interface

If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2).

When configured to **false**, the router disables the strict ERO next-hop direct resolution.

Default	false
Introduced	22.5.R1
Platforms	All

tunnel-table-pref

Synopsis	Enter the **tunnel-table-pref** context
Context	**configure** router *string* mpls tunnel-table-pref
Tree	tunnel-table-pref
Description	Commands in this context configure the tunnel table preference for RSVP-TE LSP and SR-TE LSP tunnel types.
Introduced	21.10.R1
Platforms	All

rsvp-te *number*

Synopsis	RSVP-TE tunnel table preference
Context	**configure** router *string* mpls tunnel-table-pref rsvp-te *number*
Tree	rsvp-te
Description	This command configures the tunnel table preference for RSVP-TE LSP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. Nokia recommends that tunnel types have unique preference values. In a situation where two or more tunnel types are set to the same preference value, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	7
Introduced	21.10.R1

Context	**configure** router *string* nat inside large-scale dual-stack-lite endpoint *string* ip-fragmentation *keyword*
Tree	ip-fragmentation
Options	fragment-ipv6, fragment-ipv6-unless-ipv4-df-set
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

min-first-fragment-size-rx *number*

Synopsis	Minimum MTU size for upstream packets
Context	**configure** router *string* nat inside large-scale dual-stack-lite endpoint *string* min-first-fragment-size-rx *number*
Tree	min-first-fragment-size-rx
Description	This command configures the minimum MTU size for the first fragment in the upstream direction. This command can be used to enable processing of first IPv6 fragments smaller than 1280 bytes. RFC 8200 recommends the minimum MTU in IPv6 be 1280 bytes which allows fragmentation only for packets that are larger than 1280 bytes. If a first fragment is smaller than 1280 bytes, DS-lite implementation in the SR OS, by default, drops the first fragment.
Range	512 to 1280
Default	1280
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reassembly *boolean*

Synopsis	Reassembly of IPv6 payload datagrams
Context	**configure** router *string* nat inside large-scale dual-stack-lite endpoint *string* reassembly *boolean*
Tree	reassembly
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-mtu *number*

Synopsis	DS-Lite tunnel MTU for this address

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* nat inside large-scale dual-stack-lite endpoint *string* tunnel-mtu *number*
Tree	tunnel-mtu
Description	This command configures the Dual Stack Lite (DS-Lite) tunnel MTU for this address.
Range	464 to 9212
Default	1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

max-subscriber-limit *number*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Largest value for all subscriber limits in each deterministic pool
Context	**configure** router *string* nat inside large-scale dual-stack-lite max-subscriber-limit *number*

nat-import *reference*

Synopsis	Import BGP-VPN routes in NAT inside routing context
Context	**configure** router *string* nat inside large-scale nat44 nat-import *reference*
Tree	nat-import
Description	This command references an import policy to determine the routes that should be installed in the routing table as NAT routes, which are used to steer traffic to NAT. A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route is associated with a NAT policy that maps traffic destined into a NAT pool and outside routing context. If the NAT policy is not explicitly configured in the import route-policy, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context. All BGP-VPN routes that are destined to be imported into NAT inside routing context must be configured with action-type accept in the route policy.
Reference	**configure** policy-options policy-statement *string*
Max. Instances	5
Notes	This element is ordered by the user.
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-prefix [ip-prefix-length] *string*

Synopsis	Enter the **source-prefix** list instance

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* nat inside large-scale nat44 source-prefix *string*
Tree	source-prefix
Description	Commands in this context configure the source prefix used to identify traffic for NAT processing. After the traffic is diverted to the ESA-VM or vISA, its source IP address is checked to determine if it belongs to the configured prefix. If it does, the traffic is processed by NAT, otherwise, it is dropped.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**ip-prefix-length**] *string*

address-pooling *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Outside IP address allocation mode for a NAT subscriber
Context	**configure** router *string* nat outside pool *string* address-pooling *keyword*
Tree	address-pooling
Description	This command configures address pooling which defines a relationship between the NAT subscriber and its outside IP address(es). The behavior in NAT, as defined in RFC 7857, strongly recommends that the NAT subscribers be mapped to a single outside IP address. If this outside IP address runs out of ports, no new ports for the subscriber are allocated. This behavior is called paired address pooling. The alternative behavior is arbitrary address pooling, where a NAT subscriber is mapped to multiple IP addresses when the current outside IP address runs out of ports. This way, the subscriber becomes associated with multiple outside IP addresses. While this results in better resource utilization in NAT, it may negatively affect the behavior of some applications.
Options	paired, arbitrary
Default	paired
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

address-range [start] *string* end *string*

icmp-echo-reply *boolean*

Synopsis	Allow NAT pool IP addresses to respond to ICMP PINGs
Context	**configure** router *string* nat outside pool *string* icmp-echo-reply *boolean*
Tree	icmp-echo-reply
Description	This command allows IP addresses in the NAT pool to respond to ICMP Echo requests (PINGs). The configuration can be toggled while the pool is in use. In L2-aware NAT when port-block-extensions is disabled, the reply from an outside IP address is generated only when this IP address has at least one host (binding) behind it. In L2-aware NAT when port-block-extensions is enabled, the reply from an outside IP address is generated regardless if a binding is present. In LSN, the reply from an outside IP address is generated regardless if a binding is present.
Default	false
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2-aware

Synopsis	Enter the **l2-aware** context
Context	**configure** router *string* nat outside pool *string* l2-aware

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	l2-aware
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-host

Synopsis	Enable the **default-host** context
Context	**configure** router *string* nat outside pool *string* l2-aware default-host
Tree	default-host
Description	Commands in this context configure the default DMZ host options. A default DMZ host is a node on the inside to which all unknown traffic is redirected by changing the destination IPv4 address in the traffic header. During this operation, the checksums in the Layer 3 and Layer 4 header (UDP and TCP) are recalculated. Unknown traffic in NAT represent all unmatched traffic arriving from the outside (where there is no pinhole or a matching flow record created by traffic initiated from the inside). The purpose of the default DMZ host is to capture and analyze the unknown traffic as part of threat analysis. The rate of redirected unknown traffic can be restricted by configuration.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

inside-router-instance *string*

Synopsis	Router instance of the DMZ
Context	**configure** router *string* nat outside pool *string* l2-aware default-host inside-router-instance *string*
Tree	inside-router-instance
Description	This command configures the router instance on the inside where the default DMZ host resides.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ip-address *string*

Synopsis	IP address of the default DMZ host
Context	**configure** router *string* nat outside pool *string* l2-aware default-host ip-address *string*
Tree	ip-address

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the IP address of the default DMZ host. Redirection to the default DMZ host is achieved by replacing the destination IP address in the traffic header in the unknown traffic initiated from the outside with the one of the default DMZ host.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rate-limit *number*

Synopsis	Rate limit for unknown traffic sent to default DMZ host
Context	**configure** router *string* nat outside pool *string* l2-aware default-host rate-limit *number*
Tree	rate-limit
Description	This command configures the rate limit of the unknown traffic sent to the default DMZ host. Unknown traffic sent to the default DMZ host is rate limited by a configurable value expressed in mbps. The rate limit is configurable per NAT pool per ISA, vISA, or ESA-VM.
Range	1 to 10000
Units	megabps
Default	10
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

external-assignment *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	External IP address for Layer-2-aware
Context	**configure** router *string* nat outside pool *string* l2-aware external-assignment *boolean*
Tree	external-assignment
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2023 Nokia.

port-block-extension

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **port-block-extension** context
Context	**configure** router *string* nat outside pool *string* l2-aware port-block-extension
Tree	port-block-extension
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ports *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Number of ports per dynamic port-block
Context	**configure** router *string* nat outside pool *string* l2-aware port-block-extension ports *number*
Tree	ports
Description	For Carrier Grade NAT (CGN), this command represents the size of all port blocks for NAT subscribes in the NAT pool. For L2-Aware NAT, this command represents only the size of the initial port block of a subscriber in the L2-aware NAT pool. Additional port-blocks (extended port blocks) for the L2-Aware subscriber must be explicitly enabled under the **l2-aware port-block-extension** hierarchy in the NAT pool. This command does not affect the size of extended port-blocks.
Range	10 to 5000
Notes	This element is mandatory.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context	**configure** router *string* nat outside pool *string* l2-aware port-block-extension subscriber-limit *number*
Tree	subscriber-limit
Description	When port-block extensions for the L2-Aware subscribers are enabled, the port space for an outside IP address is divided into the following: • well-known port (this is a fixed and permanently allocated block of ports for all NAT types) • static port-forwarding range (if enabled by configuration) • port range allocated for initial port blocks of each L2-Aware subscriber • port range allocated for extended port blocks for the remainder after the three previous port ranges The number of L2-Aware NAT subscribers per an outside IP address multiplied by the size of the initial port-block size determines the size of the port range reserved for initial port-blocks of each subscriber. The lower boundary of the extended port range is determined by adding the upper boundary of the configured port forwarding range and the size of the port range allocated for initial port blocks.
Range	2 to 2000
Notes	This element is mandatory.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

watermarks

Context	**configure** router *string* nat outside pool *string* large-scale
Tree	large-scale
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-host

Synopsis	Enable the **default-host** context
Context	**configure** router *string* nat outside pool *string* large-scale default-host
Tree	default-host
Description	Commands in this context configure the default DMZ host options. A default DMZ host is a node on the inside to which all unknown traffic is redirected by changing the destination IPv4 address in the traffic header. During this operation, the checksums in the Layer 3 and Layer 4 header (UDP and TCP) are recalculated. Unknown traffic in NAT represent all unmatched traffic arriving from the outside (where there is no pinhole or a matching flow record created by traffic initiated from the inside). The purpose of the default DMZ host is to capture and analyze the unknown traffic as part of threat analysis. The rate of redirected unknown traffic can be restricted by configuration.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

inside-router-instance *string*

Synopsis	Router instance of the DMZ
Context	**configure** router *string* nat outside pool *string* large-scale default-host inside-router-instance *string*
Tree	inside-router-instance
Description	This command configures the router instance on the inside where the default DMZ host resides.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ip-address *string*

Synopsis	IP address of the default DMZ host
Context	**configure** router *string* nat outside pool *string* large-scale default-host ip-address *string*

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ip-address
Description	This command configures the IP address of the default DMZ host. Redirection to the default DMZ host is achieved by replacing the destination IP address in the traffic header in the unknown traffic initiated from the outside with the one of the default DMZ host.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rate-limit *number*

Synopsis	Rate limit for unknown traffic sent to default DMZ host
Context	**configure** router *string* nat outside pool *string* large-scale default-host rate-limit *number*
Tree	rate-limit
Description	This command configures the rate limit of the unknown traffic sent to the default DMZ host. Unknown traffic sent to the default DMZ host is rate limited by a configurable value expressed in mbps. The rate limit is configurable per NAT pool per ISA, vISA, or ESA-VM.
Range	1 to 10000
Units	megabps
Default	10
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

deterministic

Synopsis	Enter the **deterministic** context
Context	**configure** router *string* nat outside pool *string* large-scale deterministic
Tree	deterministic
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-reservation *number*

Synopsis	Number of ports per deterministic port-block
Context	**configure** router *string* nat outside pool *string* large-scale deterministic port-reservation *number*
Tree	port-reservation
Range	1 to 65536
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** router *string* nat outside pool *string* large-scale deterministic watermarks
Tree	watermarks
Description	Commands in this context monitor extended (dynamic) port-block utilization per outside IP in a NAT pool in deterministic LSN. High and low thresholds are configured in percentages of total available extended port-blocks per outside IP in a pool. Both values represent extended port-block utilization or occupancy per outside IP in a pool. For the system to generate those events, the NAT event-id 2045 must be enabled through configuration in the log event-control.
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

high *number*

Synopsis	High watermark percentage
Context	**configure** router *string* nat outside pool *string* large-scale deterministic watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dynamic-block-reservation *boolean*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Synopsis	Reserve dynamic block for subscriber
Context	**configure** router *string* nat outside pool *string* port-forwarding dynamic-block-reservation *boolean*
Tree	dynamic-block-reservation
Description	When configured to **true**, the system reserves dynamic port block when the first port forward for the subscriber is created. The dynamic port block allocation is logged only if the block is being used and mappings are created. Dynamic port block reservation due to the port forward creation but without any dynamic mapping, is not logged. The reserved port block is released only when the last mapping in the block expires and there are no port forwards associated with the subscriber. The de-allocation log (syslog or RADIUS) is generated when the dynamic port block is completely released. Dynamic port block reservations can be enabled only if the configured maximum number of subscribers per outside IP addresses are less than or equal to the maximum number of configured port blocks per outside IP address. When configured to **false**, dynamic port blocks are not reserved when the first port forward for the subscriber is created.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

range-end *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	End of the wildcard range for port forwards
Context	**configure** router *string* nat outside pool *string* port-forwarding range-end *number*
Tree	range-end
Description	This command configures the upper boundary of the wildcard port range dedicated to port forwarding in a NAT pool, whereas the **range-start** command configures the lower boundary (the starting port) of the wildcard port range dedicated to port forwarding in a NAT pool. If unconfigured, the **range-end** implicit value is set to 1023, that represents the end of the well-known port range that is always enabled. Port forwards are supported only in pools in NAPT mode. Pools in 1:1 mode do not support port-forwards.
Range	0 | 1023 to 65535

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

range-start *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Start of the wildcard range for port forwards
Context	**configure** router *string* nat outside pool *string* port-forwarding range-start *number*
Tree	range-start
Description	This command configures the lower boundary (the starting port) of the wildcard port range dedicated to port forwarding in a NAT pool, whereas the **range-end** command configures the upper boundary of the wildcard port range dedicated to port forwarding in a NAT pool. Port 0 is always excluded from the port forwarding range. Port forwards are supported only in pools in Network Address and Port Translation (NAPT) mode. Pools in 1:1 mode do not support configured port forwards.
Range	0 | 1 | 1025 to 65535
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-reservation

Synopsis	Enter the **port-reservation** context
Context	**configure** router *string* nat outside pool *string* port-reservation
Tree	port-reservation

Synopsis	Port block size for NAT subscribers
Context	**configure** router *string* nat outside pool *string* port-reservation port-blocks *number*
Tree	port-blocks
Description	In CGN, this command specifies the number of port-blocks per outside IP address in the NAT pool. The available ports per outside IP address (the end port minus the upper bound value of the static port-forwarding range) are divided into the number of port blocks specified in this command. This implicitly determines the size of each port block. For L2-aware NAT, this command can be configured only if the port block extensions (extended port blocks) are disabled. You must disable the **l2-aware port-block-extension** hierarchy in the NAT pool.
Range	0 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ports *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Size of the port block for NAT subscribers
Context	**configure** router *string* nat outside pool *string* port-reservation ports *number*
Tree	ports
Description	For carrier-grade NAT (CGN), this command specifies the size of port blocks for NAT subscribes in the NAT pool. For L2-aware NAT, this command specifies the size of the initial port-block of a subscriber in the pool. Additional port blocks (extended port blocks) for the L2-aware subscriber must be explicitly enabled under the **l2-aware port-block-extension** hierarchy in the NAT pool. This command does not affect the size of extended port blocks.
Range	1 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.

interface [interface-name] *string*

Synopsis	Enter the **interface** list instance
Context	**configure** router *string* ospf *number* area *string* interface *string*
Tree	interface
Description	Commands in this context configure the attributes of the OSPF area interface. Unless they are explicitly configured, interfaces are not activated by default in any interior gateway protocol such as OSPF.
Introduced	16.0.R1
Platforms	All

[**interface-name**] *string*

Synopsis	Router interface name
Context	**configure** router *string* ospf *number* area *string* interface *string*
Tree	interface
Description	This command specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **configure router interface** and **configure service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be a string composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message is returned. If the IP interface exists in a different area it is moved to this area.
String Length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

adjacency-set [id] *reference*

Synopsis	Add a list entry for **adjacency-set**
Context	**configure** router *string* ospf *number* area *string* interface *string* adjacency-set *reference*
Tree	adjacency-set
Max. Instances	1024

Use subject to Terms available at: www.nokia.com/terms.

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** router *string* ospf *number* area *string* interface *string* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	23.3.R1
Platforms	All

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** router *string* ospf *number* area *string* interface *string* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds
Introduced	23.3.R1
Platforms	All

dead-interval *number*

Synopsis	OSPF wait time for Hellos before neighbor declared down
Context	**configure** router *string* ospf *number* area *string* interface *string* dead-interval *number*

interface-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Interface type
Context	**configure** router *string* ospf *number* area *string* interface *string* interface-type *keyword*
Tree	interface-type
Description	This command specifies the interface type. **broadcast** - Broadcast network To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet. **non-broadcast** - Non-broadcast network **point-to-point** - Point-to-point link Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point. **p2mp-nbma** - Point-to-multipoint on a link without broadcast or multicast support No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type. **secondary** - Multiple secondary adjacencies allowed A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.
Options	broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma
Introduced	16.0.R1
Platforms	All

load-balancing-weight *number*

Synopsis	Load balancing weight for an OSPF interface

node-sid

Synopsis	Enable the **node-sid** context
Context	**configure** router *string* ospf *number* area *string* interface *string* node-sid
Tree	node-sid
Description	Commands in this context configure a node SID index or label value for the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address. In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary. This command fails if the network interface is not a loopback type or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node. The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required because the index and, therefore, the label ranges of IGP instances are not allowed to overlap. The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set. The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS resolves to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

Platforms	All

clear-n-flag *boolean*

Synopsis	Clear the N-flag in an OSPF prefix
Context	**configure** router *string* ospf *number* area *string* interface *string* node-sid clear-n-flag *boolean*
Tree	clear-n-flag
Description	When configured to **true**, this command allows the user to clear the N-flag in an OSPF prefix SID sub-TLV originated for the prefix of a loopback interface on the system. When configured to **false**, the N-flag in an OSPF prefix SID sub-TLV originated for the prefix of a loopback interface on the system is not cleared. When the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

advertise *reference*

Synopsis	Flexible Algorithm Definition advertisement
Context	**configure** router *string* ospf *number* flexible-algorithms flex-algo *number* advertise *reference*
Tree	advertise
Description	This command enables the advertisement of a locally configured Flexible Algorithm Definition (FAD). The winning FAD that a router uses must be consistent with the winning FAD on all other routers, which avoids routing loops and traffic blackholing. The winning FAD is selected using a tiebreaker algorithm that first selects the highest advertised FAD priority followed by the highest system ID.
Reference	**configure** routing-options flexible-algorithm-definitions flex-algo *string*
Introduced	21.7.R1
Platforms	All

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context

allow-sr-over-srte *boolean*

Synopsis	Enable SR over SR-TE LSPs
Context	**configure** router *string* ospf *number* igp-shortcut allow-sr-over-srte *boolean*
Tree	allow-sr-over-srte
Description	When configured to **true**, the router only allows SR-MPLS SRv4 and SRv6 IGP shortcuts to use SR-TE LSPs with **allow-sr-over-srte** explicitly enabled with an adjacency SID as top SID in the SR-TE LSP. IPv4 and IPv6 addresses can use all available SR-TE LSPs as IGP shortcuts regardless of the explicit **allow-sr-over-srte** configuration. Under ECMP, when this command is configured to **true**, preference is given to the SR-TE LSPs with **allow-sr-over-srte** explicitly configured over the LSPs that do not have **allow-sr-over-srte** configured.
Default	false
Introduced	23.3.R1
Platforms	All

Synopsis	Policy to exclude prefixes from LFA SPF calculation
Context	**configure** router *string* ospf *number* loopfree-alternate exclude prefix-policy *reference*
Tree	prefix-policy
Description	This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation. An excluded prefix is not included in LFA calculation regardless of its priority. The prefix tag is, however, used in the main SPF.
Reference	**configure** policy-options policy-statement *string*
Max. Instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R3
Platforms	All

multi-homed-prefix

Synopsis	Enable the **multi-homed-prefix** context
Context	**configure** router *string* ospf *number* loopfree-alternate multi-homed-prefix
Tree	multi-homed-prefix
Description	Commands in this context configure a multihomed prefix LFA for both RTM routes (IP FRR) and SR-OSPF tunnels. SR-OSPF tunnels enable multihomed prefix extension in both algorithm 0 and flexible-algorithm numbers. This feature makes use of the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes. This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of local anycast prefixes.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The computed IP next-hop based backup path is added to OSPF routes of external /32 prefixes (OSPFv2 routes types 3, 4, 5, and 7) and local /32 anycast prefixes in the RTM if the prefix is not protected by base LFA or if the user set leaf preference value to all. The user must enable the ip-fast-reroute leaf to have these backup paths programmed into the FIB in datapath.

The computed IP next hop or repair tunnel based backup path is also programmed for SR-OSPF node SID tunnels of external /32 prefixes and to /32 prefixes in same area as the computing node S and which are advertised by multiple routers (anycast prefix) in both algorithm 0 and flexible-algorithm numbers.

Context	**configure** router *string* ospf *number* loopfree-alternate ti-lfa max-sr-frr-labels *number*
Tree	max-sr-frr-labels
Description	This command configures the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.
Range	0 to 3
Default	2
Introduced	16.0.R1
Platforms	All

adj-sid-hold *(number | keyword)*

Synopsis Adjacency SID hold time

Context **configure** router *string* ospf *number* segment-routing adj-sid-hold *(number | keyword)*

Tree adj-sid-hold

Description This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

tunnel-table-pref *number*

Synopsis	Preference of SR tunnels created by the IGP instance
Context	**configure** router *string* ospf *number* segment-routing tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel type explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available. The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs. The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note: The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on the lowest IGP instance ID. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

Nokia recommends not to set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

advertise-delay *boolean*

Synopsis	Enable the advertisement of link delay for TE
Context	**configure** router *string* ospf *number* traffic-engineering-options advertise-delay *boolean*
Tree	advertise-delay
Description	When configured to **true**, the router advertises link delay in the IGP LSDB within the OSPF-TE TLV attribute or when the Application-Specific Link Attribute (ASLA) is enabled within SR-TE ASLA. When the router is configured under the **configure router ospf traffic-engineering-options sr-te application-specific-link-attributes** command to generate SR-TE ASLA attributes, link delay is advertised as a legacy RFC 3630 TLV when RSVP-TE is enabled and as an ASLA RFC 8920 TLV for SR-TE when MPLS is enabled for an interface. SR OS accepts and handles both legacy RSVP-TE TLVs and ASLAs for the RSVP application. However, SR OS only advertises RFC 3630 legacy RSVP-TE TLVs (as recommended by RFC 8920) to avoid compatibility issues. When configured to **false**, the router disables link delay advertisement.
Default	false
Introduced	22.10.R1
Platforms	All

sr-te *keyword*

[**interface-name**] *string*

Synopsis	Router interface name
Context	**configure** router *string* ospf3 *number* area *string* interface *string*
Tree	interface
Description	This command specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **configure router interface** and **configure service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be a string composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message is returned. If the IP interface exists in a different area it is moved to this area.
String Length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** router *string* ospf3 *number* area *string* interface *string* bfd-liveness strict *boolean*
Tree	strict

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	23.3.R1
Platforms	All

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** router *string* ospf3 *number* area *string* interface *string* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds
Introduced	23.3.R1
Platforms	All

Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Interface type
Context	**configure** router *string* ospf3 *number* area *string* interface *string* interface-type *keyword*
Tree	interface-type
Description	This command specifies the interface type.

broadcast - Broadcast network

To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

non-broadcast - Non-broadcast network

point-to-point - Point-to-point link

Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point.

p2mp-nbma - Point-to-multipoint on a link without broadcast or multicast support

No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type.

secondary - Multiple secondary adjacencies allowed

A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

clear-n-flag *boolean*

Synopsis	Clear the N-flag in an OSPF3 prefix
Context	**configure** router *string* ospf3 *number* area *string* interface *string* node-sid clear-n-flag *boolean*
Tree	clear-n-flag
Description	When configured to **true**, this command allows the user to clear the N-flag in an OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. When configured to **false**, the N-flag in an OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system is not cleared. When the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.
Default	false
Introduced	16.0.R5
Platforms	All

export-policy *reference*

Synopsis	Export policies that determine exported routes

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *string* ospf3 *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS. If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied. Routing policies are created in the **configure router policy-options** context.
Reference	**configure** policy-options policy-statement *string*
Max. Instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

max-sr-frr-labels *number*

Synopsis	Maximum number of labels the TI-LFA backup path can use
Context	**configure** router *string* ospf3 *number* loopfree-alternate ti-lfa max-sr-frr-labels *number*
Tree	max-sr-frr-labels
Description	This command configures the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.
Range	0 to 3
Default	2
Introduced	16.0.R5
Platforms	All

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time
Context	**configure** router *string* ospf3 *number* segment-routing adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency. When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

© 2023 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
