Synopsis	Enter the **destination** context
Context	**configure** log log-id *log-name* destination
Tree	destination
Description	Commands in this context specify where log event data is to be sent.
Introduced	16.0.R1
Platforms	All

cli

Synopsis	Enable the **cli** context
Context	**configure** log log-id *log-name* destination cli
Tree	cli
Description	Commands in this context configure log events directed to any subscribed CLI session. Subscribe to a CLI log from within a CLI session using the **tools perform log subscribe-to log-id** command. Events are sent to the CLI session for the duration of the CLI session or until a **tools perform log unsubscribe-from** command is issued. A local circular memory log is maintained for CLI logs.
Notes	The following elements are part of a choice: **cli**, **console**, **file**, **memory**, **netconf**, **openconfig-messages**, **snmp**, or **syslog**.
Introduced	16.0.R1
Platforms	All

max-entries *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Number of events stored in this CLI log
Context	**configure** log log-id *log-name* destination cli max-entries *number*
Tree	max-entries
Range	50 to 3000
Default	100
Introduced	16.0.R1
Platforms	All

console

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Send log events to the system console port
Context	**configure** log log-id *log-name* destination console
Tree	console
Description	When specified, the system directs log events to the console port. If the console is not connected, the system drops all entries.
Notes	The following elements are part of a choice: **cli**, **console**, **file**, **memory**, **netconf**, **openconfig-messages**, **snmp**, or **syslog**.
Introduced	16.0.R1
Platforms	All

file *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	File to send log events
Context	**configure** log log-id *log-name* destination file *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	file
Description	This command specifies the file where the system directs log events. When the command is modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. Use the **clear log** command to force a rollover. Subsequent log entries are then written to the new location. If a rollover does not occur or the log is not cleared, the system continues to use the old location.
Reference	**configure** log file *file-policy-name*
Notes	The following elements are part of a choice: **cli**, **console**, **file**, **memory**, **netconf**, **openconfig-messages**, **snmp**, or **syslog**.
Introduced	16.0.R1
Platforms	All

memory

Synopsis	Enable the **memory** context
Context	**configure** log log-id *log-name* destination memory
Tree	memory
Description	Commands in this context configure log events directed to a memory file. A memory file is a circular buffer. When the file is full, each new entry replaces the oldest entry in the log.
Notes	The following elements are part of a choice: **cli**, **console**, **file**, **memory**, **netconf**, **openconfig-messages**, **snmp**, or **syslog**.
Introduced	16.0.R1
Platforms	All

max-entries *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Number of events stored in this memory log
Context	**configure** log log-id *log-name* destination memory max-entries *number*
Tree	max-entries
Range	50 to 3000
Default	100
Introduced	16.0.R1

Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

netconf

Synopsis	Enable the **netconf** context
Context	**configure** log log-id *log-name* destination netconf
Tree	netconf
Description	Commands in this context configure log events directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.
Notes	The following elements are part of a choice: **cli**, **console**, **file**, **memory**, **netconf**, **openconfig-messages**, **snmp**, or **syslog**.
Introduced	16.0.R1
Platforms	All

max-entries *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Number of events stored in this NETCONF log
Context	**configure** log log-id *log-name* destination netconf max-entries *number*
Tree	max-entries
Range	50 to 3000
Introduced	16.0.R1
Platforms	All

openconfig-messages

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Send events to OpenConfig /system/messages container
Context	**configure** log log-id *log-name* destination openconfig-messages
Tree	openconfig-messages

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command directs log events to the OpenConfig /system/messages container. The **openconfig-messages** destination is only applicable to **log-id** 102, the default non-deletable **log-id** used for the OpenConfig messages model.
Notes	The following elements are part of a choice: **cli**, **console**, **file**, **memory**, **netconf**, **openconfig-messages**, **snmp**, or **syslog**.
Introduced	26.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

snmp

Synopsis	Enable the **snmp** context
Context	**configure** log log-id *log-name* destination snmp
Tree	snmp
Description	Commands in this context configure log events directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.
Notes	The following elements are part of a choice: **cli**, **console**, **file**, **memory**, **netconf**, **openconfig-messages**, **snmp**, or **syslog**.
Introduced	16.0.R1
Platforms	All

max-entries *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Number of events stored in this SNMP log
Context	**configure** log log-id *log-name* destination snmp max-entries *number*
Tree	max-entries
Range	50 to 3000
Default	100
Introduced	16.0.R1
Platforms	All

syslog *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Syslog collector to send log events
Context	**configure** log log-id *log-name* destination syslog *reference*
Tree	syslog
Description	This command specifies the syslog collector to direct log events. To remain consistent with the standards governing syslog, messages to syslog are truncated to 1024 bytes.
Reference	**configure** log syslog *log-syslog-name*
Notes	The following elements are part of a choice: **cli**, **console**, **file**, **memory**, **netconf**, **openconfig-messages**, **snmp**, or **syslog**.
Introduced	16.0.R1
Platforms	All

filter *reference*

Synopsis	Event filter policy with the log destination
Context	**configure** log log-id *log-name* filter *reference*
Tree	filter
Reference	**configure** log filter *log-filter-name*
Introduced	16.0.R1
Platforms	All

netconf-stream *named-item*

Synopsis	Destination NETCONF stream name
Context	**configure** log log-id *log-name* netconf-stream *named-item*
Tree	netconf-stream
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

python-policy *reference*

Synopsis	Python policy name
Context	**configure** log log-id *log-name* python-policy *reference*
Tree	python-policy
Reference	**configure** python python-policy *named-item*
Introduced	16.0.R1
Platforms	All

severity *keyword*

Synopsis	Send log events of specified severity and greater
Context	**configure** log log-id *log-name* severity *keyword*
Tree	severity
Description	This command configures the minimum syslog severity of events that are sent to the OpenConfig /system/messages container. The severity leaf applies only to **log-id** 102, the default non-deletable **log-id** used for the OpenConfig messages model. If the severity is not configured, log events of all severities are sent.
Options	emergency, alert, critical, error, warning, notice, informational, debug
Introduced	26.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

cak-name-prefix *string*

Synopsis	Prefix string to include in the CKN
Context	**configure** macsec connectivity-association *string* auto-gen-psk cak-name-prefix *string*
Tree	cak-name-prefix
Description	This command configures the prefix string to use in the CKN. The system generates each CKN by combining the following: • 20 bytes of the **cak-name-prefix**. If the entire 20 bytes is not configured, the system pads the remaining bytes with zeroes. • 2 bytes of zeroes that are reserved for future use • 6 bytes of the local chassis mac (to ensure that the CKNs on different chassis are unique) • 4 bytes of a counter that increments by one every time a new CKN is generated
String length	2 to 40
String format	'cak-name-prefix' must be even-length hex up to 40 characters (e.g. 0a1b2c)
Introduced	26.7.R1
Platforms	All

generate-interval *number*

Synopsis	Interval to autogenerate and distribute a new PSK
Context	**configure** macsec connectivity-association *string* auto-gen-psk generate-interval *number*
Tree	generate-interval
Range	10 to 86400
Units	minutes
Default	1440
Introduced	26.7.R1
Platforms	All

recovery-keychain *reference*

Synopsis	Keychain to initialize and recover PSK autogeneration
Context	**configure** macsec connectivity-association *string* auto-gen-psk recovery-keychain *reference*
Tree	recovery-keychain

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the MACsec keychain used to establish the initial MKA. The initial MKA is used to distribute the first auto-generated PSK and establish the autogenerating MKA session. The system also uses the keychain as a backup if the autogenerated MKA fails for any reason.
Reference	**configure** system security keychains keychain *named-item*
Introduced	26.7.R1
Platforms	All

cipher-suite *keyword*

Synopsis	Data path encryption algorithm
Context	**configure** macsec connectivity-association *string* cipher-suite *keyword*
Tree	cipher-suite
Options	gcm-aes-128, gcm-aes-256, gcm-aes-xpn-128, gcm-aes-xpn-256
Default	gcm-aes-128
Introduced	16.0.R1
Platforms	All

Options	static – Use static PSK auto-gen – Use autogenerated PSK
Default	static
Introduced	26.7.R1
Platforms	All

replay-protection *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Discard packet when not within the replay window size
Context	**configure** macsec connectivity-association *string* replay-protection *boolean*
Tree	replay-protection
Description	When configured to **true**, replay protection is enabled and packets are discarded when they are not within the replay window size. With replay protection, the sequence of the ID number of received packets is checked. If a packet arrives out of sequence and the difference between the packet IDs exceeds the replay protection window size, the packet is counted by the receiving port and discarded. For example if the replay protection window size is configured to five and a packet with an ID of 1006 arrives on the receiving link immediately following the packet assigned an ID of 1000, the packet with ID 1006 is counted and discarded because it is outside the parameter of the window size. Replay protection is particularly useful for addressing man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link that arrives on the receiving link out of sequence will be detected and dropped instead of forwarded through the network. Replay protection should not be enabled in cases where packets are expected to arrive out of order. When configured to **false**, replay protection is not enabled.

pre-shared-key [psk-id] *number*

Synopsis	Enter the **pre-shared-key** list instance
Context	**configure** macsec connectivity-association *string* static-cak pre-shared-key *number*
Tree	pre-shared-key
Description	Commands in this context configure pre-shared key attributes to enable MACsec using static connectivity association key (CAK) security mode. A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). The pre-shared key, the CKN and the CAK, must match on both ends of a link. A pre-shared key is configured on both devices at each end of a point-to-point link to enable MACsec via static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the successful MKA liveliness negotiation.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The encryption type is used to encrypt the SAK and authenticate the MKA packet. The symmetric encryption key SAK (Security Association Key) must be encrypted (wrapped) via the MKA protocols. The AES key is derived from the pre-shared-key.

Max. instances	2
Introduced	16.0.R1
Platforms	All

cak *encrypted-leaf-hex-without-prefix*

Synopsis	Connectivity association key (CAK) for the PSK
Context	**configure** macsec connectivity-association *string* static-cak pre-shared-key *number* cak *encrypted-leaf-hex-without-prefix*
Tree	cak
Description	This command specifies the connectivity association key (CAK) for the pre-shared key. Two values are derived from the CAK: • Key Encryption Key (KEK), used to encrypt the MKA and SAK (symmetric key used for data path PDUs) distributed between all members • Integrity Check Value (ICV), used to authenticate the MKA and SAK PDUs distributed between all members This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 126
String format	'encrypted-leaf-hex-without-prefix' must have clear text in hex without 0x or end with hash/hash2/hash3/custom
Introduced	16.0.R1
Platforms	All

use-lag-port-weight *boolean*

Synopsis	Use LAG port weight in calculating MCAC constraints
Context	**configure** mcac policy *string* bundle *string* mc-constraints use-lag-port-weight *boolean*
Tree	use-lag-port-weight

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, port weight is used when determining available bandwidth per level when LAG ports go down or come up. This command is required for proper operation on mixed port-speed LAGs and can also be used for unmixed port-speed LAGs.
Default	false
Introduced	16.0.R1
Platforms	All

source-specific-accounting *keyword*

Synopsis	MCAC accounting setting
Context	**configure** mcac policy *string* bundle *string* source-specific-accounting *keyword*
Tree	source-specific-accounting
Description	This command configures the MCAC policy accounting behavior. **true** - Both multicast group and multicast source are used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each has a different multicast source, the MCAC accounts for each combination of group and source. **false** - Only the multicast group is used for MCAC accounting. The multicast source address is not used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each have a different multicast source, the MCAC only accounts for the mutlicast group once. **policy** - The bundle uses the source-specific accounting setting in the MCAC policy level.
Options	true – Use source-specific accounting at policy level false – Use multicast group and source MCAC accounting policy – Use multicast group for MCAC accounting
Default	policy
Introduced	24.7.R1
Platforms	All

source-specific-accounting *boolean*

Synopsis	Enable multicast group and source for MCAC accounting
Context	**configure** mcac policy *string* source-specific-accounting *boolean*
Tree	source-specific-accounting
Description	When configured to **true**, the router uses both multicast group and multicast source for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each has a different multicast source, the MCAC accounts for each combination of group and source. If the multicast source is configured as a subnet instead of an address, the MCAC automatically accounts for every source address within the subnet. If the multicast source is not configured, the MCAC assumes only one source when calculating the mandatory bandwidth. However, when joins are coming in, each group and source combination is taken into account. When configured to **false**, the router only uses the multicast group for MCAC accounting. The multicast source address is not used for MCAC accounting. For example, if multiple, multicast joins are for the same multicast group but each has a different multicast source, the MCAC only accounts for the multicast group once.
Default	false
Introduced	24.7.R1
Platforms	All

4.27.1 mirror command descriptions

mirror

Synopsis	Enter the **mirror** context
Context	**configure** mirror
Tree	mirror
Introduced	16.0.R1
Platforms	All

global-sampling-rate *number*

Synopsis	System wide global sampling rate
Context	**configure** mirror global-sampling-rate *number*
Tree	global-sampling-rate
Description	This command configures the global sampling rate. The global sampling rate provides a higher sampling rate than the sampling rate specified on the mirror destination. When set, this command applies to all mirror destination services that have the **use-global-sampling-rate** command configured. The global sampling rate takes precedence over the rate specified on the mirror destination. This means that when this command and the **configure mirror mirror-dest sampling-rate** are configured under the same mirror destination, the system automatically samples using the higher rate configured with this command and ignores the lower rate configured with the **sampling-rate** command. When unconfigured, no mirror destinations are associated to a global sampling rate and all mirror destinations mirror at the full rate, which means every packet is mirrored unless a mirror destination rate is specified.
Range	0 | 2 to 255
Default	0
Introduced	22.10.R1
Platforms	All

mirror-dest [service-name] *service-name*

Synopsis	Enter the **mirror-dest** list instance
Context	**configure** mirror mirror-dest *service-name*
Tree	mirror-dest

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context set up a packet mirroring service to allow mirrored packets to be directed locally (within the same router) or remotely (over the core of the network and with a far-end decode mirror encapsulation). The mirror destination service is composed of destination options that define where the mirrored packets are sent. It also specifies whether the defined service will receive mirrored packets from a far-end router over the network core. The mirror destination services are persistent between boots of the router and are included in the configuration saves.
Max. instances	255
Introduced	16.0.R1
Platforms	All

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** mirror mirror-dest *service-name*
Tree	mirror-dest
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the service
Context	**configure** mirror mirror-dest *service-name* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

	h1 – High 1 (high priority) nc – Network Control (high priority)
Default	be
Introduced	16.0.R1
Platforms	All

pcap [session-name] *named-item*

Synopsis	Enter the **pcap** list instance
Context	**configure** mirror mirror-dest *service-name* pcap *named-item*
Tree	pcap
Max. instances	1
Introduced	16.0.R1
Platforms	All

[**session-name**] *named-item*

Synopsis	PCAP session name
Context	**configure** mirror mirror-dest *service-name* pcap *named-item*
Tree	pcap
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

pcap-file-location

Synopsis	Enter the **pcap-file-location** context
Context	**configure** mirror mirror-dest *service-name* pcap *named-item* pcap-file-location
Tree	pcap-file-location
Description	Commands in this context configure the remote location and authentication credentials used to write the packet capture file.
Introduced	26.10.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

password *encrypted-leaf*

Synopsis	Password used to access the remote URL
Context	**configure** mirror mirror-dest *service-name* pcap *named-item* pcap-file-location password *encrypted-leaf*
Tree	password
String length	1 to 126
Introduced	26.10.R1
Platforms	All

url *ts-remote-url-ftp-sftp-512*

Synopsis	Remote destination file without username or password
Context	**configure** mirror mirror-dest *service-name* pcap *named-item* pcap-file-location url *ts-remote-url-ftp-sftp-512*
Tree	url
Description	This command specifies a file URL for the FTP or SFTP server, including the filename, for packet capture transfer. After the file URL is entered, the system attempts to establish a connection and creates a file using the specified filename. The command prompt displays an error and rejects the file URL if the session establishment fails, write privilege to the remote server fails, or the session experiences a sudden termination. If the FTP or SFTP server is unreachable, the command prompt halts for further input until the retry attempts time out after 24 seconds (after 4 attempts of about 6 seconds each). This command overwrites any file with the same filename on the FTP or SFTP server.
String length	1 to 512
Introduced	26.10.R1
Platforms	All

username *encrypted-leaf*

Synopsis	Username used to access the remote URL
Context	**configure** mirror mirror-dest *service-name* pcap *named-item* pcap-file-location username *encrypted-leaf*
Tree	username
String length	1 to 126
Introduced	26.10.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

router-instance *named-item-64*

Synopsis	Router name used for FTP transmission of the PCAP file
Context	**configure** mirror mirror-dest *service-name* pcap *named-item* router-instance *named-item-64*
Tree	router-instance
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	24.10.R1
Platforms	All

ssh-private-key

Synopsis	Enter the **ssh-private-key** context
Context	**configure** mirror mirror-dest *service-name* pcap *named-item* ssh-private-key
Tree	ssh-private-key
Description	Commands in this context configure an SSH client private key file for user authentication instead of a password. The client private key file is encrypted and must be decrypted with a passphrase before it can be used.
Introduced	26.10.R1
Platforms	All

passphrase *encrypted-leaf*

Synopsis	Passphrase protecting the SSH client private key file
Context	**configure** mirror mirror-dest *service-name* pcap *named-item* ssh-private-key passphrase *encrypted-leaf*
Tree	passphrase
String length	1 to 166
Introduced	26.10.R1
Platforms	All

url *cflash-without-slot-url*

Synopsis	Location of the file with the SSH client private key
Context	**configure** mirror mirror-dest *service-name* pcap *named-item* ssh-private-key url *cflash-without-slot-url*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	url
String length	1 to 200
String format	'cflash-without-slot-url' must be cf1-4: followed by path (e.g. cf1:/path)
Introduced	26.10.R1
Platforms	All

per-lag-hashing *boolean*

Synopsis	Enable per-LAG hashing on the mirror destination
Context	**configure** mirror mirror-dest *service-name* per-lag-hashing *boolean*
Tree	per-lag-hashing
Description	When configured to **true**, the router enables the use of all link members of the mirror destination SAP or SDP of type LAG. The hashing to link members are based on IP flows. When configured to **false**, the router disables per-LAG hashing. All mirrored packets sent to a SAP or SDP of type LAG, are sent to only one of the LAG link members. If the link member to which the mirrored packets are being sent fails, another link member takes over and provides mirrored packet forwarding. Although no hashing is performed, resiliency is still provided by this next link member.
Default	false
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

remote-source

Synopsis	Enable the **remote-source** context
Context	**configure** mirror mirror-dest *service-name* remote-source
Tree	remote-source
Introduced	16.0.R1
Platforms	All

far-end [far-end-addr] *ipv4-address*

Synopsis	Enter the **far-end** list instance
Context	**configure** mirror mirror-dest *service-name* remote-source far-end *ipv4-address*
Tree	far-end
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

[**far-end-addr**] *ipv4-address*

Synopsis	Far end IP address
Context	**configure** mirror mirror-dest *service-name* remote-source far-end *ipv4-address*
Tree	far-end
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

icb *boolean*

Synopsis	Remote source as an inter-chassis backup
Context	**configure** mirror mirror-dest *service-name* remote-source far-end *ipv4-address* icb *boolean*
Tree	icb
Default	false
Introduced	16.0.R1
Platforms	All

ing-vc-label *number*

Synopsis	Ingress virtual circuit label
Context	**configure** mirror mirror-dest *service-name* remote-source far-end *ipv4-address* ing-vc-label *number*
Tree	ing-vc-label
Range	1 to 1048575
Notes	The following elements are part of a choice: **ing-vc-label** or **label-signaling**.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

label-signaling *keyword*

Synopsis	Protocol to obtain the ingress labels
Context	**configure** mirror mirror-dest *service-name* remote-source far-end *ipv4-address* label-signaling *keyword*
Tree	label-signaling
Options	tldp
Default	tldp
Notes	The following elements are part of a choice: **ing-vc-label** or **label-signaling**.
Introduced	16.0.R1
Platforms	All

vc-id *number*

Synopsis	Virtual circuit ID associated with the remote source
Context	**configure** mirror mirror-dest *service-name* remote-source far-end *ipv4-address* vc-id *number*
Tree	vc-id
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

spoke-sdp [sdp-bind-id] *sdp-bind-id*

Synopsis	Enter the **spoke-sdp** list instance
Context	**configure** mirror mirror-dest *service-name* remote-source spoke-sdp *sdp-bind-id*
Tree	spoke-sdp
Introduced	16.0.R1
Platforms	All

Tree	spoke-sdp
String length	3 to 16
String format	'sdp-bind-id' must be sdp-id:vc-id (sdp 1..32767, vc 1..4294967295)
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the service SDP binding
Context	**configure** mirror mirror-dest *service-name* remote-source spoke-sdp *sdp-bind-id* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

control-word *boolean*

Synopsis	Enable the PW control word on spoke SDPs
Context	**configure** mirror mirror-dest *service-name* remote-source spoke-sdp *sdp-bind-id* control-word *boolean*
Tree	control-word
Description	When configured to **true**, this command enables the PW control word on spoke SDPs that are part of a mirror destination. The control word must be enabled to allow MPLS-TP OAM on spoke SDP and is only valid for spoke SDPs that are part of a mirror service of type **ether**. When configured to **false**, this command disables the PW control word.
Default	false
Introduced	16.0.R1
Platforms	All

[**service-name**] *service-name*

Synopsis	Administrative service name
Context	**configure** mirror mirror-source *service-name*
Tree	mirror-source
Description	This command creates or edits a service instance. When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

When a service is created, the use of the **customer***customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error.

This command specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The service ID must be the same number used for every platform on which this service is defined.

String length	1 to 64

sap-id *sap*

Synopsis	Subscriber SAP ID
Context	**configure** mirror mirror-source *service-name* subscriber *subscriber-id* sap-id *sap*
Tree	sap-id
String length	1 to 45
Notes	The following elements are part of a choice: (**ip-address**, **mac-address**, and **sap-id**) or **sla-profile**.
Introduced	19.10.R1
Platforms	All

sla-profile *named-item*

Synopsis	SLA profile name
Context	**configure** mirror mirror-source *service-name* subscriber *subscriber-id* sla-profile *named-item*
Tree	sla-profile
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	The following elements are part of a choice: (**ip-address**, **mac-address**, and **sap-id**) or **sla-profile**.
Introduced	19.10.R1
Platforms	All

4.28 multicast-management commands

```
configure
   –  multicast-management
      –  apply-groups reference
      –  apply-groups-exclude reference
      –  bandwidth-policy named-item
         –  admin-bw-threshold number
         –  apply-groups reference
         –  apply-groups-exclude reference
         –  description description
         –  falling-percent-reset number
         –  impm-paths
            –  primary-path
               –  apply-groups reference
               –  apply-groups-exclude reference
               –  queue-parameters
                  –  cbs decimal-number
                  –  drop-tail
                     –  low
                        –  percent-reduction-from-mbs number
                  –  mbs decimal-number
            –  secondary-path
               –  apply-groups reference
               –  apply-groups-exclude reference
               –  number-paths
                  –  number-of-paths number
                  –  redundant-sfm number
               –  queue-parameters
                  –  cbs decimal-number
                  –  drop-tail
                     –  low
                        –  percent-reduction-from-mbs number
                  –  mbs decimal-number
         –  mcast-pool
            –  percent-of-total number
            –  resv-cbs number
            –  slope-policy reference
      –  chassis-level
         –  apply-groups reference
         –  apply-groups-exclude reference
         –  mmrp-impm-override boolean
         –  per-mcast-plane-capacity
            –  mcast-capacity
               –  primary-percentage decimal-number
               –  secondary-percentage decimal-number
            –  redundant-mcast-capacity
               –  primary-percentage decimal-number
               –  secondary-percentage decimal-number
            –  total-capacity keyword
         –  round-robin-inactive-records boolean
      –  multicast-info-policy named-item
         –  apply-groups reference
         –  apply-groups-exclude reference
         –  bundle named-item
            –  admin-bw number
            –  apply-groups reference
            –  apply-groups-exclude reference
            –  bw-activity
               –  black-hole-rate number
               –  bw-activity-type keyword
```

4.28.1 multicast-management command descriptions

multicast-management

Synopsis	Enter the **multicast-management** context
Context	**configure** multicast-management
Tree	multicast-management
Description	Commands in this context configure multicast management command options.
Introduced	16.0.R1
Platforms	All

bandwidth-policy [policy-name] *named-item*

Synopsis	Enter the **bandwidth-policy** list instance
Context	**configure** multicast-management bandwidth-policy *named-item*
Tree	bandwidth-policy
Max. instances	32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

[**policy-name**] *named-item*

Synopsis	Bandwidth policy name
Context	**configure** multicast-management bandwidth-policy *named-item*
Tree	bandwidth-policy
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

admin-bw-threshold *number*

Synopsis	Administrative bandwidth threshold
Context	**configure** multicast-management bandwidth-policy *named-item* admin-bw-threshold *number*
Tree	admin-bw-threshold
Range	1 to 40000000
Units	kilobps
Default	10
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

description *description*

Synopsis	Text description
Context	**configure** multicast-management bandwidth-policy *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

falling-percent-reset *number*

multicast-info-policy [policy-name] *named-item*

Synopsis	Enter the **multicast-info-policy** list instance
Context	**configure** multicast-management multicast-info-policy *named-item*
Tree	multicast-info-policy
Description	Commands in this context configure multicast information policies. Multicast information policies are used to manage command options associated with Layer 2 and Layer 3 multicast records. Multiple features use the configured information within the policy. The multicast ingress path manager uses the policy to decide the inactive and active state behavior for each multicast record using the ingress paths to the switch fabric. The multicast ECMP join decisions for the system are influenced by the channel information contained within the policy.
Max. instances	32
Introduced	16.0.R1
Platforms	All

[**policy-name**] *named-item*

Synopsis	Multicast information policy name
Context	**configure** multicast-management multicast-info-policy *named-item*
Tree	multicast-info-policy
Description	This command configures the name of the policy. Each multicast information policy must be uniquely named within the system.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

bundle [bundle-name] *named-item*

stream-selection-buffer *keyword*

Synopsis	Buffer time for the stream selection
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* source-override *(ipv4-address-no-zone | ipv6-address-no-zone)* video stream-selection-buffer *keyword*
Tree	stream-selection-buffer
Description	This command configures the maximum time before a video packet is aged out of the active cache. Nokia recommends to set the buffer time based on the maximum jitter for the stream. The video group must be administratively disabled and then enabled again (**configure isa video-group admin-state**) for the changed buffer time to take effect.
Units	milliseconds
Options	100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, 1500, 1600, 1700, 1800, 1900, 2000, 2100, 2200, 2300, 2400, 2500, 2600, 2700, 2800, 2900, 3000
Introduced	25.3.R1
Platforms	7750 SR, 7750 SR-s

video-group *(number | keyword)*

Synopsis	Video group ID
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* source-override *(ipv4-address-no-zone | ipv6-address-no-zone)* video video-group *(number | keyword)*
Tree	video-group
Range	1 to 4
Options	none
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

video

Synopsis	Enter the **video** context
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video

fcc-channel-type *keyword*

Synopsis	Channel type for the bundle or channel
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video fcc-channel-type *keyword*
Tree	fcc-channel-type
Options	hd, sd, pip
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

fcc-min-duration *number*

Synopsis	Minimum duration of the FCC burst
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video fcc-min-duration *number*
Tree	fcc-min-duration
Range	300 to 8000
Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

fcc-server *keyword*

Synopsis	Value to override the parent value of the FCC server
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video fcc-server *keyword*
Tree	fcc-server
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

local-rt-server *keyword*

Synopsis	Value to override the parent value of local RT server

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video local-rt-server *keyword*
Tree	local-rt-server
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

reorder-audio *number*

Synopsis	Time the audio packets are reordered in the ad stream
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video reorder-audio *number*
Tree	reorder-audio
Range	100 to 1000
Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

rt-buffer-size *number*

Synopsis	Buffer size to store channel packets
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video rt-buffer-size *number*
Tree	rt-buffer-size
Range	300 to 8000
Units	milliseconds
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

rt-server

Synopsis	Enter the **rt-server** context

© 2026 Nokia.

source1 *ipv4-address*

Synopsis	Primary source IP address
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video stream-selection source1 *ipv4-address*
Tree	source1
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

source2 *ipv4-address*

Synopsis	Secondary source IP address
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video stream-selection source2 *ipv4-address*
Tree	source2
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

stream-selection-buffer *keyword*

Synopsis	Buffer time for the stream selection
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* channel start *(ipv4-address-no-zone | ipv6-address-no-zone)* end *(ipv4-address-no-zone | ipv6-address-no-zone)* video stream-selection-buffer *keyword*
Tree	stream-selection-buffer
Description	This command configures the maximum time before a video packet is aged out of the active cache. Nokia recommends to set the buffer time based on the maximum jitter for the stream. The video group must be administratively disabled and then enabled again (**configure isa video-group admin-state**) for the changed buffer time to take effect.
Units	milliseconds
Options	100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, 1500, 1600, 1700, 1800, 1900, 2000, 2100, 2200, 2300, 2400, 2500, 2600, 2700, 2800, 2900, 3000
Introduced	25.3.R1

fcc-server *boolean*

Synopsis	Enable the FCC server for a multicast bundle
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video fcc-server *boolean*
Tree	fcc-server
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

local-fcc-port *number*

Synopsis	Local port for FCC requests

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video local-fcc-port *number*
Tree	local-fcc-port
Range	1024 to 5999 | 6251 to 65535
Default	4098
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

local-rt-port *number*

Synopsis	Local port for RET requests
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video local-rt-port *number*
Tree	local-rt-port
Range	1024 to 5999 | 6251 to 65535
Default	4096
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

local-rt-server *boolean*

Synopsis	Enable local retransmission server capability
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video local-rt-server *boolean*
Tree	local-rt-server
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

reorder-audio *number*

Synopsis	Time the audio packets are reordered in the ad stream
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video reorder-audio *number*
Tree	reorder-audio
Range	100 to 1000

© 2026 Nokia.

Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

rt-buffer-size *number*

Synopsis	Buffer size to store channel packets
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video rt-buffer-size *number*
Tree	rt-buffer-size
Range	300 to 8000
Units	milliseconds
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

rt-server

Synopsis	Enable the **rt-server** context
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video rt-server
Tree	rt-server
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

ip-address *ipv4-unicast-address*

Synopsis	IP address of the upstream retransmission server
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video rt-server ip-address *ipv4-unicast-address*
Tree	ip-address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port *number*

Synopsis	RET server port number
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video rt-server port *number*
Tree	port
Range	1024 to 5999 | 6251 to 65535
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

stream-selection

Synopsis	Enter the **stream-selection** context
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video stream-selection
Tree	stream-selection
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

intf1 *named-item*

Synopsis	Primary interface
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video stream-selection intf1 *named-item*
Tree	intf1
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

intf2 *named-item*

Synopsis	Secondary interface
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video stream-selection intf2 *named-item*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	intf2
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

source1 *ipv4-address*

Synopsis	Primary source IP address
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video stream-selection source1 *ipv4-address*
Tree	source1
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

source2 *ipv4-address*

Synopsis	Secondary source IP address
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video stream-selection source2 *ipv4-address*
Tree	source2
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

stream-selection-buffer *keyword*

Synopsis	Buffer time for the stream selection
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video stream-selection-buffer *keyword*
Tree	stream-selection-buffer
Description	This command configures the maximum time before a video packet is aged out of the active cache. Nokia recommends to set the buffer time based on the maximum jitter for

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	the stream. The video group must be administratively disabled and then enabled again (**configure isa video-group admin-state**) for the changed buffer time to take effect.
Units	milliseconds
Options	100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, 1500, 1600, 1700, 1800, 1900, 2000, 2100, 2200, 2300, 2400, 2500, 2600, 2700, 2800, 2900, 3000
Default	1400
Introduced	25.3.R1
Platforms	7750 SR, 7750 SR-s

video-group *number*

Synopsis	Video group for the bundle
Context	**configure** multicast-management multicast-info-policy *named-item* bundle *named-item* video video-group *number*
Tree	video-group
Range	1 to 4
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

description *description*

Synopsis	Text description
Context	**configure** multicast-management multicast-info-policy *named-item* description *description*

String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

video-policy

Synopsis	Enter the **video-policy** context
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy
Tree	video-policy
Description	Commands in this context configure video interfaces and video services.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

video-interface [ip-address] *ipv4-unicast-address*

Synopsis	Enter the **video-interface** list instance
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address*
Tree	video-interface
Description	Commands in this context create a video interface policy context that correlates to the IP address assigned for a video interface. This interface is created in a subscriber service to which the multicast information policy is assigned. If the specified IP address does not correlate to a video interface IP address, the command options defined within this context have no effect.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

[**ip-address**] *ipv4-unicast-address*

Synopsis	IP address of the video interface
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address*
Tree	video-interface
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

extended-unicast *boolean*

Synopsis	Extend video unicast session
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address* extended-unicast *boolean*
Tree	extended-unicast
Description	When configured to **true**, video unicast is delayed from switching over to multicast for 5 minutes. The unicast session can be extended further by sending an RTCP extension request, which resets the 5-minute timer. This is ideal for services that require

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

unicast video and end devices that require extended time to switch over from unicast to multicast.

When configured to **false**, the unicast session switches over to multicast 1.5 seconds after the IGMP request is sent. Most Fast Channel Change deployments do not require a time extension.

Default	false
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

fcc-session-timeout *number*

Synopsis	FCC session timeout
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address* fcc-session-timeout *number*
Tree	fcc-session-timeout
Range	5 to 300
Units	seconds
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

hd

Synopsis	Enter the **hd** context
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address* hd
Tree	hd
Description	Commands in this context configure properties relating to requests received by the video interface for HD channel requests.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

dent-threshold *number*

Synopsis	Threshold below which the FCC server dents unicast data
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address* hd dent-threshold *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	dent-threshold
Range	1 to 31
Default	16
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

fcc-burst *number*

Synopsis	Burst rate FCC server sends unicast data to FCC client
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address* hd fcc-burst *number*
Tree	fcc-burst
Range	0 to 600
Units	percent
Default	25
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

fcc-server

Synopsis	Enter the **fcc-server** context
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address* hd fcc-server
Tree	fcc-server
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s

mode *keyword*

Synopsis	Mode the FCC server sends information to the client
Context	**configure** multicast-management multicast-info-policy *named-item* video-policy video-interface *ipv4-unicast-address* hd fcc-server mode *keyword*
Tree	mode
Options	burst, dent, hybrid

description *description*

Synopsis	Text description
Context	**configure** multicast-management multicast-reporting-destination *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

maximum-transmission-delay *number*

Synopsis	Time delay before packet transmits to the destination
Context	**configure** multicast-management multicast-reporting-destination *named-item* maximum-transmission-delay *number*
Tree	maximum-transmission-delay
Range	0 to 100
Units	deciseconds
Default	1
Introduced	16.0.R1
Platforms	All

udp-port *number*

Synopsis	UDP port where multicast reports are sent
Context	**configure** multicast-management multicast-reporting-destination *named-item* udp-port *number*
Tree	udp-port
Range	1 to 65535
Default	1037
Introduced	16.0.R1
Platforms	All

4.29.1 oam-pm command descriptions

oam-pm

Synopsis	Enter the **oam-pm** context
Context	**configure** oam-pm
Tree	oam-pm
Description	Commands in this context configure proactive and on-demand tests used to gather the performance and statistical information and define storage parameters (including binning structures).
Introduced	16.0.R1
Platforms	All

bin-group [bin-group-id] *number*

Synopsis	Enter the **bin-group** list instance
Context	**configure** oam-pm bin-group *number*
Tree	bin-group
Introduced	16.0.R5
Platforms	All

[**bin-group-id**] *number*

Synopsis	Bin group ID
Context	**configure** oam-pm bin-group *number*
Tree	bin-group
Range	1 to 255
Notes	This element is part of a list key.
Introduced	16.0.R5
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the bin group
Context	**configure** oam-pm bin-group *number* admin-state *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Options	enable, disable
Introduced	16.0.R5
Platforms	All

bin-type [bin-metric] *keyword*

Synopsis	Enter the **bin-type** list instance
Context	**configure** oam-pm bin-group *number* bin-type *keyword*
Tree	bin-type
Introduced	16.0.R5
Platforms	All

[**bin-metric**] *keyword*

Synopsis	Delay metric bin structure
Context	**configure** oam-pm bin-group *number* bin-type *keyword*
Tree	bin-type
Options	fd – Frame Delay fdr – Frame Delay Range ifdv – Inter-Frame Delay Variation
Notes	This element is part of a list key.
Introduced	16.0.R5
Platforms	All

bin [bin-number] *number*

Synopsis	Enter the **bin** list instance
Context	**configure** oam-pm bin-group *number* bin-type *keyword* bin *number*
Tree	bin
Introduced	16.0.R5
Platforms	All

[**bin-number**] *number*

Synopsis	Bin number

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** oam-pm bin-group *number* bin-type *keyword* bin *number*
Tree	bin
Range	0 to 9
Notes	This element is part of a list key.
Introduced	16.0.R5
Platforms	All

lower-bound *number*

Synopsis	Lower bound for the bin
Context	**configure** oam-pm bin-group *number* bin-type *keyword* bin *number* lower-bound *number*
Tree	lower-bound
Range	0 | 1 to 4294967295
Units	microseconds
Introduced	16.0.R5
Platforms	All

delay-event [direction] *keyword*

flr-threshold *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	FLR threshold for the test
Context	**configure** oam-pm session *named-item* ethernet lmm availability flr-threshold *number*
Tree	flr-threshold
Description	This command configures the Frame Loss Ratio (FLR) threshold used to determine whether the Delta-T is high loss. An individual Delta-T with a frame loss threshold equal to the configured threshold is marked high loss. An individual Delta-T with a frame loss threshold lower than the configured threshold is not marked as high loss.
Range	0 to 100
Units	percent
Default	50
Introduced	16.0.R5
Platforms	All

hli-force-count *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Increment HLI and CHLI counters despite availability
Context	**configure** oam-pm session *named-item* ethernet lmm availability hli-force-count *boolean*
Tree	hli-force-count
Description	When configured to **true**, the router uses High Loss Interval (HLI) and Consecutive High Loss Interval (CHLI) counters to increment regardless of availability. Without this command, HLI and CHLI counters can only increment during times of availability, which includes undetermined availability.
Default	false
Introduced	16.0.R5
Platforms	All

clear-threshold *decimal-number*

Synopsis	Clear threshold for the average FLR
Context	**configure** oam-pm session *named-item* ethernet lmm loss-events avg-flr-event *keyword* clear-threshold *decimal-number*
Tree	clear-threshold
Description	This command configures a value used for stateful behavior to configure a percentage of loss value lower than the rising percentage to indicate when to generate the clear event. If this command is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. Each unique event can only be raised once within the measurement interval. If this command is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to the following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.
Range	0.000 to 99.999
Units	percent
Introduced	16.0.R5
Platforms	All

priority *number*

Synopsis	Priority and forwarding class for the session
Context	**configure** oam-pm session *named-item* ethernet priority *number*
Tree	priority
Range	0 to 7
Default	0
Introduced	16.0.R5
Platforms	All

remote-mep *number*

Synopsis	Remote MEP for the session
Context	**configure** oam-pm session *named-item* ethernet remote-mep *number*
Tree	remote-mep
Range	1 to 8191
Introduced	16.0.R5
Platforms	All

slm

Synopsis	Enable the **slm** context
Context	**configure** oam-pm session *named-item* ethernet slm
Tree	slm
Description	Commands in this context configure the synthetic loss measurement (SLM) test and create the container used to configure the individual test parameters.
Introduced	16.0.R5
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the test
Context	**configure** oam-pm session *named-item* ethernet slm admin-state *keyword*
Tree	admin-state
Options	enable, disable

Default	disable
Introduced	16.0.R5
Platforms	All

data-tlv-size *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Data TLV size in the frames sent for the test
Context	**configure** oam-pm session *named-item* ethernet slm data-tlv-size *number*
Tree	data-tlv-size
Description	This command configures a Data TLV to PDU and increases the frame on the wire by the specified amount. **Note:** This command only configures the size of the padding added to the PDU and does not configure the total size of the frame on the wire.
Range	0 | 3 to 2000
Units	octets
Default	0
Introduced	16.0.R5
Platforms	All

flr-threshold *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	FLR threshold for the test
Context	**configure** oam-pm session *named-item* ethernet slm flr-threshold *number*
Tree	flr-threshold
Description	This command configures the Frame Loss Ratio (FLR) threshold used to determine whether the Delta-T is high loss. An individual Delta-T with a frame loss threshold equal to the configured threshold is marked high loss. An individual Delta-T with a frame loss threshold lower than the configured threshold is not marked as high loss.
Range	0 to 100
Units	percent

Default	50
Introduced	16.0.R5
Platforms	All

hli-force-count *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Increment HLI and CHLI counters despite availability
Context	**configure** oam-pm session *named-item* ethernet slm hli-force-count *boolean*
Tree	hli-force-count
Description	When configured to **true**, the router uses High Loss Interval (HLI) and Consecutive High Loss Interval (CHLI) counters to increment regardless of availability. Without this command, HLI and CHLI counters can only increment during times of availability, which includes undetermined availability.
Default	false
Introduced	16.0.R5
Platforms	All

interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Time between transmission PDUs for the session test
Context	**configure** oam-pm session *named-item* ethernet slm interval *number*
Tree	interval
Description	This command configures the message period or probe spacing for the transmission of a frame.
Range	50 | 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 | 1000
Units	milliseconds

loss-events

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **loss-events** context
Context	**configure** oam-pm session *named-item* ethernet slm loss-events
Tree	loss-events
Description	Commands in this context define the loss events and thresholds that are to be tracked.
Introduced	16.0.R5
Platforms	All

avg-flr-event [direction] *keyword*

Synopsis	Enter the **avg-flr-event** list instance
Context	**configure** oam-pm session *named-item* ethernet slm loss-events avg-flr-event *keyword*
Tree	avg-flr-event
Description	Commands in this context configure the frame loss ratio threshold to be applied and checked at the end of the measurement interval for the specified direction. This is a percentage based on the average frame loss ratio over the entire measurement interval.
Introduced	16.0.R5
Platforms	All

[**direction**] *keyword*

Synopsis	Traffic flow direction
Context	**configure** oam-pm session *named-item* ethernet slm loss-events avg-flr-event *keyword*

clear-threshold *decimal-number*

Synopsis	Clear threshold for the average FLR
Context	**configure** oam-pm session *named-item* ethernet slm loss-events avg-flr-event *keyword* clear-threshold *decimal-number*
Tree	clear-threshold
Description	This command configures a value used for stateful behavior to configure a percentage of loss value lower than the rising percentage to indicate when to generate the clear event. If this command is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. Each unique event can only be raised once within the measurement interval. If this command is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to the following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.
Range	0.000 to 99.999
Units	percent
Introduced	16.0.R5
Platforms	All

raise-threshold *decimal-number*

Synopsis	Rising threshold for the average FLR
Context	**configure** oam-pm session *named-item* ethernet slm loss-events avg-flr-event *keyword* raise-threshold *decimal-number*
Tree	raise-threshold
Description	This command configures the rising percentage that determines when the event is to be generated.
Range	0.000 to 100.000
Units	percent
Notes	This element is mandatory.
Introduced	16.0.R5
Platforms	All

timing

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **timing** context
Context	**configure** oam-pm session *named-item* ethernet slm timing
Tree	timing
Description	Commands in this context define various availability parameters and the probe spacing (interval) for the SLM frames.
Introduced	16.0.R5
Platforms	All

chli-threshold *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	CHLI threshold
Context	**configure** oam-pm session *named-item* ethernet slm timing chli-threshold *number*
Tree	chli-threshold
Description	This command configures the number of Consecutive High Loss Intervals (CHLI) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable Delta-T intervals. A CHLI can only be incremented once during a sliding window and, by default, it is only incremented during times of availability.
Range	1 to 9
Default	5
Introduced	16.0.R5
Platforms	All

Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

next-hop *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address for forwarding
Context	**configure** oam-pm session *named-item* ip forwarding next-hop *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	next-hop
Notes	The following elements are part of a mandatory choice: **bypass-routing**, **interface**, or **next-hop**.
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pattern *(keyword | number)*

Synopsis	Pattern used to fill the packet padding field
Context	**configure** oam-pm session *named-item* ip pattern *(keyword | number)*
Tree	pattern
Range	0 to 65535
Options	sequential
Default	0
	sequential
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

profile *keyword*

Synopsis	Profile type for the session
Context	**configure** oam-pm session *named-item* ip profile *keyword*
Tree	profile
Options	in, out

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	out
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

router-instance *string*

Synopsis	Router instance for the session
Context	**configure** oam-pm session *named-item* ip router-instance *string*
Tree	router-instance
Default	Base
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source IP address for the session
Context	**configure** oam-pm session *named-item* ip source *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-udp-port *number*

Synopsis	Source UDP port for the session
Context	**configure** oam-pm session *named-item* ip source-udp-port *number*
Tree	source-udp-port
Range	64374 to 64383
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ttl *number*

Synopsis	TTL value for the session
Context	**configure** oam-pm session *named-item* ip ttl *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ttl
Range	1 to 255
Default	255
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tunnel

Synopsis	Enter the **tunnel** context
Context	**configure** oam-pm session *named-item* ip tunnel
Tree	tunnel
Description	Commands in this context configure packet tunneling options for the session. This command and the **oam-pm session ip forwarding** command are mutually exclusive.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mpls

Synopsis	Enable the **mpls** context
Context	**configure** oam-pm session *named-item* ip tunnel mpls
Tree	mpls
Description	Commands in this context configure the MPLS packet tunneling options for the session. Configure the **oam-pm session ip router-instance** to Base to configure commands in the tunnel MPLS context. When entering a context under MPLS, the system removes any previous configuration of any sibling context. You can only configure one of the contexts for each OAM-PM session.
Notes	The following elements are part of a choice: **mpls** or **segment-routing-v6**.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rsvp-te

Synopsis	Enable the **rsvp-te** context
Context	**configure** oam-pm session *named-item* ip tunnel mpls rsvp-te
Tree	rsvp-te
Description	Commands in this context allow for the specification of RSVP-TE specific tunnel information used to transport the test packets. Entering this context removes all other

© 2026 Nokia.

	tunnel-type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single MPLS type can be configured for an OAM-PM session.
Notes	The following elements are part of a choice: **rsvp-te**, **rsvp-te-auto**, **sr-isis**, **sr-ospf**, **sr-ospf3**, **sr-policy**, or **sr-te**.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lsp *named-item-64*

Synopsis	Name of LSP that carries the test packets
Context	**configure** oam-pm session *named-item* ip tunnel mpls rsvp-te lsp *named-item-64*
Tree	lsp
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rsvp-te-auto

Synopsis	Enable the **rsvp-te-auto** context
Context	**configure** oam-pm session *named-item* ip tunnel mpls rsvp-te-auto
Tree	rsvp-te-auto
Description	Commands in this context configure the RSVP-TE-Auto feature and **rsvp-te-auto** (RSVP TE with dynamically-created LSPs) packet tunneling options for the session. If you enter a context within the MPLS context, the system removes any previous configuration of any sibling context. You can only configure one of the contexts for each OAM-PM session.
Notes	The following elements are part of a choice: **rsvp-te**, **rsvp-te-auto**, **sr-isis**, **sr-ospf**, **sr-ospf3**, **sr-policy**, or **sr-te**.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

from *ipv4-unicast-address*

Synopsis	IPv4 address used to identify the LSP to be tested
Context	**configure** oam-pm session *named-item* ip tunnel mpls rsvp-te-auto from *ipv4-unicast-address*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	from
Description	This command configures the headend of the RSV LSP. Configure the following three commands to identify an RSVP-TE Auto LSP: **from**, **to**, and **lsp-template**. When all three of these values are configured, the specific RSVP LSP can be identified and the test packets can be carried across the tunnel.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lsp-template *named-item*

Synopsis	LSP template used to identify the LSP to be tested
Context	**configure** oam-pm session *named-item* ip tunnel mpls rsvp-te-auto lsp-template *named-item*
Tree	lsp-template
Description	This command configures the name of the LSP template used to identify the unique LSP. Configure the following three commands to identify an RSVP-TE Auto LSP: **from**, **to**, and **lsp-template**. When all three of these values are configured, the specific RSVP LSP can be identified and the test packets can be carried across the tunnel.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

to *ipv4-unicast-address*

Synopsis	IPv4 unicast address to identify the LSP to be tested
Context	**configure** oam-pm session *named-item* ip tunnel mpls rsvp-te-auto to *ipv4-unicast-address*
Tree	to
Description	This command configures the termination point of the RSVP LSP. Configure the following three commands to identify an RSVP-TE Auto LSP: **from**, **to**, and **lsp-template**. When all three of these values are configured, the specific RSVP LSP can be identified and the test packets can be carried across the tunnel.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-isis

Synopsis	Enable the **sr-isis** context
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-isis
Tree	sr-isis
Description	Commands in this context allow for the specification of SR-ISIS specific tunnel information used to transport the test packets. Entering this context removes all the other tunnel type commands configured in the **configure oam-pm session ip tunnel mpls** context. Only a single MPLS type can be configured for an OAM-PM session.
Notes	The following elements are part of a choice: **rsvp-te**, **rsvp-te-auto**, **sr-isis**, **sr-ospf**, **sr-ospf3**, **sr-policy**, or **sr-te**.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

flex-algo *number*

Synopsis	Flex-algorithm to tunnel IP packets for session tests
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-isis flex-algo *number*
Tree	flex-algo
Range	128 to 255
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

igp-instance *number*

Synopsis	IGP instance used to tunnel IP packets
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-isis igp-instance *number*
Tree	igp-instance
Description	This command configures the IGP instance to tunnel IP packets for the session test.
Range	0 to 127
Default	0
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

prefix *(ipv4-prefix | ipv6-prefix)*

Synopsis	IP prefix to tunnel IP packets for the session tests
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-isis prefix *(ipv4-prefix* | *ipv6-prefix)*
Tree	prefix
Description	This command configures the IP prefix used with the IGP instance to tunnel IP packets for the session tests.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sr-ospf

Synopsis	Enable the **sr-ospf** context
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-ospf
Tree	sr-ospf
Description	Commands in this context allow for the specification of SR-OSPF specific tunnel information used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single MPLS type can be configured for an OAM-PM session.
Notes	The following elements are part of a choice: **rsvp-te**, **rsvp-te-auto**, **sr-isis**, **sr-ospf**, **sr-ospf3**, **sr-policy**, or **sr-te**.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

flex-algo *number*

Synopsis	Flex-algorithm to tunnel IP packets for session tests
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-ospf flex-algo *number*
Tree	flex-algo
Range	128 to 255
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

igp-instance *number*

Synopsis	IGP instance used to tunnel IP packets

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-ospf igp-instance *number*
Tree	igp-instance
Range	0 to 31
Default	0
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

prefix *ipv4-unicast-prefix*

Synopsis	IP prefix to tunnel IP packets for the session tests
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-ospf prefix *ipv4-unicast-prefix*
Tree	prefix
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sr-ospf3

Synopsis	Enable the **sr-ospf3** context
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-ospf3
Tree	sr-ospf3
Description	Commands in this context allow for the specification of SR-OSPFv3 specific tunnel information used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single MPLS type can be configured for an OAM-PM session.
Notes	The following elements are part of a choice: **rsvp-te**, **rsvp-te-auto**, **sr-isis**, **sr-ospf**, **sr-ospf3**, **sr-policy**, or **sr-te**.
Introduced	23.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

igp-instance *number*

Synopsis	IGP instance used to tunnel IP packets
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-ospf3 igp-instance *number*

endpoint *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Segment Routing endpoint for the session
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-policy endpoint *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	endpoint
Description	This command configures the unicast IPv4 or globally routable IPv6 address endpoint of the tunnel.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

segment-list *number*

Synopsis	Segment Routing segment list for the session
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-policy segment-list *number*
Tree	segment-list
Description	This command configures the identification of the segment list for the specific policy.
Range	1 to 32
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sr-te

Synopsis	Enable the **sr-te** context
Context	**configure** oam-pm session *named-item* ip tunnel mpls sr-te
Tree	sr-te
Description	Commands in this context allow for the specification of SR-TE specific tunnel information used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single MPLS type can be configured for an OAM-PM session.
Notes	The following elements are part of a choice: **rsvp-te**, **rsvp-te-auto**, **sr-isis**, **sr-ospf**, **sr-ospf3**, **sr-policy**, or **sr-te**.
Introduced	23.3.R1

admin-state *keyword*

Synopsis	Administrative state of the test
Context	**configure** oam-pm session *named-item* ip twamp-light admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

allow-ipv6-udp-checksum-zero *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Process IPv6 packets with a zero UDP checksum
Context	**configure** oam-pm session *named-item* ip twamp-light allow-ipv6-udp-checksum-zero *boolean*
Tree	allow-ipv6-udp-checksum-zero
Description	When configured to **true**, this command configures the acceptance of IPv6 packets with UDP checksums of 0. This optional configuration allows the router to process arriving IPv6 TWAMP Test packets that contain IPv6 UDP checksum of 0x0000. The UDP port specific to this TWAMP Light test bypasses the default discard IPv6 UDP checksum 0x0000. If this optional command is not configured, IPv6 UDP checksum 0x000 arriving packets are discarded. When configured to **false**, packets that arrive with an IPv6 UDP checksum of 0x0000 are discarded.
Default	false
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

delay-template *named-item-64*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Reference to a streaming delay template for the test

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** oam-pm session *named-item* ip twamp-light delay-template *named-item-64*
Tree	delay-template
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Time between transmission PDUs for the session test
Context	**configure** oam-pm session *named-item* ip twamp-light interval *number*
Tree	interval
Description	This command configures the message period or probe spacing for the transmission of a frame.
Range	50 | 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 | 1000 | 10000
Units	milliseconds
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

liveness

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **liveness** context
Context	**configure** oam-pm session *named-item* ip twamp-light liveness
Tree	liveness
Description	Commands in this context configure liveness status detection parameters for the TWAMP-Light test.
Introduced	26.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fail-threshold *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Number of failed packets to trigger liveness failure
Context	**configure** oam-pm session *named-item* ip twamp-light liveness fail-threshold *number*
Tree	fail-threshold
Description	This command configures the number of consecutive failed packets required to trigger a liveness failure.
Range	1 to 500
Units	packets
Introduced	26.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

loss

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **loss** context
Context	**configure** oam-pm session *named-item* ip twamp-light loss
Tree	loss
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

flr-threshold *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	FLR threshold for the test
Context	**configure** oam-pm session *named-item* ip twamp-light loss flr-threshold *number*
Tree	flr-threshold

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the Frame Loss Ratio (FLR) threshold used to determine whether the Delta-T is high loss. An individual Delta-T with a frame loss threshold equal to the configured threshold is marked high loss. An individual Delta-T with a frame loss threshold lower than the configured threshold is not marked as high loss.
Range	0 to 100
Units	percent
Default	50
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

hli-force-count *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Increment HLI and CHLI counters despite availability
Context	**configure** oam-pm session *named-item* ip twamp-light loss hli-force-count *boolean*
Tree	hli-force-count
Description	When configured to **true**, the router uses High Loss Interval (HLI) and Consecutive High Loss Interval (CHLI) counters to increment regardless of availability. Without this command, HLI and CHLI counters can only increment during times of availability, which includes undetermined availability.
Default	false
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

clear-threshold *decimal-number*

Synopsis	Clear threshold for the average FLR
Context	**configure** oam-pm session *named-item* ip twamp-light loss-events avg-flr-event *keyword* clear-threshold *decimal-number*
Tree	clear-threshold
Description	This command configures a value used for stateful behavior to configure a percentage of loss value lower than the rising percentage to indicate when to generate the clear event. If this command is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. Each unique event can only be raised once within the measurement interval. If this command is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to the following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.
Range	0.000 to 99.999
Units	percent
Introduced	16.0.R5
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

4.30.1 policy-options command descriptions

policy-options

Synopsis	Enter the **policy-options** context
Context	**configure** policy-options
Tree	policy-options
Description	Commands in this context configure route policies. Route policies are applied to the routing protocol.
Introduced	16.0.R1
Platforms	All

as-path [name] *named-item*

Synopsis	Enter the **as-path** list instance
Context	**configure** policy-options as-path *named-item*
Tree	as-path
Introduced	16.0.R1
Platforms	All

[**name**] *named-item*

Synopsis	AS path name
Context	**configure** policy-options as-path *named-item*
Tree	as-path
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

expression *policy-as-path-regexp*

Synopsis	Regular expression string
Context	**configure** policy-options as-path *named-item* expression *policy-as-path-regexp*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	expression
Description	This command configures a route policy AS path regular expression statement to use in route policy entries. An AS path in a BGP route matches an AS path regular expression, if the path matches the pattern of the regular expression. A regular expression incorporates terms and operators that use the terms. An individual AS number is an elementary term in the AS path regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS: • . • * • ? • {n} • {m,n} • {m, } To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.
String length	1 to 255
Introduced	16.0.R1
Platforms	All

as-path-group [name] *named-item*

Synopsis	Enter the **as-path-group** list instance
Context	**configure** policy-options as-path-group *named-item*
Tree	as-path-group
Introduced	16.0.R1
Platforms	All

[**name**] *named-item*

Synopsis	AS path group name
Context	**configure** policy-options as-path-group *named-item*
Tree	as-path-group
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

entry [entry] *number*

Synopsis	Enter the **entry** list instance
Context	**configure** policy-options as-path-group *named-item* entry *number*
Tree	entry
Introduced	16.0.R1
Platforms	All

[**entry**] *number*

Synopsis	AS path entry ID
Context	**configure** policy-options as-path-group *named-item* entry *number*
Tree	entry
Range	1 to 128
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

expression *policy-as-path-regexp*

Synopsis	Regular expression string
Context	**configure** policy-options as-path-group *named-item* entry *number* expression *policy-as-path-regexp*
Tree	expression
Description	This command configures an AS path group regular expression.

An AS path in a BGP route matches an AS path group, if the pattern of the path matches the concatenation of all regular expressions in the group. A regular expression incorporates terms and operators that use the terms. An individual AS number is an elementary term in the AS path regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS:

- .
- *
- ?
- {n}

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- {m,n}
- {m, }

To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.

String length	1 to 255
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

community [name] *policy-community-name*

Synopsis	Enter the **community** list instance
Context	**configure** policy-options community *policy-community-name*
Tree	community
Description	Commands in this context create a route policy community list or expression to use in route policy entries. A community list is an unordered set of community values (members). In general, for each member in the configured community list, there must be a match with at least one community in the route. A community expression is a set of community values that are arranged in a logical expression using operators such as AND, OR, and NOT. A route matches a community expression if it satisfies the logic of the expression. For more information, see the **expression** and **members** commands in the **configure policy-options community** context.
Introduced	16.0.R1
Platforms	All

[**name**] *policy-community-name*

Synopsis	Name of extended community set
Context	**configure** policy-options community *policy-community-name*
Tree	community
Description	This command configures a route policy community name.
String length	1 to 64
String format	'policy-community-name' must not be all spaces
Notes	This element is part of a list key.
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

expression

Synopsis	Enable the **expression** context
Context	**configure** policy-options community *policy-community-name* expression
Tree	expression
Introduced	16.0.R1
Platforms	All

exact *boolean*

Synopsis	Match exactly for the specified expression
Context	**configure** policy-options community *policy-community-name* expression exact *boolean*
Tree	exact
Default	false
Introduced	16.0.R1
Platforms	All

expr *expression-community*

Synopsis	Community expression value
Context	**configure** policy-options community *policy-community-name* expression expr *expression-community*
Tree	expr
String length	1 to 900
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

member [member] *member-community*

Synopsis	Add a list entry for **member**
Context	**configure** policy-options community *policy-community-name* member *member-community*
Tree	member

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

[**member**] *member-community*

Synopsis	Community member value
Context	**configure** policy-options community *policy-community-name* member *member-community*
Tree	member
Description	This command configures a BGP community value. Each member of a community list is a standard, extended, or large community value or a regular expression that potentially matches many community values. A regular expression incorporates terms and operators that use the terms. An individual numerical digit is an elementary term in the community regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS: • . • * • ? • {n} • {m,n} • {m, } To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.
String length	1 to 72
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

damping [name] *named-item*

Synopsis	Enter the **damping** list instance
Context	**configure** policy-options damping *named-item*
Tree	damping
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**name**] *named-item*

Synopsis	Damping profile name
Context	**configure** policy-options damping *named-item*
Tree	damping
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

half-life *number*

Synopsis	Time after the FOM value is halved
Context	**configure** policy-options damping *named-item* half-life *number*
Tree	half-life
Range	1 to 45
Units	minutes
Introduced	16.0.R1
Platforms	All

max-suppress *number*

Synopsis	Maximum time for a route to remain suppressed
Context	**configure** policy-options damping *named-item* max-suppress *number*
Tree	max-suppress
Range	1 to 720
Units	minutes
Introduced	16.0.R1
Platforms	All

reuse *number*

Synopsis	Value below which a suppressed route can be used again
Context	**configure** policy-options damping *named-item* reuse *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	reuse
Range	1 to 20000
Introduced	16.0.R1
Platforms	All

suppress *number*

Synopsis	Value above which a route is suppressed
Context	**configure** policy-options damping *named-item* suppress *number*
Tree	suppress
Range	1 to 20000
Introduced	16.0.R1
Platforms	All

extended-community-set [name] *policy-community-name*

Synopsis	Enter the **extended-community-set** list instance
Context	**configure** policy-options extended-community-set *policy-community-name*
Tree	extended-community-set
Description	Commands in this context configure an extended community set used in route policies. An extended community set defines a list of exact match route target extended communities (type 0, type 1, or type 2). The set can be referenced in policy statements to match BGP routes that carry or do not carry the specified route targets.
Introduced	25.10.R3
Platforms	All

[**name**] *policy-community-name*

Synopsis	Name of extended community set
Context	**configure** policy-options extended-community-set *policy-community-name*
Tree	extended-community-set
Description	This command configures a route policy community name.
String length	1 to 64
String format	'policy-community-name' must not be all spaces
Notes	This element is part of a list key.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.10.R3
Platforms	All

member [value] *member-community*

Synopsis	Add a list entry for **member**
Context	**configure** policy-options extended-community-set *policy-community-name* member *member-community*
Tree	member
Description	Commands in this context add a route target member of an extended community set. The member must be configured in an exact match format and it must start with the substring 'target:'. This substring is followed by two numbers separated from each other by a colon. The meaning of the two numbers depends on whether the route target is in type 0, type 1 or type 2 format. These members cannot be configured to be regular expressions.
Introduced	25.10.R3
Platforms	All

[**value**] *member-community*

Synopsis	Member of an extended community set
Context	**configure** policy-options extended-community-set *policy-community-name* member *member-community*
Tree	member
String length	1 to 72
String format	'value' must be target-type extended community (target:...:...)
Notes	This element is part of a list key.
Introduced	25.10.R3
Platforms	All

global-variables

Synopsis	Enter the **global-variables** context
Context	**configure** policy-options global-variables
Tree	global-variables
Introduced	16.0.R4
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

name [variable-name] *policy-var-name*

Synopsis	Enter the **name** list instance
Context	**configure** policy-options global-variables name *policy-var-name*
Tree	name
Max. instances	1000
Introduced	16.0.R4
Platforms	All

[**variable-name**] *policy-var-name*

Synopsis	Global variable name used to reference policy functions
Context	**configure** policy-options global-variables name *policy-var-name*
Tree	name
String length	1 to 32
String format	'policy-var-name' must start and end with @ (e.g. @name@)
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the policy variable
Context	**configure** policy-options global-variables name *policy-var-name* address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	address
Notes	The following elements are part of a mandatory choice: **address**, **decimal**, **number**, **prefix**, or **value**.
Introduced	16.0.R4
Platforms	All

decimal *decimal-number*

Synopsis	Attribute decimal to which variable name is resolved

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options global-variables name *policy-var-name* decimal *decimal-number*
Tree	decimal
Range	0.000 to 4294967295.000
Notes	The following elements are part of a mandatory choice: **address**, **decimal**, **number**, **prefix**, or **value**.
Introduced	19.7.R1
Platforms	All

number *number*

Synopsis	Numerical value of the policy variable
Context	**configure** policy-options global-variables name *policy-var-name* number *number*
Tree	number
Range	0 to 4294967295
Notes	The following elements are part of a mandatory choice: **address**, **decimal**, **number**, **prefix**, or **value**.
Introduced	16.0.R4
Platforms	All

prefix *(ipv4-prefix | ipv6-prefix)*

Synopsis	Prefix value associated with the variable name
Context	**configure** policy-options global-variables name *policy-var-name* prefix *(ipv4-prefix | ipv6-prefix)*
Tree	prefix
Notes	The following elements are part of a mandatory choice: **address**, **decimal**, **number**, **prefix**, or **value**.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

value *named-item*

Synopsis	Policy variable value
Context	**configure** policy-options global-variables name *policy-var-name* value *named-item*
Tree	value

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	The following elements are part of a mandatory choice: **address**, **decimal**, **number**, **prefix**, or **value**.
Introduced	16.0.R4
Platforms	All

policy-statement [name] *named-item-64*

Synopsis	Enter the **policy-statement** list instance
Context	**configure** policy-options policy-statement *named-item-64*
Tree	policy-statement
Description	Commands in this context configure a route policy statement. Route policy statements control the flow of routing information to and from a specific protocol, set of protocols, or to a specific BGP neighbor. The policy statement is a logical grouping of match and action criteria. A single policy statement can affect routing in one or more protocols and one or more peers or neighbors. A single policy statement can also affect both the import and export of routing information.
Max. instances	65535
Introduced	16.0.R1
Platforms	All

[**name**] *named-item-64*

Synopsis	Route policy statement name
Context	**configure** policy-options policy-statement *named-item-64*
Tree	policy-statement
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

default-action

Synopsis	Enable the **default-action** context
Context	**configure** policy-options policy-statement *named-item-64* default-action
Tree	default-action
Description	Commands in this context configure actions to apply to routes that do not match any entries of a route policy statement.
Introduced	16.0.R1
Platforms	All

action-type *keyword*

Synopsis	Action type for routes matching the route policy entry
Context	**configure** policy-options policy-statement *named-item-64* default-action action-type *keyword*
Tree	action-type
Options	accept, reject, next-entry, next-policy
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

add-paths-send-limit *(number | keyword)*

Synopsis	BGP Add-Paths send limit applied for routes
Context	**configure** policy-options policy-statement *named-item-64* default-action add-paths-send-limit *(number | keyword)*
Tree	add-paths-send-limit
Range	1 to 16
Options	all, multipaths
Introduced	16.0.R1
Platforms	All

admin-tag-policy *(param-midstring-64 | string)*

Synopsis	Administrative tag policy name

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options policy-statement *named-item-64* default-action admin-tag-policy *(param-midstring-64 | string)*
Tree	admin-tag-policy
String length	1 to 64
String format	'param-midstring-64' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	16.0.R1
Platforms	All

advertise-label *keyword*

Synopsis	Label allocation for matched BGP routes
Context	**configure** policy-options policy-statement *named-item-64* default-action advertise-label *keyword*
Tree	advertise-label
Description	This command configures the label allocation method for advertised routes. The effect of this command depends on the context where the associated policy is applied.
Options	per-prefix, pop, pop-and-forward
Introduced	16.0.R1
Platforms	All

aigp-metric

Synopsis	Enter the **aigp-metric** context
Context	**configure** policy-options policy-statement *named-item-64* default-action aigp-metric
Tree	aigp-metric
Introduced	16.0.R1
Platforms	All

add *(number | string)*

Synopsis	AIGP metric to add
Context	**configure** policy-options policy-statement *named-item-64* default-action aigp-metric add *(number | string)*
Tree	add
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	0 to 4294967295
Notes	The following elements are part of a choice: **add** or **set**.
Introduced	16.0.R1
Platforms	All

set *(keyword | number | string)*

Synopsis	AIGP metric
Context	**configure** policy-options policy-statement *named-item-64* default-action aigp-metric set *(keyword | number | string)*
Tree	set
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	0 to 4294967295
Options	igp
Notes	The following elements are part of a choice: **add** or **set**.
Introduced	16.0.R1
Platforms	All

as-path

Synopsis	Enter the **as-path** context
Context	**configure** policy-options policy-statement *named-item-64* default-action as-path
Tree	as-path
Introduced	16.0.R1
Platforms	All

add *(param-midstring | string)*

Synopsis	AS path to add
Context	**configure** policy-options policy-statement *named-item-64* default-action as-path add *(param-midstring | string)*
Tree	add
String length	1 to 32
String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: **add** or **replace**.
Introduced	16.0.R1
Platforms	All

replace *(param-midstring | string)*

Synopsis	AS path to replace
Context	**configure** policy-options policy-statement *named-item-64* default-action as-path replace *(param-midstring | string)*
Tree	replace
String length	1 to 32
String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)
Notes	The following elements are part of a choice: **add** or **replace**.
Introduced	16.0.R1
Platforms	All

as-path-prepend

Synopsis	Enter the **as-path-prepend** context
Context	**configure** policy-options policy-statement *named-item-64* default-action as-path-prepend
Tree	as-path-prepend
Introduced	16.0.R1
Platforms	All

as-path *(number | string | keyword)*

Synopsis	AS number to prepend to the AS path attribute
Context	**configure** policy-options policy-statement *named-item-64* default-action as-path-prepend as-path *(number | string | keyword)*
Tree	as-path
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	1 to 4294967295
Options	most-recent
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

repeat *(number | string)*

Synopsis	Number of times to prepend the specified AS number
Context	**configure** policy-options policy-statement *named-item-64* default-action as-path-prepend repeat *(number | string)*
Tree	repeat
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	1 to 50
Default	1
Introduced	16.0.R1
Platforms	All

bgp-high-priority *boolean*

Synopsis	Tag routes as high priority for fast table updates
Context	**configure** policy-options policy-statement *named-item-64* default-action bgp-high-priority *boolean*
Tree	bgp-high-priority
Description	When configured to **true**, eligible BGP routes matched by the policy entry or policy default-action are tagged as needing faster route table updates. This action applies only when the policy is applied as a BGP import policy to a base router BGP peer or VPRN BGP peer and applies only to the following route types: • IPv4 • label-IPv4 • IPv6 • label-IPv6 This command is useful when the BGP RIB contains a large number of routes and quick routing table updates are needed for a small subset of these routes. The effectiveness of this command decreases as the subset becomes a larger proportion of the total RIB. When configured to **false**, no routes are tagged for faster route table updates.
Default	false
Introduced	20.5.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

bgp-leak *boolean*

Synopsis	Allow leaking for BGP routes
Context	**configure** policy-options policy-statement *named-item-64* default-action bgp-leak *boolean*
Tree	bgp-leak
Default	false
Introduced	16.0.R1

bgp-tunnel-metric

Synopsis	Enter the **bgp-tunnel-metric** context
Context	**configure** policy-options policy-statement *named-item-64* default-action bgp-tunnel-metric
Tree	bgp-tunnel-metric
Description	Commands in this context configure the tunnel-table metrics associated with BGP label unicast routes that pass through to the default action of the policy.
Introduced	20.5.R1
Platforms	All

prefer-aigp *boolean*

Synopsis	Use AIGP attribute as tunnel metric when present
Context	**configure** policy-options policy-statement *named-item-64* default-action bgp-tunnel-metric prefer-aigp *boolean*
Tree	prefer-aigp
Description	When configured to **true**, and a BGP-LU route is selected for installation in TTM and it is matched by this action in a BGP import policy. The TTM metric of the tunnel is set to the AIGP metric value of the BGP-LU route plus the IGP cost to reach the BGP next-hop if it has the AIGP path attribute, otherwise it is set to the value implied by the value leaf. When configured to **false**, the AIGP attribute is removed from the advertised routes and is ignored if present in the received routes.
Default	false
Introduced	20.5.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

prefer-med *boolean*

Synopsis	Use MED attribute as tunnel metric when present
Context	**configure** policy-options policy-statement *named-item-64* default-action bgp-tunnel-metric prefer-med *boolean*
Tree	prefer-med
Description	When configured to **true**, if a BGP-LU route is selected for installation in the TTM and is matched by this action in a BGP import policy, the TTM metric of the tunnel is set to the MED metric value of the BGP-LU route with the IGP cost to reach the BGP next hop added to it. When configured to **false**, the BGP tunnel metric associated with the BGP-LU route accepted by this policy action is not determined using the MED attribute.
Default	false
Introduced	23.3.R1
Platforms	All

value *(string | number)*

Synopsis	BGP tunnel table metric value
Context	**configure** policy-options policy-statement *named-item-64* default-action bgp-tunnel-metric value *(string | number)*
Tree	value
Description	This command configures a BGP tunnel metric is assigned to routes that do not match any entry. If a BGP-LU route is selected for installation in TTM and it is matched by this action in a BGP import policy, the TTM metric of the associated tunnel is set to this value (or the value associated with the parameter name) if either: • the prefer-aigp option is set to false • the prefer-aigp option is set to true but the BGP-LU route does not have an AIGP attribute
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	0 to 4294967295
Introduced	20.5.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

egress-statistics *boolean*

Synopsis	Enable egress statistics for BGP-LU routes
Context	**configure** policy-options policy-statement *named-item-64* default-action egress-statistics *boolean*
Tree	egress-statistics
Description	When configured to **true**, this command enables the allocation of statistical indexes to BGP labeled unicast route entries that are programmed on egress data paths. When configured to **false**, this command disables the allocation of statistical indexes to BGP-LU route entries.
Default	false
Introduced	20.10.R1
Platforms	All

flex-algo *(string | number)*

Synopsis	Flexible algorithm for BGP next-hop autobind operation
Context	**configure** policy-options policy-statement *named-item-64* default-action flex-algo *(string | number)*
Tree	flex-algo
Description	This command configures the Flex-Algorithm for use in the BGP next-hop automatic bind operation in a BGP import policy. A Flex-Algorithm aware autobind of the BGP next-hop is enabled when the route is matched by the policy statement entry. Flex-Algorithm aware next-hop lookup is supported for unicast BGP, VPRN, and BGP-LU. This command is not supported for multicast address families.
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	128 to 255
Introduced	20.10.R1
Platforms	All

ingress-statistics *boolean*

Synopsis	Enable ingress statistics for BGP-LU routes
Context	**configure** policy-options policy-statement *named-item-64* default-action ingress-statistics *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ingress-statistics
Description	When configured to **true**, this command enables the allocation of statistical indexes to BGP labeled unicast route entries that are programmed on ingress data paths. For effective operation, a prefix must be advertised with a label per prefix for ILM statistics. When configured to **false**, this command disables the allocation of statistical indexes to BGP-LU route entries.
Default	false
Introduced	20.10.R1
Platforms	All

install-backup-path *boolean*

Synopsis	Install a preprogrammed backup path for the prefix
Context	**configure** policy-options policy-statement *named-item-64* default-action install-backup-path *boolean*
Tree	install-backup-path
Default	false
Introduced	16.0.R1
Platforms	All

local-preference *(number | string)*

Synopsis	BGP local preference for routes not matching any entry

nat-policy *(param-midstring | string)*

Synopsis	BGP-VPN imported route and a NAT policy association
Context	**configure** policy-options policy-statement *named-item-64* default-action nat-policy *(param-midstring | string)*
Tree	nat-policy
Description	This command assigns a NAT policy to the matched routes that do not have a more specific NAT policy configured under action. A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route must be associated with a NAT policy that maps traffic into a NAT pool and outside routing context. If the NAT policy is not specified within the route policy entry, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context. All BGP-VPN routes that are destined to be imported into the NAT inside routing context must have action-type **accept** regardless of whether the NAT policy is configured in the action.
String length	1 to 32
String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

next-hop *(keyword | ipv4-address-no-zone | ipv6-address-no-zone | string)*

Synopsis	Next-hop IP address applied to routes
Context	**configure** policy-options policy-statement *named-item-64* default-action next-hop *(keyword | ipv4-address-no-zone | ipv6-address-no-zone | string)*
Tree	next-hop
String length	1 to 32
String format	'next-hop' must start and end with @ (e.g. @name@)
Options	peer-address, self
Introduced	16.0.R1
Platforms	All

origin *(keyword | string)*

Synopsis	BGP origin for routes that are exported into BGP
Context	**configure** policy-options policy-statement *named-item-64* default-action origin *(keyword | string)*

© 2026 Nokia.

String length	1 to 32
String format	'origin' must start and end with @ (e.g. @name@)
Options	igp, egp, incomplete
Introduced	16.0.R1
Platforms	All

origin-validation-state *(keyword | string)*

Synopsis	Origin validation state for routes
Context	**configure** policy-options policy-statement *named-item-64* default-action origin-validation-state *(keyword | string)*
Tree	origin-validation-state
String length	1 to 32
String format	'origin-validation-state' must start and end with @ (e.g. @name@)
Options	valid, not-found, invalid
Introduced	16.0.R1
Platforms	All

preference *(number | string)*

Synopsis	Route preference applied to routes
Context	**configure** policy-options policy-statement *named-item-64* default-action preference *(number | string)*
Tree	preference
String length	1 to 32
String format	'preference' must start and end with @ (e.g. @name@)
Range	1 to 255
Introduced	16.0.R1
Platforms	All

resolve-static *boolean*

Synopsis	Resolve next hop of a static route for the BGP next hop
Context	**configure** policy-options policy-statement *named-item-64* default-action resolve-static *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	resolve-static
Default	false
Introduced	16.0.R1
Platforms	All

route-table-install *boolean*

Synopsis	Allow BGP route installation in the route table
Context	**configure** policy-options policy-statement *named-item-64* default-action route-table-install *boolean*
Tree	route-table-install
Default	true
Introduced	19.10.R1
Platforms	All

source-class *number*

Synopsis	Default source class for the policy statement
Context	**configure** policy-options policy-statement *named-item-64* default-action source-class *number*
Tree	source-class
Description	This command specifies the policy accounting source class index to associate with matched routes.
Range	1 to 255
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

sr-label-index

Synopsis	Enter the **sr-label-index** context
Context	**configure** policy-options policy-statement *named-item-64* default-action sr-label-index
Tree	sr-label-index
Description	Commands in this context configure the policy action to associate a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes. The use of this action in a policy entry that matches more than one /32 labeled IPv4 route may create SID conflicts.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This action only takes effect in BGP peer import policies (and only on received /32 labeled IPv4 routes) and in route table import policies associated with the labeled IPv4 RIB.

When this action occurs in a policy applied as a peer import policy, a prefix SID attribute can be added to a received /32 labeled IPv4 route that was not sent with this attribute, or the received prefix SID attribute can be replaced with a new one.

Introduced 19.10.R1

Platforms All

prefer-igp *boolean*

Synopsis Use the SR label index from the IGP route when present

Context **configure** policy-options policy-statement *named-item-64* default-action sr-label-index prefer-igp *boolean*

Tree prefer-igp

Description When configured to **true**, BGP obtains the SID index from the IGP route (if a SID index is present) and the **configure router bgp segment-routing prefix-sid-range global** command is set to **true**.

This command applies only to route table import policies.

When configured to **false**, or the SID index is not present in the IGP route, or the **configure router bgp segment-routing prefix-sid-range global** command is not set to **true**, BGP obtains the label index value from the **value** command.

Default false

Introduced 19.10.R1

Platforms All

value *(string | number)*

Synopsis BGP SR label index associated with routes

Context **configure** policy-options policy-statement *named-item-64* default-action sr-label-index value *(string | number)*

Tree value

Description This command specifies the BGP SR label index value to be associated with a route or routes.

If this command specifies an index value that causes a SID conflict with another BGP route, all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation.

If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than SID-based allocation.

String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	0 to 1048575
Introduced	19.10.R1
Platforms	All

sr-maintenance-policy *(param-midstring | string)*

Synopsis	SR maintenance policy as an action
Context	**configure** policy-options policy-statement *named-item-64* default-action sr-maintenance-policy *(param-midstring | string)*
Tree	sr-maintenance-policy
Description	This command applies a named segment routing maintenance policy as an action for route policies. It is only used for SR policy routes.
String length	1 to 32
String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	20.10.R1
Platforms	All

sr-return-path-bfd-label *(policy-var-name | number)*

Synopsis	S-BFD return path label
Context	**configure** policy-options policy-statement *named-item-64* default-action sr-return-path-bfd-label *(policy-var-name | number)*
Tree	sr-return-path-bfd-label
Description	This command configures an additional MPLS label to add to the bottom of the label stack for the S-BFD packet and sets the S-BFD session to echo mode. This command applies to the initiator of the S-BFD sessions. The label value can either be a binding SID for an SR policy or another MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through the MPLS return path. This value takes precedence over the return path label value in a maintenance policy (configured using the **configure router segment-routing maintenance-policy return-path-label** command) that is also applied as the policy-statement action. This command can only be configured if the **sr-maintenance-policy** is also configured. If this command is unconfigured, and there is no **return-path-label** command configuration in the maintenance policy that is also applied as an action, and the policy statement is reevaluated, S-BFD returns to asynchronous mode and no return path label is pushed by the initiator node. S-BFD packets for this LSP or path received by the reflector are routed through the IGP path.

entry [entry-id] *number*

Synopsis	Enter the **entry** list instance
Context	**configure** policy-options policy-statement *named-item-64* entry *number*
Tree	entry
Description	Commands in this context create or edit route policy entries within the route policy statement. Multiple entries can be created using unique entries. The router exits the filter when the first match is found and executes the action specified. For this reason, entries must be sequenced correctly from most to least explicit.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

An entry does not require matching criteria defined (in which case, everything matches) but, at a minimum, must define an action to be considered complete. Entries without an action are considered incomplete and are rendered inactive.

Introduced	16.0.R1
Platforms	All

Context	**configure** policy-options policy-statement *named-item-64* entry *number* action as-path-prepend
Tree	as-path-prepend
Introduced	16.0.R1
Platforms	All

as-path *(number | string | keyword)*

Synopsis	AS number to prepend to the AS path attribute
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action as-path-prepend as-path *(number | string | keyword)*
Tree	as-path
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	1 to 4294967295
Options	most-recent
Introduced	16.0.R1
Platforms	All

repeat *(number | string)*

Synopsis	Number of times to prepend the specified AS number
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action as-path-prepend repeat *(number | string)*
Tree	repeat
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	1 to 50
Default	1
Introduced	16.0.R1
Platforms	All

bgp-high-priority *boolean*

Synopsis	Tag routes as high priority for fast table updates

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options policy-statement *named-item-64* entry *number* action bgp-high-priority *boolean*
Tree	bgp-high-priority
Description	When configured to **true**, eligible BGP routes matched by the policy entry or policy default-action are tagged as needing faster route table updates. This action applies only when the policy is applied as a BGP import policy to a base router BGP peer or VPRN BGP peer and applies only to the following route types: • IPv4 • label-IPv4 • IPv6 • label-IPv6 This command is useful when the BGP RIB contains a large number of routes and quick routing table updates are needed for a small subset of these routes. The effectiveness of this command decreases as the subset becomes a larger proportion of the total RIB. When configured to **false**, no routes are tagged for faster route table updates.
Default	false
Introduced	20.5.R1
Platforms	All

bgp-leak *boolean*

Synopsis	Allow leaking for BGP routes
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action bgp-leak *boolean*
Tree	bgp-leak
Default	false
Introduced	16.0.R1
Platforms	All

bgp-med

adjust *string*

Synopsis	BGP-MED adjustment
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action bgp-med adjust *string*
Tree	adjust
String length	1 to 64
String format	'expression' must contain _igp_ or _med_ or @parameter@ 'expression' must contain one operator: +, - or *
Notes	The following elements are part of a choice: **adjust** or **set**.
Introduced	19.7.R1
Platforms	All

set *(keyword | number | string)*

Synopsis	BGP-MED assignment
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action bgp-med set *(keyword | number | string)*
Tree	set
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	0 to 4294967295
Options	igp, min-igp
Notes	The following elements are part of a choice: **adjust** or **set**.
Introduced	19.7.R1
Platforms	All

bgp-tunnel-metric

Synopsis	Enter the **bgp-tunnel-metric** context
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action bgp-tunnel-metric
Tree	bgp-tunnel-metric
Description	Commands in this context configure the tunnel-table metrics associated with BGP label unicast routes that pass through to the default action of the policy.
Introduced	20.5.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms All

prefer-aigp *boolean*

Synopsis Use AIGP attribute as tunnel metric when present

Context **configure** policy-options policy-statement *named-item-64* entry *number* action bgp-tunnel-metric prefer-aigp *boolean*

Tree prefer-aigp

Description When configured to **true**, and a BGP-LU route is selected for installation in TTM and it is matched by this action in a BGP import policy. The TTM metric of the tunnel is set to the AIGP metric value of the BGP-LU route plus the IGP cost to reach the BGP next-hop if it has the AIGP path attribute, otherwise it is set to the value implied by the value leaf.

When configured to **false**, the AIGP attribute is removed from the advertised routes and is ignored if present in the received routes.

Default false

Introduced 20.5.R1

Platforms All

prefer-med *boolean*

Synopsis Use MED attribute as tunnel metric when present

Context **configure** policy-options policy-statement *named-item-64* entry *number* action bgp-tunnel-metric prefer-med *boolean*

Tree prefer-med

Description When configured to **true**, if a BGP-LU route is selected for installation in the TTM and is matched by this action in a BGP import policy, the TTM metric of the tunnel is set to the MED metric value of the BGP-LU route with the IGP cost to reach the BGP next hop added to it.

When configured to **false**, the BGP tunnel metric associated with the BGP-LU route accepted by this policy action is not determined using the MED attribute.

Default false

Introduced 23.3.R1

Platforms All

value *(string | number)*

Synopsis BGP tunnel table metric value

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options policy-statement *named-item-64* entry *number* action bgp-tunnel-metric value *(string | number)*
Tree	value
Description	This command configures a BGP tunnel metric is assigned to routes that do not match any entry. If a BGP-LU route is selected for installation in TTM and it is matched by this action in a BGP import policy, the TTM metric of the associated tunnel is set to this value (or the value associated with the parameter name) if either: • the prefer-aigp option is set to false • the prefer-aigp option is set to true but the BGP-LU route does not have an AIGP attribute
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)

String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)
Options	none
Introduced	16.0.R1
Platforms	All

dest-class *number*

Synopsis	Default destination class for the policy statement
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action dest-class *number*
Tree	dest-class
Description	This command specifies the policy accounting destination class index to associate with matched routes.
Range	1 to 255
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

egress-statistics *boolean*

Synopsis	Enable egress statistics for BGP-LU routes
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action egress-statistics *boolean*
Tree	egress-statistics
Description	When configured to **true**, this command enables the allocation of statistical indexes to BGP labeled unicast route entries that are programmed on egress data paths. When configured to **false**, this command disables the allocation of statistical indexes to BGP-LU route entries.
Default	false
Introduced	20.10.R1
Platforms	All

flex-algo *(string | number)*

Synopsis	Flexible algorithm for BGP next-hop autobind operation
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action flex-algo *(string | number)*
Tree	flex-algo

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the Flex-Algorithm for use in the BGP next-hop automatic bind operation in a BGP import policy. A Flex-Algorithm aware autobind of the BGP next-hop is enabled when the route is matched by the policy statement entry. Flex-Algorithm aware next-hop lookup is supported for unicast BGP, VPRN, and BGP-LU. This command is not supported for multicast address families.
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	128 to 255
Introduced	20.10.R1
Platforms	All

forwarding-class

Synopsis	Enter the **forwarding-class** context

nat-policy *(param-midstring | string)*

Synopsis	BGP-VPN imported route and a NAT policy association
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action nat-policy *(param-midstring | string)*
Tree	nat-policy
Description	This command assigns a NAT policy to the matched routes that do not have a more specific NAT policy configured under action. A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route must be associated with a NAT policy that maps traffic into a NAT pool and outside routing context. If the NAT policy is not specified within the route policy entry, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context. All BGP-VPN routes that are destined to be imported into the NAT inside routing context must have action-type **accept** regardless of whether the NAT policy is configured in the action.
String length	1 to 32
String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

next-hop *(keyword | ipv4-address-no-zone | ipv6-address-no-zone | string)*

Introduced	19.10.R1
Platforms	All

source-class *number*

Synopsis	Default source class for the policy statement
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action source-class *number*
Tree	source-class
Description	This command specifies the policy accounting source class index to associate with matched routes.
Range	1 to 255
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-label-index

Synopsis	Enter the **sr-label-index** context
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action sr-label-index
Tree	sr-label-index
Description	Commands in this context configure the policy action to associate a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes. The use of this action in a policy entry that matches more than one /32 labeled IPv4 route may create SID conflicts. This action only takes effect in BGP peer import policies (and only on received /32 labeled IPv4 routes) and in route table import policies associated with the labeled IPv4 RIB. When this action occurs in a policy applied as a peer import policy, a prefix SID attribute can be added to a received /32 labeled IPv4 route that was not sent with this attribute, or the received prefix SID attribute can be replaced with a new one.
Introduced	19.10.R1
Platforms	All

prefer-igp *boolean*

Synopsis	Use the SR label index from the IGP route when present
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action sr-label-index prefer-igp *boolean*
Tree	prefer-igp
Description	When configured to **true**, BGP obtains the SID index from the IGP route (if a SID index is present) and the **configure router bgp segment-routing prefix-sid-range global** command is set to **true**. This command applies only to route table import policies. When configured to **false**, or the SID index is not present in the IGP route, or the **configure router bgp segment-routing prefix-sid-range global** command is not set to **true**, BGP obtains the label index value from the **value** command.
Default	false
Introduced	19.10.R1
Platforms	All

Context	**configure** policy-options policy-statement *named-item-64* entry *number* action sr-label-index value *(string | number)*
Tree	value
Description	This command specifies the BGP SR label index value to be associated with a route or routes. If this command specifies an index value that causes a SID conflict with another BGP route, all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation. If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than SID-based allocation.
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	0 to 1048575
Introduced	19.10.R1
Platforms	All

sr-maintenance-policy *(param-midstring | string)*

Synopsis	SR maintenance policy as an action
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action sr-maintenance-policy *(param-midstring | string)*
Tree	sr-maintenance-policy
Description	This command applies a named segment routing maintenance policy as an action for route policies. It is only used for SR policy routes.
String length	1 to 32
String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	20.10.R1
Platforms	All

sr-return-path-bfd-label *(policy-var-name | number)*

Synopsis	S-BFD return path label
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action sr-return-path-bfd-label *(policy-var-name | number)*
Tree	sr-return-path-bfd-label
Description	This command configures an additional MPLS label to add to the bottom of the label stack for the S-BFD packet and sets the S-BFD session to echo mode.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command applies to the initiator of the S-BFD sessions. The label value can either be a binding SID for an SR policy or another MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through the MPLS return path. This value takes precedence over the return path label value in a maintenance policy (configured using the **configure router segment-routing maintenance-policy return-path-label** command) that is also applied as the policy-statement action. This command can only be configured if the **sr-maintenance-policy** is also configured.

If this command is unconfigured, and there is no **return-path-label** command configuration in the maintenance policy that is also applied as an action, and the policy statement is reevaluated, S-BFD returns to asynchronous mode and no return path label is pushed by the initiator node. S-BFD packets for this LSP or path received by the reflector are routed through the IGP path.

String length	1 to 32
String format	'policy-var-name' must start and end with @ (e.g. @name@)
Range	32 to 1048575
Introduced	23.10.R1
Platforms	All

srv6-locator *(param-midstring-64 | string)*

Synopsis	Locator for SRv6 TLV to use
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action srv6-locator *(param-midstring-64 | string)*
Tree	srv6-locator
Description	This command configures either a string encoding a midstring parameter delimited by at signs (@), or a reference to a named locator for the SRv6 TLV to use. For a VRF export policy, the referenced locator must already be configured using the commands in the **configure service vprn segment-routing-v6 locator** context. For a BGP export policy, the referenced locator must already be configured using the commands in the **configure router segment-routing segment-routing-v6 base-routing-instance locator** context.
String length	1 to 64
String format	'param-midstring-64' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

srv6-micro-segment-locator *(param-midstring-64 | string)*

Synopsis	Micro-segment locator for SRv6 TLV to use

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options policy-statement *named-item-64* entry *number* action srv6-micro-segment-locator *(param-midstring-64 | string)*
Tree	srv6-micro-segment-locator
Description	This command configures either a string encoding a midstring parameter delimited by at signs (@), or a reference to a named micro-segment locator for the SRv6 TLV to use. For a VRF export policy, the referenced micro-segment locator must already be configured using the commands in the **configure service vprn segment-routing-v6 micro-segment-locator** context. For a BGP export policy, the referenced micro-SID locator must already be configured using the commands in the **configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator** context.
String length	1 to 64
String format	'param-midstring-64' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

srv6-return-path-bfd-sid *(policy-var-name | ipv6-address)*

Synopsis	SRv6 return path BFD SID applied to SRv6 policy routes
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action srv6-return-path-bfd-sid *(policy-var-name | ipv6-address)*
Tree	srv6-return-path-bfd-sid
Description	This command configures the S-BFD session to echo mode and pushes an additional SRv6 SID in the SRH only for S-BFD packets sent on the imported SRv6 policy.
String length	1 to 32
String format	'policy-var-name' must start and end with @ (e.g. @name@)
Introduced	23.3.R1
Platforms	All

sticky-ecmp *boolean*

Synopsis	Specify the sticky ECMP flag for BGP ECMP routes
Context	**configure** policy-options policy-statement *named-item-64* entry *number* action sticky-ecmp *boolean*
Tree	sticky-ecmp
Default	false
Introduced	16.0.R1

route-exists *string*

Synopsis	Conditional expression to test route existence
Context	**configure** policy-options policy-statement *named-item-64* entry *number* conditional-expression route-exists *string*
Tree	route-exists
String length	1 to 255
String format	'route-exists' must have prefix in [ ] and optional all or none (e.g. [10.0.0.0/8] all)
Introduced	16.0.R1
Platforms	All

description *description*

Synopsis	Text description
Context	**configure** policy-options policy-statement *named-item-64* entry *number* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

from

Synopsis	Enable the **from** context
Context	**configure** policy-options policy-statement *named-item-64* entry *number* from
Tree	from
Description	Commands in this context configure policy match criteria based on the source route or the protocol from which it is received. If conditions are not specified, all route sources are considered to match.
Introduced	16.0.R1
Platforms	All

aggregate-contributor *boolean*

Synopsis	Enable aggregate route match criterion

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options policy-statement *named-item-64* entry *number* from aggregate-contributor *boolean*
Tree	aggregate-contributor
Description	When configured to **true**, matches all routes (BGP and non-BGP) that have contributed to an active aggregate route. If the prefix tree above a particular route includes no active aggregate routes or the most specific active aggregate route in the prefix tree above this route has a policy that rejects the route, then it is not considered as an aggregate-contributor. This match condition is only supported when used in a BGP export policy. If it is used in an entry of a BGP import policy, **vrf-export** policy or **vrf-import** policy, no routes are matched by that entry. When configured to **false**, no routes (BGP and non-BGP) that have contributed to an active aggregate route are matched.
Default	false
Introduced	20.10.R1
Platforms	All

area *ipv4-address*

Synopsis	OSPF area as a match criterion
Context	**configure** policy-options policy-statement *named-item-64* entry *number* from area *ipv4-address*
Tree	area
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	All

as-path

Synopsis	Enter the **as-path** context
Context	**configure** policy-options policy-statement *named-item-64* entry *number* from as-path

expression *string*

Synopsis	Community expression statement as a match criterion
Context	**configure** policy-options policy-statement *named-item-64* entry *number* from community expression *string*
Tree	expression
Description	This command configures a community expression statement as a match criterion for the policy statement. This statement is a logical expression string composed of logical operators (keywords AND, OR, NOT), community names delimited by square brackets [], and parentheses ( ) to group subexpressions. If the expression contains special characters (for example, #, $, spaces), the entire string must be enclosed in double quotes. The expression specified must already be defined using the **configure policy-options community expression expr** command. The following are examples of valid logical expressions: "[community_list_A] OR ([community_list_B] AND [community_list_C])"

origin *keyword*

Synopsis	Route origin match criteria
Context	**configure** policy-options policy-statement *named-item-64* entry *number* from origin *keyword*
Tree	origin
Description	This command configures a match criteria for the origin attribute of the route. The origin attribute is applicable to BGP routes and to the following subscriber-management routes: Host routes (for example, IPv4 /32 address, or IPv6 SLAAC prefix) carry the origin attribute with AAA, dynamic, or static values, depending on the address assignment method. For CUPS hosts, the origin attribute is always PFCP. Host routes can also be distinguished using the **sub-mgmt** option for the **protocol** command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Dynamically provisioned prefixes or loopback addresses use AAA or PFCP origin values, depending on the protocol that provides the prefix and address. Dynamic routes can also be distinguished using the **direct** option for the **protocol** command.

Statically configured prefixes under the subscriber interface do not have an origin attribute. These routes can be distinguished using the **direct** option for the **protocol** command.

Framed routes for non-CUPS hosts do not have an origin attribute. Framed routes for CUPS hosts use PFCP for the origin attribute. Alternatively, framed routes can be distinguished using the **managed** option for the **protocol** command.

The values that are specific to subscriber-management routes are never carried in BGP updates as part of the BGP origin attribute and are not visible within the BGP process.

Options	igp, egp, incomplete, any, aaa, dynamic, static, bonding, pfcp
Introduced	16.0.R1

route-distinguisher-list *(param-midstring-64 | string)*

Synopsis	Route distinguisher list as a match criterion
Context	**configure** policy-options policy-statement *named-item-64* entry *number* from route-distinguisher-list *(param-midstring-64 | string)*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	route-distinguisher-list
Description	This command specifies the (possibly parameterized) name of a route distinguisher (RD) list. This match condition is supported by policies applied as VRF-import or BGP peer import policies. A BGP route can match a policy entry with this match criterion if the NLRI field contains an RD that is matched by at least one of the entries in the RD list. BGP routes belonging to address families other than VPN-IPv4, VPN-IPv6, MCAST-VPN-IPv4, MCAST-VPN-IPv6, EVPN, FlowSpec-VPN IPv4, FlowSpec-VPN IPv6, MVPN-IPv4, or MVPN-IPv6 route do not match policy entries with this match criterion.
String length	1 to 64
String format	'param-midstring-64' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	23.3.R1
Platforms	All

srv6-sid-prefix *(policy-var-name | ipv6-unicast-prefix)*

Synopsis	SRv6 SID or uSID as match criterion for the BGP route
Context	**configure** policy-options policy-statement *named-item-64* entry *number* from srv6-sid-prefix *(policy-var-name | ipv6-unicast-prefix)*
Tree	srv6-sid-prefix
Description	This command configures either the name of a prefix policy variable or an IPv6 prefix and prefix length, as a match criterion for a BGP route. **Note**: If the name of a prefix policy variable is the match criterion, the name must start and end with an at sign (@). A BGP route matches this condition if it has an SRv6 TLV, and the SID or micro-segment (uSID) value in that TLV is matched by the bits of the IPv6 prefix (up to the specified prefix length). This match condition is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.
String length	1 to 32
String format	'policy-var-name' must start and end with @ (e.g. @name@)
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

srv6-tlv *keyword*

Synopsis	SRv6 TLV presence as match criterion for BGP route
Context	**configure** policy-options policy-statement *named-item-64* entry *number* from srv6-tlv *keyword*
Tree	srv6-tlv
Description	This command configures whether the entry matches a BGP route with a prefix SID attribute containing an SRv6 TLV.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If this command is not configured, a BGP route can match the entry, regardless of whether it has a prefix SID attribute or whether that prefix SID attribute has SRv6 TLVs.

This match condition is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

If the **present** option is configured, a BGP route only matches this entry if it has a prefix SID attribute containing an SRv6 TLV.

If the **not-present** option is configured, a BGP route only matches this entry if it does not have a prefix SID attribute containing an SRv6 TLV.

Options	present, not-present
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

bgp-high-priority *boolean*

Synopsis	Tag routes as high priority for fast table updates
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action bgp-high-priority *boolean*
Tree	bgp-high-priority
Description	When configured to **true**, eligible BGP routes matched by the policy entry or policy default-action are tagged as needing faster route table updates. This action applies only when the policy is applied as a BGP import policy to a base router BGP peer or VPRN BGP peer and applies only to the following route types: • IPv4 • label-IPv4 • IPv6 • label-IPv6 This command is useful when the BGP RIB contains a large number of routes and quick routing table updates are needed for a small subset of these routes. The effectiveness of this command decreases as the subset becomes a larger proportion of the total RIB. When configured to **false**, no routes are tagged for faster route table updates.
Default	false
Introduced	20.5.R1
Platforms	All

bgp-leak *boolean*

Synopsis	Allow leaking for BGP routes

Tree	bgp-tunnel-metric
Description	Commands in this context configure the tunnel-table metrics associated with BGP label unicast routes that pass through to the default action of the policy.
Introduced	20.5.R1
Platforms	All

prefer-aigp *boolean*

Synopsis	Use AIGP attribute as tunnel metric when present
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action bgp-tunnel-metric prefer-aigp *boolean*
Tree	prefer-aigp
Description	When configured to **true**, and a BGP-LU route is selected for installation in TTM and it is matched by this action in a BGP import policy. The TTM metric of the tunnel is set to the AIGP metric value of the BGP-LU route plus the IGP cost to reach the BGP next-hop if it has the AIGP path attribute, otherwise it is set to the value implied by the value leaf. When configured to **false**, the AIGP attribute is removed from the advertised routes and is ignored if present in the received routes.
Default	false
Introduced	20.5.R1
Platforms	All

prefer-med *boolean*

Synopsis	Use MED attribute as tunnel metric when present
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action bgp-tunnel-metric prefer-med *boolean*
Tree	prefer-med
Description	When configured to **true**, if a BGP-LU route is selected for installation in the TTM and is matched by this action in a BGP import policy, the TTM metric of the tunnel is set to the MED metric value of the BGP-LU route with the IGP cost to reach the BGP next hop added to it. When configured to **false**, the BGP tunnel metric associated with the BGP-LU route accepted by this policy action is not determined using the MED attribute.
Default	false
Introduced	23.3.R1
Platforms	All

© 2026 Nokia.

Description	This command specifies the policy accounting destination class index to associate with matched routes.
Range	1 to 255
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

egress-statistics *boolean*

Synopsis	Enable egress statistics for BGP-LU routes
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action egress-statistics *boolean*
Tree	egress-statistics
Description	When configured to **true**, this command enables the allocation of statistical indexes to BGP labeled unicast route entries that are programmed on egress data paths. When configured to **false**, this command disables the allocation of statistical indexes to BGP-LU route entries.
Default	false
Introduced	20.10.R1
Platforms	All

flex-algo *(string | number)*

Synopsis	Flexible algorithm for BGP next-hop autobind operation
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action flex-algo *(string | number)*
Tree	flex-algo

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the Flex-Algorithm for use in the BGP next-hop automatic bind operation in a BGP import policy. A Flex-Algorithm aware autobind of the BGP next-hop is enabled when the route is matched by the policy statement entry. Flex-Algorithm aware next-hop lookup is supported for unicast BGP, VPRN, and BGP-LU. This command is not supported for multicast address families.
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	128 to 255
Introduced	20.10.R1
Platforms	All

nat-policy *(param-midstring | string)*

Synopsis	BGP-VPN imported route and a NAT policy association
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action nat-policy *(param-midstring | string)*
Tree	nat-policy
Description	This command assigns a NAT policy to the matched routes that do not have a more specific NAT policy configured under action. A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route must be associated with a NAT policy that maps traffic into a NAT pool and outside routing context. If the NAT policy is not specified within the route policy entry, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context. All BGP-VPN routes that are destined to be imported into the NAT inside routing context must have action-type **accept** regardless of whether the NAT policy is configured in the action.
String length	1 to 32
String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sr-label-index

Synopsis	Enter the **sr-label-index** context
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action sr-label-index
Tree	sr-label-index
Description	Commands in this context configure the policy action to associate a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes. The use of this action in a policy entry that matches more than one /32 labeled IPv4 route may create SID conflicts. This action only takes effect in BGP peer import policies (and only on received /32 labeled IPv4 routes) and in route table import policies associated with the labeled IPv4 RIB. When this action occurs in a policy applied as a peer import policy, a prefix SID attribute can be added to a received /32 labeled IPv4 route that was not sent with this attribute, or the received prefix SID attribute can be replaced with a new one.
Introduced	19.10.R1
Platforms	All

prefer-igp *boolean*

Synopsis	Use the SR label index from the IGP route when present
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action sr-label-index prefer-igp *boolean*
Tree	prefer-igp
Description	When configured to **true**, BGP obtains the SID index from the IGP route (if a SID index is present) and the **configure router bgp segment-routing prefix-sid-range global** command is set to **true**. This command applies only to route table import policies. When configured to **false**, or the SID index is not present in the IGP route, or the **configure router bgp segment-routing prefix-sid-range global** command is not set to **true**, BGP obtains the label index value from the **value** command.
Default	false
Introduced	19.10.R1
Platforms	All

value *(string | number)*

Synopsis	BGP SR label index associated with routes

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action sr-label-index value *(string | number)*
Tree	value
Description	This command specifies the BGP SR label index value to be associated with a route or routes. If this command specifies an index value that causes a SID conflict with another BGP route, all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation. If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than SID-based allocation.
String length	1 to 32
String format	'param-name' must start and end with @ (e.g. @name@)
Range	0 to 1048575
Introduced	19.10.R1
Platforms	All

sr-maintenance-policy *(param-midstring | string)*

Synopsis	SR maintenance policy as an action
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action sr-maintenance-policy *(param-midstring | string)*
Tree	sr-maintenance-policy
Description	This command applies a named segment routing maintenance policy as an action for route policies. It is only used for SR policy routes.
String length	1 to 32
String format	'param-midstring' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	20.10.R1
Platforms	All

sr-return-path-bfd-label *(policy-var-name | number)*

Synopsis	S-BFD return path label
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action sr-return-path-bfd-label *(policy-var-name | number)*
Tree	sr-return-path-bfd-label
Description	This command configures an additional MPLS label to add to the bottom of the label stack for the S-BFD packet and sets the S-BFD session to echo mode.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command applies to the initiator of the S-BFD sessions. The label value can either be a binding SID for an SR policy or another MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through the MPLS return path. This value takes precedence over the return path label value in a maintenance policy (configured using the **configure router segment-routing maintenance-policy return-path-label** command) that is also applied as the policy-statement action. This command can only be configured if the **sr-maintenance-policy** is also configured.

If this command is unconfigured, and there is no **return-path-label** command configuration in the maintenance policy that is also applied as an action, and the policy statement is reevaluated, S-BFD returns to asynchronous mode and no return path label is pushed by the initiator node. S-BFD packets for this LSP or path received by the reflector are routed through the IGP path.

String length	1 to 32
String format	'policy-var-name' must start and end with @ (e.g. @name@)
Range	32 to 1048575
Introduced	23.10.R1
Platforms	All

srv6-locator *(param-midstring-64 | string)*

Synopsis	Locator for SRv6 TLV to use
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action srv6-locator *(param-midstring-64 | string)*
Tree	srv6-locator
Description	This command configures either a string encoding a midstring parameter delimited by at signs (@), or a reference to a named locator for the SRv6 TLV to use. For a VRF export policy, the referenced locator must already be configured using the commands in the **configure service vprn segment-routing-v6 locator** context. For a BGP export policy, the referenced locator must already be configured using the commands in the **configure router segment-routing segment-routing-v6 base-routing-instance locator** context.
String length	1 to 64
String format	'param-midstring-64' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

srv6-micro-segment-locator *(param-midstring-64 | string)*

Synopsis	Micro-segment locator for SRv6 TLV to use

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action srv6-micro-segment-locator *(param-midstring-64 | string)*
Tree	srv6-micro-segment-locator
Description	This command configures either a string encoding a midstring parameter delimited by at signs (@), or a reference to a named micro-segment locator for the SRv6 TLV to use. For a VRF export policy, the referenced micro-segment locator must already be configured using the commands in the **configure service vprn segment-routing-v6 micro-segment-locator** context. For a BGP export policy, the referenced micro-SID locator must already be configured using the commands in the **configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator** context.
String length	1 to 64
String format	'param-midstring-64' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

srv6-return-path-bfd-sid *(policy-var-name | ipv6-address)*

Synopsis	SRv6 return path BFD SID applied to SRv6 policy routes
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action srv6-return-path-bfd-sid *(policy-var-name | ipv6-address)*
Tree	srv6-return-path-bfd-sid
Description	This command configures the S-BFD session to echo mode and pushes an additional SRv6 SID in the SRH only for S-BFD packets sent on the imported SRv6 policy.
String length	1 to 32
String format	'policy-var-name' must start and end with @ (e.g. @name@)
Introduced	23.3.R1
Platforms	All

sticky-ecmp *boolean*

Synopsis	Specify the sticky ECMP flag for BGP ECMP routes
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* action sticky-ecmp *boolean*
Tree	sticky-ecmp
Default	false
Introduced	19.10.R1

aggregate-contributor *boolean*

Synopsis	Enable aggregate route match criterion
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* from aggregate-contributor *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	aggregate-contributor
Description	When configured to **true**, matches all routes (BGP and non-BGP) that have contributed to an active aggregate route. If the prefix tree above a particular route includes no active aggregate routes or the most specific active aggregate route in the prefix tree above this route has a policy that rejects the route, then it is not considered as an aggregate-contributor. This match condition is only supported when used in a BGP export policy. If it is used in an entry of a BGP import policy, **vrf-export** policy or **vrf-import** policy, no routes are matched by that entry. When configured to **false**, no routes (BGP and non-BGP) that have contributed to an active aggregate route are matched.
Default	false
Introduced	20.10.R1
Platforms	All

area *ipv4-address*

Synopsis	OSPF area as a match criterion
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* from area *ipv4-address*
Tree	area
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	19.10.R1
Platforms	All

origin *keyword*

Synopsis	Route origin match criteria
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* from origin *keyword*
Tree	origin
Description	This command configures a match criteria for the origin attribute of the route. The origin attribute is applicable to BGP routes and to the following subscriber-management routes: Host routes (for example, IPv4 /32 address, or IPv6 SLAAC prefix) carry the origin attribute with AAA, dynamic, or static values, depending on the address assignment method. For CUPS hosts, the origin attribute is always PFCP. Host routes can also be distinguished using the **sub-mgmt** option for the **protocol** command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Dynamically provisioned prefixes or loopback addresses use AAA or PFCP origin values, depending on the protocol that provides the prefix and address. Dynamic routes can also be distinguished using the **direct** option for the **protocol** command.

Statically configured prefixes under the subscriber interface do not have an origin attribute. These routes can be distinguished using the **direct** option for the **protocol** command.

Framed routes for non-CUPS hosts do not have an origin attribute. Framed routes for CUPS hosts use PFCP for the origin attribute. Alternatively, framed routes can be distinguished using the **managed** option for the **protocol** command.

The values that are specific to subscriber-management routes are never carried in BGP updates as part of the BGP origin attribute and are not visible within the BGP process.

Options	igp, egp, incomplete, any, aaa, dynamic, static, bonding, pfcp
Introduced	19.10.R1

route-distinguisher-list *(param-midstring-64 | string)*

Synopsis	Route distinguisher list as a match criterion
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* from route-distinguisher-list *(param-midstring-64 | string)*
Tree	route-distinguisher-list
Description	This command specifies the (possibly parameterized) name of a route distinguisher (RD) list. This match condition is supported by policies applied as VRF-import or BGP peer import policies. A BGP route can match a policy entry with this match criterion if the NLRI field contains an RD that is matched by at least one of the entries in the RD list. BGP routes belonging to address families other than VPN-IPv4, VPN-IPv6, MCAST-VPN-IPv4, MCAST-VPN-IPv6, EVPN, FlowSpec-VPN IPv4, FlowSpec-VPN IPv6, MVPN-IPv4, or MVPN-IPv6 route do not match policy entries with this match criterion.
String length	1 to 64
String format	'param-midstring-64' must contain @param@ somewhere (e.g. prefix@name@suffix)
Introduced	23.3.R1
Platforms	All

srv6-sid-prefix *(policy-var-name | ipv6-unicast-prefix)*

Synopsis	SRv6 SID or uSID as match criterion for the BGP route
Context	**configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* from srv6-sid-prefix *(policy-var-name | ipv6-unicast-prefix)*
Tree	srv6-sid-prefix
Description	This command configures either the name of a prefix policy variable or an IPv6 prefix and prefix length, as a match criterion for a BGP route. **Note**: If the name of a prefix policy variable is the match criterion, the name must start and end with an at sign (@). A BGP route matches this condition if it has an SRv6 TLV, and the SID or micro-segment (uSID) value in that TLV is matched by the bits of the IPv6 prefix (up to the specified prefix length). This match condition is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.
String length	1 to 32
String format	'policy-var-name' must start and end with @ (e.g. @name@)
Introduced	23.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

srv6-tlv *keyword*

Synopsis SRv6 TLV presence as match criterion for BGP route

Context **configure** policy-options policy-statement *named-item-64* named-entry *named-item-255* from srv6-tlv *keyword*

Tree srv6-tlv

Description This command configures whether the entry matches a BGP route with a prefix SID attribute containing an SRv6 TLV.

If this command is not configured, a BGP route can match the entry, regardless of whether it has a prefix SID attribute or whether that prefix SID attribute has SRv6 TLVs.

This match condition is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

If the **present** option is configured, a BGP route only matches this entry if it has a prefix SID attribute containing an SRv6 TLV.

If the **not-present** option is configured, a BGP route only matches this entry if it does not have a prefix SID attribute containing an SRv6 TLV.

Options present, not-present

Introduced 23.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

prefix-list [name] *named-item-64*

Synopsis	Enter the **prefix-list** list instance
Context	**configure** policy-options prefix-list *named-item-64*
Tree	prefix-list
Introduced	16.0.R1
Platforms	All

[**name**] *named-item-64*

Synopsis	Prefix list name
Context	**configure** policy-options prefix-list *named-item-64*
Tree	prefix-list
Description	This command specifies the name for a prefix list. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@", "start@variable@end", "@variable@end", or "start@variable@".
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

prefix [ip-prefix] *(ipv4-prefix | ipv6-prefix)* type *keyword*

Introduced	16.0.R1
Platforms	All

mask-pattern [address] *(ipv4-address-no-zone* | *ipv6-address-no-zone)*

Synopsis	Add a list entry for **mask-pattern**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** policy-options prefix-list *named-item-64* prefix *(ipv4-prefix | ipv6-prefix)* type *keyword* mask-pattern *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	mask-pattern
Notes	The following elements are part of a choice: **mask-pattern**, (**end-length** and **start-length**), **through-length**, or **to-prefix**.
Introduced	20.7.R1
Platforms	All

[**address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Address mask for matching routes to the prefix entry
Context	**configure** policy-options prefix-list *named-item-64* prefix *(ipv4-prefix | ipv6-prefix)* type *keyword* mask-pattern *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	mask-pattern
Description	This command specifies the address mask to compare against the prefix entry to determine whether the route is considered a match. A route matches the prefix entry if the following conditions are met. • The bitwise logical AND of the prefix address and its mask matches the bitwise logical AND of the route address and its mask. • The prefix length of the prefix entry matches the prefix length of the route. For example, for a prefix entry of 17.1.0.0/32, routes with an address 17.1.x.0 (where x can be 0 through 255) and a prefix length of 32 match the entry.
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	All

start-length *number*

Synopsis	Start in the prefix range length
Context	**configure** policy-options prefix-list *named-item-64* prefix *(ipv4-prefix | ipv6-prefix)* type *keyword* start-length *number*
Tree	start-length
Range	0 to 128
Notes	The following elements are part of a choice: **mask-pattern**, (**end-length** and **start-length**), **through-length**, or **to-prefix**.
Introduced	16.0.R1
Platforms	All

through-length *number*

Synopsis	Prefix through length
Context	**configure** policy-options prefix-list *named-item-64* prefix *(ipv4-prefix* | *ipv6-prefix)* type *keyword* through-length *number*
Tree	through-length
Range	0 to 128
Notes	The following elements are part of a choice: **mask-pattern**, (**end-length** and **start-length**), **through-length**, or **to-prefix**.
Introduced	16.0.R1
Platforms	All

to-prefix [ip-prefix] *(ipv4-prefix* | *ipv6-prefix)*

Synopsis	Add a list entry for **to-prefix**
Context	**configure** policy-options prefix-list *named-item-64* prefix *(ipv4-prefix* | *ipv6-prefix)* type *keyword* to-prefix *(ipv4-prefix* | *ipv6-prefix)*
Tree	to-prefix
Notes	The following elements are part of a choice: **mask-pattern**, (**end-length** and **start-length**), **through-length**, or **to-prefix**.
Introduced	20.7.R1
Platforms	All

[**ip-prefix**] *(ipv4-prefix* | *ipv6-prefix)*

Synopsis	IP prefix for "to" match type
Context	**configure** policy-options prefix-list *named-item-64* prefix *(ipv4-prefix* | *ipv6-prefix)* type *keyword* to-prefix *(ipv4-prefix* | *ipv6-prefix)*
Tree	to-prefix
Description	This command configures an IP prefix to use in a route policy prefix list for the to match type. If the prefix entry is in the format *prefix1*/*length1*, and this command is configured in the format *prefix2*/*length2*, a route matches the prefix entry if the following conditions are met. • The route shares the same most-significant bits (specified by *length1*) with the prefix entry • The route shares the same most-significant bits (specified by *length2*) with this IP prefix value • The prefix length of the route is in the range of *length1* to *length2* (inclusive)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	For example, for a prefix entry of 10.0.0.8 with a to IP prefix value of 10.0.0.0/32, routes 10.0.0.0/8, 10.0.0.0/9, 10.0.0.0.0/10, and so on, to 10.0.0.0/32 are considered matches for the prefix entry.
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	All

route-distinguisher-list [name] *named-item-64*

Synopsis	Enter the **route-distinguisher-list** list instance
Context	**configure** policy-options route-distinguisher-list *named-item-64*
Tree	route-distinguisher-list
Introduced	23.3.R1
Platforms	All

[**name**] *named-item-64*

Synopsis	Route distinguisher list name
Context	**configure** policy-options route-distinguisher-list *named-item-64*
Tree	route-distinguisher-list
Description	This command creates a list of entries used to match the RD in BGP routes of specific address families.
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character 'name' must not contain @ (use @param@ in policy expressions)
Notes	This element is part of a list key.
Introduced	23.3.R1
Platforms	All

rd-entry [rd] *string*

Synopsis	Add a list entry for **rd-entry**
Context	**configure** policy-options route-distinguisher-list *named-item-64* rd-entry *string*
Tree	rd-entry
Max. instances	128

Introduced	23.3.R1
Platforms	All

[**rd**] *string*

Synopsis	Route distinguisher
Context	**configure** policy-options route-distinguisher-list *named-item-64* rd-entry *string*
Tree	rd-entry
Description	This command creates an RD matching entry containing an IPv4 address or ASN and the assigned number. The following formats are supported: • *a.b.c.d*/*m*:* – RD in IPv4 format with a wildcard character (such as 10.0.0.0/16:*) • *a.b.c.d*/*m*:*n* – RD in IPv4 format with a specific number (such as 10.0.0.2/32:535) • *asn*:* – RD in ASN format with a wildcard character (such as 65000:*) • *asn*:*n* – RD in ASN format with a specific number (such as 65000:535) See the "Route distinguishers" section of the *7450 ESS, 7750 SR, 7950 XRS, and VSR Layer 3 Services Guide: IES and VPRN* for information about Type values.
String length	3 to 28
String format	'rd' must be ip/mask:num, asn:num or 4byte-asn:num (e.g. 10.0.0.0/8:100 or 65535:0)
Notes	This element is part of a list key.
Introduced	23.3.R1
Platforms	All

4.31.1 port command descriptions

port [port-id] *port*

Synopsis	Enter the **port** list instance
Context	**configure** port *port*
Tree	port
Description	Commands in this context configure ports, multilink bundles, and BPGs. Before a port can be configured, the chassis slot must be provisioned with a valid card type and the MDA must be provisioned with a valid MDA type.
Introduced	16.0.R1
Platforms	All

[**port-id**] *port*

Synopsis	Port ID
Context	**configure** port *port*
Tree	port
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

access

Synopsis	Enter the **access** context
Context	**configure** port *port* access
Tree	access
Description	Commands in this context configure egress and ingress pool policy commands.
Introduced	16.0.R1
Platforms	All

egress

Synopsis	Enter the **egress** context
Context	**configure** port *port* access egress

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	egress
Description	Commands in this context specify the configuration of access egress buffer pools to determine how a CBS-reserved space is handled and the strategy for utilizing the shared buffer space.
Introduced	16.0.R1
Platforms	All

pool [name] *named-item*

Synopsis	Enter the **pool** list instance
Context	**configure** port *port* access egress pool *named-item*
Tree	pool
Description	Commands in this context configure pool policies for the pool instance.
Introduced	16.0.R1
Platforms	All

[**name**] *named-item*

Synopsis	Pool name for the access port
Context	**configure** port *port* access egress pool *named-item*
Tree	pool
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
MD-CLI default	default
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

amber-alarm-threshold *number*

Synopsis	Threshold for the amber alarm on oversubscription
Context	**configure** port *port* access egress pool *named-item* amber-alarm-threshold *number*
Tree	amber-alarm-threshold
Range	1 to 1000
Units	percent

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

monitor-pool-depth

Synopsis	Enter the **monitor-pool-depth** context
Context	**configure** port *port* access egress pool *named-item* monitor-pool-depth
Tree	monitor-pool-depth
Introduced	24.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of pool-depth monitoring
Context	**configure** port *port* access egress pool *named-item* monitor-pool-depth admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	24.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

alarm-thresholds

Synopsis	Enter the **alarm-thresholds** context
Context	**configure** port *port* access egress pool *named-item* monitor-pool-depth alarm-thresholds
Tree	alarm-thresholds
Introduced	24.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

reserved-pool-in-use *decimal-number*

Synopsis	Alarm threshold for reserved buffer pool usage
Context	**configure** port *port* access egress pool *named-item* monitor-pool-depth alarm-thresholds reserved-pool-in-use *decimal-number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	reserved-pool-in-use
Description	This command configures the reserved pool in-use threshold. A tmnxResvPoolUse ThreshExcd trap is generated when the reserved pool usage exceeds this threshold percentage. When the usage returns below the threshold percentage, the tmnxResvPool UseThreshNotExcd trap is generated.
Range	0.00 to 100.00
Units	centipercent
Introduced	24.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shared-pool-in-use *decimal-number*

Synopsis	Alarm threshold for shared of buffer pool usage
Context	**configure** port *port* access egress pool *named-item* monitor-pool-depth alarm-thresholds shared-pool-in-use *decimal-number*
Tree	shared-pool-in-use
Description	This command configures the shared pool in-use threshold. A tmnxSharedPoolUse ThreshExcd trap is generated when the shared pool usage exceeds this threshold percentage. When the usage returns below the threshold percentage, the tmnxShared PoolUseThreshNotExcd trap is generated.
Range	0.00 to 100.00
Units	centipercent
Introduced	24.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

total-pool-in-use *decimal-number*

Synopsis	Alarm threshold for usage of total buffer pool
Context	**configure** port *port* access egress pool *named-item* monitor-pool-depth alarm-thresholds total-pool-in-use *decimal-number*
Tree	total-pool-in-use
Description	This command configures the total pool in-use threshold. A tmnxTotalPoolUseThresh Excd trap is generated when the total pool usage exceeds this threshold percentage. When the usage returns below the threshold percentage, the tmnxTotalPoolUseThresh NotExcd trap is generated.
Range	0.00 to 100.00
Units	centipercent
Introduced	24.7.R1

Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

red-alarm-threshold *number*

Synopsis	Threshold for the red alarm on oversubscription
Context	**configure** port *port* access egress pool *named-item* red-alarm-threshold *number*
Tree	red-alarm-threshold
Range	1 to 1000
Units	percent
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

resv-cbs

max *number*

Synopsis	Maximum percentage for reserved CBS of the pool
Context	**configure** port *port* access egress pool *named-item* resv-cbs amber-alarm-action max *number*
Tree	max
Description	This command specifies the maximum percentage for the reserved CBS of the pool. The maximum reserved CBS must not be less than the value of the reserved CBS.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

To enable adaptive CBS sizing the **max**, **step**, and **cbs** commands must be configured. The **cbs** command must also be configured to a percentage other than the default value.

When unconfigured, CBS adaptive sizing is not enabled.

Range	1 to 100
Units	percent
Introduced	16.0.R1
Platforms	All

step *number*

Synopsis	Step-size percentage for reserved CBS of the pool
Context	**configure** port *port* access egress pool *named-item* resv-cbs amber-alarm-action step *number*
Tree	step
Description	This command specifies the step-size percentage for the reserved CBS of the pool.

To enable adaptive CBS sizing the **max**, **step**, and **cbs** commands must be configured. The **cbs** command must also be configured to a percentage other than the default value.

When unconfigured, CBS adaptive sizing is not enabled.

Range	1 to 100
Units	percent
Introduced	16.0.R1
Platforms	All

Description	Commands in this context configure connector ports and modes.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

breakout *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Port breakout of the transceiver used in the connector
Context	**configure** port *port* connector breakout *keyword*
Tree	breakout
Description	This command defines the port breakout of the transceiver used in the connector. Specifying the type triggers the creation of the ports that will be accessible under the connector. When a QSFP28 connector uses an SFP+ optical module with the QSFP28-to-SFP+/SFP28 adapter, set this command to **c1-10g**. This value indicates the presence of the adapter. For some connectors (for example, QSFPDD), there can be overlap in the breakout for different host interfaces. The same port breakout can be supported on an optical modules that uses a host interface of CAUI-4 as another optical module that uses 100GAUI-2. To distinguish from the CAUI-4 host interface, the "-aui2" suffix is used on some breakout options. This is only necessary where there is overlap. In other situations, SR OS sets the host interface correctly without requiring the distinction in the breakout option.
Options	c1-40g, c4-10g, c1-100g, c4-25g, c10-10g, c1-400g, c2-100g, c4-100g, c1-10g, c1-25g, c1-50g, c8-50g, c1-800g, c3-100g, c8-100g, c2-400g, c1-400g-flex, c2-400g-flex, c1-1g, c2-1g, c1-100g-aui2, c2-100g-aui2, c1-400g-aui4, c4-100g-aui1, c1-100g-aui1, c1-400g-aui4-flex, c8-10g
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rs-fec-mode *keyword*

Synopsis	RS-FEC mode for the Ethernet connector
Context	**configure** port *port* connector rs-fec-mode *keyword*
Tree	rs-fec-mode
Description	This command specifies the RS-FEC (Reed-Solomon Forward Error Correction) mode on the Ethernet connector.

netrx *boolean*

Synopsis	Report the network (optical side) receive alarm
Context	**configure** port *port* dwdm coherent report-alarm netrx *boolean*
Tree	netrx
Default	true
Introduced	16.0.R1
Platforms	All

nettx *boolean*

Synopsis	Report the network (optical side) transmit alarm
Context	**configure** port *port* dwdm coherent report-alarm nettx *boolean*
Tree	nettx
Default	true
Introduced	16.0.R1
Platforms	All

rx-los-reaction *keyword*

Synopsis	Reaction to an RX LOS
Context	**configure** port *port* dwdm coherent rx-los-reaction *keyword*
Tree	rx-los-reaction
Description	This command configures the reaction to an RX LOS. **Note:** If this command is disabled for some coherent DWDM transceivers, the transceiver only reports local fault alarms when an RX LOS condition occurs; however, the port returns to service faster after the LOS condition is cleared. For these transceivers, if this command is enabled, there is better visibility of individual alarms (for example, signal-fail, local fault, no-am-lock), but the port takes longer to service after the LOS condition is cleared.
Options	none, squelch
Default	squelch
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rx-los-thresh *decimal-number*

Synopsis	Average input power LOS threshold
Context	**configure** port *port* dwdm coherent rx-los-thresh *decimal-number*
Tree	rx-los-thresh
Range	-30 to -13
Units	decibel-milliwatts
Default	-23
Introduced	16.0.R1
Platforms	All

sweep

Synopsis	Enter the **sweep** context
Context	**configure** port *port* dwdm coherent sweep
Tree	sweep
Description	Commands in this context allow users to configure the dispersion sweep **start** and **end** values for the automatic mode of coherent control. If the user knows the approximate or theoretical residual dispersion of the link, these commands can be used to limit the range of sweeping for the automatic control mode and therefore achieve a faster link up.
Introduced	16.0.R1
Platforms	All

end *number*

Synopsis	Upper bound of the dispersion compensation range
Context	**configure** port *port* dwdm coherent sweep end *number*
Tree	end
Range	-50000 to 50000
Units	picoseconds per nanometer
Default	2000
Introduced	16.0.R1
Platforms	All

start *number*

Synopsis	Lower bound of the dispersion compensation range
Context	**configure** port *port* dwdm coherent sweep start *number*
Tree	start
Range	-50000 to 50000
Units	picoseconds per nanometer
Default	-25500
Introduced	16.0.R1
Platforms	All

target-power *decimal-number*

Synopsis	Average output power target for the port
Context	**configure** port *port* dwdm coherent target-power *decimal-number*
Tree	target-power
Range	-20 to 3
Units	decibel-milliwatts
Default	1
Introduced	16.0.R1
Platforms	All

frequency *number*

Synopsis	Center frequency for tunable DWDM optical interface
Context	**configure** port *port* dwdm frequency *number*
Tree	frequency
Description	This command configures the center frequency to use for a tunable DWDM optical interface. This command can be used to specify any frequency in the C band. To set the DWDM frequency, the port must be a physical port and the provisioned MDA type must have DWDM tunable optics (for example, p1-100g-tun-b), or the MDA must support the option of tunable DWDM optic modules. This command replaces the **configure port dwdm channel** command.
Range	184800000 to 196750000
Units	megahertz

adaptation-rule *keyword*

Synopsis	Adaptation rule when an aggregate shaper is used

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* aggregate-rate adaptation-rule *keyword*
Tree	adaptation-rule
Description	This command configures the adaptation rule for the PIR value of the queue-group aggregate rate. This rule determines which configured value is adapted to **oper-agg-rate** based on hardware capabilities.
Options	max – At maximum, the configured rate min – At minimum, the configured rate closest – Closest rate to the configured value
Default	closest
Introduced	24.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

burst-limit *(number | keyword)*

Synopsis	Burst limit of the queue group aggregate rate
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* aggregate-rate burst-limit *(number | keyword)*
Tree	burst-limit
Description	This command defines an explicit shaping burst size for a queue. The configured size defines the shaping leaky bucket threshold level that indicates the maximum burst over the queue shaping rate. This command is supported under the SAP ingress and SAP egress QoS policy queues. The command is also supported under the ingress and egress queue-group-templates queues.
Range	1 to 14000000
Units	bytes
Options	auto
Default	auto
Introduced	24.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

limit-unused-bandwidth *boolean*

Synopsis	Control unused bandwidth
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* aggregate-rate limit-unused-bandwidth *boolean*
Tree	limit-unused-bandwidth

Tree	drop-tail
Description	Commands in this context configure queue drop tail commands.
Introduced	16.0.R1
Platforms	All

low

Synopsis	Enter the **low** context
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* drop-tail low
Tree	low
Description	Commands in this context configure the queue low drop tail commands. The low drop tail defines the queue depth beyond which the out-of-profile packets are not accepted into the queue and discarded.
Introduced	16.0.R1
Platforms	All

percent-reduction-from-mbs *(number | keyword)*

Synopsis	Percentage reduction from the MBS for a queue drop tail
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* drop-tail low percent-reduction-from-mbs *(number | keyword)*
Tree	percent-reduction-from-mbs
Description	This command overrides the low queue drop tail as a percentage reduction from the MBS of the queue. For example, if a queue has an MBS of 600 kbytes and this percentage is configured to be 30% for the low drop tail, the low drop tail is set to 420 kbytes and the out-of-profile packets are not accepted into the queue if its depth is greater than this value, and is therefore discarded.
Range	0 to 100
Options	auto
Introduced	16.0.R1
Platforms	All

mbs *(number | keyword)*

Synopsis	MBS for the template queue

monitor-queue-depth

Synopsis	Enable the **monitor-queue-depth** context
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* monitor-queue-depth
Tree	monitor-queue-depth
Description	Commands in this context configure queue depth monitoring for the specified queue.
Introduced	20.10.R1
Platforms	All

fast-polling *boolean*

Synopsis	Enable fast polling of the queue depth
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* monitor-queue-depth fast-polling *boolean*
Tree	fast-polling
Description	When configured to **true**, this command enables fast polling of the queue depth. Faster polling allows a more accurate view of the actual depth. When configured to **false**, fast queue polling is not enabled.
Default	false
Introduced	20.10.R1
Platforms	All

violation-threshold *decimal-number*

Synopsis	Threshold for queue depth before violation is raised

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* monitor-queue-depth violation-threshold *decimal-number*
Tree	violation-threshold
Description	This command specifies threshold for the queue MBS. When the queue depth exceeds the threshold value, a violation is registered.
Range	0.01 to 99.99
Introduced	20.10.R1
Platforms	All

parent

Synopsis	Enter the **parent** context
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* parent
Tree	parent
Description	Commands in this context define the weight of the queue treatment by the parent scheduler that further governs the available bandwidth given to the queue, aside from the queue PIR setting. When multiple schedulers or queues share a child status with the parent scheduler, the weight or level commands define how the queue contends with the other children for the parent bandwidth.
Introduced	16.0.R1
Platforms	All

cir-weight *number*

Synopsis	CIR that overrides the parent for the queue group
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* parent cir-weight *number*

cir *(number | keyword)*

Synopsis	CIR for the queue
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* rate cir *(number | keyword)*
Tree	cir
Description	This command specifies the administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. Fractional values are not allowed and must be given as a positive integer. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop. The CIR can be used by the queue's parent **cir-level** and **cir-weight** commands to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.
Range	0 to 2000000000
Units	kilobps
Options	max

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

pir *(number | keyword)*

Synopsis	PIR for the queue
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* queue-overrides queue *reference* rate pir *(number | keyword)*
Tree	pir
Description	This command specifies the administrative PIR used by the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be given as a positive integer. The actual PIR rate is dependent on the queue's **adaptation-rule** commands and the actual hardware where the queue is provisioned. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.
Range	1 to 2000000000
Units	kilobps
Options	max
Introduced	16.0.R1
Platforms	All

scheduler-policy

Synopsis	Enter the **scheduler-policy** context
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* scheduler-policy

scheduler [scheduler-name] *named-item*

Synopsis	Enter the **scheduler** list instance
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	Commands in this context are used to override specific attributes of the specified scheduler name. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created has queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers. The scheduler name must exist in the applied scheduler policy.
Introduced	16.0.R1
Platforms	All

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name. Valid names consist of any string composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

parent

Synopsis	Enter the **parent** context
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* scheduler-policy overrides scheduler *named-item* parent
Tree	parent
Description	Commands in this context are used to override the scheduler's parent weight and CIR weight. The weights apply to the associated level or CIR level configured in the applied scheduler policy. The override weights are ignored if the scheduler does not have a parent command configured in the scheduler policy. This allows the parent of the scheduler to be removed from the scheduler policy without having to remove all of the queue group overrides. If the parent scheduler does not exist, causing the configured scheduler to be fostered on an egress port scheduler, then the override weights are ignored.
Introduced	16.0.R1
Platforms	All

cir-weight *number*

Synopsis	CIR that overrides the parent
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* scheduler-policy overrides scheduler *named-item* parent cir-weight *number*

rate

Synopsis	Enter the **rate** context
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* scheduler-policy overrides scheduler *named-item* rate
Tree	rate
Description	Commands in this context override specific attributes of the specified scheduler rate. The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs. The bandwidth available to the parent scheduler could be allocated to other child schedulers or the child queues on the parent scheduler may be based on a higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to an insufficient offered load or limits to their own maximum rates.
Introduced	16.0.R1
Platforms	All

cir *(number | keyword)*

Synopsis	CIR for the scheduler
Context	**configure** port *port* ethernet access egress queue-group *reference* instance-id *number* scheduler-policy overrides scheduler *named-item* rate cir *(number | keyword)*
Tree	cir
Description	This command specifies the CIR. When a parent is associated with the scheduler, this command provides the amount of bandwidth to be considered during the parent scheduler's within-cir distribution phase. When the **rate** command is executed, a valid PIR setting must be explicitly defined before specifying the CIR. If the CIR is set to **max**, the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.
Range	0 to 6400000000

Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

monitor-port-scheduler *boolean*

Synopsis	Enable congestion monitoring on egress port scheduler
Context	**configure** port *port* ethernet access egress virtual-port *named-item* monitor-port-scheduler *boolean*
Tree	monitor-port-scheduler
Description	The command enables congestion monitoring on an EPS that is applied to a Vport. Congestion monitoring must be further configured under the port-scheduler CLI hierarchy. Once the congestion monitoring is in effect, the offered rate (incoming traffic) is compared to the configured port-scheduler congestion threshold. The results of these measurements are stored as the number of samples representing the number of times the offered rates exceeded the configured congestion threshold since the last clearing of the stats. Therefore, the results represent the number of times that the port-scheduler that is applied to a Vport was congested since the last reset of the stats using a **clear** command.
Default	false
Introduced	16.0.R4
Platforms	All

queue-group [queue-group-name] *reference*

Synopsis	Enter the **queue-group** list instance
Context	**configure** port *port* ethernet access ingress queue-group *reference*
Tree	queue-group
Description	Commands in this context create an ingress queue group on the Ethernet port. Queue groups created on access ports are used as an alternative queue destination for SAPs. Queue groups can be created on both access and network oriented ports. When the port is in access mode, the queue groups must be created within the port access node. Access ingress queue groups can only be used by ingress SAP forwarding classes and only a single ingress queue group per port is supported. When the queue group is created in an ingress port context, the queue group name must be an existing ingress queue group template. Two ingress queue groups with the same name cannot be created on the same port. When creating a queue group, the system will attempt to allocate queue resources based on the queues defined in the queue group template. If the appropriate queue resources do not currently exist, the queue group will not be created. Ingress port queue groups do not support shared-queuing or multipoint shared queuing behavior. A port queue group cannot be removed from the port when a forwarding class is currently redirected to the group. All forwarding class redirections must first be removed prior to removing the queue group.
Introduced	16.0.R1
Platforms	All

queue [queue-id] *reference*

Synopsis	Enter the **queue** list instance
Context	**configure** port *port* ethernet access ingress queue-group *reference* queue-overrides queue *reference*
Tree	queue
Description	Commands in this context associate a queue for use in a queue group template. The template queue is created on each queue group object that is created with the queue group template name. Each queue is identified within the template by a queue ID number. The template ensures that all queue groups created with the template's name have the same queue IDs, providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The queue commands can be individually changed for each queue in each queue group using per queue overrides.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

cir *(number | keyword)*

Synopsis	CIR for the queue
Context	**configure** port *port* ethernet access ingress queue-group *reference* queue-overrides queue *reference* rate cir *(number | keyword)*
Tree	cir
Description	This command specifies the administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. Fractional values are not allowed and must be given as a positive integer. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop. The CIR can be used by the queue's parent **cir-level** and **cir-weight** commands to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.
Range	0 to 2000000000
Units	kilobps

Platforms	All

pir *(number | keyword)*

Synopsis	PIR for the queue
Context	**configure** port *port* ethernet access ingress queue-group *reference* queue-overrides queue *reference* rate pir *(number | keyword)*
Tree	pir
Description	This command specifies the administrative PIR used by the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be given as a positive integer. The actual PIR rate is dependent on the queue's **adaptation-rule** commands and the actual hardware where the queue is provisioned. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.
Range	1 to 2000000000
Units	kilobps
Options	max
Introduced	16.0.R1
Platforms	All

scheduler-policy

Synopsis	Enter the **scheduler-policy** context

overrides

Synopsis	Enter the **overrides** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet access ingress queue-group *reference* scheduler-policy overrides
Tree	overrides
Description	Commands in this context specify the set of attributes specifying values specific to the given queue-group instance.
Introduced	16.0.R1
Platforms	All

scheduler [scheduler-name] *named-item*

Synopsis	Enter the **scheduler** list instance
Context	**configure** port *port* ethernet access ingress queue-group *reference* scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	Commands in this context are used to override specific attributes of the specified scheduler name. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created has queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers. The scheduler name must exist in the applied scheduler policy.
Introduced	16.0.R1
Platforms	All

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** port *port* ethernet access ingress queue-group *reference* scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name. Valid names consist of any string composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1

Platforms	All

parent

Synopsis	Enter the **parent** context
Context	**configure** port *port* ethernet access ingress queue-group *reference* scheduler-policy overrides scheduler *named-item* parent
Tree	parent
Description	Commands in this context are used to override the scheduler's parent weight and CIR weight. The weights apply to the associated level or CIR level configured in the applied scheduler policy. The override weights are ignored if the scheduler does not have a parent command configured in the scheduler policy. This allows the parent of the scheduler to be removed from the scheduler policy without having to remove all of the queue group overrides. If the parent scheduler does not exist, causing the configured scheduler to be fostered on an egress port scheduler, then the override weights are ignored.
Introduced	16.0.R1
Platforms	All

rate

Synopsis	Enter the **rate** context
Context	**configure** port *port* ethernet access ingress queue-group *reference* scheduler-policy overrides scheduler *named-item* rate
Tree	rate
Description	Commands in this context override specific attributes of the specified scheduler rate. The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs. The bandwidth available to the parent scheduler could be allocated to other child schedulers or the child queues on the parent scheduler may be based on a higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to an insufficient offered load or limits to their own maximum rates.
Introduced	16.0.R1
Platforms	All

cir *(number | keyword)*

Synopsis	CIR for the scheduler
Context	**configure** port *port* ethernet access ingress queue-group *reference* scheduler-policy overrides scheduler *named-item* rate cir *(number | keyword)*
Tree	cir
Description	This command specifies the CIR. When a parent is associated with the scheduler, this command provides the amount of bandwidth to be considered during the parent scheduler's within-cir distribution phase. When the **rate** command is executed, a valid PIR setting must be explicitly defined before specifying the CIR. If the CIR is set to **max**, the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.
Range	0 to 6400000000
Units	kilobps
Options	sum, max
Introduced	16.0.R1

autonegotiate *keyword*

Synopsis	Speed and duplex autonegotiation on the Ethernet port
Context	**configure** port *port* ethernet autonegotiate *keyword*
Tree	autonegotiate

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command enables speed and duplex autonegotiation on Fast Ethernet ports and enables far-end fault indicator support on Gb ports. When autonegotiation is enabled on a port, the link attempts to automatically negotiate the link **speed** and **duplex** commands. If autonegotiation is enabled, the configured **duplex** and **speed** commands are ignored. When autonegotiation is disabled on a port, the port does not attempt to autonegotiate and will only operate at the **speed** and **duplex** command settings configured for the port. Note that disabling autonegotiation on Gb ports is not allowed as the IEEE 802.3 specification for Gb Ethernet requires autonegotiation be enabled for far end fault indication. It is required for autonegotiation to be limited for ports in a LAG to guarantee a specific port speed.
Options	true, false, limited

Range	1 to 9
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

signal-failure

Synopsis	Enter the **signal-failure** context
Context	**configure** port *port* ethernet crc-monitor signal-failure
Tree	signal-failure
Description	Commands in this context specify the error rate at which to declare the Signal Fail (SF) condition on an Ethernet interface. The value represents M*10E-N errored frames over total frames received over W seconds of the sliding window. The CRC errors on the interface are sampled once per second.

Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

multiplier *number*

Synopsis	SF multiplier
Context	**configure** port *port* ethernet crc-monitor signal-failure multiplier *number*
Tree	multiplier
Range	1 to 9
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

threshold *number*

Synopsis	SF threshold
Context	**configure** port *port* ethernet crc-monitor signal-failure threshold *number*
Tree	threshold
Range	1 to 9
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-size *number*

Synopsis	Sliding window size over which errors are measured
Context	**configure** port *port* ethernet crc-monitor window-size *number*
Tree	window-size
Description	This command specifies the sliding window size over which the Ethernet frames are sampled to detect SF or SD conditions. The command is used jointly with the **signal-failure** and the **signal-degrade** commands to configure the sliding window size.
Range	5 to 60
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

dampening

Synopsis	Enter the **dampening** context
Context	**configure** port *port* ethernet dampening
Tree	dampening
Description	Commands in this context configure Exponential Port Dampening (EPD) for the Ethernet port.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of exponential port dampening
Context	**configure** port *port* ethernet dampening admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

half-life *number*

Synopsis	Half-life decay time
Context	**configure** port *port* ethernet dampening half-life *number*
Tree	half-life
Description	This command specifies the time that must pass before penalties decay to one-half the initial amount. The half-life and maximum suppression time values must be set at the same time and the ratio of the maximum suppression time and half-life must be less than or equal to 49 and greater than or equal to one.
Range	1 to 2000
Units	seconds
Default	5
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-suppress-time *number*

Synopsis	Maximum suppression time
Context	**configure** port *port* ethernet dampening max-suppress-time *number*
Tree	max-suppress-time
Description	This command specifies the maximum suppression time, which is the time it can take after the physical link comes up before the worst case accumulated penalties have decayed to the reuse threshold. The maximum penalty is derived from the maximum suppression time, half life, and reuse threshold, using the following equation: maximum penalty = (reuse threshold) 2 expo:(maximum suppression time/half life) The half life and maximum suppression time values must be set at the same time and the ratio of the maximum suppression time and half life must be less than or equal to 49 and greater than or equal to one.
Range	1 to 43200
Units	seconds
Default	20
Introduced	16.0.R1
Platforms	All

reuse-threshold *number*

Synopsis	Threshold which port-up state is no longer suppressed
Context	**configure** port *port* ethernet dampening reuse-threshold *number*
Tree	reuse-threshold
Description	This command specifies the threshold at which the port-up state is no longer suppressed, after the port has been in a suppressed state and the accumulated penalties decay drops below this threshold. The reuse threshold value must be less than the suppress threshold value.
Range	1 to 20000
Units	penalties
Default	1000
Introduced	16.0.R1
Platforms	All

suppress-threshold *number*

Synopsis	Threshold at which the port-up state is suppressed

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet dampening suppress-threshold *number*
Tree	suppress-threshold
Description	This command specifies the threshold at which the port-up state is suppressed until the accumulated penalties drop below the reuse threshold. The reuse threshold value must be less than the suppress threshold value.
Range	1 to 20000
Units	penalties
Default	2000
Introduced	16.0.R1
Platforms	All

discard-rx-pause-frames *boolean*

Synopsis	Discard received pause frames
Context	**configure** port *port* ethernet discard-rx-pause-frames *boolean*
Tree	discard-rx-pause-frames
Description	When configured to **true**, the router discards the received pause frames, which are used for local link flow control. When configured to **false**, pause frames are processed upon receipt, and the transmit side of the receiving port pauses its transmissions.
Default	false
Introduced	20.10.R1
Platforms	All

dot1q-etype *etype*

Synopsis	Ethertype expected if port encapsulation type is dot1q
Context	**configure** port *port* ethernet dot1q-etype *etype*
Tree	dot1q-etype
Description	This command specifies the Ethertype expected when the port encapsulation type is dot1q. Dot1q encapsulation is supported only on Ethernet interfaces.
Default	33024
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

dot1x

Synopsis	Enter the **dot1x** context
Context	**configure** port *port* ethernet dot1x
Tree	dot1x
Description	Commands in this context configure port-specific 802.1x authentication attributes. 802.1x authentication is supported only when configuring Fast Ethernet, Gigabit, or 10-Gb Ethernet LAN ports on an appropriate MDA.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of dot1x packet extraction to CPM
Context	**configure** port *port* ethernet dot1x admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	21.10.R1
Platforms	All

macsec

Synopsis	Enter the **macsec** context
Context	**configure** port *port* ethernet dot1x macsec
Tree	macsec
Description	Commands in this context configure Media Access Control Security (MACsec) under the port.
Introduced	16.0.R1
Platforms	All

exclude-mac-policy *reference*

Synopsis	MAC policy excluded from MACsec encryption
Context	**configure** port *port* ethernet dot1x macsec exclude-mac-policy *reference*
Tree	exclude-mac-policy

Use subject to Terms available at: www.nokia.com/terms.

Reference	**configure** macsec mac-policy *number*
Introduced	16.0.R5
Platforms	All

exclude-protocol

Synopsis	Enter the **exclude-protocol** context
Context	**configure** port *port* ethernet dot1x macsec exclude-protocol
Tree	exclude-protocol
Introduced	16.0.R1
Platforms	All

cdp *boolean*

Synopsis	Disable MACsec for all packets on the link for CDP
Context	**configure** port *port* ethernet dot1x macsec exclude-protocol cdp *boolean*
Tree	cdp
Default	false
Introduced	16.0.R1
Platforms	All

eapol-start *boolean*

Synopsis	Disable MACsec for all packets on the link for EAPOL
Context	**configure** port *port* ethernet dot1x macsec exclude-protocol eapol-start *boolean*
Tree	eapol-start
Default	false
Introduced	16.0.R1
Platforms	All

efm-oam *boolean*

Synopsis	Disable MACsec for all packets on the link for EFM-OAM
Context	**configure** port *port* ethernet dot1x macsec exclude-protocol efm-oam *boolean*
Tree	efm-oam

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	All

eth-cfm *boolean*

Synopsis	Disable MACsec for all packets on the link for ETH-CFM
Context	**configure** port *port* ethernet dot1x macsec exclude-protocol eth-cfm *boolean*
Tree	eth-cfm
Default	false
Introduced	16.0.R1
Platforms	All

lacp *boolean*

Synopsis	Disable MACsec for all packets on the link for LACP
Context	**configure** port *port* ethernet dot1x macsec exclude-protocol lacp *boolean*
Tree	lacp
Default	false
Introduced	16.0.R1
Platforms	All

lldp *boolean*

Synopsis	Disable MACsec for all packets on the link for LLDP
Context	**configure** port *port* ethernet dot1x macsec exclude-protocol lldp *boolean*
Tree	lldp
Default	false
Introduced	16.0.R1
Platforms	All

ptp *boolean*

Synopsis	Disable MACsec for all packets on the link for PTP
Context	**configure** port *port* ethernet dot1x macsec exclude-protocol ptp *boolean*

Default	2
Introduced	16.0.R1
Platforms	All

per-host-authentication

Synopsis	Enter the **per-host-authentication** context
Context	**configure** port *port* ethernet dot1x per-host-authentication
Tree	per-host-authentication
Description	Commands in this context configure per-host authentication on the port or VLAN scope. When dot1x authentication is configured, the router authenticates each host based on the source MAC or VLAN. When a host is authenticated via RADIUS policy, its source MAC is allowed through the port, while the port is closed for any other MAC. Any traffic from the allowed host is forwarded on the port, including untagged, and tagged packets.
Introduced	20.7.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of per-host authentication
Context	**configure** port *port* ethernet dot1x per-host-authentication admin-state *keyword*
Tree	admin-state
Options	enable, disable

tx-laser *keyword*

Synopsis	Remote laser state on internal MAC transmit error
Context	**configure** port *port* ethernet down-on-internal-error tx-laser *keyword*
Tree	tx-laser
Options	off, on
Default	on
Introduced	16.0.R1
Platforms	All

down-when-looped

Synopsis	Enter the **down-when-looped** context
Context	**configure** port *port* ethernet down-when-looped
Tree	down-when-looped
Description	Commands in this context configure Ethernet loop detection.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

admin-state *keyword*

Synopsis	Administrative state of Ethernet loop detection
Context	**configure** port *port* ethernet down-when-looped admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

keep-alive *number*

Synopsis	Time interval between keepalive PDUs
Context	**configure** port *port* ethernet down-when-looped keep-alive *number*
Tree	keep-alive
Description	This command configures the time interval between the keepalive PDUs transmitted toward the network during Ethernet loop detection.
Range	1 to 120
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	All

retry-timeout *number*

Synopsis	Wait time before re-enabling port after loop detection
Context	**configure** port *port* ethernet down-when-looped retry-timeout *number*
Tree	retry-timeout
Description	This command configures the minimum wait time before re-enabling the Ethernet port after it is brought down because of a loop detection.
Range	0 | 10 to 160
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

tunneling *boolean*

Synopsis	Enable down-when-looped tunneling
Context	**configure** port *port* ethernet down-when-looped tunneling *boolean*
Tree	tunneling
Default	true
Introduced	25.3.R1
Platforms	All

use-broadcast-address *boolean*

Synopsis	Use broadcast MAC address for destination MAC address
Context	**configure** port *port* ethernet down-when-looped use-broadcast-address *boolean*
Tree	use-broadcast-address
Description	When configured to **true**, the router declares a loop when the destination MAC address matches the broadcast MAC address. When configured to **false**, the router declares a loop when the destination MAC address matches the MAC address of the Ethernet port.
Default	false
Introduced	16.0.R1
Platforms	All

duplex *keyword*

Synopsis	Duplex type for the fast Ethernet port
Context	**configure** port *port* ethernet duplex *keyword*
Tree	duplex
Description	This command configures the duplex of a Fast Ethernet port when autonegotiation is disabled. This command setting is ignored if autonegotiation is enabled for the port.
Options	full, half
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

Introduced	16.0.R1
Platforms	All

advertise-capabilities

Synopsis	Enter the **advertise-capabilities** context
Context	**configure** port *port* ethernet efm-oam discovery advertise-capabilities
Tree	advertise-capabilities
Description	Commands in this context specify settings that enable the advertisement of specific capabilities.
Introduced	16.0.R1
Platforms	All

link-monitoring *boolean*

Synopsis	Advertise link monitoring capabilities to peer
Context	**configure** port *port* ethernet efm-oam discovery advertise-capabilities link-monitoring *boolean*
Tree	link-monitoring
Description	When configured to **true**, the link monitoring capability is advertised to the peer through the EFM-OAM protocol. When configured to **false**, the router suppresses the advertisement of capabilities to a remote peer.
Default	true
Introduced	16.0.R1
Platforms	All

dying-gasp-tx-on-reset *boolean*

Synopsis	Enable generation of the Information OAMPDU off-cycle
Context	**configure** port *port* ethernet efm-oam dying-gasp-tx-on-reset *boolean*
Tree	dying-gasp-tx-on-reset
Description	When configured to **true**, this command enables the generation of the Information OAMPDU off-cycle when the soft reset notification is received by the EFM application. The local port state remains under the control of the soft reset application and does not change based on the EFM function. If the port is operationally up, then the local node will continue to consider the port as available for service data and forwarding. If the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

upstream node requires a notification to route around the local node undergoing the soft reset, then a notification must be sent to those nodes. This is a disruptive function.

When both the **grace-tx** and **dying-gasp-tx-on-reset** commands are active on the same port, the **grace-tx** command takes precedence when a soft reset is invoked if the peer vendor OUI being received is 00:16:4D or the configured **grace-vendor-oui** value.

When configured to **false**, the generation of the Information OAMPDU off-cycle is disabled.

Default true

Introduced 16.0.R1

Platforms All

grace-tx *boolean*

Synopsis Enable the sending of Grace TLV for EFM-OAM

Context **configure** port *port* ethernet efm-oam grace-tx *boolean*

Tree grace-tx

Description When configured to **true**, the system sends the Nokia Vendor specific Grace TLV in the information PDU after an ISSU or a soft reset. The Grace TLV informs a remote peer to ignore the negotiated interval and multiplier and instead use the new timeout interval.

By default, the command is disabled at the system level and enabled at the port level. Both the system and port level must be enabled to support grace on a specific port. When configured to **true**, the EFM-OAM protocol does not enter a non-operational state when both nodes acknowledge the grace function. This feature minimizes service interruption by giving the restarting router time to become operationally and administratively up within the grace period.

The peer receiving the Grace TLV must be able to parse and process the vendor-specific messaging. Do not configure grace if the Nokia Vendor Specific Grace TLV is not supported on the remote peer.

When configured to **false**, the Nokia Vendor Specific Grace TLV is not sent.

Introduced 16.0.R1

Platforms	All

hold-time *number*

Synopsis	Wait time before protocol returns to operational state
Context	**configure** port *port* ethernet efm-oam hold-time *number*
Tree	hold-time
Description	This command specifies the time the EFM-OAM protocol waits before going back to the operational state after leaving the operational state. The hold time does not apply if the EFM-OAM protocol moved from the operational state to link fault. A hold-time value of zero indicates that there is no delay in transitioning to the operational state. A non-zero value causes the EFM-OAM protocol to attempt to negotiate with a peer if possible, but it remains in the send-local-remote-ok state until the hold time has expired if negotiation is successful. If the EFM-OAM protocol is administratively disabled while it is in the operational state and then re-enabled when a non-zero hold time is configured, EFM-OAM attempts transition to the operational state immediately.
Range	1 to 50
Units	seconds
Introduced	16.0.R1
Platforms	All

ignore-efm-state *boolean*

Synopsis	Suppress port state changes for EFM-OAM faults
Context	**configure** port *port* ethernet efm-oam ignore-efm-state *boolean*
Tree	ignore-efm-state
Description	When configured to **true**, the ETH-OAM protocol does not impact the state of the port when there is a failure in the protocol state machine (discovery, configuration, timeout, loops, and so on). There is only a protocol warning message on the port. When configured to **false**, the port state is affected by any existing EFM-OAM protocol fault condition.

trigger-fault *keyword*

Synopsis	Flag setting in the information OAMPDU
Context	**configure** port *port* ethernet efm-oam trigger-fault *keyword*
Tree	trigger-fault
Description	This command configures the appropriate flag field in the information OAMPDU, bursting three consecutive packets during the off cycle. If the local port state is operational, this command changes the local port state to "Link Up". If the local port state is not operational, this configuration is installed as an EFM reason to prevent the port from returning to an up operational state. This command can be used as a precursor to administratively disabling a port. This terminates the peering relationship without having to wait for protocol timeouts, assuming the peer supports the necessary action when receiving the dying gasp or critical event flag setting.
Options	dying-gasp, critical-event
Introduced	16.0.R1
Platforms	All

tunneling *boolean*

Synopsis	Enable EFM-OAM PDU tunneling
Context	**configure** port *port* ethernet efm-oam tunneling *boolean*
Tree	tunneling
Description	When configured to **true**, the router enables EFM-OAM PDU tunneling. Enabling tunneling allows a port mode Epipe SAP to pass OAM frames through the pipe to the far end. When configured to **false**, tunneling is disabled.
Default	false
Introduced	16.0.R1

Synopsis	Administrative state of the MEP
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ais

Synopsis	Enable the **ais** context
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais
Tree	ais
Description	Commands in this context enable the reception of AIS messages.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

client-meg-level *number*

Synopsis	Client MEG level for AIS message generation

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais client-meg-level *number*
Tree	client-meg-level
Description	This command configures the client Maintenance Entity Group (MEG) level to use for AIS message generation. One restriction is that the client MEG level must be higher than the local MEG level. Only the lowest client MEG level is used for facility MEPs.
Range	1 to 7
Max. instances	7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interface-support *boolean*

Synopsis	Enable generation of AIS PDUs based on endpoint state
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interface-support *boolean*
Tree	interface-support
Description	When configured to **true**, the system enables the generation of AIS PDUs based on the associated endpoint state. AIS on Down MEPs triggers and clears based on the operational status of the entity it is configured on. If CCM is configured to **true**, transmission of the AIS PDU is based on either the nonoperational state of the entity or on any CCM defect conditions. AIS generation ceases if both the operational state is up and CCM has no defect conditions. If the MEP is not enabled with CCM, the operational state of the entity is the only consideration, assuming the command is present for the MEP. When configured to **false**, the generation of AIS PDUs is disabled.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval *number*

Synopsis	Transmission interval for AIS messages
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais interval *number*
Tree	interval
Range	1 | 60

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	seconds
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def – Generate AIS frame for any defect in CCM state machine mac-rem-err-xcon – Generate AIS frame for def-mac-status defect or higher
Default	all-def
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

priority *number*

Synopsis	Priority of the AIS messages generated by the node
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ais priority *number*
Tree	priority
Range	0 to 7
Default	7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

alarm-notification

Synopsis	Enter the **alarm-notification** context
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification
Tree	alarm-notification
Description	Commands in this context configure the Fault Notification Generator (FNG) time values to raise an alarm or reset the CCM defect alarm.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Use these timers for network management processes. The timers are not tied into delaying the notification to the fault management system on the network element and do not affect fault propagation mechanisms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fng-alarm-time *number*

Synopsis	Time that must expire before an FNG alarm is raised
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-alarm-time *number*
Tree	fng-alarm-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fng-reset-time *number*

Synopsis	Time that must expire before an FNG alarm is reset
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* alarm-notification fng-reset-time *number*
Tree	fng-reset-time
Range	250 | 500 | 1000
Units	centiseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm *boolean*

Synopsis	Generate CCM messages
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm *boolean*
Tree	ccm
Default	false
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-ltm-priority *number*

Synopsis	Priority of CCM and LTM messages transmitted by the MEP
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-ltm-priority *number*
Tree	ccm-ltm-priority
Range	0 to 7
Default	7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-padding-size *number*

Synopsis	Number of octets of padding to insert in CCM packets
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-padding-size *number*
Tree	ccm-padding-size
Description	This command sets the byte size of the optional Data TLV to be included in the ETH-CC PDU. This command increases the size of the ETH-CC PDU by the configured value. The base size of the ETH-CC PDU, including the Interface Status TLV and Port Status TLV, is 83 bytes not including the Layer 2 encapsulation. CCM padding is not supported when the CCM interval (configured through **configure eth-cfm domain association ccm-interval)** is less than 1 second.
Range	3 to 1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ccm-tlv-ignore *keyword*

Synopsis	TLV to ignore on reception
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-tlv-ignore *keyword*
Tree	ccm-tlv-ignore

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the receiving MEP to ignore the specified TLVs in the CCM PDU. The ignored TLVs are reported as absent and have no impact on the MEP state machine. When unconfigured, the MEP processes all the recognized TLVs.
Options	interface-status, port-status
Max. instances	2
Introduced	16.0.R6
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-stats *boolean*

Synopsis	Collect statistics for loss measurement message tests
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-stats *boolean*
Tree	collect-lmm-stats
Description	When configured to **true**, the router instantiates the statistical counter to transmit and receive packets for the LAG facility MEP bindings. The **show eth-cfm collect-lmm-stats** command displays entities that have been enabled to collect transit and receive counters. When configured to **false**, the router does not instantiate the counter and the LMM PDU associated with the MEP does not populate the counters in the packet.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

csf

Synopsis	Enable the **csf** context
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf
Tree	csf
Introduced	16.0.R1

Synopsis	Multiplication factor used to clear the CSF condition
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* csf multiplier *decimal-number*
Tree	multiplier
Range	0.0 | 2.0 to 30.0
Default	3.5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

description *description*

Synopsis	Text description
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-bn

Synopsis	Enter the **eth-bn** context
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-bn
Tree	eth-bn
Description	Commands in this context configure Ethernet Bandwidth Notification (ETH-BN) message handling.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

receive *boolean*

Synopsis	Enable the reception and processing of ETH-BN messages

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-bn receive *boolean*
Tree	receive
Description	When configured to **true**, this command enables the reception and processing of ETH-BN messages and the retrieval and processing of the current bandwidth field for inclusion in dynamic egress rate adjustments. The received rate is an Layer 2 rate, and is expected to be in Mb/s. If this rate is a link rate (including preamble, start frame delimiter, and inter-frame gap), this would require the use of network egress queue groups. When configured to **false**, message reception is disabled.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-update-pacing *number*

Synopsis	Pace of messages to and from ETH-CFM to QoS subsystems
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-bn rx-update-pacing *number*
Tree	rx-update-pacing
Description	This command sets the pace for update messages to and from the ETH-CFM subsystem to the QoS subsystem. The most recent update messages are held by the ETH-CFM subsystem, but the most recent update is held until the expiration of the pacing timer.
Range	1 to 600
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-test

Synopsis	Enable the **eth-test** context
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test
Tree	eth-test
Description	Commands in this context configure information used by the Ethernet Test (ETH-TST) packet. The commands must be configured on both the sender and the receiver nodes. The test packets are used with the **oam eth-cfm eth-test** command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

bit-error-threshold *number*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test bit-error-threshold *number*
Tree	bit-error-threshold
Range	0 to 11840
Units	bit errors
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

test-pattern

Synopsis	Enter the **test-pattern** context
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern
Tree	test-pattern
Description	Commands in this context specify the test pattern for the ETH-TST frames. The pattern does not have to be the same on the sender and the receiver.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

crc-tlv *boolean*

Synopsis	Generate a CRC checksum
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern crc-tlv *boolean*
Tree	crc-tlv
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

pattern *keyword*

Synopsis	Test pattern for Ethernet Test frames
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern pattern *keyword*
Tree	pattern
Description	This command specifies the test pattern of the Ethernet Test (ETH-TST) frames. This does not have to be configured the same on the sender and the receiver.
Options	all-zeros, all-ones
Default	all-zeros
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

facility-fault *boolean*

Synopsis	Allow the facility MEP to generate a network action
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* facility-fault *boolean*
Tree	facility-fault
Description	When configured to **true**, the system facility MEP responds to a fault with a network-actionable function instead of just reporting the defect condition. When configured to **false**, the system monitors transmissions and reports fault conditions.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

grace

Synopsis	Enter the **grace** context
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace
Tree	grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function and the ITU-T Y.1731 Ethernet Expected Default (ETH-ED) function.
Introduced	16.0.R1

© 2026 Nokia.

Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. When configured to **false**, the router disables the Nokia Grace function.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED). When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect *keyword*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*
Tree	low-priority-defect
Options	all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon
Default	mac-rem-err-xcon
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address *mac-unicast-address-no-zero*

Synopsis	MAC address of the MEP
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* mac-address *mac-unicast-address-no-zero*
Tree	mac-address
Description	This command specifies the MAC address of the MEP. When unconfigured, the MAC address of the port (if the MEP is on a SAP) or the MAC address of a bridge (if the MEP is on a spoke) is used.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

one-way-delay-threshold *number*

Synopsis	Threshold time limit for the one-way delay test
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* one-way-delay-threshold *number*
Tree	one-way-delay-threshold
Range	0 to 600
Units	seconds
Default	3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vlan *(number | keyword)*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Outer VLAN ID of the tunnel
Context	**configure** port *port* ethernet eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* vlan *(number | keyword)*
Tree	vlan
Range	1 to 4094
Options	none

mac-address *mac-address*

Synopsis	MAC address of the Ethernet port
Context	**configure** port *port* ethernet mac-address *mac-address*
Tree	mac-address
Description	This command specifies the MAC address of the Ethernet port. Allowed values are any non-broadcast, non-multicast MAC, and non-IEEE reserved MAC addresses. The default value indicates that an operation MAC address is to be assigned from the chassis MAC address pool.
Default	00:00:00:00:00:00
Introduced	16.0.R1
Platforms	All

min-frame-length *number*

Synopsis	Minimum transmitted frame length

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet min-frame-length *number*
Tree	min-frame-length
Description	This command configures the minimum transmitted frame length. The option 72 is only supported on FP4 and newer generations of XMA, MDA-e-XP, and MDA-s.
Range	64 | 68 | 72
Units	bytes
Default	64
Introduced	16.0.R1
Platforms	All

mode *keyword*

Synopsis	Operation mode for the Ethernet port
Context	**configure** port *port* ethernet mode *keyword*
Tree	mode
Options	access, network, hybrid
Introduced	16.0.R1
Platforms	All

mtu *number*

Synopsis	Maximum payload MTU size for the Ethernet port
Context	**configure** port *port* ethernet mtu *number*
Tree	mtu
Description	This command configures the maximum payload MTU size for the Ethernet port. This command indirectly defines the largest physical packet the port can transmit or the far-end Ethernet port can receive. Packets that cannot be fragmented at egress and exceed the MTU size are discarded. The MTU size includes the destination MAC address, source MAC address, the Ethertype or length field, and the complete Ethernet payload. This value does not include the preamble, start of frame delimiter, or the trailing CRC. For satellite client ports, the range is 512 to 9796 bytes.
Range	512 to 9800
Units	bytes
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

hs-turbo *boolean*

Synopsis	Enable HS turbo queues for higher throughput
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* hs-turbo *boolean*
Tree	hs-turbo
Description	When configured to **true**, this command enables HS turbo queues that allow the corresponding HSQ queue group queues to achieve a higher throughput. This command is not applicable to 10G ports and is ignored when it is configured under a queue group instance on a 10G port. When configured to **false**, HS turbo queues are disabled.
Default	false
Introduced	16.0.R1
Platforms	7750 SR-7/12/12e

policer-control-policy *reference*

Synopsis	Policer control policy for the QoS egress queue group
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* policer-control-policy *reference*
Tree	policer-control-policy
Reference	**configure** qos policer-control-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

queue-overrides

Synopsis	Enter the **queue-overrides** context
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides
Tree	queue-overrides
Description	Commands in this context define queue command overrides for each queue within the queue group.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

queue [queue-id] *reference*

Synopsis	Enter the **queue** list instance
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference*
Tree	queue
Introduced	16.0.R1
Platforms	All

[**queue-id**] *reference*

Synopsis	Queue ID
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference*
Tree	queue
Reference	**configure** qos queue-group-templates egress queue-group *named-item* queue *number*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

adaptation-rule

Synopsis	Enter the **adaptation-rule** context
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* adaptation-rule
Tree	adaptation-rule
Description	Commands in this context specify the method used by the system to derive the operational CIR and PIR settings when the queue is provisioned in hardware. For the CIR and PIR commands individually, the system attempts to find the best operational rate depending on the defined constraint. Commands in this context are ignored for egress HSQ queue group queues that are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the adaptation rule is performed under the **hs-wrr-group** command within the egress queue group template.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

cir *keyword*

Synopsis	Constraint used when deriving the operational CIR value
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* adaptation-rule cir *keyword*
Tree	cir
Options	max, min, closest
Introduced	16.0.R1

drop-tail

Synopsis	Enter the **drop-tail** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* drop-tail
Tree	drop-tail
Description	Commands in this context configure queue drop tail commands.
Introduced	16.0.R1
Platforms	All

low

Synopsis	Enter the **low** context
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* drop-tail low
Tree	low
Description	Commands in this context configure the queue low drop tail commands. The low drop tail defines the queue depth beyond which the out-of-profile packets are not accepted into the queue and discarded.
Introduced	16.0.R1
Platforms	All

percent-reduction-from-mbs *(number | keyword)*

Synopsis	Percentage reduction from the MBS for a queue drop tail
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* drop-tail low percent-reduction-from-mbs *(number | keyword)*
Tree	percent-reduction-from-mbs
Description	This command overrides the low queue drop tail as a percentage reduction from the MBS of the queue. For example, if a queue has an MBS of 600 kbytes and this percentage is configured to be 30% for the low drop tail, the low drop tail is set to 420 kbytes and the out-of-profile packets are not accepted into the queue if its depth is greater than this value, and is therefore discarded.
Range	0 to 100
Options	auto
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

mbs *(number | keyword)*

Synopsis	MBS for the template queue
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* mbs *(number | keyword)*
Tree	mbs
Range	0 to 2147482624
Units	bytes
Options	auto
Introduced	16.0.R1
Platforms	All

monitor-queue-depth

Synopsis	Enable the **monitor-queue-depth** context
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* monitor-queue-depth
Tree	monitor-queue-depth
Description	Commands in this context configure queue depth monitoring for the specified queue.
Introduced	20.10.R1
Platforms	All

fast-polling *boolean*

Synopsis	Enable fast polling of the queue depth
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* monitor-queue-depth fast-polling *boolean*
Tree	fast-polling
Description	When configured to **true**, this command enables fast polling of the queue depth. Faster polling allows a more accurate view of the actual depth. When configured to **false**, fast queue polling is not enabled.
Default	false
Introduced	20.10.R1
Platforms	All

violation-threshold *decimal-number*

Synopsis	Threshold for queue depth before violation is raised
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* monitor-queue-depth violation-threshold *decimal-number*
Tree	violation-threshold
Description	This command specifies threshold for the queue MBS. When the queue depth exceeds the threshold value, a violation is registered.
Range	0.01 to 99.99
Introduced	20.10.R1
Platforms	All

percent-rate

Synopsis	Enter the **percent-rate** context
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* percent-rate
Tree	percent-rate
Description	Commands in this context specify percent rates. This command is ignored for egress HSQ queue group queues, which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the percent rate is performed under the **hs-wrr-group** command within the egress queue group template.
Notes	The following elements are part of a choice: **percent-rate** or **rate**.
Introduced	16.0.R1
Platforms	All

Range	0.01 to 100.00
Units	percent
Introduced	16.0.R1
Platforms	All

rate

Synopsis	Enter the **rate** context
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* rate
Tree	rate
Description	Commands in this context specify the administrative PIR and CIR for the queue. Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth. This command can be executed at anytime, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the queue ID. This command is ignored for egress HSQ queue group queues, which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** command within the egress queue group template.
Notes	The following elements are part of a choice: **percent-rate** or **rate**.
Introduced	16.0.R1
Platforms	All

cir *(number | keyword)*

Synopsis	CIR for the queue

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* rate cir *(number | keyword)*
Tree	cir
Description	This command specifies the administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. Fractional values are not allowed and must be given as a positive integer. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop. The CIR can be used by the queue's parent **cir-level** and **cir-weight** commands to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.
Range	0 to 2000000000
Units	kilobps
Options	max
Introduced	16.0.R1
Platforms	All

pir *(number | keyword)*

Synopsis	PIR for the queue
Context	**configure** port *port* ethernet network egress queue-group *reference* instance-id *number* queue-overrides queue *reference* rate pir *(number | keyword)*
Tree	pir
Description	This command specifies the administrative PIR used by the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be given as a positive integer. The actual PIR rate is dependent on the queue's **adaptation-rule** commands and the actual hardware where the queue is provisioned. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.
Range	1 to 2000000000
Units	kilobps
Options	max
Introduced	16.0.R1
Platforms	All

signal-fail *boolean*

Synopsis	Report Ethernet signal lost alarm
Context	**configure** port *port* ethernet report-alarm signal-fail *boolean*
Tree	signal-fail
Introduced	16.0.R1
Platforms	All

rs-fec-mode *keyword*

Synopsis	RS-FEC mode on the Ethernet port
Context	**configure** port *port* ethernet rs-fec-mode *keyword*
Tree	rs-fec-mode
Description	This command specifies the RS-FEC (Reed-Solomon Forward Error Correction) mode on the Ethernet port. See "Forward Error Correction" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide* for more information about FEC settings.
Options	cl91-514-528, cl74, cl108
Introduced	16.0.R1
Platforms	All

single-fiber *boolean*

Synopsis	Enable packet gathering from a single fiber port
Context	**configure** port *port* ethernet single-fiber *boolean*
Tree	single-fiber
Description	When configured to **true**, this command enables packet gathering and redirection of IP packets from a single fiber (Rx) port of the Ethernet or SONET/SDH interface and redistributes packets to other interfaces through static routes or policy-based forwarding. Traffic is no longer transmitted out of the port. When configured to **false**, packet gathering is disabled.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

speed *number*

Synopsis	Ethernet port speed
Context	**configure** port *port* ethernet speed *number*
Tree	speed
Description	This command configures the port speed for ports that support multiple speeds. This applies to the following: • Fast Ethernet when autonegotiation is not enabled • 10/100/1000 Mb/s Ethernet when autonegotiation is not enabled • 10/1G ports supporting 10G SFP+ or 1G SFP • 40/100G ports supporting QSFP28s on non connector-based MDAs If autonegotiation is enabled for the port, this command setting is ignored. Speed cannot be configured for ports that are part of a LAG.
Range	10 | 100 | 1000 | 10000 | 25000 | 40000 | 50000 | 100000
Units	megabps
Introduced	16.0.R1
Platforms	All

ssm

Synopsis	Enter the **ssm** context
Context	**configure** port *port* ethernet ssm
Tree	ssm
Description	Commands in this context configure the Ethernet Synchronization Messaging Channel (ESMC) for the Ethernet port. The ESMC carries the Synchronization Status Message (SSM) code representing the quality level of the source of the frequency of the central clock of the node.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the ESMC for the Ethernet port

Default	disable
Introduced	16.0.R1
Platforms	All

code-type *keyword*

Synopsis	Encoding type of SSMs
Context	**configure** port *port* ethernet ssm code-type *keyword*
Tree	code-type
Description	This command configures the use of the SDH/SONET set of values to encode SSMs. Configuring the network type is only applicable to SyncE ports. It is not configurable on SONET/SDH ports.
Options	sonet – G.781 Option I compliant network sdh – G.781 Option II compliant network
Default	sdh
Introduced	16.0.R1
Platforms	All

esmc-tunnel *boolean*

Synopsis	Tunnel ESMC frames in Epipe or VPLS services
Context	**configure** port *port* ethernet ssm esmc-tunnel *boolean*
Tree	esmc-tunnel
Description	When configured to **true**, ESMC frames that are received into the Ethernet port can be tunneled in an Epipe or VPLS service. When configured to **false**, ESMC frames are extracted upon reception by the port and are not tunneled through the service.
Default	false
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-dus *boolean*

Synopsis	Force QL value transmitted be set to QL-DNU or QL-DUS
Context	**configure** port *port* ethernet ssm tx-dus *boolean*
Tree	tx-dus

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router sets the QL value transmitted from the SSM channel of the SyncE port to QL-DUS or QL-DNU. This capability is provided to block the use of the interface from the 7750 SR or 7450 ESS for timing purposes. This command is supported on TDM satellites.
Introduced	16.0.R1
Platforms	All

tx-extended-ql-tlv *boolean*

Synopsis	Include the Extended QL TLV in transmitted ESMC
Context	**configure** port *port* ethernet ssm tx-extended-ql-tlv *boolean*
Tree	tx-extended-ql-tlv
Description	When configured to **true**, the router includes the Extended QL TLV in transmitted ESMC messages. When configured to **false**, the router turns off the inclusion of the TLV in the ESMC messages.
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

symbol-monitor

Synopsis	Enter the **symbol-monitor** context
Context	**configure** port *port* ethernet symbol-monitor
Tree	symbol-monitor
Description	Commands in this context configure Ethernet symbol monitoring. Support for symbol monitoring is hardware dependent. An error message indicating that the port setting cannot be modified is presented when attempting to enable the feature or configure the individual commands on unsupported hardware.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of symbol monitoring on the port
Context	**configure** port *port* ethernet symbol-monitor admin-state *keyword*

Range	1 to 9
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

window-size *number*

Synopsis	Sliding window size over which errors are measured
Context	**configure** port *port* ethernet symbol-monitor window-size *number*
Tree	window-size

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the sliding window size over which the symbols are sampled to detect SF or SD conditions.
Range	5 to 60
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-pause-frames *boolean*

Synopsis	Transmit PAUSE frames based on received traffic rate
Context	**configure** port *port* ethernet tx-pause-frames *boolean*
Tree	tx-pause-frames
Description	When configured to **true**, the system sends PAUSE frames, when required, based on the rate of the received traffic. When configured to **false**, the system disables the transmission of PAUSE frames. This command is only supported for FP4- or FP5-based ports on the 7750 SR and 7950 XRS. This command is not supported for ports configured as satellite hosts, ESA hosts, or PXCs.
Default	true
Introduced	24.7.R1
Platforms	All

util-stats-interval *number*

Synopsis	Interval to calculate utilization statistics
Context	**configure** port *port* ethernet util-stats-interval *number*
Tree	util-stats-interval
Description	This command configures the interval used to calculate the utilization statistics. Port utilization statistics are only available for physical Ethernet ports on a host system. These statistics are not available for the following: • Ethernet ports on an Ethernet satellite • Ethernet ports on a VSR • PXC ports • vsm-cca-xp ports

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	30 to 600
Units	seconds
Default	300
Introduced	16.0.R1
Platforms	All

xgig *keyword*

Synopsis	Ethernet port mode
Context	**configure** port *port* ethernet xgig *keyword*
Tree	xgig
Description	This command configures a 10 Gb/s interface to be in LAN or WAN mode. When configuring the port to be in WAN mode, certain SONET/SDH commands can be changed to reflect the SONET/SDH requirements for the port. When configuring the port to be in LAN mode, all SONET/SDH commands are pre-determined and not configurable.
Options	lan, wan
Introduced	16.0.R1
Platforms	All

gnss

Synopsis	Enter the **gnss** context
Context	**configure** port *port* gnss
Tree	gnss
Description	Commands in this context configure GNSS port attributes.
Introduced	22.10.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se

antenna-cable-delay *number*

Synopsis	Signal delay resulting from GNSS antenna cable length
Context	**configure** port *port* gnss antenna-cable-delay *number*
Tree	antenna-cable-delay
Description	This command configures the expected signal delay resulting from the length of the GNSS antenna cable.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	Note: 7750 SR FP5 GNSS platforms support a value range of 0 to 1000.
Range	0 to 32767
Units	nanoseconds
Default	0
Introduced	22.10.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se

constellation

Synopsis	Enter the **constellation** context
Context	**configure** port *port* gnss constellation
Tree	constellation
Description	Commands in this context configure the GNSS systems that are used by the GNSS receiver.
Introduced	22.10.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se

galileo *boolean*

Synopsis	Enable GNSS receiver to use GALILEO constellation type
Context	**configure** port *port* gnss constellation galileo *boolean*
Tree	galileo
Description	When configured to **true**, this command enables the use of the European Galileo GNSS system.
Default	false
Introduced	22.10.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se

glonass *boolean*

Synopsis	Enable GNSS receiver to use GLONASS constellation type
Context	**configure** port *port* gnss constellation glonass *boolean*
Tree	glonass
Description	When configured to **true**, the system enables the use of the Russian GLONASS GNSS system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note: The **glonass** command is currently not supported.

Default false

Introduced 22.10.R1

Platforms 7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se

gps *boolean*

Synopsis Enable GNSS receiver to use GPS constellation type

Context **configure** port *port* gnss constellation gps *boolean*

Tree gps

Description When configured to **true**, this command enables the use of the American GPS GNSS system.

When configured to **false**, this command disables the use of the American GPS GNSS system.

Default true

Introduced 22.10.R1

Platforms 7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se

elevation-mask-angle *number*

Synopsis Minimum elevation mask angle

Context **configure** port *port* gnss elevation-mask-angle *number*

Tree elevation-mask-angle

Description This command configures the elevation mask angle, which provides a method of filtering satellites used by the system.

Satellites with low elevation may provide degraded accuracy because of the long signal path through the atmosphere. Signals from satellites below the configured minimum satellite elevation are not used.

Nokia does not recommend configuring an elevation mask angle below 10.

Range 0 to 89

Units degrees angle

Default 10

Introduced 22.10.R1

Platforms 7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

signal-cnr-mask *number*

Synopsis	Signal CNR mask strength in dB-Hz
Context	**configure** port *port* gnss signal-cnr-mask *number*
Tree	signal-cnr-mask
Description	This command configures the threshold to determine the signal strength of the CNR mask to filter satellites used by the system. Satellites with CNR values below the configured minimum threshold may negatively impact accuracy, and their signals are ignored.
Range	0 to 37
Default	30
Introduced	26.7.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se

hybrid-buffer-allocation

Synopsis	Enter the **hybrid-buffer-allocation** context
Context	**configure** port *port* hybrid-buffer-allocation
Tree	hybrid-buffer-allocation
Introduced	16.0.R1
Platforms	All

egress-weight

Synopsis	Enter the **egress-weight** context
Context	**configure** port *port* hybrid-buffer-allocation egress-weight
Tree	egress-weight
Introduced	16.0.R1
Platforms	All

access *number*

Introduced	16.0.R1
Platforms	All

modify-buffer-allocation

Synopsis	Enter the **modify-buffer-allocation** context
Context	**configure** port *port* modify-buffer-allocation
Tree	modify-buffer-allocation
Description	Commands in this context to configure ingress and egress percentage of rate commands. These commands only apply to physical ports (for example, it does not work on APS or similar logical ports). The percentage of rate commands are used to define a percentage value that affects the amount of buffers used by ingress and egress port managed buffer space.
Introduced	16.0.R1
Platforms	All

percentage-of-rate

Synopsis	Enter the **percentage-of-rate** context
Context	**configure** port *port* modify-buffer-allocation percentage-of-rate
Tree	percentage-of-rate
Description	Commands in this context increase or decrease the active bandwidth associated with the egress or ingress port that affects the amount of egress or ingress buffer space managed by the port. Changing a ports active bandwidth using the commands in this context are an effective means of artificially lowering the buffers managed by one egress or ingress port and giving them to the other egress or ingress ports on the same MDA.
Introduced	16.0.R1
Platforms	All

egress *number*

Synopsis	Egress rate percentage
Context	**configure** port *port* modify-buffer-allocation percentage-of-rate egress *number*

© 2026 Nokia.

Synopsis	Ingress rate percentage
Context	**configure** port *port* modify-buffer-allocation percentage-of-rate ingress *number*
Tree	ingress
Range	1 to 1000
Default	100
Introduced	16.0.R1
Platforms	All

monitor-agg-egress-queue-stats *boolean*

Synopsis	Monitor aggregate queue statistics
Context	**configure** port *port* monitor-agg-egress-queue-stats *boolean*
Tree	monitor-agg-egress-queue-stats
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

monitor-oper-group *reference*

Synopsis	Operational group to monitor
Context	**configure** port *port* monitor-oper-group *reference*
Tree	monitor-oper-group
Description	This command configures the operational group to monitor the operational group state. The state of the operational group affects the state of this port. When the operational group is inactive, the state of the port goes down and powers off the port to signal to the CE that the connected port is not available.
Reference	**configure** service oper-group *named-item*

Context	**configure** port *port* otu payload-structure-identifier payload
Tree	payload
Introduced	16.0.R4
Platforms	All

expected *keyword*

Synopsis	Expected received payload type of the PSI
Context	**configure** port *port* otu payload-structure-identifier payload expected *keyword*
Tree	expected
Options	auto, experimental, asynchronous-cbr, bit-synchronous-cbr, atm, gfp, vcat, gmp, bit-stream-octet, bit-stream-non-octet, odu-mux, reserved-80, reserved-81, reserved-82, reserved-83, reserved-84, reserved-85, reserved-86, reserved-87, reserved-88, reserved-89, reserved-8a, reserved-8b, reserved-8c, reserved-8d, reserved-8e, reserved-8f, null-test, prbs-test
Default	auto
Introduced	16.0.R4
Platforms	All

mismatch-reaction *keyword*

Synopsis	Reaction to a mismatched payload
Context	**configure** port *port* otu payload-structure-identifier payload mismatch-reaction *keyword*
Tree	mismatch-reaction
Options	squelch-rx
Introduced	16.0.R4
Platforms	All

transmit *keyword*

Synopsis	Transmit payload type
Context	**configure** port *port* otu payload-structure-identifier payload transmit *keyword*
Tree	transmit
Options	auto, experimental, asynchronous-cbr, bit-synchronous-cbr, atm, gfp, vcat, gmp, bit-stream-octet, bit-stream-non-octet, odu-mux, reserved-80, reserved-81, reserved-82, reserved-83, reserved-84, reserved-85, reserved-86, reserved-87, reserved-88,

	reserved-89, reserved-8a, reserved-8b, reserved-8c, reserved-8d, reserved-8e, reserved-8f, null-test, prbs-test
Default	auto
Introduced	16.0.R4
Platforms	All

report-alarm

Synopsis	Enter the **report-alarm** context
Context	**configure** port *port* otu report-alarm
Tree	report-alarm
Introduced	16.0.R1
Platforms	All

fec-fail *boolean*

Synopsis	Report FEC mode mismatch alarm
Context	**configure** port *port* otu report-alarm fec-fail *boolean*
Tree	fec-fail
Default	false
Introduced	16.0.R1
Platforms	All

fec-sd *boolean*

Synopsis	Report Signal Degrade alarm
Context	**configure** port *port* otu report-alarm fec-sd *boolean*
Tree	fec-sd
Default	false
Introduced	16.0.R1
Platforms	All

fec-sf *boolean*

Synopsis	Report Signal Fail alarm

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* otu report-alarm fec-sf *boolean*
Tree	fec-sf
Default	true
Introduced	16.0.R1
Platforms	All

fec-uncorr *boolean*

Synopsis	Report one or more Uncorrectable FEC errors alarm
Context	**configure** port *port* otu report-alarm fec-uncorr *boolean*
Tree	fec-uncorr
Default	false
Introduced	16.0.R1
Platforms	All

loc *boolean*

Synopsis	Report OTU alarm for loss of clock
Context	**configure** port *port* otu report-alarm loc *boolean*
Tree	loc
Default	true
Introduced	16.0.R1
Platforms	All

lof *boolean*

Synopsis	Report alarm for the loss of OTU framing
Context	**configure** port *port* otu report-alarm lof *boolean*
Tree	lof
Default	true
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

lom *boolean*

Synopsis	Report alarm for the loss of multi-frame
Context	**configure** port *port* otu report-alarm lom *boolean*
Tree	lom
Default	true
Introduced	16.0.R1
Platforms	All

los *boolean*

Synopsis	Report alarm for the loss of signal transitions on data
Context	**configure** port *port* otu report-alarm los *boolean*
Tree	los
Default	true
Introduced	16.0.R1
Platforms	All

odu-ais *boolean*

Synopsis	Report ODU Alarm Indication Signal alarm
Context	**configure** port *port* otu report-alarm odu-ais *boolean*
Tree	odu-ais
Default	false
Introduced	16.0.R1
Platforms	All

odu-bdi *boolean*

Synopsis	Report PM Backward Defect Indication alarm
Context	**configure** port *port* otu report-alarm odu-bdi *boolean*
Tree	odu-bdi
Default	false
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

odu-lck *boolean*

Synopsis	Report ODU Locked alarm
Context	**configure** port *port* otu report-alarm odu-lck *boolean*
Tree	odu-lck
Default	false
Introduced	16.0.R1
Platforms	All

odu-oci *boolean*

Synopsis	Report ODU Open Connection Indication alarm
Context	**configure** port *port* otu report-alarm odu-oci *boolean*
Tree	odu-oci
Default	false
Introduced	16.0.R1
Platforms	All

odu-tim *boolean*

Synopsis	Report PM Trace ID Mismatch alarm
Context	**configure** port *port* otu report-alarm odu-tim *boolean*
Tree	odu-tim
Default	false
Introduced	16.0.R1
Platforms	All

opu-plm *boolean*

Synopsis	Report PSI Payload Type Mismatch alarm
Context	**configure** port *port* otu report-alarm opu-plm *boolean*
Tree	opu-plm
Default	false

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

otu-ais *boolean*

Synopsis	Report OTU Alarm Indication Signal alarm
Context	**configure** port *port* otu report-alarm otu-ais *boolean*
Tree	otu-ais
Default	false
Introduced	16.0.R1
Platforms	All

otu-bdi *boolean*

Synopsis	Report SM Backward Defect Indication alarm
Context	**configure** port *port* otu report-alarm otu-bdi *boolean*
Tree	otu-bdi
Default	true
Introduced	16.0.R1
Platforms	All

otu-ber-sd *boolean*

Synopsis	Report SM Signal Degrade alarm
Context	**configure** port *port* otu report-alarm otu-ber-sd *boolean*
Tree	otu-ber-sd
Default	false
Introduced	16.0.R1
Platforms	All

otu-ber-sf *boolean*

Synopsis	Report SM Signal Fail alarm
Context	**configure** port *port* otu report-alarm otu-ber-sf *boolean*
Tree	otu-ber-sf

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	true
Introduced	16.0.R1
Platforms	All

otu-biae *boolean*

Synopsis	Report SM Backward Incoming Alignment Error alarm
Context	**configure** port *port* otu report-alarm otu-biae *boolean*
Tree	otu-biae
Default	false
Introduced	16.0.R1
Platforms	All

otu-iae *boolean*

Synopsis	Report SM Incoming Alignment Error alarm
Context	**configure** port *port* otu report-alarm otu-iae *boolean*
Tree	otu-iae
Default	false
Introduced	16.0.R1
Platforms	All

otu-tim *boolean*

Synopsis	Report SM Trace ID Mismatch alarm
Context	**configure** port *port* otu report-alarm otu-tim *boolean*
Tree	otu-tim
Default	false
Introduced	16.0.R1
Platforms	All

sd-threshold *number*

Synopsis	Error rate at which to declare signal degrade condition
Context	**configure** port *port* otu sd-threshold *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	sd-threshold
Range	5 to 9
Default	7
Introduced	16.0.R1
Platforms	All

section-monitoring

Synopsis	Enter the **section-monitoring** context
Context	**configure** port *port* otu section-monitoring
Tree	section-monitoring
Introduced	16.0.R4
Platforms	All

trail-trace-identifier

Synopsis	Enter the **trail-trace-identifier** context
Context	**configure** port *port* otu section-monitoring trail-trace-identifier
Tree	trail-trace-identifier
Introduced	16.0.R4
Platforms	All

expected

Synopsis	Enter the **expected** context
Context	**configure** port *port* otu section-monitoring trail-trace-identifier expected
Tree	expected
Introduced	16.0.R4
Platforms	All

auto-generated

Synopsis	Use the system generated TTI
Context	**configure** port *port* otu section-monitoring trail-trace-identifier expected auto-generated
Tree	auto-generated

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: **auto-generated**, **bytes**, or **string**.
Introduced	16.0.R4
Platforms	All

bytes *string*

Synopsis	TTI as a sequence of bytes
Context	**configure** port *port* otu section-monitoring trail-trace-identifier expected bytes *string*
Tree	bytes
String length	0 to 192
Notes	The following elements are part of a choice: **auto-generated**, **bytes**, or **string**.
Introduced	16.0.R4
Platforms	All

string *string*

Synopsis	TTI as a sequence of printable ASCII
Context	**configure** port *port* otu section-monitoring trail-trace-identifier expected string *string*
Tree	string
String length	0 to 64
Notes	The following elements are part of a choice: **auto-generated**, **bytes**, or **string**.
Introduced	16.0.R4
Platforms	All

mismatch-reaction *keyword*

Synopsis	Reaction to a mismatched TTI
Context	**configure** port *port* otu section-monitoring trail-trace-identifier mismatch-reaction *keyword*
Tree	mismatch-reaction
Options	squelch-rx
Introduced	16.0.R4
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

transmit

Synopsis	Enter the **transmit** context
Context	**configure** port *port* otu section-monitoring trail-trace-identifier transmit
Tree	transmit
Introduced	16.0.R4
Platforms	All

auto-generated

Synopsis	Use the system generated TTI
Context	**configure** port *port* otu section-monitoring trail-trace-identifier transmit auto-generated
Tree	auto-generated
Notes	The following elements are part of a choice: **auto-generated**, **bytes**, or **string**.
Introduced	16.0.R4
Platforms	All

bytes *string*

Synopsis	TTI as a sequence of bytes
Context	**configure** port *port* otu section-monitoring trail-trace-identifier transmit bytes *string*
Tree	bytes
String length	0 to 192
Notes	The following elements are part of a choice: **auto-generated**, **bytes**, or **string**.
Introduced	16.0.R4
Platforms	All

string *string*

Synopsis	TTI as a sequence of printable ASCII
Context	**configure** port *port* otu section-monitoring trail-trace-identifier transmit string *string*
Tree	string
String length	0 to 64
Notes	The following elements are part of a choice: **auto-generated**, **bytes**, or **string**.
Introduced	16.0.R4

© 2026 Nokia.

Platforms	All

sf-sd-method *keyword*

Synopsis	Method used to determine the SF and SD alarms
Context	**configure** port *port* otu sf-sd-method *keyword*
Tree	sf-sd-method
Options	fec, bip8
Default	fec
Introduced	16.0.R1
Platforms	All

sf-threshold *number*

Synopsis	Error rate at which to declare signal fail condition
Context	**configure** port *port* otu sf-threshold *number*
Tree	sf-threshold
Range	3 to 6
Default	5
Introduced	16.0.R1
Platforms	All

sonet-sdh

Synopsis	Enter the **sonet-sdh** context
Context	**configure** port *port* sonet-sdh
Tree	sonet-sdh
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

clock-source *keyword*

Synopsis	Clock used for transmitted data
Context	**configure** port *port* sonet-sdh clock-source *keyword*
Tree	clock-source

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	loop-timed, node-timed
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

framing *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	SONET or SDH framing
Context	**configure** port *port* sonet-sdh framing *keyword*
Tree	framing
Options	sonet, sdh
Default	sonet
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

group [group-index] *sdh-group-index*

Synopsis	Enter the **group** list instance
Context	**configure** port *port* sonet-sdh group *sdh-group-index*
Tree	group
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**group-index**] *sdh-group-index*

Synopsis	Components making up the specified SONET/SDH path
Context	**configure** port *port* sonet-sdh group *sdh-group-index*
Tree	group
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

payload *keyword*

Synopsis	SONET/SDH group payload
Context	**configure** port *port* sonet-sdh group *sdh-group-index* payload *keyword*
Tree	payload
Options	vt15, vt2, tu3
Default	tu3
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

hold-time

Synopsis	Enter the **hold-time** context
Context	**configure** port *port* sonet-sdh hold-time
Tree	hold-time
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

down *number*

Synopsis	Hold timer for link down event dampening
Context	**configure** port *port* sonet-sdh hold-time down *number*
Tree	down
Range	0 to 100
Units	deciseconds
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

up *number*

Synopsis	Hold timer for link up event dampening
Context	**configure** port *port* sonet-sdh hold-time up *number*
Tree	up
Range	0 to 100
Units	deciseconds

© 2026 Nokia.

Default	5
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

loopback *keyword*

Synopsis	Loopback to activate on SONET port
Context	**configure** port *port* sonet-sdh loopback *keyword*
Tree	loopback
Options	line, internal
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

path [path-index] *sonet-path-index*

Synopsis	Enter the **path** list instance
Context	**configure** port *port* sonet-sdh path *sonet-path-index*
Tree	path
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**path-index**] *sonet-path-index*

Synopsis	SONET/SDH path index
Context	**configure** port *port* sonet-sdh path *sonet-path-index*
Tree	path
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the SONET/SDH path
Context	**configure** port *port* sonet-sdh path *sonet-path-index* admin-state *keyword*
Tree	admin-state

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	enable, disable
Default	disable
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

crc *number*

Synopsis	Cyclic redundancy check
Context	**configure** port *port* sonet-sdh path *sonet-path-index* crc *number*
Tree	crc
Range	16 | 32
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

description *long-description*

Synopsis	Text description
Context	**configure** port *port* sonet-sdh path *sonet-path-index* description *long-description*
Tree	description
String length	1 to 160
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

egress

Synopsis	Enter the **egress** context
Context	**configure** port *port* sonet-sdh path *sonet-path-index* egress
Tree	egress
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

port-scheduler-policy

Synopsis	Enter the **port-scheduler-policy** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* sonet-sdh path *sonet-path-index* egress port-scheduler-policy
Tree	port-scheduler-policy
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

overrides

Synopsis	Enable the **overrides** context
Context	**configure** port *port* sonet-sdh path *sonet-path-index* egress port-scheduler-policy overrides
Tree	overrides
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

level [priority-level] *number*

Synopsis	Enter the **level** list instance
Context	**configure** port *port* sonet-sdh path *sonet-path-index* egress port-scheduler-policy overrides level *number*
Tree	level
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[**priority-level**] *number*

Synopsis	Port priority levels override
Context	**configure** port *port* sonet-sdh path *sonet-path-index* egress port-scheduler-policy overrides level *number*
Tree	level
Range	1 to 8
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.

Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mtu *number*

Synopsis	Maximum payload MTU size
Context	**configure** port *port* sonet-sdh path *sonet-path-index* mtu *number*
Tree	mtu
Range	512 to 9208
Units	bytes
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

network

Synopsis	Enter the **network** context
Context	**configure** port *port* sonet-sdh path *sonet-path-index* network
Tree	network
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

accounting-policy *reference*

Synopsis	Accounting policy
Context	**configure** port *port* sonet-sdh path *sonet-path-index* network accounting-policy *reference*
Tree	accounting-policy
Reference	**configure** log accounting-policy *number*
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-stats *boolean*

Synopsis	Collect accounting and statistical data
Context	**configure** port *port* sonet-sdh path *sonet-path-index* network collect-stats *boolean*
Tree	collect-stats
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

queue-policy *reference*

Synopsis	Queue policy on the SONET/SDH network path
Context	**configure** port *port* sonet-sdh path *sonet-path-index* network queue-policy *reference*
Tree	queue-policy
Reference	**configure** qos network-queue *named-item*
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

payload *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	SONET/SDH path payload
Context	**configure** port *port* sonet-sdh path *sonet-path-index* payload *keyword*
Tree	payload
Options	sts3, tug3, vt15, vt2, ds3, e3, ds1, e1
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

report-alarm

Synopsis	Enter the **report-alarm** context
Context	**configure** port *port* sonet-sdh path *sonet-path-index* report-alarm
Tree	report-alarm

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pais *boolean*

Synopsis	Report path alarm indication signal errors
Context	**configure** port *port* sonet-sdh path *sonet-path-index* report-alarm pais *boolean*
Tree	pais
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

plcd *boolean*

Synopsis	Report path loss of code group delineation errors
Context	**configure** port *port* sonet-sdh path *sonet-path-index* report-alarm plcd *boolean*
Tree	plcd
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

plop *boolean*

Synopsis	Report path loss of pointer errors as a trap
Context	**configure** port *port* sonet-sdh path *sonet-path-index* report-alarm plop *boolean*
Tree	plop
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pplm *boolean*

Synopsis	Report a path payload mismatch trap
Context	**configure** port *port* sonet-sdh path *sonet-path-index* report-alarm pplm *boolean*
Tree	pplm

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

prdi *boolean*

Synopsis	Report path remote defect indication errors
Context	**configure** port *port* sonet-sdh path *sonet-path-index* report-alarm prdi *boolean*
Tree	prdi
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

prei *boolean*

Synopsis	Report a path error condition as a result of b3 error
Context	**configure** port *port* sonet-sdh path *sonet-path-index* report-alarm prei *boolean*
Tree	prei
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

puneq *boolean*

Synopsis	Report path unequipped errors
Context	**configure** port *port* sonet-sdh path *sonet-path-index* report-alarm puneq *boolean*
Tree	puneq
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

scramble *boolean*

Synopsis	Enable SONET/SDH payload scrambling
Context	**configure** port *port* sonet-sdh path *sonet-path-index* scramble *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	scramble
Description	When configured to **true**, the SONET/SDH frame carries randomized patterns of 1s and 0s, which prevents continuous strings of all 1s or all 0s. This meets the needs of physical layer protocols that rely on sufficient transitions between 1s and 0s to maintain clocking. When configured to **false**, the strings of all 1s or all 0s are continuous.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

signal-label *string*

Synopsis	C2 byte value that communicates the payload type
Context	**configure** port *port* sonet-sdh path *sonet-path-index* signal-label *string*
Tree	signal-label
String length	1 to 4
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

trace-string *(keyword | string)*

Synopsis	J1 path-trace string that identifies the circuit
Context	**configure** port *port* sonet-sdh path *sonet-path-index* trace-string *(keyword | string)*
Tree	trace-string
String length	0 to 62
Options	zeros
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

report-alarm

Synopsis	Enter the **report-alarm** context
Context	**configure** port *port* sonet-sdh report-alarm
Tree	report-alarm
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

lais *boolean*

Synopsis	Report Line Indication Signal Errors alarm
Context	**configure** port *port* sonet-sdh report-alarm lais *boolean*
Tree	lais
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lb2er-sd *boolean*

Synopsis	Report line and section alarms for SONET/SDH ports
Context	**configure** port *port* sonet-sdh report-alarm lb2er-sd *boolean*
Tree	lb2er-sd
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lb2er-sf *boolean*

Synopsis	Report alarm line signal failure BER errors
Context	**configure** port *port* sonet-sdh report-alarm lb2er-sf *boolean*
Tree	lb2er-sf
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

loc *boolean*

Synopsis	Report alarm for a loss of clock
Context	**configure** port *port* sonet-sdh report-alarm loc *boolean*
Tree	loc
Default	true
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lrdi *boolean*

Synopsis	Report Line Remote Defect Indication Errors alarm
Context	**configure** port *port* sonet-sdh report-alarm lrdi *boolean*
Tree	lrdi
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lrei *boolean*

Synopsis	Report alarm for a line error condition
Context	**configure** port *port* sonet-sdh report-alarm lrei *boolean*
Tree	lrei
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

slof *boolean*

Synopsis	Report alarm for section loss of frame errors
Context	**configure** port *port* sonet-sdh report-alarm slof *boolean*
Tree	slof
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

slos *boolean*

Synopsis	Report alarm for section loss of signal error on send
Context	**configure** port *port* sonet-sdh report-alarm slos *boolean*
Tree	slos
Default	true

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ss1f *boolean*

Synopsis	Report alarm for section synchronization failure
Context	**configure** port *port* sonet-sdh report-alarm ss1f *boolean*
Tree	ss1f
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sd-threshold *number*

Synopsis	Threshold for line signal failure BER
Context	**configure** port *port* sonet-sdh sd-threshold *number*
Tree	sd-threshold
Range	3 to 9
Default	6
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

section-trace

Synopsis	Enter the **section-trace** context
Context	**configure** port *port* sonet-sdh section-trace
Tree	section-trace
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

byte *string*

Synopsis	Section trace bytes in the SONET section header
Context	**configure** port *port* sonet-sdh section-trace byte *string*
Tree	byte

© 2026 Nokia.

String length	1 to 4
Default	1
Notes	The following elements are part of a choice: **byte**, **increment-z0**, or **string**.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

increment-z0

Synopsis	Configure incrementing STM ID instead of a static value
Context	**configure** port *port* sonet-sdh section-trace increment-z0
Tree	increment-z0
Notes	The following elements are part of a choice: **byte**, **increment-z0**, or **string**.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

string *string*

Synopsis	Text string that identifies the section
Context	**configure** port *port* sonet-sdh section-trace string *string*
Tree	string
String length	0 to 16
Notes	The following elements are part of a choice: **byte**, **increment-z0**, or **string**.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sf-threshold *number*

Synopsis	Threshold for line signal failure BER
Context	**configure** port *port* sonet-sdh sf-threshold *number*
Tree	sf-threshold
Range	3 to 6
Default	3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

single-fiber *boolean*

Synopsis	Allow packet gathering and redirection from single port
Context	**configure** port *port* sonet-sdh single-fiber *boolean*
Tree	single-fiber
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

speed *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	SONET/SDH port speed
Context	**configure** port *port* sonet-sdh speed *keyword*
Tree	speed
Options	oc3, oc12, oc48, oc192, oc768, oc1
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

suppress-low-order-alarms *boolean*

Synopsis	Suppress low order alarms
Context	**configure** port *port* sonet-sdh suppress-low-order-alarms *boolean*
Tree	suppress-low-order-alarms
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx-dus *boolean*

Synopsis	Force the QL value to be set to QL-DUS/QL-DNU
Context	**configure** port *port* sonet-sdh tx-dus *boolean*
Tree	tx-dus

© 2026 Nokia.

rai *boolean*

Synopsis	Report resource availability indicator events
Context	**configure** port *port* tdm ds3 *tdm-ds3-index* report-alarm rai *boolean*
Tree	rai
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

scramble *boolean*

Synopsis	Enable TDM DS3 payload scrambling
Context	**configure** port *port* tdm ds3 *tdm-ds3-index* scramble *boolean*
Tree	scramble
Description	When configured to **true**, the TDM DS3 frame carries randomized patterns of 1s and 0s, which prevents continuous strings of all 1s or all 0s. This meets the needs of physical layer protocols that rely on sufficient transitions between 1s and 0s to maintain clocking. When configured to **false**, the strings of all 1s or all 0s are continuous.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

looped *boolean*

Synopsis	Report looped packet errors
Context	**configure** port *port* tdm e3 *tdm-e3-index* report-alarm looped *boolean*
Tree	looped
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

los *boolean*

Synopsis	Report loss of signal errors
Context	**configure** port *port* tdm e3 *tdm-e3-index* report-alarm los *boolean*
Tree	los
Default	true
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

oof *boolean*

Synopsis	Report out-of-frame errors
Context	**configure** port *port* tdm e3 *tdm-e3-index* report-alarm oof *boolean*
Tree	oof
Default	false
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

rai *boolean*

Synopsis	Report resource availability indicator events
Context	**configure** port *port* tdm e3 *tdm-e3-index* report-alarm rai *boolean*
Tree	rai
Default	false
Introduced	20.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

scramble *boolean*

Synopsis	Enable TDM E3 payload scrambling
Context	**configure** port *port* tdm e3 *tdm-e3-index* scramble *boolean*
Tree	scramble
Description	When configured to **true**, the TDM E3 frame carries randomized patterns of 1s and 0s, which prevents continuous strings of all 1s or all 0s. This meets the needs of physical layer protocols that rely on sufficient transitions between 1s and 0s to maintain clocking. When configured to **false**, the strings of all 1s or all 0s are continuous.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

hold-time

Synopsis	Enter the **hold-time** context
Context	**configure** port *port* tdm hold-time
Tree	hold-time
Introduced	19.5.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

down *number*

Synopsis	Hold timer for link down event dampening
Context	**configure** port *port* tdm hold-time down *number*
Tree	down
Range	0 to 100
Default	5
Introduced	19.5.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

up *number*

Synopsis	Hold timer for link up event dampening
Context	**configure** port *port* tdm hold-time up *number*

Tree	up
Range	1 to 100
Introduced	19.5.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

transceiver

Synopsis	Enter the **transceiver** context
Context	**configure** port *port* transceiver
Tree	transceiver
Introduced	16.0.R4
Platforms	All

digital-coherent-optics *boolean*

Synopsis	Enable digital coherent optics module for transceiver
Context	**configure** port *port* transceiver digital-coherent-optics *boolean*
Tree	digital-coherent-optics
Default	false
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

optical-line-system

Synopsis	Enable the **optical-line-system** context
Context	**configure** port *port* transceiver optical-line-system
Tree	optical-line-system
Description	Commands in this context configure the QSFP-LS pluggable optical line system, used in conjunction with 400G ZR/ZR+ coherent pluggable modules.
Introduced	23.10.R1
Platforms	All

egress-amplifier-gain *decimal-number*

Synopsis	Gain for the egress amplifier

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** port *port* transceiver optical-line-system egress-amplifier-gain *decimal-number*
Tree	egress-amplifier-gain
Range	0.00 to 25.00
Units	decibels
Default	25.00
Introduced	23.10.R1
Platforms	All

power-save *boolean*

Synopsis	Enable low-power optic mode
Context	**configure** port *port* transceiver power-save *boolean*
Tree	power-save
Description	When configured to **true**, the system uses low-power optic mode to reduce optic and port power consumption when the port is populated with an optic and is administratively disabled.
Default	false
Introduced	25.10.R1
Platforms	7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Introduced 16.0.R4

Platforms All

down-on-peer-tldp-pw-status-faults *boolean*

Synopsis Force PW port to go down for certain PW status bits

Context **configure** pw-port *number* epipe *reference* down-on-peer-tldp-pw-status-faults *boolean*

Tree down-on-peer-tldp-pw-status-faults

Description When configured to **true**, the router causes the PW port configured on an Epipe to go locally operationally down if any of the following status bits are received on a mate spoke SDP across an FPE:

- 0x00000001 - Pseudowire Not Forwarding
- 0x00000002 - Local Attachment Circuit (ingress) Receive Fault
- 0x00000004 - Local Attachment Circuit (egress) Transmit Fault
- 0x00000008 - Local PSN-facing PW (ingress) Receive Fault
- 0x00000010 - Local PSN-facing PW (egress) Transmit Fault

When configured to **false**, the mate PW status fault bits are not taken into account in the operational state of the PW port.

Default false

Introduced 22.2.R1

egress

Synopsis	Enter the **egress** context
Context	**configure** pw-port *number* sdp *reference* egress
Tree	egress
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

shaper

Synopsis	Enter the **shaper** context
Context	**configure** pw-port *number* sdp *reference* egress shaper
Tree	shaper
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

intermediate-destination-id *named-item*

Synopsis	Intermediate destination ID applicable to ESM PW SAPs
Context	**configure** pw-port *number* sdp *reference* egress shaper intermediate-destination-id *named-item*
Tree	intermediate-destination-id
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pw-sap-secondary-shaper *named-item*

Synopsis	Secondary shaper applicable to PW SAPs
Context	**configure** pw-port *number* sdp *reference* egress shaper pw-sap-secondary-shaper *named-item*
Tree	pw-sap-secondary-shaper
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

virtual-port *named-item*

Synopsis	Virtual port applicable to all PW SAPs
Context	**configure** pw-port *number* sdp *reference* egress shaper virtual-port *named-item*
Tree	virtual-port
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vc-label *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Egress VC label representing the PW port
Context	**configure** pw-port *number* sdp *reference* egress vc-label *number*
Tree	vc-label
Range	16 to 1048575
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

entropy-label *boolean*

Synopsis	Enable entropy level insertion on the PW port
Context	**configure** pw-port *number* sdp *reference* entropy-label *boolean*
Tree	entropy-label
Description	When configured to **true**, the entropy label and ELI are inserted in packets for which at least one LSP in the stack for the far-end of the tunnel used by the service has advertised entropy label capability. • For RSVP or SR-TE tunnels, the **entropy-label** command must be set to **true** under the **configure router mpls** or **configure router mpls lsp** context. • For SR-ISIS, SR-OSPF, or SR-TE tunnels, the **override-tunnel-elc** command must be set to **true** under the **configure router isis entropy-label** or **configure router ospf entropy-label** context.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- For LDP tunnels, the **entropy-label-capability** command must be set to **true** under the **configure router ldp** context.

When configured to **false**, entropy label insertion on the PW port is not allowed.

The entropy label is only applicable to PW ports bound to a static port; it is not applicable to ports using an FPE.

Default	false
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ingress

Synopsis	Enter the **ingress** context
Context	**configure** pw-port *number* sdp *reference* ingress
Tree	ingress
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vc-label *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Ingress VC label representing the PW-port
Context	**configure** pw-port *number* sdp *reference* ingress vc-label *number*
Tree	vc-label
Range	1 to 1048575
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

monitor-oper-group *reference*

Synopsis	Name of the operational group to monitor
Context	**configure** pw-port *number* sdp *reference* monitor-oper-group *reference*
Tree	monitor-oper-group
Reference	**configure** service oper-group *named-item*

© 2026 Nokia.

Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vc-id *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Virtual Circuit ID signaled to the peer
Context	**configure** pw-port *number* sdp *reference* vc-id *number*
Tree	vc-id
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vc-type *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Forwarding mode for the PW-port
Context	**configure** pw-port *number* sdp *reference* vc-type *keyword*
Tree	vc-type
Options	ether, vlan
Default	ether
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vlan-vc-tag *number*

Synopsis	VLAN VC tag
Context	**configure** pw-port *number* sdp *reference* vlan-vc-tag *number*
Tree	vlan-vc-tag

4.35.1 python command descriptions

python

Synopsis	Enter the **python** context
Context	**configure** python
Tree	python
Introduced	16.0.R1
Platforms	All

python-policy [name] *named-item*

Synopsis	Enter the **python-policy** list instance
Context	**configure** python python-policy *named-item*
Tree	python-policy
Max. instances	64
Introduced	16.0.R1
Platforms	All

[**name**] *named-item*

Synopsis	Python policy name
Context	**configure** python python-policy *named-item*
Tree	python-policy
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

cache

Synopsis	Enable the **cache** context
Context	**configure** python python-policy *named-item* cache

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	cache
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the Python cache
Context	**configure** python python-policy *named-item* cache admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

entry-size *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum data structure size for Python cache entry
Context	**configure** python python-policy *named-item* cache entry-size *number*
Tree	entry-size
Range	32 to 2048
Units	bytes
Default	256
Introduced	16.0.R1
Platforms	All

max-entries *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum number of Python cache entries to be stored

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** python python-policy *named-item* cache max-entries *number*
Tree	max-entries
Range	1 to 1000000
Default	128000
Introduced	16.0.R1
Platforms	All

max-entry-lifetime *number*

Synopsis	Maximum lifetime for each Python cache entry
Context	**configure** python python-policy *named-item* cache max-entry-lifetime *number*
Tree	max-entry-lifetime
Range	1 to 604800
Units	seconds
Default	86400
Introduced	16.0.R1
Platforms	All

mcs-peer

Synopsis	Enable the **mcs-peer** context
Context	**configure** python python-policy *named-item* cache mcs-peer
Tree	mcs-peer
Introduced	16.0.R1
Platforms	All

ip-address *reference*

Synopsis	IP address of the MCS peer
Context	**configure** python python-policy *named-item* cache mcs-peer ip-address *reference*
Tree	ip-address
Reference	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Notes	This element is mandatory.
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

sync-tag *named-item*

Synopsis	Tag to synchronize the cached entries in the policy
Context	**configure** python python-policy *named-item* cache mcs-peer sync-tag *named-item*
Tree	sync-tag
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

minimum-lifetimes

Synopsis	Enter the **minimum-lifetimes** context
Context	**configure** python python-policy *named-item* cache minimum-lifetimes
Tree	minimum-lifetimes
Introduced	16.0.R1
Platforms	All

high-availability *number*

Synopsis	Minimum lifetime of a cache entry to be synced with CPM
Context	**configure** python python-policy *named-item* cache minimum-lifetimes high-availability *number*
Tree	high-availability
Range	1 to 600
Units	seconds
Introduced	16.0.R1
Platforms	All

multi-chassis-redundancy *number*

Synopsis	Minimum lifetime for synchronization with the MCS peer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** python python-policy *named-item* cache minimum-lifetimes multi-chassis-redundancy *number*
Tree	multi-chassis-redundancy
Range	1 to 600
Units	seconds
Introduced	16.0.R1
Platforms	All

persistence *number*

Synopsis	Minimum lifetime for cache entry to be made persistent
Context	**configure** python python-policy *named-item* cache minimum-lifetimes persistence *number*
Tree	persistence
Range	1 to 1800
Units	seconds
Introduced	16.0.R1
Platforms	All

persistence *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Allow persistence for cached entries
Context	**configure** python python-policy *named-item* cache persistence *boolean*
Tree	persistence
Default	false
Introduced	16.0.R1
Platforms	All

description *description*

Synopsis	Text description
Context	**configure** python python-policy *named-item* description *description*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

dhcp [message-type] *keyword* direction *keyword*

Synopsis	Enter the **dhcp** list instance
Context	**configure** python python-policy *named-item* dhcp *keyword* direction *keyword*
Tree	dhcp
Introduced	16.0.R1
Platforms	All

[**message-type**] *keyword*

Synopsis	DHCP message type
Context	**configure** python python-policy *named-item* dhcp *keyword* direction *keyword*
Tree	dhcp
Options	discover, offer, request, decline, ack, nak, release, inform, force-renew, lease-query, lease-unassigned, lease-unknown, lease-active
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

direction *keyword*

Synopsis	Event that is either incoming or outgoing
Context	**configure** python python-policy *named-item* dhcp *keyword* direction *keyword*
Tree	dhcp
Options	ingress, egress
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

Description	This command configures a user that is different from the current user of the session. Script authentication, authorization, accounting, and any activity within the script, is run as the specified user. This user must be locally configured and script authorization will use the user's local AAA profile even if remote authorization is configured. If this command is not configured, the current user of the session is used.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	22.10.R1
Platforms	All

4.36.1 qos command descriptions

qos

Synopsis	Enter the **qos** context
Context	**configure** qos
Tree	qos
Introduced	16.0.R1
Platforms	All

adv-config-policy [adv-config-policy-name] *named-item*

Synopsis	Enter the **adv-config-policy** list instance
Context	**configure** qos adv-config-policy *named-item*
Tree	adv-config-policy
Max. instances	255
Introduced	16.0.R1
Platforms	All

[**adv-config-policy-name**] *named-item*

Synopsis	Advanced QoS policy name
Context	**configure** qos adv-config-policy *named-item*
Tree	adv-config-policy
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

child-control

Synopsis	Enter the **child-control** context
Context	**configure** qos adv-config-policy *named-item* child-control

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	child-control
Introduced	16.0.R1
Platforms	All

bandwidth-distribution

Synopsis	Enter the **bandwidth-distribution** context
Context	**configure** qos adv-config-policy *named-item* child-control bandwidth-distribution
Tree	bandwidth-distribution
Introduced	16.0.R1
Platforms	All

above-offered-allowance

Synopsis	Enter the **above-offered-allowance** context
Context	**configure** qos adv-config-policy *named-item* child-control bandwidth-distribution above-offered-allowance
Tree	above-offered-allowance
Description	Commands in this context control the child's above offered allowance bandwidth. The configuration is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm (specified via the **configure qos port-scheduler-policy hqos-algorithm** command).
Introduced	19.10.R2
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

delta-consumed-agg-rate

Synopsis	Enter the **delta-consumed-agg-rate** context
Context	**configure** qos adv-config-policy *named-item* child-control bandwidth-distribution above-offered-allowance delta-consumed-agg-rate
Tree	delta-consumed-agg-rate
Introduced	19.10.R2
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

percent *decimal-number*

Synopsis	Percentage of the delta consumed aggregate rate
Context	**configure** qos adv-config-policy *named-item* child-control bandwidth-distribution above-offered-allowance delta-consumed-agg-rate percent *decimal-number*
Tree	percent
Description	This command configures the percentage of the delta (from the beginning to the end of the current H-QoS below CIR or above CIR pass) of the aggregate rate consumed by other members that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm; otherwise it is ignored.
Range	0.00 to 100.00
Default	20.00
Introduced	19.10.R2
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

delta-consumed-higher-tier-rate

Synopsis	Enter the **delta-consumed-higher-tier-rate** context
Context	**configure** qos adv-config-policy *named-item* child-control bandwidth-distribution above-offered-allowance delta-consumed-higher-tier-rate
Tree	delta-consumed-higher-tier-rate
Introduced	19.10.R2
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

percent *decimal-number*

Synopsis	Percentage of the delta consumed higher-tier rate
Context	**configure** qos adv-config-policy *named-item* child-control bandwidth-distribution above-offered-allowance delta-consumed-higher-tier-rate percent *decimal-number*
Tree	percent
Description	This command configures the percentage of the delta (from the beginning to the end of the current H-QoS below CIR or above CIR pass) of the higher-tier rate consumed by its other members that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. Higher tier refers to the Vport aggregate rate and port scheduler level, group, and maximum rates.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm; otherwise it is ignored.

Range 0.00 to 100.00

Default 5.00

Introduced 19.10.R2

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

unconsumed-agg-rate

Synopsis Enter the **unconsumed-agg-rate** context

Context **configure** qos adv-config-policy *named-item* child-control bandwidth-distribution above-offered-allowance unconsumed-agg-rate

Tree unconsumed-agg-rate

Introduced 19.10.R2

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

percent *decimal-number*

Synopsis Percentage of the unconsumed aggregate rate

Context **configure** qos adv-config-policy *named-item* child-control bandwidth-distribution above-offered-allowance unconsumed-agg-rate percent *decimal-number*

Tree percent

Description This command configures the percentage of the unconsumed aggregate rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm; otherwise it is ignored.

Range 0.00 to 100.00

Default 100.00

Introduced 19.10.R2

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

unconsumed-higher-tier-rate

Synopsis Enter the **unconsumed-higher-tier-rate** context

Context **configure** qos adv-config-policy *named-item* child-control bandwidth-distribution above-offered-allowance unconsumed-higher-tier-rate

Tree unconsumed-higher-tier-rate

Introduced	16.0.R1
Platforms	All

avg-frame-overhead-mode *keyword*

Synopsis	Method of average frame overhead calculation
Context	**configure** qos adv-config-policy *named-item* child-control offered-measurement avg-frame-overhead-mode *keyword*
Tree	avg-frame-overhead-mode
Description	This command configures the calculation method for the average frame overhead. The average frame overhead represents the additional bytes associated with the physical medium (wire) and it facilitates more precise rate calculations based on the actual medium characteristics. This command is exclusively applicable to Ethernet ports. On Ethernet, the wire overhead typically amounts to 20 bytes. These 20 bytes are comprised of 7 bytes for the preamble, 1 byte for the Start of Frame Delimiter (SFD), and 12 bytes for the Inter-Packet Gap (IPG). When used in conjunction with the **avg-frame-overhead** command that is configured directly under a queue, this command allows you to enable, disable, or customize this overhead. To activate this command, you must apply the associated advanced configuration policy to a specific queue. auto - Automatically calculate average frame overhead. This setting impacts rate calculations on port schedulers (whether on a port or within a Vport) and aggregate rate limits for subscribers and Vports where rate calculations are based on wire rates. from-queue - Manually configure average frame overhead under the queue under the queue level using the **avg-frame-overhead** command where the overhead value is specified in percentages of an average frame size. The default value for the **avg-frame-overhead** command (overhead is 0), the rate calculations throughout the H-QoS hierarchy are based on Layer 2 packets (Layer 2 rates).
Options	auto – Automatically calculate average frame overhead from-queue – Manually configure average frame overhead
Default	auto
Introduced	24.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fast-start *boolean*

Synopsis	Allow fast detection of initial bandwidth
Context	**configure** qos adv-config-policy *named-item* child-control offered-measurement fast-start *boolean*
Tree	fast-start

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	All

fast-stop *boolean*

Synopsis	Allow fast detection of lack of offered rate
Context	**configure** qos adv-config-policy *named-item* child-control offered-measurement fast-stop *boolean*
Tree	fast-stop
Default	false
Introduced	16.0.R1
Platforms	All

granularity

Synopsis	Enter the **granularity** context
Context	**configure** qos adv-config-policy *named-item* child-control offered-measurement granularity
Tree	granularity
Introduced	16.0.R1
Platforms	All

percent *decimal-number*

Synopsis	Percentage of PIR used as threshold sensitivity to offered rate change
Context	**configure** qos adv-config-policy *named-item* child-control offered-measurement granularity percent *decimal-number*
Tree	percent
Range	0.00 to 100.00
Notes	The following elements are part of a choice: **percent** or **rate**.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

allocation-weight *number*

Synopsis	Allocation weight of the queue-set size
Context	**configure** qos fp-resource-policy *fp-resource-policy-name* aggregate-shapers queue-sets size *number* allocation-weight *number*
Tree	allocation-weight
Description	This command configures the allocation weight for the specified queue-set size. The available queue-sets are distributed based on the allocation weight among different queue-set sizes.
Range	0 to 100
Introduced	22.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

reserved-non-shaper-queues *number*

Synopsis	Number of queues reserved for non-shaper queues
Context	**configure** qos fp-resource-policy *fp-resource-policy-name* aggregate-shapers reserved-non-shaper-queues *number*
Tree	reserved-non-shaper-queues
Description	This command configures the number of egress queues that will not be used by hardware aggregate shapers.
Range	2048 to 262144
Default	8192
Introduced	22.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

ingress-percent-of-total *decimal-number*

WARNING:
Modifying this element resets the associated cards/XIOMs/MDAs for the new value to take effect. On the 7750 SR-1, the configuration must be saved and the router must be rebooted for the new value to take effect.

Synopsis	Percentage of total ingress queues allocated
Context	**configure** qos fp-resource-policy *fp-resource-policy-name* queues ingress-percent-of-total *decimal-number*
Tree	ingress-percent-of-total
Description	This command configures the percentage of the total number of queues on the FP on which the policy is applied that are allocated to ingress, with the remainder allocated to egress. The ingress and egress buffer pool sizes are not affected by the queue allocation. The allocation is performed in sets of 8192 queues, with a minimum of 8192 queues at ingress and 8192 queues at egress. If the percentage configured results in the queue allocation not being a multiple of 8192, the number of queues at ingress is rounded down to the next 8192 boundary, and consequently the number of queues at egress is rounded up to the next 8192 boundary, both while respecting the minimum at ingress and egress. If the FP resource policy is applied to any FP and the updated allocation is not achievable with the current ingress or egress queue consumption on any of the related FPs, the command fails. The configuration of this command (which includes removing the configuration) causes the router to immediately reset the associated cards, XIOMs and MDAs on all FPs on which the FP resource policy is applied, except on the 7750 SR-1, where the configuration must be saved and the router rebooted, immediately after committing the configuration transaction.
Range	4.00 to 97.00
Introduced	20.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

port-bw-oversubscription-factor *number*

Synopsis	Over subscription factor for port-class pool sizes
Context	**configure** qos hs-pool-policy *named-item* mid-tier mid-pool *number* port-bw-oversubscription-factor *number*
Tree	port-bw-oversubscription-factor
Description	This command modifies the size of the mid-pool when calculating the port-class pool sizes based on port bandwidth ratios. The over subscription factor for a mid-pool can be modified at any time, causing the corresponding port-class pool dynamic sizes to be recalculated. A similar behavior can be obtained by increasing the mid-pool's allocation-percent of its parent root-pool. However, the major difference in using this command is that it provides larger port-class pools without allowing the mid-pool to use a higher number of buffers in the root pool.
Range	1 to 10
Default	1
Introduced	16.0.R1
Platforms	7750 SR-7/12/12e

allocation-weight *number*

Synopsis	Root pool allocation weight used to calculate pool size
Context	**configure** qos hs-pool-policy *named-item* root-tier root-pool *number* allocation-weight *number*
Tree	allocation-weight
Description	This command specifies the weight that is applied to the root pool and is divided by the sum of all root pool weights to derive the pool's buffer allocation factor. The amount of buffers remaining after the system-reserve percentage is applied is multiplied by the buffer allocation factor to derive the pool size. A root pool with an allocation weight set to “0” is considered inactive and is not allocated buffers. When a root pool’s allocation weight is modified, all root pools, mid-tier pools, and port class pool sizes are reevaluated and modified when necessary.

Platforms	7750 SR-7/12/12e

hw-agg-shaper-scheduler-policy [name] *named-item-64*

Synopsis	Enter the **hw-agg-shaper-scheduler-policy** list instance
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64*
Tree	hw-agg-shaper-scheduler-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the attributes of a hardware aggregate shaper scheduler policy.
Max. instances	127
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

[**name**] *named-item-64*

Synopsis	Name of the hardware aggregate shaper scheduler policy
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64*
Tree	hw-agg-shaper-scheduler-policy
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

congestion-threshold *number*

Synopsis	Congestion threshold of the scheduler
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* congestion-threshold *number*
Tree	congestion-threshold
Description	This command configures the congestion threshold for the hardware aggregate shaper scheduler policy, which, if exceeded, triggers the hardware aggregate scheduler algorithm. The value is expressed as a percentage of the scheduler rate.
Range	0 to 100
Default	90
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

description *description*

Synopsis	Text description
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* description *description*

Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

group [group-name] *named-item*

Synopsis	Add a list entry for **group**
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* group *named-item*
Tree	group
Max. instances	6
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

[**group-name**] *named-item*

Synopsis	Name of the HW aggregate shaper scheduler policy group
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* group *named-item*
Tree	group
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

max-percent-rate *decimal-number*

Synopsis	Maximum frame-based bandwidth percentage
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* max-percent-rate *decimal-number*
Tree	max-percent-rate
Description	This command configures the rate of the hardware aggregate shaper scheduler expressed as a percentage of the port rate.
Range	0.01 to 100.00

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: **max-percent-rate** or **max-rate**.
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

max-rate *(number | keyword)*

Synopsis	Maximum frame-based bandwidth limit
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* max-rate *(number | keyword)*
Tree	max-rate
Range	1 to 6400000000
Units	kilobps
Options	max
Default	max
Notes	The following elements are part of a choice: **max-percent-rate** or **max-rate**.
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

monitor-threshold *number*

Synopsis	Monitor threshold for the scheduler
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* monitor-threshold *number*
Tree	monitor-threshold
Description	This command configures the monitor threshold for the hardware aggregate shaper scheduler policy, which is used for egress scheduler monitoring. The value is expressed as a percentage of the scheduler rate, which is considered as a limit for determining congestion.
Range	0 to 100
Default	0
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

sched-class [class-id] *number*

Synopsis	Enter the **sched-class** list instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* sched-class *number*
Tree	sched-class
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

[**class-id**] *number*

Synopsis	Scheduling class ID for the scheduler policy
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* sched-class *number*
Tree	sched-class
Range	1 to 6
Notes	This element is part of a list key.
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

group *reference*

Synopsis	Group associated with the scheduling class
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* sched-class *number* group *reference*
Tree	group
Description	This command assigns the specified scheduling class to a group within a hardware aggregate shaper scheduler policy.
Reference	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* group *named-item*
Introduced	21.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

weight *number*

Synopsis	Weight associated with the scheduling class
Context	**configure** qos hw-agg-shaper-scheduler-policy *named-item-64* sched-class *number* weight *number*
Tree	weight
Description	This command configures the weight for a scheduling class within the specified group.
Range	1 to 8

Platforms	All

fragment *keyword*

Synopsis	Fragmentation state as the match criterion
Context	**configure** qos network *network-policy-name* egress ip-criteria entry *number* match fragment *keyword*
Tree	fragment
Description	This command configures fragmented or non-fragmented IP packets as a network QoS policy match criterion. When unconfigured, all packets match regardless of whether they are fragmented.
Options	false, true
Introduced	16.0.R1
Platforms	All

icmp-type *number*

Synopsis	ICMP type in the ICMP header of IPv4 packet to match
Context	**configure** qos network *network-policy-name* egress ip-criteria entry *number* match icmp-type *number*
Tree	icmp-type
Description	This command configures matching on the ICMP type field in the ICMP header of an IPv4 packet as a network QoS match criterion. An entry containing Layer 4 non-zero match criteria does not match non-initial (second, third, and so on) fragments of a fragmented packet because only the first fragment contains the Layer 4 information. Similarly, an entry containing a match criteria of zero may not match non-initial fragments when the Layer 4 header is not present in a packet fragment and other match criteria are also met.
Range	0 to 255
Introduced	16.0.R1
Platforms	All

start *number*

Synopsis	Lower bound of port range to match
Context	**configure** qos network *network-policy-name* egress ipv6-criteria entry *number* match dst-port range start *number*
Tree	start
Range	0 to 65535
Introduced	16.0.R1
Platforms	All

fragment *keyword*

Synopsis	Fragmentation state as the match criterion
Context	**configure** qos network *network-policy-name* egress ipv6-criteria entry *number* match fragment *keyword*
Tree	fragment
Description	This command configures fragmented or non-fragmented IPv6 packets as a network QoS policy match criterion. When unconfigured, all packets match regardless of whether they are fragmented.
Options	false, true, first-only, non-first-only
Introduced	16.0.R1
Platforms	All

icmp-type *number*

Synopsis	ICMPv6 type in ICMPv6 header of IPv6 packet to match
Context	**configure** qos network *network-policy-name* egress ipv6-criteria entry *number* match icmp-type *number*
Tree	icmp-type
Description	This command configures matching on the ICMPv6 type field in the ICMPv6 header of an IPv6 packet as a network QoS match criterion. An entry containing Layer 4 non-zero match criteria does not match non-initial (second, third, and so on) fragments of a fragmented packet because only the first fragment contains the Layer 4 information. Similarly, an entry containing a match criteria of zero may not match non-initial fragments when the Layer 4 header is not present in a packet fragment and other match criteria are also met.

policy-id *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	QoS network policy ID
Context	**configure** qos network *network-policy-name* policy-id *number*
Tree	policy-id
Description	This command specifies the QoS network policy ID and uniquely identifies the policy on the router. Network **policy-id 1** exists as the default policy that is applied to all network interfaces by default. The network policy-id 1 cannot be modified or deleted. It defines the default DSCP-to-FC mapping and MPLS EXP-to-FC mapping for the ingress. For the egress, it defines forwarding classes that represent individual queues and the packet marking criteria. Network **policy-id 1** exists as the default policy that is applied to all network ports by default. This default policy cannot be modified or deleted. It defines the default DSCP-to-FC mapping and default unicast meters for ingress IP traffic. For the egress, it defines the forwarding class to dot1p and DSCP values and the packet marking criteria. If a new network policy is created (for instance, **policy-id 3**), only the default action and egress forwarding class parameters are identical to the default policy. A new network policy does not contain the default DSCP-to-FC and MPLS-EXP-to-FC mapping for network QoS policy of type **ip-interface** or the DSCP-to-FC mapping (for network QoS policy of type **port**). The default network policy can be copied to create a new network policy that includes the default ingress DSCP-to-FC and MPLS EXP-to-FC mapping (as appropriate).

avg-frame-overhead *decimal-number*

Synopsis	Average packet-to-frame encapsulation overhead
Context	**configure** qos network-queue *named-item* queue *number* avg-frame-overhead *decimal-number*
Tree	avg-frame-overhead
Description	This command configures the average frame overhead, expressed as a percentage, at which the offered load expands on the physical medium (wire) at egress. This is important for accurate "on-the-wire" rate calculations at various levels of H-QoS that do not inherently account for the physical medium characteristics. For example, without considering this overhead, a port scheduler in H-QoS might inaccurately estimate the available bandwidth on the wire, potentially leading to congestion issues and unexpected packet loss. The rates impacted by the average frame overhead encompass the rates set on port-schedulers and aggregate rate limits for subscribers and Vports. This impact is evident in the configured values, which represent on-the-wire rates. Queue configured rates, however, remain unaffected by this adjustment and continue to reflect Layer 2 rates. Configure the average frame overhead in networks with physical mediums that have constant sizes of transmission units (packets or cells) or in scenarios where the average packet size is known. The average frame overhead only affects rate and weight calculations and does not impact collected statistics for accounting purposes. For Ethernet ports, the effect of this command depends on the setting of the **avg-frame-overhead-mode** command in advanced QoS configuration policy associated with the queue. If the **avg-frame-overhead-mode** is set to **auto**, the packet encapsulation overhead calculation is based on a fixed 20 bytes (7 bytes for preamble, 1 byte for start of frame delimiter and 12 bytes for Inter-Frame Gap (IFG)) that Ethernet medium adds to every packet during transmission. In other words, the configured rates for port scheduler and aggregate rate limits for subscribers and Vports represent on-the-wire rates.

arbiter-name *named-item*

Synopsis	Arbiter name
Context	**configure** qos policer-control-policy *named-item* tier *number* arbiter *named-item* arbiter-parent arbiter-name *named-item*
Tree	arbiter-name
Description	This command specifies the arbiter name. In tier 1, the arbiter name is not allowed and only the system reversed name "root" is accepted. The specified arbiter name must exist within the policer control policy at tier 1 or the parent command fails. When a tiered arbiter is acting as a parent for another tiered arbiter, the parent arbiter cannot be removed from the policy. The child arbiter receives all bandwidth directly from its parent arbiter (that receives bandwidth from the root arbiter).
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R3
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

weight *number*

Synopsis	Weight attribute at parent level applied to children
Context	**configure** qos policer-control-policy *named-item* tier *number* arbiter *named-item* arbiter-parent weight *number*
Tree	weight
Description	This command defines how multiple children at the same parent strict level compete when insufficient bandwidth exists on the parent for that level. Each child's weight is divided by the sum of the active children's weights and the result is multiplied by the available bandwidth. If a child cannot receive its entire weighted fair share of bandwidth due to a defined child rate limit, the remainder of its bandwidth is distributed between the other children based on their weights.
Range	1 to 100
Default	1
Introduced	16.0.R3
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

port-scheduler-policy [name] *named-item*

Synopsis	Enter the **port-scheduler-policy** list instance
Context	**configure** qos port-scheduler-policy *named-item*
Tree	port-scheduler-policy
Description	Commands in this context configure port scheduler policies. When a port scheduler has been associated with an egress port, it is possible to override the following command options: • The maximum rate allowed for the scheduler • The maximum rate for each priority level (1 to 8) • The CIR associated with each priority level (1 to 8) The orphan priority level (level 0) has no configuration command options and cannot be overridden.
Max. instances	1023
Introduced	16.0.R1
Platforms	All

[**name**] *named-item*

Synopsis	Port scheduler policy name
Context	**configure** qos port-scheduler-policy *named-item*
Tree	port-scheduler-policy
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

accounting-mode *keyword*

Synopsis	Accounting mode of the port scheduler policy
Context	**configure** qos port-scheduler-policy *named-item* accounting-mode *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	accounting-mode
Description	This command configures the accounting mode of the port scheduler policy. The system counts below-CIR and above-CIR packets separately only when the policer output is parented by different priority levels within the port scheduler policy.
Options	auto – Count below-CIR and above-CIR packets together separate-below-cir – Count below-CIR and above-CIR packets separately
Default	auto
Introduced	25.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

Platforms	All

monitor-threshold *number*

Synopsis	Congestion monitoring threshold
Context	**configure** qos port-scheduler-policy *named-item* group *named-item* monitor-threshold *number*
Tree	monitor-threshold
Description	This command defines the congestion monitoring threshold for the desired monitoring entity under the port scheduler for per aggregate port scheduler rate, per individual level, and per group that is aggregating multiple levels. The congestion threshold is specified as a percentage of the configured PIR for the entity for which congestion monitoring is desired. For example, if the configured PIR for level 1 is 100000 kb/s, and the monitoring threshold is set to 90%, an event where the offered rate is greater than 90,000 kb/s is recorded. This event is shown as part of the cumulative count of congestion threshold exceeds since the last clearing of the counters.
Range	0 to 100
Default	0
Introduced	16.0.R1
Platforms	All

Introduced	16.0.R1
Platforms	7750 SR-7/12/12e

rate *(number | keyword)*

Synopsis	Administrative PIR
Context	**configure** qos queue-group-templates egress queue-group *named-item* hs-wrr-group *number* rate *(number | keyword)*
Tree	rate
Range	1 to 2000000000
Units	kilobps
Options	max

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	max
Notes	The following elements are part of a choice: **percent-rate** or **rate**.
Introduced	16.0.R1
Platforms	7750 SR-7/12/12e

hw-agg-shaper-queues

Synopsis	Enter the **hw-agg-shaper-queues** context
Context	**configure** qos queue-group-templates egress queue-group *named-item* hw-agg-shaper-queues
Tree	hw-agg-shaper-queues
Description	Commands in this context configure the queue resources from which to draw for a given object (for example, queue groups).
Introduced	24.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

queue-set-size *(number | keyword)*

Synopsis	Queue-set size override for the FP resource policy
Context	**configure** qos queue-group-templates egress queue-group *named-item* hw-agg-shaper-queues queue-set-size *(number | keyword)*
Tree	queue-set-size
Description	This command configures the queue-set size or non-shaper-queue to use for this queue-group template.
Range	2 to 8
Options	non-shaper-queues
Introduced	24.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

policer [policer-id] *number*

Synopsis	Enter the **policer** list instance
Context	**configure** qos queue-group-templates egress queue-group *named-item* policer *number*
Tree	policer
Description	Commands in this context configure a QoS egress queue-group policer.
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

[**policer-id**] *number*

Synopsis	Egress queue-group policer ID
Context	**configure** qos queue-group-templates egress queue-group *named-item* policer *number*
Tree	policer
Description	This command specifies the queue-group policer that will either be created or edited within the queue group template. For VSR, the queue group template may only have up to eight policers (numbered 1 through 8).
Range	1 to 16
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

adaptation-rule

Synopsis	Enter the **adaptation-rule** context
Context	**configure** qos queue-group-templates egress queue-group *named-item* policer *number* adaptation-rule
Tree	adaptation-rule
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

cir *keyword*

Synopsis	Constraint used when deriving the operational CIR value
Context	**configure** qos queue-group-templates egress queue-group *named-item* policer *number* adaptation-rule cir *keyword*
Tree	cir
Options	max – At maximum, the configured rate min – At minimum, the configured rate closest – Closest rate to the configured value
Default	closest
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

© 2026 Nokia.

pir *keyword*

Synopsis	Constraint used when deriving the operational PIR value
Context	**configure** qos queue-group-templates egress queue-group *named-item* policer *number* adaptation-rule pir *keyword*
Tree	pir
Options	max – At maximum, the configured rate min – At minimum, the configured rate closest – Closest rate to the configured value
Default	closest
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

adv-config-policy *reference*

Synopsis	Advanced QoS policy name
Context	**configure** qos queue-group-templates egress queue-group *named-item* policer *number* adv-config-policy *reference*
Tree	adv-config-policy
Reference	**configure** qos adv-config-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

arbiter-parent

Synopsis	Enter the **arbiter-parent** context
Context	**configure** qos queue-group-templates egress queue-group *named-item* policer *number* arbiter-parent
Tree	arbiter-parent
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

arbiter-name *named-item*

Synopsis	Arbiter name
Context	**configure** qos queue-group-templates egress queue-group *named-item* policer *number* arbiter-parent arbiter-name *named-item*

sched-class *(number | keyword)*

Synopsis	Scheduling class for the queue-group queue

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos queue-group-templates egress queue-group *named-item* queue *number* sched-class *(number | keyword)*
Tree	sched-class
Description	This command configures a scheduling class for the specified queue. If the **auto** option is configured, the system automatically performs the scheduling class mapping.
Range	1 to 6
Options	auto
Default	auto
Introduced	24.10.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

scheduler-parent

Synopsis	Enable the **scheduler-parent** context
Context	**configure** qos queue-group-templates egress queue-group *named-item* queue *number* scheduler-parent
Tree	scheduler-parent
Notes	The following elements are part of a choice: **port-parent** or **scheduler-parent**.
Introduced	16.0.R1
Platforms	All

cir-level *number*

Synopsis	Level of priority while feeding to the parent
Context	**configure** qos queue-group-templates egress queue-group *named-item* queue *number* scheduler-parent cir-level *number*
Tree	cir-level
Range	0 to 8
Default	0
Introduced	16.0.R1
Platforms	All

cir-weight *number*

Synopsis	Weight used at the within-CIR port priority level

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos queue-group-templates egress queue-group *named-item* queue *number* scheduler-parent cir-weight *number*
Tree	cir-weight
Range	0 to 100
Default	1
Introduced	16.0.R1
Platforms	All

level *number*

Synopsis	Level of priority while feeding to the parent
Context	**configure** qos queue-group-templates egress queue-group *named-item* queue *number* scheduler-parent level *number*
Tree	level
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	All

scheduler-name *named-item*

Synopsis	Parent scheduler name
Context	**configure** qos queue-group-templates egress queue-group *named-item* queue *number* scheduler-parent scheduler-name *named-item*
Tree	scheduler-name
Description	This command associates a scheduler name to a queue. The scheduler name must have previously been defined within an existing scheduler policy and exist on each SAP the queue is created on. There are no checks performed to ensure that the scheduler name exists within an existing scheduler policy. Until the scheduler name exists on the egress SAP, the queue operates in an orphaned state.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

cir-non-profiling *boolean*

Synopsis	Prevent profile modification of CIR dependent packet
Context	**configure** qos queue-group-templates ingress queue-group *named-item* queue *number* cir-non-profiling *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	cir-non-profiling
Description	When configured to **true**, the system prevents the modification of the profile of a packet-dependent queue rate compared to its configured CIR. The CIR continues to be used to affect the scheduling priority of a queue. This command is only supported on hardware that is FP4-based and later and is ignored when the related policy is applied to FP3-based hardware. This command should not be configured under an ingress queue group template queue associated with a LAG which spans FP4-based and later and FP3-based hardware as the resulting operation could be different depending on which hardware type the traffic ingresses.
Default	false
Introduced	16.0.R2
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

Tree	scheduler-name

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command associates a scheduler name to a queue. The scheduler name must have previously been defined within an existing scheduler policy and exist on each SAP the queue is created on. There are no checks performed to ensure that the scheduler name exists within an existing scheduler policy. Until the scheduler name exists on the egress SAP, the queue operates in an orphaned state.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

weight *number*

Synopsis	Weight used by the scheduler for feeding the queue

Range	0.01 to 100.00
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

reference-rate *keyword*

Synopsis	Reference rate
Context	**configure** qos sap-egress *qos-policy-name* policer *number* percent-rate reference-rate *keyword*
Tree	reference-rate
Options	local-limit, reference-port-limit
Default	local-limit
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

port-parent

Synopsis	Enable the **port-parent** context
Context	**configure** qos sap-egress *qos-policy-name* policer *number* port-parent
Tree	port-parent
Notes	The following elements are part of a choice: **port-parent** or **scheduler-parent**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

cir-level *number*

Synopsis	Port priority level for within-CIR offered load
Context	**configure** qos sap-egress *qos-policy-name* policer *number* port-parent cir-level *number*
Tree	cir-level

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command defines the port priority that the policer uses to receive bandwidth for its within-CIR offered load. If this command is set to the default value, the policer does not receive bandwidth during the port schedulers with-CIR pass and the **cir-weight** command is ignored.
Range	0 to 8
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

cir-weight *number*

Synopsis	Weight to use in the within-CIR port priority level
Context	**configure** qos sap-egress *qos-policy-name* policer *number* port-parent cir-weight *number*
Tree	cir-weight
Description	This command defines the weight that the policer uses at the within-CIR port priority level. All CIR weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Each individual active weight is then divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. When this command is set to the default value, the policer receives bandwidth only after other children with a non-zero weight at this level have been serviced.
Range	0 to 100
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

level *number*

Synopsis	Port priority level for above-CIR behavior
Context	**configure** qos sap-egress *qos-policy-name* policer *number* port-parent level *number*
Tree	level
Range	1 to 8
Default	1
Introduced	16.0.R1

scheduler-parent

Synopsis	Enable the **scheduler-parent** context
Context	**configure** qos sap-egress *qos-policy-name* policer *number* scheduler-parent
Tree	scheduler-parent
Notes	The following elements are part of a choice: **port-parent** or **scheduler-parent**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

cir-level *number*

Synopsis	Port priority level for within-CIR offered load
Context	**configure** qos sap-egress *qos-policy-name* policer *number* scheduler-parent cir-level *number*
Tree	cir-level
Description	This command defines the hierarchy priority level when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If this command is set to the default value, the policer does not receive bandwidth during the schedulers within-CIR pass and the **cir-weight** command is ignored.
Range	0 to 8
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

cir-weight *number*

Synopsis	Weight to use in the within-CIR port priority level
Context	**configure** qos sap-egress *qos-policy-name* policer *number* scheduler-parent cir-weight *number*
Tree	cir-weight
Description	The command defines the relative weight of the policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent scheduler name at the within-CIR priority level. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level have been serviced.

Range	0 to 100
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

level *number*

Synopsis	Priority level for bandwidth on the parent scheduler
Context	**configure** qos sap-egress *qos-policy-name* policer *number* scheduler-parent level *number*
Tree	level
Description	This command defines the priority level when compared with other policers, queues, and schedulers when competing for bandwidth on the parent scheduler. Children of the parent scheduler with a lower priority do not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

avg-frame-overhead *decimal-number*

Synopsis	Average packet-to-frame encapsulation overhead
Context	**configure** qos sap-egress *qos-policy-name* queue *number* avg-frame-overhead *decimal-number*
Tree	avg-frame-overhead
Description	This command configures the average frame overhead, expressed as a percentage, at which the offered load expands on the physical medium (wire) at egress. This is important for accurate "on-the-wire" rate calculations at various levels of H-QoS that do not inherently account for the physical medium characteristics. For example, without considering this overhead, a port-scheduler in H-QoS might inaccurately estimate

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the available bandwidth on the wire, potentially leading to congestion issues and unexpected packet loss.

The rates impacted by the average frame overhead encompass the rates set on port-schedulers and aggregate rate limits for subscribers and Vports. This impact is evident in the configured values, which represent on-the-wire (OTW) rates. Queue configured rates, however, remain unaffected by this adjustment and continue to reflect Layer 2 rates.

Configure the average frame overhead in networks with physical mediums that have constant sizes of transmission units (packets or cells) or in scenarios where the average packet size is known.

The average frame overhead only affects rate and weight calculations and does not impact collected statistics for accounting purposes.

For Ethernet ports, the effect of this command depends on the setting of the **avg-frame-overhead-mode** command in advanced QoS configuration policy associated with the queue. If the **avg-frame-overhead-mode** is set to **auto**, the packet encapsulation overhead calculation is based on a fixed 20 bytes (7 bytes for preamble, 1 byte for start of frame delimiter and 12 bytes for Inter-Frame Gap) that Ethernet medium adds to every packet during transmission. In other words, the configured rates for port-scheduler and aggregate rate limits for subscribers and Vports represent OTW rates.

Range	0.00 to 100.00
Default	0.00
Introduced	16.0.R1

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

level *number*

Synopsis	Level of priority while feeding to the parent
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer arbiter-parent level *number*
Tree	level
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

weight *number*

Synopsis	Weight to be used by the arbiter for feeding this policer
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer arbiter-parent weight *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	weight
Range	1 to 100
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cbs *(number | keyword)*

Synopsis	Exceed threshold of the CIR leaky bucket of the policer
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer cbs *(number | keyword)*
Tree	cbs
Range	0 to 268435456
Units	bytes
Options	auto
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mbs *(number | keyword)*

Synopsis	High priority 'violate' threshold of PIR leaky bucket of this policer
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer mbs *(number | keyword)*
Tree	mbs
Range	0 to 268435456
Units	bytes
Options	auto
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

packet-byte-offset *number*

Synopsis	Packet size modification for policing information

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer packet-byte-offset *number*
Tree	packet-byte-offset
Range	-64 to 31
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

policer-id-range

Synopsis	Enable the **policer-id-range** context
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer policer-id-range
Tree	policer-id-range
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the dynamic policer ID range
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer policer-id-range end *number*
Tree	end
Range	1 to 63
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the dynamic policer ID range
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer policer-id-range start *number*
Tree	start
Range	1 to 63
Notes	This element is mandatory.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stat-mode *keyword*

Synopsis	Mode of statistics collected by the policer
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-policer stat-mode *keyword*
Tree	stat-mode
Options	no-stats, minimal, offered-profile-no-cir, offered-total-cir, offered-profile-cir, offered-limited-capped-cir, offered-profile-capped-cir
Default	minimal
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dynamic-queue

Synopsis	Enter the **dynamic-queue** context
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue
Tree	dynamic-queue
Description	Commands in this context configure dynamically-created queues for subscriber-management applications such as 5G FWA sessions. The configuration options in this context are the same as for static queues configured in the **configure qos sap-egress queue** context, but are automatically applied to dynamically-created queues. See the *7750 SR and VSR BNG CUPS User Plane Function Guide*, "PCC rules based QoS" for more information about Dynamic QoS based on PCC rules for FWA sessions. See the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for general information about configuring QoS.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cbs *(number | keyword)*

Synopsis	Committed buffer space reserved for the queue
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue cbs *(number | keyword)*
Tree	cbs

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the committed buffer space (CBS) that is reserved for the queue. The CBS is applied to each dynamic queue and is not shared.
Range	0 to 2097151
Units	kilobytes
Options	auto
Default	auto
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

mbs *(number | keyword)*

Synopsis	Maximum buffer space allowed for the queue
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue mbs *(number | keyword)*
Tree	mbs
Description	This command configures the maximum buffer space (MBS) allowed for the queue. The MBS is applied to each dynamic queue and is not shared.
Range	0 to 2147482624
Units	bytes
Options	auto
Default	auto
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

packet-byte-offset *number*

Synopsis	Packet byte offset used to modify the input packet size
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue packet-byte-offset *number*
Tree	packet-byte-offset
Description	This command configures the packet-byte offset the system uses to modify the size of the input packets. This also applies to any charging statistics.
Range	-64 to 31
Default	0
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port-parent

Synopsis	Enable the **port-parent** context
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue port-parent
Tree	port-parent
Description	Commands in this context configure the queue treatment by the port parent, that governs the available bandwidth for the queue. They define how this queue contends with the other children for the parent bandwidth. See the *7750 SR and VSR BNG CUPS User Plane Function Guide*, "PCC rules based QoS" for more information about Dynamic QoS based on PCC rules for FWA sessions. See the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for general information about configuring QoS.
Notes	The following elements are part of a choice: **port-parent** or **scheduler-parent**.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cir-level *number*

Synopsis	Port priority for within-CIR passes
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue port-parent cir-level *number*
Tree	cir-level
Range	0 to 8
Default	0
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cir-weight *number*

Synopsis	Weight used for the within-CIR port-priority level
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue port-parent cir-weight *number*
Tree	cir-weight
Description	This command configures the weight the queue uses to receive bandwidth at the within-CIR port priority level. This also applies to any charging statistics.
Range	0 to 100

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	0
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

level *number*

Synopsis	Port priority level for above-CIR offered load
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue port-parent level *number*
Tree	level
Range	1 to 8
Default	1
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

weight *number*

Synopsis	Weight used for the above-CIR port-priority level
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue port-parent weight *number*
Tree	weight
Range	0 to 100
Default	1
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

queue-id-range

Synopsis	Enable the **queue-id-range** context
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue queue-id-range
Tree	queue-id-range
Description	Commands in this context configure the range of IDs from which dynamic queues are allocated. You cannot use these IDs for static queues within the same policy. See the *7750 SR and VSR BNG CUPS User Plane Function Guide*, "PCC rules based QoS" for more information about Dynamic QoS based on PCC rules for FWA sessions.

See the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for general information about configuring QoS.

Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the dynamic queue range
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue queue-id-range end *number*
Tree	end
Range	1 to 8
Notes	This element is mandatory.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of dynamic queue range
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue queue-id-range start *number*
Tree	start
Range	1 to 8
Notes	This element is mandatory.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

scheduler-parent

Synopsis	Enable the **scheduler-parent** context
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue scheduler-parent
Tree	scheduler-parent
Description	Commands in this context configure the queue treatment by the parent scheduler that governs the available bandwidth for the queue. They define how this queue contends with the other children for the parent bandwidth.

Notes The following elements are part of a choice: **port-parent** or **scheduler-parent**.

Introduced 23.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cir-level *number*

Synopsis Priority for feeding the parent for within-CIR passes

Context **configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue scheduler-parent cir-level *number*

Tree cir-level

Description This command configures the priority level the system uses to feed to the parent for within-CIR passes.

Range 0 to 8

Default 0

Introduced 23.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cir-weight *number*

Synopsis Weight used for the within-CIR port-priority level

Context **configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue scheduler-parent cir-weight *number*

Tree cir-weight

Range 0 to 100

Default 1

Introduced 23.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

level *number*

Synopsis Priority level for the above-CIR offered load

Context **configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue scheduler-parent level *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	level
Description	This command configures the priority level of the queue (as compared to other competing schedulers and queues) for the above-CIR offered load bandwidth, when feeding the parent scheduler.
Range	1 to 8
Default	1
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

scheduler-name *named-item*

Synopsis	Name of the parent scheduler
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue scheduler-parent scheduler-name *named-item*
Tree	scheduler-name
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

weight *number*

Synopsis	Weight used for the above-CIR port priority level
Context	**configure** qos sap-egress *qos-policy-name* subscriber-mgmt dynamic-queue scheduler-parent weight *number*
Tree	weight
Range	0 to 100
Default	1
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pcc-rule-entry

use-policer-result-marking-dot1p-inner *boolean*

Synopsis	Enable using egress policer for Dot1p inner marking
Context	**configure** qos sap-egress *qos-policy-name* use-policer-result-marking-dot1p-inner *boolean*
Tree	use-policer-result-marking-dot1p-inner
Description	When configured, this command enables using the egress policer profile result to mark dot1p-inner bits.
Default	false
Introduced	23.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

use-policer-result-marking-tunnel *boolean*

Synopsis	Enable propagation of profiling on PW-SAP to tunnel
Context	**configure** qos sap-egress *qos-policy-name* use-policer-result-marking-tunnel *boolean*
Tree	use-policer-result-marking-tunnel
Description	When configured to **true**, the router propogates the profile result (in-profile or out-of-profile) generated by egress policers at the PW-SAP level to the underlying transport tunnel (network level). This allows consistent QoS markings application at both the service access and tunnel levels. For this behavior to take effect in the subscriber management context, the **configure subscriber-mgmt sla-profile egress qos qos-marking-from-sap false** command must be configured.
Default	false
Introduced	26.7.R1
Platforms	7750 SR-1, 7750 SR-1 (FP5), 7750 SR-s

sap-ingress [sap-ingress-policy-name] *qos-policy-name*

Synopsis	Enter the **sap-ingress** list instance
Context	**configure** qos sap-ingress *qos-policy-name*
Tree	sap-ingress
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**sap-ingress-policy-name**] *qos-policy-name*

Synopsis	Policy name
Context	**configure** qos sap-ingress *qos-policy-name*
Tree	sap-ingress
String length	1 to 64
String format	'qos-policy-name' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

default-fc *sap-ingress-fc-name*

Synopsis	Default forwarding class for non-matching traffic
Context	**configure** qos sap-ingress *qos-policy-name* default-fc *sap-ingress-fc-name*
Tree	default-fc
String length	1 to 32
String format	'sap-ingress-fc-name' must be one of be|l2|af|l1|h2|ef|h1|nc with optional .sub-name (e.g. be or ef.my-sub)
Introduced	16.0.R1
Platforms	All

default-priority *keyword*

Synopsis	Priority for packets received on an ingress SAP
Context	**configure** qos sap-ingress *qos-policy-name* default-priority *keyword*
Tree	default-priority
Options	low, high
Default	low
Introduced	16.0.R1
Platforms	All

description *description*

Synopsis	Text description

percent-rate

Synopsis	Enter the **percent-rate** context
Context	**configure** qos sap-ingress *qos-policy-name* policer *number* percent-rate
Tree	percent-rate
Description	Commands in this context configure the policer PIR and CIR as a percentage of the actual port speed or reference bandwidth, as opposed to absolute rate values. The reference bandwidth is configured on a per-port basis using the **configure port ethernet ingress-reference-bw** command and overrides the actual port speed. If the reference bandwidth is modified, the PIR and CIR are recalculated based on the new bandwidth and the configured percentage values.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	This command is mutually exclusive with the **rate** command used to specify absolute rate values for the policer. Configuring one removes the existing configuration of the other.
Notes	The following elements are part of a choice: **percent-rate** or **rate**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

Synopsis	Enter the **scheduler-parent** context
Context	**configure** qos sap-ingress *qos-policy-name* policer *number* scheduler-parent
Tree	scheduler-parent
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

cir-level *number*

Synopsis	Port priority level for within-CIR offered load
Context	**configure** qos sap-ingress *qos-policy-name* policer *number* scheduler-parent cir-level *number*
Tree	cir-level
Description	This command defines the hierarchy priority level when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If this command is set to the default value, the policer does not receive bandwidth during the within-CIR pass of the scheduler and the **cir-weight** command is ignored.
Range	0 to 8
Default	0
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

cir-weight *number*

Synopsis	Weight to use in the within-CIR port priority level
Context	**configure** qos sap-ingress *qos-policy-name* policer *number* scheduler-parent cir-weight *number*
Tree	cir-weight
Description	The command defines the relative weight of the policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent scheduler name at the within-CIR priority level. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. When this command is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level have been serviced.
Range	0 to 100
Default	1
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

level *number*

Synopsis	Priority level for bandwidth on the parent scheduler
Context	**configure** qos sap-ingress *qos-policy-name* policer *number* scheduler-parent level *number*
Tree	level
Description	This command defines the priority level when compared with other policers, queues, and schedulers when competing for bandwidth on the parent scheduler. Children of the parent scheduler with a lower priority do not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.
Range	1 to 8
Default	1
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context will not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.

Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	All

weight *number*

Synopsis	Weight used at the above-CIR port priority level
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* port-parent weight *number*
Tree	weight
Range	0 to 100
Default	1
Introduced	16.0.R1
Platforms	All

rate

Synopsis	Enter the **rate** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* rate
Tree	rate
Notes	The following elements are part of a choice: **percent-rate** or **rate**.
Introduced	16.0.R1
Platforms	All

cir *(number | keyword)*

Synopsis	Administrative CIR
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* rate cir *(number | keyword)*
Tree	cir
Range	0 to 6400000000
Units	kilobps
Options	sum, max
Default	sum
Introduced	16.0.R1
Platforms	All

pir *(number | keyword)*

Synopsis	Administrative PIR
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* rate pir *(number | keyword)*
Tree	pir
Range	1 to 6400000000
Units	kilobps
Options	max
Default	max
Introduced	16.0.R1
Platforms	All

scheduler-parent

Synopsis	Enable the **scheduler-parent** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* scheduler-parent
Tree	scheduler-parent
Notes	The following elements are part of a choice: **port-parent** or **scheduler-parent**.
Introduced	16.0.R1
Platforms	All

cir-level *number*

Synopsis	Level of priority while feeding to the parent
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* scheduler-parent cir-level *number*
Tree	cir-level
Range	0 to 8
Default	0
Introduced	16.0.R1
Platforms	All

cir-weight *number*

Synopsis	Weight used at the within-CIR port priority level
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* scheduler-parent cir-weight *number*
Tree	cir-weight
Range	0 to 100
Default	1
Introduced	16.0.R1
Platforms	All

level *number*

Synopsis	Level of priority while feeding to the parent
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* scheduler-parent level *number*
Tree	level
Range	1 to 8

Default	1
Introduced	16.0.R1
Platforms	All

scheduler-name *named-item*

Synopsis	Scheduler name
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* scheduler-parent scheduler-name *named-item*
Tree	scheduler-name
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

weight *number*

Synopsis	Relative weight of the scheduler to feed the queue
Context	**configure** qos scheduler-policy *named-item* tier *number* scheduler *named-item* scheduler-parent weight *number*
Tree	weight
Range	0 to 100
Default	1
Introduced	16.0.R1
Platforms	All

shared-queue [shared-queue-policy-name] *named-item*

Synopsis	Enter the **shared-queue** list instance
Context	**configure** qos shared-queue *named-item*
Tree	shared-queue
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**shared-queue-policy-name**] *named-item*

Synopsis	Name of the default shared queue policy
Context	**configure** qos shared-queue *named-item*
Tree	shared-queue
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

description *description-or-empty*

Synopsis	Text description
Context	**configure** qos shared-queue *named-item* description *description-or-empty*
Tree	description
String length	0 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

fc [fc-name] *keyword*

Synopsis	Enter the **fc** list instance
Context	**configure** qos shared-queue *named-item* fc *keyword*
Tree	fc
Introduced	16.0.R1
Platforms	All

[**fc-name**] *keyword*

Synopsis	Forwarding class mapping to queue mapping
Context	**configure** qos shared-queue *named-item* fc *keyword*
Tree	fc
Options	be – Best Effort

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

l2 – Low 2 (best effort)
af – Assured Forwarding (assured)
l1 – Low 1 (assured)
h2 – High 2 (high priority)
ef – Expedited Forwarding (high priority)
h1 – High 1 (high priority)
nc – Network Control (high priority)

Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

broadcast-queue *number*

Synopsis	ID of queue to forward all broadcast traffic
Context	**configure** qos shared-queue *named-item* fc *keyword* broadcast-queue *number*
Tree	broadcast-queue
Range	9 to 32
Introduced	16.0.R1
Platforms	All

multicast-queue *number*

Synopsis	ID of queue to forward multicast traffic
Context	**configure** qos shared-queue *named-item* fc *keyword* multicast-queue *number*
Tree	multicast-queue
Range	9 to 32
Introduced	16.0.R1
Platforms	All

queue *number*

Synopsis	ID of queue to foward all traffic
Context	**configure** qos shared-queue *named-item* fc *keyword* queue *number*
Tree	queue
Range	1 to 8
Introduced	16.0.R1
Platforms	All

Platforms	All

drop-tail

Synopsis	Enter the **drop-tail** context
Context	**configure** qos shared-queue *named-item* queue *number* drop-tail
Tree	drop-tail
Introduced	16.0.R1
Platforms	All

low

Synopsis	Enter the **low** context
Context	**configure** qos shared-queue *named-item* queue *number* drop-tail low
Tree	low
Introduced	16.0.R1
Platforms	All

percent-reduction-from-mbs *(number | keyword)*

Synopsis	Low drop-tail percent from MBS that is reduced
Context	**configure** qos shared-queue *named-item* queue *number* drop-tail low percent-reduction-from-mbs *(number | keyword)*
Tree	percent-reduction-from-mbs
Range	0 to 100
Options	auto
Default	auto
Introduced	16.0.R1
Platforms	All

mbs *number*

Synopsis	Maximum buffers for the ingress shared queue
Context	**configure** qos shared-queue *named-item* queue *number* mbs *number*
Tree	mbs

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	0 to 100
Units	percent
Introduced	16.0.R1
Platforms	All

multipoint *boolean*

Synopsis	Apply as a multicast queue
Context	**configure** qos shared-queue *named-item* queue *number* multipoint *boolean*
Tree	multipoint
Introduced	16.0.R1
Platforms	All

queue-type *keyword*

Synopsis	Method used to service queue from hardware perspective
Context	**configure** qos shared-queue *named-item* queue *number* queue-type *keyword*
Tree	queue-type
Options	expedited, auto-expedited, best-effort
Default	auto-expedited
Introduced	16.0.R1
Platforms	All

rate

Synopsis	Enter the **rate** context
Context	**configure** qos shared-queue *named-item* queue *number* rate
Tree	rate
Introduced	16.0.R1
Platforms	All

cir *number*

Synopsis	CIR percentage rate
Context	**configure** qos shared-queue *named-item* queue *number* rate cir *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	cir
Range	0 to 100
Units	percent
Introduced	16.0.R1
Platforms	All

fir *number*

Synopsis	FIR percentage rate
Context	**configure** qos shared-queue *named-item* queue *number* rate fir *number*
Tree	fir
Range	0 to 100
Units	percent
Default	0
Introduced	16.0.R2
Platforms	All

pir *number*

Synopsis	PIR percentage rate
Context	**configure** qos shared-queue *named-item* queue *number* rate pir *number*
Tree	pir
Range	1 to 100
Units	percent
Default	100
Introduced	16.0.R1
Platforms	All

slope-policy [slope-policy-name] *named-item*

Synopsis	Enter the **slope-policy** list instance
Context	**configure** qos slope-policy *named-item*
Tree	slope-policy
Max. instances	511

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

[**slope-policy-name**] *named-item*

Synopsis	Slope policy name
Context	**configure** qos slope-policy *named-item*
Tree	slope-policy
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

description *description*

Synopsis	Text description
Context	**configure** qos slope-policy *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

ecn *boolean*

Synopsis	Specifies the ecn marking is enabled for this slope policy.
Context	**configure** qos slope-policy *named-item* ecn *boolean*
Tree	ecn
Default	false
Introduced	26.10.R1
Platforms	7750 SR-1 (FP5), 7750 SR-1se, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

exceed-slope

Synopsis	Enter the **exceed-slope** context
Context	**configure** qos slope-policy *named-item* exceed-slope
Tree	exceed-slope
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the exceed-priority RED slope
Context	**configure** qos slope-policy *named-item* exceed-slope admin-state *keyword*
Tree	admin-state
Options	enable, disable
Introduced	16.0.R1
Platforms	All

max-avg *number*

Synopsis	Buffer percentage after which drop probability is one
Context	**configure** qos slope-policy *named-item* exceed-slope max-avg *number*
Tree	max-avg
Range	0 to 100
Introduced	16.0.R1
Platforms	All

max-prob *number*

Synopsis	Drop probability to increase at exceed start-average
Context	**configure** qos slope-policy *named-item* exceed-slope max-prob *number*
Tree	max-prob
Range	0 to 100
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

start-avg *number*

Synopsis	Buffer percentage after which drop probability starts to rise above zero
Context	**configure** qos slope-policy *named-item* exceed-slope start-avg *number*
Tree	start-avg
Range	0 to 100
Introduced	16.0.R1
Platforms	All

high-slope

Synopsis	Enter the **high-slope** context
Context	**configure** qos slope-policy *named-item* high-slope
Tree	high-slope
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the high priority RED slope
Context	**configure** qos slope-policy *named-item* high-slope admin-state *keyword*
Tree	admin-state
Options	enable, disable
Introduced	16.0.R1
Platforms	All

max-avg *number*

Synopsis	Buffer percentage after which drop probability is one
Context	**configure** qos slope-policy *named-item* high-slope max-avg *number*
Tree	max-avg
Range	0 to 100
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

4.37.1 redundancy command descriptions

redundancy

Synopsis	Enter the **redundancy** context
Context	**configure** redundancy
Tree	redundancy
Introduced	16.0.R1
Platforms	All

bgp-evpn

Synopsis	Enter the **bgp-evpn** context
Context	**configure** redundancy bgp-evpn
Tree	bgp-evpn
Description	Commands in this context configure BGP-EVPN global timers.
Introduced	16.0.R1
Platforms	All

ethernet-segment

Synopsis	Enter the **ethernet-segment** context
Context	**configure** redundancy bgp-evpn ethernet-segment
Tree	ethernet-segment
Description	Commands in this context configure redundancy for ES applications.
Introduced	16.0.R1
Platforms	All

activation-timer *number*

Synopsis	Global ES activation timer
Context	**configure** redundancy bgp-evpn ethernet-segment activation-timer *number*
Tree	activation-timer
Description	This command configures the global ES activation timer. This timer delays the activation of a specified ES on a PE that has been elected as the DF. The SAP or SDP binding

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

associated to an ES is activated (in case of single-active multihoming) or added to the default multicast list (in case of all-active multihoming) only when this timer has expired.

The **configure service system bgp evpn ethernet-segment df-election es-activation-timer** command configuration at the ES-level supersedes this global ES activation timer.

Range	0 to 100
Units	seconds
Default	3
Introduced	16.0.R1
Platforms	All

boot-timer *number*

Synopsis	Time before BGP EVPN multihoming DF election algorithm
Context	**configure** redundancy bgp-evpn ethernet-segment boot-timer *number*
Tree	boot-timer

Description

This command allows the necessary time for the control plane protocols to come up on PE boot-up before bringing up the ESs and running the DF algorithm.

The following considerations apply to this command:

- The boot timer duration provide enough time to allow the IOMs and BGP sessions to come up before exchanging ES routes and running the DF election for each EVI or ISID.
- The boot timer is synchronized across CPMs and is relative to the system uptime; it is not changed or reset on CPM switchover.
- The boot timer is never interrupted (the **es-activation-timer**, however, can be interrupted if there is a new event triggering the DF election).
- The boot timer runs per EVI or ISID on the ESs in the system. If the system uptime (time the system has been up since the last reboot) is less than the timer value, the system does not run the DF election for any EVI or ISID. When the boot timer expires, the DF election runs, and if the system is elected DF for the EVI or ISID, the **es-activation-timer** is triggered.
- The system does not advertise ES routes until the boot timer expires, which guarantees that the peer ES PEs only run the DF election when the PE is ready to become the DF, if required.

Range	0 to 1800
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	All

bgp-mh

Synopsis	Enter the **bgp-mh** context
Context	**configure** redundancy bgp-mh
Tree	bgp-mh
Introduced	16.0.R1
Platforms	All

site

Synopsis	Enter the **site** context
Context	**configure** redundancy bgp-mh site
Tree	site
Introduced	16.0.R1
Platforms	All

activation-timer *number*

Synopsis	Time to wait for BGP updates from remote PEs
Context	**configure** redundancy bgp-mh site activation-timer *number*
Tree	activation-timer
Range	0 to 100
Units	seconds
Default	2
Introduced	16.0.R1
Platforms	All

boot-timer *number*

Synopsis	Wait time after reboot to run the DF election algorithm
Context	**configure** redundancy bgp-mh site boot-timer *number*
Tree	boot-timer
Range	0 to 600
Units	seconds
Default	10

Introduced	16.0.R1
Platforms	All

min-down-timer *number*

Synopsis	Min downtime for BGP multi-homing site after transition
Context	**configure** redundancy bgp-mh site min-down-timer *number*
Tree	min-down-timer
Description	This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down. This timer is optimized in the following circumstances: • If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used. • If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used. • If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.
Range	1 to 100
Units	seconds
Introduced	16.0.R1
Platforms	All

cert-sync *boolean*

Synopsis	Automatically synchronize certificate files
Context	**configure** redundancy cert-sync *boolean*
Tree	cert-sync
Description	When configured to **true**, the system automatically synchronizes the certificate/CRL/key when importing or generating (for the key). If a new CF card is inserted into cf3: into the backup CPM, the system synchronizes the system-pki directory from the active CPM.
Default	true
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mgmt-ethernet

Synopsis	Enable the **mgmt-ethernet** context
Context	**configure** redundancy mgmt-ethernet
Tree	mgmt-ethernet
Description	Commands in this context configure the active CPM or CPIOM to use the management Ethernet port of the standby CPM or CPIOM if the management Ethernet port on the active CPM or CPIOM goes down.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

revert *number*

Synopsis	Time before reverting the management Ethernet port
Context	**configure** redundancy mgmt-ethernet revert *number*
Tree	revert
Description	This command allows the administrator to control when to revert to the management Ethernet port of the primary CPM or CPIOM after it comes up again.
Range	1 to 300
Units	seconds
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

multi-chassis

Synopsis	Enter the **multi-chassis** context
Context	**configure** redundancy multi-chassis
Tree	multi-chassis
Description	Commands in this context configure the attributes of multi-chassis redundancy.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipsec-domain [id] *number*

Synopsis	Enter the **ipsec-domain** list instance
Context	**configure** redundancy multi-chassis ipsec-domain *number*
Tree	ipsec-domain
Description	Commands in this context configure an IPsec domain used for N:M IPsec redundancy.
Max. instances	64
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**id**] *number*

Synopsis	IPsec domain ID
Context	**configure** redundancy multi-chassis ipsec-domain *number*
Tree	ipsec-domain
Range	1 to 255
Notes	This element is part of a list key.
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the IPsec domain
Context	**configure** redundancy multi-chassis ipsec-domain *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

designated-role *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Designated role for the IPsec domain
Context	**configure** redundancy multi-chassis ipsec-domain *number* designated-role *keyword*
Tree	designated-role
Description	This command configures the designated role of the tunnel group in the IPsec domain.
Options	standby, active
Default	standby
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

priority *number*

Synopsis	Priority for the IPsec domain
Context	**configure** redundancy multi-chassis ipsec-domain *number* priority *number*
Tree	priority
Description	This command configures the priority for the tunnel group in the IPsec domain. The node with the higher priority is more likely to be elected as active within the domain.
Range	0 to 255
Default	100
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

revertive *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable revertive behavior for the tunnel group
Context	**configure** redundancy multi-chassis ipsec-domain *number* revertive *boolean*
Tree	revertive

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router enables the revertive behavior of the tunnel group, which allows a router in an N:M domain to automatically take over as the active router in the domain when it becomes eligible to do so. When configured to **false**, the revertive behavior of the tunnel group is disabled.
Default	false
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel-group *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Tunnel group ID for an IPsec domain
Context	**configure** redundancy multi-chassis ipsec-domain *number* tunnel-group *reference*
Tree	tunnel-group
Description	This command specifies the tunnel group ID for the IPsec domain.
Reference	**configure** isa tunnel-group *number*
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

options

Synopsis	Enter the **options** context
Context	**configure** redundancy multi-chassis options
Tree	options
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-mgmt

Synopsis	Enter the **sub-mgmt** context
Context	**configure** redundancy multi-chassis options sub-mgmt
Tree	sub-mgmt

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure subscriber management options for multi-chassis redundancy.
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

dhcp-leasetime-threshold *number*

Synopsis	DHCP lease threshold to skip MCS synchronization
Context	**configure** redundancy multi-chassis options sub-mgmt dhcp-leasetime-threshold *number*
Tree	dhcp-leasetime-threshold
Description	This command configures the DHCP lease time threshold to skip MCS synchronization.DHCP leases for the **sub-mgmt** MCS applications are eligible to skip synchronization if the committed lease time is less than the active threshold on a multi-chassis peer. The active threshold is the minimum value of the thresholds configured on the nodes at each end of a multi-chassis peer. The threshold is inactive when it is unconfigured on at least one end of the multi-chassis peer.
Range	0 to 86400
Units	seconds
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **peer** list instance
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Description	This command configures the IP address of the peer in a redundant multi-chassis setup, and enters the context for further application-specific configuration options.
Max. instances	20
Introduced	16.0.R1
Platforms	All

[**ip-address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Peer IP address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)*
Tree	peer
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the MC redundancy peer
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

authentication-key *encrypted-leaf*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Authentication key used between the node and MC peer
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command specifies the authentication key used between the node and MC peer in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 110
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

description *description*

Synopsis	Text description
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

mc-endpoint

Synopsis	Enable the **mc-endpoint** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint
Tree	mc-endpoint
Introduced	22.10.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the MC-EP
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	22.10.R1
Platforms	All

bfd *boolean*

Synopsis	Enable BFD detection for the MC-EP peering tunnel
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint bfd *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	bfd
Description	When configured to **true**, the system uses Bidirectional Forwarding Detection (BFD) to control the state of the associated protocol interface, where the state of the protocol interface is tied to the state of the BFD session between the local and remote nodes. The BFD settings are configured in the IP interface contexts.
Default	false
Introduced	22.10.R1
Platforms	All

boot-timer *number*

Synopsis	Time to attempt connection before declaring failure
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* mc-endpoint boot-timer *number*
Tree	boot-timer
Description	This command configures the time interval to attempt connection that applies after the node reboots. This command specifies the time the multi-chassis endpoint (MC-EP) protocol takes to establish a connection before declaring a connection failure with the remote peer. When the time interval expires, all configured MC-EPs revert to single chassis behavior, activating the best local pseudowire.
Range	1 to 600
Units	seconds
Default	300
Introduced	22.10.R1
Platforms	All

hold-on-neighbor-failure *number*

Synopsis	Number of keepalive intervals to wait for packets
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* mc-endpoint hold-on-neighbor-failure *number*
Tree	hold-on-neighbor-failure
Description	This command configures the number of keepalive intervals that the local node waits for packets from the MC-EP peer before declaring a connection failure. When the number of intervals is reached, all configured MC-EPs revert to single chassis behavior, activating the best local pseudowire.
Range	2 to 25
Default	3

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	22.10.R1
Platforms	All

keep-alive-interval *number*

Synopsis	Interval for exchange of keepalive messages
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint keep-alive-interval *number*
Tree	keep-alive-interval
Description	This command configures the interval for which keepalive messages are exchanged between two systems participating as MC-EP when BFD is not active. The fast keepalive messages are used to detect remote node failure.
Range	5 to 500
Default	10
Introduced	22.10.R1
Platforms	All

passive-mode *boolean*

Synopsis	Enable passive mode for the MC-EP tunnel
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint passive-mode *boolean*
Tree	passive-mode
Description	When configured to **true**, the system enables passive mode behavior for the MC-EP protocol. Assuming the remote pair is configured with regular MC-EP in passive mode, the MC-EP pair remains dormant until two of the pseudowires in an MC-EP are activated by the remote PEs. When one pseudowire is active, the dormant MC-EP pair becomes active. The regular mechanism to select the best pseudowire between the active pair is initiated, and the system blocks the Rx and Tx directions of the other pseudowire.
Default	false
Introduced	22.10.R1
Platforms	All

system-priority *number*

Synopsis	System priority of the MC-EP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-endpoint system-priority *number*
Tree	system-priority
Description	This command configures the system priority of the MC-EP. The peer configured with the lower value is selected as the master. If the system priority values are equal, the peer with the higher system ID (chassis MAC address) becomes the master.
Range	0 to 255
Default	0
Introduced	22.10.R1
Platforms	All

mc-ipsec

Synopsis	Enable the **mc-ipsec** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ipsec
Tree	mc-ipsec
Description	Commands in this context configure the 1:1 and N:M MC-IPsec multi-chassis state failover mechanism that allows the IPsec tunnel to continue to function without interruption if an active node fails. See "1:1 Multichassis IPsec redundancy" and "N:M MC-IPsec redundancy" in the *7450 ESS, 7750 SR, and VSR Multiservice ISA and ESA Guide* for more information.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

bfd-liveness *boolean*

Synopsis	Enable BFD
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ipsec bfd-liveness *boolean*
Tree	bfd-liveness
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

discovery-interval

Synopsis	Enter the **discovery-interval** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* mc-ipsec discovery-interval
Tree	discovery-interval
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

boot *number*

Synopsis	Maximum interval after system bootup
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* mc-ipsec discovery-interval boot *number*
Tree	boot
Range	1 to 1800
Units	seconds
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interval-secs *number*

Synopsis	Maximum discovery interval
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* mc-ipsec discovery-interval interval-secs *number*
Tree	interval-secs
Range	1 to 1800
Units	seconds
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

domain [id] *reference*

Synopsis	Enter the **domain** list instance

admin-state *keyword*

Synopsis	Administrative state of the peer IPsec tunnel group
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ipsec tunnel-group *reference* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer-group *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Peer tunnel group
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ipsec tunnel-group *reference* peer-group *number*
Tree	peer-group
Range	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

priority *number*

Synopsis	Tunnel group priority
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* mc-ipsec tunnel-group *reference* priority *number*
Tree	priority
Description	This command configures the 1:1 MC-IPsec local priority for the tunnel group. The priority configuration is one of the factors used to select the active node between MC peers for the tunnel group. The node that has the tunnel group with the higher priority value is more likely to be elected as the active node. See "1:1 Multichassis IPsec redundancy" in the *7450 ESS, 7750 SR, and VSR Multiservice ISA and ESA Guide* for more information.
Range	0 to 255

String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

igmp *boolean*

Synopsis	Synchronize IGMP protocol information with the MC peer
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync igmp *boolean*
Tree	igmp
Default	false
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

igmp-snooping *boolean*

Synopsis	Synchronize IGMP snooping information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync igmp-snooping *boolean*
Tree	igmp-snooping
Default	false
Introduced	16.0.R1
Platforms	All

ipsec *boolean*

Synopsis	Synchronize IPsec information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync ipsec *boolean*
Tree	ipsec
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

l2tp *boolean*

Synopsis	Synchronize Layer Two Tunnel Protocol (L2TP)
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync l2tp *boolean*
Tree	l2tp
Default	false
Introduced	16.0.R1
Platforms	All

local-dhcp-server *boolean*

Synopsis	Synchronize DHCP Server information

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync local-dhcp-server *boolean*
Tree	local-dhcp-server
Default	false
Introduced	16.0.R1
Platforms	All

mc-ring *boolean*

Synopsis	Synchronize ring information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync mc-ring *boolean*
Tree	mc-ring
Default	false
Introduced	16.0.R1
Platforms	All

mld *boolean*

Synopsis	Synchronize MLD protocol information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync mld *boolean*
Tree	mld
Default	false
Introduced	16.0.R1
Platforms	All

mld-snooping *boolean*

Synopsis	Synchronize MLD snooping information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync mld-snooping *boolean*
Tree	mld-snooping
Default	false
Introduced	16.0.R1
Platforms	All

nat

Synopsis	Enable the **nat** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync nat
Tree	nat
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat-group [id] *reference*

Synopsis	Enter the **nat-group** list instance
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync nat nat-group *reference*
Tree	nat-group
Description	Commands in this context configure multi-chassis synchronization (MCS) for a NAT group. NAT group health information is exchanged between the pair of redundant NAT nodes. The system elects one of the nodes as the active node for the NAT group and the other node becomes the standby node.
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**id**] *reference*

Synopsis	NAT group ID
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync nat nat-group *reference*
Tree	nat-group
Reference	**configure** isa nat-group *number*
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sync-tag *named-item*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	NAT group synchronization tag
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync nat nat-group *reference* sync-tag *named-item*
Tree	sync-tag
Description	This command configures the synchronization tag for the NAT group. The tag must match the synchronization tag for the NAT group on the peering node.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	20.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pim-snooping

Synopsis	Enter the **pim-snooping** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync pim-snooping
Tree	pim-snooping
Introduced	16.0.R1
Platforms	All

saps *boolean*

Synopsis	Synchronize PIM snooping data with the multi-chassis peer on SDP endpoints
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync pim-snooping saps *boolean*
Tree	saps
Default	false
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

spoke-sdps *boolean*

Synopsis	Synchronize spoke SDPs with the multi-chassis peer
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync pim-snooping spoke-sdps *boolean*
Tree	spoke-sdps
Default	false
Introduced	16.0.R1
Platforms	All

python *boolean*

Synopsis	Synchronize Python
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync python *boolean*
Tree	python
Default	false
Introduced	16.0.R1
Platforms	All

srrp *boolean*

Synopsis	Synchronize SRRP information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync srrp *boolean*
Tree	srrp
Default	false
Introduced	16.0.R1
Platforms	All

sub-host-trk *boolean*

Synopsis	Synchronize subscriber host tracking information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync sub-host-trk *boolean*
Tree	sub-host-trk

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-mgmt

Synopsis	Enter the **sub-mgmt** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync sub-mgmt
Tree	sub-mgmt
Description	Commands in this context configure the synchronization of subscriber management information with the multi-chassis peer.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe *boolean*

Synopsis	Synchronize subscriber management IPoE information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync sub-mgmt ipoe *boolean*
Tree	ipoe
Description	When configured to **true**, the router synchronizes subscriber management IPoE information with the multi-chassis peer. **Note:** The configuration of this command must match on both nodes. Otherwise, the subscriber management synchronization fails.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pppoe *boolean*

Synopsis	Synchronize subscriber management PPPoE information
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync sub-mgmt pppoe *boolean*
Tree	pppoe
Description	When configured to **true**, the router synchronizes subscriber management PPPoE information with the multi-chassis peer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Note: The configuration of this command must match on both nodes. Otherwise, the subscriber management synchronization fails.

Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

wlan-gw *boolean*

Synopsis	Synchronize state between BNGs for ESM over soft-GRE
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync sub-mgmt wlan-gw *boolean*
Tree	wlan-gw
Description	When configured to **true**, this command enables the synchronization of ESM state and tunnel state to an MCS peer for ESM over soft-GRE tunnels.
Default	false
Introduced	23.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

tags

Synopsis	Enter the **tags** context
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync tags
Tree	tags
Introduced	16.0.R1
Platforms	All

lag [lag-name] *reference*

Synopsis	Enter the **lag** list instance
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync tags lag *reference*
Tree	lag
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**lag-name**] *reference*

Synopsis	LAG name
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync tags lag *reference*
Tree	lag
Reference	**configure** lag *lag-interface*
Notes	This element is part of a list key.
Introduced	21.2.R1
Platforms	All

range start *vlan-encap* end *vlan-encap*

Synopsis	Enter the **range** list instance
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* sync tags lag *reference* range start *vlan-encap* end *vlan-encap*

[**tunnel-group-id**] *number*

Synopsis	Multi-active tunnel group ID
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync tunnel-group *number*
Tree	tunnel-group
Range	1 to 64
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

sync-tag *named-item*

Synopsis	Tag to synchronize the tunnel group with the MC peer
Context	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)* sync tunnel-group *number* sync-tag *named-item*
Tree	sync-tag
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rollback-sync *keyword*

Synopsis	Automatic synchronization of rollback checkpoint files
Context	**configure** redundancy rollback-sync *keyword*
Tree	rollback-sync
Description	This command configures the automatic synchronization of locally saved rollback checkpoint files between the active and standby CPMs or CPIOMs.
Options	rollback-single – Copy only the newest rollback checkpoint file rollback-all – Copy all rollback checkpoint files

Introduced	16.0.R1
Platforms	All

srrp

Synopsis	Enter the **srrp** context
Context	**configure** redundancy srrp
Tree	srrp
Description	Commands in this context configure system attributes for SRRP.
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

auto-srrp-id-range

Synopsis	Enable the **auto-srrp-id-range** context
Context	**configure** redundancy srrp auto-srrp-id-range
Tree	auto-srrp-id-range
Description	Commands in this context reserve IDs for internal SRRP objects created for inter-BNG-UP resiliency. Manually provisioned SRRP instances cannot use these reserved IDs.
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the ID range
Context	**configure** redundancy srrp auto-srrp-id-range end *number*
Tree	end
Range	2 to 4294967295
Default	4294967295
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the ID range

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** redundancy srrp auto-srrp-id-range start *number*
Tree	start
Range	1 to 4294967294
Default	2147483648
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

switchover-exec *url*

Synopsis	CLI script file executed after a redundancy switchover
Context	**configure** redundancy switchover-exec *url*
Tree	switchover-exec
Description	This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM or CPIOM card. A switchover can happen because of a fatal failure or by manual action. The CLI script file can contain commands for environment settings, classic CLI debug configuration (excluding mirroring settings), and other commands not maintained by the configuration redundancy. The following commands are not supported in the **switchover-exec** file: **clear**, **configure**, **candidate**, **oam**, **tools**, **ping**, **traceroute**, **mstat**, **mtrace**, and **mrinfo**.
String length	1 to 100
Introduced	16.0.R1
Platforms	All

synchronize *keyword*

Synopsis	Behavior for automatic redundancy synchronization
Context	**configure** redundancy synchronize *keyword*
Tree	synchronize
Description	This command specifies the behavior for the automatic synchronization of system files on the active CPM or CPIOM to the standby CPM or CPIOM. This command does not apply to rollback checkpoint files; use the **configure redundancy rollback-sync** command to configure automatic synchronization for rollback checkpoint files.
Options	off – Disable synchronization config – Synchronize the configuration files boot-env – Synchronize all files required for the boot process
Introduced	16.0.R1

4.38 router commands

```
configure
   –  router named-item-64
      –  aggregates
         –  aggregate (ipv4-prefix | ipv6-prefix)
            –  aggregator
               –  address ipv4-unicast-address
               –  as-number number
            –  apply-groups reference
            –  apply-groups-exclude reference
            –  as-set boolean
            –  blackhole
               –  generate-icmp boolean
            –  community community
            –  description description
            –  discard-component-communities boolean
            –  indirect (ipv4-address-no-zone | ipv6-address-no-zone)
            –  local-preference number
            –  policy reference
            –  summary-only boolean
            –  tunnel-group number
         –  apply-groups reference
         –  apply-groups-exclude reference
      –  allow-bgp-to-igp-export boolean
      –  allow-icmp-redirect boolean
      –  allow-icmp6-redirect boolean
      –  apply-groups reference
      –  apply-groups-exclude reference
      –  autonomous-system number
      –  bfd
         –  seamless-bfd
            –  peer (ipv4-address-no-zone | ipv6-address-no-zone)
               –  apply-groups reference
               –  apply-groups-exclude reference
               –  discriminator number
      –  bgp
         –  add-paths
            –  evpn
               –  receive boolean
               –  send (number | keyword)
            –  ipv4
               –  receive boolean
               –  send (number | keyword)
            –  ipv6
               –  receive boolean
               –  send (number | keyword)
            –  label-ipv4
               –  receive boolean
               –  send (number | keyword)
            –  label-ipv6
               –  receive boolean
               –  send (number | keyword)
            –  mcast-vpn-ipv4
               –  receive boolean
               –  send (number | keyword)
            –  mcast-vpn-ipv6
               –  receive boolean
               –  send (number | keyword)
            –  mvpn-ipv4
               –  receive boolean
```

4.38.1 router command descriptions

router [router-name] *named-item-64*

Synopsis	Enter the **router** list instance
Context	**configure** router *named-item-64*
Tree	router
Description	Commands in this context configure a router instance that represents a virtual router in the system. At least two instances always exist in the system. The Base or transport router and the management router are created when the system is initialized and cannot be deleted.
Max. instances	4
Introduced	16.0.R1
Platforms	All

[**router-name**] *named-item-64*

Synopsis	Administrative router name
Context	**configure** router *named-item-64*
Tree	router
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character 'router-instance' must be 1 to 32 characters
MD-CLI default	Base
Notes	This element is part of a list key.
Introduced	16.0.R2
Platforms	All

aggregates

Synopsis	Enter the **aggregates** context
Context	**configure** router *named-item-64* aggregates
Tree	aggregates
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms All

aggregate [ip-prefix] *(ipv4-prefix | ipv6-prefix)*

Synopsis Enter the **aggregate** list instance

Context **configure** router *named-item-64* aggregates aggregate *(ipv4-prefix | ipv6-prefix)*

Tree aggregate

Description Commands in this context add aggregate routes to the routing table when there are one or more component routes. A component route is any route installed in the forwarding table that is a more-specific match of the aggregate.

The use of aggregate routes can lead to smaller routing table sizes by reducing the number of routes that need to be advertised to neighbor routes.

Introduced 16.0.R1

Platforms All

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis Destination IP address prefix of the aggregate route

Context **configure** router *named-item-64* aggregates aggregate *(ipv4-prefix | ipv6-prefix)*

Tree aggregate

Notes This element is part of a list key.

Introduced 16.0.R1

Platforms All

aggregator

Synopsis Enter the **aggregator** context

Context **configure** router *named-item-64* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* aggregator

Tree aggregator

Description Commands in this context configure the BGP AGGREGATOR path attribute for the aggregate route.

Introduced 16.0.R1

Platforms All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

address *ipv4-unicast-address*

Synopsis	Aggregator IP address
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* aggregator address *ipv4-unicast-address*
Tree	address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	All

as-number *number*

Synopsis	Aggregator AS number
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* aggregator as-number *number*
Tree	as-number
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

as-set *boolean*

Synopsis	Use AS_SET path segment type for the aggregate route
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* as-set *boolean*
Tree	as-set
Description	When configured to **true**, the AS_PATH attribute of the aggregate contains an AS_SET containing all AS numbers from the contributing routes. This can increase the amount of churn due to best-path changes. When configured to **false**, the AS_PATH attribute contains no AS_SET and will be originated by the ESR.
Default	false
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

blackhole

Synopsis	Enable the **blackhole** context
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* blackhole
Tree	blackhole
Notes	The following elements are part of a choice: **blackhole** or **indirect**.
Introduced	16.0.R1
Platforms	All

generate-icmp *boolean*

Synopsis	Send ICMP unreachable messages for aggregate routes
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* blackhole generate-icmp *boolean*
Tree	generate-icmp
Description	When configured to **true**, ICMP unreachable messages are sent when packets match an aggregate route in the FIB with a black-hole next-hop. When configured to **false**, ICMP unreachable messages are not generated.
Default	false
Introduced	16.0.R2
Platforms	All

community *community*

Synopsis	Community name that is added to the aggregate route
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* community *community*
Tree	community
Description	This command associates a BGP community with the aggregate route. The community name can be matched in route policies and is automatically added to BGP routes exported from the aggregate route.
String length	1 to 72
Max. instances	12
Notes	This element is ordered by the user.
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

description *description*

Synopsis	Text description
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

discard-component-communities *boolean*

Synopsis	Advertise aggregate with aggregate route community set
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* discard-component-communities *boolean*
Tree	discard-component-communities
Default	false
Introduced	19.7.R1
Platforms	All

indirect *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Address of the indirect next hop
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix | ipv6-prefix)* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	indirect
Description	This command programs aggregate routes into the forwarding table with an indirect next hop. If a packet matches the aggregate route but not a contributing route, it is forwarded toward the indirect next hop rather than being discarded.
Notes	The following elements are part of a choice: **blackhole** or **indirect**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

local-preference *number*

Synopsis	Local preference used when aggregate route is exported
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* local-preference *number*
Tree	local-preference
Description	This command configures the local preference value to use when the aggregate route is exported rather than using any of the local preference values assigned for any of the contributing routes.
Range	0 to 4294967295
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	Policy name for the aggregated route
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* policy *reference*
Tree	policy
Description	This command associates an aggregate route with a policy reference. The aggregated route is activated only when there is at least one eligible active route in the sub-trees below it that is accepted by the policy evaluation. There is no evaluation into any sub-tree that starts with another active aggregate route. Eligible routes exclude host routes and LDP shortcut routes. If an aggregate route has no policy, or the reference is to an empty policy, this configuration is treated as equivalent to a policy with one rule that accepts all routes.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	20.10.R1
Platforms	All

summary-only *boolean*

Synopsis	Advertise the aggregate route only
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* summary-only *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	summary-only
Description	When configured to **true**, the router suppresses the advertisement of more specific component routes for the aggregate. When configured to **false**, the router advertises both the aggregate route and its contributing routes.
Default	false
Introduced	16.0.R1
Platforms	All

tunnel-group *number*

Synopsis	Tunnel group from which to associate the MC IPSec state
Context	**configure** router *named-item-64* aggregates aggregate *(ipv4-prefix* | *ipv6-prefix)* tunnel-group *number*
Tree	tunnel-group
Description	This command adds the MC-IPsec state of the specific tunnel-group to the aggregate route.
Range	1 to 64
Introduced	20.7.R1
Platforms	All

allow-bgp-to-igp-export *boolean*

Synopsis	Enable the distribution of BGP routes into the IGP
Context	**configure** router *named-item-64* allow-bgp-to-igp-export *boolean*
Tree	allow-bgp-to-igp-export
Description	When configured to **true**, the router can export base BGP RTM routes into the IGP routing instance within the base router. This command applies to already exported BGP prefixes and to newly received BGP prefixes.
Default	true
Introduced	23.7.R1
Platforms	All

allow-icmp-redirect *boolean*

Synopsis	Allow ICMP redirects on the management interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* allow-icmp-redirect *boolean*
Tree	allow-icmp-redirect
Description	When configured to **true**, ICMP redirect messages can be received on the management interface. When configured to **false**, all received ICMP redirect messages are dropped. This command cannot be configured on a non-management interface.
Default	false
Introduced	16.0.R1
Platforms	All

allow-icmp6-redirect *boolean*

Synopsis	Allow IPv6 ICMP redirects on the management interface
Context	**configure** router *named-item-64* allow-icmp6-redirect *boolean*
Tree	allow-icmp6-redirect
Description	When configured to **true**, IPv6 ICMP redirect messages can be received on the management interface. When configured to **false**, all received IPv6 ICMP redirect messages are dropped. This command cannot be configured on a non-management interface.
Default	false
Introduced	16.0.R1
Platforms	All

autonomous-system *number*

Synopsis	AS number advertised to peers for this router
Context	**configure** router *named-item-64* autonomous-system *number*
Tree	autonomous-system
Description	This command configures the autonomous system (AS) number for the router. This value must be set before BGP can be activated. If the AS number is changed on a router with an active BGP instance, the new AS number is not used until the BGP instance is restarted.
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

discriminator *number*

Synopsis	Discriminator of the remote node
Context	**configure** router *named-item-64* bfd seamless-bfd peer *(ipv4-address-no-zone* | *ipv6-address-no-zone)* discriminator *number*
Tree	discriminator
Range	1 to 4294967295
Introduced	19.7.R1
Platforms	All

bgp

Synopsis	Enable the **bgp** context
Context	**configure** router *named-item-64* bgp
Tree	bgp
Description	Commands in this context configure the BGP protocol instance.
Introduced	16.0.R1
Platforms	All

add-paths

Synopsis	Enable the **add-paths** context
Context	**configure** router *named-item-64* bgp add-paths
Tree	add-paths
Description	Commands in this context configure add-paths support for the specified address families of the BGP instance. The BGP add-paths capability allows the router to send or receive multiple paths per prefix to and from a peer.
Introduced	16.0.R1
Platforms	All

evpn

Synopsis	Enter the **evpn** context
Context	**configure** router *named-item-64* bgp add-paths evpn
Tree	evpn

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the Add-Paths capability for EVPN routes. By default, Add-Paths is not enabled for EVPN routes.
Introduced	21.10.R1
Platforms	All

receive *boolean*

Synopsis	Receive multiple EVPN paths per prefix from a peer
Context	**configure** router *named-item-64* bgp add-paths evpn receive *boolean*
Tree	receive
Default	false
Introduced	21.10.R1
Platforms	All

send *(number | keyword)*

Synopsis	Maximum number of EVPN paths to send
Context	**configure** router *named-item-64* bgp add-paths evpn send *(number | keyword)*
Tree	send
Range	1 to 16
Options	all – Send all valid paths for each NLRI multipaths – Number of best multipaths for each NLRI
Introduced	21.10.R1
Platforms	All

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** router *named-item-64* bgp add-paths ipv4
Tree	ipv4
Description	Commands in this context configure add-paths support for the IPv4 unicast address family.
Introduced	16.0.R1
Platforms	All

receive *boolean*

Synopsis	Receive multiple routes per unlabeled IPv4 prefix
Context	**configure** router *named-item-64* bgp add-paths ipv4 receive *boolean*
Tree	receive
Description	When configured to **true**, this command allows multiple unlabeled IPv4 unicast routes per prefix to be received from a peer. When configured to **false**, the ADD-PATH receive capability is not enabled.
Default	false
Introduced	16.0.R1
Platforms	All

send *(number | keyword)*

Synopsis	Maximum paths per unlabeled IPv4 unicast prefix
Context	**configure** router *named-item-64* bgp add-paths ipv4 send *(number | keyword)*
Tree	send
Description	This command configures the maximum number of paths per unlabeled IPv4 unicast prefix that are allowed to be advertised to ADD-PATH peers. The actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules. When not configured, add-paths send capability is not enabled for unlabeled IPv4 unicast routes.
Range	1 to 16
Options	all – Send all valid paths for each NLRI multipaths – Number of best multipaths for each NLRI
Introduced	16.0.R1
Platforms	All

ipv6

Synopsis	Enter the **ipv6** context
Context	**configure** router *named-item-64* bgp add-paths ipv6
Tree	ipv6
Description	Commands in this context configure add-paths support for the IPv6 unicast address family.
Introduced	16.0.R1

Description	When configured to **true**, this command allows any inactive BGP route to be advertised, even though it is not the used route.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.

Default false

Introduced 16.0.R1

Platforms All

advertise-ipv6-next-hops

Synopsis Enter the **advertise-ipv6-next-hops** context

Context **configure** router *named-item-64* bgp advertise-ipv6-next-hops

Tree advertise-ipv6-next-hops

Description Commands in this context allow specified BGP address family routes to be advertised to IPv6 transport peers with a true IPv6 address when originated or when a configured or automatic next-hop-self action is applied.

This command context has no effect on routes advertised to IPv4 peers.

Introduced 16.0.R1

Platforms All

evpn *boolean*

Synopsis Advertise EVPN route with IPv6 next-hop address

Context **configure** router *named-item-64* bgp advertise-ipv6-next-hops evpn *boolean*

Tree evpn

Description When configured to **true**, EVPN routes are advertised with IPv6 next-hop addresses to IPv6 transport peers.

When configured to **false**, EVPN routes are advertised with IPv4 next-hop addresses to IPv6 transport peers.

Default false

Introduced 19.5.R1

Platforms All

ipv4 *boolean*

Synopsis Advertise IPv4 route with IPv6 next-hop address

Context **configure** router *named-item-64* bgp advertise-ipv6-next-hops ipv4 *boolean*

Tree ipv4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop. When configured to **false**, IPv4 routes are advertised with IPv4 next-hop addresses to IPv6 transport peers. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.
Default	false
Introduced	19.5.R1
Platforms	All

label-ipv4 *boolean*

Synopsis	Advertise label IPv4 route with IPv6 next-hop address
Context	**configure** router *named-item-64* bgp advertise-ipv6-next-hops label-ipv4 *boolean*

authentication-keychain *reference*

Synopsis	TCP authentication keychain for the session
Context	**configure** router *named-item-64* bgp authentication-keychain *reference*
Tree	authentication-keychain
Description	This command associates the keychain to be used to authenticate the BGP session. The keychain allows the rollover of authentication keys during the lifetime of a session.
Reference	**configure** system security keychains keychain *named-item*
Introduced	16.0.R3
Platforms	All

backup-path

Synopsis	Enter the **backup-path** context
Context	**configure** router *named-item-64* bgp backup-path
Tree	backup-path
Description	Commands in this context enable the use of a backup path for specified BGP-learned prefixes belonging to the base router. Multiple paths must be received for a prefix in order to take advantage of this feature. When a prefix has a backup path and its primary paths fail, the affected traffic is rapidly diverted to the backup path without waiting for control plane re-convergence to occur. When many prefixes share the same primary paths and in some cases, the same backup path, the time to divert failover traffic to the backup path is independent of the number of prefixes. By default, IPv4 and IPv6 prefixes do not have a backup path installed in the IOM.
Introduced	16.0.R1
Platforms	All

ipv4 *boolean*

Synopsis	Enable support for unlabeled unicast IPv4 routes
Context	**configure** router *named-item-64* bgp backup-path ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	16.0.R1
Platforms	All

compare-origin-validation-state *boolean*

Synopsis	Compare RPKI origin validation state of usable routes
Context	**configure** router *named-item-64* bgp best-path-selection compare-origin-validation-state *boolean*
Tree	compare-origin-validation-state
Description	When configured to **true**, the RPKI origin validation state is compared between BGP routes, where a Valid state is preferred over a Not-Found state, and a Not-Found state is preferred over an Invalid state. When configured to **false**, the RPKI origin validate state comparison is not performed as part of the BGP route selection process.
Default	false
Introduced	16.0.R1
Platforms	All

d-path-length-ignore *boolean*

Synopsis	Enable D-PATH length ignore
Context	**configure** router *named-item-64* bgp best-path-selection d-path-length-ignore *boolean*
Tree	d-path-length-ignore
Description	When configured to **true**, this command, enables the router to ignore the D-PATH domain segment length during best-path selection. At the base router level (or VPRN BGP level for PE-CE routers), this command allows BGP to ignore the D-PATH domain segment length for best-path selection purposes. BGP ignores the D-PATH length when comparing two VPN routes or two IFL routes within the same RD. However, these VPN/IFL routes are processed in the main-BGP instance. At the VPRN router level, this command allows the VPRN RTM to ignore the D-PATH domain segment length for best-path selection purposes (for routes in VPRN). The user can control whether the RTM considers the D-PATH length when comparing two VPN routes with different RDs. Best-path selection for EVPN-IFF routes against other owners (for example, EVPN-IFL or IPVPN) still relies on RTM preference. When EVPN-IFF RTM preference matches the RTM preference of another BGP owner, the existing RTM selection applies and D-PATH is not considered, irrespective of the **d-path-length-ignore** configuration. When configured to **false**, this command disables the ability to ignore the D-PATH domain segment length.
Default	false
Introduced	21.10.R1

Platforms All

deterministic-med *boolean*

Synopsis Group paths based on AS before MED attribute comparison

Context **configure** router *named-item-64* bgp best-path-selection deterministic-med *boolean*

Tree deterministic-med

Description When configured to **true**, BGP groups paths from the same AS that are equal up to the MED attribute comparison and then compares the best path from each group to select the overall best path. This process ensures that the best-path selection process is deterministic in all cases.

When configured to **false**, paths are not grouped and the overall best-path selection can depend on the order of route arrival.

Default false

Introduced 16.0.R1

Platforms All

ebgp-ibgp-equal

Synopsis Enter the **ebgp-ibgp-equal** context

Context **configure** router *named-item-64* bgp best-path-selection ebgp-ibgp-equal

Tree ebgp-ibgp-equal

Description Commands in this context allow BGP to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled) for the specified address families. The result is a form of EIBGP load-balancing in a multipath scenario. This behavior can be applied selectively to certain address families.

By default, the BGP decision process prefers an EBGP learned route over an IBGP learned route.

Introduced 16.0.R1

Platforms All

evpn *boolean*

Platforms	All

advertise

Synopsis	Enable the **advertise** context
Context	**configure** router *named-item-64* bgp bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**. • The interface associated with the peer has a valid BFD configuration. When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state. When unconfigured, BGP does not advertise the Strict-BFD capability to peers.
Introduced	23.7.R1
Platforms	All

holdtime *number*

Synopsis	Maximum time BGP waits for the BFD session to come up
Context	**configure** router *named-item-64* bgp bfd-strict-mode advertise holdtime *number*
Tree	holdtime
Description	This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.

Range	1 to 65535
Units	seconds
Default	30
Introduced	23.7.R1
Platforms	All

next-hop-reachability *boolean*

Synopsis	Consider next hop unreachable if BFD session is down
Context	**configure** router *named-item-64* bgp bfd-strict-mode next-hop-reachability *boolean*
Tree	next-hop-reachability
Description	When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met: • The BFD session to the peer is in a down state. • There is a valid interface BFD configuration that applies to the peer. • There is a valid BFD liveness configuration that applies to the peer. The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address. Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer. The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent. Configuring this command to **true** only affects routes belonging to the following address families: • IPv4 • IPv6 • IPv4 VPN • IPv6 VPN • labeled unicast IPv4 • labeled unicast IPv6 • EVPN • IPv4 multicast • IPv6 multicast • IPv4 VPN multicast • IPv6 VPN multicast

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Default false

Introduced 23.7.R1

Platforms All

bgp-tunnel-metric

Synopsis Enter the **bgp-tunnel-metric** context

Context **configure** router *named-item-64* bgp bgp-tunnel-metric

Tree bgp-tunnel-metric

Description Commands in this context control the tunnel table metrics associated with BGP label unicast routes.

Introduced 20.5.R1

Platforms All

prefer-aigp *boolean*

Synopsis Use the AIGP attribute as tunnel metric when present

Context **configure** router *named-item-64* bgp bgp-tunnel-metric prefer-aigp *boolean*

Tree prefer-aigp

Description When configured to **true**, the TTM metric is based on the AIGP metric if the route has the path attribute. When the BGP-LU route is selected for installation in TTM and it is not matched by a BGP import policy entry that overrides the BGP tunnel metric action, the TTM metric of the tunnel is set to the AIGP metric value of the BGP-LU route plus the resolved cost to the BGP next-hop of the route; otherwise, the metric is set to the value in the **value** setting.

When configured to **false**, the AIGP attribute is ignored for purposes to TTM metric derivation.

Default false

Introduced 20.5.R1

Platforms All

prefer-med *boolean*

Synopsis Use the MED attribute as tunnel metric when present

Context **configure** router *named-item-64* bgp bgp-tunnel-metric prefer-med *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	prefer-med
Description	When configured to **true**, the TTM metric is based on the MED metric value of the BGP-LU route. When a BGP-LU route is selected for installation in TTM and is not matched by a BGP import policy entry that overrides the BGP tunnel metric action, the TTM metric of the tunnel is set to the MED metric value of the BGP-LU route with the resolved cost to the BGP next hop of the route added to it. Otherwise, the metric is set to the value configured using the **value** command. When configured to **false**, the MED attribute is ignored for TTM metric derivation. **Note: prefer-aigp** takes precedence over this command if the received BGP-LU has both attributes.
Default	false
Introduced	23.3.R1
Platforms	All

value *number*

Synopsis	BGP tunnel metric value
Context	**configure** router *named-item-64* bgp bgp-tunnel-metric value *number*
Tree	value
Description	This command configures a BGP tunnel metric for label IPv4 routes that do not have their metric set by more specific means. If a BGP-LU route is selected for installation in the TTM and there is no tunnel metric policy action that applies to the route, the TTM metric of the associated tunnel is set to this value if either: • **prefer-aigp** is set to **false** • **prefer-aigp** is set to **true** but the BGP-LU route does not have an AIGP attribute
Range	0 to 4294967295
Default	1000
Introduced	20.5.R1
Platforms	All

bgp-tunnel-preference *number*

Synopsis	BGP tunnel table preference
Context	**configure** router *named-item-64* bgp bgp-tunnel-preference *number*
Tree	bgp-tunnel-preference
Description	This command configures the tunnel table preference for BGP-LU tunnel type.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it.

Range	1 to 255
Default	12
Introduced	21.10.R1
Platforms	All

block-prefix-sid *boolean*

Synopsis	Block the prefix SID attribute
Context	**configure** router *named-item-64* bgp block-prefix-sid *boolean*
Tree	block-prefix-sid
Description	When configured to **true**, all prefix SID attributes are removed from label IPv4 and label IPv6 routes when they are exchanged with EBGP and IBGP peers covered by the scope of the command. Locally-imposed prefix SID attributes are also removed. When configured to **false**, all prefix SID attributes associated with label IPv4 and label IPv6 routes are propagated without restriction. A change of this configuration causes the affected BGP sessions to flap.
Default	false
Introduced	19.10.R1
Platforms	All

client-reflect *boolean*

Synopsis	Allow client reflection of routes by route reflector
Context	**configure** router *named-item-64* bgp client-reflect *boolean*
Tree	client-reflect
Description	When configured to **true**, routes received from neighbors considered to be RR clients are reflected to other peers as expected. When configured to **false**, routes received from neighbors considered to be RR clients are not reflected to other clients.
Default	true
Introduced	16.0.R1

cluster

Synopsis	Enter the **cluster** context
Context	**configure** router *named-item-64* bgp cluster
Tree	cluster
Introduced	16.0.R1
Platforms	All

allow-local-fallback *boolean*

Synopsis	Allow fallback to RR topology location for ORR
Context	**configure** router *named-item-64* bgp cluster allow-local-fallback *boolean*
Tree	allow-local-fallback
Description	When configured to **true**, this command allows the RR to advertise the best BGP path from its own topology location when there are no reachable routes from the client's ORR location. The ORR location must be specified before this command can be set to **true**. When configured to **false**, no route is advertised to the clients when there are no reachable routes from the client's ORR location.
Default	false
Introduced	16.0.R1
Platforms	All

cluster-id *ipv4-address*

Synopsis	Route reflector cluster ID
Context	**configure** router *named-item-64* bgp cluster cluster-id *ipv4-address*
Tree	cluster-id
Description	The command specifies the cluster ID to associate with the routing instance, effectively making all IBGP peers of the routing instance RR clients.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

orr-location *number*

Synopsis	Optimal route reflection location for the cluster
Context	**configure** router *named-item-64* bgp cluster orr-location *number*
Tree	orr-location
Description	This command configures an ORR location ID. If a cluster ID is also specified, the clients in that cluster receive routes optimal for that specific location. With optimal route reflection, the best path advertised to a client takes location ID into account. If the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF, OSPFv3, IS-IS, or BGP-LS information in the TE DB.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

connect-retry *number*

Synopsis	BGP connect retry timer value
Context	**configure** router *named-item-64* bgp connect-retry *number*
Tree	connect-retry
Description	This command configures the BGP connect retry timer. When the timer expires, BGP tries to reconnect to the configured peer.
Range	1 to 65535
Default	120
Introduced	16.0.R1
Platforms	All

convergence

Synopsis	Enter the **convergence** context
Context	**configure** router *named-item-64* bgp convergence
Tree	convergence
Description	Commands in this context configure the route convergence delay.
Introduced	19.7.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

family [family-type] *keyword*

Synopsis	Enter the **family** list instance
Context	**configure** router *named-item-64* bgp convergence family *keyword*
Tree	family
Description	Commands in this context configure route convergence options for a specific BGP address family, specifically, the maximum amount of time BGP waits until it advertises the routes of the address family to its BGP peers.
Introduced	19.7.R1
Platforms	All

[**family-type**] *keyword*

Synopsis	Address family for which convergence selection applies
Context	**configure** router *named-item-64* bgp convergence family *keyword*
Tree	family
Options	ipv4, vpn-ipv4, ipv6, vpn-ipv6, label-ipv4, label-ipv6
Notes	This element is part of a list key.
Introduced	19.7.R1
Platforms	All

max-wait-to-advertise *number*

Synopsis	Maximum wait time before advertising routes
Context	**configure** router *named-item-64* bgp convergence family *keyword* max-wait-to-advertise *number*
Tree	max-wait-to-advertise
Range	0 to 3600
Default	0
Introduced	19.7.R1
Platforms	All

min-wait-to-advertise *number*

Synopsis	Minimum wait time before advertising routes
Context	**configure** router *named-item-64* bgp convergence min-wait-to-advertise *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	min-wait-to-advertise
Range	0 to 3600
Default	0
Introduced	19.7.R1
Platforms	All

damp-peer-oscillations

Synopsis	Enable the **damp-peer-oscillations** context
Context	**configure** router *named-item-64* bgp damp-peer-oscillations
Tree	damp-peer-oscillations
Description	Commands in this context support the DampPeerOscillations FSM behavior described in section 8.1 of RFC 4271, *A Border Gateway Protocol 4 (BGP-4)*. When unconfigured, the router does not perform peer oscillation damping and immediately transitions out of the idle state after every reset.
Introduced	16.0.R1
Platforms	All

error-interval *number*

Synopsis	Time after a reset that the session must be error-free
Context	**configure** router *named-item-64* bgp damp-peer-oscillations error-interval *number*
Tree	error-interval
Description	This command sets the interval of time after a reset, during which the session must be error-free in order to reset the penalty counter and return the idle hold time to the initial wait time.
Range	0 to 2048
Default	30
Introduced	16.0.R1
Platforms	All

idle-hold-time

Synopsis	Enter the **idle-hold-time** context
Context	**configure** router *named-item-64* bgp damp-peer-oscillations idle-hold-time
Tree	idle-hold-time

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure how long a BGP peer session remains in the idle state after some type of error causes the session to reset. In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur in a short time period after each session reset cause longer and longer hold times in the idle state.
Introduced	16.0.R1
Platforms	All

initial-wait *number*

Synopsis	Time session remains in idle state after stabilization
Context	**configure** router *named-item-64* bgp damp-peer-oscillations idle-hold-time initial-wait *number*
Tree	initial-wait
Range	0 to 2048
Default	0
Introduced	16.0.R1
Platforms	All

max-wait *number*

Synopsis	Maximum session idle time after repeated instability
Context	**configure** router *named-item-64* bgp damp-peer-oscillations idle-hold-time max-wait *number*
Tree	max-wait
Range	1 to 2048
Default	60
Introduced	16.0.R1
Platforms	All

second-wait *number*

Synopsis	Time that doubles after each session failure
Context	**configure** router *named-item-64* bgp damp-peer-oscillations idle-hold-time second-wait *number*
Tree	second-wait

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command defines the hold time that doubles after each repeated session failure that occurs in a short span of time.
Range	1 to 2048
Default	5
Introduced	16.0.R1
Platforms	All

damping *boolean*

Synopsis	Use BGP route damping to reduce route flap
Context	**configure** router *named-item-64* bgp damping *boolean*
Tree	damping
Description	When configured to **true**, this command enables route damping to reduce the number of update messages sent between BGP peers and reduce the load on peers without affecting the route convergence time for stable routes. Route damping is controlled by profiles set in route policies. If no profile is specified in the route policy, the default damping profile is used with the following parameters: • Half-life: 15 minutes • Max-suppress: 60 minutes • Suppress-threshold: 3000 • Reuse-threshold: 750 When configured to **false**, BGP route damping for learned routes is disabled.
Default	false
Introduced	16.0.R1
Platforms	All

def-recv-evpn-encap *keyword*

Synopsis	Default EVPN encapsulation type
Context	**configure** router *named-item-64* bgp def-recv-evpn-encap *keyword*
Tree	def-recv-evpn-encap
Description	This command specifies the encapsulation type that BGP uses when an EVPN route is received without the Encapsulation Extended Community.
Options	mpls, vxlan
Default	mpls
Introduced	16.0.R1

egress-peer-engineering

Synopsis	Enable the **egress-peer-engineering** context
Context	**configure** router *named-item-64* bgp egress-peer-engineering
Tree	egress-peer-engineering
Introduced	21.7.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of BGP egress engineering
Context	**configure** router *named-item-64* bgp egress-peer-engineering admin-state *keyword*
Tree	admin-state
Description	This command administratively enables or disables egress engineering for the BGP. If enabled, peer node SIDs and peer adjacency SIDs are advertised in BGP-LS.
Options	enable, disable
Default	disable
Introduced	21.7.R1
Platforms	All

enforce-first-as *boolean*

Synopsis	Enforce the configured peer AS value in received routes
Context	**configure** router *named-item-64* bgp enforce-first-as *boolean*
Tree	enforce-first-as
Description	When configured to **true** for an EBGP session, all routes received from an EBGP peer are checked to ensure that the most recent ASN in the AS_PATH attribute of each route matches the configured AS of the session. If there is not a match, the session is reset (if the **update-fault-tolerance** command in the **error-handling** context is set to **false**) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is set to **true**). This command does not flap an established session because it applies only to routes received after the command is issued. When configured to **false**, received routes are not checked for compliance with the rule.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	All

error-handling

Synopsis	Enter the **error-handling** context
Context	**configure** router *named-item-64* bgp error-handling
Tree	error-handling
Introduced	16.0.R1
Platforms	All

legacy-mode *boolean*

Synopsis	Enable legacy-mode of BGP error handling
Context	**configure** router *named-item-64* bgp error-handling legacy-mode *boolean*
Tree	legacy-mode
Description	When configured to **true**, the BGP instance handles the BGP update error messages based on the configured **update-fault-tolerance** commands. If these commands are not explicitly configured, BGP error handling follows the legacy procedures described in RFC 4271, which can result in disruptive session resets. When configured to **false**, the BGP instance ignores the configured **update-fault-tolerance** commands and applies the new error handling procedures described in RFC 7606 on all sessions.
Default	false
Introduced	24.3.R1
Platforms	All

update-fault-tolerance *boolean*

Synopsis	Tolerate non-critical errors in UPDATE messages
Context	**configure** router *named-item-64* bgp error-handling update-fault-tolerance *boolean*
Tree	update-fault-tolerance
Description	When configured to **true**, non-critical errors are handled with treat-as-withdraw, attribute-discard, and other non-disruptive approaches that do not cause a session reset. Critical errors still trigger a session reset. When configured to **false**, most errors trigger a session reset.

Default	false
Introduced	16.0.R1
Platforms	All

export

Synopsis	Enable the **export** context
Context	**configure** router *named-item-64* bgp export
Tree	export
Description	Commands in this context specify route policies that control the handling of outbound routes transmitted to all peers. Route policies are configured in the **configure policy-options** context. When no export policies are specified in this context, BGP-learned routes are advertised by default and non-BGP routes are not advertised.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	List of export policy names
Context	**configure** router *named-item-64* bgp export policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of outbound routes transmitted to certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route. Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). When no export policies are specified, BGP-learned routes are advertised by default and non-BGP routes are not advertised.
String length	1 to 255
String format	'policy-expr-string' must contain [for a bracketed policy name in a routing policy logical expression (e.g. [policyA])
Max. instances	15
Min. instances	1

extended-nh-encoding

Synopsis	Enter the **extended-nh-encoding** context
Context	**configure** router *named-item-64* bgp extended-nh-encoding
Tree	extended-nh-encoding
Description	Commands in this context specify the IPv4-related address families that can receive IPv6 next hops from peers. The peers should not send such routes unless the peers receive notification of this capability. If the router receives an enabled address family route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed. This causes either a session reset or treat-as-withdraw behavior depending on the error handling settings.
Introduced	16.0.R1
Platforms	All

ipv4 *boolean*

Synopsis	Advertise encoding capability for IPv4 routes
Context	**configure** router *named-item-64* bgp extended-nh-encoding ipv4 *boolean*

fast-external-failover *boolean*

Synopsis	Drop external BGP session immediately when link fails
Context	**configure** router *named-item-64* bgp fast-external-failover *boolean*
Tree	fast-external-failover

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router drops an external BGP session to a single-hop neighbor immediately when the local interface goes down. When configured to **false**, the BGP session remains up until the hold time expires.
Default	true
Introduced	16.0.R1
Platforms	All

flowspec

Synopsis	Enter the **flowspec** context
Context	**configure** router *named-item-64* bgp flowspec
Tree	flowspec
Description	Commands in this context configure BGP FlowSpec validations.
Introduced	16.0.R1
Platforms	All

validate-dest-prefix *boolean*

Synopsis	Validate destination prefix in FlowSpec-IPv4/IPv6 route
Context	**configure** router *named-item-64* bgp flowspec validate-dest-prefix *boolean*
Tree	validate-dest-prefix
Description	When configured to **true**, the router validates received IPv4 and IPv6 FlowSpec routes that contain a destination-prefix subcomponent. A FlowSpec route with a destination-prefix subcomponent is considered invalid if the following are true: • the route was originated outside the local AS of the receiving BGP router • the neighbor AS of the FlowSpec route does not match the neighbor AS of the best match BGP (unicast) route for the destination prefix or the neighbor AS of any longer match BGP (unicast) route for the destination prefix An invalid route is retained in the BGP RIB but it is not used for filtering traffic and is not propagated to other BGP routers. When configured to **false**, destination-prefix validation is disabled.
Default	false
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

validate-redirect-ip *boolean*

Synopsis	Validate the redirect-to-IPv4 action in FlowSpec route
Context	**configure** router *named-item-64* bgp flowspec validate-redirect-ip *boolean*
Tree	validate-redirect-ip
Description	When configured to **true**, the router validates the redirect-to-IPv4 action attached to FlowSpec-IPv4 routes that are received by the BGP instance. A FlowSpec-IPv4 route is considered invalid and is not installed as a filter rule if it is determined to have originated from a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a FlowSpec route is identified based on its AS path. When configured to **false**, the router does not perform the validation check on Flow Spec-IPv4 routes.
Default	false
Introduced	16.0.R1
Platforms	All

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** router *named-item-64* bgp graceful-restart
Tree	graceful-restart
Description	Commands in this context configure BGP graceful restart helper procedures for address families included in the GR capabilities of both peers.
Introduced	16.0.R1
Platforms	All

gr-notification *boolean*

Synopsis	Perform Graceful Restart procedures
Context	**configure** router *named-item-64* bgp graceful-restart gr-notification *boolean*
Tree	gr-notification
Description	When configured to **true**, the Graceful Restart capability sent by the router indicates support for NOTIFICATION messages. If the peer also supports this capability, the session is restarted gracefully (while preserving forwarding) if either peer sends a NOTIFICATION message due to some type of event or error. When configured to **false**, NOTIFICATION messages are not supported.

Default	false
Introduced	16.0.R1
Platforms	All

long-lived

Synopsis	Enable the **long-lived** context
Context	**configure** router *named-item-64* bgp graceful-restart long-lived
Tree	long-lived
Description	Commands in this context configure the BGP Long-Lived Graceful-Restart (LLGR) procedures. LLGR, known informally as BGP persistence, is an extension of BGP GR that allows a session to stay down for a longer period of time. During this time, learned routes are marked and re-advertised as stale but they can continue to be used as routes of last resort. The LLGR handling of a session failure can be invoked immediately or it can be delayed until the end of the traditional GR restart window.
Introduced	16.0.R1
Platforms	All

advertise-stale-to-all-neighbors *boolean*

Synopsis	Advertise stale routes to all BGP peers
Context	**configure** router *named-item-64* bgp graceful-restart long-lived advertise-stale-to-all-neighbors *boolean*

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** router *named-item-64* bgp graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	16.0.R1
Platforms	All

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time
Context	**configure** router *named-item-64* bgp graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time
Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.

Range 0 to 4095

Introduced 16.0.R1

Platforms All

helper-override-stale-time *number*

Synopsis Locally-configured stale routes override time

Context **configure** router *named-item-64* bgp graceful-restart long-lived helper-override-stale-time *number*

Tree helper-override-stale-time

Description This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability.

This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.

Range 0 to 16777215

Introduced 16.0.R1

Platforms All

without-no-export *boolean*

Synopsis Advertise LLGR stale routes to non-LLGR peers

Context **configure** router *named-item-64* bgp graceful-restart long-lived without-no-export *boolean*

Tree without-no-export

Description When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0.

When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0 and a NO_EXPORT standard community is automatically added to the routes.

Default false

Introduced 16.0.R1

Platforms All

advertise-inactive *boolean*

Synopsis Advertise an inactive BGP route to peers

Context **configure** router *named-item-64* bgp group *named-item-64* advertise-inactive *boolean*

Tree advertise-inactive

Description When configured to **true**, this command allows an inactive BGP route to be advertised, even though it is not the most preferred route. The effect of the command on advertised unlabeled, labeled, and multicapt IPv4 and IPv6 routes depends on several factors.

- If the active route for the IP prefix is a BGP route, that route is advertised.
- If the active route is a non-BGP route and there are valid inactive BGP routes to the same destination, the best valid inactive route is advertise unless the active non-BGP route is matched and accepted by an export policy applied to the session
- If the active route is a non-BGP route and there are no valid BGP routes to the same destination, no route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session.

When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicity configured to **false**.

When this command inherits a value of **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.

Introduced 16.0.R1

Description	When configured to **true**, VPN IPv4 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. The appropriate extended NH encoding capability must also be received from the remote peer before the route can be advertised with an IPv6 address instead of the IPv4 system address as the next hop.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, VPN IPv4 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop. If the route matches a BGP export policy entry that tries to change the next hop to an IPv6 address and an appropriate extended NH encoding capability was not received by the remote peer, the route is handled as though it was rejected by the policy entry.

Default	false
Introduced	16.0.R1
Platforms	All

vpn-ipv6 *boolean*

Synopsis	Advertise VPN IPv6 route with IPv6 next-hop address
Context	**configure** router *named-item-64* bgp group *named-item-64* advertise-ipv6-next-hops vpn-ipv6 *boolean*
Tree	vpn-ipv6
Description	When configured to **true**, VPN IPv6 routes are advertised with IPv6 next-hop addresses to IPv6 transport peers. When configured to **false**, VPN IPv6 routes are advertised toward IPv6 transport peers with the system IPv4 address as the BGP next hop, encoded as an IPv4-mapped IPv6 address.
Default	false
Introduced	16.0.R1
Platforms	All

aggregator-id-zero *boolean*

Synopsis	Set router ID in the BGP AGGREGATOR attribute to zero
Context	**configure** router *named-item-64* bgp group *named-item-64* aggregator-id-zero *boolean*
Tree	aggregator-id-zero
Introduced	16.0.R1
Platforms	All

aigp *boolean*

Synopsis	Add AIGP attribute to advertised routes
Context	**configure** router *named-item-64* bgp group *named-item-64* aigp *boolean*
Tree	aigp

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this command enables Accumulated IGP (AIGP) path attribute support with one or more BGP peers. BGP path selection among routes with an associated AIGP metric is based on the end-to-end IGP metrics of the different BGP paths, even when these BGP paths span more than one AS and IGP instance. When configured to **false**, the AIGP attribute is removed from advertised routes, if present, and is ignored in received routes.
Default	false
Introduced	16.0.R1
Platforms	All

as-override *boolean*

Synopsis	Replace the peer ASN with the local ASN in AS Path
Context	**configure** router *named-item-64* bgp group *named-item-64* as-override *boolean*
Tree	as-override
Description	When configured to **true**, the advertising router's local AS replaces all occurrences of the peer AS in the AS_PATH attribute. This command should be used with caution, as it breaks BGP's loop detection mechanism. When configured to **false**, no AS override is performed.
Default	false
Introduced	19.7.R1
Platforms	All

asn-4-byte *boolean*

Synopsis	Advertise the use of 4-byte ASNs
Context	**configure** router *named-item-64* bgp group *named-item-64* asn-4-byte *boolean*
Tree	asn-4-byte
Description	When this command inherits a value of **true**, the use of 4-byte ASNs is supported. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **true**. When configured to **false**, this command disables the use of 4-byte ASNs.
Introduced	16.0.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

authentication-key *encrypted-leaf*

Synopsis	BGP authentication key for peers in the group
Context	**configure** router *named-item-64* bgp group *named-item-64* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command configures the authentication key that must be configured on both peers. The stored format of the authentication key is based on the **configure system security hash-control management-interface md-cli hash-algorithm** setting**.** This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 422
Introduced	16.0.R1
Platforms	All

authentication-keychain *reference*

Synopsis	TCP authentication keychain for the session
Context	**configure** router *named-item-64* bgp group *named-item-64* authentication-keychain *reference*
Tree	authentication-keychain
Description	This command associates the keychain to be used to authenticate the BGP session. The keychain allows the rollover of authentication keys during the lifetime of a session.
Reference	**configure** system security keychains keychain *named-item*
Introduced	16.0.R3
Platforms	All

bfd

Synopsis	Enable the **bfd** context
Context	**configure** router *named-item-64* bgp group *named-item-64* bfd
Tree	bfd
Description	Commands in this context configure the BFD command options for the BGP group.
Introduced	26.10.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

multiplier *number*

Synopsis	Multiplier for the BFD session
Context	**configure** router *named-item-64* bgp group *named-item-64* bfd multiplier *number*
Tree	multiplier
Description	This command configures the number of consecutive BFD messages that must be missed from the peer before the BFD session state is changed to down and the upper level protocols (OSPF, IS-IS, BGP, or PIM) are notified of the fault.
Range	1 to 20
Default	3
Introduced	26.10.R1
Platforms	All

receive-interval *number*

Synopsis	Receive interval for the BFD session
Context	**configure** router *named-item-64* bgp group *named-item-64* bfd receive-interval *number*
Tree	receive-interval
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	26.10.R1
Platforms	All

transmit-interval *number*

Synopsis	Transmit interval for the BFD session
Context	**configure** router *named-item-64* bgp group *named-item-64* bfd transmit-interval *number*
Tree	transmit-interval
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	26.10.R1
Platforms	All

Use subject to Terms available at: www.nokia.com/terms.

type *keyword*

Synopsis	Type of BFD session endpoint to use
Context	**configure** router *named-item-64* bgp group *named-item-64* bfd type *keyword*
Tree	type
Options	cpm-np – Processed by the network processor on the CPM auto – System determines the appropriate session type fp – Processed on the forwarding plane hardware
Default	auto
Introduced	26.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

bfd-liveness *boolean*

Synopsis	Enable BFD
Context	**configure** router *named-item-64* bgp group *named-item-64* bfd-liveness *boolean*
Tree	bfd-liveness
Introduced	16.0.R1
Platforms	All

bfd-strict-mode

Synopsis	Enter the **bfd-strict-mode** context
Context	**configure** router *named-item-64* bgp group *named-item-64* bfd-strict-mode
Tree	bfd-strict-mode
Introduced	23.7.R1
Platforms	All

advertise

Synopsis	Enable the **advertise** context
Context	**configure** router *named-item-64* bgp group *named-item-64* bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**.
- The interface associated with the peer has a valid BFD configuration.

When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state.

When unconfigured, BGP does not advertise the Strict-BFD capability to peers.

Introduced 23.7.R1

Platforms All

holdtime *number*

Synopsis Maximum time BGP waits for the BFD session to come up

Context **configure** router *named-item-64* bgp group *named-item-64* bfd-strict-mode advertise holdtime *number*

Tree holdtime

Description This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.

Range 1 to 65535

Units seconds

Default 30

Introduced 23.7.R1

Platforms All

next-hop-reachability *boolean*

Synopsis Consider next hop unreachable if BFD session is down

Context **configure** router *named-item-64* bgp group *named-item-64* bfd-strict-mode next-hop-reachability *boolean*

Tree next-hop-reachability

Description When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met:

- The BFD session to the peer is in a down state.
- There is a valid interface BFD configuration that applies to the peer.
- There is a valid BFD liveness configuration that applies to the peer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address.

Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer.

The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent.

Configuring this command to **true** only affects routes belonging to the following address families:

- IPv4
- IPv6
- IPv4 VPN
- IPv6 VPN
- labeled unicast IPv4
- labeled unicast IPv6
- EVPN
- IPv4 multicast
- IPv6 multicast
- IPv4 VPN multicast
- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Introduced 23.7.R1

Platforms All

block-prefix-sid *boolean*

Synopsis Block the prefix SID attribute

Context **configure** router *named-item-64* bgp group *named-item-64* block-prefix-sid *boolean*

Tree block-prefix-sid

Description When configured to **true**, all prefix SID attributes are removed from all routes exchanged between EBGP and IBGP peers covered by the scope of the command. Locally-imposed prefix SID attributes are also removed.

When configured to **false**, all prefix SID attributes are propagated without restriction.

A change of this configuration causes the affected BGP sessions to flap.

Default false

Introduced 19.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

capability-negotiation *boolean*

Synopsis	Enable capability negotiation
Context	**configure** router *named-item-64* bgp group *named-item-64* capability-negotiation *boolean*
Tree	capability-negotiation
Description	When configured to **true**, this command enables the exchange of capabilities. When configured to **false** and the peering is flapped, new capabilities are not negotiated and strictly IPv4 exchanges are supported with the peer.
Default	true
Introduced	16.0.R1
Platforms	All

client-reflect *boolean*

Synopsis	Allow cluster RR to advertise routes to its clients
Context	**configure** router *named-item-64* bgp group *named-item-64* client-reflect *boolean*
Tree	client-reflect
Description	When unconfigured, this command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **true**. When the command inherits a value of **true**, client reflection of routes is enabled. When configured to **false**, this command disables client reflection of routes.
Introduced	16.0.R1
Platforms	All

cluster

Synopsis	Enter the **cluster** context
Context	**configure** router *named-item-64* bgp group *named-item-64* cluster
Tree	cluster
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

allow-local-fallback *boolean*

Synopsis	Allow fallback to RR topology location
Context	**configure** router *named-item-64* bgp group *named-item-64* cluster allow-local-fallback *boolean*
Tree	allow-local-fallback
Description	When configured to **true**, this command allows the RR to advertise the best BGP path from its own topology location when there are no reachable routes from the client's ORR location. The ORR location must be specified before this command can be set to **true**. When configured to **false**, no route is advertised to the client.
Default	false
Introduced	16.0.R1
Platforms	All

cluster-id *ipv4-address*

Synopsis	Route reflector cluster ID
Context	**configure** router *named-item-64* bgp group *named-item-64* cluster cluster-id *ipv4-address*
Tree	cluster-id
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	All

orr-location *number*

Synopsis	Optimal route reflection location for the cluster
Context	**configure** router *named-item-64* bgp group *named-item-64* cluster orr-location *number*
Tree	orr-location
Description	This command configures an ORR location ID. If a cluster ID is also specified, the clients in that cluster receive routes optimal for that specific location. With optimal route reflection, the best path advertised to a client takes location ID into account. If the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs are calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF, OSPFv3, IS-IS, or BGP-LS information in the TE DB.
Range	1 to 255

damp-peer-oscillations

Synopsis	Enable the **damp-peer-oscillations** context
Context	**configure** router *named-item-64* bgp group *named-item-64* damp-peer-oscillations
Tree	damp-peer-oscillations
Description	Commands in this context specify how long a BGP peer session remains in the idle state after an error causes the session to reset. In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur a short time after each session reset cause longer and longer hold times in the idle state. When unconfigured, command settings are inherited from the global-level configuration.
Introduced	16.0.R1
Platforms	All

error-interval *number*

Synopsis	Time after a reset that the session must be error-free
Context	**configure** router *named-item-64* bgp group *named-item-64* damp-peer-oscillations error-interval *number*
Tree	error-interval
Description	This command sets the interval of time after a reset, during which the session must be error-free in order to reset the penalty counter and return the idle hold time to the initial wait time.
Range	0 to 2048
Default	30
Introduced	16.0.R1

interface [interface-name] *interface-name*

Synopsis	Enter the **interface** list instance
Context	**configure** router *named-item-64* bgp group *named-item-64* dynamic-neighbor interface *interface-name*
Tree	interface
Description	Commands in this context configure an unnumbered base router network interface for dynamic neighbors. If this interface connects to a network with other BGP routers, sessions with the other routers can be set up automatically without explicitly configuring them as BGP neighbors. The interface must be IPv6 enabled, but because the interface is considered unnumbered, it does not require an IPv4 address or a global-unicast IPv6 address. The sessions are set up using IPv6 link-local addresses. The BGP unnumbered feature supports all address families that allow IPv6 link-local BGP next-hop addresses. This includes IPv4 with the use of RFC 8950 extensions. When an interface is added to the list of dynamic-neighbor interfaces, an outgoing connection attempt is initiated toward any directly connected router on the interface that announces itself using an ICMPv6 router advertisement message. The session attempt is unsuccessful if the peer type is not EBGP, the reported AS number of the peer does not match one of the allowed values, or the maximum session limit of the interface would be exceeded.
Introduced	22.10.R1
Platforms	All

egress-peer-engineering-label-unicast *boolean*

Synopsis	Generate EPE label-unicast routes for group
Context	**configure** router *named-item-64* bgp group *named-item-64* egress-peer-engineering-label-unicast *boolean*
Tree	egress-peer-engineering-label-unicast
Description	When configured to **true**, BGP generates a label-unicast route for each /32 or /128 prefix that corresponds to the BGP group address in the scope of the command. These routes can be advertised to other routers to recursively resolve unlabeled BGP routes for AS external destinations. They support the Egress Peer Engineering (EPE) use case.
Default	false
Introduced	22.2.R1
Platforms	All

enforce-first-as *boolean*

Synopsis	Enforce the configured peer AS value in received routes
Context	**configure** router *named-item-64* bgp group *named-item-64* enforce-first-as *boolean*

update-fault-tolerance *boolean*

Synopsis	Tolerate non-critical errors in UPDATE messages
Context	**configure** router *named-item-64* bgp group *named-item-64* error-handling update-fault-tolerance *boolean*
Tree	update-fault-tolerance
Description	When configured to **true**, non-critical errors are handled with treat-as-withdraw, attribute-discard, and other non-disruptive approaches that do not cause a session reset. Critical errors still trigger a session reset. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, all errors trigger a session reset.
Introduced	16.0.R1
Platforms	All

export

Synopsis	Enable the **export** context
Context	**configure** router *named-item-64* bgp group *named-item-64* export
Tree	export
Description	Commands in this context specify route policies that control the handling of outbound routes transmitted to certain peers. Route policies are configured in the **configure policy-options** context. When this context is unconfigured, the policy association for the group is inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	BGP export policy name
Context	**configure** router *named-item-64* bgp group *named-item-64* export policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of outbound routes transmitted to certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".
String length	1 to 255
String format	'policy-expr-string' must contain [for a bracketed policy name in a routing policy logical expression (e.g. [policyA])

extended-nh-encoding

Synopsis	Enable the **extended-nh-encoding** context
Context	**configure** router *named-item-64* bgp group *named-item-64* extended-nh-encoding
Tree	extended-nh-encoding
Description	Commands in this context specify the address families enabled to advertise the capability to receive label IPv4 routes, VPN IPv4 routes, or IPv6 next hops from peers. The peers should not send such routes unless notification has been received of this capability. If the router receives an enabled address family route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed. This causes either a session reset or treat-as-withdraw behavior depending on the error handling settings. When the context is unconfigured, command settings are inherited from the higher level BGP configuration.
Introduced	16.0.R1
Platforms	All

gr-notification *boolean*

Synopsis	Perform graceful restart procedures after NOTIFICATION
Context	**configure** router *named-item-64* bgp group *named-item-64* graceful-restart gr-notification *boolean*
Tree	gr-notification
Description	When configured to **true**, the Graceful Restart capability sent by the router indicates support for NOTIFICATION messages. If the peer also supports this capability, the session is restarted gracefully (while preserving forwarding) if either peer sends a NOTIFICATION message due to some type of event or error. When configured to **false**, NOTIFICATION messages are not supported.
Default	false
Introduced	16.0.R1
Platforms	All

long-lived

Synopsis	Enable the **long-lived** context
Context	**configure** router *named-item-64* bgp group *named-item-64* graceful-restart long-lived
Tree	long-lived
Description	Commands in this context configure the BGP Long-Lived Graceful-Restart (LLGR) procedures. LLGR, known informally as BGP persistence, is an extension of BGP GR that allows a session to stay down for a longer period of time. During this time, learned routes are marked and re-advertised as stale but they can continue to be used as routes of last resort. The LLGR handling of a session failure can be invoked immediately or it can be delayed until the end of the traditional GR restart window.
Introduced	16.0.R1
Platforms	All

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** router *named-item-64* bgp group *named-item-64* graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family.

This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).

Options none, all, non-fwd

Default none

Introduced 16.0.R1

Platforms All

helper-override-restart-time *number*

Synopsis Locally-configured override for restart time

Context **configure** router *named-item-64* bgp group *named-item-64* graceful-restart long-lived helper-override-restart-time *number*

Tree helper-override-restart-time

Description This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.

Range 0 to 4095

Introduced 16.0.R1

Platforms All

helper-override-stale-time *number*

Introduced	16.0.R1
Platforms	All

seconds *number*

Synopsis	Maximum time BGP waits between successive messages
Context	**configure** router *named-item-64* bgp group *named-item-64* hold-time seconds *number*
Tree	seconds
Description	This command configures the maximum time BGP waits between successive messages (either keepalive or update) from its peer before closing the connection. Although the implementation allows setting the keepalive timer at the BGP group level times separately, the configured keepalive timer is overridden by this value under the following circumstances.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the specified hold time is less than the configured keepalive time, the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed.
- If the hold time is set to zero, the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. The connection with the peer is up permanently and no keepalive packets are sent to the peer.

When unconfigured, the command setting is inherited from the BGP global-level configuration.

Range 0 | 3 to 65535

Introduced 16.0.R1

Platforms All

import

Synopsis Enable the **import** context

initial-send-delay-zero *boolean*

Synopsis	Send BGP updates as soon as the session comes up
Context	**configure** router *named-item-64* bgp group *named-item-64* initial-send-delay-zero *boolean*
Tree	initial-send-delay-zero
Description	When configured to **true**, BGP updates are sent as soon as the session comes up. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, BGP waits to send UPDATE messages for the minimum route advertisement time after a session is established.
Introduced	16.0.R1
Platforms	All

keepalive *number*

Synopsis	Time after which the BGP KEEPALIVE message is sent
Context	**configure** router *named-item-64* bgp group *named-item-64* keepalive *number*
Tree	keepalive
Description	This command configures the BGP keepalive timer value. A keepalive message is sent every time this timer expires. This value is generally one-third of the hold time interval configured in the **hold-time seconds** context. Although the implementation allows this keepalive value and the hold time interval to be independently set, under the following circumstances, the configured keepalive value is overridden by the hold time interval value:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the specified keepalive value is greater than the configured hold time, the specified keepalive value is ignored and the timer value is set to one third of the current hold time value.
- If the specified hold time interval is less than the configured keepalive value, the keepalive value is reset to one third of the specified hold time interval.
- If the hold time interval is set to zero, the configured keepalive value is ignored. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

When unconfigured, the command inherits the BGP global-level setting.

Range	0 to 21845
Introduced	16.0.R1
Platforms	All

label-preference *number*

Synopsis	Route preference for routes from labeled-unicast peers
Context	**configure** router *named-item-64* bgp group *named-item-64* label-preference *number*
Tree	label-preference
Range	1 to 255

link-bandwidth

Synopsis	Enter the **link-bandwidth** context
Context	**configure** router *named-item-64* bgp group *named-item-64* link-bandwidth
Tree	link-bandwidth
Description	Commands in this context specify the handling of the Link Bandwidth Extended Community attached to specific BGP routes. When all used multipaths of an IP prefix correspond to BGP routes with a Link Bandwidth EC, the datapath is programmed to use weighted ECMP across the BGP next hops in proportion to the bandwidth values.
Introduced	16.0.R3
Platforms	All

Context	**configure** router *named-item-64* bgp group *named-item-64* outbound-route-filtering
Tree	outbound-route-filtering

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the send and receive capabilities for Outbound Route Filtering (ORF). When this context is unconfigured, the group command settings are inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

extended-community

Synopsis	Enable the **extended-community** context
Context	**configure** router *named-item-64* bgp group *named-item-64* outbound-route-filtering extended-community
Tree	extended-community
Description	Commands in this context configure the ORF send and receive capabilities based on Extended Communities. When this context is unconfigured, the command settings are inherited from the global-level configuration.
Introduced	16.0.R1
Platforms	All

accept-orf *boolean*

Synopsis	Negotiate with peer to accept BGP ORF filters
Context	**configure** router *named-item-64* bgp group *named-item-64* outbound-route-filtering extended-community accept-orf *boolean*
Tree	accept-orf
Description	When configured to **true**, the receive capability in the BGP ORF is negotiated with a peer and ORF filters can be accepted from peers. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the accept capability in the BGP ORF is removed and any existing ORF filters that are currently in place are cleared.
Introduced	16.0.R1
Platforms	All

send-orf

Synopsis	Enable the **send-orf** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp group *named-item-64* outbound-route-filtering extended-community send-orf
Tree	send-orf
Description	Commands in this context allow BGP to negotiate the send capability in the ORF negotiation with a peer. The send capability also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD. When this context is unconfigured, the command settings are inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

Platforms	All

path-mtu-discovery *boolean*

Synopsis	Enable Path MTU Discovery
Context	**configure** router *named-item-64* bgp group *named-item-64* path-mtu-discovery *boolean*
Tree	path-mtu-discovery
Description	When configured to **true**, Path MTU Discovery (PMTUD) is enabled for the associated TCP connections. When set to **true**, PMTUD is activated toward an IPv4 BGP neighbor and the Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, this device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value so that the IP MTU constraint can be accommodated. When configured to **false** and there is no TCP MSS configuration that can be associated with a BGP neighbor (in either the BGP configuration or the first hop IP interface configuration), the router advertises a value of only 1024 bytes as the TCP MSS option value, limiting received TCP segments to that size.
Introduced	16.0.R1
Platforms	All

peer-as *number*

Synopsis	Peer AS number
Context	**configure** router *named-item-64* bgp group *named-item-64* peer-as *number*

Introduced	16.0.R1
Platforms	All

peer-ip-tracking *boolean*

Synopsis	Enable BGP peer tracking

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp group *named-item-64* peer-ip-tracking *boolean*
Tree	peer-ip-tracking
Description	When configured to **true**, this command enables BGP peer tracking. Peer tracking should be used with caution. Peer tracking can tear a session down even if the loss of connectivity turns out to be short-lived (for example, while the IGP protocol is re-converging). Next-hop tracking, which is always enabled, handles temporary connectivity issues more effectively. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, peer tracking is disabled.
Introduced	16.0.R1
Platforms	All

preference *number*

Synopsis	Route preference for routes learned from all peers
Context	**configure** router *named-item-64* bgp group *named-item-64* preference *number*

hold-excess *number*

Synopsis	Percentage of maximum routes to install in route table
Context	**configure** router *named-item-64* bgp group *named-item-64* prefix-limit *keyword* hold-excess *number*
Tree	hold-excess
Description	This command specifies the percentage of maximum routes that are allowed to be installed in the route table for the configured address family. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding and advertisement to other peers. If the **post-import** command is configured to **true**, only routes not rejected by import policies count toward the limit. A BGP route in an overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route. This command is mutually exclusive with the **idle-timeou**t and **log-only** commands.
Range	1 to 100
Introduced	23.7.R1
Platforms	All

idle-timeout *number*

Synopsis	Time BGP peering remains idle before reconnecting
Context	**configure** router *named-item-64* bgp group *named-item-64* prefix-limit *keyword* idle-timeout *number*
Tree	idle-timeout
Description	This command configures the time in minutes before a BGP peer is automatically re-established after reaching the prefix limit. When unconfigured, the BGP peer stays down until the operator performs a reset. This command and **log-only** cannot be configured simultaneously.
Range	1 to 1024
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

log-only *boolean*

Synopsis	Send warning message at threshold instead of take-down
Context	**configure** router *named-item-64* bgp group *named-item-64* prefix-limit *keyword* log-only *boolean*
Tree	log-only
Description	When configured to **true**, the router disables the BGP session from being taken down upon reaching the prefix limit. Instead, only a warning message is sent when the limit is reached. A warning message is also sent when the configured threshold percentage of the limit is reached. This command and **idle-timeout** cannot be configured simultaneously. When configured to **false**, the router generates a log event and takes the BGP session down upon reaching the prefix limit.
Default	false
Introduced	16.0.R1
Platforms	All

maximum *number*

Synopsis	Maximum number of routes to be learned from a peer
Context	**configure** router *named-item-64* bgp group *named-item-64* prefix-limit *keyword* maximum *number*
Tree	maximum
Description	This command configures the maximum number of BGP routes of the specified address family that can be received from a peer before administrative action is taken. When **log-only** is unconfigured, the BGP session is taken down whenever the limit of any family is exceeded even if the limits of the other family has not been exceeded.
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	16.0.R2
Platforms	All

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** router *named-item-64* bgp group *named-item-64* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon. This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP. Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary. When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the use of split-horizon is disabled.
Introduced	16.0.R1
Platforms	All

Tree	static-group
Default	true
Introduced	16.0.R1
Platforms	All

tcp-mss *(number | keyword)*

Synopsis	TCP maximum segment size override
Context	**configure** router *named-item-64* bgp group *named-item-64* tcp-mss *(number | keyword)*
Tree	tcp-mss
Description	This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command). The configured value controls two properties of the TCP connection as follows: TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router. TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.
Range	384 to 9746
Options	ip-stack
Introduced	21.2.R1
Platforms	All

third-party-nexthop *boolean*

Synopsis	Apply third-party next-hop processing to EBGP peers
Context	**configure** router *named-item-64* bgp group *named-item-64* third-party-nexthop *boolean*
Tree	third-party-nexthop
Description	When configured to **true**, this command enables the router to send third-party next hop to EBGP peers in the same subnet as the source peer. The address family of the transport must match the address family of the route.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next hop is left unchanged.

When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, third-party next-hop processing is disabled and the next hop carries the IP address of the interface used to establish the TCP connection to the peer.

Introduced 16.0.R1

Platforms All

ttl-security *number*

Synopsis Minimum TTL value for an incoming BGP packet

Context **configure** router *named-item-64* bgp group *named-item-64* ttl-security *number*

Description	This command controls the label allocation behavior for labeled unicast IPv6 routes. The label options are **explicit-null** and **normal**.
Introduced	20.10.R1
Platforms	All

explicit-null *boolean*

Synopsis	Apply advertised label and associated programming rules
Context	**configure** router *named-item-64* bgp label-allocation label-ipv6 explicit-null *boolean*
Tree	explicit-null

Description

When configured to **true**, this command uses the advertised label and associated programming rules on this instance of BGP. The following applies:

- The router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising. It sets the BGP label value to IPv6 explicit null (value 2), forcing a POP behavior for received packets.
- The received label-unicast IPv6 routes never create tunnels in TTM that can be used to resolve other BGP routes (with an IPv6 next-hop).
- A received label-unicast IPv6 route can be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP).

When configured to **false**, advertised label IPv6 programming rules are not used. The following applies

- When the router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising, it sets the BGP label value to a proper value in the dynamic label range and programs a POP or SWAP operation for that label, depending on the origin of the route and various import policy actions that could apply to the route.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Received label-unicast IPv6 routes that have a prefix length of 128 bits are automatically installed in TTM so that they can be used to resolve other (non-labeled-unicast) BGP routes (with an IPv6 next-hop).
- A received label-unicast IPv6 route cannot be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP).
- The label-ipv6 routes used for ECMP toward an IPv6 destination cannot be a mix of routes with regular label values and routes with special (IPv6 explicit null) label values.

Changes in the value of this leaf do not cause the BGP sessions of the base router to reset.

Default	true
Introduced	20.10.R1
Platforms	All

vpn-ipv4

Synopsis	Enter the **vpn-ipv4** context
Context	**configure** router *named-item-64* bgp label-allocation vpn-ipv4
Tree	vpn-ipv4
Description	Commands in this context configure label allocation for VPN-IPv4 routes used in the context of an inter-AS model B ASBR or next-hop-self route reflector.
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mode *keyword*

Synopsis	Mode for implementing VPN-IPv4 route label allocation
Context	**configure** router *named-item-64* bgp label-allocation vpn-ipv4 mode *keyword*
Tree	mode
Description	This command configures the label-allocation mode to use with VPN-IPv4 routes in the context of an inter-AS model B ASBR or next-hop-self route reflector.
Options	next-hop – Assign same label for routes that share same next hop per-prefix – Assign unique incoming label per route prefix
Default	next-hop
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vpn-ipv6

Synopsis	Enter the **vpn-ipv6** context
Context	**configure** router *named-item-64* bgp label-allocation vpn-ipv6
Tree	vpn-ipv6
Description	Commands in this context configure label allocation for VPN-IPv6 routes used in the context of an inter-AS model B ASBR or next-hop-self route reflector.
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mode *keyword*

Synopsis	Mode for implementing VPN-IPv6 route label allocation
Context	**configure** router *named-item-64* bgp label-allocation vpn-ipv6 mode *keyword*
Tree	mode
Description	This command configures the label-allocation mode to use with VPN-IPv6 routes in the context of an inter-AS model B ASBR or next-hop-self route reflector.
Options	next-hop – Assign same label for routes that share same next hop per-prefix – Assign unique incoming label per route prefix
Default	next-hop
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

label-preference *number*

Synopsis	Route preference for routes from labeled-unicast peers
Context	**configure** router *named-item-64* bgp label-preference *number*
Tree	label-preference
Range	1 to 255
Default	170
Introduced	16.0.R1
Platforms	All

link-state-route-export *boolean*

Synopsis	Allow the export of the TED NLRI database

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp link-state-route-export *boolean*
Tree	link-state-route-export
Description	When configured to **true**, this command allows BGP to export link-state information to BGP neighbors. When configured to **false**, link-state information is not exported.
Default	false
Introduced	16.0.R1
Platforms	All

link-state-route-import *boolean*

Synopsis	Allow the import of the TED NLRI database
Context	**configure** router *named-item-64* bgp link-state-route-import *boolean*
Tree	link-state-route-import
Description	When configured to **true**, this command enables the import of link-state information into the BGP-LS address family for advertisement to other BGP neighbors. When configured to **false**, this command disables the import of link-state information.
Default	false
Introduced	16.0.R1
Platforms	All

local-as

Synopsis	Enter the **local-as** context
Context	**configure** router *named-item-64* bgp local-as
Tree	local-as
Introduced	16.0.R1
Platforms	All

as-number *number*

Synopsis	Local (or virtual) BGP AS number
Context	**configure** router *named-item-64* bgp local-as as-number *number*
Tree	as-number
Range	1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

prepend-global-as *boolean*

Synopsis	Prepend global AS when advertising routes to BGP peer
Context	**configure** router *named-item-64* bgp local-as prepend-global-as *boolean*
Tree	prepend-global-as
Description	When configured to **true**, the global ASN is added to the AS_PATH attribute in outbound routes sent to the peer. When configured to **false**, the global ASN is hidden in paths announced to the EBGP peer.
Default	true
Introduced	16.0.R1
Platforms	All

private *boolean*

Synopsis	Hide the local ASN in sent paths learned from peering
Context	**configure** router *named-item-64* bgp local-as private *boolean*
Tree	private
Description	When configured to **true**, the local ASN is hidden in paths learned from the peering. When configured to **false**, the local ASN is advertised to all peers, including those that can use the global ASN for establishing BGP peering sessions.
Default	false
Introduced	16.0.R1
Platforms	All

local-preference *number*

Synopsis	Default local preference if not in incoming routes
Context	**configure** router *named-item-64* bgp local-preference *number*
Tree	local-preference
Max. range	0 to 4294967295
Default	100
