Tree	security-policy
Description	Commands in this context specify a security policy used by the tunnel.
Introduced	22.7.R1
Platforms	VSR

id *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Security policy ID for use by the tunnel
Context	**configure** router *named-item-64* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy id *number*
Tree	id
Max. range	0 to 4294967295
Introduced	22.7.R1
Platforms	VSR

strict-match *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	**configure** router *named-item-64* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy strict-match *boolean*
Tree	strict-match

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this command enables strict match of the security policy entry. When a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry. If there is no match, the setup fails, and TS_UNACCEPTABLE is sent. If there is a match, but there is an existing CHILD_SA for the matched security policy, the setup fails, and NO_PROPOSAL_CHOSEN is sent. If there is a match, and there is not a CHILD_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD_SA is created.
Default	false
Introduced	22.7.R1
Platforms	VSR

ipv6-exception *reference*

Synopsis	IPv6 filter exception used to bypass encryption
Context	**configure** router *named-item-64* interface *interface-name* ipsec ipv6-exception *reference*
Tree	ipv6-exception
Description	This command specifies the IPv6 filter exception for an IPsec-secured IPv6 interface. When an IPv6 filter exception is added, clear text packets that match the exception criteria in the IPv6 filter exception can ingress the interface, even when IPsec is enabled on the interface.
Reference	**configure** filter ipv6-exception *filter-name*
Introduced	22.7.R1
Platforms	VSR

public-sap *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

multiplier *number*

Synopsis	Number of consecutive BFD messages missed from the peer
Context	**configure** router *named-item-64* interface *interface-name* ipv4 bfd multiplier *number*
Tree	multiplier
Description	This command configures the number of missed messages before the BFD session state is changed to down and the upper-level protocol is notified of the fault. A multiplier of less than 3 should not be used in production environments.
Range	1 to 20
Default	3
Introduced	16.0.R1
Platforms	All

receive *number*

Synopsis	BFD receive interval over this interface
Context	**configure** router *named-item-64* interface *interface-name* ipv4 bfd receive *number*
Tree	receive
Description	This command specifies the receive interval for the BFD session. On the 7750 SR, this command can only be configured to a value less than 100 when the **type** command is configured to **cpm-np**.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	16.0.R1
Platforms	All

transmit-interval *number*

Synopsis	BFD transmit interval over this interface
Context	**configure** router *named-item-64* interface *interface-name* ipv4 bfd transmit-interval *number*
Tree	transmit-interval
Description	This command configures the transmit intervals. On the 7750 SR, this command can only be configured to a value less than 100 when the **type** command is configured to **cpm-np**.

Range	10 to 100000
Units	milliseconds
Default	100
Introduced	16.0.R1
Platforms	All

type *keyword*

Synopsis	Local termination point for the BFD session
Context	**configure** router *named-item-64* interface *interface-name* ipv4 bfd type *keyword*
Tree	type
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: • **auto** (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the **cpm-np**. • **cpm-np** – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems. • **fp** – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.
Options	cpm-np, auto, fp
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

dhcp

Synopsis	Enter the **dhcp** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp

Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	All

gi-address *ipv4-unicast-address*

Synopsis	GI address for the DHCP relay
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp gi-address *ipv4-unicast-address*
Tree	gi-address
Description	This command configures the GI address to distinguish between the different subscriber interfaces (and potentially group interfaces) defined when the router functions as a DHCP relay. By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.
Introduced	16.0.R1
Platforms	All

option-82

Synopsis	Enter the **option-82** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	option-82
Description	Commands in this context configure the processing required when the router receives a DHCP request that already has an Option 82 field in the packet.
Introduced	16.0.R1
Platforms	All

action *keyword*

Synopsis	Action to take with received DHCP Option 82
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 action *keyword*
Tree	action
Options	replace, drop, keep
Default	keep
Introduced	16.0.R1
Platforms	All

circuit-id

Synopsis	Enter the **circuit-id** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 circuit-id
Tree	circuit-id
Introduced	16.0.R1
Platforms	All

ascii-tuple

Synopsis	Use the ASCII-encoded tuple for the circuit ID
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 circuit-id ascii-tuple
Tree	ascii-tuple
Notes	The following elements are part of a choice: **ascii-tuple**, **if-name**, **ifindex**, **none**, **port-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

if-name

Synopsis	Use the interface name for the circuit ID
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 circuit-id if-name
Tree	if-name
Notes	The following elements are part of a choice: **ascii-tuple**, **if-name**, **ifindex**, **none**, **port-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

ifindex

Synopsis	Use the interface index for the circuit ID
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 circuit-id ifindex
Tree	ifindex
Notes	The following elements are part of a choice: **ascii-tuple**, **if-name**, **ifindex**, **none**, **port-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

none

Synopsis	Do not include the circuit ID
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 circuit-id none
Tree	none
Notes	The following elements are part of a choice: **ascii-tuple**, **if-name**, **ifindex**, **none**, **port-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

port-id

Synopsis	Use the port ID for the circuit ID

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 circuit-id port-id
Tree	port-id
Notes	The following elements are part of a choice: **ascii-tuple**, **if-name**, **ifindex**, **none**, **port-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

vlan-ascii-tuple

Synopsis	Include the VLAN ID and dot1p bits in the ASCII tuple
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 circuit-id vlan-ascii-tuple
Tree	vlan-ascii-tuple
Description	When configured, the router includes the VLAN ID and dot1p bits with the ASCII-tuple information. This only occurs on dot1q and QinQ-encapsulated ports. When the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of the outgoing packet. When unconfigured, the router leaves the circuit ID sub-option of the DHCP packet empty.
Notes	The following elements are part of a choice: **ascii-tuple**, **if-name**, **ifindex**, **none**, **port-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

remote-id

Synopsis	Enter the **remote-id** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 remote-id
Tree	remote-id
Description	Commands in this context configure the remote IP sub-option of the DHCP packet with the identity of the remote host end (typically the DHCP client).
Introduced	16.0.R1
Platforms	All

ascii-string *string-not-all-spaces*

Synopsis	User-defined ASCII string for the remote ID

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 remote-id ascii-string *string-not-all-spaces*

Platforms	All

relay-plain-bootp *boolean*

Synopsis	Relay plain BOOTP messages
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp relay-plain-bootp *boolean*
Tree	relay-plain-bootp
Description	When configured to **true**, the system relays plain BOOTP messages. When configured to **false**, the system considers the plain BOOTP packets as malformed DHCP packets; therefore, the system does not relay the messages.
Default	false
Introduced	16.0.R1
Platforms	All

release-include-gi-address *boolean*

Synopsis	Include gateway IP address in DHCP Release messages
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp release-include-gi-address *boolean*
Tree	release-include-gi-address
Default	false
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server *ipv4-unicast-address*

Synopsis	IP addresses for DHCP server requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp server *ipv4-unicast-address*
Tree	server
Description	This command configures a list of servers that this interface forwards requests to. The operator can enter the list of servers as either IP addresses or fully qualified domain names. The operator must specify at least one server specified for DHCP relay to work. If there are multiple servers, the system forwards the request to all the servers in the list.
Max. instances	8

src-ip-addr *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp src-ip-addr *keyword*
Tree	src-ip-addr
Options	auto, gi-address
Default	auto
Introduced	16.0.R1
Platforms	All

trusted *boolean*

Synopsis	Relay untrusted packets
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp trusted *boolean*
Tree	trusted
Description	When configured to **true**, the router enables the trusted mode on the interface. When enabled, the relay agent changes the existing GI address (of the request) to the ingress interface, and forwards the request. A DHCP request that contains a GI address of 0.0.0.0 and an Option 82 field in the packet is discarded unless it arrives on a trusted circuit. This behavior only applies if the Relay Agent Information Option action is to keep the existing information. When the Option 82 field is replaced by the relay agent, the original Option 82 information is lost, and there is no reason to enable the trusted option.
Default	false
Introduced	16.0.R1
Platforms	All

icmp

Synopsis	Enter the **icmp** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 icmp
Tree	icmp

neighbor-discovery

Synopsis	Enter the **neighbor-discovery** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery
Tree	neighbor-discovery
Introduced	16.0.R1
Platforms	All

learn-unsolicited *boolean*

Synopsis	Learn new entries from any received NA message
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery learn-unsolicited *boolean*
Tree	learn-unsolicited
Description	When configured to **true**, the router can learn neighbor entries from received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited (S) flag set. The command can be enabled for global addresses, link-local addresses, or for both. When configured to **false**, the router follows standard behavior for learning neighbor entries. • If an unsolicited NA (regardless of the S flag) is received from a neighbor that is not yet in the Neighbor Discovery (ND) cache, the NA is ignored. • If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the STALE state.
Default	false
Introduced	16.0.R1
Platforms	All

limit

Synopsis	Enter the **limit** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery limit
Tree	limit
Description	Commands in this context configure the maximum number of dynamic neighbor entries that can be learned on the interface

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When the number of entries reaches the threshold (the configured percentage) of this limit, the system sends an SNMP trap.

When the limit is exceeded, the system learns no new entries until an entry expires and traffic to these destinations is dropped. Already learned entries are refreshed.

Introduced	16.0.R1
Platforms	All

log-only *boolean*

Synopsis	Generate log entries only if limit is reached
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery limit log-only *boolean*
Tree	log-only
Default	false
Introduced	16.0.R1

Platforms	All

local-proxy-arp *boolean*

Synopsis	Enable local proxy ARP on interface
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery local-proxy-arp *boolean*
Tree	local-proxy-arp
Description	When configured to **true**, the router enables local proxy ARP on the interface. When configured to **false**, the router does not respond to ARP requests for addresses on the same subnet.
Introduced	16.0.R1
Platforms	All

proactive-refresh *boolean*

Synopsis	Send a single refresh message before entry timeout
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery proactive-refresh *boolean*
Tree	proactive-refresh
Description	When configured to **true**, the router always sends a refresh message 30 seconds before the timeout of the entry (a single refresh message with no retries). When configured to **false**, the router marks an entry as stale 30 seconds before age-out, and the router only sends an ARP request to refresh the entry if the IOM receives traffic that uses it. Then, the IOM asks the ARP application to send a refresh message. With ARP proactive refresh enabled, the ARP module sends a refresh message regardless of the IOM receiving traffic.
Default	false
Introduced	16.0.R1
Platforms	All

proxy-arp-policy *reference*

Synopsis	Proxy ARP policy name
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery proxy-arp-policy *reference*

address *ipv4-unicast-address*

Synopsis	Primary IPv4 address assigned to the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv4 primary address *ipv4-unicast-address*
Tree	address
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

broadcast *keyword*

Synopsis	Broadcast address format
Context	**configure** router *named-item-64* interface *interface-name* ipv4 primary broadcast *keyword*
Tree	broadcast
Description	This command overrides the default broadcast address that the IP interface uses when sourcing IP broadcasts. This command does not affect the type of broadcasts the IP interface can receive. The IP interface can receive either the local broadcast or the valid subnet broadcast address sent by a host.
Options	all-ones, host-ones
Default	host-ones
Introduced	16.0.R1
Platforms	All

gre-termination *boolean*

Synopsis	Enable GRE termination
Context	**configure** router *named-item-64* interface *interface-name* ipv4 primary gre-termination *boolean*
Tree	gre-termination
Description	When configured to **true**, the router terminates MPLS-over-GRE and IP-over-GRE packets for destination IP addresses from a user-defined subnet. The user defines a subnet for the termination of GRE packets by executing this command on a numbered network IP interface or a loopback interface.
Default	false

track-srrp *number*

Synopsis	SRRP instance whose state is tracked on this IP address
Context	**configure** router *named-item-64* interface *interface-name* ipv4 primary track-srrp *number*
Tree	track-srrp
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

qos-route-lookup *keyword*

Synopsis	IP address for QoS route lookup for ingress IP packets
Context	**configure** router *named-item-64* interface *interface-name* ipv4 qos-route-lookup *keyword*
Tree	qos-route-lookup
Description	This command specifies the IP address type used for QPPB enabled per-packet QoS handling (in terms of FC and priority). When using QPPB, routes are associated with a QoS treatment (FC and optionally priority) through either explicit configuration or the route policy. If an IPv4 or IPv6 packet arrives on an interface where the configuration of this command applies to the packet, the QoS treatment of the packet is based on the route that matched the destination IP address or the route that matched the source IP address.

Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of VRRP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated. An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

authentication-key *encrypted-leaf*

Synopsis	Password for simple text authentication
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command optionally assigns a simple text password authentication key to generate master VRRP advertisement messages and validate received VRRP advertisement messages. If this command is re-executed with a different password key defined, the new key immediately replaces the old key. This command may be executed at any time.
String length	1 to 38
Introduced	16.0.R1
Platforms	All

backup *ipv4-unicast-address*

Synopsis	Virtual router IP addresses for the interface

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* backup *ipv4-unicast-address*
Tree	backup
Description	This command associates virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instances create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance. For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is advertising to backup virtual routers receiving the messages. The specified *unicast-ipv4-address* must be equal to one of the existing IP addresses in the parental IP interface (primary or secondary) or this command fails. See "Owner and non-owner VRRP" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about owner and non-owner virtual router instances.
Max. instances	16
Introduced	16.0.R1
Platforms	All

bfd-liveness

Synopsis	Enable the **bfd-liveness** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* bfd-liveness
Tree	bfd-liveness
Description	Commands in this context assign a Bidirectional Forwarding Detection (BFD) session to a specific VRRP or SRRP instance. This BFD session provides a heartbeat mechanism that speeds up the transition of the standby VRRP router to an active state. If the associated BFD session fails, the VRRP routers immediately send a VRRP advertisement message. In addition, the standby VRRP routers transition to a master state to speed up convergence. The VRRP election process takes place based on the advertisement messages sent by all VRRP routers. Only one BFD session can be assigned to any VRRP or SRRP instance, but multiple SRRP or VRRP sessions can use the same BFD session.
Introduced	16.0.R1

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* mac *mac-unicast-address*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address. Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC. An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.

Introduced 16.0.R1

Platforms All

master-int-inherit *boolean*

Synopsis Allow master instance to dictate the master down timer

Context **configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* master-int-inherit *boolean*

Tree master-int-inherit

Description When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 16.0.R1

Platforms All

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

Context **configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* message-interval *number*

Tree message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

The usage of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

Range	1 to 2559
Units	deciseconds
Default	10
Introduced	16.0.R1
Platforms	All

monitor-oper-group *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	VRRP instance to follow a specified operational group
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* monitor-oper-group *reference*
Tree	monitor-oper-group
Description	This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router, the operational group is up and the operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	22.2.R1
Platforms	All

ntp-reply *boolean*

Synopsis	Allow processing of NTP requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* ntp-reply *boolean*
Tree	ntp-reply
Description	When configured to **true**, the router redirects NTP requests to the VRRP virtual IP address. This behavior only applies to the router acting as the master VRRP router. When configured to **false**, the router does not process NTP requests.
Default	false

Introduced	20.2.R1
Platforms	All

oper-group *reference*

Synopsis	Operational group name associated with the VRRP
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* oper-group *reference*
Tree	oper-group
Description	This command configures an operational group to associate with the VRRP. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up. The operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	16.0.R1
Platforms	All

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down). When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.
Default	false
Introduced	16.0.R1
Platforms	All

ping-reply *boolean*

Synopsis	Allow non-owner master to reply to ICMP echo requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* ping-reply *boolean*
Tree	ping-reply
Description	When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address). When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.
Default	false
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policy *reference*

Synopsis	VRRP priority control policy
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* policy *reference*
Tree	policy
Description	This command configures a VRRP priority control policy to associate with the virtual router instance. VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis. An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value. For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.
Reference	**configure** vrrp policy *number*
Introduced	16.0.R1
Platforms	All

preempt *boolean*

Synopsis	Allow the VRRP to override an existing non-owner master
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* preempt *boolean*
Tree	preempt
Description	When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router. When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.
Default	true
Introduced	16.0.R1
Platforms	All

priority *number*

Synopsis	Base priority for the VRRP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* priority *number*
Tree	priority
Description	This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process. The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

ssh-reply *boolean*

Synopsis	Allow the non-owner master to reply to SSH requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* ssh-reply *boolean*
Tree	ssh-reply
Description	When configured to **true**, the router allows the non-owner master to reply to SSH requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the SSH request. SSH cannot be disabled at the management security level (either on the parental IP interface or on the SSH source host address). When configure to **false**, SSH requests to non-owner master virtual IP addresses are silently discarded.
Default	false
Introduced	16.0.R1
Platforms	All

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	16.0.R1
Platforms	All

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	16.0.R1
Platforms	All

ipv6

Synopsis	Enable the **ipv6** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6
Tree	ipv6
Introduced	16.0.R1
Platforms	All

address [ipv6-address] *ipv6-address*

Synopsis	Enter the **address** list instance
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address*
Tree	address
Description	Commands in this context assign an IPv6 address to the interface. A global IPv6 address and *prefix-length* combined create a locally configured interface IPv6 prefix and subnet. The defined global IP prefix must be unique within the context of a routing instance. It cannot overlap with any other existing global IP prefix defined on another IP interface within the same routing context. This overlap restriction is not applicable for IPv6 host addresses configured on loopback interfaces. For example, an IPv6 loopback host address configured on a loopback interface may overlap with another prefix subnet configured on another IP interface within the same routing context.
Introduced	16.0.R1
Platforms	All

[**ipv6-address**] *ipv6-address*

Synopsis	IPv6 address assigned to the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address*
Tree	address
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

duplicate-address-detection *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Enable Duplicate Address Detection
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD). When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.
Default	true
Introduced	16.0.R1
Platforms	All

eui-64 *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Form IPv6 address from prefix and 64-bit interface ID
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* eui-64 *boolean*
Tree	eui-64
Description	When configured to **true**, the router forms a complete IPv6 address from the supplied prefix and 64-bit interface identifier. The 64-bit interface identifier is derived from the MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, use the base MAC address of the chassis.
Default	false
Introduced	16.0.R1
Platforms	All

prefix-length *number*

Synopsis	IPv6 address prefix length

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* prefix-length *number*
Tree	prefix-length
Range	4 to 128
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

primary-preference *number*

Synopsis	Index assigned to the IPv6 address of the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* primary-preference *number*
Tree	primary-preference
Description	This command assigns a primary preference index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications that require a fixed address of the interface, such as LDP and Segment Routing. In cases where a fixed address is required when originating packets from the interface, the IPv6 address with the lowest primary preference index is selected. If the selected address is removed, the next IPv6 address with the next lowest primary preference index is selected. If this index is not specified for the IPv6 address, the system assigns the next available index value to the address. The address index space is unique across all addresses of a given interface.
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

track-srrp *number*

Synopsis	SRRP ID whose state is tracked on this IP address
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* track-srrp *number*
Tree	track-srrp
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

bfd

Synopsis	Enter the **bfd** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6 bfd
Tree	bfd
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of BFD sessions
Context	**configure** router *named-item-64* interface *interface-name* ipv6 bfd admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

echo-receive *number*

Synopsis	Minimum echo interval over this interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 bfd echo-receive *number*
Tree	echo-receive
Range	100 to 100000
Units	milliseconds
Introduced	16.0.R1
Platforms	All

multiplier *number*

Synopsis	Number of consecutive BFD messages missed from the peer
Context	**configure** router *named-item-64* interface *interface-name* ipv6 bfd multiplier *number*
Tree	multiplier
Description	This command configures the number of missed messages before the BFD session state is changed to down and the upper-level protocol is notified of the fault. A multiplier of less than 3 should not be used in production environments.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	1 to 20
Default	3
Introduced	16.0.R1
Platforms	All

receive *number*

Synopsis	BFD receive interval over this interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 bfd receive *number*
Tree	receive
Description	This command specifies the receive interval for the BFD session. On the 7750 SR, this command can only be configured to a value less than 100 when the **type** command is configured to **cpm-np**.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	16.0.R1
Platforms	All

transmit-interval *number*

Synopsis	BFD transmit interval over this interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 bfd transmit-interval *number*
Tree	transmit-interval
Description	This command configures the transmit intervals. On the 7750 SR, this command can only be configured to a value less than 100 when the **type** command is configured to **cpm-np**.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.

type *keyword*

Synopsis	Local termination point for the BFD session
Context	**configure** router *named-item-64* interface *interface-name* ipv6 bfd type *keyword*
Tree	type
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: • **auto** (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the **cpm-np**. • **cpm-np** – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems. • **fp** – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.
Options	cpm-np, auto, fp
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

duplicate-address-detection *boolean*

Synopsis	Enable Duplicate Address Detection
Context	**configure** router *named-item-64* interface *interface-name* ipv6 duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD) on the interface. When configured to **false**, the router disables DAD on a per-interface basis. This prevents the router from performing a DAD check on the interface. All IPv6 addresses on an interface with DAD disabled, immediately enter a preferred state, without checking for uniqueness on the interface. This is useful for interfaces that enter a looped state during troubleshooting and are operationally disabled when the loop is detected, requiring manual intervention to clear the DAD violation.
Default	true
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

forward-ipv4-packets *boolean*

Synopsis	Forward unencapsulated IPv4 packets
Context	**configure** router *named-item-64* interface *interface-name* ipv6 forward-ipv4-packets *boolean*
Tree	forward-ipv4-packets
Description	When configured to **true**, the router can use an IPv6-only interface, with no configured IPv4 addresses, to forward IPv4 packets that originate or terminate locally. The interface reports that its IPv4 operational state is up if its IPv6 operational state is up. Not all protocols observe the interface as up from an IPv4 perspective. This command mostly supports BGP routing use cases; see RFC 5549 for details. When configured to **false**, the router prevents IPv4 packets from being forwarded if there are no configured IPv4 subnets.
Default	false
Introduced	19.5.R1
Platforms	All

gre-termination *boolean*

Synopsis	Enable IPv6 GRE termination on a loopback interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 gre-termination *boolean*
Tree	gre-termination
Description	When configured to **true**, the system allows the termination of PW-encapsulated (MPLS-over-GRE) packets transported over IPv6 GRE. This command is only supported on a single loopback interface in the Base router with an IPv6 address and a /128 prefix. This configuration is intended exclusively for tunneling traffic over Layer 3 redundant interfaces within the subscriber management context. This configuration is not supported for terminating traffic associated with Layer 2 services or regular Layer 3 spoke SDP VPRN interfaces.
Default	false
Introduced	25.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

link-local-address

Synopsis	Enter the **link-local-address** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv6 link-local-address
Tree	link-local-address
Description	Commands in this context configure the IPv6 link-local address that is used as a virtual SRRP IPv6 address by the master SRRP node. This address is sent in the Router Advertisements initiated by the master SRRP node. Clients use this address as IPv6 default-gateway. Both SRRP nodes, master and backup, must be configured with the same link-local address. Only one link-local address is allowed per interface. **Caution**: Removing a manually configured link-local address may impact routing protocols or static routes that have a dependency on that address. Nokia does not recommend removing a link-local address when there are active IPv6 subscriber hosts on an IES or VPRN interface.
Introduced	16.0.R1
Platforms	All

address *ipv6-address*

Synopsis	IPv6 link-local address
Context	**configure** router *named-item-64* interface *interface-name* ipv6 link-local-address address *ipv6-address*
Tree	address
Introduced	16.0.R1
Platforms	All

duplicate-address-detection *boolean*

Synopsis	Enable Duplicate Address Detection
Context	**configure** router *named-item-64* interface *interface-name* ipv6 link-local-address duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD) on the interface. When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.
Default	true
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

local-dhcp-server *reference*

Synopsis	DHCP server for the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 local-dhcp-server *reference*
Tree	local-dhcp-server
Description	This command instantiates a local DHCP server. A local DHCP server can serve multiple interfaces but is limited to the routing context in which it was created.
Reference	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

neighbor-discovery

Synopsis	Enter the **neighbor-discovery** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery
Tree	neighbor-discovery
Introduced	16.0.R1
Platforms	All

learn-unsolicited *keyword*

Synopsis	Type of entries learned from unsolicited NA messages
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery learn-unsolicited *keyword*
Tree	learn-unsolicited
Description	This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited flag set. When unconfigured, the router follows standard RFC 4861 behavior for learning of neighbor entries. The neighbor is put in the stale state. This is the standard RFC behavior.
Options	global, link-local, both
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

limit

Synopsis	Enter the **limit** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery limit
Tree	limit
Description	Commands in this context configure the maximum amount of dynamic IPv6 neighbor entries that can be learned on an IP interface. When the number of dynamic neighbor entries reaches the configured percentage of this limit the system sends an SNMP trap. When the limit is exceeded, no new entries are learned until an entry expires and traffic to these destinations is dropped. Entries that have already been learned are refreshed.
Introduced	16.0.R1
Platforms	All

log-only *boolean*

Synopsis	Generate log entries when limit is reached
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery limit log-only *boolean*
Tree	log-only
Description	When configured to **true**, the router sends the warning message at the specified threshold percentage or upon exceeding the specified limit. Entries that exceed the limit are learned. When configured to **false**, the router does not send the warning message.
Default	false
Introduced	16.0.R1
Platforms	All

max-entries *number*

Synopsis	Maximum number of entries learned on an IP interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery limit max-entries *number*
Tree	max-entries
Description	This command configures the maximum number of entries that can be learned on an IP interface. When unconfigured, no maximum limit is imposed.
Range	0 to 102400

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

threshold *number*

Synopsis	Threshold percentage that triggers a warning message
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery limit threshold *number*
Tree	threshold
Range	1 to 100
Units	percent
Default	90
Introduced	16.0.R1
Platforms	All

local-proxy-nd *boolean*

Synopsis	Enable local proxy neighbor discovery on the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery local-proxy-nd *boolean*
Tree	local-proxy-nd
Description	When configured to **true**, the router enables local proxy neighbor discovery on the interface and replies to neighbor solicitation requests when both the hosts are on the same subnet. In this case, ICMP redirects are disabled. When configured to **false**, the router disables local proxy neighbor discovery on the interface and does not reply to neighbor solicitation requests if both the hosts are on the same subnet.
Default	false
Introduced	16.0.R1
Platforms	All

proactive-refresh *keyword*

Synopsis	Proactive refresh of neighbor entries
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery proactive-refresh *keyword*
Tree	proactive-refresh

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command enables a proactive refresh of the neighbor entries. After the stale timer expires, the router sends an NUD message to the host (regardless of the existence of traffic to the IP address on the IOM), so the entry can be refreshed or removed.
Options	global, link-local, both
Introduced	16.0.R1
Platforms	All

proxy-nd-policy *reference*

Synopsis	Proxy Neighbor Discovery policy name for the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery proxy-nd-policy *reference*

qos-route-lookup *keyword*

Synopsis	IP address for QoS route lookup for ingress IP packets
Context	**configure** router *named-item-64* interface *interface-name* ipv6 qos-route-lookup *keyword*
Tree	qos-route-lookup
Description	This command specifies the IP address type used for QPPB enabled per-packet QoS handling (in terms of FC and priority). When using QPPB, routes are associated with a QoS treatment (FC and optionally priority) through either explicit configuration or the route policy. If an IPv4 or IPv6 packet arrives on an interface where the configuration of this command applies to the packet, the QoS treatment of the packet is based on the route that matched the destination IP address or the route that matched the source IP address. See "Enabling QPPB on an IP interface" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about QPPB.
Options	destination, source, source-and-dest
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes.

When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing.

Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated.

An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.

Options enable, disable

Platforms All

backup *ipv6-address*

Synopsis Virtual router IP addresses for the interface

Context **configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* backup *ipv6-address*

Tree backup

Description This command associates router IPv6 virtual router IP addresses with those of the parental IP interface.

This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance.

Non-owner virtual router instance create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance.

For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. The specified IPv6 address must be equal to one of the existing parental IP addresses in the parental IP interface (primary or secondary) or this command fails.

See "Owner and non-owner VRRP" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about owner and non-owner virtual router instances.

bfd-liveness

Synopsis	Enable the **bfd-liveness** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* bfd-liveness
Tree	bfd-liveness
Description	Commands in this context assign a bidirectional forwarding detect (BFD) session to a specific VRRP or SRRP instance. This BFD session provides a heartbeat mechanism for use in speeding up the transition of the standby VRRP router to an active state. If the associated BFD session fails, the VRRP routers immediately send a VRRP Advertisement message. In addition, the standby VRRP routers transition to a Master state to speed convergence. The normal VRRP election process takes place based on the Advertisement messages sent by all VRRP routers. There can be only one BFD session assigned to any specific VRRP or SRRP instance, but there can be multiple SRRP or VRRP sessions using the same BFD session.
Introduced	16.0.R1

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context **configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* mac *mac-unicast-address*

Tree mac

Description This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID.

Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.

Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC.

An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.

Introduced 16.0.R1

Platforms All

master-int-inherit *boolean*

Synopsis Allow master instance to dictate the master down timer

Context **configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* master-int-inherit *boolean*

Tree master-int-inherit

Description When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 16.0.R1

Platforms All

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* message-interval *number*
Tree	message-interval
Description	This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command. The use of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command: • When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as the master. • When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement. • When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.
Range	10 to 4095
Units	centiseconds
Default	100
Introduced	16.0.R1

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1
Platforms	All

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down). When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.
Default	false
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ping-reply *boolean*

Synopsis	Allow non-owner master to reply to ICMP echo requests
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* ping-reply *boolean*
Tree	ping-reply
Description	When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address). When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.
Default	false
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	VRRP priority control policy
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* policy *reference*
Tree	policy
Description	This command configures a VRRP priority control policy to associate with the virtual router instance. VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis. An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value. For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.
Reference	**configure** vrrp policy *number*
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

preempt *boolean*

Synopsis	Allow the VRRP to override an existing non-owner master
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* preempt *boolean*
Tree	preempt
Description	When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router. When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.
Default	true
Introduced	16.0.R1
Platforms	All

priority *number*

Synopsis	Base priority for the VRRP
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* priority *number*
Tree	priority
Description	This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process. The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	16.0.R1
Platforms	All

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	16.0.R1
Platforms	All

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false

port *(port-and-encap | keyword)*

Synopsis	Port to bind to this interface
Context	**configure** router *named-item-64* interface *interface-name* port *(port-and-encap | keyword)*
Tree	port
Description	This command creates an association between a logical IP interface and a physical port. An operator can also associate an interface with the system (loopback address).
String length	1 to 45
Options	system
Notes	The following elements are part of a choice: **loopback** or **port**.
Introduced	16.0.R1
Platforms	All

ptp-hw-assist

Synopsis	Enter the **ptp-hw-assist** context
Context	**configure** router *named-item-64* interface *interface-name* ptp-hw-assist
Tree	ptp-hw-assist
Description	Commands in this context enable the port-based timestamping assist of PTP packets at the physical interface. This capability is supported on specific hardware. The command may be blocked if not all hardware has the required level of support.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Only one interface per physical port can have port-based timestamping assist enabled. This feature cannot be enabled if the physical port supporting the interface is configured as a PTP port.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis Administrative state of the PTP timestamping assist

Context **configure** router *named-item-64* interface *interface-name* ptp-hw-assist admin-state *keyword*

Tree admin-state

Options enable, disable

Default disable

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

qos

Synopsis Enter the **qos** context

Context **configure** router *named-item-64* interface *interface-name* qos

Tree qos

Description Commands in this context associate a network QoS policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Introduced 16.0.R1

Platforms All

egress-instance *number*

Synopsis Port egress queue group instance for this interface

Context **configure** router *named-item-64* interface *interface-name* qos egress-instance *number*

Tree egress-instance

Description This command specifies which instance to associate with this specific network IP interface since multiple instances of the same egress queue-group can be applied to the same port.

Range 1 to 65535

ingress-instance *number*

Synopsis	Forwarding plane ingress queue group for this interface
Context	**configure** router *named-item-64* interface *interface-name* qos ingress-instance *number*
Tree	ingress-instance

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures which instance to associate with this specific network IP interface. An operator can apply multiple instances of the same ingress queue group to the same forwarding plane.
Range	1 to 65535
Introduced	16.0.R1
Platforms	All

network-policy *reference*

Synopsis	Network policy name associated with a network interface
Context	**configure** router *named-item-64* interface *interface-name* qos network-policy *reference*
Tree	network-policy
Description	This command associates an existing network policy name with the IP interface.
Reference	**configure** qos network *network-policy-name*
Introduced	16.0.R1
Platforms	All

strip-label *boolean*

Synopsis	Strip all MPLS labels before PBR processing
Context	**configure** router *named-item-64* interface *interface-name* strip-label *boolean*
Tree	strip-label
Description	When configured to **true**, the router forces packets to be stripped of all (maximum 5) MPLS labels before the packets are handed over for possible filter (PBR) processing. This command is supported on: • optical ports for the 7750 SR and 7450 ESS • null/dot1q encaps • network ports • IPv4 • IPv6
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tos-marking-state *keyword*

Synopsis	TOS marking state
Context	**configure** router *named-item-64* interface *interface-name* tos-marking-state *keyword*
Tree	tos-marking-state
Description	This command configures the ToS marking state. This command is used to alter the default trusted state to a non-trusted state. When configured to **trusted** or default, the ToS field is not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interfaces as untrusted. When configured to **untrusted**, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking defintions on each network interface.
Options	trusted, untrusted
Default	trusted
Introduced	16.0.R1
Platforms	All

untrusted

Synopsis	Enable the **untrusted** context
Context	**configure** router *named-item-64* interface *interface-name* untrusted
Tree	untrusted
Description	Commands in this context configure the untrusted state for a network IP interface. The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature. The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface.
Introduced	16.0.R4
Platforms	All

default-forwarding *keyword*

Synopsis	Default action for selective ILM
Context	**configure** router *named-item-64* interface *interface-name* untrusted default-forwarding *keyword*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	default-forwarding
Description	This command specifies the default forwarding behavior of labeled packets received on this interface. This command sets the default behavior for an untrusted interface in the datapath and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding away from the default for those VPRN ILMs. When the default behavior is to forward packets, the router checks labeled packets in the normal way against the table of programmed ILMs to decide if packets are dropped or forwarded in a GRT, a VRF, or a L2 service context. When the specified behavior is to drop packets, all labeled packets received on the interface are automatically dropped.
Options	forward, drop
Default	forward
Introduced	16.0.R4
Platforms	All

urpf-selected-vprns *boolean*

Synopsis	Enable uRPF checking of incoming traffic on interface
Context	**configure** router *named-item-64* interface *interface-name* urpf-selected-vprns *boolean*
Tree	urpf-selected-vprns
Description	When configured to **true**, the router performs uRPF checks of incoming traffic on the network interface for the following: • Packets associated with the global routing table (base router) context • Packets associated with VPRNs that have enabled the uRPF check using the **configure service vprn network ingress urpf-check** command When configured to **false**, the router performs uRPF checks for all ingress traffic on the network interface (associated with the base router and all VPRNs) based on the IPv4 and IPv6 **urpf-check** command configuration options of the network interface.
Default	false
Introduced	16.0.R1
Platforms	All

vas-if-type *keyword*

nd-router-preference *keyword*

Synopsis	Default router preference for Router Advertisements
Context	**configure** router *named-item-64* ipv6 router-advertisement interface *interface-name* nd-router-preference *keyword*
Tree	nd-router-preference
Description	This command configures the default router preference for Router Advertisements (RAs) and allows IPv6 hosts to discover and select a default gateway address by listening to RAs. This feature provides basic traffic engineering functionality for host devices. When this command is applied, the router advertises the respective router preference to the connected host to assist in its selection of the most appropriate default gateway on a link. This extension is backward compatible, both for routers (setting the router preference bits) and hosts (interpreting the router preference bits). These bits are ignored by hosts that do not implement the RFC 4191 functionality by configuring this command. Similarly, hosts that do not implement the RFC 4191 functionality interpret the

database-export

Synopsis	Enable the **database-export** context
Context	**configure** router *named-item-64* isis *number* database-export
Tree	database-export
Description	Commands in this context enable the population of the extended TE Database (TE-DB) with the link-state information from a specific IGP instance. This information includes the IGP, TE, and SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

bgp-ls-identifier

Synopsis	Enable the **bgp-ls-identifier** context
Context	**configure** router *named-item-64* isis *number* database-export bgp-ls-identifier
Tree	bgp-ls-identifier
Description	Commands in this context correlate, along with the Autonomous System Number (ASN), the BGP-LS NLRI advertisements of multiple BGP-LS speakers of the same IGP domain.
Introduced	16.0.R1
Platforms	All

value *number*

Synopsis	BGP-LS ID sent in the BGP-LS NLRI
Context	**configure** router *named-item-64* isis *number* database-export bgp-ls-identifier value *number*
Tree	value
Description	This command configures the BGP-LS ID to export. If an NRC-P network domain has multiple IGP domains, a user must configure BGP-LS speakers within each IGP domain with the same unique ASN, BGP-LS ID tuple. The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain. **Note:** If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command configuration is not strictly required because enabling the extended TE-DB populates this information automatically. However, Nokia recommends enabling the **traffic-engineering** command to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.
Max. range	0 to 4294967295
Default	0
Introduced	16.0.R1
Platforms	All

igp-identifier *number*

Synopsis	IGP instance ID in the BGP-LS NLRI

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* database-export igp-identifier *number*
Tree	igp-identifier
Description	This command configures the unique identifier for the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. The concept of instance ID defined in IS-IS (RFC 6822) is unique within a routing domain. A user can remove any overlap by configuring the new identifier value to be unique within an IGP domain when this router sends the IGP link-state information using BGP-LS.
Max. range	0 to 18446744073709551615
Introduced	16.0.R1
Platforms	All

reachable-ls-only *boolean*

Synopsis	Encode only reachable link-state information
Context	**configure** router *named-item-64* isis *number* database-export reachable-ls-only *boolean*
Tree	reachable-ls-only
Description	When configured to **true**, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged. When configure to **false**, the router continues to send link-state objects even for links that fail an IGP reachability check.
Default	false
Introduced	24.10.R1
Platforms	All

default-route-tag *number*

Synopsis	Route tag for the default route
Context	**configure** router *named-item-64* isis *number* default-route-tag *number*

Platforms	All

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** router *named-item-64* isis *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS. If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied. Routing policies are created in the **configure router policy-options** context.
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

advertise *reference*

Synopsis	Flexible Algorithm Definition advertisement
Context	**configure** router *named-item-64* isis *number* flexible-algorithms flex-algo *number* advertise *reference*
Tree	advertise
Description	This command enables the advertisement of a locally configured Flexible Algorithm Definition (FAD). The winning FAD that a router uses must be consistent with the winning FAD on all other routers, which avoids routing loops and traffic blackholing. The winning FAD is selected using a tiebreaker algorithm that first selects the highest advertised FAD priority followed by the highest system ID.
Reference	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item*
Introduced	20.7.R1
Platforms	All

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context

allow-sr-over-srte *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable SR over SR-TE LSPs
Context	**configure** router *named-item-64* isis *number* igp-shortcut allow-sr-over-srte *boolean*
Tree	allow-sr-over-srte
Description	When configured to **true**, the router only allows SR-MPLS SRv4 and SRv6 IGP shortcuts to use SR-TE LSPs with **allow-sr-over-srte** explicitly enabled with an adjacency SID as top SID in the SR-TE LSP. IPv4 and IPv6 addresses can use all available SR-TE LSPs as IGP shortcuts regardless of the explicit **allow-sr-over-srte** configuration. Under ECMP, when this command is configured to **true**, preference is given to the SR-TE LSPs with **allow-sr-over-srte** explicitly configured over the LSPs that do not have **allow-sr-over-srte** configured.
Default	false
Introduced	23.3.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the IS-IS interface
Context	**configure** router *named-item-64* isis *number* interface *interface-name* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

bfd-liveness

Synopsis	Enter the **bfd-liveness** context
Context	**configure** router *named-item-64* isis *number* interface *interface-name* bfd-liveness
Tree	bfd-liveness
Description	Commands in this context enable the use of bidirectional forwarding (BFD) to control IPv4 and IPv6 adjacencies. Enabling BFD on an IPv4 or IPv6 protocol interface ties the protocol interface state to the BFD session state between the local and remote nodes. BFD must be enabled on the applicable IP interface.
Introduced	16.0.R1

Platforms	All

csnp-interval *number*

Synopsis	Time interval between successive CSN PDUs sent
Context	**configure** router *named-item-64* isis *number* interface *interface-name* csnp-interval *number*
Tree	csnp-interval
Range	1 to 65535
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	All

default-instance *boolean*

Synopsis	Allow non-MI capable router to establish an adjacency
Context	**configure** router *named-item-64* isis *number* interface *interface-name* default-instance *boolean*
Tree	default-instance
Default	false
Introduced	16.0.R1
Platforms	All

delay-normalization

Synopsis	Enable the **delay-normalization** context
Context	**configure** router *named-item-64* isis *number* interface *interface-name* delay-normalization
Tree	delay-normalization
Description	Commands in this context configure delay normalization for the interface within the IGP instance. When configured, the normalized delay is used by the TLVs within the IGP link-state packets. When unconfigured, the measured delay is used by the respective TLVs within the IGP link-state packets.
Introduced	24.10.R1
Platforms	All

prefix-policy *reference*

Synopsis	Policy to exclude prefixes from LFA SPF calculation
Context	**configure** router *named-item-64* isis *number* loopfree-alternate exclude prefix-policy *reference*
Tree	prefix-policy
Description	This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation. An excluded prefix is not included in LFA calculation regardless of its priority. The prefix tag is, however, used in the main SPF.
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R3
Platforms	All

multi-homed-prefix

Synopsis	Enable the **multi-homed-prefix** context
Context	**configure** router *named-item-64* isis *number* loopfree-alternate multi-homed-prefix
Tree	multi-homed-prefix
Description	Commands in this context enable multihomed prefix LFA for IS-IS routes (IP FRR), SR-ISIS tunnels, and SRv6-ISIS tunnels.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This feature uses the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes.

This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of intra-area anycast prefixes.

The computed IP next hop-based backup path is added to IS-IS routes of external /32 prefixes or /128 prefixes and intra-area /32 or /128 anycast prefixes in the RTM if the prefix is not protected by the base LFA or if the user set leaf preference command option is configured to all. The user must enable the **configure routing-options ip-fast-reroute** command to have these backup paths programmed into the FIB in the datapath.

The computed IP next hop or repair tunnel-based backup path is also programmed for:

- SR-ISIS node SID tunnels of external /32 IPv4 prefixes and /128 IPv6 prefixes, and node SID tunnels of intra-area /32 IPv4 anycast prefixes and /128 anycast IPv6 prefixes, in both algorithm 0 and flexible-algorithms
- SRv6-ISIS locator routes and tunnels of external prefixes and of intra-area anycast prefixes of any size, in both algorithm 0 and flexible algorithm numbers.

As a result, an SR-TE LSP, an SR-MPLS policy, or an SRv6 policy which uses an SR-ISIS SID or an SRv6-ISIS SID of those same prefixes in its configured or computed SID list benefits from the multihomed prefix LFA protection.

Once the IP next-hop based multihomed prefix LFA is enabled, the extensions to compute an SR-TE repair tunnel for the multihomed prefix LFA in the case of SR-ISIS and SRv6-ISIS are automatically enabled if the user also enabled TI-LFA or Remote LFA. The computation reuses the SID list of the primary path or of the TI-LFA or Remote LFA backup path of the alternate ABR or ASBR or alternate owner router.

Introduced 22.7.R1

Synopsis	Advertise the inter-level routes when router is overloaded
Context	**configure** router *named-item-64* isis *number* overload-export-interlevel *boolean*
Tree	overload-export-interlevel
Default	false
Introduced	16.0.R1
Platforms	All

overload-fib-error-notify-only

Synopsis	Enable the **overload-fib-error-notify-only** context
Context	**configure** router *named-item-64* isis *number* overload-fib-error-notify-only
Tree	overload-fib-error-notify-only
Description	Commands in this context configure the IS-IS router to send a notification when an overload condition occurs while programming the FIB, instead of advertising the overload condition of the router in the IS-IS LSP. **Note**: Nokia recommends being careful using this command. When you configure the router not to advertise the IS-IS overload state in the IS-IS LSP, other routers are not instructed to take the overloaded router out of the IS-IS forwarding topology and this will cause suboptimal forwarding and non-deterministic behavior on the overloaded router. To avoid changing the default IS-IS overflow behavior, leave this command disabled. When this command is configured, the IS-IS router enters a suboptimal state where it sends only a notification trap; transit traffic can still use the router in this state. The IS-IS router tracks the segment routing prefix SIDs where FIB programming failed. With the **retry** command configured, the router retries programming the segment routing prefix SIDs in the FIB using this tracked information.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is not configured, during normal operation, the system may force the router to enter an overload state because of a lack of FIB resources. In this state, the router is used to terminate traffic and is not used to transit traffic.

Introduced 23.7.R1

Platforms All

retry *number*

Synopsis Time to retry programming failed entries in the FIB

Context **configure** router *named-item-64* isis *number* overload-fib-error-notify-only retry *number*

Tree retry

Description This command configures the time the router uses to retry programming the failed entries in the FIB.

The **overload-fib-error-notify-only** command must be configured to use the retry timer. The removal of the **overload-fib-error-notify-only** configuration causes the system to program the failed entries in the FIB by triggering an immediate SPF.

Range 10 to 1800

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time
Context	**configure** router *named-item-64* isis *number* segment-routing adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.

- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

tunnel-table-pref *number*

Synopsis Preference of SR tunnels created by the IGP instance

Context **configure** router *named-item-64* isis *number* segment-routing tunnel-table-pref *number*

Tree tunnel-table-pref

Description This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Range 1 to 255

Default 11

segment-routing-v6

Synopsis	Enter the **segment-routing-v6** context
Context	**configure** router *named-item-64* isis *number* segment-routing-v6
Tree	segment-routing-v6
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time
Context	**configure** router *named-item-64* isis *number* segment-routing-v6 adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command specifies the length of time the system holds the SRv6 adjacency route and tunnel entries programmed in datapath while the adjacency is down. When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection. • IGP withdraws the advertisement of the link TLV as well as its SRv6 End.X SID sub-TLV • The adjacency SID hold timer starts. • The route table, FIB, and tunnel table entries are kept for as long as the adjacency SID hold timer is running. This is allows packets to flow over the LFA backup path, if the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of a SRv6 policy after IGP converges. • If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change when a new LFA SPF is run while the adjacency SID hold timer is running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID value. • If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the SID value returned into the locator subnet where it was drawn from. Users of the adjacency (for example, SRv6 policy) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static SID value or a new dynamic SID value.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by tunnel of the local adjacency SID and of all remote locator routes that resolve to a next hop over this adjacency.

Each IS-IS instance runs a single timer per adjacency that IPv4 SR-MPLS, IPv6 SR-MPLS, and SRv6 adjacency SIDs share. When you enable both SR-MPLS (**configure router isis segment-routing**) and SRv6 (**configure router isis segment-routing-v6**) in the IS-IS instance, the system programs the higher of the two timer values for all SIDs on the adjacency.

Range	1 to 1800
Units	seconds
Options	none
Default	15
Introduced	21.10.R1

multi-topology

Synopsis	Enter the **multi-topology** context
Context	**configure** router *named-item-64* isis *number* segment-routing-v6 locator *reference* multi-topology
Tree	multi-topology
Description	Commands in this context enable the use of a local SRv6 locator in an IS-IS IPv6 topology. A user can enable one or more locators in an IS-IS instance. Each locator can be enabled in a single topology of an IS-IS instance, topology 0 (MT0) or topology 2 (MT2). A local locator can be used in multiple IS-IS instances, but can only be assigned to at most one IPv6 topology independently within each IS-IS instance. Use the **configure router isis segment-routing-v6 admin-state** command to enable the processing of local and remote IPv6 prefixes and SRv6 locators in MT0 and MT2. In addition, to enable SRv6 forwarding in the MT0, MT2, or both topologies, set the **configure router isis ipv6-routing** command to **native**, the **configure router isis multi-topology ipv6-unicast** command to **true**, or both.

Platforms	All

traffic-engineering-options

Synopsis	Enter the **traffic-engineering-options** context
Context	**configure** router *named-item-64* isis *number* traffic-engineering-options
Tree	traffic-engineering-options
Introduced	19.10.R1
Platforms	All

advertise-delay *boolean*

Synopsis	Enable the advertisement of link delay for TE
Context	**configure** router *named-item-64* isis *number* traffic-engineering-options advertise-delay *boolean*
Tree	advertise-delay
Description	When configured to **true**, the router advertises link delay in the IGP LSDB within legacy Traffic Engineering (TE) attributes in IS-IS or within the Application-Specific Link Attribute (ASLA) when ASLA is enabled for SR-TE or RSVP-TE applications. When the **application-link-attributes legacy** command is configured for SR-TE or RSVP-TE, link delay is advertised as a legacy TE TLV with the ASLA legacy bit set. When configured to **false**, the router disables link delay advertisement.
Default	false
Introduced	22.10.R1
Platforms	All

application-link-attributes

Synopsis	Enable the **application-link-attributes** context
Context	**configure** router *named-item-64* isis *number* traffic-engineering-options application-link-attributes
Tree	application-link-attributes
Introduced	19.10.R1
Platforms	All

Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

mac *(mac-address | keyword)*

Synopsis	Endpoint ID as a MAC address
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp endpoint mac *(mac-address | keyword)*
Tree	mac
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

interleave *boolean*

Synopsis	Enable link fragmentation and interleaving
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp interleave *boolean*
Tree	interleave
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-fragment-delay *(number | keyword)*

Synopsis	Maximum fragment delay caused by transmission on a link
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp max-fragment-delay *(number | keyword)*
Tree	max-fragment-delay
Range	5 to 1000
Units	milliseconds
Options	no-fragmentation
Default	no-fragmentation
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-links *number*

Synopsis	Maximum MLPPP links
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp max-links *number*
Tree	max-links
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

reassembly-timeout *number*

Synopsis	Reassembly timeout
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp reassembly-timeout *number*
Tree	reassembly-timeout
Range	100 | 1000
Units	milliseconds
Default	1000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

short-sequence-numbers *boolean*

Synopsis	Request a peer to send short sequence numbers
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp short-sequence-numbers *boolean*
Tree	short-sequence-numbers
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ppp

Synopsis	Enter the **ppp** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp
Tree	ppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication *keyword*

Synopsis	PPP authentication protocol to negotiate
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp authentication *keyword*
Tree	authentication
Options	pap, chap, pref-chap, pref-pap
Default	pref-chap
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication-policy *named-item*

Synopsis	Authentication policy when a DHCP message is received
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp authentication-policy *named-item*
Tree	authentication-policy
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

chap-challenge-length

Synopsis	Enter the **chap-challenge-length** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp chap-challenge-length
Tree	chap-challenge-length
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the PPP CHAP challenge length
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp chap-challenge-length end *number*
Tree	end
Range	8 to 64
Units	octets
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the PPP CHAP challenge length
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp chap-challenge-length start *number*
Tree	start
Range	8 to 64
Units	octets
Default	32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-group-interface

Synopsis	Enter the **default-group-interface** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp default-group-interface
Tree	default-group-interface
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

interface *named-item*

Synopsis	Group interface
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp default-group-interface interface *named-item*
Tree	interface
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

service-name *service-name*

Synopsis	Administrative service name
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp default-group-interface service-name *service-name*
Tree	service-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipcp-subnet-negotiation *boolean*

Synopsis	Allow IPCP subnet negotiation for PPPoE hosts
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp ipcp-subnet-negotiation *boolean*
Tree	ipcp-subnet-negotiation
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keepalive

Synopsis	Enter the **keepalive** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp keepalive
Tree	keepalive
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interval *number*

Synopsis	PPP keepalive interval
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp keepalive interval *number*
Tree	interval
Range	10 to 300
Units	seconds
Default	30
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

multiplier *number*

Synopsis	PPP keepalive multiplier
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp keepalive multiplier *number*
Tree	multiplier
Range	1 to 5
Default	3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lcp-force-ack-accm *boolean*

Synopsis	Force acknowledgement of the LCP Asynchronous Control Character Map (ACCM) option
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp lcp-force-ack-accm *boolean*
Tree	lcp-force-ack-accm
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

lcp-ignore-magic-numbers *boolean*

Synopsis	Check magic number in echo request and reply messages
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp lcp-ignore-magic-numbers *boolean*
Tree	lcp-ignore-magic-numbers
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu *number*

Synopsis	Maximum PPP MTU size
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp mtu *number*
Tree	mtu
Range	512 to 9212
Units	octets
Default	1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-authentication *boolean*

Synopsis	Use authentication AVPs that are received from LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp proxy-authentication *boolean*
Tree	proxy-authentication
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-lcp *boolean*

Synopsis	Proxy LCP AVPs that are received from LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp proxy-lcp *boolean*
Tree	proxy-lcp

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reject-disabled-ncp *boolean*

Synopsis	Force LCP Protocol Reject for IPv6CP Configure Request
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp reject-disabled-ncp *boolean*
Tree	reject-disabled-ncp
Default	false
Introduced	16.0.R6
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

user-db *named-item*

Synopsis	Local user database for PPP PAP and CHAP authentication
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp user-db *named-item*
Tree	user-db
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-address *ipv4-unicast-address*

Synopsis	Local address
Context	**configure** router *named-item-64* l2tp group *named-item-64* local-address *ipv4-unicast-address*
Tree	local-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-name *host-name*

Synopsis	Local host name used to distinguish tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* local-name *host-name*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	local-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-not-estab *number*

Synopsis	Maximum retries for unestablished tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* max-retries-not-estab *number*
Tree	max-retries-not-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *encrypted-leaf*

Synopsis	Password between L2TP LAC and LNS
Context	**configure** router *named-item-64* l2tp group *named-item-64* password *encrypted-leaf*
Tree	password
String length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

protocol *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Protocol version
Context	**configure** router *named-item-64* l2tp group *named-item-64* protocol *keyword*
Tree	protocol
Options	v2, v3, v3draft
Default	v2
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy *reference*

Synopsis	RADIUS accounting policy
Context	**configure** router *named-item-64* l2tp group *named-item-64* radius-accounting-policy *reference*
Tree	radius-accounting-policy
Reference	**configure** aaa radius l2tp-accounting-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

receive-window-size *number*

Synopsis	L2TP receive window size
Context	**configure** router *named-item-64* l2tp group *named-item-64* receive-window-size *number*
Tree	receive-window-size
Range	4 to 1024
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-assign-method *keyword*

Synopsis	Session assignment method

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp group *named-item-64* session-assign-method *keyword*
Tree	session-assign-method
Options	existing-first, weighted, weighted-random
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit *(number | keyword)*

Synopsis	Session limit
Context	**configure** router *named-item-64* l2tp group *named-item-64* session-limit *(number | keyword)*
Tree	session-limit
Range	1 to 250000
Options	unlimited
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel [tunnel-name] *named-item*

Synopsis	Enter the **tunnel** list instance
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item*
Tree	tunnel
Max. instances	31
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**tunnel-name**] *named-item*

Synopsis	Tunnel name
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item*
Tree	tunnel
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the L2TP tunnel
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

auto-establish *boolean*

Synopsis	Allow the tunnel to be automatically set up by the system
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* auto-establish *boolean*
Tree	auto-establish
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

avp-hiding *keyword*

Synopsis	The AVP hiding algorithm
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* avp-hiding *keyword*
Tree	avp-hiding
Options	never, sensitive, always
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

challenge *keyword*

Synopsis	Enable use of challenge-response authentication

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* challenge *keyword*
Tree	challenge
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

destruct-timeout *number*

Synopsis	Destruction timeout
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* destruct-timeout *number*
Tree	destruct-timeout
Range	60 to 86400
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

failover

Synopsis	Enter the **failover** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* failover
Tree	failover
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

recovery-method *keyword*

Synopsis	Recovery method of the sequence numbers after failover
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* failover recovery-method *keyword*
Tree	recovery-method
Options	mcs, recovery-tunnel
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-time *number*

Synopsis	Time requested from the L2TP peer before assuming failover as failed
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* failover recovery-time *number*
Tree	recovery-time
Range	0 to 900
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hello-interval *(number | keyword)*

Synopsis	Hello interval
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* hello-interval *(number | keyword)*
Tree	hello-interval
Range	10 to 3600
Units	seconds
Options	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

idle-timeout *(number | keyword)*

Synopsis	Idle timeout

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* idle-timeout *(number | keyword)*
Tree	idle-timeout
Range	0 to 3600
Units	seconds
Options	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tpv3

Synopsis	Enter the **l2tpv3** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* l2tpv3
Tree	l2tpv3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

private-tcp-mss-adjust *(number | keyword)*

Synopsis	TCP maximum segment size (MSS) on private network
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* l2tpv3 private-tcp-mss-adjust *(number | keyword)*
Tree	private-tcp-mss-adjust
Range	512 to 9000
Units	octets
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

public-tcp-mss-adjust *(number | keyword)*

Synopsis	TCP maximum segment size (MSS) on public network
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* l2tpv3 public-tcp-mss-adjust *(number | keyword)*
Tree	public-tcp-mss-adjust
Range	512 to 9000

© 2025 Nokia.

Units	octets
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lac

Synopsis	Enter the **lac** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lac
Tree	lac
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

df-bit *keyword*

Synopsis	DF (do not fragment) bit in data traffic transmitted as LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lac df-bit *keyword*
Tree	df-bit
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lns

Synopsis	Enter the **lns** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns
Tree	lns
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lns-group *reference*

Synopsis	ISA LNS group
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns lns-group *reference*

© 2025 Nokia.

endpoint

Synopsis	Enter the **endpoint** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp endpoint
Tree	endpoint
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ip *(ipv4-address | keyword)*

Synopsis	Endpoint ID as an IP address
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp endpoint ip *(ipv4-address | keyword)*
Tree	ip
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

mac *(mac-address | keyword)*

Synopsis	Endpoint ID as a MAC address
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp endpoint mac *(mac-address | keyword)*
Tree	mac
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

interleave *keyword*

Synopsis	Use of Link fragmentation and interleaving
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp interleave *keyword*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	interleave
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-fragment-delay *number*

Synopsis	Maximum fragment delay caused by transmission on a link
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp max-fragment-delay *number*
Tree	max-fragment-delay
Range	5 to 1000
Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-links *number*

Synopsis	Maximum MLPPP links
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp max-links *number*
Tree	max-links
Range	1 to 8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

reassembly-timeout *number*

Synopsis	Reassembly timeout
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp reassembly-timeout *number*
Tree	reassembly-timeout
Range	100 | 1000
Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

© 2025 Nokia.

short-sequence-numbers *keyword*

Synopsis	Request a peer to send short sequence numbers
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp short-sequence-numbers *keyword*
Tree	short-sequence-numbers
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ppp

Synopsis	Enter the **ppp** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp
Tree	ppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication *keyword*

Synopsis	PPP authentication protocol to negotiate
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp authentication *keyword*
Tree	authentication
Options	pap, chap, pref-chap, pref-pap
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication-policy *named-item*

Synopsis	Authentication policy when a DHCP message is received
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp authentication-policy *named-item*
Tree	authentication-policy
String length	1 to 32
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

chap-challenge-length

Synopsis	Enter the **chap-challenge-length** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp chap-challenge-length
Tree	chap-challenge-length
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the PPP CHAP challenge length
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp chap-challenge-length end *number*
Tree	end
Range	8 to 64
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the PPP CHAP challenge length
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp chap-challenge-length start *number*
Tree	start
Range	8 to 64
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-group-interface

Synopsis	Enter the **default-group-interface** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp default-group-interface
Tree	default-group-interface
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface *named-item*

Synopsis	Group interface
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp default-group-interface interface *named-item*
Tree	interface
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

service-name *service-name*

Synopsis	Administrative service name
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp default-group-interface service-name *service-name*
Tree	service-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipcp-subnet-negotiation *keyword*

Synopsis	Use of IPCP subnet negotiation for PPPoE hosts
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp ipcp-subnet-negotiation *keyword*
Tree	ipcp-subnet-negotiation
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keepalive

Synopsis	Enter the **keepalive** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp keepalive
Tree	keepalive
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interval *number*

Synopsis	PPP keepalive interval
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp keepalive interval *number*
Tree	interval
Range	10 to 300
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

multiplier *number*

Synopsis	PPP keepalive multiplier
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp keepalive multiplier *number*
Tree	multiplier
Range	1 to 5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lcp-force-ack-accm *keyword*

Synopsis	Forced acknowledgement of the LCP Asynchronous Control Character Map (ACCM) option
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp lcp-force-ack-accm *keyword*
Tree	lcp-force-ack-accm

© 2025 Nokia.

Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lcp-ignore-magic-numbers *keyword*

Synopsis	Magic-Number field in LCP Echo-Request and LCP Echo-Reply messages that are checked
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp lcp-ignore-magic-numbers *keyword*
Tree	lcp-ignore-magic-numbers
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu *number*

Synopsis	Maximum PPP MTU size
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp mtu *number*
Tree	mtu
Range	512 to 9212
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-authentication *keyword*

Synopsis	Authentication AVPs that are received from LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp proxy-authentication *keyword*
Tree	proxy-authentication
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

proxy-lcp *keyword*

Synopsis	Use the Proxy LCP AVPs that are received from the LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp proxy-lcp *keyword*
Tree	proxy-lcp
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reject-disabled-ncp *keyword*

Synopsis	Force LCP Project Reject for IPv6CP Configure Request
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp reject-disabled-ncp *keyword*
Tree	reject-disabled-ncp
Options	false, true
Introduced	16.0.R6
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

user-db *named-item*

Synopsis	Local user database for PPP PAP and CHAP authentication
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp user-db *named-item*
Tree	user-db
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-address *ipv4-unicast-address*

Synopsis	Local address
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* local-address *ipv4-unicast-address*
Tree	local-address

© 2025 Nokia.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-name *host-name*

Synopsis	Local host name used to distinguish tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* local-name *host-name*
Tree	local-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-not-estab *number*

Synopsis	Maximum retries for unestablished tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* max-retries-not-estab *number*
Tree	max-retries-not-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *encrypted-leaf*

Synopsis	Password between L2TP LAC and LNS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* password *encrypted-leaf*
Tree	password
String length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer *ipv4-unicast-address*

Synopsis	Peer address
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* peer *ipv4-unicast-address*
Tree	peer
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference *number*

Synopsis	Tunnel preference number with its group
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* preference *number*
Tree	preference
Range	0 to 16777215
Default	50
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy *reference*

Synopsis	RADIUS accounting policy
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* radius-accounting-policy *reference*
Tree	radius-accounting-policy
Reference	**configure** aaa radius l2tp-accounting-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

receive-window-size *number*

Synopsis	L2TP receive window size
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* receive-window-size *number*
Tree	receive-window-size
Range	4 to 1024
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

remote-name *host-name*

Synopsis	Remote tunnel host name
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* remote-name *host-name*
Tree	remote-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit *(number | keyword)*

Synopsis	L2TP session limit for each tunnel of this router
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* session-limit *(number | keyword)*
Tree	session-limit
Range	1 to 65534
Options	unlimited
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group-session-limit *number*

Synopsis	L2TP session limit for each group of this router
Context	**configure** router *named-item-64* l2tp group-session-limit *number*
Tree	group-session-limit

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	1 to 250000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hello-interval *(number | keyword)*

Synopsis	Hello interval
Context	**configure** router *named-item-64* l2tp hello-interval *(number | keyword)*
Tree	hello-interval
Range	10 to 3600
Units	seconds
Options	infinite
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

idle-timeout *(number | keyword)*

Synopsis	Idle timeout
Context	**configure** router *named-item-64* l2tp idle-timeout *(number | keyword)*
Tree	idle-timeout
Range	0 to 3600
Units	seconds
Options	infinite
Default	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ignore-avps

Synopsis	Enter the **ignore-avps** context
Context	**configure** router *named-item-64* l2tp ignore-avps
Tree	ignore-avps
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

sequencing-required *boolean*

Synopsis	Ignore Sequencing Required AVP
Context	**configure** router *named-item-64* l2tp ignore-avps sequencing-required *boolean*
Tree	sequencing-required
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tpv3

Synopsis	Enter the **l2tpv3** context
Context	**configure** router *named-item-64* l2tp l2tpv3
Tree	l2tpv3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cookie-length *number*

Synopsis	Cookie field length
Context	**configure** router *named-item-64* l2tp l2tpv3 cookie-length *number*
Tree	cookie-length
Range	4 | 8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

digest-type *keyword*

Synopsis	Hashing algorithm that calculates the message digest
Context	**configure** router *named-item-64* l2tp l2tpv3 digest-type *keyword*
Tree	digest-type
Options	md5, sha1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

nonce-length *number*

Synopsis	Length of the local L2TPv3 nonce (random number)
Context	**configure** router *named-item-64* l2tp l2tpv3 nonce-length *number*
Tree	nonce-length
Range	0 | 16 to 64
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *encrypted-leaf*

Synopsis	L2TPv3 password
Context	**configure** router *named-item-64* l2tp l2tpv3 password *encrypted-leaf*
Tree	password
String length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

private-tcp-mss-adjust *number*

Synopsis	TCP maximum segment size (MSS) on private network
Context	**configure** router *named-item-64* l2tp l2tpv3 private-tcp-mss-adjust *number*
Tree	private-tcp-mss-adjust
Range	512 to 9000
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

public-tcp-mss-adjust *number*

Synopsis	TCP maximum segment size (MSS) on public network
Context	**configure** router *named-item-64* l2tp l2tpv3 public-tcp-mss-adjust *number*
Tree	public-tcp-mss-adjust
Range	512 to 9000

Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

transport-type

Synopsis	Enter the **transport-type** context
Context	**configure** router *named-item-64* l2tp l2tpv3 transport-type
Tree	transport-type
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip *boolean*

Synopsis	Use IP as the transport type for the L2TPv3 tunnel
Context	**configure** router *named-item-64* l2tp l2tpv3 transport-type ip *boolean*
Tree	ip
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lac

Synopsis	Enter the **lac** context
Context	**configure** router *named-item-64* l2tp lac
Tree	lac
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

calling-number-format *ascii-specification*

Synopsis	Calling Number AVP for L2TP control messages
Context	**configure** router *named-item-64* l2tp lac calling-number-format *ascii-specification*
Tree	calling-number-format
String length	1 to 255

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	%S %s
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cisco-nas-port

Synopsis	Enter the **cisco-nas-port** context
Context	**configure** router *named-item-64* l2tp lac cisco-nas-port
Tree	cisco-nas-port
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ethernet *binary-specification*

Synopsis	L2TP Cisco NAS port AVP with binary patterns for Ethernet
Context	**configure** router *named-item-64* l2tp lac cisco-nas-port ethernet *binary-specification*
Tree	ethernet
String length	1 to 255
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

df-bit *boolean*

Synopsis	Send all L2TP packets with DF bit set to 1
Context	**configure** router *named-item-64* l2tp lac df-bit *boolean*
Tree	df-bit
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

fragmentation

Synopsis	Enable the **fragmentation** context
Context	**configure** router *named-item-64* l2tp lac fragmentation
Tree	fragmentation

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-action *keyword*

Synopsis	Default action for L2TP sessions
Context	**configure** router *named-item-64* l2tp lac fragmentation default-action *keyword*
Tree	default-action
Description	This command configures the default action for L2TP sessions. This setting can be overwritten in the LUDB by using the **configure subscriber-mgmt local-user-db ppp host l2tp lac-fragmentation** command.
Options	deny – Deny packet fragmentation for L2TP sessions permit – Permit packet fragmentation for L2TP sessions
Default	deny
Introduced	25.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

fpe *reference*

Synopsis	FPE that constructs the data endpoints
Context	**configure** router *named-item-64* l2tp lac fragmentation fpe *reference*
Tree	fpe
Description	This command configures the association between the FPE and the data endpoints.
Reference	**configure** fwd-path-ext fpe *number*
Notes	This element is mandatory.
Introduced	25.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-address *ipv4-unicast-address*

Synopsis	Local address
Context	**configure** router *named-item-64* l2tp local-address *ipv4-unicast-address*
Tree	local-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

local-name *host-name*

Synopsis	Local host name
Context	**configure** router *named-item-64* l2tp local-name *host-name*
Tree	local-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels
Context	**configure** router *named-item-64* l2tp max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-not-estab *number*

Synopsis	Maximum retries for unestablished tunnels
Context	**configure** router *named-item-64* l2tp max-retries-not-estab *number*
Tree	max-retries-not-estab
Range	2 to 7
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

next-attempt *keyword*

Synopsis	Tunnel that is selected when previous session setup failed
Context	**configure** router *named-item-64* l2tp next-attempt *keyword*
Tree	next-attempt
Options	same-preference-level, next-preference-level

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	next-preference-level
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *encrypted-leaf*

Synopsis	L2TP password
Context	**configure** router *named-item-64* l2tp password *encrypted-leaf*
Tree	password
String length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer-address-change-policy *keyword*

Synopsis	Reaction for L2TP response from a different address
Context	**configure** router *named-item-64* l2tp peer-address-change-policy *keyword*
Tree	peer-address-change-policy
Options	accept, ignore, reject
Default	reject
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy *reference*

Synopsis	RADIUS accounting policy
Context	**configure** router *named-item-64* l2tp radius-accounting-policy *reference*
Tree	radius-accounting-policy
Reference	**configure** aaa radius l2tp-accounting-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

receive-window-size *number*

Synopsis	L2TP receive window size

© 2025 Nokia.

cdn-temporary-no-facilities *boolean*

Synopsis	Replace result code with general error
Context	**configure** router *named-item-64* l2tp replace-result-code cdn-temporary-no-facilities *boolean*
Tree	cdn-temporary-no-facilities
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rtm-debounce-time *(number | keyword)*

Synopsis	Debounce timer that declares L2TP action for route table management events
Context	**configure** router *named-item-64* l2tp rtm-debounce-time *(number | keyword)*
Tree	rtm-debounce-time
Range	0 to 5000
Units	milliseconds
Options	infinite
Default	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-assign-method *keyword*

Synopsis	Session assignment method
Context	**configure** router *named-item-64* l2tp session-assign-method *keyword*
Tree	session-assign-method
Options	existing-first, weighted, weighted-random
Default	existing-first
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit *number*

Synopsis	L2TP session limit of this router

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp session-limit *number*
Tree	session-limit
Range	1 to 250000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel-selection-blacklist

Synopsis	Enter the **tunnel-selection-blacklist** context
Context	**configure** router *named-item-64* l2tp tunnel-selection-blacklist
Tree	tunnel-selection-blacklist
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

add-tunnel-on

Synopsis	Enter the **add-tunnel-on** context
Context	**configure** router *named-item-64* l2tp tunnel-selection-blacklist add-tunnel-on
Tree	add-tunnel-on
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

address-change-timeout *boolean*

Synopsis	Enable a timed-out tunnel to be forced to the denylist
Context	**configure** router *named-item-64* l2tp tunnel-selection-blacklist add-tunnel-on address-change-timeout *boolean*
Tree	address-change-timeout
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-err-code *boolean*

Synopsis	Add to deny if CDN is received with code: General error

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp tunnel-selection-blacklist add-tunnel-on cdn-err-code *boolean*
Tree	cdn-err-code
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-invalid-dst *boolean*

Synopsis	Force tunnel to the denylist in case of Result Codes 6
Context	**configure** router *named-item-64* l2tp tunnel-selection-blacklist add-tunnel-on cdn-invalid-dst *boolean*
Tree	cdn-invalid-dst
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-permanent-no-facilities *boolean*

Synopsis	Force tunnel to the denylist in case of Result Codes 5
Context	**configure** router *named-item-64* l2tp tunnel-selection-blacklist add-tunnel-on cdn-permanent-no-facilities *boolean*
Tree	cdn-permanent-no-facilities
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cdn-temporary-no-facilities *boolean*

Synopsis	Force tunnel to the denylist in case of Result Codes 4
Context	**configure** router *named-item-64* l2tp tunnel-selection-blacklist add-tunnel-on cdn-temporary-no-facilities *boolean*
Tree	cdn-temporary-no-facilities

egress-statistics

Synopsis	Enter the **egress-statistics** context
Context	**configure** router *named-item-64* ldp egress-statistics

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	egress-statistics
Description	Commands in this context configure LDP egress datapath statistics at the ingress LER.
Introduced	16.0.R1
Platforms	All

fec-prefix [ip-prefix] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Enter the **fec-prefix** list instance
Context	**configure** router *named-item-64* ldp egress-statistics fec-prefix *(ipv4-prefix | ipv6-prefix)*
Tree	fec-prefix
Description	Commands in this context configure statistics in the egress datapath at the ingress LER or LSR for an LDP FEC. The egress datapath counters are updated for both originating and transit packets. Originating packets may be service packets or IP user and control packets forwarded over the LDP LSP when used as an IGP shortcut. Transit packets of the FEC are packets that are label switched on this node. When ECMP is enabled and multiple paths exist for an FEC, the same set of counters is updated for each packet forwarded over any NHLFE associated with this FEC, and for as long as this FEC is active. The statistics can be enabled on FEC prefixes imported from both LDP neighbors and T-LDP neighbors (LDP over RSVP). LDP sets up egress statistics collection for LDP tunnels whose FECs match the exact prefix specified in this command. Service FECs, that is, FEC 128 and FEC 129, are not valid. LDP FEC egress statistics are collected at the PHP node for an LDP FEC using an implicit null egress label.
Introduced	16.0.R1
Platforms	All

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	FEC IP prefix
Context	**configure** router *named-item-64* ldp egress-statistics fec-prefix *(ipv4-prefix | ipv6-prefix)*
Tree	fec-prefix
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

accounting-policy *reference*

Synopsis	Accounting policy ID

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* ldp egress-statistics fec-prefix *(ipv4-prefix | ipv6-prefix)* accounting-policy *reference*
Tree	accounting-policy
Description	This command associates an accounting policy to the FEC prefix for statistics collection. An accounting policy must be configured with the **combined-ldp-lsp-egress** record type to be used for LDP FEC statistics.
Reference	**configure** log accounting-policy *number*
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the LDP egress statistics
Context	**configure** router *named-item-64* ldp egress-statistics fec-prefix *(ipv4-prefix | ipv6-prefix)* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

collect-stats *boolean*

Synopsis	Collect FEC prefix statistics
Context	**configure** router *named-item-64* ldp egress-statistics fec-prefix *(ipv4-prefix | ipv6-prefix)* collect-stats *boolean*
Tree	collect-stats
Description	When configured to **true**, the router performs accounting and statistics collection. When configured to **false**, the forwarding engine continues to accumulate statistics, however, the CPU does not obtain the results and write them to the billing file. If this command is subsequently re-enabled, the counters written to the billing file include all the traffic measured while the command was disabled.
Default	false
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

entropy-label-capability *boolean*

Synopsis	Enable entropy label capability on the LDP instance
Context	**configure** router *named-item-64* ldp entropy-label-capability *boolean*
Tree	entropy-label-capability
Default	false
Introduced	16.0.R1
Platforms	All

export-policy *reference*

Synopsis	Export policies to determine routes exported to LDP
Context	**configure** router *named-item-64* ldp export-policy *reference*

Tree	pop
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

swap-label *number*

Synopsis	Value mapped to egress label associated with next-hop entry that LSR uses to swap incoming label
Context	**configure** router *named-item-64* ldp fec-originate *(ipv4-prefix* | *ipv6-prefix)* swap-label *number*
Tree	swap-label
Range	6 to 1048575
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

generate-basic-fec-only *boolean*

Synopsis	Enable mLDP to generate a basic FEC
Context	**configure** router *named-item-64* ldp generate-basic-fec-only *boolean*
Tree	generate-basic-fec-only
Description	When configured to **true**, mLDP generates a basic FEC even if the actual root node is resolved using BGP. This functionality is useful when a connected router does not support the mLDP recursive FEC type. This command only operates with recursive opaque type 7 FECs and non-recursive type 1 FECs. When configured to **false**, mLDP generates a recursive FEC if the actual root node is resolved using BGP.
Default	false
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

log-only *boolean*

Synopsis	Trap and syslog message to generate when reaching the threshold and limit
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-limit log-only *boolean*
Tree	log-only
Default	false
Introduced	16.0.R1
Platforms	All

threshold *number*

Synopsis	Threshold that generates trap and warning when reached
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-limit threshold *number*
Tree	threshold
Range	1 to 100
Default	90
Introduced	16.0.R1
Platforms	All

fec-type-capability

Synopsis	Enter the **fec-type-capability** context
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-type-capability
Tree	fec-type-capability
Introduced	16.0.R1
Platforms	All

p2mp *boolean*

Synopsis	Enable P2MP FEC capability for the session
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-type-capability p2mp *boolean*
Tree	p2mp

import-prefixes *reference*

Synopsis	FEC prefixes to be redistributed to this LDP peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* import-prefixes *reference*
Tree	import-prefixes
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

pe-id-mac-flush-interop *boolean*

Synopsis	Send PE-ID TLV in LDP MAC withdrawal message
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* pe-id-mac-flush-interop *boolean*
Tree	pe-id-mac-flush-interop
Default	false
Introduced	16.0.R1
Platforms	All

shortcut-local-ttl-propagate *boolean*

Synopsis	Propagate TTL over LSP shortcut for local packets
Context	**configure** router *named-item-64* ldp shortcut-local-ttl-propagate *boolean*
Tree	shortcut-local-ttl-propagate
Default	true
Introduced	16.0.R1
Platforms	All

shortcut-transit-ttl-propagate *boolean*

Synopsis	Enable TTL propagation over LSP shortcut
Context	**configure** router *named-item-64* ldp shortcut-transit-ttl-propagate *boolean*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	shortcut-transit-ttl-propagate
Default	true
Introduced	16.0.R1
Platforms	All

targeted-session

Synopsis	Enter the **targeted-session** context
Context	**configure** router *named-item-64* ldp targeted-session
Tree	targeted-session
Introduced	16.0.R1
Platforms	All

auto-rx

Synopsis	Enter the **auto-rx** context
Context	**configure** router *named-item-64* ldp targeted-session auto-rx
Tree	auto-rx
Description	Commands in this context specify the LDP session configuration to accept targeted Hello messages from any peer.
Introduced	20.10.R1
Platforms	All

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** router *named-item-64* ldp targeted-session auto-rx ipv4
Tree	ipv4
Introduced	20.10.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of IPv4 capabilities for peers
Context	**configure** router *named-item-64* ldp targeted-session auto-rx ipv4 admin-state *keyword*

Tree	admin-state
Options	enable, disable
Default	disable
Introduced	20.10.R1
Platforms	All

tunneling *boolean*

Synopsis	Enable tunneling for targeted peers
Context	**configure** router *named-item-64* ldp targeted-session auto-rx ipv4 tunneling *boolean*
Tree	tunneling
Description	When configured to **true**, this command enables the local system to use the targeted LDP session to send FEC label bindings that are advertised to other LDP peers. For LDP rLFA, the source node requires the PQ node's label binding information in order to reach the destination. If the **auto-rx** and **auto-tx** contexts are both administratively enabled, this command must be set to **true** for LDP rLFA to function properly. When configured to **false**, FEC label bindings are not sent via the LDP session.
Default	false
Introduced	20.10.R1
Platforms	All

auto-tx

Synopsis	Enter the **auto-tx** context
Context	**configure** router *named-item-64* ldp targeted-session auto-tx
Tree	auto-tx
Description	Commands in this context specify the LDP session configuration to send targeted Hello messages toward PQ nodes determined by the rLFA algorithm.
Introduced	20.10.R1
Platforms	All

ipv4

authentication-key *encrypted-leaf*

Synopsis	Authentication key between LDP peers
Context	**configure** router *named-item-64* ldp tcp-session-parameters authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command specifies the authentication key used to establish a session between LDP peers. Authentication uses the MD-5 message-based digest. The peer address used in authentication must be the TCP session transport address. If one or more transport addresses used in the Hello adjacencies to the same peer LSR are different from the LSR ID value, the user must add each transport address to the authentication key configuration as a separate peer. As a result, when the TCP connection is bootstrapped by a specific Hello adjacency, the authentication can operate over that TCP connection by using its specific transport address. The per-peer authentication configuration takes precedence over global authentication configuration, and authentication keychain configuration takes precedence over authentication key configuration.
String length	1 to 370
Introduced	21.2.R1
Platforms	All

authentication-keychain *reference*

Synopsis	Authentication keychain to use for the TCP session
Context	**configure** router *named-item-64* ldp tcp-session-parameters authentication-keychain *reference*

tunnel-table-pref *number*

Synopsis	Tunnel table preference value for address FECs
Context	**configure** router *named-item-64* ldp tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the tunnel table preference for an LDP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	9
Introduced	21.10.R1

Tree policy

Description This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment.

Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface when redirection is configured
- subscriber level and group-interface level when redirection is unconfigured

In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).

Reference **configure** mcac policy *string*

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** router *named-item-64* mld group-interface *reference* mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).
Reference	**configure** mcac policy *string*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

query-interval *number*

Synopsis	Tunnel table preference
Context	**configure** router *named-item-64* mpls forwarding-policies forwarding-policy *named-item-64* tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the TTM preference value of an MPLS forwarding policy. It is used by applications to select one tunnel type to bind to in TTM when multiple tunnel types are enabled for the application. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	255
Introduced	16.0.R4
Platforms	All

interface [interface-name] *reference*

Synopsis	Enter the **interface** list instance
Context	**configure** router *named-item-64* mpls interface *reference*
Tree	interface
Description	Commands in this context configure the attributes for MPLS protocol support on an IP interface.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

MPLS commands are not executed on an IP interface where MPLS is not enabled. An MPLS interface must be explicitly enabled (admin-state enabled).

The MPLS interface must be admin-state disabled to delete the interface definition.

A corresponding RSVP interface must also be configured. The MPLS interface cannot be deleted without also deleting the RSVP interface.

Introduced	16.0.R1
Platforms	All

admin-group *reference*

Synopsis	Administrative groups supported by the interface
Context	**configure** router *named-item-64* mpls interface *reference* admin-group *reference*
Tree	admin-group
Description	This command specifies the administrative groups that the interface supports. This information is advertised as part of OSPF and IS-IS to help CSPF compute constrained LSPs that must include or exclude certain administrative groups. An MPLS interface is assumed to belong to all the administrative groups unless this command is issued under the interface configuration. With this command configured, the interface is assumed to belong to only the groups specifically configured in this command. Only the administrative groups bound to an MPLS interface are advertised in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

max-bandwidth *number*

Synopsis	Maximum bandwidth to request for an LSP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth max-bandwidth *number*
Tree	max-bandwidth
Description	This command configures the maximum bandwidth that the auto-bandwidth allocation can request for an LSP. This maximum bandwidth applies regardless of how the bandwidth adjustment is triggered. The maximum bandwidth must be greater than the minimum bandwidth.
Range	0 to 6400000
Units	megabps
Default	100000
Introduced	16.0.R1
Platforms	All

min-bandwidth *number*

Synopsis	Minimum bandwidth to request for an LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth min-bandwidth *number*
Tree	min-bandwidth
Description	This command configures the minimum bandwidth that the auto-bandwidth allocation is allowed to request for an LSP. This minimum bandwidth applies regardless of how the bandwidth adjustment is triggered.
Range	0 to 6400000
Units	megabps
Default	0
Introduced	16.0.R1
Platforms	All

monitor-bandwidth *boolean*

Synopsis	Collect and display auto-bandwidth measurements for LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth monitor-bandwidth *boolean*
Tree	monitor-bandwidth
Description	When configured to **true**, passive monitoring for auto-bandwidth is enabled on the system. This prevents the system from performing any automatic bandwidth adjustments, but does not affect the collection and display of bandwidth measurements.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, passive monitoring is disabled, which allows the system to perform auto-bandwidth adjustments.

Default false

Introduced 16.0.R1

Platforms All

multipliers

Synopsis Enter the **multipliers** context

Context **configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth multipliers

Tree multipliers

Description Commands in this context configure the sample multiplier and adjust multiplier for the LSP.

Introduced 16.0.R1

Platforms All

adjust-multiplier *number*

Synopsis Number of collection intervals in the adjust interval

Context **configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth multipliers adjust-multiplier *number*

Tree adjust-multiplier

Description This command configures the number of collection intervals between periodic evaluations by the ingress LER about whether to adjust the LSP bandwidth. The router keeps track of the maximum average data rate of each LSP since the last reset of the adjust count. The maximum of this average data rate over multiple sample intervals is the measured bandwidth input to the auto-bandwidth adjustment algorithms.

Setting this to a value less than the sample multiplier is not allowed. Nokia recommends setting the adjust multiplier to a multiple of the sample multiplier.

When this command is not configured, the router uses the value configured for the **configure router mpls auto-bandwidth-multipliers** command.

Range 1 to 16383

Introduced 16.0.R1

Platforms All

Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth multipliers sample-multiplier *number*
Tree	sample-multiplier
Description	This command configures the number of collection intervals between periodic computations of the data rate of the LSP. The byte count includes the Layer 2 encapsulation of MPLS packets and represents traffic of all forwarding classes and priorities (in-profile versus out-of-profile) belonging to the LSP. The router calculates the average data rate (in bits per second) over each sample interval. When this command is not configured, the router uses the value configured for the **configure router mpls auto-bandwidth-multipliers** command.
Range	1 to 511
Introduced	16.0.R1
Platforms	All

overflow-limit

Synopsis	Enable the **overflow-limit** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth overflow-limit
Tree	overflow-limit
Description	Commands in this context configure the overflow-triggered auto-bandwidth adjustment. The bandwidth adjustment is initiated when the configured **number** of overflow samples is reached, regardless of how much time remains until the adjust interval ends. A sample interval is counted as an overflow if the average data rate during the sample interval is higher than the currently reserved bandwidth by at least the configured thresholds. If overflow-triggered auto-bandwidth adjustment is successful, the overflow count, maximum average data rate, and adjust count are reset. If overflow-triggered auto-bandwidth adjustment fails, the overflow count is reset but the maximum average data rate and adjust count maintain the current values.
Introduced	16.0.R1
Platforms	All

bw *number*

Synopsis	Minimum difference in absolute bandwidth
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth overflow-limit bw *number*
Tree	bw

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the minimum difference between the current bandwidth of the LSP and the sampled data rate relative to the current bandwidth, for counting an overflow or underflow sample.
Range	1 to 6400000
Units	megabps
Introduced	16.0.R1
Platforms	All

number *number*

Synopsis	Number of samples to trigger auto-bandwidth adjustment
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth overflow-limit number *number*
Tree	number
Description	This command configures the number of overflow or underflow samples that trigger an overflow or underflow auto-bandwidth adjustment attempt.
Range	1 to 10
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

threshold *number*

Synopsis	Minimum difference in percentage of bandwidth
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth overflow-limit threshold *number*
Tree	threshold
Description	This command configures the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) for counting an overflow or underflow sample.
Range	0 to 100
Units	percent
Default	0
Introduced	16.0.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

underflow-limit

Synopsis	Enable the **underflow-limit** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth underflow-limit
Tree	underflow-limit
Description	Commands in this context configure the underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust-interval; it is triggered when the number of consecutive underflow samples reaches the configured threshold **number**. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last **number** of consecutive underflow samples. A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the configured thresholds.
Introduced	16.0.R1
Platforms	All

bw *number*

Synopsis	Minimum difference in absolute bandwidth
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth underflow-limit bw *number*

Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

threshold *number*

Synopsis	Minimum difference in percentage of bandwidth
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth underflow-limit threshold *number*
Tree	threshold
Description	This command configures the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) for counting an overflow or underflow sample.
Range	0 to 100
Units	percent
Default	0
Introduced	16.0.R1
Platforms	All

use-last-adj-bw

Synopsis	Enable the **use-last-adj-bw** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth use-last-adj-bw
Tree	use-last-adj-bw
Description	Commands in this context enable the carryover of the last adjusted bandwidth from the previous path to the new primary or secondary path when the LSP switches between paths.
Introduced	16.0.R5
Platforms	All

secondary-retry-limit *(number | keyword)*

Synopsis	Maximum number of retry limits for secondary paths

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth use-last-adj-bw secondary-retry-limit *(number | keyword)*
Tree	secondary-retry-limit
Description	This command configures the maximum number of retry attempts for secondary paths. After each successful attempt, the counter is reset to zero.
Range	1 to 10000
Options	infinite – Allow an unlimited number of retry attempts
Default	5
Introduced	16.0.R5
Platforms	All

bfd

Synopsis	Enter the **bfd** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd
Tree	bfd
Description	Commands in this context configure BFD on RSVP LSPs or Seamless BFD on SR-TE LSPs.
Introduced	16.0.R1
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD on the RSVP LSP or S-BFD on the SR-TE LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, LSP BFD is enabled on the RSVP LSP or S-BFD is enabled for the SR-TE LSP. LSP BFD must also be configured under the **configure router** context. The named BFD template provides the configuration settings for the BFD session, which must be configured and associated with the service using the BFD template. When configured to **false**, LSP BFD is disabled on the RSVP LSP or S-BFD on the SR-TE LSP.
Default	false
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

bfd-template *reference*

Synopsis	BFD template to be used by LSP BFD sessions
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd bfd-template *reference*
Tree	bfd-template
Reference	**configure** bfd bfd-template *named-item*
Introduced	16.0.R1
Platforms	All

failure-action *keyword*

Synopsis	Action when LSP BFD fails on the RSVP SR-TE LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd failure-action *keyword*
Tree	failure-action
Description	The command specifies the action when LSP BFD fails on an RSVP, SR-TE, or LDP LSP. Regardless of the failure action specified, when the BFD session goes down on the LSP, the system generates an SNMP trap.
Options	none, down, failover, failover-or-down
Default	none
Introduced	16.0.R1
Platforms	All

lsp-ping-interval *(number | keyword)*

Synopsis	Interval for periodic LSP ping for BFD bootstrapping
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd lsp-ping-interval *(number | keyword)*
Tree	lsp-ping-interval
Range	60 to 300
Units	seconds
Options	none
Default	60
Introduced	16.0.R1
Platforms	All

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048575
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source address for the S-BFD packets
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures a source address for the S-BFD packets sent on the SR-TE LSP. If this command is not configured, the system uses the LSP **from** address, where applicable. Otherwise, the system uses the system IPv4 address for IPv4 SR-TE LSPs or the IPv6 address corresponding to the IPv6 TE router ID for IPv6 SR-TE LSPs.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer.

For RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up
- the initial administrative state of the LSP
- the retry signaling of non-standby secondary paths

Range	1 to 60
Units	seconds
Default	4
Introduced	19.7.R1
Platforms	All

bgp-shortcut *boolean*

Synopsis	Include LSP for BGP routes

admin-state *keyword*

Synopsis	Administrative state of statistics for the LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* egress-statistics admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

collect-stats *boolean*

Synopsis	Collect LSP statistics
Context	**configure** router *named-item-64* mpls lsp *named-item-64* egress-statistics collect-stats *boolean*
Tree	collect-stats
Description	When configured to **true**, this command enables LSP statistics collection. When you apply accounting policies, the forwarding engine collects data in the appropriate records and by default the CPU obtains and writes the results to the designated billing file. When configured to **false**, the forwarding engine still accumulates statistics. However, the CPU does not write them to the billing file. If you subsequently re-enable this command, the counters written to the billing file include all the traffic collected while the command was disabled.
Default	false
Introduced	16.0.R1
Platforms	All

path-computation-method *keyword*

Synopsis	Path computation method
Context	**configure** router *named-item-64* mpls lsp *named-item-64* path-computation-method *keyword*
Tree	path-computation-method
Description	This command configures the path computation method of an RSVP-TE or SR-TE LSP. If this command is not configured to one of the supported options, the default path computation method is used depending on the type of LSP; the hop-to-label translation is used for the SR-TE LSP template and the IGP-based path is used for the RSVP-TE-LSP. See "SR-TE LSP path computation using hop-to-label translation" in the *7750 Service Router and 7950 Extensible Routing System Segment Routing nad PCE User Guide* for more information.
Options	local-cspf, pce
Introduced	19.7.R1
Platforms	All

path-profile [profile-id] *number*

Synopsis	Enter the **path-profile** list instance
Context	**configure** router *named-item-64* mpls lsp *named-item-64* path-profile *number*
Tree	path-profile
Description	Commands in this context configure the attributes of the PCE path profile.
Max. instances	5
Introduced	16.0.R1
Platforms	All

pce-control *boolean*

Synopsis	Enable PCE controlled LSP mode of operation
Context	**configure** router *named-item-64* mpls lsp *named-item-64* pce-control *boolean*
Tree	pce-control
Description	When configured to **true**, this command enables a PCE-controlled mode of operation for the LSP. In this mode, the router delegates full control of the LSP to the PCE (PCE controlled). The PCE acts in stateful-active mode for this LSP and is able to reroute the path following a failure or to re-optimize the path and update the router without a request from the router. When configured to **false**, the PCE-controlled mode of operation for the LSP has no effect.
Default	false
Introduced	16.0.R1
Platforms	All

pce-report *keyword*

Synopsis	Global configuration of reporting to PCE to override
Context	**configure** router *named-item-64* mpls lsp *named-item-64* pce-report *keyword*
Tree	pce-report
Options	false, true
Introduced	16.0.R1
Platforms	All

primary [path-name] *reference*

Synopsis	Enter the **primary** list instance
Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference*
Tree	primary
Description	Commands in this context configure a preferred path for the LSP. This command is optional only if the secondary path name is included in the LSP definition. Only one primary path can be defined for an LSP. Some attributes of the LSP, such as the bandwidth and hop-limit can be optionally specified as the attributes of the primary path. The attributes specified in this command override the LSP attributes.
Max. instances	1

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference* bfd return-path-label *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048575
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source address for S-BFD packets
Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference* bfd source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures a source address for the S-BFD packets sent on the SR-TE LSP path. The system uses the LSP **from** address, where applicable. Otherwise, the system uses the system IPv4 address for IPv4 SR-TE LSPs or the IPv6 address corresponding to the IPv6 TE router ID for IPv6 SR-TE LSPs.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs. For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer. For RSVP-TE LSPs, the timer controls the following:

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- a path undergoing MBB when BFD is up
- the initial administrative state of the LSP
- the retry signaling of non-standby secondary paths

Range	1 to 60
Units	seconds
Default	4
Introduced	19.7.R1
Platforms	All

delay-metric-limit *number*

Synopsis	Delay metric limit
Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference* delay-metric-limit *number*
Tree	delay-metric-limit
Description	This command configures the upper limit of the delay metric used by the local CSPF in the LSP path computation. The computation uses this configuration value only if the metric type is configured to **delay** in the **configure router mpls lsp metric-type** context. If the configured metric type is **delay** and this command is not configured, the computation selects the lowest latency path.
Range	1 to 16777215
Units	microseconds

secondary [path-name] *reference*

Synopsis	Enter the **secondary** list instance
Context	**configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference*
Tree	secondary
Description	Commands in this context configure an alternative path that the LSP uses if the primary path is not available. This command is optional and is not required when the **configure router mpls lsp primary** command is specified. After the switchover from the primary to the secondary, the system continuously tries to revert to the primary path. The switch back to the primary path is based on the retry-timer interval. The system does not switch among secondary paths. The system starts the signaling (RSVP-TE) or programming (SR-TE) of all non-standby secondary paths at the same time. Retry counters are maintained for each unsuccessful attempt. After the retry limit is reached on a path, the system does not attempt to signal the path and administratively disables the path. The first successfully established non-standby secondary path is made the active path for the LSP. For RSVP-TE LSPs, up to eight secondary paths can be specified (or seven if a primary is configured). For SR-TE LSPs, up to three paths of any type (with a maximum of one primary) can be configured. By default, a secondary path is non-standby unless the **standby** keyword is configured. All non-standby secondary paths are considered equal, and the first available path is used.

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048575
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source address for S-BFD packets
Context	**configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference* bfd source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures a source address for the S-BFD packets sent on the SR-TE LSP path. The system uses the LSP **from** address, where applicable. Otherwise, the system uses the system IPv4 address for IPv4 SR-TE LSPs or the IPv6 address corresponding to the IPv6 TE router ID for IPv6 SR-TE LSPs.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs. For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer. For RSVP-TE LSPs, the timer controls the following: • a path undergoing MBB when BFD is up • the initial administrative state of the LSP • the retry signaling of non-standby secondary paths
Range	1 to 60

lsp-self-ping

Synopsis	Enter the **lsp-self-ping** context
Context	**configure** router *named-item-64* mpls lsp-self-ping
Tree	lsp-self-ping
Description	Commands in this context configure LSP Self Ping parameters.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

LSP Self Ping checks that the datapath of an RSVP LSP has been programmed by all LSRs along its path before switching the traffic to it. If enabled, LSP Self Ping packets are sent periodically at a configurable interval following the receipt of the RESV message for an RSVP LSP path following an MBB or other event where the active path changes while the previous active path stayed up. The router will not switch traffic to the new path until an LSP Self Ping reply is received from the far-end LER.

When configured under the MPLS context, LSP Self Ping is enabled for all RSVP LSPs, unless it is explicitly disabled for a given LSP.

Introduced 19.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval *number*

Synopsis MPLS periodic LSP Self Ping interval

Context **configure** router *named-item-64* mpls lsp-self-ping interval *number*

Tree interval

Description This command configures the interval at which LSP Self Ping packets are periodically sent on a candidate path of an RSVP LSP.

This value is used for all LSPs that have LSP Self Ping enabled.

Range 1 to 10

Units seconds

Default 1

Introduced 19.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rsvp-te *boolean*

Synopsis Activate LSP Self Ping on RSVP-TE LSPs

Context **configure** router *named-item-64* mpls lsp-self-ping rsvp-te *boolean*

Tree rsvp-te

Description When configured to **true**, this command enables LSP Self Ping on all RSVP-TE LSPs, unless an individual LSP has this explicitly disabled under the **configure router mpls lsp lsp-self-ping** command or in the LSP template.

When configured to **false**, this command disables LSP Self Ping on all RSVP-TE LSPs.

Default false

Introduced 19.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

max-bandwidth *number*

Synopsis	Maximum bandwidth to request for an LSP
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth max-bandwidth *number*
Tree	max-bandwidth
Description	This command configures the maximum bandwidth that the auto-bandwidth allocation can request for an LSP. This maximum bandwidth applies regardless of how the bandwidth adjustment is triggered. The maximum bandwidth must be greater than the minimum bandwidth.
Range	0 to 6400000
Units	megabps
Default	100000
Introduced	16.0.R1
Platforms	All

min-bandwidth *number*

Synopsis	Minimum bandwidth to request for an LSP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth min-bandwidth *number*
Tree	min-bandwidth
Description	This command configures the minimum bandwidth that the auto-bandwidth allocation is allowed to request for an LSP. This minimum bandwidth applies regardless of how the bandwidth adjustment is triggered.
Range	0 to 6400000
Units	megabps
Default	0
Introduced	16.0.R1
Platforms	All

monitor-bandwidth *boolean*

Synopsis	Collect and display auto-bandwidth measurements for LSP
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth monitor-bandwidth *boolean*
Tree	monitor-bandwidth
Description	When configured to **true**, passive monitoring for auto-bandwidth is enabled on the system. This prevents the system from performing any automatic bandwidth adjustments, but does not affect the collection and display of bandwidth measurements. When configured to **false**, passive monitoring is disabled, which allows the system to perform auto-bandwidth adjustments.
Default	false
Introduced	16.0.R1
Platforms	All

multipliers

Synopsis	Enter the **multipliers** context
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth multipliers
Tree	multipliers
Description	Commands in this context configure the sample multiplier and adjust multiplier for the LSP.
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms All

adjust-multiplier *number*

Synopsis Number of collection intervals in the adjust interval

Context **configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth multipliers adjust-multiplier *number*

Tree adjust-multiplier

Description This command configures the number of collection intervals between periodic evaluations by the ingress LER about whether to adjust the LSP bandwidth. The router keeps track of the maximum average data rate of each LSP since the last reset of the adjust count. The maximum of this average data rate over multiple sample intervals is the measured bandwidth input to the auto-bandwidth adjustment algorithms.

Setting this to a value less than the sample multiplier is not allowed. Nokia recommends setting the adjust multiplier to a multiple of the sample multiplier.

When this command is not configured, the router uses the value configured for the **configure router mpls auto-bandwidth-multipliers** command.

Range 1 to 16383

Introduced 16.0.R1

Platforms All

sample-multiplier *number*

Synopsis Multiplier for collection intervals in a sample interval

Context **configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth multipliers sample-multiplier *number*

Tree sample-multiplier

Description This command configures the number of collection intervals between periodic computations of the data rate of the LSP. The byte count includes the Layer 2 encapsulation of MPLS packets and represents traffic of all forwarding classes and priorities (in-profile versus out-of-profile) belonging to the LSP. The router calculates the average data rate (in bits per second) over each sample interval.

When this command is not configured, the router uses the value configured for the **configure router mpls auto-bandwidth-multipliers** command.

Range 1 to 511

Introduced 16.0.R1

Platforms All

© 2025 Nokia.

overflow-limit

Synopsis	Enable the **overflow-limit** context
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth overflow-limit
Tree	overflow-limit
Description	Commands in this context configure the overflow-triggered auto-bandwidth adjustment. The bandwidth adjustment is initiated when the configured number of overflow samples is reached, regardless of how much time remains until the adjust interval ends. A sample interval is counted as an overflow if the average data rate during the sample interval is higher than the currently reserved bandwidth by at least the configured thresholds. If the overflow-triggered auto-bandwidth adjustment is successful, the overflow count, maximum average data rate, and adjust count are reset. If overflow-triggered auto-bandwidth adjustment fails, the overflow count is reset but the maximum average data rate and adjust count maintain the current values.
Introduced	16.0.R1
Platforms	All

bw *number*

Synopsis	Minimum difference in absolute bandwidth
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth overflow-limit bw *number*
Tree	bw
Description	This command configures the minimum difference between the current bandwidth of the LSP and the sampled data rate relative to the current bandwidth, for counting an overflow or underflow sample.
Range	1 to 6400000
Units	megabps
Introduced	16.0.R1
Platforms	All

number *number*

Synopsis	Number of samples to trigger auto-bandwidth adjustment
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth overflow-limit number *number*
Tree	number

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the number of overflow or underflow samples that trigger an overflow or underflow auto-bandwidth adjustment attempt.
Range	1 to 10
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

threshold *number*

Synopsis	Minimum difference in percentage of bandwidth
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth overflow-limit threshold *number*
Tree	threshold
Description	This command configures the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) for counting an overflow or underflow sample.
Range	0 to 100
Units	percent
Default	0
Introduced	16.0.R1
Platforms	All

underflow-limit

Synopsis	Enable the **underflow-limit** context
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth underflow-limit
Tree	underflow-limit
Description	Commands in this context configure the underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust-interval; it is triggered when the number of consecutive underflow samples reaches the configured threshold **number**. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last **number** of consecutive underflow samples. A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the configured thresholds.
Introduced	16.0.R1
Platforms	All

return-path-label *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.

Range	32 to 1048575
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Source address for S-BFD packets
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures a source address for the S-BFD packets sent on the SR-TE LSP path instantiated according to the LSP template. The system uses the LSP **from** address, where applicable. Otherwise, the system uses the system IPv4 address for IPv4 SR-TE LSPs or the IPv6 address corresponding to the IPv6 TE router ID for IPv6 SR-TE LSPs.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Time to wait for BFD to become operationally available
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs. For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer. For RSVP-TE LSPs, the timer controls the following: • a path undergoing MBB when BFD is up • the initial administrative state of the LSP • the retry signaling of non-standby secondary paths
Range	1 to 60
Units	seconds
Default	4
Introduced	19.7.R1

allow-sr-over-srte *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Use as eligible SRv4 or SRv6 IGP shortcut
Context	**configure** router *named-item-64* mpls lsp-template *named-item* igp-shortcut allow-sr-over-srte *boolean*
Tree	allow-sr-over-srte
Description	When configured to **true**, the router performs local SPF and the SR-TE LSP template is used as an eligible IGP SR-MPLS shortcut for SR-MPLS SRv4 or SRv6 only if the SR-TE is explicitly allowed using this command and when the top SID in the SR-TE LSP is an adjacency SID.
Default	false
Introduced	23.3.R1
Platforms	All

lfa-type *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	LSP usage in LFA SPF

pce-control *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable PCE controlled LSP mode of operation
Context	**configure** router *named-item-64* mpls lsp-template *named-item* pce-control *boolean*
Tree	pce-control
Description	When configured to **true**, this command enables a PCE-controlled mode of operation for the LSP. In this mode, the router delegates full control of the LSP to the PCE (PCE controlled). The PCE acts in stateful-active mode for this LSP and is able to reroute the path following a failure or to re-optimize the path and update the router without a request from the router. When configured to **false**, the PCE-controlled mode of operation for the LSP has no effect.
Default	false
Introduced	21.10.R1
Platforms	All

pce-report *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

resignal-on-igp-event *boolean*

Synopsis	Reoptimize RSVP LSP paths upon IGP events

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context **configure** router *named-item-64* mpls resignal-on-igp-event *boolean*

Tree resignal-on-igp-event

Description When configured to **true**, the system enables the ad hoc reoptimization of the active CSPF path of all RSVP-TE LSPs at the receipt of an IGP link event. The following link events are supported:

- link down
- link up
- IGP or TE metric change
- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates the active paths of all RSVP-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops, and computing a new CSPF path. MPLS signals and programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

Default false

Introduced 24.10.R1

Platforms All

resignal-on-igp-overload *boolean*

Synopsis Resignal all RSVP-TE LSPs upon IGP overload

Context **configure** router *named-item-64* mpls resignal-on-igp-overload *boolean*

Tree resignal-on-igp-overload

Description When configured to **true**, the receipt of the IS-IS overload bit in the TE-DB triggers the immediate resignaling of all RSVP-TE LSPs. MPLS forces the expiry of the resignal timer and the TE-DB computes a new CSPF for each RSVP-TE LSP active path. The re-optimization causes the immediate transition of RSVP-TE LSP paths away from the IS-IS node in overload using the MBB operation.

This command cannot be configured to **true** when the **retry-on-igp-overloa**d command is configured to **true**.

When configured to **false**, the default behavior is maintained where MBB re-optimization occurs only when a timer-based resignal is performed or a manual resignal is executed.

Default false

Introduced 20.10.R1

resignal-on-igp-event *boolean*

Synopsis	Reoptimize SR-TE LSPs upon IGP link events
Context	**configure** router *named-item-64* mpls sr-te-resignal resignal-on-igp-event *boolean*
Tree	resignal-on-igp-event
Description	When configured to **true**, the system enables the ad hoc reoptimization of all CSPF paths in the operational UP state of all SR-TE LSPs at the receipt of an IGP link event. The following link events are supported: • link down • link up • IGP or TE metric change • SRLG change • admin group change

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates all the paths in the operational UP state of all SR-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops and labels, and computing a new CSPF path. MPLS programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls sr-te-resignal resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

Default false

Introduced 19.10.R1

Platforms All

resignal-on-igp-overload *boolean*

Synopsis Enable resignaling of SR-TE LSPs upon IGP overload

Context **configure** router *named-item-64* mpls sr-te-resignal resignal-on-igp-overload *boolean*

Tree resignal-on-igp-overload

Description When configured to **true**, the system enables ad-hoc re-optimzation of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router.

When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up.

The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the **configure router mpls sr-te-resignal resignal-timer** command to configure the resignal timer for the SR-TE application.

When configured to **false**, MPLS does not act immediately on an IS-IS overload bit from a remote router. MPLS acts on it at the next timer-based or manual re-optimization of the SR-TE LSPs.

Default false

Introduced 23.3.R1

strict-ero-nhop-direct-resolution *boolean*

Synopsis	Resolves RSVP-TE LSP ERO to local and host routes only
Context	**configure** router *named-item-64* mpls strict-ero-nhop-direct-resolution *boolean*
Tree	strict-ero-nhop-direct-resolution
Description	When configured to **true**, the router enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table. This command applies to an ERO when all of the following conditions are met: • the ERO next hop is an IPv4 address • the ERO object is a strict hop • the IPv4 address matches the primary subnet of a local numbered interface If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2). When configured to **false**, the router disables the strict ERO next-hop direct resolution.
Default	false
Introduced	22.5.R1
Platforms	All

tunnel-table-pref

rsvp-te *number*

Synopsis	RSVP-TE tunnel table preference
Context	**configure** router *named-item-64* mpls tunnel-table-pref rsvp-te *number*
Tree	rsvp-te
Description	This command configures the tunnel table preference for RSVP-TE LSP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. Nokia recommends that tunnel types have unique preference values. In a situation where two or more tunnel types are set to the same preference value, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	7
Introduced	21.10.R1
Platforms	All

sr-te *number*

Synopsis	SR-TE tunnel table preference
Context	**configure** router *named-item-64* mpls tunnel-table-pref sr-te *number*
Tree	sr-te
Description	This command configures the tunnel table preference for SR-TE LSP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

local-address *ipv4-unicast-address*

Synopsis	Local end IP address of the MSDP group
Context	**configure** router *named-item-64* msdp group *named-item* local-address *ipv4-unicast-address*
Tree	local-address
Description	This command configures the local end address of an MSDP session. For MSDP to function, at least one peer with a local address must be configured. This address must be present on the node and is used to validate incoming connections to the peer and to establish connections to the remote peer. The specified IP address is validated and used as the local address for MSDP peers from that point. If a subsequent address is configured, it replaces the existing configuration and terminates any existing sessions

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a session is terminated, all information pertaining to and learned from that peer is removed. When a new peering session is created or a peering session is lost, an event message is generated.

Introduced 19.10.R1

Platforms All

mode *keyword*

Synopsis Topology of the group of peers

Context **configure** router *named-item-64* msdp group *named-item* mode *keyword*

Tree mode

Description This command configures the MSDP group topology. MSDP peers can be grouped in a full-mesh topology to prevent excessive flooding of SA messages to neighboring peers.

In a mesh group, SA messages received from a mesh group member are always accepted but are not flooded to other members of the same mesh group. These SA messages are only flooded to non-mesh group peers or members of other mesh groups.

Note: In a meshed configuration, all members of the group must have a peer connection with every other mesh group member. If this rule is not adhered to, unpredictable results may occur.

Options standard, mesh-group

Default standard

Introduced 19.10.R1

Platforms All

peer [ip-address] *ipv4-unicast-address*

Synopsis Enter the **peer** list instance

Context **configure** router *named-item-64* msdp group *named-item* peer *ipv4-unicast-address*

Tree peer

Description Commands in this context configure an MSDP group peer. For MSDP to function, at least one peer with a local address must be configured.

After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources.

By default, the options applied to a peer are inherited from the global or group level. To override these inherited options, configure the peer-specific options within this context.

authentication-key *encrypted-leaf*

Synopsis	MD5 authentication key for the MSDP peering session
Context	**configure** router *named-item-64* msdp group *named-item* peer *ipv4-unicast-address* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command configures a Message Digest 5 (MD5) authentication key to be used with a specific MSDP peering session. The authentication key is not inherited from the global or group level and must be configured per peer.
String length	1 to 370
Introduced	19.10.R1
Platforms	All

default-peer *boolean*

Synopsis	Set the peer as a default MSDP peer
Context	**configure** router *named-item-64* msdp group *named-item* peer *ipv4-unicast-address* default-peer *boolean*
Tree	default-peer
Description	When configured to **true**, the system sets the peer as a default MSDP peer. All SA messages from a default peer are accepted without the usual peer-reverse-path-forwarding (RPF) check. Unlike the normal multicast RPF checks, the peer-RPF check stops SA messages from looping. When configured to **false**, the system sets the peer as a non-default peer, which forces all SA messages from the peer to be RPF checked. See "Peer-RPF check" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Multicast Routing Protocols Guide* for information about the peer-RPF check rules.
Default	false
Introduced	19.10.R1
Platforms	All

export-policy *reference*

Synopsis	Policy to export source-active states into MSDP

force-unique-ip-addresses *boolean*

Synopsis	Enforce unique IPv4 addresses for L2-aware subscribers
Context	**configure** router *named-item-64* nat inside l2-aware force-unique-ip-addresses *boolean*
Tree	force-unique-ip-addresses
Description	When configured to **true**, the system enforces the uniqueness of IPv4 addresses of L2-aware subscribers in an inside routing context. This functionality is required if multicast sourced from the inside routing context is enabled for L2-aware subscribers.
Default	false
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscribers [prefix] *ipv4-prefix-with-host-bits*

Synopsis	Add a list entry for **subscribers**
Context	**configure** router *named-item-64* nat inside l2-aware subscribers *ipv4-prefix-with-host-bits*
Tree	subscribers
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**prefix**] *ipv4-prefix-with-host-bits*

Synopsis	Layer-2 Aware NAT subscriber prefix
Context	**configure** router *named-item-64* nat inside l2-aware subscribers *ipv4-prefix-with-host-bits*
Tree	subscribers
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

large-scale

Synopsis	Enter the **large-scale** context
Context	**configure** router *named-item-64* nat inside large-scale

Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

deterministic

Synopsis	Enter the **deterministic** context
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite deterministic
Tree	deterministic
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

address-map [from] *ipv6-prefix* to *ipv6-prefix* nat-policy *reference*

Synopsis	Enter the **address-map** list instance
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite deterministic address-map *ipv6-prefix* to *ipv6-prefix* nat-policy *reference*
Tree	address-map
Description	Commands in this context map inside IPv6 addresses of deterministic DS-Lite subscribers to the outside IPv4 addresses in a NAT pool. This context is only applicable to deterministic DS-Lite with a single ESA-VM in a NAT-group. The number of subscribers per outside IP address is flexible and not restricted to a discrete range governed by the 2^n rule.
Introduced	24.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**from**] *ipv6-prefix*

Synopsis	Lower bound of IPv6 address of inside IPv6 NAT range
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite deterministic address-map *ipv6-prefix* to *ipv6-prefix* nat-policy *reference*
Tree	address-map
Description	This command specifies the starting IPv6 address or IPv6 prefix for a DS-Lite subscriber or B4 element on the inside IPv6 address range.
Notes	This element is part of a list key.
Introduced	24.7.R1

© 2025 Nokia.

Max. instances	128
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**address**] *ipv6-address*

Synopsis	Dual Stack Lite IPv6 address
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address*
Tree	endpoint
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ip-fragmentation *keyword*

Synopsis	Fragmentation control of the AFTR originated downstream IPv6 traffic
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address* ip-fragmentation *keyword*
Tree	ip-fragmentation
Options	fragment-ipv6, fragment-ipv6-unless-ipv4-df-set
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

min-first-fragment-size-rx *number*

Synopsis	Minimum MTU size for upstream packets
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address* min-first-fragment-size-rx *number*
Tree	min-first-fragment-size-rx
Description	This command configures the minimum MTU size for the first fragment in the upstream direction. This command can be used to enable processing of first IPv6 fragments smaller than 1280 bytes. RFC 8200 recommends the minimum MTU in IPv6 be 1280 bytes which allows fragmentation only for packets that are larger than 1280 bytes. If a first fragment is smaller than 1280 bytes, DS-lite implementation in the SR OS, by default, drops the first fragment.
Range	512 to 1280

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	1280
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reassembly *boolean*

Synopsis	Reassembly of IPv6 payload datagrams
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address* reassembly *boolean*
Tree	reassembly
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-mtu *number*

Synopsis	DS-Lite tunnel MTU for this address
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address* tunnel-mtu *number*
Tree	tunnel-mtu
Description	This command configures the Dual Stack Lite (DS-Lite) tunnel MTU for this address.
Range	464 to 9212
Default	1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

max-subscriber-limit *number*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Largest value for all subscriber limits in each deterministic pool
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite max-subscriber-limit *number*

max-subscriber-limit *number*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Largest value for all subscriber limits in each deterministic pool
Context	**configure** router *named-item-64* nat inside large-scale nat44 max-subscriber-limit *number*
Tree	max-subscriber-limit
Range	1 | 2 | 4 | 8 | 16 | 32 | 64 | 128 | 256 | 512 | 1024 | 2048 | 4096 | 8192 | 16384 | 32768
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-import *reference*

Synopsis	Import BGP-VPN routes in NAT inside routing context
Context	**configure** router *named-item-64* nat inside large-scale nat44 nat-import *reference*
Tree	nat-import
Description	This command references an import policy to determine the routes that should be installed in the routing table as NAT routes, which are used to steer traffic to NAT. A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route is associated with a NAT policy that maps traffic destined into a NAT pool and outside routing context. If the NAT policy is not explicitly configured in the import route-policy, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context. All BGP-VPN routes that are destined to be imported into NAT inside routing context must be configured with action-type accept in the route policy.
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

source-prefix [ip-prefix-length] *ipv4-unicast-prefix*

Synopsis	Enter the **source-prefix** list instance

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* nat inside large-scale nat44 source-prefix *ipv4-unicast-prefix*
Tree	source-prefix
Description	Commands in this context configure the source prefix used to identify traffic for NAT processing. After the traffic is diverted to the ESA-VM or vISA, its source IP address is checked to determine if it belongs to the configured prefix. If it does, the traffic is processed by NAT, otherwise, it is dropped.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**ip-prefix-length**] *ipv4-unicast-prefix*

Synopsis	IPv4 prefix length
Context	**configure** router *named-item-64* nat inside large-scale nat44 source-prefix *ipv4-unicast-prefix*
Tree	source-prefix
Notes	This element is part of a list key.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-policy *reference*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	AT policy associated with the source prefix
Context	**configure** router *named-item-64* nat inside large-scale nat44 source-prefix *ipv4-unicast-prefix* nat-policy *reference*
Tree	nat-policy
Reference	**configure** service nat nat-policy *external-named-item*
Notes	This element is mandatory.

address-pooling *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Outside IP address allocation mode for a NAT subscriber
Context	**configure** router *named-item-64* nat outside pool *named-item* address-pooling *keyword*
Tree	address-pooling
Description	This command configures address pooling which defines a relationship between the NAT subscriber and its outside IP address(es). The behavior in NAT, as defined in RFC 7857, strongly recommends that the NAT subscribers be mapped to a single outside IP address. If this outside IP address runs out of ports, no new ports for the subscriber are allocated. This behavior is called paired address pooling. The alternative behavior is arbitrary address pooling, where a NAT subscriber is mapped to multiple IP addresses when the current outside IP address runs out of ports. This way, the subscriber becomes associated with multiple outside IP addresses. While this results in better resource utilization in NAT, it may negatively affect the behavior of some applications.
Options	paired, arbitrary
Default	paired

Context	**configure** router *named-item-64* nat outside pool *named-item* address-range *ipv4-unicast-address* end *ipv4-unicast-address* exclude *ipv4-unicast-address* end-address *ipv4-unicast-address*
Tree	exclude
Description	Commands in this context exclude the specified range of IPv4 addresses from the NAT pool without impacting the traffic associated with the remaining addresses. Excluded IP addresses are withdrawn from the routing table, ensuring that downstream traffic destined for them does not reach the ESA-VM. Instead, such traffic is dropped at the forwarding plane level. This approach offloads drop processing from the ESA-VM, which significantly improves system performance by reducing CPU overhead related to packet drops. While exclusion of IPv4 addresses from the NAT pool may introduce some routing churn (for example, remicroneting), the user can aggregate NAT routes to limit the impact to the local node. If routing changes are allowed to propagate upstream, the benefit is that unwanted traffic is dropped earlier at an upstream router, thereby reducing the load on the downstream network. IPv4 addresses excluded from the NAT pool using this command are returned to the pool when this command is deleted. The following applies when an address is excluded: • All NAT sessions associated with that public IP are removed. • Any static port-forward actions tied to that address transition to the **down** state. • Subscribers mapped to the excluded public IP can be reassigned to a new NAT address.

Tree	l2-aware
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-host

Synopsis	Enable the **default-host** context
Context	**configure** router *named-item-64* nat outside pool *named-item* l2-aware default-host
Tree	default-host
Description	Commands in this context configure the default DMZ host options. A default DMZ host is a node on the inside to which all unknown traffic is redirected by changing the destination IPv4 address in the traffic header. During this operation, the checksums in the Layer 3 and Layer 4 header (UDP and TCP) are recalculated. Unknown traffic in NAT represent all unmatched traffic arriving from the outside (where there is no pinhole or a matching flow record created by traffic initiated from the inside). The purpose of the default DMZ host is to capture and analyze the unknown traffic as part of threat analysis. The rate of redirected unknown traffic can be restricted by configuration.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

inside-router-instance *string*

Synopsis	Router instance of the DMZ

subscriber-limit *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Number of L2-Aware NAT subscribers per outside address
Context	**configure** router *named-item-64* nat outside pool *named-item* l2-aware port-block-extension subscriber-limit *number*
Tree	subscriber-limit
Description	When port-block extensions for the L2-Aware subscribers are enabled, the port space for an outside IP address is divided into the following: • well-known port (this is a fixed and permanently allocated block of ports for all NAT types) • static port-forwarding range (if enabled by configuration) • port range allocated for initial port blocks of each L2-Aware subscriber • port range allocated for extended port blocks for the remainder after the three previous port ranges The number of L2-Aware NAT subscribers per an outside IP address multiplied by the size of the initial port-block size determines the size of the port range reserved for initial port-blocks of each subscriber.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	The lower boundary of the extended port range is determined by adding the upper boundary of the configured port forwarding range and the size of the port range allocated for initial port blocks.
Range	2 to 2000
Notes	This element is mandatory.

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Limit of free ports for TCP per outside IP address
Context	**configure** router *named-item-64* nat outside pool *named-item* large-scale flexible-port-allocation free-port-limit tcp *number*
Tree	tcp
Description	This command configures the minimum number of ports for TCP protocol per outside IP address in an LSN44 pool with flexible port allocations that are free so that a new subscriber is mapped to the outside IP address. This limit is set to avoid rapid port depletion for new subscribers in paired pooling mode, or unnecessary toggling between external IP addresses for existing subscribers in arbitrary pooling mode.
Range	1 to 10000
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

udp *number*

dynamic-block-reservation *boolean*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Reserve dynamic block for subscriber
Context	**configure** router *named-item-64* nat outside pool *named-item* port-forwarding dynamic-block-reservation *boolean*
Tree	dynamic-block-reservation
Description	When configured to **true**, the system reserves dynamic port block when the first port forward for the subscriber is created. The dynamic port block allocation is logged only if the block is being used and mappings are created. Dynamic port block reservation due to the port forward creation but without any dynamic mapping, is not logged.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The reserved port block is released only when the last mapping in the block expires and there are no port forwards associated with the subscriber. The de-allocation log (syslog or RADIUS) is generated when the dynamic port block is completely released.

Dynamic port block reservations can be enabled only if the configured maximum number of subscribers per outside IP addresses are less than or equal to the maximum number of configured port blocks per outside IP address.

When configured to **false**, dynamic port blocks are not reserved when the first port forward for the subscriber is created.

Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

range-end *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	End of the wildcard range for port forwards
Context	**configure** router *named-item-64* nat outside pool *named-item* port-forwarding range-end *number*
Tree	range-end
Description	This command configures the upper boundary of the wildcard port range dedicated to port forwarding in a NAT pool, whereas the **range-start** command configures the lower boundary (the starting port) of the wildcard port range dedicated to port forwarding in a NAT pool. If unconfigured, the **range-end** implicit value is set to 1023, that represents the end of the well-known port range that is always enabled. Port forwards are supported only in pools in NAPT mode. Pools in 1:1 mode do not support port-forwards.
Range	0 | 1023 to 65535
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

range-start *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Start of the wildcard range for port forwards
Context	**configure** router *named-item-64* nat outside pool *named-item* port-forwarding range-start *number*
Tree	range-start
Description	This command configures the lower boundary (the starting port) of the wildcard port range dedicated to port forwarding in a NAT pool, whereas the **range-end** command configures the upper boundary of the wildcard port range dedicated to port forwarding in a NAT pool. Port 0 is always excluded from the port forwarding range. Port forwards are supported only in pools in Network Address and Port Translation (NAPT) mode. Pools in 1:1 mode do not support configured port forwards.
Range	0 | 1 | 1025 to 65535
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-blocks *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Port block size for NAT subscribers

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* nat outside pool *named-item* port-reservation port-blocks *number*
Tree	port-blocks
Description	In CGN, this command specifies the number of port-blocks per outside IP address in the NAT pool. The available ports per outside IP address (the end port minus the upper bound value of the static port-forwarding range) are divided into the number of port blocks specified in this command. This implicitly determines the size of each port block. For L2-aware NAT, this command can be configured only if the port block extensions (extended port blocks) are disabled. You must disable the **l2-aware port-block-extension** hierarchy in the NAT pool.
Range	0 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ports *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Size of the port block for NAT subscribers
Context	**configure** router *named-item-64* nat outside pool *named-item* port-reservation ports *number*
Tree	ports
Description	For carrier-grade NAT (CGN), this command specifies the size of port blocks for NAT subscribers in the NAT pool. For Layer 2 aware NAT, this command specifies the size of the initial port block of a subscriber in the pool. Additional port blocks (extended port blocks) for the Layer 2 aware subscriber must be explicitly enabled under the **l2-aware port-block-extension** hierarchy in the NAT pool. This command does not affect the size of extended port blocks. For deterministic pools, the port range begins with zero. However, for non-deterministic pools, the port range begins with one.
Range	0 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.
Introduced	16.0.R1

rpki-session [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **rpki-session** list instance
Context	**configure** router *named-item-64* origin-validation rpki-session *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	rpki-session
Description	This command configures a session with an RPKI local cache server by using the RPKI to Router (RPKI-RTR) protocol. Using these sessions, the router learns dynamic VRP entries expressing valid origin AS and prefix associations. SR OS supports the RPKI-RTR protocol over TCP/IPv4 or TCP/IPv6 transport. The router can set up an RPKI-RTR session using the base routing table (in-band) or the management router (out-of-band). Use the **configure router management** command to configure a session using the management port.
Introduced	19.5.R1
Platforms	All

[**ip-address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IPv4 or IPv6 address for the RPKI local cache server
Context	**configure** router *named-item-64* origin-validation rpki-session *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	rpki-session
Description	This command specifies an IPv4 address or an IPv6 address for the RPKI local cache server. If the IPv6 address is link-local, the interface name must be appended to the IPv6 address after a hyphen (-).
Notes	This element is part of a list key.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	stale-time
Description	This command configures the maximum length of time that prefix origin validation records learned from the cache server remain usable after the RPKI-RTR session goes down. When the timer expires, all remaining stale entries associated with the session are deleted.
Range	60 to 3600
Units	seconds
Default	3600
Introduced	19.5.R1
Platforms	All

static-entry [ip-prefix] *(ipv4-prefix | ipv6-prefix)* upto *number* origin-as *number*

Synopsis	Enter the **static-entry** list instance
Context	**configure** router *named-item-64* origin-validation static-entry *(ipv4-prefix | ipv6-prefix)* upto *number* origin-as *number*
Tree	static-entry
Description	Commands in this context configure a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored, along with dynamic VRP entries (learned from local cache servers using the RPKI-RTR protocol), in the origin validation database of the router. This database is used for determining the origin validation state of IPv4 and IPv6 BGP routes received over sessions with origin validation enabled. Static entries can be configured only in the **configure router origin-validation** context of the base router.
Introduced	19.5.R1
Platforms	All

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	IPv4 or IPv6 address with the minimum prefix and length

Synopsis	Enter the **interface** list instance
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name*
Tree	interface
Description	Commands in this context configure the attributes of the OSPF area interface. Unless they are explicitly configured, interfaces are not activated by default in any interior gateway protocol such as OSPF.
Introduced	16.0.R1
Platforms	All

[**interface-name**] *interface-name*

Synopsis	Router interface name
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name*
Tree	interface
Description	This command specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **configure router interface** and **configure service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be a string composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message is returned. If the IP interface exists in a different area it is moved to this area.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	23.3.R1
Platforms	All

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds
Introduced	23.3.R1
Platforms	All

interface-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Interface type
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* interface-type *keyword*
Tree	interface-type
Description	This command specifies the interface type. **broadcast** - Broadcast network

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

non-broadcast - Non-broadcast network

point-to-point - Point-to-point link

Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point.

p2mp-nbma - Point-to-multipoint on a link without broadcast or multicast support

No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type.

secondary - Multiple secondary adjacencies allowed

A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

Options	broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma
Introduced	16.0.R1
Platforms	All

node-sid

Synopsis Enable the **node-sid** context

Context **configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* node-sid

Tree node-sid

Description Commands in this context configure a node SID index or label value for the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address.

In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary.

This command fails if the network interface is not a loopback type or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required because the index and, therefore, the label ranges of IGP instances are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS resolves to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

Introduced 16.0.R1

Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* node-sid clear-n-flag *boolean*
Tree	clear-n-flag
Description	When configured to **true**, this command allows the user to clear the N-flag in an OSPF prefix SID sub-TLV originated for the prefix of a loopback interface on the system. When configured to **false**, the N-flag in an OSPF prefix SID sub-TLV originated for the prefix of a loopback interface on the system is not cleared. When the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

database-export

Synopsis	Enable the **database-export** context
Context	**configure** router *named-item-64* ospf *number* database-export
Tree	database-export
Description	Commands in this context enable the population of the extended TE Database (TE-DB) with the link-state information from a specific IGP instance. This information includes the IGP, TE, and SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.
Introduced	16.0.R1
Platforms	All

bgp-ls-identifier

Synopsis	Enable the **bgp-ls-identifier** context
Context	**configure** router *named-item-64* ospf *number* database-export bgp-ls-identifier

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	bgp-ls-identifier
Description	Commands in this context correlate, along with the Autonomous System Number (ASN), the BGP-LS NLRI advertisements of multiple BGP-LS speakers of the same IGP domain.
Introduced	16.0.R1
Platforms	All

value *number*

Synopsis	BGP-LS ID sent in the BGP-LS NLRI
Context	**configure** router *named-item-64* ospf *number* database-export bgp-ls-identifier value *number*
Tree	value
Description	This command configures the BGP-LS ID to export. If an NRC-P network domain has multiple IGP domains, a user must configure BGP-LS speakers within each IGP domain with the same unique ASN, BGP-LS ID tuple. The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain. **Note:** If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command configuration is not strictly required because enabling the extended TE-DB populates this information automatically. However, Nokia recommends enabling the **traffic-engineering** command to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.
Max. range	0 to 4294967295
Default	0
Introduced	16.0.R1
Platforms	All

igp-identifier *number*

Synopsis	IGP instance in the BGP-LS NLRI
Context	**configure** router *named-item-64* ospf *number* database-export igp-identifier *number*
Tree	igp-identifier
Description	This command identifies the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. The concept of an instance ID specified for OSPF is local subnet significant (RFC 6549). An IGP identifier value can be configured to be unique within a specified IGP domain when the router sends the IGP link state information using BGP-LS.
Max. range	0 to 18446744073709551615

© 2025 Nokia.

Introduced	16.0.R1
Platforms	All

reachable-ls-only *boolean*

Synopsis	Encode only reachable link-state information
Context	**configure** router *named-item-64* ospf *number* database-export reachable-ls-only *boolean*
Tree	reachable-ls-only
Description	When configured to **true**, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged. When configure to **false**, the router continues to send link-state objects even for links that fail an IGP reachability check.
Default	false
Introduced	24.10.R1
Platforms	All

entropy-label

Synopsis	Enter the **entropy-label** context
Context	**configure** router *named-item-64* ospf *number* entropy-label

Platforms	All

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** router *named-item-64* ospf *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.

If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied.

Routing policies are created in the **configure router policy-options** context.

Reference	**configure** policy-options policy-statement *named-item-64*

micro-loop-avoidance

Synopsis	Enable the **micro-loop-avoidance** context
Context	**configure** router *named-item-64* ospf *number* flexible-algorithms flex-algo *number* micro-loop-avoidance

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	micro-loop-avoidance
Description	When configured, the system enables micro-loop avoidance for an SR-OSPF flexible algorithm, and consequently, inherits the FIB delay timer from the SR-OSPF **configure router ospf segment-routing** context. When this command is configured, FIB updates are delayed before the system programs new primary next hops to avoid micro-loops. When configured, the feature applies to the following contexts: • OSPFv2 SR-OSPF IPv4 tunnel (node SID) • IPv4 and IPv6 SR-TE LSPs that use a node SID in their segment list • IPv4 and IPv6 SR policies that use a node SID in their segment list When micro-loop-avoidance is disabled (by removing this command from the configuration), the system forces any running FIB delay to expire immediately and programs the new next hops for all impacted node SIDs. When disabled, micro-loop avoidance is disabled instantaneously and will be disabled for the next SPF runs. Micro-loop avoidance remains disabled until it is re-enabled.
Introduced	24.3.R1
Platforms	All

participate *boolean*

Synopsis	Allow participation in the Flexible Algorithm
Context	**configure** router *named-item-64* ospf *number* flexible-algorithms flex-algo *number* participate *boolean*
Tree	participate
Description	When configured to **true**, the router advertises the capability to participate in a flexible algorithm within the IS-IS Router Capability TLV. A router only advertises participation when the winning FAD can be supported, which includes segment routing support. When configured to **false**, flexible algorithm participation is not enabled.
Default	false

allow-sr-over-srte *boolean*

Synopsis	Enable SR over SR-TE LSPs
Context	**configure** router *named-item-64* ospf *number* igp-shortcut allow-sr-over-srte *boolean*
Tree	allow-sr-over-srte
Description	When configured to **true**, the router only allows SR-MPLS SRv4 and SRv6 IGP shortcuts to use SR-TE LSPs with **allow-sr-over-srte** explicitly enabled with an adjacency SID as top SID in the SR-TE LSP. IPv4 and IPv6 addresses can use all available SR-TE LSPs as IGP shortcuts regardless of the explicit **allow-sr-over-srte** configuration. Under ECMP, when this command is configured to **true**, preference is given to the SR-TE LSPs with **allow-sr-over-srte** explicitly configured over the LSPs that do not have **allow-sr-over-srte** configured.

Platforms	All

multi-homed-prefix

Synopsis	Enable the **multi-homed-prefix** context
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate multi-homed-prefix
Tree	multi-homed-prefix
Description	Commands in this context configure a multihomed prefix LFA for both RTM routes (IP FRR) and SR-OSPF tunnels. SR-OSPF tunnels enable multihomed prefix extension in both algorithm 0 and flexible-algorithm numbers. This feature makes use of the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes. This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of local anycast prefixes. The computed IP next-hop based backup path is added to OSPF routes of external /32 prefixes (OSPFv2 routes types 3, 4, 5, and 7) and local /32 anycast prefixes in the RTM if the prefix is not protected by base LFA or if the user set leaf preference value to all. The user must enable the ip-fast-reroute leaf to have these backup paths programmed into the FIB in datapath.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The computed IP next hop or repair tunnel based backup path is also programmed for SR-OSPF node SID tunnels of external /32 prefixes and to /32 prefixes in same area as the computing node S and which are advertised by multiple routers (anycast prefix) in both algorithm 0 and flexible-algorithm numbers.

adj-sid-hold *(number | keyword)*

Synopsis Adjacency SID hold time

Context **configure** router *named-item-64* ospf *number* segment-routing adj-sid-hold *(number | keyword)*

Tree adj-sid-hold

Description This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

Platforms All

override-bmi *number*

Synopsis Value to override the announced node MSD-BMI value

Context **configure** router *named-item-64* ospf *number* segment-routing maximum-sid-depth override-bmi *number*

Tree override-bmi

Description This command overrides the announced MSD node Base MPLS Imposition (BMI) value. The MSD-BMI value announced by a router can be used by recipients to understand the number of MPLS labels that can be imposed inclusive of all service, transport, or special labels.

When unconfigured, the router announces the maximum supported BMI of the node assuming the most simple services and Layer 2 encapsulation.

Range 0 to 12

Introduced 20.2.R1

Platforms All

override-erld *number*

Synopsis Value to override the announced node MSD-ERLD value

Context **configure** router *named-item-64* ospf *number* segment-routing maximum-sid-depth override-erld *number*

Tree override-erld

Description This command configures the override Entropy Readable Label Depth (ERLD) Maximum Sid Depth (MSD) value. Information about the capability of each intermediate LSR of reading the maximum label stack depth is used by ingress LSRs to perform EL-based load balancing.

When unconfigured, the router announces the node maximum supported ERLD assuming the most simple Layer 2 encapsulation.

Range 0 to 15

Introduced 20.2.R1

Platforms All

micro-loop-avoidance

Tree	micro-loop-avoidance
Description	Commands in this context configure micro-loop avoidance for SR-OSPF.
Introduced	24.3.R1
Platforms	All

fib-delay *number*

Synopsis	FIB delay
Context	**configure** router *named-item-64* ospf *number* segment-routing micro-loop-avoidance fib-delay *number*
Tree	fib-delay
Description	This command configures the FIB delay before programming new primary next hops. Configure the FIB delay timer to a value that corresponds to the worst-case IGP convergence in a network domain. The default FIB delay timer value corresponds to a network with a nominal convergence time. When configured, the feature applies to the following contexts: • SPFv2 SR-OSPF IPv4 tunnel (node SID) • IPv4 and IPv6 SR-TE LSPs that use a node SID in their segment list • IPv4 and IPv6 SR policies that use a node SID in their segment list When micro-loop avoidance is disabled, the system forces any running FIB delay to expire immediately and the system programs new next hops for all impacted node SIDs. When disabled, micro-loop avoidance is disabled instantaneously and will be disabled for the next SPF runs. Micro-loop avoidance remains disabled until it is re-enabled.
Range	1 to 300
Units	deciseconds
Default	15
Introduced	24.3.R1

tunnel-table-pref *number*

Synopsis	Preference of SR tunnels created by the IGP instance
Context	**configure** router *named-item-64* ospf *number* segment-routing tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel type explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note: The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

Nokia recommends not to set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

advertise-delay *boolean*

Synopsis	Enable the advertisement of link delay for TE
Context	**configure** router *named-item-64* ospf *number* traffic-engineering-options advertise-delay *boolean*
Tree	advertise-delay
Description	When configured to **true**, the router advertises link delay in the IGP LSDB within the OSPF-TE TLV attribute or when the Application-Specific Link Attribute (ASLA) is enabled within SR-TE ASLA. When the router is configured under the **configure router ospf traffic-engineering-options sr-te application-specific-link-attributes** command to generate SR-TE ASLA attributes, link delay is advertised as a legacy RFC 3630 TLV when RSVP-TE is enabled and as an ASLA RFC 8920 TLV for SR-TE when MPLS is enabled for an interface. SR OS accepts and handles both legacy RSVP-TE TLVs and ASLAs for the RSVP application. However, SR OS only advertises RFC 3630 legacy RSVP-TE TLVs (as recommended by RFC 8920) to avoid compatibility issues. When configured to **false**, the router disables link delay advertisement.
Default	false
Introduced	22.10.R1

Tree	remain-down-on-failure
Default	false
Introduced	16.0.R1
Platforms	All

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	23.3.R1
Platforms	All

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds

interface-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Interface type
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* interface-type *keyword*
Tree	interface-type
Description	This command specifies the interface type. **broadcast** - Broadcast network To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet. **non-broadcast** - Non-broadcast network **point-to-point** - Point-to-point link Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point. **p2mp-nbma** - Point-to-multipoint on a link without broadcast or multicast support No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type. **secondary** - Multiple secondary adjacencies allowed A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.
Options	broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma
Introduced	16.0.R1
Platforms	All

node-sid

Synopsis	Enable the **node-sid** context
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* node-sid
Tree	node-sid
Description	Commands in this context configure a node SID index or label value for the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address. In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary. This command fails if the network interface is not a loopback type or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node. The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

because the index and, therefore, the label ranges of IGP instances are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS resolves to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

Introduced 16.0.R4

Platforms All

clear-n-flag *boolean*

Synopsis Clear the N-flag in an OSPF3 prefix

Context **configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* node-sid clear-n-flag *boolean*

Tree clear-n-flag

Description When configured to **true**, this command allows the user to clear the N-flag in an OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system.

When configured to **false**, the N-flag in an OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system is not cleared.

When the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

Tree	database-export
Description	Commands in this context enable the population of the extended TE Database (TE-DB) with the link-state information from a specific IGP instance. This information includes the IGP, TE, and the SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.
Introduced	16.0.R4
Platforms	All

bgp-ls-identifier

Synopsis	Enable the **bgp-ls-identifier** context
Context	**configure** router *named-item-64* ospf3 *number* database-export bgp-ls-identifier
Tree	bgp-ls-identifier
Description	Commands in this context correlate, along with the Autonomous System Number (ASN), the BGP-LS NLRI advertisements of multiple BGP-LS speakers of the same IGP domain.
Introduced	16.0.R4
Platforms	All

value *number*

Synopsis	BGP-LS ID sent in the BGP-LS NLRI
Context	**configure** router *named-item-64* ospf3 *number* database-export bgp-ls-identifier value *number*
Tree	value
Description	This command configures the BGP-LS ID to export. If an NRC-P network domain has multiple IGP domains, a user must configure BGP-LS speakers within each IGP domain with the same unique ASN, BGP-LS ID tuple. The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain. **Note:** If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command configuration is not strictly required because enabling the extended TE-DB populates this information automatically. However, Nokia recommends enabling the **traffic-engineering** command to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.
Max. range	0 to 4294967295
Default	0
Introduced	16.0.R4

igp-identifier *number*

Synopsis	IGP instance in the BGP-LS NLRI
Context	**configure** router *named-item-64* ospf3 *number* database-export igp-identifier *number*
Tree	igp-identifier
Description	This command identifies the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. The concept of an instance ID specified for OSPF is local subnet significant (RFC 6549). An IGP identifier value can be configured to be unique within a specified IGP domain when the router sends the IGP link state information using BGP-LS.
Max. range	0 to 18446744073709551615
Introduced	16.0.R4
Platforms	All

reachable-ls-only *boolean*

Synopsis	Encode only reachable link-state information
Context	**configure** router *named-item-64* ospf3 *number* database-export reachable-ls-only *boolean*
Tree	reachable-ls-only
Description	When configured to **true**, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged. When configure to **false**, the router continues to send link-state objects even for links that fail an IGP reachability check.
Default	false
Introduced	24.10.R1
Platforms	All

export-limit

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** router *named-item-64* ospf3 *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS. If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied.

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time
Context	**configure** router *named-item-64* ospf3 *number* segment-routing adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency. When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

tunnel-table-pref *number*

Synopsis	Preference of SR tunnels created by the IGP instance
Context	**configure** router *named-item-64* ospf3 *number* segment-routing tunnel-table-pref *number*
Tree	tunnel-table-pref

Description

This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel type explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note: The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

Nokia recommends not to set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

admin-state *keyword*

Synopsis	Administrative state of the P2MP policy
Context	**configure** router *named-item-64* p2mp-sr-tree p2mp-policy *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	21.5.R1
Platforms	All

candidate-path [candidate-path-name] *named-item*

Synopsis	Enter the **candidate-path** list instance
Context	**configure** router *named-item-64* p2mp-sr-tree p2mp-policy *named-item* candidate-path *named-item*
Tree	candidate-path
Description	Commands in this context configure a candidate path in the P2MP policy entry for the P2MP SR tree. A P2MP SR policy can contain multiple candidate paths, which are redundant trees. Each candidate path represents a P2MP SR tree with its own traffic engineering constraints. Each candidate path has its own preference and the candidate path with the highest preference is the active P2MP SR tunnel.
Introduced	21.5.R1
Platforms	All

[**candidate-path-name**] *named-item*

Synopsis	Candidate path name
Context	**configure** router *named-item-64* p2mp-sr-tree p2mp-policy *named-item* candidate-path *named-item*
Tree	candidate-path
String length	1 to 32
Notes	This element is part of a list key.
Introduced	21.5.R1
Platforms	All

segment-routing-v6

Synopsis	Enter the **segment-routing-v6** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6
Tree	segment-routing-v6
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

downstream-nodes [downstream-node-index] *number*

Synopsis	Enter the **downstream-nodes** list instance
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 downstream-nodes *number*
Tree	downstream-nodes
Description	Commands in this context configure the downstream node entry for the replication segment. The downstream node is equivalent to an outgoing interface. On a replication node, a replication segment can have multiple downstream nodes, each of which has outgoing interfaces or protection next hops.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

[**downstream-node-index**] *number*

Synopsis	Downstream node index
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 downstream-nodes *number*
Tree	downstream-nodes
Range	1 to 4096
Notes	This element is part of a list key.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

admin-state *keyword*

Synopsis	Administrative state of the downstream next-hop entries
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 downstream-nodes *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	disable
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

replication-sid *ipv6-unicast-address*

Synopsis	Replication SID for next-hop entries
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 downstream-nodes *number* replication-sid *ipv6-unicast-address*
Tree	replication-sid
Description	This command configures the outgoing replication Segment Identifier (SID) for the next hop of the P2MP SR tree SRv6 replication segment. The SRv6 replication SID does not currently support a SID list. The IPv6 address specifies the replication SID, including the locator and function. SR OS supports the 16-bit function from bit 64 to bit 80, with the locator configurable from bit 0 to 64 of the IPv6 address.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

incoming-sid

Synopsis	Enter the **incoming-sid** context
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid
Tree	incoming-sid
Description	Commands in this context configure the incoming replication SID for the P2MP SR tree replication segment entry.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator

Synopsis	Enter the **locator** context
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid locator
Tree	locator

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the incoming replication SID locator for the P2MP SR tree replication segment entry.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

function *keyword*

Synopsis	Function of the incoming replication SID
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid locator function *keyword*
Tree	function
Options	end-replicate – Use the incoming SID to find the replication state
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

function-value *number*

Synopsis	Incoming SID function value
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid locator function-value *number*
Tree	function-value
Range	1 to 1048575
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

disjointness-reference *boolean*

Synopsis	Configure P-flag in the disjointness configuration TLV
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item* disjointness-reference *boolean*
Tree	disjointness-reference
Description	When configured to **true**, the router sets the P-flag in the disjointness configuration TLV. When the P-flag is set, it indicates that this LSP path is the reference path for the disjoint set of paths. The PCE must first compute the path of this LSP and then apply the requested disjointness type to compute the path of all other paths in the same diversity association ID. When configured to **false**, the router does not set the P-flag in the disjointness configuration TLV.
Default	false
Introduced	22.5.R1
Platforms	All

disjointness-type *keyword*

Synopsis	Disjointness type for the association group
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item* disjointness-type *keyword*
Tree	disjointness-type
Options	strict, loose
Default	loose
Introduced	22.5.R1

level *number*

Synopsis	Level ID to associate with number of down LAG ports
Context	**configure** router *named-item-64* pim interface *interface-name* mcac mc-constraints number-down *number* level *number*
Tree	level
Description	This command specifies the bandwidth for a given level. Level 1 has the highest priority and level 8 has the lowest priority.
Range	1 to 8
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

use-lag-port-weight *boolean*

Synopsis	Use LAG port weight in calculating MCAC constraints
Context	**configure** router *named-item-64* pim interface *interface-name* mcac mc-constraints use-lag-port-weight *boolean*
Tree	use-lag-port-weight
Description	When configured to **true**, port weight is used when determining available bandwidth per level when LAG ports go down or come up. This command is required for proper operation on mixed port-speed LAGs and can also be used for unmixed port-speed LAGs.
Default	false
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** router *named-item-64* pim interface *interface-name* mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface when redirection is configured
- subscriber level and group-interface level when redirection is unconfigured

In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).

Reference	**configure** mcac policy *string*
Introduced	16.0.R1
Platforms	All

multicast-senders *keyword*

Synopsis	Subnet matching for the incoming data packets
Context	**configure** router *named-item-64* pim interface *interface-name* multicast-senders *keyword*

pim-ssm-scaling *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable PIM-SSM scaling
Context	**configure** router *named-item-64* pim pim-ssm-scaling *boolean*
Tree	pim-ssm-scaling
Description	When configured to **true**, this command enables an increase of PIM SSM (S,G) scaling to a maximum of 256000 per system. The total maximum multicast capacity is, however, constrained by the lowest-performance FP. When the maximum link capacity from the fabric to the lowest-performance FP is reached, the link to that FP is overloaded, resulting in packet loss for all FPs. This capacity constraint is independent of whether the lowest-performance FP has a receiver on it or not. If the multicast management chassis per-plane total capacity is configured to an explicit value larger than that supported by the lowest-performance FP, then IMPM believes that there is more plane capacity available than there actually is and the result is (S,G) packet loss instead of blackholing. By setting the multicast management chassis per-plane total capacity to **dynamic**, the system automatically sets the switch fabric multicast plane capacity to the minimum value supported by the fabric and all line cards in the system. When PIM SSM scaling is enabled, the following multicast features are disabled: • DM • MoFRR • JP policy • InBand features (BIER and MLDP) • Extranet • ASM

© 2025 Nokia.

purpose *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Purpose of the RADIUS proxy
Context	**configure** router *named-item-64* radius proxy *named-item* purpose *keyword*
Tree	purpose
Options	accounting, authentication, accounting-authentication
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

python-policy *reference*

Synopsis	Python policy
Context	**configure** router *named-item-64* radius proxy *named-item* python-policy *reference*
Tree	python-policy
Reference	**configure** python python-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

secret *encrypted-leaf*

Synopsis	Format of the secret key to access the RADIUS proxy server
Context	**configure** router *named-item-64* radius proxy *named-item* secret *encrypted-leaf*
Tree	secret
String length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

send-accounting-response *boolean*

Synopsis	Allow RADIUS proxy server to respond to Accounting-Response messages

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* radius proxy *named-item* send-accounting-response *boolean*
Tree	send-accounting-response
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

wlan-gw

Synopsis	Enter the **wlan-gw** context
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw
Tree	wlan-gw
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

address *ipv4-unicast-address*

Synopsis	IPv4 address of the distributed RADIUS proxy server
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw address *ipv4-unicast-address*
Tree	address
Description	This command configures the IPv4 address of the distributed RADIUS proxy server for use by the access points.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipv6-address *ipv6-unicast-without-local-address*

Synopsis	IPv6 address of the distributed RADIUS proxy server
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw ipv6-address *ipv6-unicast-without-local-address*
Tree	ipv6-address
Description	This command configures the IPv6 address of the distributed RADIUS proxy server for use by the access points.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw-group *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	ISA WLAN gateway group
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw-group *reference*
Tree	wlan-gw-group
Reference	**configure** isa wlan-gw-group *number*
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

server [name] *named-item*

Synopsis	Enter the **server** list instance
Context	**configure** router *named-item-64* radius server *named-item*
Tree	server
Max. instances	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**name**] *named-item*

Synopsis	External RADIUS server name
Context	**configure** router *named-item-64* radius server *named-item*
Tree	server
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

accept-coa *boolean*

Synopsis	Process Change of Authorization (CoA) messages

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* radius server *named-item* accept-coa *boolean*
Tree	accept-coa
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

acct-port *number*

Synopsis	UDP port number of the RADIUS for accounting events
Context	**configure** router *named-item-64* radius server *named-item* acct-port *number*
Tree	acct-port
Range	1 to 65535
Default	1813
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the RADIUS server
Context	**configure** router *named-item-64* radius server *named-item* address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	address
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

auth-port *number*

Synopsis	UDP port number of the RADIUS to be used as match criteria
Context	**configure** router *named-item-64* radius server *named-item* auth-port *number*
Tree	auth-port
Range	1 to 65535
Default	1812
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Platforms	All

rip

Synopsis	Enable the **rip** context
Context	**configure** router *named-item-64* rip
Tree	rip
Introduced	16.0.R4
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the RIP instance
Context	**configure** router *named-item-64* rip admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R4
Platforms	All

authentication-key *encrypted-leaf*

Synopsis	Authentication password passed between RIP neighbors
Context	**configure** router *named-item-64* rip authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command sets the authentication password to be passed between RIP neighbors. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication password from the configuration and disables authentication.
String length	1 to 51
Introduced	16.0.R4
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

authentication-type *keyword*

Synopsis	Authentication type used between RIP neighbors
Context	**configure** router *named-item-64* rip authentication-type *keyword*
Tree	authentication-type
Description	This command sets the type of authentication to be used between RIP neighbors. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication type from the configuration and effectively disables authentication.
Options	none, password, md5, md20
Default	none
Introduced	16.0.R4
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD to control the state of protocol adjacency
Context	**configure** router *named-item-64* rip bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, this command enables BFD to control the state of the associated protocol adjacency. When configured to **false**, this command removes BFD from the associated protocol adjacency.
Default	false
Introduced	16.0.R4
Platforms	All

check-zero *boolean*

Synopsis	Enable checking of mandatory zero fields
Context	**configure** router *named-item-64* rip check-zero *boolean*
Tree	check-zero
Description	When configured to **true**, this command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages. When configured to **false**, this command disables the check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.

Tree	neighbor
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the RIP neighbor interface
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R4
Platforms	All

authentication-key *encrypted-leaf*

Synopsis	Authentication password passed between RIP neighbors
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command sets the authentication password to be passed between RIP neighbors. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication password from the configuration and disables authentication.
String length	1 to 51
Introduced	16.0.R4
Platforms	All

authentication-type *keyword*

Synopsis	Authentication type

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* authentication-type *keyword*
Tree	authentication-type
Description	This command configures the type of authentication to be used. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication type from the configuration and effectively disables authentication.
Options	none, password, md5, md20
Introduced	16.0.R4
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD to control the state of protocol adjacency
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, this command enables BFD to control the state of the associated protocol adjacency. When configured to **false**, this command removes BFD from the associated protocol adjacency.
Introduced	16.0.R4
Platforms	All

check-zero *boolean*

Synopsis	Enable checking of mandatory zero fields
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* check-zero *boolean*
Tree	check-zero
Description	When configured to **true**, this command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages. When configured to **false**, this command disables the check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.
Introduced	16.0.R4
Platforms	All

split-horizon *boolean*

Synopsis	Enable split horizon and poison reverse
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* split-horizon *boolean*
Tree	split-horizon

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity). When configured to **false**. this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.
Introduced	16.0.R4
Platforms	All

timers

Synopsis	Enable the **timers** context
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* timers

split-horizon *boolean*

Synopsis	Enable split horizon and poison reverse
Context	**configure** router *named-item-64* ripng group *named-item* neighbor *interface-name* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity). When configured to **false**. this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.
Introduced	16.0.R4
Platforms	All

timers

authentication-over-bypass *boolean*

Synopsis	Enable MD5 authentication over bypass LSP of PLR and MP
Context	**configure** router *named-item-64* rsvp authentication-over-bypass *boolean*
Tree	authentication-over-bypass
Description	When configured to **true**, this command configures the MD5 authentication over the bypass LSP of all Point of Local Repairs (PLRs) and Merge Points (MPs) on the router. Only enable this command when the TE interfaces in the RSVP-TE network use the same MD5 authentication parameters. When a Point of Local Repair (PLR) activates a bypass LSP towards a Merge Point (MP), by default, the INTEGRITY object corresponding to the bypass LSP interface is not added to a transmitted RSVP message except for packets of routed RSVP messages (Resv, Srefresh, and ACK), and only when the packet is intended for a bypass LSP endpoint (PLR or MP) that is a directly connected neighbor. When this command is enabled, the INTEGRITY object of the interface corresponding to the bypass LSP is added to a transmitted RSVP message regardless of whether the bypass LSP endpoint (PLR or MP) is a directly connected RSVP neighbor. The INTEGRITY object is included with the following RSVP messages: Path, PathTear, Path Err, Resv, ResvTear, ResvErr, Srefresh, and ACK. In all cases, an RSVP message received from a PLR or a MP (sender address in the SenderTemplate oe FilterSpec is different from an Extended Tunnel Id in a Session

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Object), and which includes the INTEGRITY object is authenticated against the bypass LSP interface. An RSVP message received from a PLR or MP without the INTEGRITY object is also accepted.

When configured to **false**, the router disables MD5 authentication over bypass LSP of the PLRs and MPs.

Default	false
Introduced	22.10.R1

Context **configure** router *named-item-64* rsvp interface *reference* authentication-key *encrypted-leaf*

Tree authentication-key

Description This command configures the authentication key for use between RSVP neighbors to authenticate RSVP messages. Authentication uses the MD5 message-based digest.

When enabled on an RSVP interface, authentication of RSVP messages operates in both directions of the interface. A router maintains a security association using one authentication key for each interface to an RSVP neighbor.

An RSVP neighbor transmits an authenticating digest of the RSVP message that is computed using the shared authentication key and a keyed-hash algorithm. The message digest is included in an INTEGRITY object, which also contains a flags field, a key identifier field, and a sequence number field. An RSVP neighbor uses the key together with the authentication algorithm to process received RSVP messages. The RSVP MD5 authentication complies to the procedures for RSVP message generation in RFC 2747, *RSVP Cryptographic Authentication*.

The MD5 implementation does not support the authentication challenge procedures in RFC 2747.

hold-down-timer *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Hold down timer for SR policy candidate paths
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* hold-down-timer *number*
Tree	hold-down-timer
Description	This command configures the hold down timer for the maintenance policy. The purpose of the timer is to prevent bouncing of the SR policy path state if S-BFD sessions associated with the segment lists flap, causing the threshold to be repeatedly crossed in a short period of time. The timer is started when the number of up S-BFD sessions drops below the threshold. The SR policy path is not considered to be up again until the hold down timer has expired and the number of up S-BFD sessions reaches or exceeds the threshold and the internal hold timer is not running. If the revert timer is also configured, the revert timer is not started until after the number of up S-BFD sessions equals or exceeds the threshold and the hold down timer for the primary candidate path has expired.
Range	0 to 5000
Units	deciseconds
Default	0
Introduced	20.10.R1
Platforms	All

mode *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Protection mode for SR policy candidate paths
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* mode *keyword*
Tree	mode
Description	This command specifies the data path programming and protection mechanism for SR policy candidate paths to which the maintenance policy is applied.
Options	none, ecmp-protected, linear

© 2025 Nokia.

Default	none
Introduced	20.10.R1
Platforms	All

return-path-label *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048575
Introduced	22.10.R1
Platforms	All

revert-timer *number*

Synopsis	Revert timer for SR policy candidate paths
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* revert-timer *number*
Tree	revert-timer
Description	This command configures the revert timer for SR Policy candidate paths. The revert timer is started when the primary path recovers (the number of S-BFD sessions that are up equals or exceeds the threshold value and the hold down timer has expired). When the timer expires, the system reverts to the primary path.
Range	0 to 4320
Units	minutes

© 2025 Nokia.

Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

end-x [value] *number*

Synopsis	Enter the **end-x** list instance
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 base-routing-instance locator *reference* function end-x *number*
Tree	end-x
Description	Commands in this context configure the attributes of the End.X SID function associated with a P2P interface. A static function value can be configured for each combination of SRH mode and protection type. For a specific interface, the static function value associated with the same combination of protection type and SRH mode overrides any corresponding function value that is automatically allocated (**end.x-auto-allocate** list configuration). If more than one value is configured for an interface and combination of SRH mode and protection type, they are all advertised in IS-IS.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When used in remote TI-LFA repair tunnel programming, IS-IS uses rules to select one End.X value from the multiple values received in IS-IS link advertisements.

Values assigned to loopback and system interfaces are not advertised in IS-IS.

End.X SID functions for adjacencies over broadcast interfaces are always automatically allocated based on the configuration of the **end.x-auto-allocate** list.

Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

end-x-auto-allocate [srh-mode] *keyword* protection *keyword*

Synopsis	Add a list entry for **end-x-auto-allocate**
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 base-routing-instance locator *reference* function end-x-auto-allocate *keyword* protection *keyword*
Tree	end-x-auto-allocate
Description	This command adds a list entry for the automatic allocation of the End.X SID function for all adjacencies over all network interfaces on the router (P2P and broadcast interfaces). A list entry is a combination of the protection type and the SRH mode. Any combinations in addition to the maximum supported by this command must be allocated statically under each P2P interface (**end.x** configuration). When no list entries are configured, no End.X function values are automatically allocated by default for a locator.
Max. instances	2
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

label-block *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Reserved label block
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* label-block *reference*
Tree	label-block
Description	This command associates a pre-configured reserved label block with the micro-SID block.
Reference	**configure** router *named-item-64* mpls-labels reserved-label-block *named-item-64*
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

prefix

Synopsis	Enter the **prefix** context
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* prefix
Tree	prefix
Description	Commands in this context configure the IPv6 prefix for an SRv6 micro-segment locator.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

ip-prefix *ipv6-unicast-prefix*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	SRv6 locator prefix
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* prefix ip-prefix *ipv6-unicast-prefix*
Tree	ip-prefix
Description	This command configures the IPv6 prefix for the locator.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For regular SRv6, the locator prefix length range is the sum of the length of the block field and the length of the node ID field. For micro-segment SRv6, the locator prefix length must be equal to the micro-SID block length.

Introduced 22.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

static-function

Synopsis Enter the **static-function** context

Context **configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* static-function

Tree static-function

Description Commands in this context configure the function field parameters of a static uA or service micro-SID assignment.

Introduced 22.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

max-entries *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis Maximum number of static SID functions

Context **configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* static-function max-entries *number*

Tree max-entries

Description This command configures the maximum number of values that are reserved from the function field to assign to static SID functions.

Range 1 to 1048575

Default 1

Introduced 22.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

termination-fpe *reference*

Synopsis FPE ID for SRv6 termination

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* termination-fpe *reference*
Tree	termination-fpe
Description	This command associates the FPE ID with the locator for SRv6 termination in local services.
Reference	**configure** fwd-path-ext fpe *number*
Max. instances	1
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

block-length *number*

Synopsis	Micro-SID block length
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block-length *number*
Tree	block-length
Range	8 | 16 | 24 | 32 | 40 | 48 | 56 | 64
Default	32
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

global-sid-entries *number*

Synopsis	Maximum number of micro-segment locators network wide
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment global-sid-entries *number*
Tree	global-sid-entries
Description	This command defines the maximum number of unique micro-segment locators that can be configured network wide. The value is expressed in multiples of 1024 and must be the same on every platform network wide.
Range	4 to 60
Default	16
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sid-length *number*

Synopsis	Micro-SID length
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment sid-length *number*
Tree	sid-length
Description	This command configures the length of the micro-SIDs.
Range	16
Default	16
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

micro-segment-locator [locator-name] *named-item-64*

Synopsis	Enter the **micro-segment-locator** list instance
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64*
Tree	micro-segment-locator
Max. instances	16
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

[**locator-name**] *named-item-64*

Synopsis	SRv6 locator name
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64*
Tree	micro-segment-locator
String length	1 to 64
Notes	This element is part of a list key.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

admin-state *keyword*

Synopsis	Administrative state of the locator
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

algorithm *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	IGP flexible algorithm ID
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* algorithm *number*
Tree	algorithm
Description	This command configures an IGP flexible algorithm for a locator. A locator can only be part of one algorithm but it can be used in multiple IGP instances.
Range	128 to 255
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

block *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Pre-defined micro-SID block
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* block *reference*
Tree	block

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command associates a pre-defined micro-SID block with the micro-segment SRv6 locator.
Reference	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64*
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

un

Synopsis	Enter the **un** context
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* un
Tree	un
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

srh-mode *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Segment Routing Header (SRH) mode
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* un srh-mode *keyword*
Tree	srh-mode
Description	This command configures the popping mode for the SID.
Options	psp, usp, psp-usd, usp-usd, psp-usp-usd
Default	psp
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

value *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Synopsis	SRv6 function value
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* un value *number*
Tree	value
Range	1 to 1048575
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

origination-fpe *reference*

Synopsis	List of the SRv6 origination FPEs
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 origination-fpe *reference*
Tree	origination-fpe
Description	This command configures the origination Forwarding Path Extension (FPE) for SRv6 tunnels on local services. The origination FPE must be different from any of the SRv6 termination FPEs.
Reference	**configure** fwd-path-ext fpe *number*
Max. instances	1
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

source-address *ipv6-unicast-address*

Synopsis	Source address used in the SRv6 packet
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 source-address *ipv6-unicast-address*
Tree	source-address
Description	This command specifies the global default source IPv6 address used in the SA field of the outerIPv6 header of the SRv6 encapsulated packet. The value is inherited in the BGP and services contexts (for example, **configure router "base" bgp segment-routing-v6 source-address** and **configure service vprn bgp-ipvpn segment-routing-v6 source-address**), but is overwritten by the value configured in those contexts. A source IPv6 address must be configured in the global context or in the BGP or services context. The system does not check if the entered address is a valid local address.

Platforms	All

[**segment-index**] *number*

Synopsis	Index for identifying a segment in a segment list
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number*
Tree	segment
Description	This command configures the index for identifying a segment in a segment list. Each segment list can have up to 11 segments for SR-MPLS policies, and 24 segments for an SRv6 segment list which only includes micro-segments. For an SRv6 segment list that mixes regular and micro-segments, up to 7 regular segments can be configured.
Range	1 to 24
Notes	This element is part of a list key.
Introduced	16.0.R1

Platforms All

behavior-and-structure

Synopsis Enable the **behavior-and-structure** context

Context **configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number* behavior-and-structure

Tree behavior-and-structure

Description Commands in this context configure the behavior and structure of the SRv6 policy micro-segment.

Behavior and structure are necessary (but not sufficient) for the SRv6 policy micro-segment to be compressed by a head-end.

Introduced 23.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

behavior *keyword*

Synopsis Behavior of the SRv6 uSID

Context **configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number* behavior-and-structure behavior *keyword*

Tree behavior

Description This command configures the behavior of the SRv6 policy micro-segment (uSID).

The only allowed values are flavorless behaviors of NEXT-CSID. The compression algorithm however supports all flavors.

Although END.T with NEXT-CSID is a configurable value, SR OS does not support this behavior for locally-instantiated SIDs. However, configuring this value allows a traffic-engineered path to be built that includes nodes that would support such behavior.

Options end-next-csid, end-x-next-csid, end-t-next-csid, end-b6-encaps-next-csid, end-b6-encaps-red-next-csid

Notes This element is mandatory.

Introduced 23.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

block-length *number*

Synopsis Locator block length of the SRv6 uSID

Tree	ip-address

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures an SRv6 binding SID for a remote SRv6 policy. The command cannot be used with a local head-end location (**configure router segment-routing sr-policies static-policy head-end local**). This command and the **configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid locator** command or the **configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid micro-segment-locator** command are mutually exclusive. If the remote head-end is an SR OS system, the binding SID can either be a regular SID or uSID. If it is a uSID, it must be configured with a node ID in the following format: <block><uN><uB6>::) The format of the binding SID is a 128-bit IPv6 address.
Notes	The following elements are part of a choice: **ip-address** or (**locator** and **micro-segment-locator**).
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator

Synopsis	Enable the **locator** context
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-routing-v6 binding-sid *number* locator
Tree	locator
Description	Commands in this context configure a binding SID locator for a local SRv6 policy. This command and the **configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid ip-address** command for a non-local SRv6 policy are mutually exclusive.
Notes	The following elements are part of a choice: **ip-address** or (**locator** and **micro-segment-locator**).
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

function *keyword*

hold-down

Synopsis	Enable the **hold-down** context
Context	**configure** router *named-item-64* static-routes hold-down
Tree	hold-down
Description	Commands in this context enable the hold-down time feature globally for static routes in the system.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap.

The commands in this context apply to all static routes in the VPRN and the base router instance in which this hold-down time is configured in.

Introduced 16.0.R1

Platforms All

initial *number*

Synopsis Value for the initial hold-down time

Context **configure** router *named-item-64* static-routes hold-down initial *number*

Tree initial

Description This command specifies the initial value of the hold-down time globally for static routes in the system.

When a static route is ready to become active, it remains inactive for the hold-down time before activating the static-route. If, during this hold-down period, the static route becomes inactive again because of factors such as interface failure, the hold-down timer is reset, effectively postponing the activation of the route until the next opportunity.

Range 1 to 65535

Notes This element is mandatory.

Introduced 16.0.R1

Platforms All

max-value *number*

Synopsis Maximum value of the hold-down time

Context **configure** router *named-item-64* static-routes hold-down max-value *number*

Tree max-value

Description This command specifies the maximum value of the hold-down time globally for static routes in the system.

Range 1 to 65535

Notes This element is mandatory.

Introduced 16.0.R1

Platforms All

cpe-check [address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **cpe-check** list instance
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)* cpe-check *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	cpe-check
Description	When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device. This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route. **Note**: A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-

leak-destination

Synopsis	Enter the **leak-destination** context
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* leak-destination
Tree	leak-destination
Description	Commands in this context configure a list of VPRNs that receive a leaked copy of the static route. When a VPRN service is added to this list, the static route is leaked into that VPRN if the following conditions are met: • all the configured next hops of the static route are direct next hops • the static route is an active route, or it is capable of immediately becoming an active route when a more-preferred route for the same prefix is removed Static routes leaked using this method appear as "VPN Leak" protocol routes in the route table of the VPRN.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a packet received by a VPRN matches a "VPN Leak" route leaked using this method, the packet is forwarded according to the configuration of the static route in the GRT, even if the static route is currently non-best in the GRT.

Introduced 24.10.R1

Platforms All

address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Backup next-hop IP address
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)* backup-next-hop address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	address
Description	This command specifies the backup IP forwarding address that is used for static route Fast ReRoute (FRR). The configured address, if reachable, acts as pre-installed backup forwarding information that can be used when the primary IP next-hop suddenly fails. The configured backup next-hop IP address can be directly or indirectly connected (using an IGP or tunnel) to the node. The backup next-hop forwarding information or the Next-hop Label Forwarding Entry (NHLFE) tunnel forwarding information from the IP Routing Table Manager (RTM) is used to preconfigure an IP fast-reroute backup path. One backup next-hop address can protect a single primary static route entry next-hop address without ECMP and it is only activated when the primary next-hop has no active ECMP. The configured IP address can be either on the network or the access side.
Introduced	21.2.R1
Platforms	All

bfd-liveness *boolean*

cpe-check [address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **cpe-check** list instance
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)* cpe-check *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	cpe-check
Description	When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device. This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route. **Note**: A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.
Max. instances	1

Context	**configure** router *named-item-64* ttl-propagate lsr-label-route *keyword*
Tree	lsr-label-route
Options	none – Do not propagate TTL or hop-limit field value all – Propagate TTL or hop-limit field value
Default	none
Introduced	16.0.R1
Platforms	All

sr-mpls-local *keyword*

Synopsis	TTL propagation for local CPM generated IP packets
Context	**configure** router *named-item-64* ttl-propagate sr-mpls-local *keyword*
Tree	sr-mpls-local
Description	This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy. This command enables or disables propagation of the TTL or hop-limit field value of CPM originated IP packet to all labels in the segment routing transport label stack. Use the **sr-mpls-transit** command to configure TTL or hop-limit propagation for transit IP packets.
Options	none – Do not propagate TTL or hop-limit field value all – Propagate TTL or hop-limit field value

Default	all
Introduced	24.7.R1
Platforms	All

sr-mpls-transit *keyword*

Synopsis	TTL propagation for in-transit user IP packets
Context	**configure** router *named-item-64* ttl-propagate sr-mpls-transit *keyword*
Tree	sr-mpls-transit
Description	This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy. This command enables or disables propagation of the TTL or hop-limit field value for transit IP packets to all labels in the segment routing transport label stack. Transit IP packets are packets of base router prefixes received on an access interface or a network interface (with or without tunnel encapsulation) and whose FIB lookup results in forwarding them over an SR-MPLS tunnel. Use the **sr-mpls-local** command to configure TTL or hop-limit propagation for CPM originated IP packets.
Options	none – Do not propagate TTL or hop-limit field value all – Propagate TTL or hop-limit field value
Default	all
Introduced	24.7.R1
Platforms	All

vprn-local *keyword*

Context	**configure** router *named-item-64* twamp-light reflector prefix *(ipv4-prefix | ipv6-prefix)* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

type *keyword*

Synopsis	Processing behavior type for the reflector
Context	**configure** router *named-item-64* twamp-light reflector type *keyword*
Tree	type
Description	This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light** the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet. In mixed environments where different types of Session-Senders may be targeting a common TWAMP Light reflector, set the value to **stamp**. When the reflector is operating in **stamp** mode, the primary parsing is based on STAMP, checking and processing known TLVs, or determining if the arriving PDU is a TWAMP Light PDU. A Session-Sender launching a TWAMP Light-based packet must use all zeros padding pattern when the pad size is non zero.
Options	stamp, twamp-light
Default	twamp-light
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ntf-logout-retry-count *number*

Synopsis	Number of retransmissions of an NTF_LOGOUT message
Context	**configure** router *named-item-64* wpp portal *named-item* ntf-logout-retry-count *number*
Tree	ntf-logout-retry-count
Range	0 to 5
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

port-format *keyword*

Synopsis	Format of the port in the ACK_INO message
Context	**configure** router *named-item-64* wpp portal *named-item* port-format *keyword*
Tree	port-format
Options	standard, vendor-specific
Default	standard
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

retry-interval *number*

Synopsis	Time between two consecutive retransmissions
Context	**configure** router *named-item-64* wpp portal *named-item* retry-interval *number*
Tree	retry-interval
Range	10 to 2000
Units	milliseconds
Default	2000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

secret *encrypted-leaf*

Synopsis	Message authentication between portal and BRAS by applying the secret used by WPPv2

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* wpp portal *named-item* secret *encrypted-leaf*
Tree	secret
String length	1 to 115
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

version *number*

Synopsis	Protocol version to be expected by the WPP portal
Context	**configure** router *named-item-64* wpp portal *named-item* version *number*
Tree	version
Range	1 | 2
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

String length	1 to 80
Introduced	20.7.R1
Platforms	All

exclude

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **exclude** context
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* exclude
Tree	exclude
Description	Commands in this context define administrative groups that are used to exclude links from the Flexible Algorithm topology graph. Administrative groups, also known as link colors, are attributes associated with a link. The exclude rule that is part of the FAD specifies that links with the named administrative groups set are to be excluded from the topology graph.
Introduced	20.7.R1
Platforms	All

admin-group [group-name] *reference*

Synopsis	Add a list entry for **admin-group**
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* exclude admin-group *reference*
Tree	admin-group
Introduced	20.7.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**group-name**] *reference*

Synopsis	Administrative group name
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* exclude admin-group *reference*
Tree	admin-group
Reference	**configure** routing-options if-attribute admin-group *named-item*
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	All

flags-tlv *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Advertise the FAD Flags TLV
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* flags-tlv *boolean*
Tree	flags-tlv
Description	When configured to **true**, the router advertises the FAD Flags TLV within the FAD. The M-flag within the TLV is set to 1, specifying the use of a Flex-Algorithm specific prefix metric. A router receiving the TLV modifies the constrained SPF (cSPF) based on the M-flag status. When configured to **false**, the FAD Flags TLV is not included with the FAD advertisement.
Default	true
Introduced	20.10.R1
Platforms	All

include-all

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **include-all** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-all
Tree	include-all
Description	Commands in this context define administrative groups that are used to include links from the Flexible Algorithm topology graph. Administrative groups, also known as link colors, are attributes associated with a link. The include-all rule that is part of the FAD specifies that all named administrative groups must be present in a link to be included in the topology graph.
Introduced	20.7.R1
Platforms	All

admin-group [group-name] *reference*

Synopsis	Add a list entry for **admin-group**
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-all admin-group *reference*
Tree	admin-group
Introduced	20.7.R1
Platforms	All

[**group-name**] *reference*

Synopsis	Administrative group name
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-all admin-group *reference*
Tree	admin-group
Reference	**configure** routing-options if-attribute admin-group *named-item*
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	All

include-any

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **include-any** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-any
Tree	include-any
Description	Commands in this context define administrative groups that are used to include links from the Flexible Algorithm topology graph. Administrative groups, also known as link colors, are attributes associated with a link. The include-all rule that is part of the FAD specifies that any link with the named administrative groups is included in the topology graph.
Introduced	20.7.R1
Platforms	All

admin-group [group-name] *reference*

Synopsis	Add a list entry for **admin-group**
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-any admin-group *reference*
Tree	admin-group
Introduced	20.7.R1
Platforms	All

[**group-name**] *reference*

Synopsis	Administrative group name
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* include-any admin-group *reference*

Reference	**configure** routing-options if-attribute admin-group *named-item*
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	All

metric-type *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	FAD metric type

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* metric-type *keyword*
Tree	metric-type
Options	igp, delay, te-metric
Default	igp
Introduced	20.7.R1
Platforms	All

priority *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	FAD priority
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* priority *number*
Tree	priority
Description	This command configures the priority of the FAD. The priority is used as a tie-breaker when the router has received multiple FADs for the same flexible algorithm.
Range	0 to 255
Default	100
Introduced	20.7.R1
Platforms	All

if-attribute

Synopsis	Enter the **if-attribute** context
Context	**configure** routing-options if-attribute
Tree	if-attribute
Introduced	16.0.R1
Platforms	All

admin-group [group-name] *named-item*

Synopsis	Enter the **admin-group** list instance

Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-group
Max. instances	256
Introduced	16.0.R1
Platforms	All

[**group-name**] *named-item*

Synopsis	Interface group name
Context	**configure** routing-options if-attribute admin-group *named-item*
Tree	admin-group
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

value *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Integer value associated with the group
Context	**configure** routing-options if-attribute admin-group *named-item* value *number*
Tree	value
Range	0 to 255
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

srlg-group [name] *named-item*

Synopsis	Enter the **srlg-group** list instance
Context	**configure** routing-options if-attribute srlg-group *named-item*
Tree	srlg-group

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Max. instances	1024
Introduced	16.0.R1
Platforms	All

[**name**] *named-item*

Synopsis	SRLG name
Context	**configure** routing-options if-attribute srlg-group *named-item*
Tree	srlg-group
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

penalty-weight *number*

Synopsis	Integer value of the penalty weight assigned to SRLG
Context	**configure** routing-options if-attribute srlg-group *named-item* penalty-weight *number*
Tree	penalty-weight
Description	This command specifies the penalty weight associated with a SRLG. The higher the penalty weight, the less desirable it is to use the link with a given SRLG.
Range	0 to 65535
Default	0
Introduced	16.0.R1
Platforms	All

value *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Integer value associated with the SRLG
Context	**configure** routing-options if-attribute srlg-group *named-item* value *number*
Tree	value

© 2025 Nokia.

Range	0 to 4294967295
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

ip-fast-reroute *boolean*

Synopsis	Enable IP fast reroute capability
Context	**configure** routing-options ip-fast-reroute *boolean*
Tree	ip-fast-reroute
Default	false
Introduced	16.0.R1
Platforms	All

policy-accounting

Synopsis	Enter the **policy-accounting** context
Context	**configure** routing-options policy-accounting
Tree	policy-accounting
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

policy-acct-template [name] *named-item*

Synopsis	Enter the **policy-acct-template** list instance
Context	**configure** routing-options policy-accounting policy-acct-template *named-item*
Tree	policy-acct-template
Max. instances	1024
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

[**name**] *named-item*

Synopsis	Policy accounting template name

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** routing-options policy-accounting policy-acct-template *named-item*
Tree	policy-acct-template
String length	1 to 32
Notes	This element is part of a list key.
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

destination-class [index] *number*

Synopsis	Enter the **destination-class** list instance
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* destination-class *number*
Tree	destination-class
Max. instances	255
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

[**index**] *number*

Synopsis	Destination class index
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* destination-class *number*
Tree	destination-class
Range	1 to 255
Notes	This element is part of a list key.
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

policer *reference*

Synopsis	Policer ID
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* destination-class *number* policer *reference*
Tree	policer

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Reference	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number*
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

policer [policer-id] *number*

Synopsis	Enter the **policer** list instance
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number*
Tree	policer
Description	Commands in this context configure the policer definition for the instance. Policing by action of a policy accounting template is only supported by cards and systems that are FP4 and later.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

[**policer-id**] *number*

Synopsis	Policer ID
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number*
Tree	policer
Range	1 to 63
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

max-burst-size *(number | keyword)*

Synopsis	Exceed threshold to drop packets from PIR leaky bucket
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number* max-burst-size *(number | keyword)*
Tree	max-burst-size
Description	This command specifies the maximum burst size for the policer. When this value is exceeded, packets are considered violating and are dropped.
Range	0 to 16777216

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	bytes
Options	auto
Default	auto
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

peak-rate *(number | keyword)*

Synopsis	Peak rate of the policy accounting policer
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number* peak-rate *(number | keyword)*
Tree	peak-rate
Description	This command configures the peak rate of the policy accounting policer, which is the fill or drain rate of the bucket.
Range	1 to 6400000000
Options	max
Default	max
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

source-class [index] *number*

Synopsis	Add a list entry for **source-class**
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* source-class *number*
Tree	source-class
Max. instances	255
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	All

exclude-group [group-name] *reference*

Synopsis	Add a list entry for **exclude-group**
Context	**configure** routing-options route-next-hop-policy template *named-item* exclude-group *reference*
Tree	exclude-group
Max. instances	32
Introduced	16.0.R1
Platforms	All

[**group-name**] *reference*

Synopsis	Administrative group name
Context	**configure** routing-options route-next-hop-policy template *named-item* exclude-group *reference*
Tree	exclude-group
Description	This command specifies the name of the administrative group. If the same group name is part of both include and exclude statements, the exclude statement wins. In other words, the exclude statement can be viewed as having an implicit preference value of 0.
Reference	**configure** routing-options if-attribute admin-group *named-item*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

include-group [group-name] *reference*

Synopsis	Enter the **include-group** list instance

4.41.1 saa command descriptions

saa

Synopsis	Enter the **saa** context
Context	**configure** saa
Tree	saa
Description	Commands in this context configure the Service Assurance Agent (SAA) tests.
Introduced	16.0.R4
Platforms	All

owner [owner-name] *named-item* test *named-item*

Synopsis	Enter the **owner** list instance
Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
Introduced	16.0.R4
Platforms	All

[**owner-name**] *named-item*

Synopsis	Optional owner name of the SAA operation
Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
Description	This command configures the owner associated with the SAA operation.
String length	1 to 32
MD-CLI default	TiMOS CLI
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

test *named-item*

Synopsis	SAA test name

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

accounting-policy *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Accounting policy associated with the SAA test
Context	**configure** saa owner *named-item* test *named-item* accounting-policy *reference*
Tree	accounting-policy
Reference	**configure** log accounting-policy *number*
Introduced	16.0.R4
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the SAA test
Context	**configure** saa owner *named-item* test *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R4
Platforms	All

continuous *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Execute the SAA tests as continuous
Context	**configure** saa owner *named-item* test *named-item* continuous *boolean*
Tree	continuous
Description	When configured to **true**, the SAA test execution is continuous, that is, it cannot be started or stopped with the **oam saa test start** or **stop** commands. The SAA test types supported by this command include the following: • **cpe-ping** • **dns** • **eth-cfm-loopback** • **eth-cfm-two-way-delay** • **eth-cfm-two-way-slm** • **icmp-ping** (not applicable to **rapid** type) • **lsp-ping** • **mac-ping** • **sdp-ping** • **vccv-ping** • **vprn-ping**
Default	false
Introduced	16.0.R4
Platforms	All

description *description*

Synopsis	Text description
Context	**configure** saa owner *named-item* test *named-item* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R4
Platforms	All

jitter-event [direction] *keyword* threshold-type *keyword*

Synopsis	Enter the **jitter-event** list instance
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword*
Tree	jitter-event

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the jitter event thresholds used to evaluate the jitter event value at the termination of an SAA test probe. The system generates SAA threshold events as required.
Introduced	16.0.R4
Platforms	All

[**direction**] *keyword*

Synopsis	Direction for OAM ping responses for OAM ping test run
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword*
Tree	jitter-event
Options	inbound, outbound, round-trip
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

threshold-type *keyword*

Synopsis	Threshold type
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword*
Tree	jitter-event
Options	rising, falling
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

threshold *number*

Synopsis	Threshold jitter value
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword* threshold *number*
Tree	threshold
Description	This command specifies the threshold jitter value. The system generates an SAA threshold event when the jitter value of the test run crosses the threshold value.

router-instance *string*

Synopsis	Router name or VPRN service name
Context	**configure** saa owner *named-item* test *named-item* type dns router-instance *string*
Tree	router-instance
Default	_Base_and_management
Introduced	22.10.R1
Platforms	All

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address on the local system
Context	**configure** saa owner *named-item* test *named-item* type dns source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures the IP address on the local system. If unconfigured, the router uses a system selected local IP address.
Introduced	22.10.R1
Platforms	All

target-address *string-not-all-spaces*

Synopsis	DNS name to be resolved to an IP address
Context	**configure** saa owner *named-item* test *named-item* type dns target-address *string-not-all-spaces*
Tree	target-address
String length	1 to 255
Notes	This element is mandatory.
Introduced	22.10.R1
Platforms	All

timeout *number*

Synopsis	Maximum time to wait for a reply message
Context	**configure** saa owner *named-item* test *named-item* type dns timeout *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	timeout
Description	This command specifies the maximum time the router waits for a message response after sending the message request. When the timeout expires, the requesting router assumes the message response is not received. Any response received after the request times out is silently discarded.
Range	1 to 120
Units	seconds
Default	5
Introduced	22.10.R1
Platforms	All

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation
Tree	trap-generation
Introduced	22.10.R1
Platforms	All

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	22.10.R1
Platforms	All

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation probe-fail-threshold *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	22.10.R1
Platforms	All

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	22.10.R1
Platforms	All

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	22.10.R1
Platforms	All

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	22.10.R1
Platforms	All

eth-cfm-loopback

Synopsis	Enable the **eth-cfm-loopback** context
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback
Tree	eth-cfm-loopback
Description	Commands in this context configure an Ethernet CFM loopback test in SAA.
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	24.10.R1
Platforms	All

count *number*

Synopsis	Number of packets to send
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback count *number*
Tree	count
Range	1 to 100
Units	packets
Default	1
Introduced	24.10.R1
Platforms	All

destination *(mac-unicast-address-no-zero | number)*

Synopsis	Destination MAC address or remote MEP ID of the peer
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback destination *(mac-unicast-address-no-zero | number)*
Tree	destination
Description	This command specifies the Layer 2 unicast MAC address of the destination MEP or, alternatively, the remote MEP ID. When the remote MEP ID option is used instead of the MAC address, the domain and association information of the source MEP for the test is used to check for a locally stored unicast MAC address for the peer. The local MEP must be administratively enabled.
Range	1 to 8191
Notes	This element is mandatory.
Introduced	24.10.R1
Platforms	All

interval *number*

Synopsis	Interval between packets sent
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	5
Introduced	24.10.R1
Platforms	All

ma-admin-name *(named-item-64 | admin-name)*

Synopsis	Source Ethernet Maintenance Association (MA) name
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback ma-admin-name *(named-item-64 | admin-name)*
Tree	ma-admin-name
String length	1 to 64
Notes	This element is mandatory.
Introduced	24.10.R1

timeout *number*

Synopsis	Maximum time to wait for a reply packet
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback timeout *number*
Tree	timeout
Description	This command configures the maximum time the router waits for a reply packet after sending the last probe for the test. When the timeout expires, the test is marked complete and no more packets are processed.
Range	1 to 10
Units	seconds
Default	5
Introduced	24.10.R1
Platforms	All

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation
Tree	trap-generation
Introduced	24.10.R1
Platforms	All

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	24.10.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	24.10.R1
Platforms	All

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	24.10.R1
Platforms	All

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	24.10.R1

Introduced	22.10.R1
Platforms	All

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation probe-fail *boolean*
Tree	probe-fail

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	22.10.R1
Platforms	All

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	22.10.R1
Platforms	All

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	22.10.R1
Platforms	All

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation test-fail *boolean*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	22.10.R1
Platforms	All

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	22.10.R1
Platforms	All

ttl *number*

Synopsis	TTL value for the echo request MPLS label

Tree	ttl
Range	1 to 255
Default	255
Introduced	22.10.R1
Platforms	All

sdp-ping

Synopsis	Enable the **sdp-ping** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** saa owner *named-item* test *named-item* type sdp-ping
Tree	sdp-ping
Description	Commands in this context configure tests on SDPs for unidirectional or round-trip connectivity, as well as for performing SDP MTU path tests.
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	24.10.R1
Platforms	All

count *number*

Synopsis	Number of SDP echo request packets to send
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping count *number*
Tree	count
Description	This command specifies the number of echo request packets to send. Each request must either time out or receive a reply before the next message request is sent. The **interval** value must expire before the next message request is sent.
Range	1 to 100
Units	packets
Default	1
Introduced	24.10.R1
Platforms	All

interval *number*

Synopsis	Interval between SDP echo request packets sent
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	1
Introduced	24.10.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

originating-sdp-identifier *number*

Synopsis	SDP ID used to send packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping originating-sdp-identifier *number*
Tree	originating-sdp-identifier
Description	This command specifies the SDP ID that is used by SDP ping. The far-end address of the specified SDP ID is the expected responder ID within each reply received. The SDP ID defines the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If this ID is invalid, administratively down, or otherwise unavailable, the SDP echo request message is not sent, and an error message is displayed. After the interval timer expires, the SDP ping attempts to send the next request, if required.
Range	1 to 32767
Notes	This element is mandatory.
Introduced	24.10.R1
Platforms	All

qos

Synopsis	Enter the **qos** context
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping qos
Tree	qos
Introduced	24.10.R1
Platforms	All

fc *keyword*

Synopsis	FC for the transmitted SDP echo request packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping qos fc *keyword*
Tree	fc
Options	be – Best effort l2 – Low 2 (best effort) af – Assured forwarding (assured) l1 – Low 1 (assured) h2 – High 2 (high priority) ef – Expedited forwarding (high priority) h1 – High 1 (high priority) nc – Network control (high priority)

Use subject to Terms available at: www.nokia.com/terms.

Default	be
Introduced	24.10.R1
Platforms	All

profile *keyword*

Synopsis	QoS profile for transmitted SDP echo request packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping qos profile *keyword*
Tree	profile
Options	in – In profile out – Out of profile
Default	out
Introduced	24.10.R1
Platforms	All

responder-sdp-identifier *number*

Synopsis	SDP ID used by the far-end to reply to the request
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping responder-sdp-identifier *number*
Tree	responder-sdp-identifier
Description	This command configures the return SDP ID to be used by the far-end router for the message reply for round-trip SDP connectivity testing. If this ID does not exist on the far-end router, or terminates on a different router from the originating router, or another issue prevents the far-end router from using this ID, the SDP echo reply is sent using generic IP or GRE OAM encapsulation. The received FC (as mapped on the ingress network interface for the far end) defines the FC encapsulation for the reply message.
Range	1 to 32767
Introduced	24.10.R1
Platforms	All

size *number*

Synopsis	Size of the SDP echo request packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping size *number*
Tree	size

Description	This command configures the size of the SDP echo request packets, which includes the SDP header and payload. The size does not include the SDP encapsulation, VC label (if applied), or any DLC headers or trailers.
Range	72 to 9786
Units	bytes
Default	72
Introduced	24.10.R1
Platforms	All

timeout *number*

Synopsis	Maximum time to wait for SDP echo reply packets
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping timeout *number*
Tree	timeout
Description	This command configures the time the router waits for a message reply after sending the last probe for a specific test. When the timeout expires, the test is marked complete and no more packets are processed.
Range	1 to 10
Units	seconds
Default	5
Introduced	24.10.R1
Platforms	All

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation
Tree	trap-generation
Introduced	24.10.R1
Platforms	All

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation probe-fail *boolean*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	24.10.R1
Platforms	All

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	24.10.R1
Platforms	All

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	24.10.R1
Platforms	All

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	24.10.R1
Platforms	All

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type sdp-ping trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	24.10.R1
Platforms	All

vccv-ping

Synopsis	Enable the **vccv-ping** context
Context	**configure** saa owner *named-item* test *named-item* type vccv-ping
Tree	vccv-ping
Description	Commands in this context configure a Virtual Circuit Connectivity Verification (VCCV) ping test. A VCCV-ping test checks connectivity of a VLL inband. It verifies that the destination (target) PE is the egress for the Layer 2 FEC and provides for a cross-check between the data plane and the control plane. Because it is inband, the VCCV-ping message is sent using the same encapsulation and along the same path as user packets in that VLL. The VCCV-ping test is the equivalent of the LSP-ping test for a VLL service. The

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	VCCV-ping test reuses an LSP-ping message format and can be used to test a VLL configured over both an MPLS and a GRE SDP.
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	23.10.R1
Platforms	All

count *number*

Synopsis	Number of echo request packets to send
Context	**configure** saa owner *named-item* test *named-item* type vccv-ping count *number*
Tree	count
Range	1 to 100
Units	packets
Default	1
Introduced	23.10.R1
Platforms	All

interval *number*

Synopsis	Interval between packets sent
Context	**configure** saa owner *named-item* test *named-item* type vccv-ping interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	1
Introduced	23.10.R1
Platforms	All

qos

Synopsis	Enter the **qos** context
Context	**configure** saa owner *named-item* test *named-item* type vccv-ping qos
Tree	qos
Introduced	23.10.R1

4.42.1 satellite command descriptions

satellite

Synopsis	Enter the **satellite** context
Context	**configure** satellite
Tree	satellite
Description	Commands in this context configure a satellite chassis hosted by the associated local system.
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ethernet-satellite [satellite-id] *number*

Synopsis	Enter the **ethernet-satellite** list instance
Context	**configure** satellite ethernet-satellite *number*
Tree	ethernet-satellite
Description	Commands in this context configure an Ethernet satellite.
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**satellite-id**] *number*

Synopsis	Ethernet satellite ID
Context	**configure** satellite ethernet-satellite *number*
Tree	ethernet-satellite
Range	1 to 40
Notes	This element is part of a list key.
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the satellite
Context	**configure** satellite ethernet-satellite *number* admin-state *keyword*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Options	enable, disable
Default	disable
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

central-frequency-clock

Synopsis	Enter the **central-frequency-clock** context
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock
Tree	central-frequency-clock
Description	Commands in this context configure frequency references used in the Ethernet satellite. The **configure satellite ethernet-satellite sync-e** command must be configured to **true** before being committed. Otherwise, an error message is generated.
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ref1

Synopsis	Enter the **ref1** context
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock ref1
Tree	ref1
Description	Commands in this context configure options for the first timing reference used in the Ethernet satellite. The source ports for ref1 can be either uplinks or client ports.
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the satellite timing reference
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock ref1 admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

quality-level-override *keyword*

Synopsis	Quality level of the satellite timing reference
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock ref1 quality-level-override *keyword*
Tree	quality-level-override
Options	unused, prs, stu, st2, tnc, st3e, st3, prc, ssua, ssub, sec, eec1, eec2
Default	unused
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-port *port*

Synopsis	Source port for timing reference within satellite
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock ref1 source-port *port*
Tree	source-port
Description	This command configures the source port used for the input reference to the frequency clock. The port can be any port of the Ethernet satellite.
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ref2

Synopsis	Enter the **ref2** context
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock ref2
Tree	ref2
Description	Commands in this context configure options for the second timing reference used in the Ethernet satellite. The source ports for ref2 can be either uplinks or client ports.
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

admin-state *keyword*

Synopsis	Administrative state of the satellite timing reference
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock ref2 admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

quality-level-override *keyword*

Synopsis	Quality level of the satellite timing reference
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock ref2 quality-level-override *keyword*
Tree	quality-level-override
Options	unused, prs, stu, st2, tnc, st3e, st3, prc, ssua, ssub, sec, eec1, eec2
Default	unused
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-port *port*

Synopsis	Source port for timing reference within satellite
Context	**configure** satellite ethernet-satellite *number* central-frequency-clock ref2 source-port *port*
Tree	source-port
Description	This command configures the source port used for the input reference to the frequency clock. The port can be any port of the Ethernet satellite.
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Synopsis	Port template name
Context	**configure** satellite ethernet-satellite *number* port-template *named-item*
Tree	port-template
String length	1 to 32
Introduced	19.10.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ptp-ip

Synopsis	Enter the **ptp-ip** context
Context	**configure** satellite ethernet-satellite *number* ptp-ip
Tree	ptp-ip
Description	Commands in this context configure the Precision Time Protocol over IP (PTP over IP) transparent clock functionality. To allow this command to function, first configure the **ptp-tc** option for the **configure satellite ethernet-satellite feature** command.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of PTP over IP transparent clock
Context	**configure** satellite ethernet-satellite *number* ptp-ip admin-state *keyword*
Tree	admin-state
Description	This command configures the administrative state of the PTP over IP transparent clock functionality. To allow this command to function, first configure the **ptp-tc** option for the **configure satellite ethernet-satellite feature** command.
Options	enable, disable
Default	disable
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

ipv4-address *ipv4-address*

Synopsis	IPv4 destination address of PTP messages
Context	**configure** satellite ethernet-satellite *number* ptp-ip ipv4-address *ipv4-address*
Tree	ipv4-address
Description	This command configures the IPv4 destination address of PTP messages received into the satellite client ports. Use the same IPv4 address used for the PTP process on the host system. Only unicast addresses can be used.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv6-address *ipv6-address*

Synopsis	IPv6 destination address of PTP messages
Context	**configure** satellite ethernet-satellite *number* ptp-ip ipv6-address *ipv6-address*
Tree	ipv6-address
Description	This command configures the IPv6 destination address of PTP messages received into the satellite client ports. Use the same IPv6 address used for the PTP process on the host system. Only unicast addresses can be used.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

ptp-tc *boolean*

Synopsis	Enable the 1EEE 1588 transparent clock function
Context	**configure** satellite ethernet-satellite *number* ptp-tc *boolean*
Tree	ptp-tc
Default	false
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sat-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Type of satellite variant for the associated chassis
Context	**configure** satellite ethernet-satellite *number* sat-type *keyword*
Tree	sat-type
Options	es48-1gb-sfp, es24-1gb-sfp, es48-1gb-tx, es24-1gb-tx, es24-sass-1gb-sfp, es48-sass-1gb-sfp, es24-sasmxp-1gb-sfp, es64-10gb-sfpp+4-100gb-qsfp28, es24-sfpp+8-sfp28+2-qsfp28, es32-qsfp28+4-qsfpdd, es6-qsfpdd+48-sfp56, es48-sfpp+6-qsfp28
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.

software-repository *reference*

Synopsis	Software repository bound to the associated satellite
Context	**configure** satellite ethernet-satellite *number* software-repository *reference*
Tree	software-repository
Reference	**configure** system software-repository *named-item*
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sync-e *boolean*

Synopsis	Enable the synchronous Ethernet operation
Context	**configure** satellite ethernet-satellite *number* sync-e *boolean*
Tree	sync-e
Description	When configured to **true**, this command enables the Ethernet satellite for synchronous Ethernet operation so that the transmit timing of the satellite access ports use the frequency of the central clock of the host router. To enable this functionality, both host ports on the router that connect to the U1 and U2 ports of the satellite must be synchronous Ethernet-capable ports. When configured to **false**, the command disables the Ethernet satellite for synchronous Ethernet operation.
Default	false
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

uplink-distribution *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Forwarding complex type for uplink distribution
Context	**configure** satellite ethernet-satellite *number* uplink-distribution *keyword*
Tree	uplink-distribution
Description	This command specifies the forwarding complex used for the satellite uplink association to the ports. With **single-complex**, all uplinks for the associated satellite must be connected to ports using a single forwarding complex.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	With **dual-complex**, all uplinks for the associated satellite must be connected to ports using a double forwarding complex. This option optimizes the resources across the two complexes.
Options	single-complex, dual-complex
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

file-transfer

Synopsis	Enter the **file-transfer** context
Context	**configure** satellite file-transfer
Tree	file-transfer
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ftp *boolean*

Synopsis	Use FTP between host and satellite
Context	**configure** satellite file-transfer ftp *boolean*
Tree	ftp
Description	When configured to **true**, the file transfer FTP is used between 7750 SR or 7950 XRS host and the 7210 SAS Ethernet satellite.
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

scp *boolean*

Synopsis	Use FTP between host and satellite
Context	**configure** satellite file-transfer scp *boolean*
Tree	scp
Description	When configured to **true**, the file transfer SCP protocol is used between 7750 SR or 7950 XRS host and the 7210 SAS Ethernet satellite. When configured to **false**, the file transfer FTP protocol is used between 7750 SR or 7950 XRS host and the 7210 SAS Ethernet satellite.
Default	false

4.43.1 service command descriptions

service

Synopsis	Enter the **service** context
Context	**configure** service
Tree	service
Introduced	16.0.R1
Platforms	All

cpipe [service-name] *service-name*

Synopsis	Enter the **cpipe** list instance
Context	**configure** service cpipe *service-name*
Tree	cpipe
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** service cpipe *service-name*
Tree	cpipe
String length	1 to 64
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the service
Context	**configure** service cpipe *service-name* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable

© 2025 Nokia.

Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

customer *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Service customer ID
Context	**configure** service cpipe *service-name* customer *reference*
Tree	customer
Reference	**configure** service customer *customer-name*
Notes	This element is mandatory.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

description *description*

Synopsis	Text description
Context	**configure** service cpipe *service-name* description *description*
Tree	description
String length	1 to 80
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

endpoint [name] *named-item*

Synopsis	Enter the **endpoint** list instance
Context	**configure** service cpipe *service-name* endpoint *named-item*
Tree	endpoint
Max. instances	2
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**name**] *named-item*

Synopsis	Service endpoint name
Context	**configure** service cpipe *service-name* endpoint *named-item*
Tree	endpoint
String length	1 to 32
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

description *description*

Synopsis	Text description
Context	**configure** service cpipe *service-name* endpoint *named-item* description *description*
Tree	description
String length	1 to 80
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

hold-time-active *number*

Synopsis	Time before entering standby when MC-LAG SAP goes down
Context	**configure** service cpipe *service-name* endpoint *named-item* hold-time-active *number*
Tree	hold-time-active
Range	1 to 60
Units	deciseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

revert-time *(number | keyword)*

Synopsis	Time to wait before reverting to primary spoke SDP
Context	**configure** service cpipe *service-name* endpoint *named-item* revert-time *(number | keyword)*
Tree	revert-time

© 2025 Nokia.

Range	1 to 600
Units	seconds
Options	never, immediate
Default	immediate
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sap [sap-id] *sap*

Synopsis	Enter the **sap** list instance
Context	**configure** service cpipe *service-name* sap *sap*
Tree	sap
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**sap-id**] *sap*

Synopsis	SAP ID
Context	**configure** service cpipe *service-name* sap *sap*
Tree	sap
String length	1 to 45
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

accounting-policy *reference*

Synopsis	Accounting policy
Context	**configure** service cpipe *service-name* sap *sap* accounting-policy *reference*
Tree	accounting-policy
Reference	**configure** log accounting-policy *number*
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.

admin-state *keyword*

Synopsis	Administrative state of the SAP
Context	**configure** service cpipe *service-name* sap *sap* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cem

Synopsis	Enter the **cem** context
Context	**configure** service cpipe *service-name* sap *sap* cem
Tree	cem
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

packet

Synopsis	Enter the **packet** context
Context	**configure** service cpipe *service-name* sap *sap* cem packet
Tree	packet
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

jitter-buffer *number*

Synopsis	Jitter buffer size
Context	**configure** service cpipe *service-name* sap *sap* cem packet jitter-buffer *number*
Tree	jitter-buffer
Range	1 to 250
Units	milliseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

payload-size *number*

Synopsis	Size of payload packets transmitted to PSN by CEM SAP
Context	**configure** service cpipe *service-name* sap *sap* cem packet payload-size *number*
Tree	payload-size
Range	2 to 1514
Units	bytes
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

report-alarm

Synopsis	Enter the **report-alarm** context
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm
Tree	report-alarm
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

buffer-overrun *boolean*

Synopsis	Report alarm for buffer overrun
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm buffer-overrun *boolean*
Tree	buffer-overrun
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

buffer-underrun *boolean*

Synopsis	Report alarm for buffer underrun
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm buffer-underrun *boolean*
Tree	buffer-underrun
Default	true
Introduced	20.10.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

malformed-packets *boolean*

Synopsis	Report alarm for malformed packets
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm malformed-packets *boolean*
Tree	malformed-packets
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

packet-loss *boolean*

Synopsis	Report remote peer is currently in packet loss status
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm packet-loss *boolean*
Tree	packet-loss
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

remote-fault *boolean*

Synopsis	Report remote TDM interface is currently not in service
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm remote-fault *boolean*
Tree	remote-fault
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

remote-packet-loss *boolean*

Synopsis	Report remote peer is currently in packet loss status
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm remote-packet-loss *boolean*
Tree	remote-packet-loss

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

remote-rdi *boolean*

Synopsis	Report remote TDM interface is currently in RDI status
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm remote-rdi *boolean*
Tree	remote-rdi
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

stray-packets *boolean*

Synopsis	Report alarm for stray packets
Context	**configure** service cpipe *service-name* sap *sap* cem report-alarm stray-packets *boolean*
Tree	stray-packets
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rtp-header *boolean*

Synopsis	Use RTP header for transmitted packets to the PSN
Context	**configure** service cpipe *service-name* sap *sap* cem rtp-header *boolean*
Tree	rtp-header
Description	When configured to **true**, the router uses the RTP header when packets are transmitted to the packet service network (PSN) by the CEM SAP. This mode must be enabled for differential-timed E1s.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

collect-stats *boolean*

Synopsis	Collect accounting statistics
Context	**configure** service cpipe *service-name* sap *sap* collect-stats *boolean*
Tree	collect-stats
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

description *long-description*

Synopsis	Text description
Context	**configure** service cpipe *service-name* sap *sap* description *long-description*
Tree	description
String length	1 to 160
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

dist-cpu-protection *reference*

Synopsis	Distributed CPU protection policy for SAP
Context	**configure** service cpipe *service-name* sap *sap* dist-cpu-protection *reference*
Tree	dist-cpu-protection
Reference	**configure** system security dist-cpu-protection policy *named-item*
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

egress

Synopsis	Enter the **egress** context
Context	**configure** service cpipe *service-name* sap *sap* egress
Tree	egress
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

agg-rate

Synopsis	Enter the **agg-rate** context
Context	**configure** service cpipe *service-name* sap *sap* egress agg-rate
Tree	agg-rate
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

adaptation-rule *keyword*

Synopsis	Adaptation rule to compute the operational PIR value when an aggregate shaper is used
Context	**configure** service cpipe *service-name* sap *sap* egress agg-rate adaptation-rule *keyword*
Tree	adaptation-rule
Options	max, min, closest
Default	closest
Introduced	22.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

burst-limit *(number | keyword)*

Synopsis	Shaping burst size when an aggregate shaper is used
Context	**configure** service cpipe *service-name* sap *sap* egress agg-rate burst-limit *(number | keyword)*
Tree	burst-limit
Range	1 to 14000000
Units	bytes
Options	auto
Default	auto
Introduced	22.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

limit-unused-bandwidth *boolean*

Synopsis	Enable aggregate rate overrun protection
Context	**configure** service cpipe *service-name* sap *sap* egress agg-rate limit-unused-bandwidth *boolean*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	limit-unused-bandwidth
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rate *number*

Synopsis	Enforced aggregate rate for all queues
Context	**configure** service cpipe *service-name* sap *sap* egress agg-rate rate *number*
Tree	rate
Range	1 to 6400000000
Units	kilobps
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

qos

Synopsis	Enter the **qos** context
Context	**configure** service cpipe *service-name* sap *sap* egress qos
Tree	qos
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

policer-control-policy

Synopsis	Enter the **policer-control-policy** context
Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy
Tree	policer-control-policy
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

overrides

Synopsis	Enable the **overrides** context
Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy overrides

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	overrides
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

root

Synopsis	Enter the **root** context
Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy overrides root
Tree	root
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

max-rate *(number | keyword)*

Synopsis	Maximum frame-based bandwidth limit
Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy overrides root max-rate *(number | keyword)*
Tree	max-rate
Range	1 to 6400000000
Options	max
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

priority-mbs-thresholds

Synopsis	Enter the **priority-mbs-thresholds** context
Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy overrides root priority-mbs-thresholds
Tree	priority-mbs-thresholds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

min-thresh-separation *(number | keyword)*

Synopsis	Minimum amount of separation buffer space

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy overrides root priority-mbs-thresholds min-thresh-separation *(number | keyword)*
Tree	min-thresh-separation
Range	0 to 16777216
Units	bytes
Options	auto
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

priority [priority-level] *number*

Synopsis	Enter the **priority** list instance
Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy overrides root priority-mbs-thresholds priority *number*
Tree	priority
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

[**priority-level**] *number*

Synopsis	Priority level
Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy overrides root priority-mbs-thresholds priority *number*
Tree	priority
Range	1 to 8
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

mbs-contribution *(number | keyword)*

Synopsis	Minimum amount of cumulative buffer space allowed
Context	**configure** service cpipe *service-name* sap *sap* egress qos policer-control-policy overrides root priority-mbs-thresholds priority *number* mbs-contribution *(number | keyword)*
Tree	mbs-contribution

scheduler [scheduler-name] *named-item*

Synopsis	Enter the **scheduler** list instance
Context	**configure** service cpipe *service-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service cpipe *service-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

String length	1 to 32
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service cpipe *service-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

scheduler [scheduler-name] *named-item*

Synopsis	Enter the **scheduler** list instance
Context	**configure** service customer *customer-name* multi-service-site *named-item* egress scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Introduced	16.0.R1
Platforms	All

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service customer *customer-name* multi-service-site *named-item* egress scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context will not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context does not change.

evi *number*

Synopsis	EVPN ID
Context	**configure** service epipe *service-name* bgp-evpn evi *number*
Tree	evi
Description	This command configures an EVPN instance (EVI) unique in the system. It is used for the service-carving algorithm for multi-homing and auto-deriving route target and route distinguishers. The following options are supported:

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If this EVPN identifier is not specified, the value is zero and no route distinguisher or route target is automatically derived from it.If the specified EVPN identifier is lower than 65535 and no other route distinguisher or route target is configured in the service, the following applies:

- the route distinguisher is derived from <system_ip>:evi
- the route target is derived from <autonomous-system>:evi

If the specified EVPN identifier is higher than 65535 and no other route distinguisher or route target is configured in the service, the following applies.

- The route distinguisher cannot be automatically derived. An error is generated if enabling EVPN is attempted without a route distinguisher. A manual or an **auto-rd** route distinguisher must be configured.
- The route target can only be automatically derived if the **evi-three-byte-auto-rt** command is configured. If configured, the route target is automatically derived in accordance with the rules described in RFC8365.

Range	1 to 16777215

eth-tag *number*

Synopsis	Ethernet tag of the attachment circuit
Context	**configure** service epipe *service-name* bgp-evpn local-attachment-circuit *named-item* eth-tag *number*
Tree	eth-tag
Description	This command configures the Ethernet tag value of the attachment circuit. When configured in the local attachment circuit context, the tag value is used in the advertised AD per-EVI route sent for the attachment circuit.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured in the remote attachment circuit context, the value is compared with the Ethernet tag value of the imported D per-EVI routes for the service. When there is a match, the system creates an EVPN destination for the Epipe.

Range 1 to 16777215

Introduced 20.10.R1

Platforms All

vlan-signaled-flexible-cross-connect *boolean*

Synopsis Enable FXC VLAN-signaled mode

Context **configure** service epipe *service-name* bgp-evpn local-attachment-circuit *named-item* vlan-signaled-flexible-cross-connect *boolean*

Tree vlan-signaled-flexible-cross-connect

Description When configured to **true**, the router enables the FXC Epipe in VLAN-signaled mode. In addition, a separate EVPN Auto-Discovery per-EVI route is advertised per-SAP, and the Ethernet tag IDs are autoderived from the normalized tags for the SAP.

When configured to **false**, the router advertises a single Auto-Discovery per-EVI route for the service using the configured local Ethernet tag ID.

Default false

Introduced 24.10.R1

Platforms 7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s
