enforce-strict-tunnel-tagging *boolean*

Synopsis	Enable/disable enforcement of strict tunnel tagging
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-strict-tunnel-tagging *boolean*
Tree	enforce-strict-tunnel-tagging
Default	false
Introduced	16.0.R4
Platforms	All

enforce-untagged-route *keyword*

Synopsis	Untagged route type enforcement
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-untagged-route *keyword*
Tree	enforce-untagged-route
Description	This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services. If the **untagged-tunnel** option is configured, untagged routes only bind to LSPs with no administrative tag configured. If both tagged and untagged tunnels to the next hop exist, the system only considers the untagged tunnels. If no untagged tunnels to the next hop exist, the resolution of untagged routes fails.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The **untagged-tunnel** option can be used in combination with the **enforce-strict-tunnel-tagging** command configured to **true**, in which case tagged routes resolve to tagged LSPs, and untagged routes only resolve to untagged LSPs.

When unconfigured, untagged routes can bind to tagged or untagged LSPs.

Options	none – Untagged routes can bind to tagged or untagged LSPs untagged-tunnel – Untagged routes only bind to LSPs without an admin tag
Default	none
Introduced	24.10.R1
Platforms	All

resolution *keyword*

Synopsis	Resolution method for tunnel selection

bgp *boolean*

Synopsis	Use BGP tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter bgp *boolean*
Tree	bgp
Description	When configured to **true**, BGP searches the BGP LSP for the address of the BGP next hop.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, BGP tunneling is not used and inter-area or inter-as prefixes are not resolved.

Default	false
Introduced	16.0.R1
Platforms	All

ldp *boolean*

Synopsis	Use LDP tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter ldp *boolean*
Tree	ldp
Description	When configured to **true**, BGP searches for an LDP LSP with a FEC prefix corresponding to the address of the BGP next hop. When configured to **false**, LDP tunneling is not used for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

mpls-fwd-policy *boolean*

Synopsis	Use MPLS forwarding policy for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter mpls-fwd-policy *boolean*
Tree	mpls-fwd-policy
Description	When configured to **true**, BGP uses the MPLS forwarding policy to determine the address of the BGP next hop. When configured to **false**, the MPLS forwarding policy is not used for next-hop resolution.
Default	false
Introduced	19.5.R1
Platforms	All

rib-api *boolean*

Synopsis	Use RIB API gRPC service for next-hop resolution

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter rib-api *boolean*
Tree	rib-api
Description	When configured to **true**, BGP uses tunnels programmed using the RIB API gRPC service to resolve the next hops of routes imported into the EVPN service. When configured to **false**, the RIB API service tunnels are not used for next-hop resolution.
Default	false
Introduced	19.5.R1
Platforms	All

rsvp *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter rsvp *boolean*
Tree	rsvp
Description	When configured to **true**, BGP searches the best metric RSVP LSP to determine the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID. When configured to **false**, the RSVP LSP is not used for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

sr-isis *boolean*

Synopsis	Use IS-IS SR tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-isis *boolean*
Tree	sr-isis
Description	When configured to **true**, BGP uses an IS-IS tunnel type to resolve the BGP next hop. When the **sr-isis** command is enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure. • Select the SR tunnel submitted by the IS-IS instance with the lowest tunnel table preference.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, IS-IS tunneling is not used for next-hop resolution.

Default false

Introduced 16.0.R1

Platforms All

sr-ospf *boolean*

Synopsis Use OSPF SR tunneling for next-hop resolution

Context **configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf *boolean*

Tree sr-ospf

Description When configured to **true**, BGP uses an OSPF tunnel type to resolve the BGP next hop.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPF instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF tunneling is not used for next-hop resolution.

Default false

Introduced 16.0.R1

Platforms All

sr-ospf3 *boolean*

Synopsis Use OSPFv3 SR tunneling for next-hop resolution

Context **configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf3 *boolean*

Tree sr-ospf3

Description When configured to **true**, BGP uses an OSPF3 tunnel type to resolve the BGP next hop.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Select the SR tunnel submitted by the OSPFv3 instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF3 tunneling is not used for next-hop resolution.

Default false

Introduced 19.10.R1

Platforms All

sr-policy *boolean*

Synopsis Use SR policies for next-hop resolution

Context **configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-policy *boolean*

Tree sr-policy

Description When configured to **true**, this command enables the use of SR policies to resolve the next hop of BGP-EVPN service routes.

This command configures BGP to search for an SR policy with:

- a non-null endpoint that matches the next hop of the service route, and
- a color value that matches the highest numbered color for the extended community attached to the service route

Default false

Introduced 19.5.R1

Platforms All

sr-te *boolean*

Synopsis Use SR-TE tunneling for next-hop resolution

Context **configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-te *boolean*

Tree sr-te

Description When configured to **true**, BGP uses an SR-TE tunnel type to resolve the BGP next hop.

In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID.

When configured to **false**, SR-TE tunneling is not used for next-hop resolution.

Default false

Introduced	16.0.R1
Platforms	All

udp *boolean*

Synopsis	Use MPLS over UDP tunneling for next-hop resolution
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter udp *boolean*
Tree	udp
Description	When configured to **true**, BGP uses an MPLS over UDP tunnel type to determine the address of the BGP next hop. When configured to **false**, MPLS over UDP tunneling is not used for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

weighted-ecmp *boolean*

Synopsis	Allow weighted load balancing
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* auto-bind-tunnel weighted-ecmp *boolean*
Tree	weighted-ecmp
Description	When configured to **true**, this router enables weighted ECMP for packets using tunnels that a VPLS or Epipe automatically binds to. Packets are sprayed across LSPs in the ECMP according to the outcome of the hash algorithm and the configured load balancing weight of each LSP. When configured to **false**, this command disables weighted ECMP for next-hop tunnel selection.
Default	false
Introduced	22.7.R1
Platforms	All

control-word *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Synopsis	Enable support for control word
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* control-word *boolean*
Tree	control-word
Description	When configured to **true**, the router enables the transmission and reception of the control word for all EVPN-MPLS destinations at the same time.
Default	false
Introduced	16.0.R1
Platforms	All

default-route-tag *one-byte-value*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Default route tag
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* default-route-tag *one-byte-value*
Tree	default-route-tag
Description	This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed. When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.
Introduced	16.0.R4
Platforms	All

domain-id *domain-id*

Synopsis	Domain ID of received BGP route before readvertisement
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* domain-id *domain-id*
Tree	domain-id
Description	This command specifies the domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example,

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).

Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:

Seg Len=1 / 65000:1:128

If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:

Seg Len=2 / 65000:2:70 / 65000:1:128

That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

The command is also supported in Epipe services with two instances. As in the case of multi-instance VPRN services, the configured domain ID in an Epipe instance is prepended to the AD per EVI route redistributed to the other instance.

Introduced 23.10.R1

Platforms All

dynamic-egress-label-limit *boolean*

Synopsis Enables dynamic egress label limit

Context **configure** service epipe *service-name* bgp-evpn mpls *number* dynamic-egress-label-limit *boolean*

Tree dynamic-egress-label-limit

Description When configured to **true**, this command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.

For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.

For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

When configured to **false** this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

Default false

Introduced 22.2.R1

Platforms All

evi-three-byte-auto-rt *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Auto-derive the BGP EVPN route target
Context	**configure** service epipe *service-name* bgp-evpn mpls *number* evi-three-byte-auto-rt *boolean*
Tree	evi-three-byte-auto-rt
Description	When configured to **true**, the BGP-EVPN instance import and export route target is auto-derived as described in RFC 8365 (Global-Administrator:A/Type/D-ID/Service-ID). Where: • Global Administrator – is the configured 2-octet AS number; if the configured ASN exceeds the 2 byte limit, the low order 16-bit value is taken • A=0 (for auto-derivation) • Type=4 (EVI-based route-target)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- D-ID= [1..2] – encodes the BGP instance, which allows the auto-derivation of different route-targets in multi-instance services; the value is inherited from the corresponding BGP instance
- Service ID=3-octet EVI

When configured to **false**, route target derivation is not allowed.

Default false

Introduced 21.10.R1

domain-id *domain-id*

Synopsis Domain ID of received BGP route before readvertisement

Context **configure** service epipe *service-name* bgp-evpn segment-routing-v6 *number* domain-id *domain-id*

Tree domain-id

Description This command specifies the domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).

Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:

Seg Len=1 / 65000:1:128

If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:

Seg Len=2 / 65000:2:70 / 65000:1:128

That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

The command is also supported in Epipe services with two instances. As in the case of multi-instance VPRN services, the configured domain ID in an Epipe instance is prepended to the AD per EVI route redistributed to the other instance.

Introduced 23.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

ecmp *number*

Synopsis	Maximum ECMP value configured on the service
Context	**configure** service epipe *service-name* bgp-evpn segment-routing-v6 *number* ecmp *number*
Tree	ecmp
Range	1 to 32
Default	1
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

evi-three-byte-auto-rt *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Auto-derive the BGP EVPN route target
Context	**configure** service epipe *service-name* bgp-evpn segment-routing-v6 *number* evi-three-byte-auto-rt *boolean*
Tree	evi-three-byte-auto-rt
Description	When configured to **true**, the BGP-EVPN instance import and export route target is auto-derived as described in RFC 8365 (Global-Administrator:A/Type/D-ID/Service-ID). Where: • Global Administrator – is the configured 2-octet AS number; if the configured ASN exceeds the 2 byte limit, the low order 16-bit value is taken • A=0 (for auto-derivation) • Type=4 (EVI-based route-target) • D-ID= [1..2] – encodes the BGP instance, which allows the auto-derivation of different route-targets in multi-instance services; the value is inherited from the corresponding BGP instance • Service ID=3-octet EVI When configured to **false**, route target derivation is not allowed.
Default	false
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

force-vc-forwarding *keyword*

Synopsis	Datapath forwarding to force vlan-vc-type
Context	**configure** service epipe *service-name* bgp-evpn segment-routing-v6 *number* force-vc-forwarding *keyword*
Tree	force-vc-forwarding
Description	This command allows the system to preserve the VLAN ID and 802.1p bits of the service-delimiting qtag in a new tag added in the customer frame before sending it to the EVPN destinations. This command may be used in conjunction with the **sap ingress vlan-translation** command. If so used, the configured translated VLAN ID is the VLAN ID sent to the EVPN destinations as opposed to the service-delimiting tag VLAN ID. If the ingress SAP/SDP binding is 'null'-encapsulated, the output VLAN ID and pbits is zero.
Options	vlan, qinq-c-tag-c-tag, qinq-s-tag-c-tag
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

oper-group *reference*

Synopsis	Operational group
Context	**configure** service epipe *service-name* bgp-evpn segment-routing-v6 *number* oper-group *reference*
Tree	oper-group
Description	This command adds the BGP EVPN SRv6 instance or an Ethernet Segment (ES) as a member of the operational group. When configured on a BGP EVPN instance, the operational group is up when it is either empty (meaning that the operational group has no members) or at least an EVPN destination is created under the EVPN instance added as member. When configured, no

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

other SAP, SDP binding, or BGP EVPN instance can be added to the same operational group within the same or different service.

The operational group is down when it is applied on a BGP EVPN instance as well as:

- the service is administratively disabled
- the BGP EVPN MPLS and VXLAN is administratively disabled
- all the EVPN destinations in the instance are removed

When configured on an ES, the state of the operational group depends on the state of the SAPs contained in the ES. The operational group transitions to up if at least one SAP in the ES is up. The operational group goes down when all the associated SAPs are operationally down. Monitor the ES operational group on the LAG associated with the ES, along with single-active multihoming, so that the NDF state can be signaled to the CE by LAG standby signaling.

pbb

Synopsis	Enter the **pbb** context
Context	**configure** service epipe *service-name* pbb
Tree	pbb
Introduced	16.0.R1
Platforms	All

force-qtag-forwarding *boolean*

Synopsis	Add an IEEE 802.1q tag after CMAC addresses PBB header
Context	**configure** service epipe *service-name* pbb force-qtag-forwarding *boolean*
Tree	force-qtag-forwarding
Default	false
Introduced	16.0.R1
Platforms	All

local-switch-service-state *keyword*

Synopsis	Endpoint state used to determine PBB-Epipe state
Context	**configure** service epipe *service-name* pbb local-switch-service-state *keyword*
Tree	local-switch-service-state
Description	In a PBB Epipe with two SAPs and a PBB tunnel, this command controls whether the operational state of the PBB-Epipe service depends on the state of the PBB tunnel only, or on the state of two of the three endpoints (PBB tunnel and two SAPs). The second case implies that at least one of the SAPs must be up for the PBB-Epipe service to be operationally up.
Options	sap, pbb-tunnel
Default	sap
Introduced	21.7.R1
Platforms	All

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service epipe *service-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1

collect-lmm-fc-stats

Synopsis	Enter the **collect-lmm-fc-stats** context
Context	**configure** service epipe *service-name* sap *sap* eth-cfm collect-lmm-fc-stats
Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection. The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively. This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter
Context	**configure** service epipe *service-name* sap *sap* eth-cfm collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc-in-profile *keyword*

Context	**configure** service epipe *service-name* sap *sap* eth-cfm collect-lmm-fc-stats fc-in-profile *keyword*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	fc-in-profile
Description	This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-stats *boolean*

Synopsis	Collect statistics for loss measurement message tests
Context	**configure** service epipe *service-name* sap *sap* eth-cfm collect-lmm-stats *boolean*
Tree	collect-lmm-stats
Description	When set to **true**, this command configures the collection of OAM path-monitoring LMM test statistics on Router Facility MEPs. (Facility is at a different level of the hierarchy than the collection of LMM statistics for service SAPs and MPLS SDP bindings.) The **show eth-cfm mep** command can be used to determine if the Facility MEP is collecting stats. When this command is configured to **false**, no LMM statistics are collected in this context. This command is mutually exclusive with the **collect-lmm-fc-stats** command when there is entity resource contention.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cfm-vlan-tag *one-or-two-vlan-tags*

Synopsis	VLAN tags to apply to CFM PDUs for egress processing
Context	**configure** service epipe *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* cfm-vlan-tag *one-or-two-vlan-tags*
Tree	cfm-vlan-tag
Description	This command allows the CFM function to include additional VLAN tags to the CFM packet that are carried to the egress and treated as service delimited. Typically, this function is used to influence the VLAN carried over a binding that uses the **vc-type vlan** or the binding forces the use of one or more VLAN tag that results in a mismatch between the service data arriving at the binding and the locally generated ETH-CFM PDUs arriving at the same egress. When this command is included under the MEP or MIP configuration, the tags used as part of the configuration typically match the SAP service delimited configuration.
String length	1 to 9
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Tree	rx-eth-vsm-grace
Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router disables the Nokia Grace function.

Default true

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-vsm-grace *boolean*

Synopsis Transmit ETH-ED PDUs from the MEP

Context **configure** service epipe *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*

Tree tx-eth-vsm-grace

Description When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards.

The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect.

The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED).

When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.

Default true

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lbm-svc-act-responder *boolean*

Synopsis Process service activation streams in ETH-CFM LBM

Context **configure** service epipe *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* lbm-svc-act-responder *boolean*

Context	**configure** service epipe *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon
Default	mac-rem-err-xcon
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address *mac-unicast-address-no-zero*

Synopsis	MAC address of the MEP
Context	**configure** service epipe *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* mac-address *mac-unicast-address-no-zero*
Tree	mac-address
Description	This command specifies the MAC address of the MEP. When unconfigured, the MAC address of the port (if the MEP is on a SAP) or the MAC address of a bridge (if the MEP is on a spoke) is used.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

monitor-oper-group *reference*

Synopsis	Operational group to monitor
Context	**configure** service epipe *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* monitor-oper-group *reference*
Tree	monitor-oper-group
Description	This command operationally affects the state of the SAP based on the state of the operational group. When the monitoring function detects an operationally down state for the operational group, the SAP is set to operationally down and any CFM defects that were present on the MEP are cleared. The MEP enters a pseudo down state and does not try to transmit CFM packets and it is not expecting to receive CFM packets. When the monitoring function detects an operationally up state for the operational group, the CFM reason code that brought the SAP operationally down is removed. Assuming no other conditions prevent this, the SAP transitions to operationally up and the MEP is initialized. This command is applicable to MEPs with a direction of down (**configure service sap eth-cfm mep direction down**) and a **configure eth-cfm domain association ccm-interval** of 1 second or higher.
Reference	**configure** service oper-group *named-item*

squelch-ingress-ctag-levels *number*

Synopsis	Squelch levels using additional VLAN C-Tag space
Context	**configure** service epipe *service-name* sap *sap* eth-cfm squelch-ingress-ctag-levels *number*
Tree	squelch-ingress-ctag-levels
Description	This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding plus an additional VLAN, up to a maximum tag length of two tags. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level to be dropped.
Range	0 to 7
Max. instances	8
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

squelch-ingress-levels *number*

Synopsis	Levels for which ETH-CFM packets are silently discarded
Context	**configure** service epipe *service-name* sap *sap* eth-cfm squelch-ingress-levels *number*
Tree	squelch-ingress-levels
Description	This command defines the levels of the ETH-CFM packets that are silently discarded. At ingress, ETH-CFM packets that meet the following conditions are silently discarded: • The packet is ingressing into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The packet level matches the configured levels.

All ETH-CFM packets ingressing to the SAP or SDP binding that match the configured levels are dropped without regard for other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option.

The list of levels must be a complete contiguous list from 0 up to the highest level that is to be dropped.

Range	0 to 7
Max. instances	8

ethernet

Synopsis	Enter the **ethernet** context
Context	**configure** service epipe *service-name* sap *sap* ethernet
Tree	ethernet
Introduced	20.5.R1
Platforms	All

llf

Synopsis	Enter the **llf** context
Context	**configure** service epipe *service-name* sap *sap* ethernet llf
Tree	llf
Description	Commands in this context enable Link Loss Forwarding (LLF) on an Ethernet port. This feature provides an end-to-end OAM fault notification for Ethernet VLL service. It brings down the Ethernet port (Ethernet LLF) or sends a SONET/SDH Path AIS (ATM LLF) toward the attached CE when there is a local fault on the pseudowire or service, or a remote fault on the SAP or pseudowire, signaled with label withdrawal or T-LDP status bits. It ceases when the fault disappears. The Ethernet port must be configured for null encapsulation. This feature is also supported in Epipes with BGP-EVPN enabled. In this case, upon removal of the EVPN destination, the port transitions to an operationally down state, however the AD per-EVI route for the SAP is still advertised (the SAP remains operationally up). The port transitions to the operationally up state when the EVPN destination is created.
Introduced	20.5.R1

Tree	admin-state
Options	enable, disable
Default	disable
Introduced	20.5.R1
Platforms	All

ignore-oper-down *boolean*

Synopsis	Ignore operational down state of the SAP on SAP failure
Context	**configure** service epipe *service-name* sap *sap* ignore-oper-down *boolean*
Tree	ignore-oper-down
Description	When configured to **true**, the Epipe service does not transition to the operational down state when the SAP fails. This command can only be set to **true** for a single SAP in an Epipe. The command can be used in Epipes with or without EVPN enabled. When configured to **false**, the Epipe service transitions to the operational down state when SAP fails.
Default	false
Introduced	16.0.R1
Platforms	All

ingress

Tree	scheduler
Introduced	16.0.R1
Platforms	All

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service epipe *service-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1

Introduced	16.0.R1
Platforms	All

service-mtu *number*

Synopsis	MTU size
Context	**configure** service epipe *service-name* service-mtu *number*
Tree	service-mtu
Description	This command configures the Maximum Transmission Unit (MTU) value (payload) for the service. The system uses the value to validate the operational state of the SAP and SDP binding within the service. The value overrides the default MTU for the service type. The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) are used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state. When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state. If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated. Binding operational states are automatically reevaluated. For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

In the **configure service epipe spoke-sdp** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE.

Range	1 to 9782

adv-service-mtu *number*

Synopsis	Service MTU used in signaling
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* adv-service-mtu *number*
Tree	adv-service-mtu
Description	This command configures the MTU value that is signaled in the targeted LDP for the spoke-SDP, instead of the service MTU. However, the configuration does not affect the locally enforced value, which is still based on the service MTU. This MTU value cannot be configured on a spoke-SDP that is bound to an SDP with the **adv-mtu-override** command (**configure service sdp** context). When unconfigured, an adjusted service MTU is used (**service-mtu** command).

wait-for-up-timer *number*

Synopsis	Time waited for BFD up status
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time interval that is used to wait for a BFD session to come up. This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP for use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.

Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection. The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively. This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV,

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.

Range 3 to 1500

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cfm-vlan-tag *one-or-two-vlan-tags*

Synopsis VLAN tags to apply to CFM PDUs for egress processing

Context **configure** service epipe *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* cfm-vlan-tag *one-or-two-vlan-tags*

Tree cfm-vlan-tag

Description This command allows the CFM function to include additional VLAN tags to the CFM packet that are carried to the egress and treated as service delimited. Typically, this function is used to influence the VLAN carried over a binding that uses the **vc-type vlan** or the binding forces the use of one or more VLAN tag that results in a mismatch between the service data arriving at the binding and the locally generated ETH-CFM PDUs arriving at the same egress. When this command is included under the MEP or MIP configuration, the tags used as part of the configuration typically match the SAP service delimited configuration.

String length 1 to 9

Introduced 21.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-eth-vsm-grace *boolean*

Synopsis	Receive and process Nokia ETH-CFM Grace PDU on the MEP
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace rx-eth-vsm-grace *boolean*
Tree	rx-eth-vsm-grace
Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. When configured to **false**, the router disables the Nokia Grace function.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** service epipe *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED). When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

dynamic-tunnel-redundant-nexthop *ipv4-unicast-address*

Synopsis	Redundant next-hop address for the dynamic IPsec tunnel
Context	**configure** service ies *service-name* interface *interface-name* dynamic-tunnel-redundant-nexthop *ipv4-unicast-address*
Tree	dynamic-tunnel-redundant-nexthop
Description	This command configures a redundant next-hop address on a public or private IPsec interface (with a public or private tunnel SAP) for dynamic IPsec tunnel in 1:1 MC-IPsec. A standby node uses the specified next-hop address to shunt traffic to the master in case it receives traffic destined to a tunnel endpoint address. The standby tunnel group needs to be operationally up for the feature to work. The next-hop address is resolved in the routing table of a corresponding service.

packet-too-big

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **packet-too-big** context
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp6-generation packet-too-big
Tree	packet-too-big
Description	Commands in this context configure the parameters to send ICMPv6 PTB (Packet Too Big) messages on the private side. The system sends PTB messages if a received IPv6 packet on the private side is greater than 1280 bytes and it exceeds the private MTU of the tunnel. The private MTU for the tunnel is configured via the **configure router interface ipsec ipsec-tunnel ip-mtu** command for the interface.
Introduced	22.7.R1
Platforms	VSR

admin-state *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Administrative state of Packet Too Big message sends
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* icmp6-generation packet-too-big admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable

Introduced	22.7.R1
Platforms	VSR

strict-match *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	**configure** service ies *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy strict-match *boolean*
Tree	strict-match
Description	When configured to **true**, this command enables strict match of the security policy entry. When a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry. If there is no match, the setup fails, and TS_UNACCEPTABLE is sent. If there is a match, but there is an existing CHILD_SA for the matched security policy, the setup fails, and NO_PROPOSAL_CHOSEN is sent. If there is a match, and there is not a CHILD_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD_SA is created.

Synopsis	Local termination point for the BFD session
Context	**configure** service ies *service-name* interface *interface-name* ipv4 bfd type *keyword*
Tree	type

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: • **auto** (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the **cpm-np**. • **cpm-np** – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems. • **fp** – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.
Options	cpm-np, auto, fp
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

gi-address *ipv4-unicast-address*

Synopsis	GI address for the DHCP relay
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp gi-address *ipv4-unicast-address*
Tree	gi-address
Description	This command configures the GI address to distinguish between the different subscriber interfaces (and potentially group interfaces) defined when the router functions as a DHCP relay. By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.
Introduced	16.0.R1
Platforms	All

Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp option-82 circuit-id sap-id
Tree	sap-id
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

vlan-ascii-tuple

Synopsis	Include the VLAN ID and dot1p bits in the ASCII tuple
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp option-82 circuit-id vlan-ascii-tuple
Tree	vlan-ascii-tuple
Description	When configured, the router includes the VLAN ID and dot1p bits with the ASCII-tuple information. This only occurs on dot1q and QinQ-encapsulated ports. When the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of the outgoing packet. When unconfigured, the router leaves the circuit ID sub-option of the DHCP packet empty.
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

remote-id

Synopsis	Enter the **remote-id** context
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp option-82 remote-id
Tree	remote-id
Description	Commands in this context configure the remote IP sub-option of the DHCP packet with the identity of the remote host end (typically the DHCP client).
Introduced	16.0.R1
Platforms	All

server *ipv4-unicast-address*

Synopsis	IP addresses for DHCP server requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp server *ipv4-unicast-address*
Tree	server
Description	This command configures a list of servers that this interface forwards requests to. The operator can enter the list of servers as either IP addresses or fully qualified domain names. The operator must specify at least one server specified for DHCP relay to work. If there are multiple servers, the system forwards the request to all the servers in the list.
Max. instances	8
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

src-ip-addr *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp src-ip-addr *keyword*
Tree	src-ip-addr
Options	auto, gi-address
Default	auto
Introduced	16.0.R1
Platforms	All

trusted *boolean*

Synopsis	Relay untrusted packets
Context	**configure** service ies *service-name* interface *interface-name* ipv4 dhcp trusted *boolean*
Tree	trusted
Description	When configured to **true**, the router enables the trusted mode on the interface. When enabled, the relay agent changes the existing GI address (of the request) to the ingress interface, and forwards the request. A DHCP request that contains a GI address of 0.0.0.0 and an Option 82 field in the packet is discarded unless it arrives on a trusted circuit.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This behavior only applies if the Relay Agent Information Option action is to keep the existing information. When the Option 82 field is replaced by the relay agent, the original Option 82 information is lost, and there is no reason to enable the trusted option.

Default	false
Introduced	16.0.R1

learn-unsolicited *boolean*

Synopsis	Learn new entries from any received NA message
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery learn-unsolicited *boolean*
Tree	learn-unsolicited
Description	When configured to **true**, the router can learn neighbor entries from received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited (S) flag set. The command can be enabled for global addresses, link-local addresses, or for both. When configured to **false**, the router follows standard behavior for learning neighbor entries. • If an unsolicited NA (regardless of the S flag) is received from a neighbor that is not yet in the Neighbor Discovery (ND) cache, the NA is ignored. • If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the STALE state.
Default	false
Introduced	16.0.R1
Platforms	All

limit

Synopsis	Enter the **limit** context
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery limit
Tree	limit

populate *boolean*

Synopsis	Allow static and dynamic hosts to be populated in system ARP cache
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery populate *boolean*
Tree	populate
Default	false
Introduced	16.0.R1
Platforms	All

proactive-refresh *boolean*

Synopsis	Send a single refresh message before entry timeout
Context	**configure** service ies *service-name* interface *interface-name* ipv4 neighbor-discovery proactive-refresh *boolean*
Tree	proactive-refresh
Description	When configured to **true**, the router always sends a refresh message 30 seconds before the timeout of the entry (a single refresh message with no retries). When configured to **false**, the router marks an entry as stale 30 seconds before age-out, and the router only sends an ARP request to refresh the entry if the IOM receives traffic that uses it. Then, the IOM asks the ARP application to send a refresh message. With ARP proactive refresh enabled, the ARP module sends a refresh message regardless of the IOM receiving traffic.
Default	false
Introduced	16.0.R1
Platforms	All

qos-route-lookup *keyword*

Synopsis	IP address for QoS route lookup for ingress IP packets

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* ipv4 qos-route-lookup *keyword*
Tree	qos-route-lookup
Description	This command specifies the IP address type used for QPPB enabled per-packet QoS handling (in terms of FC and priority). When using QPPB, routes are associated with a QoS treatment (FC and optionally priority) through either explicit configuration or the route policy. If an IPv4 or IPv6 packet arrives on an interface where the configuration of this command applies to the packet, the QoS treatment of the packet is based on the route that matched the destination IP address or the route that matched the source IP address. See "Enabling QPPB on an IP interface" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about QPPB.
Options	destination, source, source-and-dest

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* admin-state *keyword*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated. An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

authentication-key *encrypted-leaf*

Synopsis	Password for simple text authentication
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command optionally assigns a simple text password authentication key to generate master VRRP advertisement messages and validate received VRRP advertisement messages. If this command is re-executed with a different password key defined, the new key immediately replaces the old key. This command may be executed at any time.
String length	1 to 38
Introduced	16.0.R1
Platforms	All

backup *ipv4-unicast-address*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* backup *ipv4-unicast-address*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	backup
Description	This command associates virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instances create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance. For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is advertising to backup virtual routers receiving the messages. The specified *unicast-ipv4-address* must be equal to one of the existing IP addresses in the parental IP interface (primary or secondary) or this command fails. See "Owner and non-owner VRRP" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about owner and non-owner virtual router instances.

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* mac *mac-unicast-address*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address. Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC. An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.
Introduced	16.0.R1
Platforms	All

master-int-inherit *boolean*

Synopsis	Allow master instance to dictate the master down timer
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* master-int-inherit *boolean*
Tree	master-int-inherit

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 16.0.R1

Platforms All

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

Context **configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* message-interval *number*

Tree message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

The usage of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

Range 1 to 2559

Synopsis	Allow processing of NTP requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* ntp-reply *boolean*
Tree	ntp-reply
Description	When configured to **true**, the router redirects NTP requests to the VRRP virtual IP address. This behavior only applies to the router acting as the master VRRP router. When configured to **false**, the router does not process NTP requests.
Default	false
Introduced	20.2.R1
Platforms	All

oper-group *reference*

Synopsis	Operational group name associated with the VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* oper-group *reference*
Tree	oper-group

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures an operational group to associate with the VRRP. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up. The operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	16.0.R1
Platforms	All

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1
Platforms	All

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down).

When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.

Default false

Introduced 16.0.R1

Platforms All

ping-reply *boolean*

Synopsis Allow non-owner master to reply to ICMP echo requests

Context **configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* ping-reply *boolean*

Tree ping-reply

Description When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address).

When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.

Default false

Introduced 16.0.R1

Platforms All

policy *reference*

Synopsis VRRP priority control policy

Context **configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* policy *reference*

Tree policy

Description This command configures a VRRP priority control policy to associate with the virtual router instance.

VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis.

An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.

For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.

Reference **configure** vrrp policy *number*

Introduced 16.0.R1

Platforms All

preempt *boolean*

Synopsis Allow the VRRP to override an existing non-owner master

Context **configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* preempt *boolean*

Tree preempt

Description When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router.

When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

Default true

Introduced 16.0.R1

Platforms All

priority *number*

Synopsis Base priority for the VRRP

Context **configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* priority *number*

Tree priority

Description This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process.

The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.

Range 1 to 255

Introduced 16.0.R1

Platforms	All

ssh-reply *boolean*

Synopsis	Allow the non-owner master to reply to SSH requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* ssh-reply *boolean*
Tree	ssh-reply
Description	When configured to **true**, the router allows the non-owner master to reply to SSH requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the SSH request. SSH cannot be disabled at the management security level (either on the parental IP interface or on the SSH source host address). When configure to **false**, SSH requests to non-owner master virtual IP addresses are silently discarded.
Default	false
Introduced	16.0.R1
Platforms	All

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	16.0.R1
Platforms	All

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	16.0.R1
Platforms	All

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** service ies *service-name* interface *interface-name* ipv4 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false

Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

primary-preference *number*

Synopsis	Index assigned to the IPv6 address of the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 address *ipv6-address* primary-preference *number*
Tree	primary-preference
Description	This command assigns a primary preference index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications that require a fixed address of the interface, such as LDP and Segment Routing. In cases where a fixed address is required when originating packets from the interface, the IPv6 address with the lowest primary preference index is selected. If the selected address is removed, the next IPv6 address with the next lowest primary preference index is selected. If this index is not specified for the IPv6 address, the system assigns the next available index value to the address. The address index space is unique across all addresses of a given interface.

transmit-interval *number*

Synopsis	BFD transmit interval over this interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 bfd transmit-interval *number*
Tree	transmit-interval
Description	This command configures the transmit intervals. On the 7750 SR, this command can only be configured to a value less than 100 when the **type** command is configured to **cpm-np**.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	16.0.R1
Platforms	All

type *keyword*

Synopsis	Local termination point for the BFD session
Context	**configure** service ies *service-name* interface *interface-name* ipv6 bfd type *keyword*
Tree	type
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: • **auto** (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the **cpm-np**. • **cpm-np** – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems. • **fp** – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.
Options	cpm-np, auto, fp
Default	auto
Introduced	16.0.R1

learn-unsolicited *keyword*

Synopsis	Type of entries learned from unsolicited NA messages
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery learn-unsolicited *keyword*
Tree	learn-unsolicited
Description	This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited flag set. When unconfigured, the router follows standard RFC 4861 behavior for learning of neighbor entries. The neighbor is put in the stale state. This is the standard RFC behavior.
Options	global, link-local, both
Introduced	16.0.R1
Platforms	All

limit

Synopsis	Enter the **limit** context
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery limit
Tree	limit
Introduced	16.0.R1
Platforms	All

log-only *boolean*

Synopsis	Generate log entries when limit is reached
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery limit log-only *boolean*
Tree	log-only
Description	When configured to **true**, the router sends the warning message at the specified threshold percentage or upon exceeding the specified limit. Entries that exceed the limit are learned. When configured to **false**, the router does not send the warning message.
Default	false
Introduced	16.0.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

max-entries *number*

Synopsis	Maximum number of entries learned on an IP interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery limit max-entries *number*
Tree	max-entries
Description	This command configures the maximum number of entries that can be learned on an IP interface. When unconfigured, no maximum limit is imposed.
Range	0 to 102400
Introduced	16.0.R1
Platforms	All

threshold *number*

Synopsis	Threshold percentage that triggers a warning message
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery limit threshold *number*
Tree	threshold
Range	1 to 100
Units	percent
Default	90
Introduced	16.0.R1
Platforms	All

local-proxy-nd *boolean*

Synopsis	Enable local proxy neighbor discovery on the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 neighbor-discovery local-proxy-nd *boolean*
Tree	local-proxy-nd
Description	When configured to **true**, the router enables local proxy neighbor discovery on the interface and replies to neighbor solicitation requests when both the hosts are on the same subnet. In this case, ICMP redirects are disabled. When configured to **false**, the router disables local proxy neighbor discovery on the interface and does not reply to neighbor solicitation requests if both the hosts are on the same subnet.

Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of VRRP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated. An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

backup *ipv6-address*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* backup *ipv6-address*
Tree	backup
Description	This command associates router IPv6 virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instance create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance. For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. The specified IPv6 address must be equal to one of the existing parental IP addresses in the parental IP interface (primary or secondary) or this command fails.

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* mac *mac-unicast-address*
Tree	mac

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID.

Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.

Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC.

An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.

Introduced 16.0.R1

Platforms All

master-int-inherit *boolean*

Synopsis Allow master instance to dictate the master down timer

Context **configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* master-int-inherit *boolean*

Tree master-int-inherit

Description When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 16.0.R1

Platforms All

Tree message-interval

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

The use of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as the master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

ntp-reply *boolean*

Synopsis	Allow processing of NTP requests
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* ntp-reply *boolean*
Tree	ntp-reply
Description	When configured to **true**, the router redirects NTP requests to the VRRP virtual IP address. This behavior only applies to the router acting as the master VRRP router. When configured to **false**, the router does not process NTP requests.
Default	false
Introduced	20.2.R1
Platforms	All

oper-group *reference*

Synopsis	Operational group name associated with the VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* oper-group *reference*
Tree	oper-group
Description	This command configures an operational group to associate with the VRRP. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up. The operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	16.0.R1
Platforms	All

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1
Platforms	All

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down). When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.
Default	false
Introduced	16.0.R1
Platforms	All

ping-reply *boolean*

Synopsis	Allow non-owner master to reply to ICMP echo requests
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* ping-reply *boolean*
Tree	ping-reply

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address). When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.
Default	false
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	VRRP priority control policy
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* policy *reference*
Tree	policy
Description	This command configures a VRRP priority control policy to associate with the virtual router instance. VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis. An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value. For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.
Reference	**configure** vrrp policy *number*
Introduced	16.0.R1
Platforms	All

preempt *boolean*

Synopsis	Allow the VRRP to override an existing non-owner master
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* preempt *boolean*
Tree	preempt

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router. When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.
Default	true
Introduced	16.0.R1
Platforms	All

priority *number*

Synopsis	Base priority for the VRRP
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* priority *number*
Tree	priority
Description	This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process. The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	16.0.R1
Platforms	All

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** service ies *service-name* interface *interface-name* ipv6 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	16.0.R1
Platforms	All

load-balancing

Synopsis	Enter the **load-balancing** context
Context	**configure** service ies *service-name* interface *interface-name* load-balancing

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	load-balancing
Introduced	16.0.R1
Platforms	All

flow-label-load-balancing *boolean*

Synopsis	Enable flow label load balancing
Context	**configure** service ies *service-name* interface *interface-name* load-balancing flow-label-load-balancing *boolean*
Tree	flow-label-load-balancing
Description	When configured to **true**, the router enables load balancing in ECMP and LAG based on the output of a hash performed on the triplet (SA, DA, flow label) in the header of an IPv6 packet received on an IES, VPRN, R-VPLS, CSC, or network interface. When configured to **false**, the router disables load balancing in ECMP and LAG.
Default	false
Introduced	21.5.R1
Platforms	All

ip-load-balancing *keyword*

Synopsis	IP load-balancing algorithm
Context	**configure** service ies *service-name* interface *interface-name* load-balancing ip-load-balancing *keyword*
Tree	ip-load-balancing
Description	This command specifies whether to include the source address, destination address, or both in LAG or ECMP hash on IP interfaces. Additionally, when the **l4-load-balancing** command is enabled, this command also includes the source or destination port in the hash inputs.
Options	both, destination, source, inner-ip
Default	both
Introduced	16.0.R3
Platforms	All

spi-load-balancing *boolean*

Synopsis	Enable SPI use in hashing

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* load-balancing spi-load-balancing *boolean*
Tree	spi-load-balancing
Description	When configured to **true**, the router uses the Security Parameter Index (SPI) in hashing for ESP and AH encrypted IPv4 and IPv6 traffic. This is a per-interface setting.
Default	false
Introduced	16.0.R1
Platforms	All

teid-load-balancing *boolean*

Synopsis	Enable use of TEID in hashing
Context	**configure** service ies *service-name* interface *interface-name* load-balancing teid-load-balancing *boolean*
Tree	teid-load-balancing
Default	false
Introduced	16.0.R1
Platforms	All

loopback *boolean*

Synopsis	Use interface as a loopback interface
Context	**configure** service ies *service-name* interface *interface-name* loopback *boolean*
Tree	loopback
Introduced	16.0.R1
Platforms	All

mac *mac-unicast-address*

Synopsis	MAC address for the interface
Context	**configure** service ies *service-name* interface *interface-name* mac *mac-unicast-address*
Tree	mac
Description	This command assigns a specific MAC address to an IP interface.
Introduced	16.0.R1
Platforms	All

ping-template

Synopsis	Enable the **ping-template** context
Context	**configure** service ies *service-name* interface *interface-name* ping-template
Tree	ping-template
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the ping template
Context	**configure** service ies *service-name* interface *interface-name* ping-template admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

destination-address *ipv4-unicast-address*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Ping template destination address
Context	**configure** service ies *service-name* interface *interface-name* ping-template destination-address *ipv4-unicast-address*
Tree	destination-address

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the address to where the ICMP echo requests are directed to test connectivity. The source of the ICMP echo request is the primary IPv4 address of the interface under which the ping-template is configured. The destination address must be on the same subnet as the source IP address. Unnumbered interfaces and loopback addresses are not supported.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

name *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

parent

eth-cfm

Synopsis	Enter the **eth-cfm** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm
Tree	eth-cfm
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-fc-stats

Synopsis	Enter the **collect-lmm-fc-stats** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm collect-lmm-fc-stats
Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection. The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively. This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc-in-profile *keyword*

Synopsis	Forwarding class name for profile-aware counter
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm collect-lmm-fc-stats fc-in-profile *keyword*
Tree	fc-in-profile
Description	This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-stats *boolean*

Synopsis	Collect statistics for loss measurement message tests
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm collect-lmm-stats *boolean*
Tree	collect-lmm-stats
Description	When configured to **true**, the router instantiates the statistical counter to transmit and receive packets for the LAG facility MEP bindings. The **show eth-cfm collect-lmm-stats** command displays entities that have been enabled to collect transit and receive counters. When configured to **false**, the router does not instantiate the counter and the LMM PDU associated with the MEP does not populate the counters in the packet.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*

Synopsis	Enter the **mep** list instance
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

md-admin-name *reference*

Synopsis	Maintenance Domain (MD) name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Reference	**configure** eth-cfm domain *admin-name*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Synopsis	Maintenance Association (MA) name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Reference	**configure** eth-cfm domain *admin-name* association *admin-name*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mep-id *number*

Synopsis	Maintenance Endpoint (MEP) ID
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Range	1 to 8191
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the MEP
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ais *boolean*

Synopsis	Enable the generation and the reception of AIS messages

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais *boolean*
Tree	ais
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

alarm-notification

Synopsis	Enter the **alarm-notification** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification
Tree	alarm-notification
Description	Commands in this context configure the Fault Notification Generator (FNG) time values to raise an alarm or reset the CCM defect alarm. Use these timers for network management processes. The timers are not tied into delaying the notification to the fault management system on the network element and do not affect fault propagation mechanisms.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fng-alarm-time *number*

Synopsis	Time that must expire before an FNG alarm is raised
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-alarm-time *number*
Tree	fng-alarm-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fng-reset-time *number*

Tree	fng-reset-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm *boolean*

Synopsis	Generate CCM messages
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm *boolean*
Tree	ccm
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-ltm-priority *number*

Synopsis	Priority of CCM and LTM messages transmitted by the MEP
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-ltm-priority *number*
Tree	ccm-ltm-priority
Range	0 to 7
Default	7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-padding-size *number*

Synopsis	Number of octets of padding to insert in CCM packets
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-padding-size *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV, is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.
Range	3 to 1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

csf

Synopsis	Enable the **csf** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf
Tree	csf
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

multiplier *decimal-number*

Synopsis	Multiplication factor used to clear the CSF condition
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf multiplier *decimal-number*
Tree	multiplier
Range	0.0 | 2.0 to 30.0
Default	3.5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

description *description*

Synopsis	Text description

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-vsm-grace

Synopsis	Enter the **eth-vsm-grace** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace
Tree	eth-vsm-grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-eth-vsm-grace *boolean*

Synopsis	Receive and process Nokia ETH-CFM Grace PDU on the MEP
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace rx-eth-vsm-grace *boolean*
Tree	rx-eth-vsm-grace
Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. When configured to **false**, the router disables the Nokia Grace function.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED).

When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.

Default true

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

monitor-oper-group *reference*

Synopsis Operational group to monitor

Context **configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* monitor-oper-group *reference*

Tree monitor-oper-group

Description This command operationally affects the state of the SAP based on the state of the operational group. When the monitoring function detects an operationally down state for the operational group, the SAP is set to operationally down and any CFM defects that were present on the MEP are cleared. The MEP enters a pseudo down state and does not try to transmit CFM packets and it is not expecting to receive CFM packets. When the monitoring function detects an operationally up state for the operational group, the CFM reason code that brought the SAP operationally down is removed. Assuming no other conditions prevent this, the SAP transitions to operationally up and the MEP is initialized.

This command is applicable to MEPs with a direction of down (**configure service sap eth-cfm mep direction down**) and a **configure eth-cfm domain association ccm-interval** of 1 second or higher.

squelch-ingress-levels *number*

Synopsis	Levels for which ETH-CFM packets are silently discarded
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* eth-cfm squelch-ingress-levels *number*
Tree	squelch-ingress-levels
Description	This command defines the levels of the ETH-CFM packets that are silently discarded. At ingress, ETH-CFM packets that meet the following conditions are silently discarded: • The packet is ingressing into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding. • The packet level matches the configured levels. All ETH-CFM packets ingressing to the SAP or SDP binding that match the configured levels are dropped without regard for other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level that is to be dropped.
Range	0 to 7

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on),

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

clear-df-bit *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Clear the Do-not-Fragment bit
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* clear-df-bit *boolean*
Tree	clear-df-bit
Description	When configured to **true**, the DF bit is cleared (set to 0) in all payload IP packets associated with the GRE or IPsec tunnel, before any potential fragmentation resulting from the ip-mtu command. This requires a modification of the header checksum. When configured to **false**, clearing of the DF bit is disabled.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

delivery-service *service-name*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Service to originate and terminate GRE packets
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* delivery-service *service-name*
Tree	delivery-service
Description	This command specifies the service used to originate and terminate the GRE encapsulated packets belonging to the GRE tunnel. The delivery service may be the same service that owns the private tunnel SAP associated with the GRE tunnel. The GRE tunnel does not come up until a valid delivery service is configured.
String length	1 to 64

ip-mtu *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	IP MTU for the interface
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* ip-mtu *number*
Tree	ip-mtu
Description	This command specifies the IP MTU for the interface. If the DF bit is not set in the packet, IP packet fragmentation is performed, if necessary, based on this configured value. When unconfigured, all IP packets, regardless of the packet size or DF bit setting, are allowed into the tunnel without fragmentation.
Range	512 to 9000
Units	bytes
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipsec-transport-mode-profile *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	IPsec transport mode profile name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* ipsec-transport-mode-profile *reference*
Tree	ipsec-transport-mode-profile
Reference	**configure** ipsec ipsec-transport-mode-profile *named-item*
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Local IP address of this tunnel
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* local-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	local-ip-address
Description	This command specifies the local IP address to use for the IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The address must belong to one of the IP subnets associated with the public SAP interface of the tunnel group. The source IP address, the remote IP address, and the backup remote IP address of a tunnel must all belong to the same address family (IPv4 or IPv6). When this command specifies an IPv6 address, it must be a global unicast address.
Introduced	16.0.R1
Platforms	All

pmtu-discovery-aging *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Tree	propagate-pmtu-v4
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

propagate-pmtu-v6 *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable propagation of path MTU to IPv6 hosts
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* propagate-pmtu-v6 *boolean*
Tree	propagate-pmtu-v6
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

public-tcp-mss-adjust *(number | keyword)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	TCP Maximum Segment Size (MSS) on the public side
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* public-tcp-mss-adjust *(number | keyword)*
Tree	public-tcp-mss-adjust
Description	This command specifies the TCP MSS for TCP traffic sent from the public network to the private network. The value is used to adjust the TCP MSS option in the TCP SYN packet.
Range	512 to 9000
Units	bytes
Options	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

reassembly *(number | keyword)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum reassembly wait time
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* reassembly *(number | keyword)*
Tree	reassembly
Description	This command configures the maximum time to wait to receive all fragments of a particular IPsec or GRE packet for reassembly.
Range	1 to 5000
Units	milliseconds
Options	use-tunnel-group-setting, none
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

remote-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Remote IP address of the tunnel
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* remote-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	remote-ip-address
Introduced	16.0.R1
Platforms	All

ipsec-gateway [name] *named-item*

Synopsis	Enter the **ipsec-gateway** list instance
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item*
Tree	ipsec-gateway

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Max. instances	1
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**name**] *named-item*

Synopsis	IPsec gateway name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item*
Tree	ipsec-gateway
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the IPsec gateway
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

cert

Synopsis	Enter the **cert** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert
Tree	cert
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

cert-profile *reference*

Synopsis	Certificate profile name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert cert-profile *reference*
Tree	cert-profile
Reference	**configure** ipsec cert-profile *named-item*
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

status-verify

Synopsis	Enter the **status-verify** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert status-verify
Tree	status-verify
Description	Commands in this context configure certificate revocation status verification.
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-result *keyword*

Synopsis	Default result of Certificate Status Verification (CSV)
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert status-verify default-result *keyword*
Tree	default-result
Description	This command specifies the default result when both the primary and secondary methods fail to provide an answer.
Options	revoked, good
Default	revoked
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

primary *keyword*

Synopsis	Primary method of CSV to verify the revocation status

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert status-verify primary *keyword*
Tree	primary
Options	crl, ocsp
Default	crl
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

secondary *keyword*

Synopsis	Secondary method of CSV to verify the revocation status
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert status-verify secondary *keyword*
Tree	secondary
Options	none, crl, ocsp
Default	none
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

trust-anchor-profile *reference*

Synopsis	Trust anchor profile name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* cert trust-anchor-profile *reference*
Tree	trust-anchor-profile
Reference	**configure** ipsec trust-anchor-profile *named-item*
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

client-db

Synopsis	Enable the **client-db** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* client-db
Tree	client-db

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the IPsec client database. The client database is used to authenticate the IKEv2 dynamic LAN-to-LAN tunnel.
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

fallback *boolean*

Synopsis	Fall back to the default authentication policy
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* client-db fallback *boolean*
Tree	fallback
Description	When configured to **true**, this command specifies whether the IPsec gateway can fall back to the default authentication policy when the IPsec tunnel authentication request fails to match any clients in the IPsec database. When configured to **false** and the client database lookup fails to return a matched result, the system fails the tunnel setup.
Default	true
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

name *reference*

Synopsis	Client database name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* client-db name *reference*
Tree	name
Reference	**configure** ipsec client-db *named-item*
Notes	This element is mandatory.
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-secure-service

Synopsis	Enable the **default-secure-service** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* default-secure-service
Tree	default-secure-service

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface *interface-name*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Private IPsec tunnel interface name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* default-secure-service interface *interface-name*
Tree	interface
String length	1 to 32
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

service-name *service-name*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Default security service name
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* default-secure-service service-name *service-name*
Tree	service-name
String length	1 to 64
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-tunnel-template *reference*

Synopsis	Default tunnel policy template for the gateway
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* ipsec-gateway *named-item* default-tunnel-template *reference*
Tree	default-tunnel-template
Reference	**configure** ipsec tunnel-template *number*

Platforms	All

link-map-profile *number*

Synopsis	LAG link map profile for a SAP or network interface
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* lag link-map-profile *number*
Tree	link-map-profile
Description	This command assigns a preconfigured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. After an operator assigns a LAG link map profile, the system rehashes the SAP or network interface egress traffic over the LAG as required by the new configuration. If the LAG link map profile for a SAP or network interface is deleted, the system reverts back to per-flow hashing.
Range	1 to 64
Introduced	16.0.R1
Platforms	All

per-link-hash

Synopsis	Enter the **per-link-hash** context
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* lag per-link-hash
Tree	per-link-hash
Introduced	16.0.R1
Platforms	All

class *number*

Synopsis	Class used on LAG egress using weighted per-link-hash
Context	**configure** service ies *service-name* interface *interface-name* sap *sap* lag per-link-hash class *number*
Tree	class
Range	1 to 3
Default	1
Introduced	16.0.R1

Description	This command configures a named BFD template to be used by VCCV BFD on PWs belonging to the VLL service. The template specifies parameters, such as the minimum transmit and receive control packet timer intervals, used by the BFD session. Template parameters are configured under the **configure router bfd** context.
Options	none, down
Default	none
Introduced	21.2.R1
Platforms	All

wait-for-up-timer *number*

Synopsis	Time waited for BFD up status
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time interval that is used to wait for a BFD session to come up.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP for use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.

Range	1 to 60
Units	seconds
Introduced	21.2.R1
Platforms	All

entropy-label

Synopsis	Enable the use of entropy labels for spoke SDPs
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* entropy-label
Tree	entropy-label
Notes	The following elements are part of a choice: **entropy-label** or **hash-label**.
Introduced	16.0.R1
Platforms	All

eth-cfm

Synopsis	Enter the **eth-cfm** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm
Tree	eth-cfm
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-fc-stats

Synopsis	Enter the **collect-lmm-fc-stats** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats
Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection. The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively. This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc-in-profile *keyword*

Synopsis	Forwarding class name for profile-aware counter
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats fc-in-profile *keyword*
Tree	fc-in-profile
Description	This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

collect-lmm-stats *boolean*

Synopsis	Collect statistics for loss measurement message tests
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm collect-lmm-stats *boolean*
Tree	collect-lmm-stats
Description	When configured to **true**, the router instantiates the statistical counter to transmit and receive packets for the LAG facility MEP bindings. The **show eth-cfm collect-lmm-stats** command displays entities that have been enabled to collect transit and receive counters. When configured to **false**, the router does not instantiate the counter and the LMM PDU associated with the MEP does not populate the counters in the packet.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*

Synopsis	Enter the **mep** list instance
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

md-admin-name *reference*

Synopsis	Maintenance Domain (MD) name
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Reference	**configure** eth-cfm domain *admin-name*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ma-admin-name *reference*

Synopsis	Maintenance Association (MA) name
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Reference	**configure** eth-cfm domain *admin-name* association *admin-name*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mep-id *number*

Synopsis	Maintenance Endpoint (MEP) ID
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Range	1 to 8191
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the MEP
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ais *boolean*

Synopsis	Enable the generation and the reception of AIS messages
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais *boolean*
Tree	ais
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

alarm-notification

Synopsis	Enter the **alarm-notification** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification
Tree	alarm-notification
Description	Commands in this context configure the Fault Notification Generator (FNG) time values to raise an alarm or reset the CCM defect alarm. Use these timers for network management processes. The timers are not tied into delaying the notification to the fault management system on the network element and do not affect fault propagation mechanisms.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fng-alarm-time *number*

Synopsis	Time that must expire before an FNG alarm is raised
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-alarm-time *number*
Tree	fng-alarm-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fng-reset-time *number*

Synopsis	Time that must expire before an FNG alarm is reset
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-reset-time *number*
Tree	fng-reset-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm *boolean*

Synopsis	Generate CCM messages
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm *boolean*
Tree	ccm
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-ltm-priority *number*

Synopsis	Priority of CCM and LTM messages transmitted by the MEP
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-ltm-priority *number*
Tree	ccm-ltm-priority
Range	0 to 7
Default	7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ccm-padding-size *number*

Synopsis	Number of octets of padding to insert in CCM packets
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-padding-size *number*
Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV, is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.
Range	3 to 1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

csf

Synopsis	Enable the **csf** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf
Tree	csf
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

multiplier *decimal-number*

Synopsis	Multiplication factor used to clear the CSF condition
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf multiplier *decimal-number*
Tree	multiplier
Range	0.0 | 2.0 to 30.0
Default	3.5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

description *description*

Synopsis	Text description
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-test

Synopsis	Enable the **eth-test** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test
Tree	eth-test
Description	Commands in this context configure information used by the Ethernet Test (ETH-TST) packet. The commands must be configured on both the sender and the receiver nodes. The test packets are used with the **oam eth-cfm eth-test** command.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

bit-error-threshold *number*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test bit-error-threshold *number*
Tree	bit-error-threshold
Range	0 to 11840
Units	bit errors
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

test-pattern

Synopsis	Enter the **test-pattern** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern
Tree	test-pattern
Description	Commands in this context specify the test pattern for the ETH-TST frames. The pattern does not have to be the same on the sender and the receiver.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

crc-tlv *boolean*

Synopsis	Generate a CRC checksum
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern crc-tlv *boolean*
Tree	crc-tlv
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pattern *keyword*

Synopsis	Test pattern for Ethernet Test frames
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern pattern *keyword*
Tree	pattern
Description	This command specifies the test pattern of the Ethernet Test (ETH-TST) frames. This does not have to be configured the same on the sender and the receiver.
Options	all-zeros, all-ones
Default	all-zeros
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fault-propagation *keyword*

Synopsis	Fault propagation for the MEP
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* fault-propagation *keyword*
Tree	fault-propagation
Options	use-if-status-tlv, suspend-ccm
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

grace

Synopsis	Enter the **grace** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace
Tree	grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function and the ITU-T Y.1731 Ethernet Expected Default (ETH-ED) function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-ed

Synopsis	Enter the **eth-ed** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed
Tree	eth-ed
Description	Commands in this context configure the ITU-T Y.1731 ETH-ED function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

max-rx-defect-window *number*

Synopsis	Maximum received ETH-ED expected defect window duration

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed max-rx-defect-window *number*
Tree	max-rx-defect-window
Range	1 to 86400
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

priority *number*

Synopsis	Transmission priority for ETH-ED PDUs
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed priority *number*
Tree	priority
Range	0 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-eth-ed *boolean*

Synopsis	Receive and process ETH-ED ITU-T Y.1731 PDUs on the MEP
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed rx-eth-ed *boolean*
Tree	rx-eth-ed
Description	This command enables the reception and processing of the ITU-T Y.1731 ETH-ED PDU on the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-ed *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed tx-eth-ed *boolean*
Tree	tx-eth-ed
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-vsm-grace

Synopsis	Enter the **eth-vsm-grace** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace
Tree	eth-vsm-grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-eth-vsm-grace *boolean*

Synopsis	Receive and process Nokia ETH-CFM Grace PDU on the MEP
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace rx-eth-vsm-grace *boolean*
Tree	rx-eth-vsm-grace
Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. When configured to **false**, the router disables the Nokia Grace function.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED). When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon
Default	mac-rem-err-xcon
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

one-way-delay-threshold *number*

Synopsis	Threshold time limit for the one-way delay test
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* one-way-delay-threshold *number*
Tree	one-way-delay-threshold
Range	0 to 600
Units	seconds

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

squelch-ingress-levels *number*

Synopsis	Levels for which ETH-CFM packets are silently discarded
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* eth-cfm squelch-ingress-levels *number*
Tree	squelch-ingress-levels
Description	This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level that will be dropped.
Range	0 to 7
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

hash-label

Synopsis	Enable the **hash-label** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* hash-label
Tree	hash-label
Description	Commands in this context configure the use of hash labels for egress datapaths. For information about hash-label handling, see the "Hash labels" section of the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide*.
Notes	The following elements are part of a choice: **entropy-label** or **hash-label**.
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

signal-capability

Synopsis	Signal hash label capability to the remote PE
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* hash-label signal-capability
Tree	signal-capability
Description	When configured, this command enables the signaling and negotiating of the hash label between the local and remote PE nodes. The signaling process outcome determines whether the local PE inserts the hash label on the user packets. This outcome can override the local PE configuration.
Introduced	16.0.R1
Platforms	All

ingress

Synopsis	Enter the **ingress** context
Context	**configure** service ies *service-name* interface *interface-name* spoke-sdp *sdp-bind-id* ingress

static-tunnel-redundant-nexthop *ipv4-unicast-address*

Synopsis	Address for the static ISA tunnel redundant next-hop

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* interface *interface-name* static-tunnel-redundant-nexthop *ipv4-unicast-address*
Tree	static-tunnel-redundant-nexthop
Description	This command configures a redundant next-hop address on a public or private IPsec interface (with a public or private tunnel SAP) for a static IPsec tunnel in 1:1 MC-IPsec. A standby node uses the specified next-hop address to shunt traffic to the master in case it receives traffic destined to a tunnel endpoint address. The standby tunnel group needs to be operationally up for the feature to work. The next-hop address is resolved in the routing table of the corresponding service.
Notes	The following elements are part of a choice: **multi-chassis-shunting-profile** or (**dynamic-tunnel-redundant-nexthop** and **static-tunnel-redundant-nexthop**).
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tos-marking-state *keyword*

Synopsis	TOS marking state
Context	**configure** service ies *service-name* interface *interface-name* tos-marking-state *keyword*

Context	**configure** service ies *service-name* redundant-interface *interface-name* hold-time ipv4 up
Tree	up
Description	Commands in this context configure the up hold timer, which specifies the delay before deactivation of the associated interface. The delay is invoked whenever the system attempts to bring the associated IP interface down.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

seconds *number*

Synopsis	Up hold time for the IP interface
Context	**configure** service ies *service-name* redundant-interface *interface-name* hold-time ipv4 up seconds *number*
Tree	seconds
Range	1 to 1200
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip-mtu *number*

Synopsis	IP MTU applied to outgoing packets
Context	**configure** service ies *service-name* redundant-interface *interface-name* ip-mtu *number*
Tree	ip-mtu

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the IP maximum transmission unit (MTU) for the associated router IP interface.
Range	512 to 9786
Units	bytes
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv4
Tree	ipv4
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

primary

Synopsis	Enable the **primary** context
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv4 primary
Tree	primary
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

address *ipv4-unicast-address*

Synopsis	IPv4 address to be assigned to the interface
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv4 primary address *ipv4-unicast-address*
Tree	address
Notes	This element is mandatory.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

prefix-length *number*

Synopsis	IPv4 address prefix length

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv4 primary prefix-length *number*
Tree	prefix-length
Range	0 to 32
Notes	This element is mandatory.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

remote-ip *ipv4-unicast-address*

Synopsis	Remote IP address for the interface
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv4 primary remote-ip *ipv4-unicast-address*
Tree	remote-ip
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6

Synopsis	Enable the **ipv6** context
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv6
Tree	ipv6
Description	Commands in this context configure IPv6 addresses on this interface.
Introduced	25.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

address [ipv6-address] *ipv6-address*

Synopsis	Enter the **address** list instance
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv6 address *ipv6-address*
Tree	address
Description	Commands in this context configure the IPv6 address of the redundant interface. The IPv6 address for the redundant interface can only be configured when the spoke SDP of the redundant interface is set to VC type **ipipe**.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Max. instances	1
Introduced	25.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**ipv6-address**] *ipv6-address*

Synopsis	IPv6 address assigned to the interface
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv6 address *ipv6-address*
Tree	address
Notes	This element is part of a list key.
Introduced	25.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

duplicate-address-detection *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Enable Duplicate Address Detection
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv6 address *ipv6-address* duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD). When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.
Default	true
Introduced	25.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

eui-64 *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Form IPv6 address from prefix and 64-bit interface ID
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv6 address *ipv6-address* eui-64 *boolean*
Tree	eui-64
Description	When configured to **true**, the router forms a complete IPv6 address from the supplied prefix and 64-bit interface identifier. The 64-bit interface identifier is derived from the MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, use the base MAC address of the chassis.
Default	false
Introduced	25.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

prefix-length *number*

Synopsis	IPv6 address prefix length
Context	**configure** service ies *service-name* redundant-interface *interface-name* ipv6 address *ipv6-address* prefix-length *number*
Tree	prefix-length
Range	4 to 128
Notes	This element is mandatory.
Introduced	25.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

spoke-sdp [sdp-bind-id] *sdp-bind-id*

Synopsis	Enter the **spoke-sdp** list instance
Context	**configure** service ies *service-name* redundant-interface *interface-name* spoke-sdp *sdp-bind-id*
Tree	spoke-sdp
Max. instances	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**sdp-bind-id**] *sdp-bind-id*

Synopsis	SDP binding ID

data-trigger

Synopsis	Enter the **data-trigger** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* data-trigger
Tree	data-trigger
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

accept-ipv6-link-local-address *boolean*

Synopsis	Enable IPv6 Link Local Address to start authentication

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* data-trigger accept-ipv6-link-local-address *boolean*
Tree	accept-ipv6-link-local-address
Description	When configured to **true**, the system triggers authentication of the subscriber based on an IPv6 packet with a source IP Link Local Address (LLA). The authentication trigger only occurs if the anti-spoof is type nh-mac. If the anti-spoof is not nh-mac, the packet with an IPv6 LLA is ignored. When configured to **false**, the system ignores all IPv6 packets with a LLA as a source IP address.
Default	false
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of data-triggered host creation
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* data-trigger admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *very-long-description*

Synopsis	Text description
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* description *very-long-description*
Tree	description

gi-address *ipv4-unicast-address*

Synopsis	GI address for the DHCP relay
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp gi-address *ipv4-unicast-address*
Tree	gi-address
Description	This command configures the GI address to distinguish between the different subscriber interfaces (and potentially group interfaces) defined when the router functions as a DHCP relay. By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.
Introduced	16.0.R1

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp offer-selection server *ipv4-unicast-address*
Tree	server
Max. instances	8
Notes	The following elements are part of a choice: **client-mac** or **server**.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**ipv4-address**] *ipv4-unicast-address*

Synopsis	IP address of the DHCP server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp offer-selection server *ipv4-unicast-address*
Tree	server
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

discover-delay *number*

Synopsis	Delay before sending DHCP Discover messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp offer-selection server *ipv4-unicast-address* discover-delay *number*
Tree	discover-delay
Description	This command configures the time to delay DHCP Discover messages sent to the server.
Range	1 to 100
Units	deciseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

option-82

Synopsis	Enter the **option-82** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82
Tree	option-82
Description	Commands in this context configure the processing required when the router receives a DHCP request that already has an Option 82 field in the packet.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

action *keyword*

Synopsis	Action to take with received DHCP Option 82
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 action *keyword*
Tree	action
Options	replace, drop, keep
Default	keep
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

circuit-id

Synopsis	Enter the **circuit-id** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 circuit-id
Tree	circuit-id
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ascii-tuple

Synopsis	Use the ASCII-encoded tuple for the circuit ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 circuit-id ascii-tuple
Tree	ascii-tuple
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ifindex

Synopsis	Use the interface index for the circuit ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 circuit-id ifindex
Tree	ifindex
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

none

Synopsis	Do not include the circuit ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 circuit-id none
Tree	none
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sap-id

Synopsis	Use the SAP ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 circuit-id sap-id
Tree	sap-id
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

vlan-ascii-tuple

Synopsis	Include the VLAN ID and dot1p bits in the ASCII tuple
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 circuit-id vlan-ascii-tuple
Tree	vlan-ascii-tuple
Description	When configured, the router includes the VLAN ID and dot1p bits with the ASCII-tuple information. This only occurs on dot1q and QinQ-encapsulated ports. When the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of the outgoing packet. When unconfigured, the router leaves the circuit ID sub-option of the DHCP packet empty.
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

remote-id

Synopsis	Enter the **remote-id** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 remote-id
Tree	remote-id
Description	Commands in this context configure the remote IP sub-option of the DHCP packet with the identity of the remote host end (typically the DHCP client).
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ascii-string *string-not-all-spaces*

Synopsis	User-defined ASCII string for the remote ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 remote-id ascii-string *string-not-all-spaces*
Tree	ascii-string
String length	1 to 32
Notes	The following elements are part of a choice: **ascii-string**, **mac**, or **none**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mac

Synopsis	Use the MAC address for the remote ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 remote-id mac
Tree	mac
Notes	The following elements are part of a choice: **ascii-string**, **mac**, or **none**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

none

Synopsis	Do not include the remote ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 remote-id none
Tree	none
Notes	The following elements are part of a choice: **ascii-string**, **mac**, or **none**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

vendor-specific-option

Synopsis	Enter the **vendor-specific-option** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option
Tree	vendor-specific-option
Description	Commands in this context configure the Nokia Vendor-Specific Option (VSO) of the DHCP packet.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-mac-address *boolean*

Synopsis	Send the MAC address in the VSO
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option client-mac-address *boolean*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	client-mac-address
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pool-name *boolean*

Synopsis	Send the pool name in the VSO
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option pool-name *boolean*
Tree	pool-name
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sap-id *boolean*

Synopsis	Send SAP ID in the sub-option of the DHCP relay packet
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option sap-id *boolean*
Tree	sap-id
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

service-id *boolean*

Synopsis	Send the service ID in the Vendor Specific Option
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option service-id *boolean*
Tree	service-id
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

string *string-not-all-spaces*

Synopsis	User-defined ASCII string for the VSO
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option string *string-not-all-spaces*
Tree	string
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

system-id *boolean*

Synopsis	Send the system ID in the VSO
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option system-id *boolean*
Tree	system-id
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

proxy-server

Synopsis	Enter the **proxy-server** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp proxy-server
Tree	proxy-server
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the DHCP proxy server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp proxy-server admin-state *keyword*
Tree	admin-state
Options	enable, disable

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

emulated-server *ipv4-unicast-address*

Synopsis	IP address used as DHCP server address in SAP context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp proxy-server emulated-server *ipv4-unicast-address*
Tree	emulated-server
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lease-time

Synopsis	Enter the **lease-time** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp proxy-server lease-time
Tree	lease-time
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-override *boolean*

Synopsis	Use lease time information provided by RADIUS server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp proxy-server lease-time radius-override *boolean*
Tree	radius-override
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

value *number*

Synopsis	DHCP lease time
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp proxy-server lease-time value *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	value
Range	300 to 315446399
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

python-policy *reference*

Synopsis	Python policy name
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp python-policy *reference*
Tree	python-policy
Description	This command associates a Python policy name with the interface.
Reference	**configure** python python-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

relay-proxy

Synopsis	Enable the **relay-proxy** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp relay-proxy
Tree	relay-proxy
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

release-update-src-ip *boolean*

Synopsis	Update the source IP address of a DHCP RELEASE message
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp relay-proxy release-update-src-ip *boolean*
Tree	release-update-src-ip
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

siaddr-override *ipv4-unicast-address*

Synopsis	DHCP server IP address for address hiding function
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp relay-proxy siaddr-override *ipv4-unicast-address*
Tree	siaddr-override
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

release-include-gi-address *boolean*

Synopsis	Include gateway IP address in DHCP Release messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp release-include-gi-address *boolean*
Tree	release-include-gi-address
Default	false
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server *ipv4-unicast-address*

Synopsis	IP addresses for DHCP server requests
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp server *ipv4-unicast-address*
Tree	server
Description	This command configures a list of servers that this interface forwards requests to. The operator can enter the list of servers as either IP addresses or fully qualified domain names. The operator must specify at least one server specified for DHCP relay to work. If there are multiple servers, the system forwards the request to all the servers in the list.
Max. instances	8
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

src-ip-addr *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp src-ip-addr *keyword*
Tree	src-ip-addr
Options	auto, gi-address
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

trusted *boolean*

Synopsis	Relay untrusted packets
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp trusted *boolean*
Tree	trusted
Description	When configured to **true**, the router enables the trusted mode on the interface. When enabled, the relay agent changes the existing GI address (of the request) to the ingress interface, and forwards the request. A DHCP request that contains a GI address of 0.0.0.0 and an Option 82 field in the packet is discarded unless it arrives on a trusted circuit. This behavior only applies if the Relay Agent Information Option action is to keep the existing information. When the Option 82 field is replaced by the relay agent, the original Option 82 information is lost, and there is no reason to enable the trusted option.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-db *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Local user database for authentication
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 dhcp user-db *reference*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	user-db
Reference	**configure** subscriber-mgmt local-user-db *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

icmp

Synopsis	Enter the **icmp** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 icmp
Tree	icmp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mask-reply *boolean*

Synopsis	Allow responses to ICMP mask requests on the interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 icmp mask-reply *boolean*
Tree	mask-reply
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

param-problem

Synopsis	Enter the **param-problem** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 icmp param-problem
Tree	param-problem
Description	Commands in this context specify the settings for ICMP Parameter Problem messages generated by the interface.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

use-matching-address *boolean*

Synopsis	Use the subscriber interface address as source address
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 icmp ttl-expired use-matching-address *boolean*
Tree	use-matching-address
Description	When configured to **true**, the system uses a matching subscriber interface address as the source address of the ICMP TTL expired message. For matching to occur, the source address of the offending packet must be in the same subnet of the subscriber interface address. When configured to **false**, the system uses the first configured address.
Default	false
Introduced	22.10.R1

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

unreachables

Synopsis	Enter the **unreachables** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 icmp unreachables
Tree	unreachables
Description	Commands in this context specify the settings for ICMP host and network destination unreachable messages generated by the interface.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of sending unreachable messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 icmp unreachables admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

number *number*

Synopsis	Maximum number of unreachable messages to send
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 icmp unreachables number *number*
Tree	number
Range	10 to 2000
Default	100
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

seconds *number*

Synopsis	Time to limit the number of ICMP unreachable messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 icmp unreachables seconds *number*
Tree	seconds
Range	1 to 60
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ignore-df-bit *boolean*

Synopsis	Ignore DF bit in the IPv4 header when fragmenting
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 ignore-df-bit *boolean*
Tree	ignore-df-bit
Description	When configured to **true**, fragmentation is applied according to the applicable egress MTU instead of the DF bit for frames egressing the WLAN-GW group. The DF bit is reset for frames that are fragmented. When configured to **false**, the router fragments a packet larger than the MTU if the DF bit is set to 0 and drops the packet if the DF bit is set to 1.
Default	false
Introduced	20.5.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

neighbor-discovery

Synopsis	Enter the **neighbor-discovery** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 neighbor-discovery
Tree	neighbor-discovery
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

local-proxy-arp *boolean*

Synopsis	Enable local proxy ARP on interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 neighbor-discovery local-proxy-arp *boolean*
Tree	local-proxy-arp
Description	When configured to **true**, the router enables local proxy ARP on the interface. When configured to **false**, the router does not respond to ARP requests for addresses on the same subnet.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

populate *boolean*

Synopsis	Allow population of static and dynamic hosts
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 neighbor-discovery populate *boolean*
Tree	populate
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

proxy-arp-policy *reference*

Synopsis	Proxy ARP policy name
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 neighbor-discovery proxy-arp-policy *reference*
Tree	proxy-arp-policy
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

remote-proxy-arp *boolean*

Synopsis	Enable remote proxy ARP on the interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 neighbor-discovery remote-proxy-arp *boolean*
Tree	remote-proxy-arp
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout *number*

Synopsis	Timeout for an ARP entry learned on the interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 neighbor-discovery timeout *number*
Tree	timeout
Range	0 to 65535
Units	seconds
Default	14400
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

qos-route-lookup *keyword*

Synopsis	QoS route lookup
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 qos-route-lookup *keyword*
Tree	qos-route-lookup
Options	destination
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

urpf-check

Synopsis	Enable the **urpf-check** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 urpf-check
Tree	urpf-check
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mode *keyword*

Synopsis	Unicast RPF check mode
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv4 urpf-check mode *keyword*
Tree	mode
Options	strict – Check source address match in RT and interface loose – Check source address match in RT only strict-no-ecmp – Check source address match in ECMP route
Default	strict
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6

Synopsis	Enable the **ipv6** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6
Tree	ipv6
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

allow-multiple-wan-addresses *boolean*

Synopsis	Allow multiple WAN addresses
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 allow-multiple-wan-addresses *boolean*
Tree	allow-multiple-wan-addresses
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

auto-reply

Synopsis	Enter the **auto-reply** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 auto-reply
Tree	auto-reply
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

neighbor-solicitation *boolean*

Synopsis	Enable auto-reply for NS
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 auto-reply neighbor-solicitation *boolean*
Tree	neighbor-solicitation
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

router-solicitation *boolean*

Synopsis	Enable auto-reply for RS
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 auto-reply router-solicitation *boolean*
Tree	router-solicitation
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp6

Synopsis	Enter the **dhcp6** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6
Tree	dhcp6
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

allow-client-id-change *boolean*

Synopsis	Allow changes to the client ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 allow-client-id-change *boolean*
Tree	allow-client-id-change
Default	false
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

filter *reference*

Synopsis	DHCPv6 filter
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 filter *reference*
Tree	filter
Reference	**configure** filter dhcp6-filter *number*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

option

Synopsis	Enter the **option** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 option
Tree	option
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interface-id

Synopsis	Enter the **interface-id** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 option interface-id

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	interface-id
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ascii-tuple

Synopsis	Use ASCII-encoded concatenated tuple
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 option interface-id ascii-tuple
Tree	ascii-tuple
Notes	The following elements are part of a choice: **ascii-tuple**, **if-index**, **sap-id**, or **string**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

if-index

Synopsis	Use interface index in the DHCPv6 relay packet
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 option interface-id if-index
Tree	if-index
Notes	The following elements are part of a choice: **ascii-tuple**, **if-index**, **sap-id**, or **string**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sap-id

Synopsis	Use SAP ID in interface ID option in relay packet
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 option interface-id sap-id
Tree	sap-id
Notes	The following elements are part of a choice: **ascii-tuple**, **if-index**, **sap-id**, or **string**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

string *string-not-all-spaces*

Synopsis	String for interface ID option in DHCPv6 relay packet
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 option interface-id string *string-not-all-spaces*
Tree	string
String length	1 to 80
Notes	The following elements are part of a choice: **ascii-tuple**, **if-index**, **sap-id**, or **string**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

remote-id *boolean*

Synopsis	Send remote ID option in the DHCPv6 relay packet
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 option remote-id *boolean*
Tree	remote-id
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

override-slaac *boolean*

Synopsis	Allow WAN address offered by DHCP to overwrite the WAN address acquired from SLAAC
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 override-slaac *boolean*
Tree	override-slaac
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pd-managed-route

Synopsis	Enable the **pd-managed-route** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 pd-managed-route

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	pd-managed-route
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

next-hop *keyword*

Synopsis	Next hop type
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 pd-managed-route next-hop *keyword*
Tree	next-hop
Options	ipv4, ipv6
Default	ipv6
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

proxy-server

Synopsis	Enter the **proxy-server** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server
Tree	proxy-server
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the DHCPv6 proxy server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

client-applications

Synopsis	Enter the **client-applications** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server client-applications
Tree	client-applications
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp *boolean*

Synopsis	Enable IPoE clients to use DHCP relay or proxy server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server client-applications dhcp *boolean*
Tree	dhcp
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ppp *boolean*

Synopsis	Allow PPPoE clients to use DHCP relay functionality
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server client-applications ppp *boolean*
Tree	ppp
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preferred-lifetime *(number | keyword)*

Synopsis	Time for prefix to remain preferred on this interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server preferred-lifetime *(number | keyword)*
Tree	preferred-lifetime
Range	300 to 4294967294

© 2025 Nokia.

Units	seconds
Options	infinite
Default	3600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rebind-timer *number*

Synopsis	Rebind timer (T2) for this interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server rebind-timer *number*
Tree	rebind-timer
Range	0 to 1209600
Units	seconds
Default	2880
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

renew-timer *number*

Synopsis	Renew timer (T1)
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server renew-timer *number*
Tree	renew-timer
Range	0 to 604800
Units	seconds
Default	1800
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server-id

Synopsis	Enter the **server-id** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server server-id
Tree	server-id

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

duid-en-ascii *string-not-all-spaces*

Synopsis	Vendor-assigned ID based on Enterprise Number (DUID-EN)
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server server-id duid-en-ascii *string-not-all-spaces*
Tree	duid-en-ascii
String length	1 to 58
Notes	The following elements are part of a choice: **duid-en-ascii**, **duid-en-hex**, or **duid-ll**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

duid-en-hex *string*

Synopsis	DUID system ID in hexadecimal format
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server server-id duid-en-hex *string*
Tree	duid-en-hex
String length	1 to 118
Notes	The following elements are part of a choice: **duid-en-ascii**, **duid-en-hex**, or **duid-ll**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

duid-ll

Synopsis	Use link-layer address (DUID-LL) as DUID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server server-id duid-ll
Tree	duid-ll
Notes	The following elements are part of a choice: **duid-en-ascii**, **duid-en-hex**, or **duid-ll**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

valid-lifetime *(number | keyword)*

Synopsis	Time for prefix to remain valid on this interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 proxy-server valid-lifetime *(number | keyword)*
Tree	valid-lifetime
Range	300 to 4294967294
Units	seconds
Options	infinite
Default	86400
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

python-policy *reference*

Synopsis	Python policy
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 python-policy *reference*
Tree	python-policy
Reference	**configure** python python-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

relay

Synopsis	Enter the **relay** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay
Tree	relay
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of DHCPv6 Relay

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

advertise-selection

Synopsis	Enter the **advertise-selection** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection
Tree	advertise-selection
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-mac

Synopsis	Enter the **client-mac** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection client-mac
Tree	client-mac
Notes	The following elements are part of a choice: **client-mac** or **server**.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mac-address *keyword*

Synopsis	Designated client MAC addresses for Advertise selection
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection client-mac mac-address *keyword*
Tree	mac-address
Options	odd, even
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

preference-option

Synopsis	Enter the **preference-option** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection client-mac preference-option
Tree	preference-option
Description	Commands in this context configure the DHCPv6 preference option that is inserted in the DHCPv6 Advertise message.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

value *number*

Synopsis	Preference option value for DHCPv6 Advertise messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection client-mac preference-option value *number*
Tree	value
Range	0 to 255
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

solicit-delay *number*

Synopsis	Delay before sending DHCPv6 Solicit messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection client-mac solicit-delay *number*
Tree	solicit-delay
Description	This command configures the time to delay DHCPv6 Solicit messages sent from the designated client MAC addresses.
Range	1 to 100
Units	deciseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference-option

Synopsis	Enter the **preference-option** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection preference-option
Tree	preference-option
Description	Commands in this context configure the DHCPv6 preference option that is inserted in the DHCPv6 Advertise message.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

value *number*

Synopsis	Preference option value for DHCPv6 Advertise messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection preference-option value *number*
Tree	value
Range	0 to 255
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server [ipv6-address] *ipv6-address*

Synopsis	Enter the **server** list instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection server *ipv6-address*
Tree	server
Max. instances	8
Notes	The following elements are part of a choice: **client-mac** or **server**.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**ipv6-address**] *ipv6-address*

Synopsis	IP address of the DHCPv6 server

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection server *ipv6-address*
Tree	server
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference-option

Synopsis	Enter the **preference-option** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection server *ipv6-address* preference-option
Tree	preference-option
Description	Commands in this context configure the DHCPv6 preference option that is inserted in the DHCPv6 Advertise message.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

value *number*

Synopsis	Preference option value for DHCPv6 Advertise messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection server *ipv6-address* preference-option value *number*
Tree	value
Range	0 to 255
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

solicit-delay *number*

Synopsis	Delay before sending DHCPv6 Solicit messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection server *ipv6-address* solicit-delay *number*
Tree	solicit-delay

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the time to delay DHCPv6 Solicit messages sent to the server.
Range	1 to 100
Units	deciseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

solicit-delay *number*

Synopsis	Delay before sending DHCPv6 Solicit messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay advertise-selection solicit-delay *number*
Tree	solicit-delay
Description	This command configures the time to delay DHCPv6 Solicit messages. The delay is applied to DHCPv6 Solicit messages for which no overriding value is configured in the **server** instance or the **client-mac** context.
Range	1 to 100
Units	deciseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-applications

Synopsis	Enter the **client-applications** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay client-applications
Tree	client-applications
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp *boolean*

Synopsis	Enable IPoE clients to use DHCP relay or proxy server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay client-applications dhcp *boolean*
Tree	dhcp
Default	true

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ppp *boolean*

Synopsis	Allow PPPoE clients to use DHCP relay functionality
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay client-applications ppp *boolean*
Tree	ppp
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lease-split

Synopsis	Enter the **lease-split** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay lease-split
Tree	lease-split
Description	Commands in this context configure DHCPv6 lease split. DHCPv6 lease split is active when administratively enabled and for all IA_NA and IA_PD options in the transaction, the configured lease split valid lifetime (short lease time) is less than or equal to one of the following: • the renew time T1 committed by the server (long renew time) • half of the preferred lifetime committed by the server when T1 committed by the server equals zero
Introduced	21.2.R1

© 2025 Nokia.

server *ipv6-address-with-zone*

Synopsis	DHCP6 servers to which the DHCP6 requests are forwarded
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay server *ipv6-address-with-zone*
Tree	server
Max. instances	8
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address *ipv6-unicast-address*

Synopsis	Source IPv6 address for the DHCPv6 relay messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 relay source-address *ipv6-unicast-address*
Tree	source-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

snooping

Synopsis	Enter the **snooping** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 snooping
Tree	snooping
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

admin-state *keyword*

Synopsis	Administrative state of DHCPv6 snooping
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 dhcp6 snooping admin-state *keyword*
Tree	admin-state
Options	enable, disable

© 2025 Nokia.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

urpf-check

Synopsis	Enable the **urpf-check** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 urpf-check
Tree	urpf-check
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mode *keyword*

Synopsis	Unicast RPF check mode
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* ipv6 urpf-check mode *keyword*
Tree	mode
Options	strict – Check source address match in RT and interface loose – Check source address match in RT only strict-no-ecmp – Check source address match in ECMP route
Default	strict
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-address-assignment

Synopsis	Enter the **local-address-assignment** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment
Tree	local-address-assignment
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of Local Address Assignment

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv4
Tree	ipv4
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-applications

Synopsis	Enter the **client-applications** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv4 client-applications
Tree	client-applications
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe *boolean*

Synopsis	Request local addresses for non-DHCP/managed IPoE hosts
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv4 client-applications ipoe *boolean*
Tree	ipoe
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

ppp *boolean*

Synopsis	Request local addresses for PPP IPCP hosts
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv4 client-applications ppp *boolean*
Tree	ppp
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

default-pool *named-item*

Synopsis	Default pools
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv4 default-pool *named-item*
Tree	default-pool
String length	1 to 32
Max. instances	2
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server *reference*

Synopsis	Local DHCPv4 server for local pools management
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv4 server *reference*
Tree	server
Reference	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6

Synopsis	Enter the **ipv6** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv6
Tree	ipv6
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-applications

Synopsis	Enter the **client-applications** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv6 client-applications
Tree	client-applications
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe-slaac *boolean*

Synopsis	Request local addresses for IPoE SLAAC hosts
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv6 client-applications ipoe-slaac *boolean*
Tree	ipoe-slaac
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe-wan *boolean*

Synopsis	Request local addresses for IPoE IA NA hosts
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv6 client-applications ipoe-wan *boolean*
Tree	ipoe-wan
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

ppp-slaac *boolean*

Synopsis	Request local addresses for PPP SLAAC hosts
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv6 client-applications ppp-slaac *boolean*
Tree	ppp-slaac
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server *reference*

Synopsis	Local DHCPv6 server for local pools management
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* local-address-assignment ipv6 server *reference*
Tree	server
Reference	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mac *mac-unicast-address*

Synopsis	MAC address for the interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* mac *mac-unicast-address*
Tree	mac
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nasreq-auth-policy *reference*

Synopsis	Diameter NASREQ application policy to use for authentication
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* nasreq-auth-policy *reference*
Tree	nasreq-auth-policy
Reference	**configure** subscriber-mgmt diameter-nasreq-policy *named-item*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

oper-up-while-empty *boolean*

Synopsis	Enable this group interface without any active SAPs
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* oper-up-while-empty *boolean*
Tree	oper-up-while-empty
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pppoe

Synopsis	Enter the **pppoe** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* pppoe
Tree	pppoe
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of PPPoE
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* pppoe admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

anti-spoof *keyword*

Synopsis	PPPoE anti-spoof filtering

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* pppoe anti-spoof *keyword*
Tree	anti-spoof
Options	mac-sid, mac-sid-ip
Default	mac-sid
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* pppoe description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp-client

Synopsis	Enter the **dhcp-client** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* pppoe dhcp-client
Tree	dhcp-client
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-id *keyword*

Synopsis	Type of information that DHCP option 61 contains
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* pppoe dhcp-client client-id *keyword*
Tree	client-id
Options	mac-pppoe-session-id
Introduced	16.0.R7
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

eth-cfm

Synopsis	Enter the **eth-cfm** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm
Tree	eth-cfm
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

collect-lmm-fc-stats

Synopsis	Enter the **collect-lmm-fc-stats** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm collect-lmm-fc-stats
Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively.

This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

fc *keyword*

Synopsis Forwarding class name for profile-unaware counter

Context **configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm collect-lmm-fc-stats fc *keyword*

Tree fc

Description This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter.

An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context.

When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.

Options be, l2, af, l1, h2, ef, h1, nc

Max. instances 8

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

fc-in-profile *keyword*

Synopsis Forwarding class name for profile-aware counter

Context **configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm collect-lmm-fc-stats fc-in-profile *keyword*

Tree fc-in-profile

Description This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter.

An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.

Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

collect-lmm-stats *boolean*

Synopsis	Collect statistics for loss measurement message tests
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm collect-lmm-stats *boolean*
Tree	collect-lmm-stats
Description	When configured to **true**, the router instantiates the statistical counter to transmit and receive packets for the LAG facility MEP bindings. The **show eth-cfm collect-lmm-stats** command displays entities that have been enabled to collect transit and receive counters. When configured to **false**, the router does not instantiate the counter and the LMM PDU associated with the MEP does not populate the counters in the packet.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*

Synopsis	Enter the **mep** list instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

md-admin-name *reference*

Synopsis	Maintenance Domain (MD) name

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number*
Tree	mep
Reference	**configure** eth-cfm domain *admin-name*
Notes	This element is part of a list key.

Tree	fng-reset-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

ccm *boolean*

Synopsis	Generate CCM messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm *boolean*
Tree	ccm
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

ccm-ltm-priority *number*

Synopsis	Priority of CCM and LTM messages transmitted by the MEP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-ltm-priority *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ccm-ltm-priority
Range	0 to 7
Default	7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

ccm-padding-size *number*

Synopsis	Number of octets of padding to insert in CCM packets
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-padding-size *number*
Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV, is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.
Range	3 to 1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

csf

Synopsis	Enable the **csf** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf
Tree	csf
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

multiplier *decimal-number*

Synopsis	Multiplication factor used to clear the CSF condition

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf multiplier *decimal-number*
Tree	multiplier
Range	0.0 | 2.0 to 30.0
Default	3.5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

description *description*

Synopsis	Text description
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

eth-test

Synopsis	Enable the **eth-test** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test
Tree	eth-test
Description	Commands in this context configure information used by the Ethernet Test (ETH-TST) packet. The commands must be configured on both the sender and the receiver nodes. The test packets are used with the **oam eth-cfm eth-test** command.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

bit-error-threshold *number*

Synopsis	Lowest priority defect allowed to generate fault alarm

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test bit-error-threshold *number*
Tree	bit-error-threshold
Range	0 to 11840
Units	bit errors
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

test-pattern

Synopsis	Enter the **test-pattern** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern
Tree	test-pattern
Description	Commands in this context specify the test pattern for the ETH-TST frames. The pattern does not have to be the same on the sender and the receiver.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

crc-tlv *boolean*

Synopsis	Generate a CRC checksum
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern crc-tlv *boolean*
Tree	crc-tlv
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

pattern *keyword*

Synopsis	Test pattern for Ethernet Test frames

Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. When configured to **false**, the router disables the Nokia Grace function.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED). When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon
Default	mac-rem-err-xcon
Introduced	16.0.R1

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

squelch-ingress-levels *number*

Synopsis	Levels for which ETH-CFM packets are silently discarded
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* eth-cfm squelch-ingress-levels *number*
Tree	squelch-ingress-levels
Description	This command defines the levels of the ETH-CFM packets that are silently discarded. At ingress, ETH-CFM packets that meet the following conditions are silently discarded: • The packet is ingressing into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding. • The packet level matches the configured levels. All ETH-CFM packets ingressing to the SAP or SDP binding that match the configured levels are dropped without regard for other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level that is to be dropped.
Range	0 to 7
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	link-map-profile
Description	This command assigns a preconfigured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. After an operator assigns a LAG link map profile, the system rehashes the SAP or network interface egress traffic over the LAG as required by the new configuration. If the LAG link map profile for a SAP or network interface is deleted, the system reverts back to per-flow hashing.
Range	1 to 64
Introduced	16.0.R1

MD-CLI default	00:00:00:00:00:00
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the static host
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ancp-string *ancp-string*

Synopsis	ANCP string
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* ancp-string *ancp-string*
Tree	ancp-string
String length	1 to 63
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

app-profile

Synopsis	Enter the **app-profile** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* app-profile
Tree	app-profile
Introduced	21.10.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

profile *reference*

Synopsis	Application profile used by the static host
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* app-profile profile *reference*
Tree	profile
Reference	**configure** application-assurance group *number* partition *number* policy app-profile *named-item*
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

scope *keyword*

Synopsis	Scope of the static host application profile
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* app-profile scope *keyword*
Tree	scope
Options	subscriber, mac
Default	subscriber
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

int-dest-id *int-dest-id*

Synopsis	Intermediate destination ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* int-dest-id *int-dest-id*
Tree	int-dest-id
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

managed-route [prefix] *ipv4-unicast-prefix*

Synopsis	Enter the **managed-route** list instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix*
Tree	managed-route
Description	Commands in this context configure managed route parameters.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**prefix**] *ipv4-unicast-prefix*

Synopsis	Managed route prefix associated with IPv4 static host
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix*
Tree	managed-route
Description	This command configures the managed route prefix. The prefix length must be in the range of 1 to 32.
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cpe-check

Synopsis	Enable the **cpe-check** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check
Tree	cpe-check
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

destination-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	IP address of the target CPE device
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check destination-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	destination-ip-address
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

drop-count *number*

Synopsis	Consecutive ping replies missed before CPE deemed down
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check drop-count *number*
Tree	drop-count
Range	1 to 255
Default	3
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

failed-action

Synopsis	Enter the **failed-action** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check failed-action
Tree	failed-action
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

metric *number*

Synopsis	Metric associated with the provisioned managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check failed-action metric *number*
Tree	metric
Max. range	0 to 4294967295
Default	0
Notes	The following elements are part of a choice: (**metric**, **preference**, and **tag**) or **withdraw**.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference *number*

Synopsis	Preference associated to the provisioned managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check failed-action preference *number*
Tree	preference
Range	0 to 255
Notes	The following elements are part of a choice: (**metric**, **preference**, and **tag**) or **withdraw**.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tag *number*

Synopsis	Route tag used if CPE check fails
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check failed-action tag *number*
Tree	tag
Max. range	0 to 4294967295
Default	0
Notes	The following elements are part of a choice: (**metric**, **preference**, and **tag**) or **withdraw**.
Introduced	22.10.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

withdraw *boolean*

Synopsis	Withdraw the route when the CPE check fails
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check failed-action withdraw *boolean*
Tree	withdraw
Default	false
Notes	The following elements are part of a choice: (**metric**, **preference**, and **tag**) or **withdraw**.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interval *number*

Synopsis	Interval between ICMP pings to target CPE IP address
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check interval *number*
Tree	interval
Range	1 to 255
Units	seconds
Default	1
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

log *boolean*

Synopsis	Log CPE connectivity checks transitions
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check log *boolean*
Tree	log
Default	false
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

padding-size *number*

Synopsis	Padding size for CPE connectivity checks
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check padding-size *number*
Tree	padding-size
Range	0 to 16384
Units	bytes
Default	56
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source IP address used in the ICMP messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check source-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-ip-address
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout *number*

Synopsis	Time interval determining that a ping is missed
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* cpe-check timeout *number*
Tree	timeout
Range	1 to 10
Units	seconds
Default	1
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

metric *number*

Synopsis	Metric associated with the managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* metric *number*
Tree	metric
Max. range	0 to 4294967295
Default	0
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference *number*

Synopsis	Preference associated with the managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* preference *number*
Tree	preference
Range	0 to 255
Default	0
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tag *number*

Synopsis	Route tag associated with the managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* managed-route *ipv4-unicast-prefix* tag *number*
Tree	tag
Max. range	0 to 4294967295
Default	0
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rip-policy *reference*

Synopsis	RIP policy name
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* rip-policy *reference*
Tree	rip-policy
Reference	**configure** subscriber-mgmt rip-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shcv

Synopsis	Enter the **shcv** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* shcv
Tree	shcv
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sla-profile *reference*

Synopsis	SLA profile name
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* sla-profile *reference*
Tree	sla-profile
Reference	**configure** subscriber-mgmt sla-profile *external-named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-profile *reference*

Synopsis	Sub-profile name

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* sub-profile *reference*
Tree	sub-profile
Reference	**configure** subscriber-mgmt sub-profile *external-named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber-id

Synopsis	Enter the **subscriber-id** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* subscriber-id
Tree	subscriber-id
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

string *subscriber-id*

Synopsis	Subscriber identification
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* subscriber-id string *subscriber-id*
Tree	string
String length	1 to 64
Notes	The following elements are part of a choice: **string** or **use-sap-id**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

use-sap-id

Synopsis	Use the SAP id as subscriber ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv4 *ipv4-unicast-address* mac *mac-unicast-address* subscriber-id use-sap-id
Tree	use-sap-id

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: **string** or **use-sap-id**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6 [prefix] *ipv6-unicast-prefix* mac *mac-unicast-address*

Synopsis	Enter the **ipv6** list instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address*
Tree	ipv6
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**prefix**] *ipv6-unicast-prefix*

Synopsis	IPv6 prefix
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address*
Tree	ipv6
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mac *mac-unicast-address*

Synopsis	MAC address
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address*
Tree	ipv6
MD-CLI default	00:00:00:00:00:00
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the static host
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ancp-string *ancp-string*

Synopsis	ANCP string
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* ancp-string *ancp-string*
Tree	ancp-string
String length	1 to 63
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

app-profile

Synopsis	Enter the **app-profile** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* app-profile
Tree	app-profile
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

profile *reference*

Synopsis	Application profile used by the static host

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* app-profile profile *reference*
Tree	profile
Reference	**configure** application-assurance group *number* partition *number* policy app-profile *named-item*
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

scope *keyword*

Synopsis	Scope of the static host application profile
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* app-profile scope *keyword*
Tree	scope
Options	subscriber, mac
Default	subscriber
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

int-dest-id *int-dest-id*

Synopsis	Intermediate destination ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* int-dest-id *int-dest-id*
Tree	int-dest-id
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mac-linking *ipv4-unicast-address*

Synopsis	IPv6 host linked with IPv4 host via learned MAC address
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* mac-linking *ipv4-unicast-address*

Tree	mac-linking
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

managed-route [ipv6-prefix] *ipv6-unicast-prefix*

Synopsis	Enter the **managed-route** list instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix*
Tree	managed-route
Description	Commands in this context configure managed route parameters.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**ipv6-prefix**] *ipv6-unicast-prefix*

Synopsis	Managed route prefix associated with IPv6 static host
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix*
Tree	managed-route
Description	This command configures the managed route prefix. The prefix length must be in the range of 1 to 128.
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cpe-check

Synopsis	Enable the **cpe-check** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check
Tree	cpe-check
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

destination-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	IP address of the target CPE device
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check destination-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	destination-ip-address
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

drop-count *number*

Synopsis	Consecutive ping replies missed before CPE deemed down
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check drop-count *number*
Tree	drop-count
Range	1 to 255
Default	3
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

failed-action

Synopsis	Enter the **failed-action** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check failed-action
Tree	failed-action
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

metric *number*

Synopsis	Metric associated with the provisioned managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check failed-action metric *number*
Tree	metric
Max. range	0 to 4294967295
Default	0
Notes	The following elements are part of a choice: (**metric**, **preference**, and **tag**) or **withdraw**.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference *number*

Synopsis	Preference associated to the provisioned managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check failed-action preference *number*
Tree	preference
Range	0 to 255
Notes	The following elements are part of a choice: (**metric**, **preference**, and **tag**) or **withdraw**.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tag *number*

Synopsis	Route tag used if CPE check fails
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check failed-action tag *number*
Tree	tag
Max. range	0 to 4294967295
Default	0
Notes	The following elements are part of a choice: (**metric**, **preference**, and **tag**) or **withdraw**.
Introduced	22.10.R1

© 2025 Nokia.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

withdraw *boolean*

Synopsis	Withdraw the route when the CPE check fails
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check failed-action withdraw *boolean*
Tree	withdraw
Default	false
Notes	The following elements are part of a choice: (**metric**, **preference**, and **tag**) or **withdraw**.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interval *number*

Synopsis	Interval between ICMP pings to target CPE IP address
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check interval *number*
Tree	interval
Range	1 to 255
Units	seconds
Default	1
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

log *boolean*

Synopsis	Log CPE connectivity checks transitions
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check log *boolean*
Tree	log
Default	false
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

padding-size *number*

Synopsis	Padding size for CPE connectivity checks
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check padding-size *number*
Tree	padding-size
Range	0 to 16384
Units	bytes
Default	56
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source IP address used in the ICMP messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check source-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-ip-address
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout *number*

Synopsis	Time interval determining that a ping is missed
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* cpe-check timeout *number*
Tree	timeout
Range	1 to 10
Units	seconds
Default	1
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

metric *number*

Synopsis	Metric associated with the managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* metric *number*
Tree	metric
Max. range	0 to 4294967295
Default	0
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference *number*

Synopsis	Preference associated with the managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* preference *number*
Tree	preference
Range	0 to 255
Default	0
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tag *number*

Synopsis	Route tag associated with the managed route
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* managed-route *ipv6-unicast-prefix* tag *number*
Tree	tag
Max. range	0 to 4294967295
Default	0
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

retail-svc-id *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Retail service ID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* retail-svc-id *number*
Tree	retail-svc-id
Range	1 to 2147483647
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

shcv

Synopsis	Enter the **shcv** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* shcv
Tree	shcv
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sla-profile *reference*

Synopsis	SLA profile name
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* sla-profile *reference*
Tree	sla-profile
Reference	**configure** subscriber-mgmt sla-profile *external-named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sub-profile *reference*

Synopsis	Sub-profile name
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* sub-profile *reference*
Tree	sub-profile
Reference	**configure** subscriber-mgmt sub-profile *external-named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber-id

Synopsis	Enter the **subscriber-id** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* subscriber-id
Tree	subscriber-id
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

string *subscriber-id*

Synopsis	Subscriber identification
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* subscriber-id string *subscriber-id*
Tree	string
String length	1 to 64
Notes	The following elements are part of a choice: **string** or **use-sap-id**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

use-sap-id

Synopsis	Use the SAP id as subscriber ID

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host ipv6 *ipv6-unicast-prefix* mac *mac-unicast-address* subscriber-id use-sap-id
Tree	use-sap-id
Notes	The following elements are part of a choice: **string** or **use-sap-id**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mac-learning

Synopsis	Enter the **mac-learning** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host mac-learning
Tree	mac-learning
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

data-triggered *boolean*

Synopsis	Enable learning of MAC addresses from data packets
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host mac-learning data-triggered *boolean*
Tree	data-triggered
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

single-mac *boolean*

Synopsis	Enforce single MAC address and subscriber for the SAP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* static-host mac-learning single-mac *boolean*
Tree	single-mac
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

sub-sla-mgmt

Synopsis	Enter the **sub-sla-mgmt** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt
Tree	sub-sla-mgmt
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of SAP subscriber management
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

defaults

Synopsis	Enter the **defaults** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults
Tree	defaults
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

app-profile *reference*

Synopsis	Default application profile name for this SAP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults app-profile *reference*
Tree	app-profile
Reference	**configure** application-assurance group *number* partition *number* policy app-profile *named-item*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

int-dest-id

Synopsis	Enter the **int-dest-id** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults int-dest-id
Tree	int-dest-id
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

string *int-dest-id*

Synopsis	Use the configured string
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults int-dest-id string *int-dest-id*
Tree	string
String length	1 to 32
Notes	The following elements are part of a choice: **string** or **top-q-tag**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

top-q-tag

Synopsis	Use the top Q-tag of this SAP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults int-dest-id top-q-tag
Tree	top-q-tag
Notes	The following elements are part of a choice: **string** or **top-q-tag**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sla-profile *reference*

Synopsis	Default SLA profile for hosts on this SAP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults sla-profile *reference*
Tree	sla-profile
Reference	**configure** subscriber-mgmt sla-profile *external-named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-profile *reference*

Synopsis	Default subscriber profile for the SAP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults sub-profile *reference*
Tree	sub-profile
Reference	**configure** subscriber-mgmt sub-profile *external-named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber-id

Synopsis	Enter the **subscriber-id** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults subscriber-id
Tree	subscriber-id
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

auto-id

Synopsis	Use auto-generated subscriber identification string
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* sap *sap* sub-sla-mgmt defaults subscriber-id auto-id
Tree	auto-id
Notes	The following elements are part of a choice: **auto-id**, **sap-id**, or **string**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

monitor-oper-group

Synopsis	Enter the **monitor-oper-group** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* srrp *number* monitor-oper-group
Tree	monitor-oper-group
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group-name *reference*

Synopsis	Operational group name
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* srrp *number* monitor-oper-group group-name *reference*
Tree	group-name
Reference	**configure** service oper-group *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

priority-step *number*

Synopsis	Step value to change priority of SRRP instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* srrp *number* monitor-oper-group priority-step *number*
Tree	priority-step
Range	1 to 10
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

one-garp-per-sap *boolean*

Synopsis	Send one gratuitous ARP to each SAP

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* srrp *number* one-garp-per-sap *boolean*
Tree	one-garp-per-sap
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

policy *reference*

Synopsis	VRRP priority control policy associated with the SRRP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* srrp *number* policy *reference*
Tree	policy
Reference	**configure** vrrp policy *number*
Max. instances	2
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preempt *boolean*

Synopsis	Allow the SRRP instance to override an existing master
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* srrp *number* preempt *boolean*
Tree	preempt
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

priority *number*

Synopsis	Priority for this interface at this level
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* srrp *number* priority *number*
Tree	priority

© 2025 Nokia.

gateway-address [address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **gateway-address** list instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw gateway-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	gateway-address
Max. instances	10
Introduced	16.0.R4
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Gateway endpoint address of the WLAN Gateway tunnel
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw gateway-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	gateway-address
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

purpose

Synopsis	Enter the **purpose** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw gateway-address *(ipv4-address-no-zone | ipv6-address-no-zone)* purpose
Tree	purpose
Introduced	16.0.R4
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

xconnect *boolean*

Synopsis	Use tunnel IP address for crosse-connect traffic

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw gateway-address *(ipv4-address-no-zone | ipv6-address-no-zone)* purpose xconnect *boolean*
Tree	xconnect
Default	false
Introduced	16.0.R4
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

gateway-router *string*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Routing instance the WLAN-GW endpoint resides in
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw gateway-router *string*
Tree	gateway-router
Introduced	16.0.R4
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

group-encryption

Synopsis	Enter the **group-encryption** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw group-encryption
Tree	group-encryption
Introduced	21.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

encryption-keygroup-inbound *reference*

Synopsis	Encryption keygroup for inbound traffic
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw group-encryption encryption-keygroup-inbound *reference*
Tree	encryption-keygroup-inbound
Reference	**configure** group-encryption encryption-keygroup *number*

Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

max-bd *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum number of bridge domains
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw lanext max-bd *number*
Tree	max-bd
Range	1 to 131071
Default	131071
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

learn-ap-mac

Synopsis	Enable the **learn-ap-mac** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw learn-ap-mac
Tree	learn-ap-mac
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

delay-auth *boolean*

Synopsis	Delay AP-MAC until after ARP/ND authentication response
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw learn-ap-mac delay-auth *boolean*
Tree	delay-auth
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

mcs-peer

Synopsis	Enable the **mcs-peer** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mcs-peer
Tree	mcs-peer
Description	Commands in this context configure a multi-chassis synchronization peer.
Introduced	23.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

address *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	IP address of the MCS peer
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mcs-peer address *reference*
Tree	address
Description	This command configures the IPv4 address or the global IPv6 unicast address for a multi-chassis synchronization peer.
Reference	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	This element is mandatory.
Introduced	23.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

sync-tag *named-item*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Synchronization tag shared by MCS peers
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mcs-peer sync-tag *named-item*
Tree	sync-tag
Description	This command configures the synchronization tag for synchronization of ESM and the tunnel state for ESM over soft-GRE with an MCS peer.
String length	1 to 32
Notes	This element is mandatory.
Introduced	23.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

mobility

Synopsis	Enter the **mobility** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mobility
Tree	mobility
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

hold-time *number*

Synopsis	Minimum time between two mobility events for single UE

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mobility hold-time *number*
Tree	hold-time
Range	0 to 255
Units	seconds
Default	5
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

inter-tunnel-type *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable mobility between terminating tunnel types
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mobility inter-tunnel-type *boolean*
Tree	inter-tunnel-type
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

inter-vlan *boolean*

Synopsis	Allow mobility within different VLANs of the same range
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mobility inter-vlan *boolean*
Tree	inter-vlan
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

trigger

Synopsis	Enter the **trigger** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mobility trigger
Tree	trigger
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

control *boolean*

Synopsis	Use control traffic as a mobility trigger
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mobility trigger control *boolean*
Tree	control
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

data *boolean*

Synopsis	Use data traffic as mobility trigger
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mobility trigger data *boolean*
Tree	data
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

iapp *boolean*

Synopsis	Use IAPP messages as a mobility trigger
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw mobility trigger iapp *boolean*
Tree	iapp
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

oper-down-on-group-degrade *boolean*

Synopsis	Bring interface down when the ISA WLAN Gateway degraded
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw oper-down-on-group-degrade *boolean*
Tree	oper-down-on-group-degrade
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

promiscuous-mode *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable promiscuous mode for this group interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw promiscuous-mode *boolean*
Tree	promiscuous-mode
Description	When configured to **true**, the router accepts all traffic, including traffic that is not destined for a WLAN gateway group interface MAC or virtual MAC address for ESM processing. When configured to **false**, the router only accepts traffic that is destined for a WLAN gateway group interface MAC or virtual MAC address for ESM processing.
Default	false
Introduced	23.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp-mss-adjust *number*

Synopsis	TCP Maximum Segment Size (MSS) adjustment for gateway
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw tcp-mss-adjust *number*
Tree	tcp-mss-adjust
Range	160 to 10240
Units	bytes
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-egress-qos

Synopsis	Enter the **tunnel-egress-qos** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw tunnel-egress-qos
Tree	tunnel-egress-qos
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Administrative state of egress QoS for WLAN-GW tunnels
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw tunnel-egress-qos admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

agg-rate-limit *(number | keyword)*

Synopsis	HQoS aggregate rate limit
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw tunnel-egress-qos agg-rate-limit *(number | keyword)*
Tree	agg-rate-limit
Range	1 to 100000000
Options	max
Default	max
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

granularity *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Granularity of the egress shaping for WLAN Gateway
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw tunnel-egress-qos granularity *keyword*
Tree	granularity
Options	per-tunnel – Applied to each tunnel per-retailer – Applied to each retailer Mobile Network Operator's fraction of the tunnel payload
Default	per-tunnel
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

hold-time *(number | keyword)*

Synopsis	Minimum time to hold egress shaping resources
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw tunnel-egress-qos hold-time *(number | keyword)*
Tree	hold-time
Range	1 to 86400
Units	seconds
Options	infinite
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

multi-client-only *boolean*

Synopsis	Allow shaping for tunnel traffic for multiple UEs
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw tunnel-egress-qos multi-client-only *boolean*
Tree	multi-client-only
Default	false
Introduced	16.0.R1

© 2025 Nokia.

Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

learn-l2tp-cookie *(keyword | hex-string)*

Synopsis	System that learns the cookie from L2TP tunnels terminating on this interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw tunnel-encaps learn-l2tp-cookie *(keyword | hex-string)*
Tree	learn-l2tp-cookie
String length	6
Options	never – Never interpret the cookie always – Interpret cookie regardless of first two octets value
Default	never
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-range [range] *string*

Synopsis	Enter the **vlan-range** list instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string*
Tree	vlan-range
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**range**] *string*

Synopsis	IEEE 802.1q VLAN tag range
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string*
Tree	vlan-range
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication

Synopsis	Enter the **authentication** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* authentication
Tree	authentication
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

hold-time *number*

Synopsis	Minimum time UE held down after failed authentication
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* authentication hold-time *number*
Tree	hold-time
Range	0 to 3600
Units	seconds
Default	5
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

local

Synopsis	Enable the **local** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* authentication local
Tree	local
Introduced	22.2.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

coa-policy *reference*

Synopsis	RADIUS ISA policy applied to CoA or disconnect messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* authentication local coa-policy *reference*
Tree	coa-policy

© 2025 Nokia.

vlan-mismatch-timeout *number*

Synopsis	Timeout if packet received with a non-matching VLAN tag
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* authentication vlan-mismatch-timeout *number*
Tree	vlan-mismatch-timeout
Range	5 to 60
Units	seconds
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

data-triggered-ue-creation

Synopsis	Enter the **data-triggered-ue-creation** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation
Tree	data-triggered-ue-creation
Description	Commands in this context configure data-triggered subscriber creation for Wi-Fi subscribers. Data-triggered UE creation only works upon receipt of TCP and UDP packets.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of data-triggered UE creation
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

arp *boolean*

Synopsis	Authenticate ARP packets received from an unknown UE
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation arp *boolean*
Tree	arp
Default	false
Introduced	22.7.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

create-proxy-cache-entry

Synopsis	Enter the **create-proxy-cache-entry** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation create-proxy-cache-entry
Tree	create-proxy-cache-entry
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

mac-format *mac-specification*

Synopsis	MAC address format
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation create-proxy-cache-entry mac-format *mac-specification*
Tree	mac-format
String length	2 to 7
Default	aa:
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-server

Synopsis	Enable the **proxy-server** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation create-proxy-cache-entry proxy-server
Tree	proxy-server
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

name *named-item*

Synopsis	RADIUS Proxy server name
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation create-proxy-cache-entry proxy-server name *named-item*
Tree	name
String length	1 to 32
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

router-instance *string*

Synopsis	Router instance of the RADIUS proxy server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation create-proxy-cache-entry proxy-server router-instance *string*
Tree	router-instance
Notes	This element is mandatory.
Introduced	16.0.R4
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

ospf *boolean*

Synopsis	Authenticate OSPF packets received from an unknown UE
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* data-triggered-ue-creation ospf *boolean*
Tree	ospf

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the system triggers UE authentication based on OSPFv2 or OSPFv3 packets. These packets are used with the dynamic VPLS service.
Default	false
Introduced	23.7.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

dhcp4

Synopsis	Enter the **dhcp4** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp4
Tree	dhcp4
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of DHCPv4
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp4 admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

dns *ipv4-unicast-address*

Synopsis	DNS servers signaled in DHCP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp4 dns *ipv4-unicast-address*
Tree	dns
Max. instances	2
Notes	This element is ordered by the user.
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2-aware-ip-address *(ipv4-unicast-address | keyword)*

Synopsis	L2-Aware NAT inside IP address
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp4 l2-aware-ip-address *(ipv4-unicast-address | keyword)*
Tree	l2-aware-ip-address
Options	from-pool – IP address allocated from a pool
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

lease-time

Synopsis	Enter the **lease-time** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp4 lease-time
Tree	lease-time
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

active *number*

Synopsis	Lease time an authenticated user
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp4 lease-time active *number*
Tree	active
Range	300 to 3600
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

initial *number*

Synopsis	Lease time for migrant user (unauthenticated)

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp4 lease-time initial *number*
Tree	initial
Range	300 to 3600
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

nbns *ipv4-unicast-address*

Synopsis	NetBIOS servers signaled in DHCP
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp4 nbns *ipv4-unicast-address*
Tree	nbns
Max. instances	2
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

dhcp6

Synopsis	Enter the **dhcp6** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp6
Tree	dhcp6
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the protocol
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp6 admin-state *keyword*
Tree	admin-state

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

preferred-lifetime

Synopsis	Enter the **preferred-lifetime** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp6 preferred-lifetime
Tree	preferred-lifetime
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

active *number*

Synopsis	Preferred signaled lifetime after full authentication
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dhcp6 preferred-lifetime active *number*
Tree	active

Reference **configure** application-assurance group *number* partition *number* policy app-profile *named-item*

Introduced 21.10.R1

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

url-parameter *aa-http-url-param*

Synopsis AA URL parameter included for HTTP portal redirect

Context **configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm application-assurance url-parameter *aa-http-url-param*

Tree url-parameter

String length 1 to 247

Introduced 22.2.R1

Platforms 7750 SR, 7750 SR-e, 7750 SR-s, VSR

captive-portal-api-url *one-time-http-redirect-url*

Synopsis Captive portal URL

Context **configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm captive-portal-api-url *one-time-http-redirect-url*

Tree captive-portal-api-url

Description This command specifies a URL for an RFC 8908 captive portal API server that is included in DHCP, RA, and DHCPv6 messages as described in RFC 8910. This command supports the same macro substitutions as the **configure subscriber-mgmt http-redirect-policy url** command.

This command is mutually exclusive with the **one-time-redirect** and **send-unrestricted-portal-url** commands in the same context.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured, the WLAN-GW populates the URL in DHCP, RA, and DHCPv6 messages based on whether redirect is applied and the value of the **one-time-redirect** command.

String length	1 to 255
Introduced	24.3.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

egress

Synopsis	Enter the **egress** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm egress
Tree	egress
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

policer *reference*

Synopsis	Policer for egress traffic
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm egress policer *reference*
Tree	policer
Reference	**configure** subscriber-mgmt isa-policer *named-item*
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

ingress

Synopsis	Enter the **ingress** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm ingress
Tree	ingress
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ip-filter *reference*

Synopsis	Filter for ingress traffic
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm ingress ip-filter *reference*
Tree	ip-filter
Reference	**configure** subscriber-mgmt isa-filter *named-item*
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

policer *reference*

Synopsis	Policer for ingress traffic
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm ingress policer *reference*
Tree	policer
Reference	**configure** subscriber-mgmt isa-policer *named-item*
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

soft-quota-exhausted-filter *reference*

Synopsis	Filter applied when soft volume quota is reached
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm ingress soft-quota-exhausted-filter *reference*
Tree	soft-quota-exhausted-filter
Description	This command applies a filter when a soft volume quota is reached. The filter replaces the currently applied filter (which can be preconfigured using the **ip-filter** command in the **configure service vprn subscriber-interface group-interface wlan-gw vlan-range dsm ingress ip-filter** context or be set using a RADIUS CoA message) for the UE upon quota exhaustion. If the quota is extended using a RADIUS CoA message, the filter is automatically reverted. Configuration changes apply only to new DSM UEs and not to existing UEs.
Reference	**configure** subscriber-mgmt isa-filter *named-item*
Introduced	21.7.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

one-time-redirect

Synopsis	Enter the **one-time-redirect** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm one-time-redirect
Tree	one-time-redirect
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

port *number*

Synopsis	Destination port of packets for HTTP redirect
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm one-time-redirect port *number*
Tree	port
Range	1 to 65535
Default	80
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

url *one-time-http-redirect-url*

Synopsis	URL for redirected HTTP protocol packets
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm one-time-redirect url *one-time-http-redirect-url*
Tree	url
String length	1 to 255
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

send-unrestricted-portal-url *boolean*

Synopsis	Send an indicator if no captive portal is enabled
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm send-unrestricted-portal-url *boolean*
Tree	send-unrestricted-portal-url

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router sends the special URL indicator urn:ietf:params:capport:unrestricted in DHCP, DHCPv6, and RA messages, to indicate to the client that no captive portal is enabled. This allows the client to disable all portal detection logic, thereby optimizing the user experience.
Default	false
Introduced	24.3.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

volume-quota-direction *keyword*

Synopsis	Volume quota direction for WLAN GW
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dsm volume-quota-direction *keyword*
Tree	volume-quota-direction
Description	This command specifies the direction that volume quotas are applied. Configuration changes apply only to new DSM UEs and not to existing UEs.
Options	both – Both directions ingress – Ingress direction (upstream) egress – Egress direction (downstream)
Default	both
Introduced	21.7.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

dynamic-service *boolean*

Synopsis	Dynamically assign WLAN-GW subscriber to a VPLS service
Context	**configure** service ies *service-name* subscriber-interface *interface-name* group-interface *interface-name* wlan-gw vlan-range *string* dynamic-service *boolean*
Tree	dynamic-service
Description	When configured to **true**, the WLAN-GW subscriber is dynamically assigned to a VPLS service, based on RADIUS authentication reply attributes. This feature is used in conjunction with the **configure service vpls wlan-gw wlan-gw-group** command. See "Dynamic VPLS service" in the *7450 ESS, 7750 SR, and VSR Triple Play Service Delivery Architecture Guide* for more information about the dynamic VPLS service feature.
Default	false
Introduced	23.3.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hold-time

Synopsis	Enter the **hold-time** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* hold-time
Tree	hold-time
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv4

Synopsis	Enter the **ipv4** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* hold-time ipv4
Tree	ipv4
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

down

Synopsis	Enter the **down** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* hold-time ipv4 down
Tree	down
Description	Commands in this context configure the down hold timer, which specifies the delay before activating the associated interface. The delay is invoked whenever the system attempts to bring the associated IP interface up, unless an operator configures the **init-only** command.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

init-only *boolean*

Synopsis	Apply delay only at interface configuration or reboot
Context	**configure** service ies *service-name* subscriber-interface *interface-name* hold-time ipv4 down init-only *boolean*
Tree	init-only
Description	This command applies a delay only when the IP interface is first configured or after a system reboot.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

seconds *number*

Synopsis	Down hold time for the IP interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* hold-time ipv4 down seconds *number*
Tree	seconds
Range	1 to 1200

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

up

Synopsis	Enter the **up** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* hold-time ipv4 up
Tree	up
Description	Commands in this context configure the up hold timer, which specifies the delay before deactivation of the associated interface. The delay is invoked whenever the system attempts to bring the associated IP interface down.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

seconds *number*

Synopsis	Up hold time for the IP interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* hold-time ipv4 up seconds *number*
Tree	seconds
Range	1 to 1200
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipv6

Synopsis	Enter the **ipv6** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* hold-time ipv6
Tree	ipv6
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

gi-address *ipv4-unicast-address*

Synopsis	GI address for the DHCP relay
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp gi-address *ipv4-unicast-address*
Tree	gi-address
Description	This command configures the GI address to distinguish between the different subscriber interfaces (and potentially group interfaces) defined when the router functions as a DHCP relay. By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lease-populate

Synopsis	Enter the **lease-populate** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp lease-populate
Tree	lease-populate
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-leases *number*

Synopsis	Maximum number of DHCPv4 leases
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp lease-populate max-leases *number*
Tree	max-leases
Range	0 to 511999
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

option-82

Synopsis	Enter the **option-82** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp option-82
Tree	option-82
Description	Commands in this context configure the processing required when the router receives a DHCP request that already has an Option 82 field in the packet.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

vendor-specific-option

Synopsis	Enter the **vendor-specific-option** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option
Tree	vendor-specific-option
Description	Commands in this context configure the Nokia Vendor-Specific Option (VSO) of the DHCP packet.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-mac-address *boolean*

Synopsis	Send the MAC address in the VSO
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option client-mac-address *boolean*
Tree	client-mac-address
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sap-id *boolean*

Synopsis	Send SAP ID in the sub-option of the DHCP relay packet
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option sap-id *boolean*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	sap-id
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

service-id *boolean*

Synopsis	Send the service ID in the Vendor Specific Option
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option service-id *boolean*
Tree	service-id
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

string *string-not-all-spaces*

Synopsis	User-defined ASCII string for the VSO
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option string *string-not-all-spaces*
Tree	string
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

system-id *boolean*

Synopsis	Send the system ID in the VSO
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp option-82 vendor-specific-option system-id *boolean*
Tree	system-id
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

proxy-server

Synopsis	Enter the **proxy-server** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp proxy-server
Tree	proxy-server
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the DHCP proxy server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp proxy-server admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

emulated-server *ipv4-unicast-address*

Synopsis	IP address used as DHCP server address in SAP context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp proxy-server emulated-server *ipv4-unicast-address*
Tree	emulated-server
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lease-time

Synopsis	Enter the **lease-time** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp proxy-server lease-time
Tree	lease-time
Introduced	16.0.R1

© 2025 Nokia.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-override *boolean*

Synopsis	Use lease time information provided by RADIUS server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp proxy-server lease-time radius-override *boolean*
Tree	radius-override
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

value *number*

Synopsis	DHCP lease time
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp proxy-server lease-time value *number*
Tree	value
Range	300 to 315446399
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

python-policy *reference*

Synopsis	Python policy
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp python-policy *reference*
Tree	python-policy
Reference	**configure** python python-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

relay-proxy

Synopsis	Enable the **relay-proxy** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp relay-proxy
Tree	relay-proxy
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

release-update-src-ip *boolean*

Synopsis	Update the source IP address of a DHCP RELEASE message
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp relay-proxy release-update-src-ip *boolean*
Tree	release-update-src-ip
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

siaddr-override *ipv4-unicast-address*

Synopsis	DHCP server IP address for address hiding function
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp relay-proxy siaddr-override *ipv4-unicast-address*
Tree	siaddr-override
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

release-include-gi-address *boolean*

Synopsis	Include the GI address in DHCP relay messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp release-include-gi-address *boolean*
Tree	release-include-gi-address
Default	false
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

server *ipv4-unicast-address*

Synopsis	DHCP server IP addresses
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp server *ipv4-unicast-address*
Tree	server
Max. instances	8
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

src-ip-addr *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp src-ip-addr *keyword*
Tree	src-ip-addr
Options	auto, gi-address
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

virtual-subnet *boolean*

Synopsis	Enable a virtual subnet for DHCPv4 hosts
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 dhcp virtual-subnet *boolean*
Tree	virtual-subnet
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

export-host-routes *boolean*

Synopsis	Allow export of subscriber management host routes

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 export-host-routes *boolean*
Tree	export-host-routes
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

unnumbered

Synopsis	Enter the **unnumbered** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 unnumbered
Tree	unnumbered
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip-address *ipv4-unicast-address*

Synopsis	IP address for the subscriber interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 unnumbered ip-address *ipv4-unicast-address*
Tree	ip-address
Notes	The following elements are part of a choice: **ip-address** or **ip-int-name**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip-int-name *interface-name*

Synopsis	Interface name from which an IPv4 addressed is borrowed
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv4 unnumbered ip-int-name *interface-name*
Tree	ip-int-name
String length	1 to 32
Notes	The following elements are part of a choice: **ip-address** or **ip-int-name**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Default	ipv6
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

proxy-server

Synopsis	Enter the **proxy-server** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server
Tree	proxy-server
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the DHCPv6 proxy server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-applications

Synopsis	Enter the **client-applications** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server client-applications
Tree	client-applications
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp *boolean*

Synopsis	Enable IPoE clients to use DHCP relay or proxy server

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server client-applications dhcp *boolean*
Tree	dhcp
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ppp *boolean*

Synopsis	Allow PPPoE clients to use DHCP relay functionality
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server client-applications ppp *boolean*
Tree	ppp
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preferred-lifetime *(number | keyword)*

Synopsis	Time for prefix to remain preferred on this interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server preferred-lifetime *(number | keyword)*
Tree	preferred-lifetime
Range	300 to 4294967294
Units	seconds
Options	infinite
Default	3600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rebind-timer *number*

Synopsis	Rebind timer (T2) for this interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server rebind-timer *number*
Tree	rebind-timer

© 2025 Nokia.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

duid-en-hex *string*

Synopsis	DUID system ID in hexadecimal format
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server server-id duid-en-hex *string*
Tree	duid-en-hex
String length	1 to 118
Notes	The following elements are part of a choice: **duid-en-ascii**, **duid-en-hex**, or **duid-ll**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

duid-ll

Synopsis	Use link-layer address (DUID-LL) as DUID
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server server-id duid-ll
Tree	duid-ll
Notes	The following elements are part of a choice: **duid-en-ascii**, **duid-en-hex**, or **duid-ll**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime *(number | keyword)*

Synopsis	Time for prefix to remain valid on this interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 proxy-server valid-lifetime *(number | keyword)*
Tree	valid-lifetime
Range	300 to 4294967294
Units	seconds
Options	infinite
Default	86400
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

python-policy *reference*

Synopsis	Python policy
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 python-policy *reference*
Tree	python-policy
Reference	**configure** python python-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

relay

Synopsis	Enter the **relay** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay
Tree	relay
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of DHCPv6 Relay
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

client-applications

Synopsis	Enter the **client-applications** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay client-applications
Tree	client-applications

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp *boolean*

Synopsis	Enable IPoE clients to use DHCP relay or proxy server
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay client-applications dhcp *boolean*
Tree	dhcp
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ppp *boolean*

Synopsis	Allow PPPoE clients to use DHCP relay functionality
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay client-applications ppp *boolean*
Tree	ppp
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lease-split

Synopsis	Enter the **lease-split** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay lease-split
Tree	lease-split
Description	Commands in this context configure DHCPv6 lease split. DHCPv6 lease split is active when administratively enabled and for all IA_NA and IA_PD options in the transaction, the configured lease split valid lifetime (short lease time) is less than or equal to one of the following: • the renew time T1 committed by the server (long renew time) • half of the preferred lifetime committed by the server when T1 committed by the server equals zero
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of DHCPv6 lease split
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay lease-split admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime *number*

Synopsis	DHCPv6 lease split valid lifetime (short lease time)
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay lease-split valid-lifetime *number*
Tree	valid-lifetime
Range	300 to 315446399
Units	seconds
Default	3600
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

link-address *ipv6-address*

Synopsis	Link address for the DHCPv6 relay messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay link-address *ipv6-address*
Tree	link-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server *ipv6-address-with-zone*

Synopsis	DHCP6 server(s) to which the DHCP6 requests are forwarded
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay server *ipv6-address-with-zone*
Tree	server
Max. instances	8
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-address *ipv6-unicast-address*

Synopsis	Source IPv6 address for the DHCPv6 relay messages
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 dhcp6 relay source-address *ipv6-unicast-address*
Tree	source-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe-bridged-mode *boolean*

Synopsis	Enable IPv6 IPoE bridged mode
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 ipoe-bridged-mode *boolean*
Tree	ipoe-bridged-mode
Default	false

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

link-local-address

Synopsis	Enter the **link-local-address** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 link-local-address
Tree	link-local-address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

address *ipv6-address*

Synopsis	IPv6 link local address
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 link-local-address address *ipv6-address*
Tree	address
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

prefix [ipv6-prefix] *ipv6-prefix*

Synopsis	Enter the **prefix** list instance
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 prefix *ipv6-prefix*
Tree	prefix
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[ipv6-prefix] *ipv6-prefix*

Synopsis	IPv6 address for a router interface
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 prefix *ipv6-prefix*
Tree	prefix

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

holdup-time *number*

Synopsis	Time to wait before route accepts new state attribute
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 prefix *ipv6-prefix* holdup-time *number*
Tree	holdup-time
Range	100 to 5000
Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

host-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Host type for subscriber interface prefixes
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 prefix *ipv6-prefix* host-type *keyword*
Tree	host-type
Options	pd – IPv6 ESM hosts for DHCPv6 prefix-delegation wan – ESM hosts for DHCPv6 addresses or by WAN interface pd-wan – Both prefix-delegation and ESM hosts
Default	pd
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-srrp *number*

Synopsis	SRRP instance whose state is tracked on this IP address
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 prefix *ipv6-prefix* track-srrp *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	track-srrp
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

router-advertisements

Synopsis	Enter the **router-advertisements** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements
Tree	router-advertisements
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of router advertisements
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

force-mcast *keyword*

Synopsis	Protocol with forced multicast
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements force-mcast *keyword*
Tree	force-mcast
Options	ip, ip-mac
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

max-advertisement-interval *number*

Synopsis	Maximum advertisement interval
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements max-advertisement-interval *number*
Tree	max-advertisement-interval
Range	900 to 1800
Units	seconds
Default	1800
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

min-advertisement-interval *number*

Synopsis	Minimum advertisement interval
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements min-advertisement-interval *number*
Tree	min-advertisement-interval
Range	900 to 1350
Units	seconds
Default	900
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

options

Synopsis	Enter the **options** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements options
Tree	options
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

current-hop-limit *number*

Synopsis	Hop limit to be advertised

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements options current-hop-limit *number*
Tree	current-hop-limit
Range	0 to 255
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dns

Synopsis	Enter the **dns** context
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements options dns
Tree	dns
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

include-rdnss *boolean*

Synopsis	Include the RDNSS server option 25
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements options dns include-rdnss *boolean*
Tree	include-rdnss
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rdnss-lifetime *(number | keyword)*

Synopsis	Maximum time for the RDNSS address to remain valid
Context	**configure** service ies *service-name* subscriber-interface *interface-name* ipv6 router-advertisements options dns rdnss-lifetime *(number | keyword)*
Tree	rdnss-lifetime
Range	900 to 3600
Units	seconds
Options	infinite

© 2025 Nokia.

export *ipv4-unicast-prefix*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Route to export to peer
Context	**configure** service ies *service-name* subscriber-interface *interface-name* wlan-gw redundancy export *ipv4-unicast-prefix*
Tree	export
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

monitor *ipv4-unicast-prefix*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Peer route to monitor
Context	**configure** service ies *service-name* subscriber-interface *interface-name* wlan-gw redundancy monitor *ipv4-unicast-prefix*
Tree	monitor
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-mgmt

Synopsis	Enter the **subscriber-mgmt** context
Context	**configure** service ies *service-name* subscriber-mgmt
Tree	subscriber-mgmt
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

multi-chassis-shunt-id *number*

Synopsis	Shunt ID for a pair of resilient nodes

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service ies *service-name* subscriber-mgmt multi-chassis-shunt-id *number*
Tree	multi-chassis-shunt-id
Description	This command configures the shunt ID that is used to shunt downstream traffic from a standby node to an active node. Because this ID identifies the traffic service on the standby node, the same ID must be configured per service on each node. This configuration is required for inter-BNG-UP resiliency shunting, but not for non-BNG-UP shunting. However, when configured, it is also used for shunting non-BNG-UP sessions in the same service.
Range	1 to 8191
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

up-resiliency

Synopsis	Enter the **up-resiliency** context
Context	**configure** service ies *service-name* subscriber-mgmt up-resiliency
Tree	up-resiliency
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

monitor-oper-group [oper-group] *reference*

Synopsis	Enter the **monitor-oper-group** list instance
Context	**configure** service ies *service-name* subscriber-mgmt up-resiliency monitor-oper-group *reference*
Tree	monitor-oper-group
Description	Commands in this context define parameters to derive the service health based on monitored operational groups. The BNG-UP sends the health value to the MAG-c. The MAG-c uses the value to determine the need for a BNG-UP status change (active or standby). **Note:** The following is only applicable for the **configure service vpls capture-sap** context. If the configured groups are not the same for all capture SAPs sharing the same underlying port or LAG, the configuration of a Layer 2 access ID alias is required, or else the system chooses arbitrarily one set of configured groups.
Max. instances	2
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**oper-group**] *reference*

Synopsis	Operational group name
Context	**configure** service ies *service-name* subscriber-mgmt up-resiliency monitor-oper-group *reference*
Tree	monitor-oper-group
Reference	**configure** service oper-group *named-item*
Notes	This element is part of a list key.
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

health-drop *number*

Synopsis	Number subtracted from the health value per failure
Context	**configure** service ies *service-name* subscriber-mgmt up-resiliency monitor-oper-group *reference* health-drop *number*
Tree	health-drop
Description	This command configures the drop in the health value for every operational group member failure. Every failure of an operational group member decreases the base health value to a possible minimum of 0.
Range	1 to 100
Default	1
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

video-interface [interface-name] *interface-name*

Synopsis	Enter the **video-interface** list instance
Context	**configure** service ies *service-name* video-interface *interface-name*
Tree	video-interface
Max. instances	9
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service ipipe *service-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	20.10.R1

[scheduler-name] *named-item*

Synopsis	Scheduler name
Context	**configure** service ipipe *service-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

service-mtu *number*

Synopsis	MTU size
Context	**configure** service ipipe *service-name* service-mtu *number*
Tree	service-mtu

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description This command configures the Maximum Transmission Unit (MTU) value (payload) for the service. The system uses the value to validate the operational state of the SAP and SDP binding within the service. The value overrides the default MTU for the service type.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) are used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated.

Binding operational states are automatically reevaluated.

For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

In the **configure service epipe spoke-sdp** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE.

Platforms	All

bfd-template *reference*

Synopsis	BFD template associated with the SDP binding
Context	**configure** service ipipe *service-name* spoke-sdp *sdp-bind-id* bfd bfd-template *reference*
Tree	bfd-template
Description	This command configures a named BFD template to be used by VCCV BFD on PWs belonging to the VLL service. The template specifies parameters, such as the minimum transmit and receive control packet timer intervals, used by the BFD session. Template parameters are configured under the **configure router bfd** context.
Reference	**configure** bfd bfd-template *named-item*
Introduced	21.2.R1
Platforms	All

ce-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the CE device
Context	**configure** service ipipe *service-name* spoke-sdp *sdp-bind-id* ce-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	ce-address
Introduced	20.10.R1
Platforms	All

control-word *boolean*

Synopsis	Use control word as part of packet encapsulation
Context	**configure** service ipipe *service-name* spoke-sdp *sdp-bind-id* control-word *boolean*
Tree	control-word
Default	false

forward

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Forward mode of operation
Context	**configure** service nat classifier *named-item* entry *number* action forward
Tree	forward
Notes	The following elements are part of a choice: (**destination-nat**, **dnat**, and **dnat-ip-address**) or **forward**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** service nat classifier *named-item* entry *number* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

match

Synopsis	Enter the **match** context
Context	**configure** service nat classifier *named-item* entry *number* match
Tree	match
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dst-port-range

Synopsis	Enter the **dst-port-range** context
Context	**configure** service nat classifier *named-item* entry *number* match dst-port-range
Tree	dst-port-range
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

end *number*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Upper bound of the port range
Context	**configure** service nat classifier *named-item* entry *number* match dst-port-range end *number*
Tree	end
Range	0 | 1 to 65535
Default	65535
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

start *number*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Lower bound of the port range
Context	**configure** service nat classifier *named-item* entry *number* match dst-port-range start *number*
Tree	start
Range	0 | 1 to 65535
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

foreign-ip-address *ipv4-unicast-address*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Foreign IP address as the match criterion
Context	**configure** service nat classifier *named-item* entry *number* match foreign-ip-address *ipv4-unicast-address*

Use subject to Terms available at: www.nokia.com/terms.

Tree	foreign-ip-address
Introduced	19.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol *keyword*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	IP protocol to match
Context	**configure** service nat classifier *named-item* entry *number* match protocol *keyword*
Tree	protocol
Options	tcp, udp
Default	udp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

deterministic-script

Synopsis	Enter the **deterministic-script** context
Context	**configure** service nat deterministic-script
Tree	deterministic-script
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

location *ftp-tftp-url*

Synopsis	Remote location where Python script is exported
Context	**configure** service nat deterministic-script location *ftp-tftp-url*
Tree	location
String length	1 to 180
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

firewall-policy [name] *external-named-item*

Synopsis	Enter the **firewall-policy** list instance
Context	**configure** service nat firewall-policy *external-named-item*
Tree	firewall-policy
Description	Commands in this context configure the attributes of the firewall policy, for use in contexts where basic protection from outside attack vectors is required. Firewall policies cannot be deleted if they are in use.
Max. instances	2048
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**name**] *external-named-item*

Synopsis	Firewall policy name
Context	**configure** service nat firewall-policy *external-named-item*
Tree	firewall-policy
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

alg

Synopsis	Enter the **alg** context
Context	**configure** service nat firewall-policy *external-named-item* alg
Tree	alg
Description	Commands in this context configure the Application Layer Gateway (ALG) attributes of the policy.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

ftp *boolean*

Synopsis	Use FTP ALG for the policy

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat firewall-policy *external-named-item* alg ftp *boolean*
Tree	ftp
Default	true
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

rtsp *boolean*

Synopsis	Use RTSP ALG for the policy
Context	**configure** service nat firewall-policy *external-named-item* alg rtsp *boolean*
Tree	rtsp
Description	When configured to **true**, Real-Time Streaming Protocol (RTSP) ALG is used for the policy.
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

sip *boolean*

Synopsis	Use SIP ALG for the policy
Context	**configure** service nat firewall-policy *external-named-item* alg sip *boolean*
Tree	sip
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** service nat firewall-policy *external-named-item* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

domain

Synopsis	Enter the **domain** context
Context	**configure** service nat firewall-policy *external-named-item* domain
Tree	domain
Description	Commands in this context configure the attributes of the domain for the firewall policy. All associated traffic must be part of the prefixes specified by this domain.
Notes	The following elements are part of a choice: **domain** or **l2-outside**.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

name *named-item*

Synopsis	Firewall domain name
Context	**configure** service nat firewall-policy *external-named-item* domain name *named-item*
Tree	name
String length	1 to 32
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

router-instance *string*

Synopsis	Router or VPRN service name
Context	**configure** service nat firewall-policy *external-named-item* domain router-instance *string*
Tree	router-instance
Description	This command specifies the router instance or VPRN service for this domain. All associated traffic must be part of the prefixes specified by this domain.
Introduced	16.0.R4
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

filtering *keyword*

Synopsis	Filtering method for inbound traffic for the policy
Context	**configure** service nat firewall-policy *external-named-item* filtering *keyword*
Tree	filtering

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	endpoint-independent, address-and-port-dependent
Default	endpoint-independent
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2-outside

Synopsis	Use Layer 2 outside service address location
Context	**configure** service nat firewall-policy *external-named-item* l2-outside
Tree	l2-outside
Description	This command specifies Layer 2 outside service address location for the NAT policy instead of Layer 3 outside service.
Notes	The following elements are part of a choice: **domain** or **l2-outside**.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-limits

Synopsis	Enter the **port-limits** context
Context	**configure** service nat firewall-policy *external-named-item* port-limits
Tree	port-limits
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

forwarding *number*

Synopsis	Maximum number of port forwarding entries
Context	**configure** service nat firewall-policy *external-named-item* port-limits forwarding *number*
Tree	forwarding
Range	1 to 65535
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

priority-sessions

Synopsis	Enter the **priority-sessions** context
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions
Tree	priority-sessions
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

fc

Synopsis	Enter the **fc** context
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc
Tree	fc
Description	Commands in this context specify which Forwarding Class (FC) options have prioritized sessions.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

af *boolean*

Synopsis	Prioritize traffic from AF forwarding classes
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc af *boolean*
Tree	af
Description	When configured to **true**, traffic from Assured Forwarding (AF) FC sessions is prioritized.
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

be *boolean*

Synopsis	Prioritize traffic from BE forwarding classes
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc be *boolean*
Tree	be

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, traffic from Best Effort (BE) FC sessions is prioritized. When configured to **false**, BE traffic is not prioritized.
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

ef *boolean*

Synopsis	Prioritize traffic from EF forwarding classes
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc ef *boolean*
Tree	ef
Description	When configured to **true**, traffic from Expedited Forwarding (EF) FC sessions is prioritized. When configured to **false**, EF traffic is not prioritized.
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

h1 *boolean*

Synopsis	Prioritize traffic from H1 forwarding classes
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc h1 *boolean*
Tree	h1
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

h2 *boolean*

Synopsis	Prioritize traffic from H2 forwarding classes
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc h2 *boolean*
Tree	h2
Default	false
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

l1 *boolean*

Synopsis	Prioritize traffic from L1 forwarding classes
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc l1 *boolean*
Tree	l1
Description	When configured to **true**, traffic from L1 sessions is prioritized.
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2 *boolean*

Synopsis	Prioritize traffic from L2 forwarding classes
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc l2 *boolean*
Tree	l2
Description	When configured to **true**, traffic from L2 sessions is prioritized. When configured to false, L2 traffic is not prioritized.
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

nc *boolean*

Synopsis	Prioritize traffic from NC forwarding classes
Context	**configure** service nat firewall-policy *external-named-item* priority-sessions fc nc *boolean*
Tree	nc
Description	When configured to **true**, traffic from Network Class (NC) sessions is prioritized. When configured to **false**, NC traffic is not prioritized.
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

session-limits

Synopsis	Enter the **session-limits** context
Context	**configure** service nat firewall-policy *external-named-item* session-limits
Tree	session-limits
Description	Commands in this context configure session-limit attributes for the policy.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

max *number*

Synopsis	Maximum number of sessions per subscriber
Context	**configure** service nat firewall-policy *external-named-item* session-limits max *number*
Tree	max
Range	1 to 65535
Default	65535
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

reserved *number*

Synopsis	Number of sessions reserved for prioritized sessions
Context	**configure** service nat firewall-policy *external-named-item* session-limits reserved *number*
Tree	reserved
Description	This command configures the number of sessions per block that are reserved for prioritized sessions.
Range	1 to 65534
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat firewall-policy *external-named-item* session-limits watermarks

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	watermarks
Description	This command configures watermarks for NAT resources.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

high *number*

Synopsis	High watermark percentage
Context	**configure** service nat firewall-policy *external-named-item* session-limits watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

low *number*

Synopsis	Low watermark percentage
Context	**configure** service nat firewall-policy *external-named-item* session-limits watermarks low *number*
Tree	low
Description	This command configures the low threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp

Synopsis	Enter the **tcp** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat firewall-policy *external-named-item* tcp
Tree	tcp
Description	Commands in this context configure the Transmission Control Protocol (TCP) attributes of the policy.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

mss-adjust *number*

Synopsis	TCP MSS adjustment value
Context	**configure** service nat firewall-policy *external-named-item* tcp mss-adjust *number*
Tree	mss-adjust
Description	This command configures the value to use to adjust the TCP Maximum Segment Size (MSS) option, if not already present or the present value is higher.
Range	160 to 10240
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

timeouts

Synopsis	Enter the **timeouts** context
Context	**configure** service nat firewall-policy *external-named-item* timeouts
Tree	timeouts
Description	Commands in this context configure the attributes of session idle timeouts for the policy.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

icmp6-query *number*

Synopsis	Timeout applied to an ICMPv6 Query session
Context	**configure** service nat firewall-policy *external-named-item* timeouts icmp6-query *number*
Tree	icmp6-query
Range	60 to 240
Units	seconds
Default	60

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

sip *number*

Synopsis	SIP inactive media timeout
Context	**configure** service nat firewall-policy *external-named-item* timeouts sip *number*
Tree	sip
Range	10 to 7200
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp

Synopsis	Enter the **tcp** context
Context	**configure** service nat firewall-policy *external-named-item* timeouts tcp
Tree	tcp
Description	Commands in this context configure TCP timeout attributes.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

established *number*

Synopsis	Idle timeout for TCP session in established state
Context	**configure** service nat firewall-policy *external-named-item* timeouts tcp established *number*
Tree	established
Range	60 to 86400
Units	seconds
Default	7440
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rst *number*

Synopsis	Suspend time for TCP connection ports closed by RST
Context	**configure** service nat firewall-policy *external-named-item* timeouts tcp rst *number*
Tree	rst
Description	This command configures the suspend time for outside TCP ports that are used in translations for TCP connections, when they are closed by TCP Reset (RST). After the timer expires, the outside ports can be reused for new TCP translations.
Range	0 to 240
Units	seconds
Default	0
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

syn *number*

Synopsis	TCP session timeout when synchronizing initial sequence
Context	**configure** service nat firewall-policy *external-named-item* timeouts tcp syn *number*
Tree	syn
Range	6 to 86400
Units	seconds
Default	15
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

time-wait *number*

Synopsis	Timeout applied to a TCP session in the time-wait state
Context	**configure** service nat firewall-policy *external-named-item* timeouts tcp time-wait *number*
Tree	time-wait
Range	0 to 240
Units	seconds
Default	0
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

transitory *number*

Synopsis	Idle timeout for TCP session in transitory state
Context	**configure** service nat firewall-policy *external-named-item* timeouts tcp transitory *number*
Tree	transitory
Range	60 to 86400
Units	seconds
Default	240
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat firewall-policy *external-named-item* timeouts udp
Tree	udp
Description	Commands in this context configure the User Datagram Protocol (UDP) mapping timeout attributes.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

dns *number*

Synopsis	Timeout applied to UDP session with destination port 53
Context	**configure** service nat firewall-policy *external-named-item* timeouts udp dns *number*
Tree	dns
Range	15 to 86400
Units	seconds
Default	15
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

initial *number*

Synopsis	UDP mapping timeout applied to new sessions

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat firewall-policy *external-named-item* timeouts udp initial *number*
Tree	initial
Range	10 to 300
Units	seconds
Default	15
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

normal *number*

Synopsis	UDP mapping timeout
Context	**configure** service nat firewall-policy *external-named-item* timeouts udp normal *number*
Tree	normal
Range	60 to 86400
Units	seconds
Default	300
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

unknown-protocol *number*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Timeout for flows with an unknown protocol
Context	**configure** service nat firewall-policy *external-named-item* timeouts unknown-protocol *number*
Tree	unknown-protocol
Range	60 to 86400
Units	seconds
Default	300
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat firewall-policy *external-named-item* udp
Tree	udp
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

inbound-refresh *boolean*

Synopsis	Extend UDP session timeout on inbound traffic
Context	**configure** service nat firewall-policy *external-named-item* udp inbound-refresh *boolean*
Tree	inbound-refresh
Description	When configured to **true**, the router extends the UDP session timeout on inbound traffic. When configured to **false**, the router does not extend the UDP session timeout.
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

unknown-protocols

Synopsis	Enter the **unknown-protocols** context
Context	**configure** service nat firewall-policy *external-named-item* unknown-protocols
Tree	unknown-protocols
Description	Commands in this context configure the treatment of flows of unknown Layer 4 protocols that cannot be natively handled by the system.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

all

Synopsis	Allow all protocols to create unknown flows
Context	**configure** service nat firewall-policy *external-named-item* unknown-protocols all
Tree	all

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured, all protocols are permitted to create unknown flows. Protocol or IPv6 extension header values that are explicitly supported by SR OS are not treated as unknown protocols.
Notes	The following elements are part of a choice: **all** or **protocol**.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol *number*

Synopsis	IANA number of protocol allowed to create unknown flow
Context	**configure** service nat firewall-policy *external-named-item* unknown-protocols protocol *number*
Tree	protocol
Description	This command specifies the Internet Assigned Numbers Authority (IANA) number of a protocol that is permitted to create unknown flows. Protocol or IPv6 extension header values that are explicitly supported by SR OS can be configured but are not treated as unknown protocols.
Range	0 to 255
Max. instances	8
Notes	The following elements are part of a choice: **all** or **protocol**.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

map-t

Synopsis	Enter the **map-t** context
Context	**configure** service nat map-t
Tree	map-t
Description	Commands in this context create a MAP domain template, which defines MAP rules and options specific to the MAP domain. A MAP domain represents a set of CEs that share the same default gateway (Border Relay (BR) IPv6 prefix - DMR rule) and a set of basic MAP rules (BMRs). As a bordering node between the IPv6 and IPv4 realm, the BR performs stateless IPv4 and IPv6 translation based on MAP rules. A MAP domain can be instantiated within a routing context by referencing an existing MAP domain template.
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

domain [name] *named-item*

Synopsis	Enter the **domain** list instance
Context	**configure** service nat map-t domain *named-item*
Tree	domain
Description	Commands in this context configure MAP rules and options for this MAP-T domain. A MAP-T domain represents a set of CEs that share the same default gateway (Border Relay (BR) IPv6 prefix - DMR rule) and a set of basic MAP rules (BMRs). As a bordering node between the IPv6 and IPv4 realm, the BR performs stateless IPv4 and IPv6 translation based on MAP rules. A MAP-T domain can be instantiated within a routing context by referencing an existing MAP-T domain profile within this routing context.
Max. instances	63
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

[**name**] *named-item*

Synopsis	MAP domain name
Context	**configure** service nat map-t domain *named-item*
Tree	domain
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

admin-state *keyword*

Synopsis	Administrative state of the MAP-T domain
Context	**configure** service nat map-t domain *named-item* admin-state *keyword*
Tree	admin-state
Description	This command configures the administrative state of the MAP-T domain. A MAP-T domain can be administratively enabled only when the DMR prefix is configured. Disabling an instantiated domain withdraws all routes associated with it.
Options	enable, disable
Default	disable

Reference	**configure** fwd-path-ext fpe *number*
Introduced	24.10.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

ip-fragmentation

Synopsis	Enter the **ip-fragmentation** context
Context	**configure** service nat map-t domain *named-item* ip-fragmentation
Tree	ip-fragmentation
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

v6-frag-header *boolean*

Synopsis	Enable insertion of fragmentation header in IPv6 packet
Context	**configure** service nat map-t domain *named-item* ip-fragmentation v6-frag-header *boolean*
Tree	v6-frag-header
Description	When configured to **true**, this command enables the insertion of the fragmentation header in an IPv6 packet when translating non-fragmented IPv4 packets with DF=0. When configured to **false**, this command disables the insertion of the fragmentation header in an IPv6 packet. The size of the IPv6 packet is reduced by 8 bytes.
Default	false
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

ipv6-udp-checksum-recalculation *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the IPv6 UDP checksum recalculation in ESA
Context	**configure** service nat map-t domain *named-item* ipv6-udp-checksum-recalculation *boolean*
Tree	ipv6-udp-checksum-recalculation

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router recalculates the UDP checksum for translated IPv6 packets when the incoming IPv4 packet has a zero UDP checksum.
Default	false
Introduced	25.3.R2
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

map-t-group *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	MAP-T group with domain association
Context	**configure** service nat map-t domain *named-item* map-t-group *reference*
Tree	map-t-group
Reference	**configure** isa map-t-group *number*
Introduced	24.10.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

mapping-rule [rule-name] *named-item*

Synopsis	Enter the **mapping-rule** list instance
Context	**configure** service nat map-t domain *named-item* mapping-rule *named-item*
Tree	mapping-rule
Description	Commands in this context configure MAP-T rules.
Max. instances	16383
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

[**rule-name**] *named-item*

Synopsis	Mapping rule name
Context	**configure** service nat map-t domain *named-item* mapping-rule *named-item*
Tree	mapping-rule
Description	This command configures a mapping rule name.

rule-prefix *ipv6-prefix*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	MAP-T rule prefix
Context	**configure** service nat map-t domain *named-item* mapping-rule *named-item* rule-prefix *ipv6-prefix*
Tree	rule-prefix
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

statistics-collection *boolean*

Synopsis	Enable statistics collection
Context	**configure** service nat map-t domain *named-item* mapping-rule *named-item* statistics-collection *boolean*
Tree	statistics-collection
Description	When configured to **true**, the router collects detailed statistics for the MAP-T rule. This command must be configured for each rule for which detailed statistics tracking is required. This command must be set to **true** for each rule requiring detailed statistics tracking.
Default	false
Introduced	24.7.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

mtu *number*

Synopsis	IPv6 MTU for the domain
Context	**configure** service nat map-t domain *named-item* mtu *number*
Tree	mtu
Description	This command configures the IPv6 MTU of the translated packet in a MAP domain. The configured MTU applies to traffic in the downstream direction, toward the CE. The

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configured MTU value must be lower than the MTU of the outgoing port for the traffic, which includes Layer 2 overhead.

Range	160 to 8686
Default	8686
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

tcp-mss-adjust *number*

Synopsis	TCP maximum segment size
Context	**configure** service nat map-t domain *named-item* tcp-mss-adjust *number*
Tree	tcp-mss-adjust
Description	This command configures the TCP maximum segment size (MSS) adjustments in a MAP domain. The TCP SYN and SYN-ACK packets are intercepted in both directions, and if their MSS value is larger than the one configured using this command, the MSS value in the packet is rewritten (lowered) to the configured value. The end hosts use the lowest setting of the two hosts. The MSS value does not account for the IP or TCP header length. If the MSS value in the SYN or SYN-ACK is not found, a new value is added and set to the configured value.
Range	0 | 160 to 8626
Default	0
Introduced	16.0.R4
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, VSR

nat-policy [name] *external-named-item*

Synopsis	Enter the **nat-policy** list instance
Context	**configure** service nat nat-policy *external-named-item*
Tree	nat-policy
Max. instances	4096
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**name**] *external-named-item*

Synopsis	NAT policy name

© 2025 Nokia.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

alg

Synopsis	Enter the **alg** context
Context	**configure** service nat nat-policy *external-named-item* alg
Tree	alg
Description	Commands in this context configure the Application Layer Gateway (ALG) attributes of the policy.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ftp *boolean*

Synopsis	Use FTP ALG for the policy
Context	**configure** service nat nat-policy *external-named-item* alg ftp *boolean*
Tree	ftp
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pptp *boolean*

Synopsis	Use PPTP ALG for the policy
Context	**configure** service nat nat-policy *external-named-item* alg pptp *boolean*
Tree	pptp
Description	When configured to **true**, the policy uses Point-to-Point Tunneling Protocol (PPTP) ALG. PPTP sessions can only be initiated from NAT inside. GRE traffic is allowed through NAT only if the corresponding mapping exists. There can be seven calls (GRE tunnels) per control session.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	When configured to **false**, PPTP ALG is not used.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rtsp *boolean*

Synopsis	Use RTSP ALG for the policy
Context	**configure** service nat nat-policy *external-named-item* alg rtsp *boolean*
Tree	rtsp
Description	When configured to **true**, Real-Time Streaming Protocol (RTSP) ALG is used for the policy.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sip *boolean*

Synopsis	Use SIP ALG for the policy
Context	**configure** service nat nat-policy *external-named-item* alg sip *boolean*
Tree	sip
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

block-limit *number*

Synopsis	Maximum number of port blocks per subscriber
Context	**configure** service nat nat-policy *external-named-item* block-limit *number*
Tree	block-limit
Range	1 to 40
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dnat

Synopsis	Enter the **dnat** context
Context	**configure** service nat nat-policy *external-named-item* dnat
Tree	dnat
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

classifier *reference*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	NAT classifier
Context	**configure** service nat nat-policy *external-named-item* dnat classifier *reference*
Tree	classifier
Description	When configured within the NAT policy, this command references a NAT classifier that activates DNAT functionality. The configuration uses a filter-like approach to identify the traffic that is subjected to DNAT. It is required for translation of the destination IP address.
Reference	**configure** service nat classifier *named-item*
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dnat-only

Synopsis	Enable the **dnat-only** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat nat-policy *external-named-item* dnat-only
Tree	dnat-only
Description	Commands in this context configure the attributes of DNAT-only. When DNAT-only is configured, no source or port NAT (SNAPT) is performed. Only the destination IP address (going from inside to outside) is translated; the source IP address and port are not translated.
Notes	The following elements are part of a choice: **dnat-only**, **l2-outside**, or **pool**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-group *reference*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	NAT group
Context	**configure** service nat nat-policy *external-named-item* dnat-only nat-group *reference*
Tree	nat-group
Description	This command configures the NAT group in which DNAT translation takes place for the outside routing context.
Reference	**configure** isa nat-group *number*
Notes	The following elements are part of a mandatory choice: **nat-group** or **wlan-gw-group**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

router-instance *string*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

pool

Synopsis	Enter the **pool** context
Context	**configure** service nat nat-policy *external-named-item* pool
Tree	pool
Notes	The following elements are part of a choice: **dnat-only**, **l2-outside**, or **pool**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

name *named-item*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	NAT pool name
Context	**configure** service nat nat-policy *external-named-item* pool name *named-item*
Tree	name
String length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

router-instance *string*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Router or VPRN service name
Context	**configure** service nat nat-policy *external-named-item* pool router-instance *string*
Tree	router-instance
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port-forwarding-range-end *number*

Synopsis	End of the port forwarding range
Context	**configure** service nat nat-policy *external-named-item* port-forwarding-range-end *number*
Tree	port-forwarding-range-end
Description	This command specifies the end of the port range available for port forwarding. The start of the range is always equal to one. The number of ports that can be configured is half of the available block => 64512 / 2 = 32256. In combination with the configured value for **port-forwarding-range-end**, the formulas are: max port-reservation blocks = 65535 - port-forwarding-range-end max port-reservation ports = (65535 - port-forwarding-range-end) / 2 If **port-reservation** is already configured, the following applies for the maximum port-forwarding-range-end: max port-forwarding-range-end = 65535 - port-reservation blocksmax port-forwarding-range-end = 65535 - (port-reservation ports * 2)
Range	1023 to 65535
Default	1023
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-limits

Synopsis	Enter the **port-limits** context
Context	**configure** service nat nat-policy *external-named-item* port-limits
Tree	port-limits
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dynamic-ports *number*

Synopsis	Maximum number of dynamic ports per subscriber
Context	**configure** service nat nat-policy *external-named-item* port-limits dynamic-ports *number*
Tree	dynamic-ports

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command limits the number of ports per protocol on an outside IP address for a subscriber regardless of the pool pairing mode. This command applies to LSN44 pools with flexible port allocation.
Range	1 to 65536
Default	65536
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

forwarding *number*

Synopsis	Maximum number of port forwarding entries
Context	**configure** service nat nat-policy *external-named-item* port-limits forwarding *number*
Tree	forwarding
Range	1 to 65535
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reserved *number*

Synopsis	Number of ports reserved for prioritized sessions
Context	**configure** service nat nat-policy *external-named-item* port-limits reserved *number*
Tree	reserved
Description	This command configures the number of ports per block that are reserved for prioritized sessions.
Range	1 to 65534
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat nat-policy *external-named-item* port-limits watermarks
Tree	watermarks
Description	This command configures watermarks for NAT resources.
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

high *number*

Synopsis	High watermark percentage
Context	**configure** service nat nat-policy *external-named-item* port-limits watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

low *number*

Synopsis	Low watermark percentage
Context	**configure** service nat nat-policy *external-named-item* port-limits watermarks low *number*
Tree	low
Description	This command configures the low threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

priority-sessions

Synopsis	Enter the **priority-sessions** context
Context	**configure** service nat nat-policy *external-named-item* priority-sessions
Tree	priority-sessions
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

fc

Synopsis	Enter the **fc** context
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc
Tree	fc
Description	Commands in this context specify which Forwarding Class (FC) options have prioritized sessions.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

af *boolean*

Synopsis	Prioritize traffic from AF forwarding classes
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc af *boolean*
Tree	af
Description	When configured to **true**, traffic from Assured Forwarding (AF) FC sessions is prioritized.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

be *boolean*

Synopsis	Prioritize traffic from BE forwarding classes
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc be *boolean*
Tree	be
Description	When configured to **true**, traffic from Best Effort (BE) FC sessions is prioritized. When configured to **false**, BE traffic is not prioritized.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ef *boolean*

Synopsis	Prioritize traffic from EF forwarding classes
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc ef *boolean*
Tree	ef
Description	When configured to **true**, traffic from Expedited Forwarding (EF) FC sessions is prioritized. When configured to **false**, EF traffic is not prioritized.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

h1 *boolean*

Synopsis	Prioritize traffic from H1 forwarding classes
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc h1 *boolean*
Tree	h1
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

h2 *boolean*

Synopsis	Prioritize traffic from H2 forwarding classes
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc h2 *boolean*
Tree	h2
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l1 *boolean*

Synopsis	Prioritize traffic from L1 forwarding classes
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc l1 *boolean*
Tree	l1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, traffic from L1 sessions is prioritized.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2 *boolean*

Synopsis	Prioritize traffic from L2 forwarding classes
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc l2 *boolean*
Tree	l2
Description	When configured to **true**, traffic from L2 sessions is prioritized. When configured to false, L2 traffic is not prioritized.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nc *boolean*

Synopsis	Prioritize traffic from NC forwarding classes
Context	**configure** service nat nat-policy *external-named-item* priority-sessions fc nc *boolean*
Tree	nc
Description	When configured to **true**, traffic from Network Class (NC) sessions is prioritized. When configured to **false**, NC traffic is not prioritized.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

session-limits

Synopsis	Enter the **session-limits** context
Context	**configure** service nat nat-policy *external-named-item* session-limits
Tree	session-limits
Description	Commands in this context configure session-limit attributes for the policy.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max *number*

Synopsis	Maximum number of sessions per subscriber
Context	**configure** service nat nat-policy *external-named-item* session-limits max *number*
Tree	max
Range	1 to 65535
Default	65535
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reserved *number*

Synopsis	Number of sessions reserved for prioritized sessions
Context	**configure** service nat nat-policy *external-named-item* session-limits reserved *number*
Tree	reserved
Description	This command configures the number of sessions per block that are reserved for prioritized sessions.
Range	1 to 65534
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat nat-policy *external-named-item* session-limits watermarks
Tree	watermarks
Description	This command configures watermarks for NAT resources.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

high *number*

Synopsis	High watermark percentage
Context	**configure** service nat nat-policy *external-named-item* session-limits watermarks high *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

low *number*

Synopsis	Low watermark percentage
Context	**configure** service nat nat-policy *external-named-item* session-limits watermarks low *number*
Tree	low
Description	This command configures the low threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp

Synopsis	Enter the **tcp** context
Context	**configure** service nat nat-policy *external-named-item* tcp
Tree	tcp
Description	Commands in this context configure the Transmission Control Protocol (TCP) attributes of the policy.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mss-adjust *number*

Synopsis	TCP MSS adjustment value

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat nat-policy *external-named-item* tcp mss-adjust *number*
Tree	mss-adjust
Description	This command configures the value to use to adjust the TCP Maximum Segment Size (MSS) option, if not already present or the present value is higher.
Range	160 to 10240
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reset-unknown *boolean*

Synopsis	Generate TCP reset for packets from unknown flows
Context	**configure** service nat nat-policy *external-named-item* tcp reset-unknown *boolean*
Tree	reset-unknown
Description	When configured to **true**, TCP packets are dropped and a TCP reset is generated if the NAT inside receives a TCP packet without the SYN flag set for an unknown flow. When configured to **false**, no TCP reset is generated.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

timeouts

Synopsis	Enter the **timeouts** context
Context	**configure** service nat nat-policy *external-named-item* timeouts
Tree	timeouts
Description	Commands in this context configure the attributes of session idle timeouts for the policy.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

icmp-query *number*

Synopsis	Timeout applied to an ICMP Query session
Context	**configure** service nat nat-policy *external-named-item* timeouts icmp-query *number*
Tree	icmp-query
Range	60 to 240

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	seconds
Default	60
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sip *number*

Synopsis	SIP inactive media timeout
Context	**configure** service nat nat-policy *external-named-item* timeouts sip *number*
Tree	sip
Range	10 to 7200
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-retention *number*

Synopsis	IP address hold time after host and port blocks expire
Context	**configure** service nat nat-policy *external-named-item* timeouts subscriber-retention *number*
Tree	subscriber-retention
Description	This command configures the time to keep a NAT subscriber and its associated IP address after all hosts and associated port blocks expire. If a NAT subscriber host appears before the retention timeout elapses, it is given the same outside IP address.
Range	0 to 1440
Units	minutes
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp

Synopsis	Enter the **tcp** context
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp
Tree	tcp

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure TCP timeout attributes.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

established *number*

Synopsis	Idle timeout for TCP session in established state
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp established *number*
Tree	established
Range	60 to 86400
Units	seconds
Default	7440
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rst *number*

Synopsis	Suspend time for TCP connection ports closed by RST
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp rst *number*
Tree	rst
Description	This command configures the suspend time for outside TCP ports that are used in translations for TCP connections, when they are closed by TCP Reset (RST). After the timer expires, the outside ports can be reused for new TCP translations.
Range	0 to 240
Units	seconds
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syn *number*

Synopsis	TCP session timeout when synchronizing initial sequence
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp syn *number*
Tree	syn
Range	6 to 86400

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	seconds
Default	15
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

time-wait *number*

Synopsis	Timeout applied to a TCP session in the time-wait state
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp time-wait *number*
Tree	time-wait
Range	0 to 240
Units	seconds
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

transitory *number*

Synopsis	Idle timeout for TCP session in transitory state
Context	**configure** service nat nat-policy *external-named-item* timeouts tcp transitory *number*
Tree	transitory
Range	60 to 86400
Units	seconds
Default	240
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat nat-policy *external-named-item* timeouts udp
Tree	udp
Description	Commands in this context configure the User Datagram Protocol (UDP) mapping timeout attributes.
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dns *number*

Synopsis	Timeout applied to UDP session with destination port 53
Context	**configure** service nat nat-policy *external-named-item* timeouts udp dns *number*
Tree	dns
Range	15 to 86400
Units	seconds
Default	15
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

initial *number*

Synopsis	UDP mapping timeout applied to new sessions
Context	**configure** service nat nat-policy *external-named-item* timeouts udp initial *number*
Tree	initial
Range	10 to 300
Units	seconds
Default	15
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

normal *number*

Synopsis	UDP mapping timeout
Context	**configure** service nat nat-policy *external-named-item* timeouts udp normal *number*
Tree	normal
Range	60 to 86400
Units	seconds
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat nat-policy *external-named-item* udp
Tree	udp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

inbound-refresh *boolean*

Synopsis	Extend UDP session timeout on inbound traffic
Context	**configure** service nat nat-policy *external-named-item* udp inbound-refresh *boolean*
Tree	inbound-refresh
Description	When configured to **true**, the router extends the UDP session timeout on inbound traffic. When configured to **false**, the router does not extend the UDP session timeout.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pcp-server-policy [name] *named-item*

Synopsis	Enter the **pcp-server-policy** list instance
Context	**configure** service nat pcp-server-policy *named-item*
Tree	pcp-server-policy
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**name**] *named-item*

Synopsis	PCP server policy name
Context	**configure** service nat pcp-server-policy *named-item*
Tree	pcp-server-policy
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** service nat pcp-server-policy *named-item* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lifetime

Synopsis	Enter the **lifetime** context
Context	**configure** service nat pcp-server-policy *named-item* lifetime
Tree	lifetime
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

maximum *number*

Synopsis	Maximum lifetime of explicit mappings made by the PCP servers
Context	**configure** service nat pcp-server-policy *named-item* lifetime maximum *number*
Tree	maximum
Range	61 to 86400
Default	86400
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

minimum *number*

Synopsis	Minimum lifetime of explicit mappings made by the PCP servers
Context	**configure** service nat pcp-server-policy *named-item* lifetime minimum *number*
Tree	minimum
Range	60 to 86399

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	120
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

max-description-size *number*

Synopsis	Maximum length of mapping descriptions made by the PCP servers
Context	**configure** service nat pcp-server-policy *named-item* max-description-size *number*
Tree	max-description-size
Range	1 to 64
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

opcode

Synopsis	Enter the **opcode** context
Context	**configure** service nat pcp-server-policy *named-item* opcode
Tree	opcode
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

announce *boolean*

Synopsis	Process the announce PCP requests
Context	**configure** service nat pcp-server-policy *named-item* opcode announce *boolean*
Tree	announce
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

get *boolean*

Synopsis	Process the get PCP requests
Context	**configure** service nat pcp-server-policy *named-item* opcode get *boolean*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	get
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

map *boolean*

Synopsis	Process the map PCP requests
Context	**configure** service nat pcp-server-policy *named-item* opcode map *boolean*
Tree	map
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

option

Synopsis	Enter the **option** context
Context	**configure** service nat pcp-server-policy *named-item* option
Tree	option
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

description *boolean*

Synopsis	Text description
Context	**configure** service nat pcp-server-policy *named-item* option description *boolean*
Tree	description
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

next *boolean*

Synopsis	Process the PCP requests that contain the next option
Context	**configure** service nat pcp-server-policy *named-item* option next *boolean*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	next
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-reservation *boolean*

Synopsis	Process the PCP requests that contain the prefer failure option
Context	**configure** service nat pcp-server-policy *named-item* option port-reservation *boolean*
Tree	port-reservation
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-set *boolean*

Synopsis	Support the PORT_SET option in PCP MAP requests
Context	**configure** service nat pcp-server-policy *named-item* option port-set *boolean*
Tree	port-set
Description	When configured to **true**, the PCP MAP option optimizes PCP performance for applications that require multiple sets of port forwards. A range of consecutive port forwards can be requested by the PCP client with a single PCP request. When configured to **false**, the default behavior is applied, where a plain MAP option is used to allocate a single port in a single request.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

prefer-failure *boolean*

Synopsis	Process the PCP requests that contain the port reservation option
Context	**configure** service nat pcp-server-policy *named-item* option prefer-failure *boolean*
Tree	prefer-failure
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

third-party *boolean*

Synopsis	Process the PCP requests that contain the third party option
Context	**configure** service nat pcp-server-policy *named-item* option third-party *boolean*
Tree	third-party
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reuse-external-ip-address *boolean*

Synopsis	Reuse external IP address for NAT subscriber
Context	**configure** service nat pcp-server-policy *named-item* reuse-external-ip-address *boolean*
Tree	reuse-external-ip-address
Description	When configured to **true**, the system reuses the external IP address assigned to a subscriber when the requested well-known port or external IP mapping is not available. When configured to **false**, a request for a well-known port is allocated as requested on a different external IP address if the port is already allocated to another subscriber sharing the same external IP address. The existing external IP address is initially allocated to the subscriber as a result of the initial traffic flow. This configuration flag can be set dynamically but the flag affects only PCP port forwards that are created after the flag has been set.
Default	false
Introduced	19.10.R3
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

version

Synopsis	Enter the **version** context
Context	**configure** service nat pcp-server-policy *named-item* version
Tree	version
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

maximum *number*

Synopsis	Maximum protocol version supported by the PCP servers

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat pcp-server-policy *named-item* version maximum *number*
Tree	maximum
Range	1 to 255
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

minimum *number*

Synopsis	Minimum protocol version supported by the PCP servers
Context	**configure** service nat pcp-server-policy *named-item* version minimum *number*
Tree	minimum
Range	1 to 255

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rate-limit *number*

Synopsis	Frame limit
Context	**configure** service nat syslog export-policy *named-item* rate-limit *number*
Tree	rate-limit
Range	10 to 2147483647
Units	packets per second
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

severity-level *keyword*

Synopsis	Severity level in the PRI part of the syslog messages
Context	**configure** service nat syslog export-policy *named-item* severity-level *keyword*
Tree	severity-level
Options	emergency, alert, critical, error, warning, notice, info, debug
Default	info
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

up-nat-policy [name] *external-named-item*

Synopsis	Enter the **up-nat-policy** list instance
Context	**configure** service nat up-nat-policy *external-named-item*
Tree	up-nat-policy
Max. instances	32
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**name**] *external-named-item*

Synopsis	UP NAT policy name
Context	**configure** service nat up-nat-policy *external-named-item*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	up-nat-policy
Description	This command specifies the UP NAT policy name. The name default has a special meaning representing the default UP NAT policy template. The system uses the default template when the BNG CPF does not receive a more specific name when the subscriber is instantiated.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

alg

Synopsis	Enter the **alg** context
Context	**configure** service nat up-nat-policy *external-named-item* alg
Tree	alg
Description	Commands in this context configure the Application Layer Gateway (ALG) attributes of the policy.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ftp *boolean*

Synopsis	Use FTP ALG for the policy
Context	**configure** service nat up-nat-policy *external-named-item* alg ftp *boolean*
Tree	ftp
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pptp *boolean*

Synopsis	Use PPTP ALG for the policy
Context	**configure** service nat up-nat-policy *external-named-item* alg pptp *boolean*
Tree	pptp
Description	When configured to **true**, the policy uses Point-to-Point Tunneling Protocol (PPTP) ALG.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

PPTP sessions can only be initiated from NAT inside.

GRE traffic is allowed through NAT only if the corresponding mapping exists.

There can be seven calls (GRE tunnels) per control session.

When configured to **false**, PPTP ALG is not used.

Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rtsp *boolean*

Synopsis	Use RTSP ALG for the policy
Context	**configure** service nat up-nat-policy *external-named-item* alg rtsp *boolean*
Tree	rtsp
Description	When configured to **true**, Real-Time Streaming Protocol (RTSP) ALG is used for the policy.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sip *boolean*

Synopsis	Use SIP ALG for the policy
Context	**configure** service nat up-nat-policy *external-named-item* alg sip *boolean*
Tree	sip
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

block-limit *number*

Synopsis	Maximum number of port blocks per NAT subscriber
Context	**configure** service nat up-nat-policy *external-named-item* block-limit *number*
Tree	block-limit
Range	1 to 10
Default	1

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-host

Synopsis	Enable the **default-host** context
Context	**configure** service nat up-nat-policy *external-named-item* default-host
Tree	default-host
Description	Commands in this context configure the default DMZ host options. A default DMZ host is a node on the inside to which all unknown traffic is redirected by changing the destination IPv4 address in the traffic header. During this operation, the checksums in the Layer 3 and Layer 4 header (UDP and TCP) are recalculated. Unknown traffic in NAT represent all unmatched traffic arriving from the outside (where there is no pinhole or a matching flow record created by traffic initiated from the inside). The purpose of the default DMZ host is to capture and analyze the unknown traffic as part of threat analysis. The rate of redirected unknown traffic can be restricted by configuration.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

inside-router-instance *string*

Synopsis	Router instance of the DMZ
Context	**configure** service nat up-nat-policy *external-named-item* default-host inside-router-instance *string*
Tree	inside-router-instance
Description	This command configures the router instance on the inside where the default DMZ host resides.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ip-address *ipv4-unicast-address*

Synopsis	IP address of the default DMZ host
Context	**configure** service nat up-nat-policy *external-named-item* default-host ip-address *ipv4-unicast-address*
Tree	ip-address

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the IP address of the default DMZ host. Redirection to the default DMZ host is achieved by replacing the destination IP address in the traffic header in the unknown traffic initiated from the outside with the one of the default DMZ host.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rate-limit *number*

Synopsis	Rate limit for unknown traffic sent to default DMZ host
Context	**configure** service nat up-nat-policy *external-named-item* default-host rate-limit *number*
Tree	rate-limit
Description	This command configures the rate limit of the unknown traffic sent to the default DMZ host. Unknown traffic sent to the default DMZ host is rate limited by a configurable value expressed in mbps. The rate limit is configurable per NAT pool per ISA, vISA, or ESA-VM.
Range	1 to 10000
Units	megabps
Default	10
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** service nat up-nat-policy *external-named-item* description *description*
Tree	description
String length	1 to 80
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

filtering *keyword*

Synopsis	Filtering method for inbound traffic for the policy
Context	**configure** service nat up-nat-policy *external-named-item* filtering *keyword*
Tree	filtering

© 2025 Nokia.

Options	endpoint-independent, address-and-port-dependent
Default	endpoint-independent
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

flow-log-policy

Synopsis	Enter the **flow-log-policy** context
Context	**configure** service nat up-nat-policy *external-named-item* flow-log-policy
Tree	flow-log-policy
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipfix *reference*

Synopsis	IPFIX export policy
Context	**configure** service nat up-nat-policy *external-named-item* flow-log-policy ipfix *reference*
Tree	ipfix
Description	This command specifies an IP flow information export policy for the flow-log policy.
Reference	**configure** service ipfix export-policy *named-item*
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

icmp-echo-reply *boolean*

Synopsis	Enable replies to ICMP Echo Request messages
Context	**configure** service nat up-nat-policy *external-named-item* icmp-echo-reply *boolean*
Tree	icmp-echo-reply
Default	false
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-block-extension

Synopsis	Enable the **port-block-extension** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat up-nat-policy *external-named-item* port-block-extension
Tree	port-block-extension
Description	Commands in this context configure the attributes for dynamic allocation of NAT port-blocks beyond the initial port-blocks.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ports *number*

Synopsis	Number of ports per dynamic port block
Context	**configure** service nat up-nat-policy *external-named-item* port-block-extension ports *number*
Tree	ports
Range	10 to 5000
Notes	This element is mandatory.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat up-nat-policy *external-named-item* port-block-extension watermarks
Tree	watermarks
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

high *number*

Synopsis	High watermark percentage
Context	**configure** service nat up-nat-policy *external-named-item* port-block-extension watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	percent
Notes	This element is mandatory.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

low *number*

Synopsis	Low watermark percentage
Context	**configure** service nat up-nat-policy *external-named-item* port-block-extension watermarks low *number*
Tree	low
Description	This command configures the low threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-limits

Synopsis	Enter the **port-limits** context
Context	**configure** service nat up-nat-policy *external-named-item* port-limits
Tree	port-limits
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reserved *number*

Synopsis	Number of ports reserved for prioritized sessions
Context	**configure** service nat up-nat-policy *external-named-item* port-limits reserved *number*
Tree	reserved
Description	This command configures the number of ports per block that are reserved for prioritized sessions.
Range	1 to 65534

© 2025 Nokia.

Tree	be
Description	When configured to **true**, traffic from Best Effort (BE) FC sessions is prioritized. When configured to **false**, BE traffic is not prioritized.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ef *boolean*

Synopsis	Prioritize traffic from EF forwarding classes
Context	**configure** service nat up-nat-policy *external-named-item* priority-sessions fc ef *boolean*
Tree	ef
Description	When configured to **true**, traffic from Expedited Forwarding (EF) FC sessions is prioritized. When configured to **false**, EF traffic is not prioritized.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

h1 *boolean*

Synopsis	Prioritize traffic from H1 forwarding classes
Context	**configure** service nat up-nat-policy *external-named-item* priority-sessions fc h1 *boolean*
Tree	h1
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

h2 *boolean*

Synopsis	Prioritize traffic from H2 forwarding classes
Context	**configure** service nat up-nat-policy *external-named-item* priority-sessions fc h2 *boolean*
Tree	h2
Default	false

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l1 *boolean*

Synopsis	Prioritize traffic from L1 forwarding classes
Context	**configure** service nat up-nat-policy *external-named-item* priority-sessions fc l1 *boolean*
Tree	l1
Description	When configured to **true**, traffic from L1 sessions is prioritized.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2 *boolean*

Synopsis	Prioritize traffic from L2 forwarding classes
Context	**configure** service nat up-nat-policy *external-named-item* priority-sessions fc l2 *boolean*
Tree	l2
Description	When configured to **true**, traffic from L2 sessions is prioritized. When configured to false, L2 traffic is not prioritized.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nc *boolean*

Synopsis	Prioritize traffic from NC forwarding classes
Context	**configure** service nat up-nat-policy *external-named-item* priority-sessions fc nc *boolean*
Tree	nc
Description	When configured to **true**, traffic from Network Class (NC) sessions is prioritized. When configured to **false**, NC traffic is not prioritized.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

session-limits

Synopsis	Enter the **session-limits** context
Context	**configure** service nat up-nat-policy *external-named-item* session-limits
Tree	session-limits
Description	Commands in this context configure session-limit attributes for the policy.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

max *number*

Synopsis	Maximum number of sessions per subscriber
Context	**configure** service nat up-nat-policy *external-named-item* session-limits max *number*
Tree	max
Range	1 to 65535
Default	65535
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reserved *number*

Synopsis	Number of sessions reserved for prioritized sessions
Context	**configure** service nat up-nat-policy *external-named-item* session-limits reserved *number*
Tree	reserved
Description	This command configures the number of sessions per block that are reserved for prioritized sessions.
Range	1 to 65534
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

watermarks

Synopsis	Enable the **watermarks** context
Context	**configure** service nat up-nat-policy *external-named-item* session-limits watermarks

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	watermarks
Description	This command configures watermarks for NAT resources.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

high *number*

Synopsis	High watermark percentage
Context	**configure** service nat up-nat-policy *external-named-item* session-limits watermarks high *number*
Tree	high
Description	This command configures the high threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

low *number*

Synopsis	Low watermark percentage
Context	**configure** service nat up-nat-policy *external-named-item* session-limits watermarks low *number*
Tree	low
Description	This command configures the low threshold value as a percentage of the total port-block space in a NAT pool.
Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp

Synopsis	Enter the **tcp** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat up-nat-policy *external-named-item* tcp
Tree	tcp
Description	Commands in this context configure the Transmission Control Protocol (TCP) attributes of the policy.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mss-adjust *number*

Synopsis	TCP MSS adjustment value
Context	**configure** service nat up-nat-policy *external-named-item* tcp mss-adjust *number*
Tree	mss-adjust
Description	This command configures the value to use to adjust the TCP Maximum Segment Size (MSS) option, if not already present or the present value is higher.
Range	160 to 10240
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reset-unknown *boolean*

Synopsis	Generate TCP reset for packets from unknown flows
Context	**configure** service nat up-nat-policy *external-named-item* tcp reset-unknown *boolean*
Tree	reset-unknown
Description	When configured to **true**, TCP packets are dropped and a TCP reset is generated if the NAT inside receives a TCP packet without the SYN flag set for an unknown flow. When configured to **false**, no TCP reset is generated.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

timeouts

Synopsis	Enter the **timeouts** context
Context	**configure** service nat up-nat-policy *external-named-item* timeouts
Tree	timeouts
Description	Commands in this context configure the attributes of session idle timeouts for the policy.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

icmp-query *number*

Synopsis	Timeout applied to an ICMP Query session
Context	**configure** service nat up-nat-policy *external-named-item* timeouts icmp-query *number*
Tree	icmp-query
Range	60 to 240
Units	seconds
Default	60
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sip *number*

Synopsis	SIP inactive media timeout
Context	**configure** service nat up-nat-policy *external-named-item* timeouts sip *number*
Tree	sip
Range	10 to 7200
Units	seconds
Default	120
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-retention *number*

Synopsis	IP address hold time after host and port blocks expire
Context	**configure** service nat up-nat-policy *external-named-item* timeouts subscriber-retention *number*
Tree	subscriber-retention
Description	This command configures the time to keep a NAT subscriber and its associated IP address after all hosts and associated port blocks expire. If a NAT subscriber host appears before the retention timeout elapses, it is given the same outside IP address.
Range	0 to 1440
Units	minutes

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	0
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tcp

Synopsis	Enter the **tcp** context
Context	**configure** service nat up-nat-policy *external-named-item* timeouts tcp
Tree	tcp
Description	Commands in this context configure TCP timeout attributes.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

established *number*

Synopsis	Idle timeout for TCP session in established state
Context	**configure** service nat up-nat-policy *external-named-item* timeouts tcp established *number*
Tree	established
Range	60 to 86400
Units	seconds
Default	7440
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rst *number*

Synopsis	Suspend time for TCP connection ports closed by RST
Context	**configure** service nat up-nat-policy *external-named-item* timeouts tcp rst *number*
Tree	rst
Description	This command configures the suspend time for outside TCP ports that are used in translations for TCP connections, when they are closed by TCP Reset (RST). After the timer expires, the outside ports can be reused for new TCP translations.
Range	0 to 240
Units	seconds
Default	0

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syn *number*

Synopsis	TCP session timeout when synchronizing initial sequence
Context	**configure** service nat up-nat-policy *external-named-item* timeouts tcp syn *number*
Tree	syn
Range	6 to 86400
Units	seconds
Default	15
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

time-wait *number*

Synopsis	Timeout applied to a TCP session in the time-wait state
Context	**configure** service nat up-nat-policy *external-named-item* timeouts tcp time-wait *number*
Tree	time-wait
Range	0 to 240
Units	seconds
Default	0
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

transitory *number*

Synopsis	Idle timeout for TCP session in transitory state
Context	**configure** service nat up-nat-policy *external-named-item* timeouts tcp transitory *number*
Tree	transitory
Range	60 to 86400
Units	seconds
Default	240
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2025 Nokia.

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat up-nat-policy *external-named-item* timeouts udp
Tree	udp
Description	Commands in this context configure the User Datagram Protocol (UDP) mapping timeout attributes.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dns *number*

Synopsis	Timeout applied to UDP session with destination port 53
Context	**configure** service nat up-nat-policy *external-named-item* timeouts udp dns *number*
Tree	dns
Range	15 to 86400
Units	seconds
Default	15
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

initial *number*

Synopsis	UDP mapping timeout applied to new sessions
Context	**configure** service nat up-nat-policy *external-named-item* timeouts udp initial *number*
Tree	initial
Range	10 to 300
Units	seconds
Default	15
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

normal *number*

Synopsis	UDP mapping timeout

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service nat up-nat-policy *external-named-item* timeouts udp normal *number*
Tree	normal
Range	60 to 86400
Units	seconds
Default	300
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

udp

Synopsis	Enter the **udp** context
Context	**configure** service nat up-nat-policy *external-named-item* udp
Tree	udp
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

inbound-refresh *boolean*

Synopsis	Extend UDP session timeout on inbound traffic
Context	**configure** service nat up-nat-policy *external-named-item* udp inbound-refresh *boolean*
Tree	inbound-refresh
Description	When configured to **true**, the router extends the UDP session timeout on inbound traffic. When configured to **false**, the router does not extend the UDP session timeout.
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

oper-group [name] *named-item*

Synopsis	Enter the **oper-group** list instance
Context	**configure** service oper-group *named-item*
Tree	oper-group
Max. instances	32768
Introduced	16.0.R1

© 2025 Nokia.

auto-learn-mac-protect-exclude-list *named-item*

Synopsis	Name of the MAC protect exclusion list
Context	**configure** service pw-template *pw-template-name* fdb auto-learn-mac-protect-exclude-list *named-item*
Tree	auto-learn-mac-protect-exclude-list
Description	This command configures the name of a MAC protect exclusion list. Dynamically-learned MAC Source Addresses (SA) are protected if they are learned on an object with ALMP configured and no exclusion list is associated with the object, or if the MAC SA does not match any entry in an associated exclusion list. An exclusion list can be used in multiple objects of a service. If a list is empty, ALMP does not exclude any learned MAC SAs from protection on the object.
String length	1 to 32
Introduced	20.5.R1
Platforms	All

discard-unknown-source *boolean*

Synopsis	Discard frames with unknown source
Context	**configure** service pw-template *pw-template-name* fdb discard-unknown-source *boolean*
Tree	discard-unknown-source
Default	false

mac-pinning *boolean*

Synopsis	Enable MAC address pinning on this spoke SDP
Context	**configure** service pw-template *pw-template-name* fdb mac-pinning *boolean*
Tree	mac-pinning
Default	false
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

maximum-mac-addresses *number*

Synopsis	Maximum number of MAC address entries in the FDB
Context	**configure** service pw-template *pw-template-name* fdb maximum-mac-addresses *number*
Tree	maximum-mac-addresses
Description	This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this PW template. When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared. When the configured limit is reached and the **configure service pw-template fdb discard-unknown-source** command is set to **true** for this PW template, packets with unknown source MAC addresses are discarded. If **discard-unknown-source** is set to **false**, the packets are forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown. However, if the **configure service vpls fdb discard-unknown** command is set to **true**, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached. When unconfigured, the PW template uses the global MAC learning limitations.
Range	1 to 511999
Introduced	16.0.R1
Platforms	All

protected-src-mac-violation-action *keyword*

Synopsis	Action for protected source MAC restriction
Context	**configure** service pw-template *pw-template-name* fdb protected-src-mac-violation-action *keyword*
Tree	protected-src-mac-violation-action
Options	sdp-bind-oper-down, alarm-only, discard

Platforms	All

hash-label

Synopsis	Enable the **hash-label** context
Context	**configure** service pw-template *pw-template-name* hash-label
Tree	hash-label
Description	Commands in this context configure the use of hash labels for egress datapaths. For information about hash-label handling, see the "Hash labels" section of the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide*.
Notes	The following elements are part of a choice: **entropy-label** or **hash-label**.
Introduced	16.0.R1
Platforms	All

signal-capability

Synopsis	Signal hash label capability to the remote PE
Context	**configure** service pw-template *pw-template-name* hash-label signal-capability
Tree	signal-capability
Description	When configured, this command enables the signaling and negotiating of the hash label between the local and remote PE nodes. The signaling process outcome determines whether the local PE inserts the hash label on the user packets. This outcome can override the local PE configuration. The node must withdraw the label it sent to its peer and send a new label mapping message with the new value of the F-bit in the flow label interface option sub-TLV of the pseudowire ID FEC element.
Introduced	16.0.R1
Platforms	All

igmp-snooping

Synopsis	Enter the **igmp-snooping** context

Description Commands in this context configure the system IP address of the far-end destination router for the SDP that is the termination point for a service.

The far-end IP address must be explicitly configured. The destination IP address must be that of an SR OS and for a GRE SDP it must match the system IP address of the far-end router.

If the SDP uses GRE for the destination encapsulation, the IP address is checked against other GRE SDPs to verify uniqueness. If the IP address is not unique within the configured GRE SDPs, an error is generated and the IP address is not associated with the SDP. The local device may not know whether the IP address is actually a system IP interface address on the far-end device.

If the SDP uses MPLS encapsulation, the far-end address is used to check LSP names when added to the SDP. If the **to** IP address defined within the LSP configuration does not exactly match the SDP far-endaddress, the LSP is not added to the SDP and an error is generated. Alternatively, an SDP that uses MPLS can have an MPLS-TP node with an MPLS-TP node-id and optionally, a global ID. In this case, the SDP must use an MPLS-TP LSP and the SDP **configure service sdp signaling** command option must be set to **off**.

An SDP cannot be administratively enabled until a far-end IP address or MPLS-TP node ID is defined. The SDP is operational when it is administratively enabled and the far-end IP address is contained in the IGP routing table as a host route. OSPF ABRs should not summarize host routes between areas. This can cause SDPs to become operationally down. Defined static host routes (direct and indirect) in the local device to mitigate this issue.

On a tunnel configured as SDP with a delivery type of **gre-eth-bridged**, this command designates L2oGRE tunnel end points. This is the only configuration option allowed for this type of SDP.

Introduced 16.0.R1

local-end *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Local end address of the tunnel defined by the SDP
Context	**configure** service sdp *number* local-end *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	local-end
Description	This command configures the local-end address of the following SDP encapsulation types: • IPv6 address of the termination point of an SDP of encapsulation type **l2tpv3** (L2TP v3 tunnel) • IPv4/IPv6 source address of an SDP of encapsulation type **gre-eth-bridged** (L2oGRE SDP) • IPv4/IPv6 source address of an SDP of encapsulation type **gre** (GRE SDP) When used as the source address of an SDP of encapsulation type **gre** (GRE SDP), the primary IPv4 or IPv6 address of any local network IP interface, loopback or otherwise, may be used. The addresses of the following interfaces are not supported: • unnumbered network IP interface • IES interface • VPRN interface • CSC VPRN interface This command option value adheres to the following rules: • A maximum of 15 distinct address values can be configured for all GRE SDPs under the **configure service sdp local-end** context, and all L2oGRE SDPs under the **configure service system gre-eth-bridged tunnel-termination** context. • The same source address cannot be used in both contexts because an address configured for a L2oGRE SDP matches an internally created interface that is not available to other applications. • The local-end address of a GRE SDP, when different from the system, need not match the primary address of an interface that has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

signaling *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Signaling protocol used to obtain pseudowire labels
Context	**configure** service sdp *number* signaling *keyword*
Tree	signaling
Description	This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if the SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if the SDP does not already have pseudowires signaled over it. Also, BGP signaling is not supported with mixed mode LSP SDPs. **Note**: If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by using the **admin-state** command to administratively disable and then enable the SDP.

Description	When configured to **true**, the router compares the received EVPN VPWS AD per-EVI routes based on the BGP path attributes. The **attribute-propagation** command must be configured to **true**. When configured to **false**, the router does not compare the routes.
Default	false
Introduced	23.10.R1
Platforms	All

d-path-ignore *boolean*

Synopsis	Ignore D-PATH for BGP path selection
Context	**configure** service system bgp evpn ad-per-evi-routes d-path-ignore *boolean*
Tree	d-path-ignore
Description	When configured to **true**, the router ignores the Domain PATH attribute (D-PATH) when BGP computes the best path selection for received routes. When configured to **false**, the router considers the D-PATH length and value as a tiebreaker in determining the best-path selection. In accordance with *draft-sr-bess-evpn-dpath*, the router compares the D-PATH attribute received in AD per-EVI routes with the same key (same or different RD) as follows: • Routes with the shortest D-PATH are preferred; therefore, routes not tied for the shortest D-PATH are removed. Routes without D-PATH are considered zero-length D-PATH. • Routes with the numerically lowest left-most Domain-ID are preferred; therefore, routes not tied for the numerically lowest left-most Domain-ID are removed from consideration.
Default	false
Introduced	23.10.R1
Platforms	All

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	AC-influenced DF election capability
Context	**configure** service system bgp evpn ethernet-segment *named-item* ac-df-capability *keyword*
Tree	ac-df-capability
Description	This command configures the Attachment Circuit-influenced (AC-influenced) designated forwarder (DF) election capability (AC-DF) into the DF election for the Ethernet Segment (ES). AC-DF supports EVPN Auto-Discovery per EVI/ES (AD per EVI/ES) routes for a specific PE, to ensure the PE is included in the candidate DF election list. When AC-DF is excluded on a specific ES, the presence or absence of the AD per EVI/ES routes from the ES peers does not modify the candidate DF election list for the ES. Excluding the AC-DF is recommended in ESs that use an operational group monitored by the access LAG to signal the standby LACP or to power-off.
Options	include, exclude

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **advertise-ifl-host-ad-routes** context
Context	**configure** service system bgp evpn ethernet-segment *named-item* advertise-ifl-host-ad-routes
Tree	advertise-ifl-host-ad-routes
Description	Commands in this context enable the AD per-EVI and AD per-ES routes for advertisement in the VPRN and BGP EVPN instances with R-VPLS services attached to the Ethernet segment. The AD per-EVI routes for the VPRNs contain the route distinguisher, route targets, and label or VNI of the VPRN BGP EVPN instance. The instance is specified by using the **bgp-evpn-instance** command option. The AD per-ES routes for the VPRNs contain the route distinguisher and route targets of the VPRN BGP EVPN instance. On the remote PEs, the reception of EVPN-IFL-HOST routes with an ESI matching the ESI of the VPRN AD per-EVI or -ES routes, enables the IP aliasing procedures for EVPN-IFL-HOST routes.
Introduced	25.3.R1
Platforms	All

vprn-next-hop [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **vprn-next-hop** list instance
Context	**configure** service system bgp evpn ethernet-segment *named-item* association vprn-next-hop *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	vprn-next-hop
Description	Commands in this list instance are used to associate an IPv4 or IPv6 address to an Ethernet segment. A virtual Ethernet segment using this VPRN next-hop association represents a Layer 3 Ethernet segment as described in *draft-sajassi-bess-evpn-ip-aliasing*. This IP address must be installed in the route table of the VPRN service identified by the EVI so that the Auto-Discovery per-ES or EVI routes for the ES are advertised. Only one VPRN next hop is supported per Ethernet segment.
Max. instances	1
Notes	The following elements are part of a choice: **lag**, **network-interconnect-vxlan**, **port**, **pw-port**, **sdp**, or **vprn-next-hop**.
Introduced	22.10.R1
Platforms	All

multi-homing-mode *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Multihoming mode of the Ethernet segment
Context	**configure** service system bgp evpn ethernet-segment *named-item* multi-homing-mode *keyword*
Tree	multi-homing-mode
Description	This command configures the multihoming mode for the Ethernet segment as defined in RFC 7432. By default, the use of ESI label is enabled for **all-active** and **single-active** as defined in RFC 7432 (for **single-active multi-homing,** the ESI label is used to avoid transient loops). When **single-active no-esi-label** or **all-active no-esi-label** is specified, the system does not allocate a label for the ESI; and therefore, advertises ESI label 0 to peers. Even if the ESI is configured not to send the ESI label, on reception of an ESI label from a peer, the PE always sends traffic to that peer using the received ESI label.
Options	none, single-active, single-active-no-esi-label, all-active, all-active-no-esi-label
Default	none
Introduced	16.0.R1

etree-leaf-label *boolean*

Synopsis	Enable E-Tree leaf label for PE
Context	**configure** service system bgp evpn etree-leaf-label *boolean*
Tree	etree-leaf-label
Description	When configured to **true**, this command enables EVPN Ethernet-Tree (E-Tree) VPLS services on the router (not B-VPLS), allocates an E-Tree leaf label for the Provider Edge (PE) device, and configures the ILM entry.This command ensures that in-flight traffic can perform an ILM entry lookup at any time, and avoids discards when administratively enabling or disabling services, or reduces the timing window so that it does not occur during normal operation or configuration. The value for the E-Tree leaf label is set via the **etree-leaf-label-value** command. When configured to **false**, PE leaf labels are not supported.
Default	false
Introduced	16.0.R1
Platforms	All

etree-leaf-label-value *(number | keyword)*

Platforms	All

attribute-uniform-propagation *boolean*

Synopsis	Enable attribute uniform propagation
Context	**configure** service system bgp evpn ip-prefix-routes interface-ful attribute-uniform-propagation *boolean*
Tree	attribute-uniform-propagation
Description	When configured to **true**, the system enables the uniform propagation of BGP attributes for EVPN-IFF routes. When configured to **false**, the system re-originates the BGP path attributes when propagating EVPN-IFF routes into other inter-subnet forwarding families.
Default	false
Introduced	24.3.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

bgp-path-selection *boolean*

Synopsis	Enable BGP path selection
Context	**configure** service system bgp evpn ip-prefix-routes interface-ful bgp-path-selection *boolean*
Tree	bgp-path-selection
Description	When configured to **true**, the system enables BGP path selection for EVPN-IFF routes. The EVPN-IFF routes are ordered and selected in a similar manner as IP-VPN or EVPN-IFL routes, that is, based on the regular BGP path selection process. When configured to **false**, the system orders EVPN-IFF routes based on their {R-VPLS Ifindex, RD, Ethernet Tag}. For example, if two EVPN-IFF routes with different Route Distinguishers (RDs) are received for the same prefix on the same R-VPLS, the route with the lowest RD is selected.
Default	false
Introduced	24.3.R1
Platforms	All

d-path-length-ignore *boolean*

Synopsis	Ignore the D-PATH length when using BGP path selection
Context	**configure** service system bgp evpn ip-prefix-routes interface-ful d-path-length-ignore *boolean*
Tree	d-path-length-ignore
Default	false
Introduced	24.3.R1
Platforms	All

vxlan-router-mac *mac-unicast-address-no-zero*

Synopsis	VXLAN router MAC address
Context	**configure** service system bgp evpn ip-prefix-routes interface-less vxlan-router-mac *mac-unicast-address-no-zero*
Tree	vxlan-router-mac
Description	This command configures the router MAC address of the VXLAN instance in the VPRN. This MAC address is encoded in the router MAC extended community that is advertised with the IP prefix routes with VXLAN encapsulation. This MAC address is configured at the system level and used by all the VPRN services configured with VXLAN instances. When unconfigured, the chassis base MAC is used as the inner source MAC in the originated packets for all the EVPN IFL VXLAN instances, as well as in the MAC extended community of the router.
Introduced	24.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

multicast-leave-sync-propagation *number*

Synopsis	Multicast leave group synchronization delay
Context	**configure** service system bgp evpn multicast-leave-sync-propagation *number*
Tree	multicast-leave-sync-propagation
Description	This command configures the additional amount of time that the system waits before removing a multicast state that was synchronized in an Ethernet Segment via Multicast Join or Leave Synch routes. This value represents a delta corresponding to the time it takes for a BGP advertisement to propagate to ES peers. The node triggering the route computes the maximum response time as the product of the locally configured values, Last Member Query Count and Last Member Query Interval, and adds the delta value to the maximum response time. The query count value is configured in the **configure services vrpn igmp robust-count** command. The query interval value is taken from the **configure service vpls sap igmp-snooping query-last-member-interval** or the **configure service vpls spoke-sdp igmp-snooping query-last-member-interval** configuration, depending on the Ethernet Segment. Increasing the maximum response time by this value can help minimize the churn of removing and recreating the state on the node. This value should be configured consistently in all ES peers.
Range	0 to 300
Units	seconds
Default	5
Introduced	20.7.R1
Platforms	All

table-size *number*

Synopsis	Maximum FDB entries in the system
Context	**configure** service system fdb table-size *number*
Tree	table-size
Description	This command configures the maximum system FDB table size, which is dependent on the chassis type. CPMs with at least 16 GB of memory are required when exceeding 500 000 MAC addresses in a system. This command cannot be set to a value lower than the default, which is chassis-dependent. The maximum system FDB table size also limits the maximum FDB table size of any card within the system. The command default depends on the chassis type and available memory.
Range	4095 to 2047999
Introduced	16.0.R1

port *number*

Synopsis	HTTP TCP port to which the UPnP IGD listens
Context	**configure** service upnp policy *external-named-item* port *number*
Tree	port
Range	1 to 65535
Default	5000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

strict-mode *boolean*

Synopsis	Enable UPnP strict mode
Context	**configure** service upnp policy *external-named-item* strict-mode *boolean*
Tree	strict-mode
Description	When configured to **true**, this command enables UPnP strict mode, in which the system only allows changes to an existing UPnP mapping if the request comes from the same UPnP client.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vpls [service-name] *service-name*

Synopsis	Enter the **vpls** list instance
Context	**configure** service vpls *service-name*
Tree	vpls
Description	Commands in this context create or edit a Virtual Private LAN Services (VPLS) instance.
Introduced	16.0.R1
Platforms	All

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** service vpls *service-name*

adv-service-mtu *number*

Synopsis	Advertised service MTU value
Context	**configure** service vpls *service-name* bgp *number* adv-service-mtu *number*
Tree	adv-service-mtu
Description	This command configures the MTU signaled value used in the BGP for BGP-VPLS service and in the LDP for BGP-AD service. The router uses the value for signaling and for validation with the received MTU instead of the service MTU. However, the value does not affect the locally enforced value, which is still based on the service MTU.
Range	0 to 9782
Introduced	22.2.R1
Platforms	All

pw-template-binding [pw-template-name] *reference*

Synopsis	Enter the **pw-template-binding** list instance
Context	**configure** service vpls *service-name* bgp *number* pw-template-binding *reference*
Tree	pw-template-binding
Max. instances	100
Introduced	16.0.R1

Tree	accept-ivpls-evpn-flush
Default	false
Introduced	16.0.R1
Platforms	All

evi *number*

Synopsis	EVPN ID
Context	**configure** service vpls *service-name* bgp-evpn evi *number*
Tree	evi
Description	This command configures a 2-byte EVPN instance (EVI) unique in the system. It is used for the service-carving algorithm for multi-homing and auto-deriving route target and route distinguishers. If not specified, the EVPN ID value is zero and no route distinguisher or route targets are auto-derived from it. If the EVI ID value is specified and no other **route-distinguisher** or **route-target** is configured in the service, the following rules apply: • the route distinguisher is derived from <system_ip>:evi • the route target is derived from <autonomous-system>:evi If VSI import and export policies are configured, the route target must be configured in the policies and those values take precedence over the auto-derived route targets. If **bgp-ad vpls-id** and **bgp-evpn evi** are both configured on the same service, the VPLS ID auto-derived route target or route distinguisher takes precedence over the values auto-derived from the EVI. Use the **show service id bgp** command to display the operational route target for a service.
Range	1 to 16777215
Introduced	16.0.R1
Platforms	All

ignore-mtu-mismatch *boolean*

Synopsis	Ignore MTU mismatch
Context	**configure** service vpls *service-name* bgp-evpn ignore-mtu-mismatch *boolean*
Tree	ignore-mtu-mismatch
Description	When configured to **true**, the system ignores the received Layer 2 MTU in the L2 Attributes extended community of the IMET route for a peer. When configured to **false**, the system compares the local service MTU against the received Layer 2 MTU and if there is a mismatch, keeps the EVPN destination to the peer with operational state down.

num-moves *number*

Synopsis	BGP EVPN MAC duplication detection number of moves
Context	**configure** service vpls *service-name* bgp-evpn mac-duplication detect num-moves *number*
Tree	num-moves
Range	3 to 10
Default	5
Introduced	16.0.R1
Platforms	All

trusted-mac-move-factor *number*

Synopsis	Trusted MAC move factor
Context	**configure** service vpls *service-name* bgp-evpn mac-duplication detect trusted-mac-move-factor *number*
Tree	trusted-mac-move-factor
Description	This command configures the factor by which the number of moves is multiplied when detecting a MAC duplication event for trusted MACs. For example, if the number of moves is 5 and the trusted MAC move factor is 3, 5 moves, within the window, is enough to declare a non-trusted MAC as duplicate. However, 15 moves are needed to declare a trusted MAC as duplicate. By default the factor for a trusted MAC is the same as for a non-trusted MAC. This provides a backwards compatible solution upon upgrade of the node.
Range	1 to 10
Default	1
Introduced	23.7.R1
Platforms	All

window *number*

Synopsis	BGP EVPN MAC duplication detection window
Context	**configure** service vpls *service-name* bgp-evpn mac-duplication detect window *number*
Tree	window

enforce-untagged-route *keyword*

Synopsis	Untagged route type enforcement
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-untagged-route *keyword*
Tree	enforce-untagged-route
Description	This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services. If the **untagged-tunnel** option is configured, untagged routes only bind to LSPs with no administrative tag configured. If both tagged and untagged tunnels to the next hop exist, the system only considers the untagged tunnels. If no untagged tunnels to the next hop exist, the resolution of untagged routes fails. The **untagged-tunnel** option can be used in combination with the **enforce-strict-tunnel-tagging** command configured to **true**, in which case tagged routes resolve to tagged LSPs, and untagged routes only resolve to untagged LSPs. When unconfigured, untagged routes can bind to tagged or untagged LSPs.
Options	none – Untagged routes can bind to tagged or untagged LSPs untagged-tunnel – Untagged routes only bind to LSPs without an admin tag
Default	none
Introduced	24.10.R1
Platforms	All

resolution *keyword*

Synopsis	Resolution method for tunnel selection
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution *keyword*

Tree	mpls-fwd-policy

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, BGP uses the MPLS forwarding policy to determine the address of the BGP next hop. When configured to **false**, the MPLS forwarding policy is not used for next-hop resolution.
Default	false
Introduced	19.5.R1
Platforms	All

rib-api *boolean*

Synopsis	Use RIB API gRPC service for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter rib-api *boolean*
Tree	rib-api
Description	When configured to **true**, BGP uses tunnels programmed using the RIB API gRPC service to resolve the next hops of routes imported into the EVPN service. When configured to **false**, the RIB API service tunnels are not used for next-hop resolution.
Default	false
Introduced	19.5.R1
Platforms	All

rsvp *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter rsvp *boolean*
Tree	rsvp
Description	When configured to **true**, BGP searches the best metric RSVP LSP to determine the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID. When configured to **false**, the RSVP LSP is not used for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-isis *boolean*

Synopsis	Use IS-IS SR tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-isis *boolean*
Tree	sr-isis
Description	When configured to **true**, BGP uses an IS-IS tunnel type to resolve the BGP next hop. When the **sr-isis** command is enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure. • Select the SR tunnel submitted by the IS-IS instance with the lowest tunnel table preference. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID. When configured to **false**, IS-IS tunneling is not used for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

sr-ospf *boolean*

Synopsis	Use OSPF SR tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf *boolean*
Tree	sr-ospf
Description	When configured to **true**, BGP uses an OSPF tunnel type to resolve the BGP next hop. When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure. • Select the SR tunnel submitted by the OSPF instance with the lowest tunnel table preference. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID. When configured to **false**, OSPF tunneling is not used for next-hop resolution.
Default	false
Introduced	16.0.R1

sr-ospf3 *boolean*

Synopsis Use OSPFv3 SR tunneling for next-hop resolution

Context **configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf3 *boolean*

Tree sr-ospf3

Description When configured to **true**, BGP uses an OSPF3 tunnel type to resolve the BGP next hop.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPFv3 instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF3 tunneling is not used for next-hop resolution.

Default false

Introduced 19.10.R1

Platforms All

sr-policy *boolean*

Synopsis Use SR policies for next-hop resolution

Context **configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-policy *boolean*

Tree sr-policy

Description When configured to **true**, this command enables the use of SR policies to resolve the next hop of BGP-EVPN service routes.

This command configures BGP to search for an SR policy with:

- a non-null endpoint that matches the next hop of the service route, and
- a color value that matches the highest numbered color for the extended community attached to the service route

Default false

Introduced 19.5.R1

Platforms All

sr-te *boolean*

Synopsis	Use SR-TE tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-te *boolean*
Tree	sr-te
Description	When configured to **true**, BGP uses an SR-TE tunnel type to resolve the BGP next hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID. When configured to **false**, SR-TE tunneling is not used for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

udp *boolean*

Synopsis	Use MPLS over UDP tunneling for next-hop resolution
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter udp *boolean*
Tree	udp
Description	When configured to **true**, BGP uses an MPLS over UDP tunnel type to determine the address of the BGP next hop. When configured to **false**, MPLS over UDP tunneling is not used for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

weighted-ecmp *boolean*

Synopsis	Allow weighted load balancing
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* auto-bind-tunnel weighted-ecmp *boolean*
Tree	weighted-ecmp
Description	When configured to **true**, this router enables weighted ECMP for packets using tunnels that a VPLS or Epipe automatically binds to. Packets are sprayed across LSPs in the ECMP according to the outcome of the hash algorithm and the configured load balancing weight of each LSP.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, this command disables weighted ECMP for next-hop tunnel selection.

Default	false
Introduced	22.7.R1
Platforms	All

control-word *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable control word support
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* control-word *boolean*
Tree	control-word
Description	When configured to **true**, the router enables the transmission and reception of the control word for all EVPN-MPLS destinations at the same time.
Default	false
Introduced	16.0.R1
Platforms	All

default-route-tag *one-byte-value*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Default route tag
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* default-route-tag *one-byte-value*
Tree	default-route-tag
Description	This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed. When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.
Introduced	16.0.R4
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

dynamic-egress-label-limit *boolean*

Synopsis	Enables dynamic egress label limit
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* dynamic-egress-label-limit *boolean*
Tree	dynamic-egress-label-limit
Description	When configured to **true**, this command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table. For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed. For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES. When configured to **false** this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.
Default	false
Introduced	22.2.R1
Platforms	All

ecmp *number*

Synopsis	Maximum ECMP routes information
Context	**configure** service vpls *service-name* bgp-evpn mpls *number* ecmp *number*
Tree	ecmp
Range	1 to 32

advertise-l2-attributes *boolean*

Synopsis	Advertise Layer 2 attributes

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* bgp-evpn routes incl-mcast advertise-l2-attributes *boolean*
Tree	advertise-l2-attributes
Description	When configured to **true**, the router advertises the Layer 2 Attributes Extended Community including: • the service MTU in the Layer 2 MTU field • the F bit, which is set to 1 if the **hash-label** command is set to true (in the **configure service vpls bgp-evpn mpls** context); otherwise, the F bit is set to 0 • the C bit, which is set to 1 if the **control-word** command is set to true (in the **configure service vpls bgp-evpn mpls** context); otherwise, the C bit is set to 0 The router compares the received Layer 2 MTU from a peer with the local service MTU. If there is a mismatch, the operation state of the EVPN destination is set to down, except if the **configure service vpls bgp-evpn ignore-mtu-mistmatch** command is set to **true**. A mismatch between the received C bit and the local **control-word** setting (in the **configure service vpls bgp-evpn mpls** context) results in the operational state of the EVPN destination being set to down. A mismatch between the received F bit and the local F bit (via the hash label configuration) results in the operational state of the EVPN destination being set to down. When configured to **false**, the Layer 2 Attributes Extended Community is not advertised with the Inclusive Multicast Ethernet Tag route for the service.

domain-id *domain-id*

Synopsis	Domain ID of received BGP route before readvertisement
Context	**configure** service vpls *service-name* bgp-evpn routes ip-prefix domain-id *domain-id*
Tree	domain-id
Description	This command specifies the domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances). Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred). In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N: Seg Len=1 / 65000:1:128 If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows: Seg Len=2 / 65000:2:70 / 65000:1:128 That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

vlan-aware-bundle-eth-tag *number*

Synopsis	Ethernet tag associated with VPLS service
Context	**configure** service vpls *service-name* bgp-evpn routes vlan-aware-bundle-eth-tag *number*
Tree	vlan-aware-bundle-eth-tag
Description	This command configures the Ethernet Tag ID in the EVPN routes for control-plane interoperability mode with VLAN-aware bundle services. The configuration of a non-default value requires the previous configuration of a VLAN-aware bundle name on the service. When set to a non-zero value, the EVPN routes advertised for the VPLS service are advertised with this value into the Ethernet Tag ID field of the routes. On reception of EVPN routes with non-zero Ethernet Tag ID, BGP imports the routes based on the import route target as usual. However, the system checks the received Ethernet Tag ID field and only processes those routes whose Ethernet Tag ID matches the local VLAN-aware bundle Ethernet Tag ID.

force-vc-forwarding *keyword*

Synopsis	Datapath forwarding to force vlan-vc-type
Context	**configure** service vpls *service-name* bgp-evpn segment-routing-v6 *number* force-vc-forwarding *keyword*
Tree	force-vc-forwarding
Description	This command allows the system to preserve the VLAN ID and 802.1p bits of the service-delimiting qtag in a new tag added in the customer frame before sending it to the EVPN destinations. This command may be used in conjunction with the **sap ingress vlan-translation** command. If so used, the configured translated VLAN ID is the VLAN ID sent to the EVPN destinations as opposed to the service-delimiting tag VLAN ID. If the ingress SAP/SDP binding is 'null'-encapsulated, the output VLAN ID and pbits is zero.
Options	vlan, qinq-c-tag-c-tag, qinq-s-tag-c-tag
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

mh-mode *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Multihoming mode
Context	**configure** service vpls *service-name* bgp-evpn segment-routing-v6 *number* mh-mode *keyword*
Tree	mh-mode
Options	access, network
Default	network
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

oper-group *reference*

Synopsis	Operational group
Context	**configure** service vpls *service-name* bgp-evpn segment-routing-v6 *number* oper-group *reference*
Tree	oper-group

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description This command adds the BGP EVPN SRv6 instance or an Ethernet Segment (ES) as a member of the operational group.

When configured on a BGP EVPN instance, the operational group is up when it is either empty (meaning that the operational group has no members) or at least an EVPN destination is created under the EVPN instance added as member. When configured, no other SAP, SDP binding, or BGP EVPN instance can be added to the same operational group within the same or different service.

The operational group is down when it is applied on a BGP EVPN instance as well as:

- the service is administratively disabled
- the BGP EVPN MPLS and VXLAN is administratively disabled
- all the EVPN destinations in the instance are removed

When configured on an ES, the state of the operational group depends on the state of the SAPs contained in the ES. The operational group transitions to up if at least one SAP in the ES is up. The operational group goes down when all the associated SAPs are operationally down. Monitor the ES operational group on the LAG associated with the ES, along with single-active multihoming, so that the NDF state can be signaled to the CE by LAG standby signaling.

Reference **configure** service oper-group *named-item*

Introduced 22.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

source-address *ipv6-unicast-address*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Source IPv6 address
Context	**configure** service vpls *service-name* bgp-evpn segment-routing-v6 *number* source-address *ipv6-unicast-address*
Tree	source-address
Description	When configured, this command specifies the source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet. When not configured, the source IPv6 address is inherited from the configuration of the global default address in the **router "base" segment-routing segment-routing-v6 source-address** context. A source IPv6 address must be configured in this context or in the base router context. The system does not check if the address entered is a valid local address.
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

split-horizon-group *reference*

default-route-tag *one-byte-value*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Default route tag
Context	**configure** service vpls *service-name* bgp-evpn vxlan *number* default-route-tag *one-byte-value*
Tree	default-route-tag
Description	This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed. When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.
Introduced	16.0.R4
Platforms	All

ecmp *number*

evi-three-byte-auto-rt *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis Auto-derive the BGP EVPN route target

Context **configure** service vpls *service-name* bgp-evpn vxlan *number* evi-three-byte-auto-rt *boolean*

Tree evi-three-byte-auto-rt

Description When configured to **true**, the BGP-EVPN instance import and export route target is auto-derived as described in RFC 8365 (Global-Administrator:A/Type/D-ID/Service-ID).

Where:

- Global Administrator – is the configured 2-octet AS number; if the configured ASN exceeds the 2 byte limit, the low order 16-bit value is taken
- A=0 (for auto-derivation)
- Type=4 (EVI-based route-target)
- D-ID= [1..2] – encodes the BGP instance, which allows the auto-derivation of different route-targets in multi-instance services; the value is inherited from the corresponding BGP instance
- Service ID=3-octet EVI

When configured to **false**, route target derivation is not allowed.

Default false

Introduced 21.10.R1

Context	**configure** service vpls *service-name* capture-sap *sap* pfcp up-resiliency monitor-oper-group *reference*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	monitor-oper-group
Description	Commands in this context define parameters to derive the service health based on monitored operational groups. The BNG-UP sends the health value to the MAG-c. The MAG-c uses the value to determine the need for a BNG-UP status change (active or standby). **Note:** The following is only applicable for the **configure service vpls capture-sap** context. If the configured groups are not the same for all capture SAPs sharing the same underlying port or LAG, the configuration of a Layer 2 access ID alias is required, or else the system chooses arbitrarily one set of configured groups.
Max. instances	2
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**oper-group**] *reference*

maximum-mac-addresses *number*

Synopsis	Maximum number of MAC address entries in the FDB
Context	**configure** service vpls *service-name* endpoint *named-item* fdb maximum-mac-addresses *number*
Tree	maximum-mac-addresses
Description	This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this endpoint. When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared. Packets with unknown source MAC addresses are still forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown. However, if the **configure service vpls fdb discard-unknown** command is set to **true**, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached. When unconfigured, the endpoint uses the global MAC learning limitations.
Range	1 to 511999
Introduced	16.0.R1
Platforms	All

protected-src-mac-violation-action *keyword*

Synopsis	Action when a relearn request for a protected MAC is received on the SDP

Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

alarm-notification

Synopsis	Enter the **alarm-notification** context
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification
Tree	alarm-notification
Description	Commands in this context configure the Fault Notification Generator (FNG) time values to raise an alarm or reset the CCM defect alarm. Use these timers for network management processes. The timers are not tied into delaying the notification to the fault management system on the network element and do not affect fault propagation mechanisms.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fng-alarm-time *number*

Synopsis	Time that must expire before an FNG alarm is raised
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-alarm-time *number*
Tree	fng-alarm-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fng-reset-time *number*

Synopsis	Time that must expire before an FNG alarm is reset
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-reset-time *number*
Tree	fng-reset-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm *boolean*

Synopsis	Generate CCM messages
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm *boolean*
Tree	ccm
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-ltm-priority *number*

Synopsis	Priority of CCM and LTM messages transmitted by the MEP
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-ltm-priority *number*
Tree	ccm-ltm-priority
Range	0 to 7
Default	7
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-padding-size *number*

Synopsis	Number of octets of padding to insert in CCM packets

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-padding-size *number*
Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV, is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.
Range	3 to 1500
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cfm-vlan-tag *one-or-two-vlan-tags*

Synopsis	VLAN tags to apply to CFM PDUs for egress processing
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* cfm-vlan-tag *one-or-two-vlan-tags*
Tree	cfm-vlan-tag
Description	This command allows the CFM function to include additional VLAN tags to the CFM packet that are carried to the egress and treated as service delimited. Typically, this function is used to influence the VLAN carried over a binding that uses the **vc-type vlan** or the binding forces the use of one or more VLAN tag that results in a mismatch between the service data arriving at the binding and the locally generated ETH-CFM PDUs arriving at the same egress. When this command is included under the MEP or MIP configuration, the tags used as part of the configuration typically match the SAP service delimited configuration.
String length	1 to 9
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

description *description*

Synopsis	Text description
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* description *description*
Tree	description

Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-test

Synopsis	Enable the **eth-test** context
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test
Tree	eth-test
Description	Commands in this context configure information used by the Ethernet Test (ETH-TST) packet. The commands must be configured on both the sender and the receiver nodes. The test packets are used with the **oam eth-cfm eth-test** command.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

bit-error-threshold *number*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test bit-error-threshold *number*
Tree	bit-error-threshold
Range	0 to 11840
Units	bit errors
Default	1
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

test-pattern

Synopsis	Enter the **test-pattern** context
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern
Tree	test-pattern
Description	Commands in this context specify the test pattern for the ETH-TST frames. The pattern does not have to be the same on the sender and the receiver.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.

Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-vsm-grace

Synopsis	Enter the **eth-vsm-grace** context
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace
Tree	eth-vsm-grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-eth-vsm-grace *boolean*

Synopsis	Receive and process Nokia ETH-CFM Grace PDU on the MEP
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace rx-eth-vsm-grace *boolean*
Tree	rx-eth-vsm-grace
Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. When configured to **false**, the router disables the Nokia Grace function.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	true
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** service vpls *service-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED). When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.
Default	true
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm

local-age-time *number*

Synopsis	Aging time for locally learned MAC addresses
Context	**configure** service vpls *service-name* fdb mac-learning local-age-time *number*
Tree	local-age-time
Description	This command configures the aging time for locally learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance. In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or a Service Destination Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs. In each VPLS service instance, there are independent aging timers for locally learned MAC and remotely learned MAC entries in the FDB. As in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time).
Range	60 to 86400
Default	300
Introduced	16.0.R1
Platforms	All

remote-age-time *number*

Synopsis	Aging time for remotely learned MAC addresses
Context	**configure** service vpls *service-name* fdb mac-learning remote-age-time *number*
Tree	remote-age-time
Description	This command configures the aging time for remotely learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance. In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or a Service Destination Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs. In each VPLS service instance, there are independent aging timers for locally learned MAC and remotely learned MAC entries in the FDB. As in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). To reduce the amount of signaling required between switches, configure this time larger than the **local-age-time** command.

ignore-l2vpn-mtu-mismatch *boolean*

Synopsis	Ignore the L2 VPN MTU mismatch with local service MTU
Context	**configure** service vpls *service-name* ignore-l2vpn-mtu-mismatch *boolean*
Tree	ignore-l2vpn-mtu-mismatch

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router ignores the value of the Layer 2 MTU in the Layer 2 Info Extended Community received in a BGP update message or the value of the MTU interface parameter received in an LDP label mapping message against the local service MTU or locally signaled MTU. It may, therefore, bring up the VPLS service regardless of any MTU mismatch. When configured to **false**, an MTU mismatch prevents the system from bringing up a VPLS service.
Default	false
Introduced	22.2.R1
Platforms	All

interface [interface-name] *interface-name*

Synopsis	Enter the **interface** list instance
Context	**configure** service vpls *service-name* interface *interface-name*

adv-service-mtu *number*

Synopsis	Advertise service MTU value
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* adv-service-mtu *number*
Tree	adv-service-mtu
Description	This command configures the MTU value that is signaled in the targeted LDP for the spoke-SDP. The router uses the value for signaling and for validation with the received MTU instead of the service MTU. However, the value does not affect the locally enforced value, which is still based on the service MTU. This command cannot be configured on a spoke-SDP that is bound to an SDP with the **adv-mtu-override** command.
Range	0 to 9782
Introduced	24.7.R1
Platforms	All

collect-lmm-fc-stats

Synopsis	Enter the **collect-lmm-fc-stats** context
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats
Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection. The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively. This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc-in-profile *keyword*

Synopsis	Forwarding class name for profile-aware counter
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats fc-in-profile *keyword*
Tree	fc-in-profile
Description	This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification
Tree	alarm-notification
Description	Commands in this context configure the Fault Notification Generator (FNG) time values to raise an alarm or reset the CCM defect alarm.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Use these timers for network management processes. The timers are not tied into delaying the notification to the fault management system on the network element and do not affect fault propagation mechanisms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fng-alarm-time *number*

Synopsis	Time that must expire before an FNG alarm is raised
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-alarm-time *number*
Tree	fng-alarm-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fng-reset-time *number*

Synopsis	Time that must expire before an FNG alarm is reset
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-reset-time *number*
Tree	fng-reset-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm *boolean*

Synopsis	Generate CCM messages
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm *boolean*
Tree	ccm
Default	false

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-ltm-priority *number*

Synopsis	Priority of CCM and LTM messages transmitted by the MEP
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-ltm-priority *number*
Tree	ccm-ltm-priority
Range	0 to 7
Default	7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-padding-size *number*

Synopsis	Number of octets of padding to insert in CCM packets
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-padding-size *number*
Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV, is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.
Range	3 to 1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cfm-vlan-tag *one-or-two-vlan-tags*

Synopsis	VLAN tags to apply to CFM PDUs for egress processing
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* cfm-vlan-tag *one-or-two-vlan-tags*
Tree	cfm-vlan-tag

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command allows the CFM function to include additional VLAN tags to the CFM packet that are carried to the egress and treated as service delimited. Typically, this function is used to influence the VLAN carried over a binding that uses the **vc-type vlan** or the binding forces the use of one or more VLAN tag that results in a mismatch between the service data arriving at the binding and the locally generated ETH-CFM PDUs arriving at the same egress. When this command is included under the MEP or MIP configuration, the tags used as part of the configuration typically match the SAP service delimited configuration.
String length	1 to 9
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

csf

Synopsis	Enable the **csf** context
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf
Tree	csf
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

multiplier *decimal-number*

Synopsis	Multiplication factor used to clear the CSF condition
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf multiplier *decimal-number*
Tree	multiplier
Range	0.0 | 2.0 to 30.0
Default	3.5

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED). When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lbm-svc-act-responder *boolean*

Synopsis	Process service activation streams in ETH-CFM LBM
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* lbm-svc-act-responder *boolean*
Tree	lbm-svc-act-responder
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon

© 2025 Nokia.

auto-learn-mac-protect-exclude-list *reference*

Synopsis	Referenced MAC protect exclusion list name
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* fdb auto-learn-mac-protect-exclude-list *reference*
Tree	auto-learn-mac-protect-exclude-list
Description	This command references the name of a MAC protect exclusion list. Dynamically-learned MAC Source Addresses (SA) are protected if they are learned on an object with ALMP configured and no exclusion list is associated with the object, or if the MAC SA does not match any entry in an associated exclusion list. An exclusion list can be used in multiple objects of a service. If a list is empty, ALMP does not exclude any learned MAC SAs from protection on the object.
Reference	**configure** service mac-list *named-item*
Introduced	20.5.R1
Platforms	All

mac-pinning *boolean*

Synopsis	MAC address pinning in active status
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* fdb mac-pinning *boolean*
Tree	mac-pinning
Default	false
Introduced	16.0.R1
Platforms	All

protected-src-mac-violation-action *keyword*

force-vc-forwarding *keyword*

Synopsis	VC forwarding action
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* force-vc-forwarding *keyword*
Tree	force-vc-forwarding
Options	vlan, qinq-c-tag-c-tag, qinq-s-tag-c-tag
Introduced	16.0.R1
Platforms	All

hash-label

Synopsis	Enable the **hash-label** context
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* hash-label
Tree	hash-label
Description	Commands in this context configure the use of hash labels for egress datapaths. For information about hash-label handling, see the "Hash labels" section of the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide*.
Notes	The following elements are part of a choice: **entropy-label** or **hash-label**.
Introduced	16.0.R1
Platforms	All

signal-capability

Synopsis	Signal hash label capability to the remote PE
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* hash-label signal-capability
Tree	signal-capability
Description	When configured, this command enables the signaling and negotiating of the hash label between the local and remote PE nodes. The signaling process outcome determines whether the local PE inserts the hash label on the user packets. This outcome can override the local PE configuration.
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* igmp-snooping mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).
Reference	**configure** mcac policy *string*
Introduced	16.0.R1
Platforms	All

mrouter-port *boolean*

Synopsis	Operate port as a multicast router port
Context	**configure** service vpls *service-name* mesh-sdp *sdp-bind-id* igmp-snooping mrouter-port *boolean*

data-delay-interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	S-PMSI data delay timer
Context	**configure** service vpls *service-name* provider-tunnel selective data-delay-interval *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	data-delay-interval
Description	This command configures the S-PMSI data delay timer. The data delay interval determines the time the router takes to switch over the traffic from the Ingress Replication binds to the wildcard S-PMSI or from the wildcard S-PMSI to the S-PMSI, after the S-PMSI is created. This time should account for the time it takes for BGP to propagate the S-PMSI A-D route to the downstream PEs and the time it takes the downstream PEs to join the tree all the way up to the root.
Range	3 to 180
Units	seconds
Default	3
Introduced	23.3.R1
Platforms	All

data-threshold

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **data-threshold** context
Context	**configure** service vpls *service-name* provider-tunnel selective data-threshold
Tree	data-threshold
Description	Commands in this context specify the data rate threshold that triggers the switch from the inclusive provider tunnel to the selective provider tunnel for (C-S, C-G) within the group range. Optionally, PE thresholds to create or delete ng-MVPN S-PMSI may also be specified. Omitting the PE thresholds preserves the currently set value (or defaults if never set). Multiple statements (one per a unique group) are allowed in the configuration. This command is not applicable to multistream S-PMSI. This command for S-PMSI trees can also be used in EVPN services. The command options are used in the same way as in MVPN when applied to EVPN, in particular the rate and PE thresholds.
Introduced	23.3.R1
Platforms	All

group-prefix [ip-group-prefix] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Enter the **group-prefix** list instance

Tree	group-prefix
Introduced	23.3.R1
Platforms	All

[**ip-group-prefix**] *(ipv4-prefix* | *ipv6-prefix)*

Synopsis	Multicast group prefix
Context	**configure** service vpls *service-name* provider-tunnel selective data-threshold group-prefix *(ipv4-prefix* | *ipv6-prefix)*
Tree	group-prefix
Notes	This element is part of a list key.
Introduced	23.3.R1
Platforms	All

pe-threshold-add *number*

Synopsis	Number of receiver PEs for S-PMSI tunnel creation
Context	**configure** service vpls *service-name* provider-tunnel selective data-threshold group-prefix *(ipv4-prefix* | *ipv6-prefix)* pe-threshold-add *number*
Tree	pe-threshold-add
Description	This command specifies the number of Receiver PEs for creating S-PMSI. A S-PMSI is created when the following apply: • The number of receiver PEs for a multicast group is non-zero. • The number of receiver PEs is below the threshold. • The BW threshold is satisfied.
Range	1 to 65535
Default	65535
Introduced	23.3.R1
Platforms	All

pe-threshold-delete *number*

Synopsis	Number of receiver PEs for S-PMSI tunnel deletion

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* provider-tunnel selective data-threshold group-prefix *(ipv4-prefix* | *ipv6-prefix)* pe-threshold-delete *number*
Tree	pe-threshold-delete
Description	This command specifies the number of Receiver PEs to delete S-PMSI. When the number of receiver PEs for a multicast group configuration is above the threshold, S-PMSI is deleted and the multicast group is moved to IR or a wildcard S-PMSI. Nokia recommends that the delete threshold be configured to be significantly larger than the add threshold to avoid re-signaling of S-PMSI as the Receiver PE count fluctuates
Range	2 to 65535
Default	65535
Introduced	23.3.R1
Platforms	All

threshold *number*

Synopsis	Threshold rate for a group prefix
Context	**configure** service vpls *service-name* provider-tunnel selective data-threshold group-prefix *(ipv4-prefix* | *ipv6-prefix)* threshold *number*
Tree	threshold
Description	This command specifies the threshold rate for a group prefix. If the rate for a (C-S, C-G) within the specified group range exceeds the threshold, traffic for the (C-S, C-G) is switched to the selective provider tunnel.
Range	0 to 4294967294
Units	kilobps
Notes	This element is mandatory.
Introduced	23.3.R1
Platforms	All

maximum-p2mp-spmsi *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum number of P2MP S-PMSIi tunnels
Context	**configure** service vpls *service-name* provider-tunnel selective maximum-p2mp-spmsi *number*
Tree	maximum-p2mp-spmsi

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the maximum number of S-PMSI tunnels for the EVPN service. When the limit is reached, no more RSVP P2MP S-PMSI or LDP P2MP S-PMSI are created and traffic over the data threshold value stays on I-PMSI
Range	1 to 4000
Default	10
Introduced	23.3.R1
Platforms	All

mldp *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable MLDP
Context	**configure** service vpls *service-name* provider-tunnel selective mldp *boolean*
Tree	mldp
Description	When configured to **true**, this command enables the use of MLDP as a protocol for an LDP P2MP LSP that is used for forwarding Broadcast, Unicast unknown, and Multicast (BUM) packets of a VPLS or B-VPLS instance. This command is also used used for forwarding IP multicast packets of an EVPN VPLS or R-VPLS service. When configured to **false**, this command disables the use of MLDP as a protocol to set up the P2MP LSP.
Default	false
Introduced	23.3.R1
Platforms	All

owner *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Provider-tunnel selective owner
Context	**configure** service vpls *service-name* provider-tunnel selective owner *keyword*
Tree	owner
Description	This command selects the owner protocol of the S-PMSI tunnel in the service. The owner must be explicitly set before the provider tunnel can be enabled.

restrict-non-configured-ip-address

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **restrict-non-configured-ip-address** context
Context	**configure** service vpls *service-name* proxy-arp restrict-non-configured-ip-address
Tree	restrict-non-configured-ip-address
Description	Commands in this context configure whether all the configured dynamic IP address entries are considered the only authorized entries in the proxy ARP or ND table. ARP or ND packets coming from a unauthorized sender IP are dropped. Therefore, unauthorized IP addresses are not learned in the proxy ARP or ND table, and ARP requests or neighbor solicitations (NS) coming from a unauthorized sender IP are not replied (unless the **sponge-mac** command option is configured).
Introduced	24.10.R1
Platforms	All

sponge-mac *mac-unicast-address-no-zero*

Synopsis	Sponge MAC used to reply to unauthorized requests
Context	**configure** service vpls *service-name* proxy-arp restrict-non-configured-ip-address sponge-mac *mac-unicast-address-no-zero*
Tree	sponge-mac
Description	This command configures the system to ignore ARP requests or neighbor solicitations from an unauthorized IP address. These requests are not learned in the proxy ARP or ND table (when the **restrict-non-configured-ip-address** command is configured), and the system replies with the configured sponge MAC address. Any IP address that is not configured as proxy ARP, ND dynamic ARP, or neighbor IP address is considered unauthorized and there is no reply.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The configured sponge MAC address is not installed in the FDB or advertised in EVPN. If needed, the sponge MAC address can be configured as a static MAC in the same service in the node or a remote node.

This command supersedes the operation of the **restrict-non-configured-ip-address** command for replies to ARP requests or neighbor solicitation:

- If only **restrict-non-configured-ip-address** is configured, all ARP or ND packets from unauthorized IPs are dropped.
- If **restrict-non-configured-ip-address sponge-mac** is configured, ARP or ND packets from unauthorized IPs are dropped except for ARP requests or neighbor solicitation messages, to which the system replies with the configured sponge MAC address.

sap [sap-id] *reference*

Synopsis	Add a list entry for **sap**
Context	**configure** service vpls *service-name* proxy-nd dynamic-neighbor ip-address *ipv6-address* sap *reference*
Tree	sap
Description	Commands in this context configure the proxy ARP or ND entry for creation when the ARP or neighbor advertisement (NA) packet for the configured IP address is received on the configured SAP, when configured under the **dynamic-arp ip-address** context. This command can be configured in combination with the **mac-list** for the entry, in which case, the MAC of the ARP or NA message and the SAP on which the ARP or NA packet is received are both checked before creating the entry.
Max. instances	1
Introduced	24.10.R1

advertise-neighbor-type *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Advertisement type of static or dynamic entries in EVPN
Context	**configure** service vpls *service-name* proxy-nd evpn advertise-neighbor-type *keyword*
Tree	advertise-neighbor-type
Description	This command enables the advertisement of static or dynamic entries that are learned as host, router, or host and router (only one option is possible in a specified service). It also determines the R flag (host or router) when sending Neighbor Advertisement (NA) messages for existing EVPN entries in the proxy-ND table. The **router-host** command option is only possible when the ARP/ND extended community is advertised along with the MAC/IP routes. It determines that both host and router (dynamic and static) entries are advertised in MAC/IP routes, with an indication whether the entry is host or router in the R flag. These EVPN entries are installed as host or router entries depending on the R flag of the route, and NA messages for them are sent with the proper host or router indication.
Options	router, host, router-host
Default	router
Introduced	16.0.R1

restrict-non-configured-ip-address

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **restrict-non-configured-ip-address** context
Context	**configure** service vpls *service-name* proxy-nd restrict-non-configured-ip-address
Tree	restrict-non-configured-ip-address
Description	Commands in this context configure whether all the configured dynamic IP address entries are considered the only authorized entries in the proxy ARP or ND table. ARP or ND packets coming from a unauthorized sender IP are dropped. Therefore, unauthorized IP addresses are not learned in the proxy ARP or ND table, and ARP requests or neighbor solicitations (NS) coming from a unauthorized sender IP are not replied (unless the **sponge-mac** command option is configured).
Introduced	24.10.R1
Platforms	All

sponge-mac *mac-unicast-address-no-zero*

Synopsis	Sponge MAC used to reply to unauthorized requests
Context	**configure** service vpls *service-name* proxy-nd restrict-non-configured-ip-address sponge-mac *mac-unicast-address-no-zero*
Tree	sponge-mac

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description This command configures the system to ignore ARP requests or neighbor solicitations from an unauthorized IP address. These requests are not learned in the proxy ARP or ND table (when the **restrict-non-configured-ip-address** command is configured), and the system replies with the configured sponge MAC address. Any IP address that is not configured as proxy ARP, ND dynamic ARP, or neighbor IP address is considered unauthorized and there is no reply.

The configured sponge MAC address is not installed in the FDB or advertised in EVPN. If needed, the sponge MAC address can be configured as a static MAC in the same service in the node or a remote node.

This command supersedes the operation of the **restrict-non-configured-ip-address** command for replies to ARP requests or neighbor solicitation:

- If only **restrict-non-configured-ip-address** is configured, all ARP or ND packets from unauthorized IPs are dropped.
- If **restrict-non-configured-ip-address sponge-mac** is configured, ARP or ND packets from unauthorized IPs are dropped except for ARP requests or neighbor solicitation messages, to which the system replies with the configured sponge MAC address.

bgp-vpls-mh-veid *number*

Synopsis	BGP-VPLS multi-homing VE-ID
Context	**configure** service vpls *service-name* sap *sap* bgp-vpls-mh-veid *number*
Tree	bgp-vpls-mh-veid
Description	This command specifies a VE ID that is configured on SAPs that are part of an EVPN single-active Ethernet Segment. The configuration of this command allows the advertisement of L2VPN routes that indicate the state of multi-homed SAPs to the remote BGP-VPLS PEs, which can trigger a MAC flush operation on the service to avoid traffic from being blackholed when a failure occurs in the active PE.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured from the SAP, L2VPN routes are withdrawn, which causes MAC flush processing on the remote BGP-VPLS.

Context	**configure** service vpls *service-name* sap *sap* dhcp
Tree	dhcp
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of DHCP
Context	**configure** service vpls *service-name* sap *sap* dhcp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Introduced	16.0.R1
Platforms	All

description *description*

Synopsis	Text description
Context	**configure** service vpls *service-name* sap *sap* dhcp description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	All

lease-populate

Synopsis	Enter the **lease-populate** context
Context	**configure** service vpls *service-name* sap *sap* dhcp lease-populate
Tree	lease-populate
Introduced	16.0.R1
Platforms	All

max-leases *number*

Synopsis	Maximum number of DHCPv4 leases
Context	**configure** service vpls *service-name* sap *sap* dhcp lease-populate max-leases *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	max-leases
Range	0 to 131071
Introduced	16.0.R1
Platforms	All

option-82

Synopsis	Enter the **option-82** context
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82
Tree	option-82
Description	Commands in this context configure the processing required when the router receives a DHCP request that already has an Option 82 field in the packet.
Introduced	16.0.R1
Platforms	All

action *keyword*

Synopsis	Action to take with received DHCP Option 82
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 action *keyword*
Tree	action
Options	replace, drop, keep
Default	keep
Introduced	16.0.R1
Platforms	All

circuit-id

Synopsis	Enter the **circuit-id** context
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 circuit-id
Tree	circuit-id
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ascii-tuple

Synopsis	Use the ASCII-encoded tuple for the circuit ID
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 circuit-id ascii-tuple
Tree	ascii-tuple
Notes	The following elements are part of a choice: **ascii-tuple**, **hex-string**, **none**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

hex-string *hex-string*

Synopsis	User-defined hexadeciaml value of the option
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 circuit-id hex-string *hex-string*
Tree	hex-string
String length	1 to 66
Notes	The following elements are part of a choice: **ascii-tuple**, **hex-string**, **none**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

none

Synopsis	Do not include the circuit ID
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 circuit-id none
Tree	none
Notes	The following elements are part of a choice: **ascii-tuple**, **hex-string**, **none**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

vlan-ascii-tuple

Synopsis	Include the VLAN ID and dot1p bits in the ASCII tuple
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 circuit-id vlan-ascii-tuple

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	vlan-ascii-tuple
Description	When configured, the router includes the VLAN ID and dot1p bits with the ASCII-tuple information. This only occurs on dot1q and QinQ-encapsulated ports. When the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of the outgoing packet. When unconfigured, the router leaves the circuit ID sub-option of the DHCP packet empty.
Notes	The following elements are part of a choice: **ascii-tuple**, **hex-string**, **none**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

remote-id

Synopsis	Enter the **remote-id** context
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 remote-id
Tree	remote-id
Description	Commands in this context configure the remote IP sub-option of the DHCP packet with the identity of the remote host end (typically the DHCP client).
Introduced	16.0.R1
Platforms	All

ascii-string *string-not-all-spaces*

Synopsis	User-defined ASCII string for the remote ID
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 remote-id ascii-string *string-not-all-spaces*
Tree	ascii-string
String length	1 to 32
Notes	The following elements are part of a choice: **ascii-string**, **hex-string**, **mac**, or **none**.
Introduced	16.0.R1
Platforms	All

hex-string *hex-string*

Synopsis	Option as a hexadecimal string
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 remote-id hex-string *hex-string*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	hex-string
String length	1 to 66
Notes	The following elements are part of a choice: **ascii-string**, **hex-string**, **mac**, or **none**.
Introduced	16.0.R1
Platforms	All

mac

Synopsis	Use the MAC address for the remote ID
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 remote-id mac
Tree	mac
Notes	The following elements are part of a choice: **ascii-string**, **hex-string**, **mac**, or **none**.
Introduced	16.0.R1
Platforms	All

none

Synopsis	Do not include the remote ID
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 remote-id none
Tree	none
Notes	The following elements are part of a choice: **ascii-string**, **hex-string**, **mac**, or **none**.
Introduced	16.0.R1
Platforms	All

vendor-specific-option

Synopsis	Enter the **vendor-specific-option** context
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 vendor-specific-option
Tree	vendor-specific-option
Description	Commands in this context configure the Nokia Vendor-Specific Option (VSO) of the DHCP packet.
Introduced	16.0.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

client-mac-address *boolean*

Synopsis	Send the MAC address in the VSO
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 vendor-specific-option client-mac-address *boolean*
Tree	client-mac-address
Default	false
Introduced	16.0.R1
Platforms	All

sap-id *boolean*

Synopsis	Send SAP ID in the sub-option of the DHCP relay packet
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 vendor-specific-option sap-id *boolean*
Tree	sap-id
Default	false
Introduced	16.0.R1
Platforms	All

service-id *boolean*

Synopsis	Send the service ID in the Vendor Specific Option
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 vendor-specific-option service-id *boolean*
Tree	service-id
Default	false
Introduced	16.0.R1
Platforms	All

string *string-not-all-spaces*

Synopsis	User-defined ASCII string for the VSO
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 vendor-specific-option string *string-not-all-spaces*
Tree	string

© 2025 Nokia.

String length	1 to 32
Introduced	16.0.R1
Platforms	All

system-id *boolean*

Synopsis	Send the system ID in the VSO
Context	**configure** service vpls *service-name* sap *sap* dhcp option-82 vendor-specific-option system-id *boolean*
Tree	system-id
Default	false
Introduced	16.0.R1
Platforms	All

proxy-server

Synopsis	Enter the **proxy-server** context
Context	**configure** service vpls *service-name* sap *sap* dhcp proxy-server
Tree	proxy-server
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the DHCP proxy server
Context	**configure** service vpls *service-name* sap *sap* dhcp proxy-server admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

emulated-server *ipv4-unicast-address*

Synopsis	IP address used as DHCP server address in SAP context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* sap *sap* dhcp proxy-server emulated-server *ipv4-unicast-address*
Tree	emulated-server
Introduced	16.0.R1
Platforms	All

lease-time

Synopsis	Enter the **lease-time** context
Context	**configure** service vpls *service-name* sap *sap* dhcp proxy-server lease-time
Tree	lease-time
Introduced	16.0.R1
Platforms	All

radius-override *boolean*

Synopsis	Use lease time information provided by RADIUS server
Context	**configure** service vpls *service-name* sap *sap* dhcp proxy-server lease-time radius-override *boolean*
Tree	radius-override
Default	false
Introduced	16.0.R1
Platforms	All

value *number*

Synopsis	DHCP lease time
Context	**configure** service vpls *service-name* sap *sap* dhcp proxy-server lease-time value *number*
Tree	value
Range	300 to 315446399
Units	seconds
Introduced	16.0.R1
Platforms	All

interface-type *keyword*

Synopsis	LDRA interface type
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra interface-type *keyword*
Tree	interface-type
Description	This command specifies the LDRA interface type. **client-facing** - configure the SAP as an untrusted client-facing interface. Only DHCPv6 client messages are accepted and encapsulated in a Relay-Forward message. It is mandatory to configure an interface ID for client-facing SAPs. Relay-Forward, Relay-Reply, and DHCPv6 server messages are silently dropped when received on a client-facing SAP. **network-facing** - configure the SAP as a network-facing interface. Only Relay-Reply messages are accepted: the server message is extracted from the Relay-Reply message and forwarded in the VPLS. All other DHCPv6 message types are silently dropped when received on a network-facing SAP.
Options	client-facing, network-facing
Notes	This element is mandatory.
Introduced	23.10.R1
Platforms	All

options

Synopsis	Enter the **options** context
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options
Tree	options
Introduced	23.10.R1
Platforms	All

interface-id

Synopsis	Enable the **interface-id** context
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options interface-id
Tree	interface-id
Introduced	23.10.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ascii-tuple

Synopsis	Use an ASCII-encoded concatenated tuple
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options interface-id ascii-tuple
Tree	ascii-tuple
Description	This command specifies the use of the ASCII-encoded concatenated tuple, which consists of the system name, service ID, and SAP ID separated by "|".
Notes	The following elements are part of a mandatory choice: **ascii-tuple** or **vlan-ascii-tuple**.
Introduced	23.10.R1
Platforms	All

vlan-ascii-tuple

Synopsis	Use an enhanced ASCII-encoded concatenated tuple
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options interface-id vlan-ascii-tuple
Tree	vlan-ascii-tuple
Description	This command specifies the use of the ASCII-encoded concatenated tuple enhanced with VLAN ID and dot1p bits, consisting of the system name, service ID, SAP ID, dot1p inner VLAN, and inner VLAN ID separated by "|".
Notes	The following elements are part of a mandatory choice: **ascii-tuple** or **vlan-ascii-tuple**.
Introduced	23.10.R1
Platforms	All

remote-id

Synopsis	Enter the **remote-id** context
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options remote-id
Tree	remote-id
Description	Commands in this context configure the Relay-Agent remote ID contents inserted by the LDRA.
Introduced	23.10.R1
Platforms	All

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mac

Synopsis	Use the DHCPv6 client source MAC address
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options remote-id mac
Tree	mac
Description	This command sets the enterprise number field of the Relay Agent remote ID to 6527 and configures the DHCPv6 client source MAC address as six hexadecimal numbers.
Notes	The following elements are part of a choice: **mac** or **string**.
Introduced	23.10.R1
Platforms	All

string *string*

Synopsis	User-defined ASCII string
Context	**configure** service vpls *service-name* sap *sap* dhcp6 ldra options remote-id string *string*
Tree	string
Description	This command sets the enterprise number field of the Relay-Agent remote ID to 6527 and configures the ASCII-encoded string.
String length	1 to 32
Notes	The following elements are part of a choice: **mac** or **string**.
Introduced	23.10.R1
Platforms	All

dist-cpu-protection *reference*

Platforms	All

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service vpls *service-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

String length	1 to 32

collect-lmm-fc-stats

Synopsis	Enter the **collect-lmm-fc-stats** context
Context	**configure** service vpls *service-name* sap *sap* eth-cfm collect-lmm-fc-stats
Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection. The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively. This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter
Context	**configure** service vpls *service-name* sap *sap* eth-cfm collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* sap *sap* eth-cfm collect-lmm-fc-stats fc-in-profile *keyword*
Tree	fc-in-profile
Description	This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-stats *boolean*

Synopsis	Collect statistics for loss measurement message tests
Context	**configure** service vpls *service-name* sap *sap* eth-cfm collect-lmm-stats *boolean*
Tree	collect-lmm-stats
Description	When configured to **true**, the router instantiates the statistical counter to transmit and receive packets for the LAG facility MEP bindings. The **show eth-cfm collect-lmm-stats** command displays entities that have been enabled to collect transit and receive counters. When configured to **false**, the router does not instantiate the counter and the LMM PDU associated with the MEP does not populate the counters in the packet.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cfm-vlan-tag *one-or-two-vlan-tags*

Synopsis	VLAN tags to apply to CFM PDUs for egress processing
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* cfm-vlan-tag *one-or-two-vlan-tags*
Tree	cfm-vlan-tag
Description	This command allows the CFM function to include additional VLAN tags to the CFM packet that are carried to the egress and treated as service delimited. Typically, this function is used to influence the VLAN carried over a binding that uses the **vc-type vlan** or the binding forces the use of one or more VLAN tag that results in a mismatch between the service data arriving at the binding and the locally generated ETH-CFM PDUs arriving at the same egress. When this command is included under the MEP or MIP configuration, the tags used as part of the configuration typically match the SAP service delimited configuration.
String length	1 to 9
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

csf

Tree	rx-eth-vsm-grace
Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router disables the Nokia Grace function.

Default true

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-vsm-grace *boolean*

Synopsis Transmit ETH-ED PDUs from the MEP

Context **configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*

Tree tx-eth-vsm-grace

Description When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards.

The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect.

The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED).

When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.

Default true

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lbm-svc-act-responder *boolean*

Synopsis Process service activation streams in ETH-CFM LBM

Context **configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* lbm-svc-act-responder *boolean*

Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon
Default	mac-rem-err-xcon
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address *mac-unicast-address-no-zero*

Synopsis	MAC address of the MEP
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* mac-address *mac-unicast-address-no-zero*
Tree	mac-address
Description	This command specifies the MAC address of the MEP. When unconfigured, the MAC address of the port (if the MEP is on a SAP) or the MAC address of a bridge (if the MEP is on a spoke) is used.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

monitor-oper-group *reference*

Synopsis	Operational group to monitor
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* monitor-oper-group *reference*
Tree	monitor-oper-group
Description	This command operationally affects the state of the SAP based on the state of the operational group. When the monitoring function detects an operationally down state for the operational group, the SAP is set to operationally down and any CFM defects that were present on the MEP are cleared. The MEP enters a pseudo down state and does not try to transmit CFM packets and it is not expecting to receive CFM packets. When the monitoring function detects an operationally up state for the operational group, the CFM reason code that brought the SAP operationally down is removed. Assuming no other conditions prevent this, the SAP transitions to operationally up and the MEP is initialized. This command is applicable to MEPs with a direction of down (**configure service sap eth-cfm mep direction down**) and a **configure eth-cfm domain association ccm-interval** of 1 second or higher.
Reference	**configure** service oper-group *named-item*

Tree	mip
Description	This command provides an option for linking a MIP with a Primary VLAN number or none. When the **none** option is provided, the MIP does not include the primary vlan.
Range	1 to 4094
Options	none
Notes	This element is part of a list key.
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cfm-vlan-tag *one-or-two-vlan-tags*

Synopsis	VLAN tags to apply to CFM PDUs for egress processing
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mip primary-vlan *(number | keyword)* cfm-vlan-tag *one-or-two-vlan-tags*
Tree	cfm-vlan-tag
Description	This command allows the CFM function to include additional VLAN tags to the CFM packet that are carried to the egress and treated as service delimited. Typically, this function is used to influence the VLAN carried over a binding that uses the vc-type vlan or the binding forces the use of one or more VLAN tag that results in a mismatch between the service data arriving at the binding and the locally generated ETH-CFM PDUs arriving at the same egress. When this command is included under the MEP or MIP configuration, the tags used as part of the configuration typically match the SAP service delimited configuration.
String length	1 to 9
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address *mac-unicast-address-no-zero*

Synopsis	MAC address of the MIP
Context	**configure** service vpls *service-name* sap *sap* eth-cfm mip primary-vlan *(number | keyword)* mac-address *mac-unicast-address-no-zero*
Tree	mac-address

Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

squelch-ingress-ctag-levels *number*

Synopsis	Squelch levels using additional VLAN C-Tag space
Context	**configure** service vpls *service-name* sap *sap* eth-cfm squelch-ingress-ctag-levels *number*
Tree	squelch-ingress-ctag-levels
Description	This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding plus an additional VLAN, up to a maximum tag length of two tags. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level to be dropped.
Range	0 to 7
Max. instances	8
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

squelch-ingress-levels *number*

Synopsis	Levels for which ETH-CFM packets are silently discarded
Context	**configure** service vpls *service-name* sap *sap* eth-cfm squelch-ingress-levels *number*
Tree	squelch-ingress-levels
Description	This command defines the levels of the ETH-CFM packets that are silently discarded. At ingress, ETH-CFM packets that meet the following conditions are silently discarded: • The packet is ingressing into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding. • The packet level matches the configured levels. All ETH-CFM packets ingressing to the SAP or SDP binding that match the configured levels are dropped without regard for other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option.

Synopsis	Referenced MAC protect exclusion list
Context	**configure** service vpls *service-name* sap *sap* fdb auto-learn-mac-protect-exclude-list *reference*
Tree	auto-learn-mac-protect-exclude-list
Description	This command references the name of a MAC protect exclusion list. Dynamically-learned MAC Source Addresses (SA) are protected if they are learned on an object with ALMP configured and no exclusion list is associated with the object, or if the MAC SA does not match any entry in an associated exclusion list. An exclusion list can be used in multiple objects of a service. If a list is empty, ALMP does not exclude any learned MAC SAs from protection on the object.
Reference	**configure** service mac-list *named-item*
Introduced	20.5.R1

maximum-mac-addresses *number*

Synopsis	Maximum number of MAC address entries in the FDB
Context	**configure** service vpls *service-name* sap *sap* fdb maximum-mac-addresses *number*
Tree	maximum-mac-addresses
Description	This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this SAP. When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared. When the configured limit is reached and the **configure service pw-template fdb discard-unknown-source** command is set to **true** for this SAP, packets with unknown source MAC addresses are discarded. If **discard-unknown-source** is set to **false**, the packets are forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown. However, if the **configure service vpls fdb discard-unknown** command is set to **true**, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached. When unconfigured, the SAP uses the global MAC learning limitations.

policy *reference*

Synopsis Multicast CAC policy name

Context **configure** service vpls *service-name* sap *sap* igmp-snooping mcac policy *reference*

Tree policy

Description This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment.

Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface when redirection is configured
- subscriber level and group-interface level when redirection is unconfigured

In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).

Tree	scheduler
Introduced	16.0.R1
Platforms	All

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service vpls *service-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

qtag-manipulation

Synopsis	Enter the **qtag-manipulation** context
Context	**configure** service vpls *service-name* sap *sap* ingress qtag-manipulation
Tree	qtag-manipulation
Introduced	16.0.R1
Platforms	All

c-tag *(number | keyword)*

Synopsis	Inner ingress vlan translation for two service delimiting vlan values
Context	**configure** service vpls *service-name* sap *sap* ingress qtag-manipulation c-tag *(number | keyword)*
Tree	c-tag
Range	0 to 4094
Options	tag-*
Notes	The following elements are part of a choice: **push-dot1q-vlan** or (**c-tag** and **s-tag**).
Introduced	22.10.R1
Platforms	All

push-dot1q-vlan *(number | keyword)*

Synopsis	VLAN translation information
Context	**configure** service vpls *service-name* sap *sap* ingress qtag-manipulation push-dot1q-vlan *(number | keyword)*
Tree	push-dot1q-vlan
Range	0 to 4094
Options	use-sap-svlan
Notes	The following elements are part of a choice: **push-dot1q-vlan** or (**c-tag** and **s-tag**).
Introduced	16.0.R1
Platforms	All

s-tag *number*

Synopsis	Outer ingress VLAN translation for two service delimiting VLAN values

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* sap *sap* ingress qtag-manipulation s-tag *number*
Tree	s-tag
Range	0 to 4094
Notes	The following elements are part of a choice: **push-dot1q-vlan** or (**c-tag** and **s-tag**).
Introduced	22.10.R1
Platforms	All

l2pt

Synopsis	Enter the **l2pt** context
Context	**configure** service vpls *service-name* sap *sap* l2pt
Tree	l2pt
Introduced	16.0.R1
Platforms	All

force-boundary

Synopsis	Enable the **force-boundary** context
Context	**configure** service vpls *service-name* sap *sap* l2pt force-boundary
Tree	force-boundary
Introduced	16.0.R1
Platforms	All

protocols

Synopsis	Enter the **protocols** context
Context	**configure** service vpls *service-name* sap *sap* l2pt force-boundary protocols
Tree	protocols
Introduced	16.0.R1
Platforms	All

cdp *boolean*

Synopsis	Enable Cisco discovery protocol
Context	**configure** service vpls *service-name* sap *sap* l2pt force-boundary protocols cdp *boolean*

Use subject to Terms available at: www.nokia.com/terms.

Tree	cdp
Default	false
Introduced	16.0.R1
Platforms	All

dtp *boolean*

Synopsis	Enable dynamic trunking protocol
Context	**configure** service vpls *service-name* sap *sap* l2pt force-boundary protocols dtp *boolean*
Tree	dtp
Default	false
Introduced	16.0.R1
Platforms	All

pagp *boolean*

Synopsis	Enable port aggregation protocol
Context	**configure** service vpls *service-name* sap *sap* l2pt force-boundary protocols pagp *boolean*
Tree	pagp
Default	false
Introduced	16.0.R1
Platforms	All

stp *boolean*

Synopsis	Enable all spanning tree protocols
Context	**configure** service vpls *service-name* sap *sap* l2pt force-boundary protocols stp *boolean*
Tree	stp
Default	true
Introduced	16.0.R1
Platforms	All

udld *boolean*

Synopsis	Enable unidirectional link detection

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* sap *sap* l2pt force-boundary protocols udld *boolean*
Tree	udld
Default	false
Introduced	16.0.R1
Platforms	All

vtp *boolean*

Synopsis	Enable virtual trunk protocol
Context	**configure** service vpls *service-name* sap *sap* l2pt force-boundary protocols vtp *boolean*
Tree	vtp
Default	false
Introduced	16.0.R1
Platforms	All

termination

Synopsis	Enable the **termination** context
Context	**configure** service vpls *service-name* sap *sap* l2pt termination
Tree	termination
Introduced	16.0.R1
Platforms	All

protocols

Synopsis	Enter the **protocols** context
Context	**configure** service vpls *service-name* sap *sap* l2pt termination protocols
Tree	protocols
Introduced	16.0.R1
Platforms	All

cdp *boolean*

Tree	cdp
Default	false
Introduced	16.0.R1
Platforms	All

dtp *boolean*

Synopsis	Enable dynamic trunking protocol
Context	**configure** service vpls *service-name* sap *sap* l2pt termination protocols dtp *boolean*
Tree	dtp
Default	false
Introduced	16.0.R1
Platforms	All

pagp *boolean*

Synopsis	Enable port aggregation protocol
Context	**configure** service vpls *service-name* sap *sap* l2pt termination protocols pagp *boolean*
Tree	pagp
Default	false
Introduced	16.0.R1
Platforms	All

stp *boolean*

Synopsis	Enable all spanning tree protocols
Context	**configure** service vpls *service-name* sap *sap* l2pt termination protocols stp *boolean*
Tree	stp
Default	true
Introduced	16.0.R1
Platforms	All

udld *boolean*

Synopsis	Enable unidirectional link detection

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vpls *service-name* sap *sap* l2pt termination protocols udld *boolean*
Tree	udld
Default	false
Introduced	16.0.R1
Platforms	All

vtp *boolean*

Synopsis	Enable virtual trunk protocol
Context	**configure** service vpls *service-name* sap *sap* l2pt termination protocols vtp *boolean*
Tree	vtp
Default	false
Introduced	16.0.R1
Platforms	All

l2tpv3-session

Synopsis	Enable the **l2tpv3-session** context
Context	**configure** service vpls *service-name* sap *sap* l2tpv3-session
Tree	l2tpv3-session
Introduced	16.0.R4
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the session for the service
Context	**configure** service vpls *service-name* sap *sap* l2tpv3-session admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R4
Platforms	All

Introduced	16.0.R4
Platforms	All

router

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **router** context
Context	**configure** service vpls *service-name* sap *sap* l2tpv3-session router
Tree	router
Introduced	16.0.R4
Platforms	All

group *named-item*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Tunnel group name
Context	**configure** service vpls *service-name* sap *sap* l2tpv3-session router group *named-item*
Tree	group
String length	1 to 32
Introduced	16.0.R4
Platforms	All

router-instance *router-instance-base-vprn-loose*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Router name used to identify the router instance
Context	**configure** service vpls *service-name* sap *sap* l2tpv3-session router router-instance *router-instance-base-vprn-loose*
Tree	router-instance

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String length	1 to 64
Introduced	16.0.R4
Platforms	All

vc-id *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	VC ID for the L2TPv3 session
Context	**configure** service vpls *service-name* sap *sap* l2tpv3-session vc-id *number*
Tree	vc-id
Range	1 to 4294967295
Introduced	16.0.R4
Platforms	All

lag

Synopsis	Enter the **lag** context
Context	**configure** service vpls *service-name* sap *sap* lag
Tree	lag
Introduced	16.0.R1
Platforms	All

link-map-profile *number*

Synopsis	LAG link map profile for a SAP or network interface
Context	**configure** service vpls *service-name* sap *sap* lag link-map-profile *number*
Tree	link-map-profile
Description	This command assigns a preconfigured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. After an operator assigns a LAG link map profile, the system rehashes the SAP or network interface egress traffic over the LAG as required by the new configuration. If the LAG link map profile for a SAP or network interface is deleted, the system reverts back to per-flow hashing.
Range	1 to 64

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

per-link-hash

Synopsis	Enter the **per-link-hash** context
Context	**configure** service vpls *service-name* sap *sap* lag per-link-hash
Tree	per-link-hash
Introduced	16.0.R1
Platforms	All

class *number*

Synopsis	Class used on LAG egress using weighted per-link-hash
Context	**configure** service vpls *service-name* sap *sap* lag per-link-hash class *number*
Tree	class
Range	1 to 3
Default	1
Introduced	16.0.R1
Platforms	All

weight *number*

Synopsis	Weight used on LAG egress using weighted per-link-hash
Context	**configure** service vpls *service-name* sap *sap* lag per-link-hash weight *number*
Tree	weight
Range	1 to 1024
Default	1
Introduced	16.0.R1
Platforms	All

managed-vlan-list

Synopsis	Enter the **managed-vlan-list** context
Context	**configure** service vpls *service-name* sap *sap* managed-vlan-list

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	managed-vlan-list
Introduced	19.10.R1
Platforms	All

range [vlan-range] *string*

Synopsis	Add a list entry for **range**
Context	**configure** service vpls *service-name* sap *sap* managed-vlan-list range *string*
Tree	range
Introduced	19.10.R1
Platforms	All

[**vlan-range**] *string*

Synopsis	Range of VLANs associated with the M-VPLS SAP
Context	**configure** service vpls *service-name* sap *sap* managed-vlan-list range *string*
Tree	range
Notes	This element is part of a list key.
Introduced	19.10.R1
Platforms	All

mc-ring

Synopsis	Enable the **mc-ring** context
Context	**configure** service vpls *service-name* sap *sap* mc-ring
Tree	mc-ring
Introduced	16.0.R1
Platforms	All

ring-node *named-item*

Synopsis	Name for the ring node associated with this SAP
Context	**configure** service vpls *service-name* sap *sap* mc-ring ring-node *named-item*
Tree	ring-node
String length	1 to 32

Tree	service-id
Range	1 to 2147483647
Introduced	16.0.R1
Platforms	All

service-mtu *number*

Synopsis	MTU size
Context	**configure** service vpls *service-name* service-mtu *number*
Tree	service-mtu
Description	This command configures the Maximum Transmission Unit (MTU) value (payload) for the service. The system uses the value to validate the operational state of the SAP and SDP binding within the service. The value overrides the default MTU for the service type. The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) are used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state. When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state. If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated. Binding operational states are automatically reevaluated. For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

In the **configure service epipe spoke-sdp** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE.

adv-service-mtu *number*

Synopsis	Advertise service MTU value
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* adv-service-mtu *number*
Tree	adv-service-mtu
Description	This command configures the MTU value that is signaled in the targeted LDP for the spoke-SDP. The router uses the value for signaling and for validation with the received MTU instead of the service MTU. However, the value does not affect the locally enforced value, which is still based on the service MTU. This command cannot be configured on a spoke-SDP that is bound to an SDP with the **adv-mtu-override** command.
Range	0 to 9782
Introduced	24.7.R1
Platforms	All

Tree	failure-action
Description	This command configures a named BFD template to be used by VCCV BFD on PWs belonging to the VLL service. The template specifies parameters, such as the minimum transmit and receive control packet timer intervals, used by the BFD session. Template parameters are configured under the **configure router bfd** context.
Options	none, down
Default	none
Introduced	21.2.R1
Platforms	All

wait-for-up-timer *number*

Synopsis	Time waited for BFD up status
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time interval that is used to wait for a BFD session to come up. This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP for use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.
Range	1 to 60
Units	seconds
Introduced	21.2.R1
Platforms	All

block-on-mesh-failure *boolean*

Synopsis	Enable blocking after all SDPs are operationally down

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc-in-profile *keyword*

Synopsis	Forwarding class name for profile-aware counter
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm collect-lmm-fc-stats fc-in-profile *keyword*
Tree	fc-in-profile
Description	This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1

ccm-ltm-priority *number*

Synopsis	Priority of CCM and LTM messages transmitted by the MEP
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-ltm-priority *number*
Tree	ccm-ltm-priority
Range	0 to 7
Default	7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-padding-size *number*

Synopsis	Number of octets of padding to insert in CCM packets
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-padding-size *number*
Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV, is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.
Range	3 to 1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cfm-vlan-tag *one-or-two-vlan-tags*

Synopsis	VLAN tags to apply to CFM PDUs for egress processing
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* cfm-vlan-tag *one-or-two-vlan-tags*
Tree	cfm-vlan-tag

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command allows the CFM function to include additional VLAN tags to the CFM packet that are carried to the egress and treated as service delimited. Typically, this function is used to influence the VLAN carried over a binding that uses the **vc-type vlan** or the binding forces the use of one or more VLAN tag that results in a mismatch between the service data arriving at the binding and the locally generated ETH-CFM PDUs arriving at the same egress. When this command is included under the MEP or MIP configuration, the tags used as part of the configuration typically match the SAP service delimited configuration.
String length	1 to 9
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

csf

Synopsis	Enable the **csf** context
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf
Tree	csf
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

multiplier *decimal-number*

Synopsis	Multiplication factor used to clear the CSF condition
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf multiplier *decimal-number*
Tree	multiplier
Range	0.0 | 2.0 to 30.0
Default	3.5
Introduced	16.0.R1

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED). When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lbm-svc-act-responder *boolean*

Synopsis	Process service activation streams in ETH-CFM LBM
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* lbm-svc-act-responder *boolean*
Tree	lbm-svc-act-responder
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*

maximum-mac-addresses *number*

Synopsis	Maximum number of MAC address entries in the FDB
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* fdb maximum-mac-addresses *number*
Tree	maximum-mac-addresses
Description	This command specifies the maximum number of FDB entries for both learned and static MAC addresses for this spoke SDP. When the configured limit is reached, no new addresses are learned from the SAP or spoke SDP until at least one FDB entry is aged out or cleared. When the configured limit is reached and the **configure service spoke-sdp fdb discard-unknown-source** command is set to **true** for this spoke SDP, packets with unknown source MAC addresses are discarded. If **discard-unknown-source** is set to **false**, the packets are forwarded if their destination MAC addresses are known, or flooded if their destination MAC addresses are unknown. However, if the **configure service vpls fdb discard-unknown** command is set to **true**, packets with unknown destination MAC addresses are discarded, even if the limit of FDB entries on the specific VPLS instance is not reached. When unconfigured, the spoke SDP uses the global MAC learning limitations.
Range	1 to 511999
Introduced	16.0.R1
Platforms	All

protected-src-mac-violation-action *keyword*

Synopsis	Action when a relearn request for a protected MAC is received on the SDP
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* fdb protected-src-mac-violation-action *keyword*

hash-label

Synopsis	Enable the **hash-label** context
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* hash-label
Tree	hash-label
Description	Commands in this context configure the use of hash labels for egress datapaths. For information about hash-label handling, see the "Hash labels" section of the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide*.
Notes	The following elements are part of a choice: **entropy-label** or **hash-label**.
Introduced	16.0.R1
Platforms	All

signal-capability

Synopsis	Signal hash label capability to the remote PE
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* hash-label signal-capability
Tree	signal-capability
Description	When configured, this command enables the signaling and negotiating of the hash label between the local and remote PE nodes. The signaling process outcome determines whether the local PE inserts the hash label on the user packets. This outcome can override the local PE configuration.
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** service vpls *service-name* spoke-sdp *sdp-bind-id* igmp-snooping mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the

Description	Commands in this context configure access operations that are sent to the TACACS+ server during authorization.
Introduced	21.10.R3
Platforms	All

access-operation-cmd *keyword*

Synopsis	Access operations sent in authorization requests
Context	**configure** service vprn *service-name* aaa remote-servers tacplus authorization request-format access-operation-cmd *keyword*
Tree	access-operation-cmd
Description	This command sends an operation argument in authorization requests.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	In model-driven interfaces, this command configures the system to send the operation in the cmd argument, and the path in the cmd-args argument, in TACACS+ authorization requests. This command does not apply to authorization requests in classic interfaces.
Options	delete
Max. instances	1
Introduced	21.10.R3
Platforms	All

use-priv-lvl *boolean*

Synopsis	Allow privilege level mapping
Context	**configure** service vprn *service-name* aaa remote-servers tacplus authorization use-priv-lvl *boolean*
Tree	use-priv-lvl
Description	When configured to **true**, this command automatically performs a single authorization request to the TACACS+ server for cmd* (all commands) immediately after login, and then uses the local profile associated (via the **priv-lvl-map**) with the priv-lvl returned by the TACACS+ server for all subsequent authorization (except **enable-admin**). After the initial authorization for cmd*, no further authorization requests are sent to the TACACS+ server (except **enable-admin**). When configured to **false**, each command is sent to the TACACS+ server for authorization (this is true regardless of whether the **tacplus use-default-template** setting is enabled).
Default	false
Introduced	16.0.R4
Platforms	All

ignore-unknown-mandatory-vsas *boolean*

Synopsis	Ignore unknown mandatory VSAs and fail authentication
Context	**configure** service vprn *service-name* aaa remote-servers tacplus ignore-unknown-mandatory-vsas *boolean*
Tree	ignore-unknown-mandatory-vsas
Description	When configured to **true**, the system ignores unknown mandatory VSAs and authentication succeeds. When configured to **false**, the system ignores unknown mandatory VSAs received in a reply from the TACACS+ server. Authentication fails and the user is disconnected because the system cannot process a mandatory VSA that is unknown.
Default	false

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R1
Platforms	All

interactive-authentication *boolean*

Use subject to Terms available at: www.nokia.com/terms.

Range	0 to 4294967295
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	Policy name for the aggregated route
Context	**configure** service vprn *service-name* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* policy *reference*
Tree	policy
Description	This command associates an aggregate route with a policy reference. The aggregated route is activated only when there is at least one eligible active route in the sub-trees below it that is accepted by the policy evaluation. There is no evaluation into any sub-tree that starts with another active aggregate route. Eligible routes exclude host routes and LDP shortcut routes. If an aggregate route has no policy, or the reference is to an empty policy, this configuration is treated as equivalent to a policy with one rule that accepts all routes.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	20.10.R1
Platforms	All

summary-only *boolean*

Synopsis	Advertise the aggregate route only
Context	**configure** service vprn *service-name* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* summary-only *boolean*
Tree	summary-only
Description	When configured to **true**, the router suppresses the advertisement of more specific component routes for the aggregate. When configured to **false**, the router advertises both the aggregate route and its contributing routes.
Default	false
Introduced	16.0.R1
Platforms	All

tunnel-group *number*

Synopsis	Tunnel group from which to associate the MC IPSec state

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* tunnel-group *number*
Tree	tunnel-group
Description	This command adds the MC-IPsec state of the specific tunnel-group to the aggregate route.
Range	1 to 64
Introduced	20.7.R1
Platforms	All

allow-export-bgp-vpn *boolean*

Synopsis	Include BGP-VPN routes for export
Context	**configure** service vprn *service-name* allow-export-bgp-vpn *boolean*
Tree	allow-export-bgp-vpn
Default	false
Introduced	16.0.R1
Platforms	All

autonomous-system *number*

Synopsis	AS number advertised to peers for this router
Context	**configure** service vprn *service-name* autonomous-system *number*
Tree	autonomous-system
Description	This command configures the autonomous system (AS) number for the router. This value must be set before BGP can be activated. If the AS number is changed on a router with an active BGP instance, the new AS number is not used until the BGP instance is restarted.
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

bgp

Synopsis	Enable the **bgp** context
Context	**configure** service vprn *service-name* bgp
Tree	bgp

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the BGP instance
Context	**configure** service vprn *service-name* bgp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1

ipv4 *boolean*

Synopsis	Enable IPv4 routes to be advertised
Context	**configure** service vprn *service-name* bgp advertise-ipv6-next-hops ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	19.5.R1
Platforms	All

aggregator-id-zero *boolean*

Synopsis	Set router ID in the BGP AGGREGATOR attribute to 0
Context	**configure** service vprn *service-name* bgp aggregator-id-zero *boolean*
Tree	aggregator-id-zero
Description	When configured to **true**, the router ID in the BGP AGGREGATOR path attribute is set to 0 when BGP aggregates routes. This prevents different routers within an AS from creating aggregate routes for the same prefix with different path attributes. When configured to **false**, the AS number and router ID are added to the AGGREGATOR path attribute.
Default	false
Introduced	16.0.R1
Platforms	All

asn-4-byte *boolean*

Synopsis	Advertise support for 4-byte ASNs
Context	**configure** service vprn *service-name* bgp asn-4-byte *boolean*

Default	true
Introduced	16.0.R1
Platforms	All

attribute-set

Synopsis	Enter the **attribute-set** context
Context	**configure** service vprn *service-name* bgp attribute-set

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	attribute-set
Description	Commands in this context configure the handling of attribute set (ATTR_SET) attributes in BGP routes received from PE-CE peers of the VPRN. ATTR_SET is an optional transitive BGP path attribute standardized by RFC 6368 that is added to BGP L3 VPN routes to provide logical separation between the BGP domain of a customer and the BGP domain of a service provider.
Introduced	23.10.R1
Platforms	All

remove *boolean*

Synopsis	Remove ATTR_SET in received BGP routes from PE-CE peers
Context	**configure** service vprn *service-name* bgp attribute-set remove *boolean*
Tree	remove
Description	When configured to **true**, BGP ignores and silently discards ATTR_SETs in BGP routes received from PE-CE peers of the VPRN. The discarded ATTR_SETs do not affect BGP best path selection in the VPRN, and they do not appear in the VPN-IP routes that result from the VRF export of the BGP routes. Nokia recommends configuring this command to **true** in most deployments. When configured to **false**, BGP ignores ATTR_SETs in BGP routes received from PE-CE peers of the VPRN, but does not discard them. This allows the ATTR_SETs to propagate between CE devices connected to the VPRN and to other PE devices when the BGP routes are exported as VPN-IP routes. **Note:** If the configuration of this command is changed, ROUTE_REFRESH messages are sent to all PE-CE peers of the VPRN.
Default	false
Introduced	23.10.R1
Platforms	All

authentication-key *encrypted-leaf*

Synopsis	BGP authentication key for all peers
Context	**configure** service vprn *service-name* bgp authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command configures the authentication key used to protect all sessions. The stored format of the authentication key is based on the **configure system security hash-control management-interface md-cli hash-algorithm** setting.
String length	1 to 370
Introduced	16.0.R1

© 2025 Nokia.

Platforms	All

authentication-keychain *reference*

Synopsis	TCP authentication keychain for the session
Context	**configure** service vprn *service-name* bgp authentication-keychain *reference*
Tree	authentication-keychain
Description	This command associates the keychain to be used to authenticate the BGP session. The keychain allows the rollover of authentication keys during the lifetime of a session.
Reference	**configure** system security keychains keychain *named-item*
Introduced	16.0.R3
Platforms	All

backup-path

Synopsis	Enter the **backup-path** context
Context	**configure** service vprn *service-name* bgp backup-path
Tree	backup-path
Description	Commands in this context enable the use of a backup path for specified BGP-learned prefixes belonging to the base router. Multiple paths must be received for a prefix in order to take advantage of this feature. When a prefix has a backup path and its primary paths fail, the affected traffic is rapidly diverted to the backup path without waiting for control plane re-convergence to occur. When many prefixes share the same primary paths and in some cases, the same backup path, the time to divert failover traffic to the backup path is independent of the number of prefixes. By default, IPv4 and IPv6 prefixes do not have a backup path installed in the IOM.
Introduced	16.0.R1
Platforms	All

ipv4 *boolean*

Synopsis	Enable support for unlabeled unicast IPv4 routes
Context	**configure** service vprn *service-name* bgp backup-path ipv4 *boolean*

compare-origin-validation-state *boolean*

Synopsis	Allow comparison of origin validation states
Context	**configure** service vprn *service-name* bgp best-path-selection compare-origin-validation-state *boolean*
Tree	compare-origin-validation-state
Description	When configured to **true**, the RPKI origin validation state is compared between BGP routes, where a Valid state is preferred over a Not-Found state, and a Not-Found state is preferred over an Invalid state. When configured to **false**, the RPKI origin validate state comparison is not performed as part of the BGP route selection process.
Default	false
Introduced	19.7.R1
Platforms	All

deterministic-med *boolean*

Synopsis	Group paths based on AS before MED attribute comparison
Context	**configure** service vprn *service-name* bgp best-path-selection deterministic-med *boolean*
Tree	deterministic-med
Description	When configured to **true**, BGP groups paths from the same AS that are equal up to the MED attribute comparison and then compares the best path from each group to

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

select the overall best path. This process ensures that the best-path selection process is deterministic in all cases.

When configured to **false**, paths are not grouped and the overall best-path selection can depend on the order of route arrival.

Default false

Introduced 16.0.R1

Platforms All

ebgp-ibgp-equal

Synopsis Enter the **ebgp-ibgp-equal** context

Context **configure** service vprn *service-name* bgp best-path-selection ebgp-ibgp-equal

Tree ebgp-ibgp-equal

Description Commands in this context allow BGP to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled) for the specified address families. The result is a form of EIBGP load-balancing in a multipath scenario. This behavior can be applied selectively to certain address families.

By default, the BGP decision process prefers an EBGP learned route over an IBGP learned route.

Introduced 16.0.R1

Platforms All

ipv4 *boolean*

Synopsis Consider EBGP and IBGP IPv4 routes equal

Context **configure** service vprn *service-name* bgp best-path-selection ebgp-ibgp-equal ipv4 *boolean*

Platforms	All

ignore-nh-metric *boolean*

Synopsis	Ignore next-hop distance in best path selection
Context	**configure** service vprn *service-name* bgp best-path-selection ignore-nh-metric *boolean*
Tree	ignore-nh-metric
Description	When configured to **true**, BGP ignores the resolved distance to the BGP next hop in its route selection process. When configured to **false**, BGP factors the distance to the next hop into its decision process when it compares two BGP routes with the same NLRI learned from base router BGP peers (in the **router** context) or IP prefix learned from VPRN BGP peers (in the **vprn** context).
Default	false

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

ignore-router-id

Synopsis	Enable the **ignore-router-id** context
Context	**configure** service vprn *service-name* bgp best-path-selection ignore-router-id
Tree	ignore-router-id
Description	Commands in this context determine whether the BGP selection process ignores the BGP identifier (router ID) comparison of two EBGP paths from different EBGP peers when determining the best path for the specified address families. By default, BGP selects the path with the lower router ID when it compares two paths from EBGP peers.
Introduced	16.0.R1
Platforms	All

origin-invalid-unusable *boolean*

Synopsis	Ignore routes with invalid origin validation state
Context	**configure** service vprn *service-name* bgp best-path-selection origin-invalid-unusable *boolean*
Tree	origin-invalid-unusable
Description	When configured to **true**, routes that have an RPKI origin validation state of Invalid are considered unusable by the best-path selection algorithm. These routes cannot be used for forwarding and cannot be advertised to BGP peers. When configured to **false**, routes with an RPKI origin validation state of Invalid are compared to other usable routes for the same prefix, according to the BGP decision process.
Default	false
Introduced	19.7.R1
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD
Context	**configure** service vprn *service-name* bgp bfd-liveness *boolean*
Tree	bfd-liveness

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, BFD is enabled on all BGP sessions, subject to the association of those BGP sessions with IP interfaces that have BFD configurations. When configured to **false**, BFD is not enabled globally for all BGP sessions.
Default	false
Introduced	16.0.R1
Platforms	All

bfd-strict-mode

Synopsis	Enter the **bfd-strict-mode** context
Context	**configure** service vprn *service-name* bgp bfd-strict-mode
Tree	bfd-strict-mode
Introduced	23.7.R1
Platforms	All

advertise

Synopsis	Enable the **advertise** context
Context	**configure** service vprn *service-name* bgp bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**. • The interface associated with the peer has a valid BFD configuration. When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state. When unconfigured, BGP does not advertise the Strict-BFD capability to peers.
Introduced	23.7.R1
Platforms	All

holdtime *number*

Synopsis	Maximum time BGP waits for the BFD session to come up
Context	**configure** service vprn *service-name* bgp bfd-strict-mode advertise holdtime *number*

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	holdtime
Description	This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.
Range	1 to 65535
Units	seconds
Default	30
Introduced	23.7.R1
Platforms	All

next-hop-reachability *boolean*

Synopsis	Consider next hop unreachable if BFD session is down
Context	**configure** service vprn *service-name* bgp bfd-strict-mode next-hop-reachability *boolean*
Tree	next-hop-reachability
Description	When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met: • The BFD session to the peer is in a down state. • There is a valid interface BFD configuration that applies to the peer. • There is a valid BFD liveness configuration that applies to the peer. The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address. Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer. The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent. Configuring this command to **true** only affects routes belonging to the following address families: • IPv4 • IPv6 • IPv4 VPN • IPv6 VPN • labeled unicast IPv4 • labeled unicast IPv6 • EVPN • IPv4 multicast

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- IPv6 multicast
- IPv4 VPN multicast
- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Default	false
Introduced	23.7.R1
Platforms	All

client-reflect *boolean*

Synopsis	Allow client reflection of routes by route reflector
Context	**configure** service vprn *service-name* bgp client-reflect *boolean*
Tree	client-reflect
Description	When configured to **true**, routes received from neighbors considered to be RR clients are reflected to other peers as expected. When configured to **false**, routes received from neighbors considered to be RR clients are not reflected to other clients.
Default	true
Introduced	16.0.R1

second-wait *number*

Synopsis	Time that doubles after each session failure
Context	**configure** service vprn *service-name* bgp damp-peer-oscillations idle-hold-time second-wait *number*
Tree	second-wait
Description	This command defines the hold time that doubles after each repeated session failure that occurs in a short span of time.
Range	1 to 2048
Default	5
Introduced	16.0.R1
Platforms	All

damping *boolean*

Synopsis	Use BGP route damping to reduce route flap
Context	**configure** service vprn *service-name* bgp damping *boolean*
Tree	damping
Description	When configured to **true**, this command enables route damping to reduce the number of update messages sent between BGP peers and reduce the load on peers without affecting the route convergence time for stable routes.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Route damping is controlled by profiles set in route policies. If no profile is specified in the route policy, the default damping profile is used with the following parameters:

- Half-life: 15 minutes
- Max-suppress: 60 minutes
- Suppress-threshold: 3000
- Reuse-threshold: 750

When configured to **false**, BGP route damping for learned routes is disabled.

error-handling

Synopsis	Enter the **error-handling** context
Context	**configure** service vprn *service-name* bgp error-handling
Tree	error-handling
Introduced	16.0.R1
Platforms	All

legacy-mode *boolean*

Synopsis	Enable legacy-mode of BGP error handling
Context	**configure** service vprn *service-name* bgp error-handling legacy-mode *boolean*
Tree	legacy-mode
Description	When configured to **true**, the BGP instance handles the BGP update error messages based on the configured **update-fault-tolerance** commands. If these commands are not explicitly configured, BGP error handling follows the legacy procedures described in RFC 4271, which can result in disruptive session resets. When configured to **false**, the BGP instance ignores the configured **update-fault-tolerance** commands and applies the new error handling procedures described in RFC 7606 on all sessions.
Default	false
Introduced	24.3.R1
Platforms	All

update-fault-tolerance *boolean*

Synopsis	Tolerate non-critical errors in UPDATE messages
Context	**configure** service vprn *service-name* bgp error-handling update-fault-tolerance *boolean*
Tree	update-fault-tolerance
Description	When configured to **true**, non-critical errors are handled with treat-as-withdraw, attribute-discard, and other non-disruptive approaches that do not cause a session reset. Critical errors still trigger a session reset. When configured to **false**, most errors trigger a session reset.
Default	false
Introduced	16.0.R1
Platforms	All

Introduced	16.0.R1
Platforms	All

fast-external-failover *boolean*

Synopsis	Drop external BGP session immediately when link fails
Context	**configure** service vprn *service-name* bgp fast-external-failover *boolean*
Tree	fast-external-failover
Description	When configured to **true**, the router drops an external BGP session to a single-hop neighbor immediately when the local interface goes down. When configured to **false**, the BGP session remains up until the hold time expires.
Default	true
Introduced	16.0.R1
Platforms	All

flowspec

Synopsis	Enter the **flowspec** context
Context	**configure** service vprn *service-name* bgp flowspec
Tree	flowspec
Description	Commands in this context configure BGP FlowSpec validations.
Introduced	16.0.R1
Platforms	All

validate-dest-prefix *boolean*

Synopsis	Validate destination prefix in FlowSpec-IPv4/IPv6 route
Context	**configure** service vprn *service-name* bgp flowspec validate-dest-prefix *boolean*
Tree	validate-dest-prefix
Description	When configured to **true**, the router validates received IPv4 and IPv6 FlowSpec routes that contain a destination-prefix subcomponent. A FlowSpec route with a destination-prefix subcomponent is considered invalid if the following are true:

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- the route was originated outside the local AS of the receiving BGP router
- the neighbor AS of the FlowSpec route does not match the neighbor AS of the best match BGP (unicast) route for the destination prefix or the neighbor AS of any longer match BGP (unicast) route for the destination prefix

An invalid route is retained in the BGP RIB but it is not used for filtering traffic and is not propagated to other BGP routers.

When configured to **false**, destination-prefix validation is disabled.

Default	false
Introduced	16.0.R1
Platforms	All

validate-redirect-ip *boolean*

Synopsis	Validate the redirect-to-IPv4 action in FlowSpec route
Context	**configure** service vprn *service-name* bgp flowspec validate-redirect-ip *boolean*
Tree	validate-redirect-ip
Description	When configured to **true**, the router validates the redirect-to-IPv4 action attached to FlowSpec-IPv4 routes that are received by the BGP instance. A FlowSpec-IPv4 route is considered invalid and is not installed as a filter rule if it is determined to have originated from a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a FlowSpec route is identified based on its AS path. When configured to **false**, the router does not perform the validation check on Flow Spec-IPv4 routes.
Default	false
Introduced	16.0.R1
Platforms	All

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** service vprn *service-name* bgp graceful-restart
Tree	graceful-restart

Context	**configure** service vprn *service-name* bgp graceful-restart long-lived family *keyword* helper-override-stale-time *number*
Tree	helper-override-stale-time
Range	0 to 16777215
Introduced	16.0.R1
Platforms	All

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** service vprn *service-name* bgp graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	16.0.R1
Platforms	All

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time
Context	**configure** service vprn *service-name* bgp graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time
Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.

Range 0 to 4095

Introduced 16.0.R1

Platforms All

helper-override-stale-time *number*

Synopsis Locally-configured stale routes override time

Context **configure** service vprn *service-name* bgp graceful-restart long-lived helper-override-stale-time *number*

Tree helper-override-stale-time

Description This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability.

This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.

Range 0 to 16777215

Introduced 16.0.R1

Platforms All

without-no-export *boolean*

Synopsis Advertise LLGR stale routes to non-LLGR peers

Context **configure** service vprn *service-name* bgp graceful-restart long-lived without-no-export *boolean*

Tree without-no-export

Description When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0.

When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0 and a NO_EXPORT standard community is automatically added to the routes.

Default false

Introduced 16.0.R1

advertise-inactive *boolean*

Synopsis	Advertise an inactive BGP route to peers
Context	**configure** service vprn *service-name* bgp group *named-item-64* advertise-inactive *boolean*
Tree	advertise-inactive
Description	When configured to **true**, this command allows an inactive BGP route to be advertised, even though it is not the most preferred route. The effect of the command on advertised unlabeled, labeled, and multicapt IPv4 and IPv6 routes depends on several factors. • If the active route for the IP prefix is a BGP route, that route is advertised. • If the active route is a non-BGP route and there are valid inactive BGP routes to the same destination, the best valid inactive route is advertise unless the active non-BGP route is matched and accepted by an export policy applied to the session • If the active route is a non-BGP route and there are no valid BGP routes to the same destination, no route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicity configured to **false**. When this command inherits a value of **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.
Introduced	16.0.R1

advertise

Synopsis	Enable the **advertise** context
Context	**configure** service vprn *service-name* bgp group *named-item-64* bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**. • The interface associated with the peer has a valid BFD configuration. When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured, BGP does not advertise the Strict-BFD capability to peers.

Introduced 23.7.R1

Platforms All

holdtime *number*

Synopsis Maximum time BGP waits for the BFD session to come up

Context **configure** service vprn *service-name* bgp group *named-item-64* bfd-strict-mode advertise holdtime *number*

Tree holdtime

Description This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.

Range 1 to 65535

Units seconds

Default 30

Introduced 23.7.R1

Platforms All

next-hop-reachability *boolean*

Synopsis Consider next hop unreachable if BFD session is down

Context **configure** service vprn *service-name* bgp group *named-item-64* bfd-strict-mode next-hop-reachability *boolean*

Tree next-hop-reachability

Description When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met:

- The BFD session to the peer is in a down state.
- There is a valid interface BFD configuration that applies to the peer.
- There is a valid BFD liveness configuration that applies to the peer.

The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address.

Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer.

The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent.

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Configuring this command to **true** only affects routes belonging to the following address families:

- IPv4
- IPv6
- IPv4 VPN
- IPv6 VPN
- labeled unicast IPv4
- labeled unicast IPv6
- EVPN
- IPv4 multicast
- IPv6 multicast
- IPv4 VPN multicast
- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Introduced 23.7.R1

Platforms All

capability-negotiation *boolean*

Synopsis Enable capability negotiation

Context **configure** service vprn *service-name* bgp group *named-item-64* capability-negotiation *boolean*

Tree capability-negotiation

Description When configured to **true**, this command enables the exchange of capabilities.

When configured to **false** and the peering is flapped, new capabilities are not negotiated and strictly IPv4 exchanges are supported with the peer.

Default true

Introduced 16.0.R1

Platforms All

Tree	default-preference
Introduced	19.5.R1
Platforms	All

ebgp *number*

Synopsis	Default preference for EBGP
Context	**configure** service vprn *service-name* bgp group *named-item-64* default-preference ebgp *number*
Tree	ebgp
Range	0 to 255
Introduced	19.5.R1
Platforms	All

ibgp *number*

Synopsis	Default preference for IBGP
Context	**configure** service vprn *service-name* bgp group *named-item-64* default-preference ibgp *number*
Tree	ibgp
Range	0 to 255
Introduced	19.5.R1
Platforms	All

description *description*

Synopsis	Text description
Context	**configure** service vprn *service-name* bgp group *named-item-64* description *description*
Tree	description
String length	1 to 80
Introduced	16.0.R1
Platforms	All

dynamic-neighbor

Synopsis	Enter the **dynamic-neighbor** context

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor
Tree	dynamic-neighbor
Description	Commands in this context configure dynamic BGP sessions for a peer group.
Introduced	16.0.R1
Platforms	All

interface [interface-name] *reference*

Synopsis	Enter the **interface** list instance
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor interface *reference*
Tree	interface
Description	Commands in this context configure an unnumbered VPRN access IP interface for dynamic neighbors. If this interface connects to a network with other BGP routers, sessions with the other routers can be set up automatically without explicitly configuring them as BGP neighbors. The interface must be IPv6 enabled, but because the interface is considered unnumbered, it does not require an IPv4 address or a global-unicast IPv6 address. The sessions are set up using IPv6 link-local addresses. The BGP unnumbered feature supports all address families that allow IPv6 link-local BGP next-hop addresses. This includes IPv4 with the use of RFC 8950 extensions. When an interface is added to the list of dynamic-neighbor interfaces, an outgoing connection attempt is initiated toward any directly connected router on the interface that announces itself using an ICMPv6 router advertisement message. The session attempt is unsuccessful if the peer type is not EBGP, the reported AS number of the peer does not match one of the allowed values, or the maximum session limit of the interface would be exceeded.
Introduced	22.10.R1
Platforms	All

[**interface-name**] *reference*

Synopsis	Name of the dynamic neighbor interface
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor interface *reference*
Tree	interface
Reference	**configure** service vprn *service-name* interface *interface-name*
Notes	This element is part of a list key.
Introduced	22.10.R1

Platforms	All

allowed-peer-as *string*

Synopsis	Allowed peer AS value or range of acceptable values
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor interface *reference* allowed-peer-as *string*
Tree	allowed-peer-as
Description	This command specifies a singular allowed peer AS value or a range of acceptable values in the format *n1*..*n*2. All values greater than or equal to *n1* and less than or equal to *n2*are acceptable. For example, if the acceptable peer AS numbers are 65001 to 65005 (range) and 62100 (singular value), configure this command to use a value of [65001..65005 62100].
Max. instances	32
Notes	This element is ordered by the user.
Introduced	22.10.R1
Platforms	All

max-sessions *number*

Synopsis	Maximum number of dynamic sessions allowed
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor interface *reference* max-sessions *number*
Tree	max-sessions
Description	This command specifies the maximum number of dynamic sessions that are allowed to be set up on the interface as a result of accepting sessions from link-local addresses or initiating sessions by receiving IPv6 router advertisements.
Range	1 to 255
Default	1
Introduced	22.10.R1
Platforms	All

match

Synopsis	Enter the **match** context
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor match

© 2025 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	match
Introduced	19.5.R1
Platforms	All

prefix [ip-prefix] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Enter the **prefix** list instance
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor match prefix *(ipv4-prefix | ipv6-prefix)*
Tree	prefix
Introduced	19.5.R1
Platforms	All

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Dynamic peer prefix for the group
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor match prefix *(ipv4-prefix | ipv6-prefix)*
Tree	prefix
Notes	This element is part of a list key.
Introduced	19.5.R1
Platforms	All

allowed-peer-as *string*

Synopsis	Allowed peer AS value or range of acceptable values
Context	**configure** service vprn *service-name* bgp group *named-item-64* dynamic-neighbor match prefix *(ipv4-prefix | ipv6-prefix)* allowed-peer-as *string*
Tree	allowed-peer-as
