Introduced	16.0.R1
Platforms	All

loop-detect *keyword*

Synopsis	Strategy for loop detection in the AS path
Context	**configure** router *named-item-64* bgp loop-detect *keyword*
Tree	loop-detect
Options	drop-peer, ignore-loop, off, discard-route
Default	ignore-loop
Introduced	16.0.R1
Platforms	All

loop-detect-threshold *number*

Synopsis	Threshold for the global ASN in a received AS path
Context	**configure** router *named-item-64* bgp loop-detect-threshold *number*
Tree	loop-detect-threshold
Range	0 to 15
Default	0
Introduced	16.0.R6
Platforms	All

med-out *(number | keyword)*

Synopsis	Default MED attribute value to advertise to peers
Context	**configure** router *named-item-64* bgp med-out *(number | keyword)*
Tree	med-out
Max. range	0 to 4294967295
Options	igp-cost
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

min-route-advertisement *number*

Synopsis	Minimum time before a prefix can be advertised to peer
Context	**configure** router *named-item-64* bgp min-route-advertisement *number*
Tree	min-route-advertisement
Range	1 to 255
Default	30
Introduced	16.0.R1
Platforms	All

monitor

Synopsis	Enable the **monitor** context
Context	**configure** router *named-item-64* bgp monitor
Tree	monitor
Description	Commands in this context specify BMP-related configurations. When this context is unconfigured, the sending of BMP messages to BMP monitoring stations is disabled.
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of BMP monitoring
Context	**configure** router *named-item-64* bgp monitor admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

all-stations *boolean*

Synopsis	Send BMP messages to all configured stations
Context	**configure** router *named-item-64* bgp monitor all-stations *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	all-stations
Description	When configured to **true**, this command specifies that BMP messages are to be sent to all configured BMP monitoring stations. When configured to **false**, the command is not used to indicate the stations which can receive BMP messages. The **station** command (at the same context level) identifies the BMP stations for which BMP messages are to be sent.
Default	false
Introduced	16.0.R1
Platforms	All

route-monitoring

Synopsis	Enter the **route-monitoring** context
Context	**configure** router *named-item-64* bgp monitor route-monitoring
Tree	route-monitoring
Introduced	16.0.R1
Platforms	All

post-policy *boolean*

Synopsis	Allow post-policy route-monitoring messages to be sent
Context	**configure** router *named-item-64* bgp monitor route-monitoring post-policy *boolean*
Tree	post-policy
Default	false
Introduced	16.0.R1
Platforms	All

pre-policy *boolean*

Synopsis	Allow pre-policy route-monitoring messages to be sent
Context	**configure** router *named-item-64* bgp monitor route-monitoring pre-policy *boolean*
Tree	pre-policy
Default	false
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

station [station-name] *reference*

Synopsis	Add a list entry for **station**
Context	**configure** router *named-item-64* bgp monitor station *reference*
Tree	station
Description	This command identifies a BMP monitoring station for which BMP messages are to be sent.
Max. instances	8
Introduced	16.0.R1
Platforms	All

[**station-name**] *reference*

Synopsis	BMP monitoring station
Context	**configure** router *named-item-64* bgp monitor station *reference*
Tree	station
Reference	**configure** bmp station *named-item*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

mp-bgp-keep *boolean*

Synopsis	Keep rejected VPN-IP routes in RIB-IN
Context	**configure** router *named-item-64* bgp mp-bgp-keep *boolean*
Tree	mp-bgp-keep
Description	When configured to **true**, the RIB-IN retains all MP-BGP routes, including VPN routes rejected by import policies or not imported by any services. As a result, sending Route Refresh messages is not required when an import policy changes. When configured to **false**, these VPN routes are deleted from the RIB-IN.
Default	false
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

multihop *number*

Synopsis	TTL in IP packet headers for EBGP peers multi-hops away
Context	**configure** router *named-item-64* bgp multihop *number*
Tree	multihop
Description	This command configures the Time to Live (TTL) value entered in the IP header of packets sent to an EBGP peer multiple hops away. This command applies only to EBGP.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

multipath

Synopsis	Enter the **multipath** context
Context	**configure** router *named-item-64* bgp multipath
Tree	multipath
Introduced	16.0.R1
Platforms	All

ebgp *number*

Synopsis	Maximum multipaths per prefix for EBGP learned routes
Context	**configure** router *named-item-64* bgp multipath ebgp *number*
Tree	ebgp
Range	1 to 64
Introduced	16.0.R1
Platforms	All

family [family-type] *keyword*

Synopsis	Enter the **family** list instance
Context	**configure** router *named-item-64* bgp multipath family *keyword*
Tree	family
Introduced	19.5.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**family-type**] *keyword*

Synopsis	Address family for which multipath selection
Context	**configure** router *named-item-64* bgp multipath family *keyword*
Tree	family
Options	ipv4, vpn-ipv4, ipv6, vpn-ipv6, label-ipv4, label-ipv6
Notes	This element is part of a list key.
Introduced	19.5.R1
Platforms	All

ebgp *number*

Synopsis	Maximum multipaths when best path is EBGP learned route
Context	**configure** router *named-item-64* bgp multipath family *keyword* ebgp *number*
Tree	ebgp
Description	This command configures the maximum number of multipaths per prefix or NLRI when the best path is an EBGP learned route. The limit configured using this command overrides the limit configured in the **max-paths** command. If the best path is an EBGP learned route, and this command is set to 1, multipaths are disabled.
Range	1 to 64
Introduced	19.5.R1
Platforms	All

ibgp *number*

Synopsis	Maximum multipaths when best path is IBGP learned route
Context	**configure** router *named-item-64* bgp multipath family *keyword* ibgp *number*
Tree	ibgp
Description	This command configures the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route. The limit configured using this command overrides the limit configured in the **max-paths** command. If the best path is an IBGP learned route and this command is set to 1, multipaths are disabled.
Range	1 to 64
Introduced	19.5.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-paths *number*

Synopsis	Maximum number of multipaths per prefix or NLRI
Context	**configure** router *named-item-64* bgp multipath family *keyword* max-paths *number*
Tree	max-paths
Description	This command configures the maximum number of multipaths per prefix or NLRI for the IP family option specified using the **family** command. Consider the following when configuring this command: • If the best path is an EBGP-learned route and the **ebgp** command is configured, the limit configured in the **ebgp** command overrides the limit configured in this command. • If the best path is an IBGP-learned route and the **ibgp** command is configured, the limit configured in the **ibgp** command overrides the limit configured in this command. • If the best path is an EBGP-learned route and the **ebgp** command is not configured, and this command is configured to 1, multipaths are disabled. • If the best path is an IBGP-learned route and the **ibgp** command is not configured, and this command is configured to 1, multipaths are disabled.
Range	1 to 64
Introduced	19.5.R1
Platforms	All

restrict *keyword*

Synopsis	AS path restriction for the non-best path
Context	**configure** router *named-item-64* bgp multipath family *keyword* restrict *keyword*
Tree	restrict
Options	same-as-path-length, same-neighbor-as, exact-as-path
Default	same-as-path-length
Introduced	19.5.R1
Platforms	All

unequal-cost *boolean*

Synopsis	Ignore differences in the next-hop cost for multipath
Context	**configure** router *named-item-64* bgp multipath family *keyword* unequal-cost *boolean*
Tree	unequal-cost

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, BGP ignores differences in the next-hop cost when determining eligible multipaths.
Default	false
Introduced	19.5.R1
Platforms	All

ibgp *number*

Synopsis	Maximum multipaths per prefix for IBGP learned routes
Context	**configure** router *named-item-64* bgp multipath ibgp *number*
Tree	ibgp
Range	1 to 64
Introduced	16.0.R1
Platforms	All

max-paths *number*

Synopsis	Maximum multipaths per prefix
Context	**configure** router *named-item-64* bgp multipath max-paths *number*
Tree	max-paths
Range	1 to 64
Default	1
Introduced	16.0.R1
Platforms	All

restrict *keyword*

Synopsis	AS path restriction for the non-best path
Context	**configure** router *named-item-64* bgp multipath restrict *keyword*
Tree	restrict
Options	same-as-path-length, same-neighbor-as, exact-as-path
Default	same-as-path-length
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

unequal-cost *boolean*

Synopsis	Ignore differences in the next-hop cost for multipath
Context	**configure** router *named-item-64* bgp multipath unequal-cost *boolean*
Tree	unequal-cost
Default	false
Introduced	19.5.R1
Platforms	All

mvpn-vrf-import-subtype-new *boolean*

Synopsis	Encode the IANA value of 0x010b in advertised routes
Context	**configure** router *named-item-64* bgp mvpn-vrf-import-subtype-new *boolean*
Tree	mvpn-vrf-import-subtype-new
Description	When configured to **true**, this command encodes the value of 0x010b for the type or subtype in advertised routes. When configured to **false**, BGP encodes the extended community type or subtype as 0x010a to preserve backwards compatibility.
Default	false
Introduced	16.0.R1
Platforms	All

neighbor [ip-address] *(ipv4-address-with-zone | ipv6-address-with-zone)*

Synopsis	Enter the **neighbor** list instance
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)*
Tree	neighbor
Description	Commands in this context configure a BGP peer or neighbor instance within the context of the BGP group.
Introduced	16.0.R1
Platforms	All

[**ip-address**] *(ipv4-address-with-zone | ipv6-address-with-zone)*

Synopsis	IP address of the BGP peer router

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)*
Tree	neighbor
String format	'ipv4-address-with-zone' must be a.b.c.d with optional %zone-id 'ipv6-address-with-zone' must be valid IPv6 with optional %zone-id 'ipv6-address-with-zone' must be valid IPv6 with optional %zone-id
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

add-paths

Synopsis	Enable the **add-paths** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths
Tree	add-paths
Description	Commands in this context allow the add-paths node to be configured for the specified families for configuration of the BGP group or neighbor. The BGP add-paths capability allows the router to send or receive multiple paths per prefix to and from a peer. When unconfigured, command settings are inherited from a higher level BGP configuration.
Introduced	16.0.R1
Platforms	All

evpn

Synopsis	Enter the **evpn** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths evpn
Tree	evpn
Description	Commands in this context configure the add-paths capability for EVPN routes. By default, add-paths is not enabled for EVPN routes.
Introduced	21.10.R1
Platforms	All

receive *boolean*

Synopsis	Receive multiple EVPN paths per prefix from a peer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths evpn receive *boolean*
Tree	receive
Default	false
Introduced	21.10.R1
Platforms	All

send *(number | keyword)*

Synopsis	Maximum paths per EVPN prefix to Add-Path peers
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths evpn send *(number | keyword)*
Tree	send
Range	1 to 16
Options	all – Send all valid paths for each NLRI multipaths – Number of best multipaths for each NLRI
Introduced	21.10.R1
Platforms	All

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths ipv4
Tree	ipv4
Introduced	16.0.R1
Platforms	All

receive *boolean*

Synopsis	Receive multiple labeled-unicast routes per IPv4 prefix
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths ipv4 receive *boolean*
Tree	receive
Description	When configured to **true**, the router can receive multiple unlabeled IPv4 unicast routes per prefix from a peer. When configured to **false**, the ADD-PATH receive capability is not enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	All

send *(number | keyword)*

Synopsis	Maximum paths per unlabeled IPv4 unicast prefix
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths ipv4 send *(number | keyword)*
Tree	send
Description	This command configures the maximum number of paths per unlabeled IPv4 unicast prefix that are allowed to be advertised to ADD-PATH peers. The actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules. When not configured, ADD-PATH send capability is not enabled for unlabeled IPv4 unicast routes.
Range	1 to 16
Options	all – Send all valid paths for each NLRI multipaths – Number of best multipaths for each NLRI
Introduced	16.0.R1
Platforms	All

ipv6

Synopsis	Enter the **ipv6** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths ipv6
Tree	ipv6
Introduced	16.0.R1
Platforms	All

receive *boolean*

Synopsis	Receive multiple routes per IPv6 prefix
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths ipv6 receive *boolean*
Tree	receive

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this command allows multiple unlabeled IPv6 unicast routes per prefix to be received from a peer. When configured to **false**, the ADD-PATH receive capability is not enabled.
Default	false
Introduced	16.0.R1
Platforms	All

send *(number | keyword)*

Synopsis	Maximum paths per unlabeled IPv6 unicast prefix
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths ipv6 send *(number | keyword)*
Tree	send
Description	This command configures the maximum number of paths per unlabeled IPv4 unicast prefix that are allowed to be advertised to ADD-PATH peers. The actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules. When not configured, ADD-PATH send capability is not enabled for unlabeled IPv4 unicast routes.
Range	1 to 16
Options	all – Send all valid paths for each NLRI multipaths – Number of best multipaths for each NLRI
Introduced	16.0.R1
Platforms	All

label-ipv4

Synopsis	Enter the **label-ipv4** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths label-ipv4
Tree	label-ipv4
Introduced	16.0.R1
Platforms	All

receive *boolean*

Synopsis	Receive multiple labeled-unicast routes per IPv4 prefix

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths label-ipv4 receive *boolean*
Tree	receive
Description	When configured to **true**, this command allows multiple labeled-unicast routes per IPv4 prefix to be received from a peer. When configured to **false**, the ADD-PATH receive capability is not enabled.
Default	false
Introduced	16.0.R1
Platforms	All

send *(number | keyword)*

Synopsis	Maximum paths per labeled IPv4 unicast prefix
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths label-ipv4 send *(number | keyword)*
Tree	send
Description	This command configures the maximum number of paths that are allowed to be advertised to add-paths peers per labeled IPv4 unicast prefix. The actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules. When not configured, ADD-PATH send capability is not enabled for labeled IPv4 unicast routes.
Range	1 to 16
Options	all – Send all valid paths for each NLRI multipaths – Number of best multipaths for each NLRI
Introduced	16.0.R1
Platforms	All

label-ipv6

Synopsis	Enter the **label-ipv6** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* add-paths label-ipv6
Tree	label-ipv6
Introduced	16.0.R1
Platforms	All

advertise-inactive *boolean*

Synopsis	Advertise an inactive BGP route to peers
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* advertise-inactive *boolean*
Tree	advertise-inactive

Description

When configured to **true**, this command allows an inactive BGP route to be advertised, even though it is not the most preferred route. The effect of the command on advertised unlabeled, labeled, and multicast IPv4 and IPv6 routes depends on several factors.

- If the active route for the IP prefix is a BGP route, that route is advertised.
- If the active route is a non-BGP route and there are valid inactive BGP routes to the same destination, the best valid inactive route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session.
- If the active route is a non-BGP route and there are no valid BGP routes to the same destination, no route is advertised unless the active non-BGP route is matched and accepted by an export policy applied to the session.

When unconfigured, the command inherits the value of the global-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, the advertisement of inactive BGP routes to other BGP peers is disabled.

Default	false
Introduced	16.0.R1
Platforms	All

aggregator-id-zero *boolean*

Synopsis	Set router ID in the BGP AGGREGATOR attribute to zero
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* aggregator-id-zero *boolean*
Tree	aggregator-id-zero
Introduced	16.0.R1
Platforms	All

aigp *boolean*

Synopsis	Add AIGP attribute to advertised routes
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* aigp *boolean*
Tree	aigp
Description	When configured to **true**, this command enables Accumulated IGP (AIGP) path attribute support with one or more BGP peers. BGP path selection among routes with an associated AIGP metric is based on the end-to-end IGP metrics of the different BGP paths, even when these BGP paths span more than one AS and IGP instance. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the AIGP attribute is removed from advertised routes, if present, and is ignored in received routes.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

as-override *boolean*

Synopsis	Replace the peer's ASN with the local ASN in AS Path
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* as-override *boolean*
Tree	as-override
Description	When configured to **true**, the advertising router's local AS replaces all occurrences of the peer AS in the AS_PATH attribute. This command should be used with caution, as it breaks BGP's loop detection mechanism. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). This command cannot be explicitly configured to **false**. When configured to **false**, no AS override is performed.
Introduced	19.7.R1
Platforms	All

asn-4-byte *boolean*

Synopsis	Advertise the use of 4-byte ASNs
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* asn-4-byte *boolean*
Tree	asn-4-byte
Introduced	16.0.R1
Platforms	All

authentication-key *encrypted-leaf*

Synopsis	BGP authentication key
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command specifies the BGP authentication key peers in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 422
Introduced	16.0.R1

Tree	bfd-strict-mode
Introduced	23.7.R1
Platforms	All

advertise

Synopsis	Enable the **advertise** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode advertise
Tree	advertise
Description	Commands in this context configure BGP to advertise the Strict-BFD capability to peers that are within scope of this command and meet the following requirements: • The inherited or configured value for the **bfd-liveness** command that applies to the peer is **true**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The interface associated with the peer has a valid BFD configuration.

When the preceding conditions are satisfied and two peers attempting to form a session both advertise the Strict-BFD capability, the BGP finite state machine in each router transitions the session state to established after the BFD session with the peer enters the up state.

When unconfigured, BGP does not advertise the Strict-BFD capability to peers.

Introduced 23.7.R1

Platforms All

holdtime *number*

Synopsis Maximum time BGP waits for the BFD session to come up

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode advertise holdtime *number*

Tree holdtime

Description This command configures the maximum time BGP waits for the BFD session to come up, provided that the Strict-BFD procedures apply to a session, and the negotiated BGP hold time is zero (no keepalives). If the negotiated BGP hold time is greater than zero, the advertised hold time is not considered.

Range 1 to 65535

Units seconds

Default 30

Introduced 23.7.R1

Platforms All

next-hop-reachability *boolean*

Synopsis Consider next hop unreachable if BFD session is down

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* bfd-strict-mode next-hop-reachability *boolean*

Tree next-hop-reachability

Description When configured to **true**, the router considers next-hop self routes belonging to specific address families received from a peer within scope of this command as having an unresolved next hop, provided that the following requirements are met:

- The BFD session to the peer is in a down state.
- There is a valid interface BFD configuration that applies to the peer.
- There is a valid BFD liveness configuration that applies to the peer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The unresolved state is maintained until the BFD session state changes to up or administratively down, even if there is a resolving route or tunnel that matches the BGP next-hop address.

Routes received from one peer with a BGP next-hop address equal to the address of another peer are not affected by the BFD session to the other peer.The behavior of the router when this command is **true** does not depend on whether Strict-BFD is used, as both features are independent.

Configuring this command to **true** only affects routes belonging to the following address families:

- IPv4
- IPv6
- IPv4 VPN
- IPv6 VPN
- labeled unicast IPv4
- labeled unicast IPv6
- EVPN
- IPv4 multicast
- IPv6 multicast
- IPv4 VPN multicast
- IPv6 VPN multicast

When configured to **false**, the router does not consider next-hop self routes belonging to the preceding address families as having an unresolved next hop if the BFD session goes down.

Introduced 23.7.R1

Platforms All

block-prefix-sid *boolean*

Synopsis Block the prefix SID attribute

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* block-prefix-sid *boolean*

Tree block-prefix-sid

Description When configured to **true**, all prefix SID attributes are removed from all routes exchanged between EBGP and IBGP peers covered by the scope of the command. Locally-imposed prefix SID attributes are also removed.

When configured to **false**, all prefix SID attributes are propagated without restriction.

A change of this configuration causes the affected BGP sessions to flap.

Default false

Introduced 19.10.R1

allow-local-fallback *boolean*

Synopsis	Allow fallback to RR topology
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* cluster allow-local-fallback *boolean*
Tree	allow-local-fallback

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this command allows the RR to advertise the best BGP path from its own topology location when there are no reachable routes from the client's ORR location. The ORR location must be specified before this command can be set to **true**. When configured to **false**, this command no route is advertised to the client.
Default	false
Introduced	16.0.R1
Platforms	All

cluster-id *ipv4-address*

Synopsis	Route reflector cluster ID
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* cluster cluster-id *ipv4-address*
Tree	cluster-id
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	All

orr-location *number*

Synopsis	Optimal route reflection location for the cluster
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* cluster orr-location *number*
Tree	orr-location
Description	This command configures an ORR location ID. If a cluster ID is also specified, the clients in that cluster receive routes optimal for that specific location. With optimal route reflection, the best path advertised to a client takes location ID into account. If the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF, OSPFv3, IS-IS, or BGP-LS information in the TE DB.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

Introduced	19.5.R1
Platforms	All

ibgp *number*

Synopsis	Default preference for IBGP
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* default-preference ibgp *number*
Tree	ibgp
Range	0 to 255
Introduced	19.5.R1
Platforms	All

default-route-target *boolean*

Synopsis	Send default RTC route (zero prefix length) to peers
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* default-route-target *boolean*
Tree	default-route-target
Description	When configured to **true**, this command sends the default RTC route (zero prefix length) toward the selected peers. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, a default RTC route is not sent.
Introduced	16.0.R1
Platforms	All

Tree	egress-engineering
Introduced	21.7.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of BGP egress engineering
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* egress-engineering admin-state *keyword*
Tree	admin-state
Description	This command administratively enables or disables egress engineering for the BGP. If enabled, peer node SIDs and peer adjacency SIDs are advertised in BGP-LS.
Options	enable, disable
Default	disable
Introduced	21.7.R1
Platforms	All

egress-peer-engineering-label-unicast *boolean*

Synopsis	Generate EPE label-unicast routes for neighbor
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* egress-peer-engineering-label-unicast *boolean*
Tree	egress-peer-engineering-label-unicast
Description	When configured to **true**, BGP generates a label-unicast route for the /32 or /128 prefix that corresponds to the BGP neighbor address. This route can be advertised to other routers to recursively resolve unlabeled BGP routes for AS external destinations. This supports the Egress Peer Engineering (EPE) use case.
Default	false
Introduced	22.2.R1
Platforms	All

enforce-first-as *boolean*

Synopsis	Enforce the configured peer AS value in received routes
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* enforce-first-as *boolean*
Tree	enforce-first-as

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description When configured to **true** for an EBGP session, all routes received from an EBGP peer are checked to ensure that the most recent ASN in the AS_PATH attribute of each route matches the configured AS of the session. If there is not a match, the session is reset (if the **update-fault-tolerance** command in the **error-handling** context is set to **false**) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is set to **true**).

This command does not flap an established session because it applies only to routes received after the command is issued.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, received routes are not checked for compliance with the rule.

Introduced 16.0.R1

Platforms All

error-handling

Synopsis Enter the **error-handling** context

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* error-handling

Tree error-handling

Introduced 16.0.R1

Platforms All

update-fault-tolerance *boolean*

Synopsis Tolerate non-critical errors in UPDATE messages

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* error-handling update-fault-tolerance *boolean*

Tree update-fault-tolerance

Description When configured to **true**, non-critical errors are handled with treat-as-withdraw, attribute-discard, and other non-disruptive approaches that do not cause a session reset. Critical errors still trigger a session reset.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, all errors trigger a session reset.

Introduced 16.0.R1

Platforms All

export

Synopsis	Enable the **export** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* export
Tree	export
Description	Commands in this context specify route policies that control the handling of outbound routes transmitted to certain peers. Route policies are configured in the **configure policy-options** context. When this context is unconfigured, the policy association for the group is inherited from the BGP global-level configuration.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	BGP export policy name
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* export policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of outbound routes transmitted to certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route. Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".
String length	1 to 255
String format	'policy-expr-string' must contain [for a bracketed policy name in a routing policy logical expression (e.g. [policyA])
Max. instances	15
Min. instances	1
Notes	This element is ordered by the user.
Introduced	16.0.R1

extended-nh-encoding

Synopsis Enable the **extended-nh-encoding** context

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* extended-nh-encoding

Tree extended-nh-encoding

Description Commands in this context specify the address families enabled to advertise the capability to receive label IPv4 routes, VPN IPv4 routes, or IPv6 next hops from peers. The peers should not send such routes unless notification has been received of this capability. If the router receives an enabled address family route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed. This causes either a session reset or treat-as-withdraw behavior depending on the error handling settings.

When the context is unconfigured, command settings are inherited from the higher level BGP configuration.

Introduced 16.0.R1

Platforms All

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	16.0.R1
Platforms	All

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time
Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.
Range	0 to 4095
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

helper-override-stale-time *number*

Synopsis	Locally-configured stale routes override time
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived helper-override-stale-time *number*
Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability. This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.
Range	0 to 16777215
Introduced	16.0.R1
Platforms	All

without-no-export *boolean*

Synopsis	Advertise LLGR stale routes to non-LLGR peers
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived without-no-export *boolean*
Tree	without-no-export
Description	When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0. When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0 and a NO_EXPORT standard community is automatically added to the routes.
Default	false
Introduced	16.0.R1

Tree	minimum-hold-time
Range	0 | 3 to 65536
Default	0
Introduced	16.0.R1
Platforms	All

seconds *number*

Synopsis	Maximum hold time between successive messages
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* hold-time seconds *number*
Tree	seconds
Description	The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection. Even though the implementation allows setting the keepalive timer at the BGP neighbor level times separately, the configured keepalive timer is overridden by this value under the following circumstances: • If the specified hold time is less than the configured keepalive time, then the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed. • If the hold time is set to zero, the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer. When unconfigured, the command setting is inherited from the BGP group-level configuration.
Range	0 | 3 to 65535
Introduced	16.0.R1

Platforms	All

import

Synopsis	Enable the **import** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* import
Tree	import
Description	Commands in this context specify route policies that control the handling of inbound routes received from certain peers. Route policies are configured in the **configure policy-options** context. When this context is unconfigured, the policy association is inherited from the BGP group-level configuration.
Introduced	16.0.R1
Platforms	All

policy *(policy-expr-string | string)*

Synopsis	Names of the BGP import policies
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* import policy *(policy-expr-string | string)*
Tree	policy
Description	This command specifies route policies that control the handling of inbound routes received from certain peers. Each object in this command is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route. Only one of the objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end"," @variable@end", or "start@variable@".
String length	1 to 255
String format	'policy-expr-string' must contain [for a bracketed policy name in a routing policy logical expression (e.g. [policyA])
Max. instances	15
Min. instances	1

initial-send-delay-zero *boolean*

Synopsis	Send BGP updates as soon as the session comes up
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* initial-send-delay-zero *boolean*
Tree	initial-send-delay-zero
Description	When configured to **true**, BGP updates are sent as soon as the session comes up. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, BGP waits to send UPDATE messages for the minimum route advertisement time after a session is established.
Introduced	16.0.R1
Platforms	All

keepalive *number*

Introduced	19.5.R1
Platforms	All

next-hop-self *boolean*

Synopsis	Advertise routes with local address as next-hop address
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* next-hop-self *boolean*
Tree	next-hop-self
Description	When configured to **true**, this command configures BGP to advertise routes to members of a group using a local address of the BGP instance as the BGP next-hop address. Note that this command is set without exception, regardless of the route source (EBGP or IBGP) or its family. When used with VPN-IPv4 and VPN-IPv6 routes, the **configure router bgp rr-vpn-forwarding** command should also be configured. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, protocol standard behavior is applied to determine whether to set **next-hop-self** in advertised routes.
Introduced	16.0.R1
Platforms	All

next-hop-unchanged

Synopsis	Enable the **next-hop-unchanged** context
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* next-hop-unchanged

Tree	extended-community
Description	Commands in this context configure the ORF send and receive capabilities based on Extended Communities. When this context is unconfigured, the command settings are inherited from the group-level configuration.
Introduced	16.0.R1
Platforms	All

accept-orf *boolean*

Synopsis	Negotiate with peer to accept BGP ORF filters
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* outbound-route-filtering extended-community accept-orf *boolean*
Tree	accept-orf
Description	When configured to **true**, the receive capability in the BGP ORF is negotiated with a peer and ORF filters can be accepted from peers.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, the accept capability in the BGP ORF is removed and any existing ORF filters that are currently in place are cleared.

Introduced 16.0.R1

Platforms All

send-orf

Synopsis Enable the **send-orf** context

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* outbound-route-filtering extended-community send-orf

Tree send-orf

Description Commands in this context allow BGP to negotiate the send capability in the ORF negotiation with a peer. The send capability also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD.

When this context is unconfigured, the command settings are inherited from the BGP group-level configuration.

Introduced 16.0.R1

Platforms All

route-target [community-name] *named-item*

path-mtu-discovery *boolean*

Synopsis	Enable path MTU discovery
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-mtu-discovery *boolean*
Tree	path-mtu-discovery
Description	When configured to **true**, Path MTU Discovery (PMTUD) is enabled for the associated TCP connections. When set to **true**, PMTUD is activated toward an IPv4 BGP neighbor and the Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, this device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value so that the IP MTU constraint can be accommodated. When PMTUD is configured to **false** and there is no TCP MSS configuration that can be associated with a BGP neighbor (in either the BGP configuration or the first hop IP interface configuration), the router advertises a value of only 1024 bytes as the TCP MSS option value, limiting received TCP segments to that size.
Introduced	16.0.R1
Platforms	All

peer-ip-tracking *boolean*

Synopsis	Enable BGP peer tracking
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* peer-ip-tracking *boolean*
Tree	peer-ip-tracking
Description	When configured to **true**, this command enables BGP peer tracking. Peer tracking should be used with caution. Peer tracking can tear a session down even if the loss of connectivity turns out to be short-lived (for example, while the IGP protocol

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

is re-converging). Next-hop tracking, which is always enabled, handles temporary connectivity issues more effectively.

When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**.

When this command inherits a value of **false**, peer tracking is disabled.

Introduced 16.0.R1

Platforms All

preference *number*

Synopsis Route preference for routes learned from all peers

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* preference *number*

Tree preference

Description This command configures the route preference for routes learned from the configured peers.

The lower the preference value, the higher the chance of the route being the active route. The router assigns BGP routes the highest default preference as compared to routes that are direct, static or learned via MPLS or OSPF.

When unconfigured, the command setting is inherited from the group-level configuration.

hold-excess *number*

Synopsis	Percentage of maximum routes to install in route table
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword* hold-excess *number*
Tree	hold-excess
Description	This command specifies the percentage of maximum routes that are allowed to be installed in the route table for the configured address family. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding and advertisement to other peers. If the **post-import** command is configured to **true**, only routes not rejected by import policies count toward the limit. A BGP route in an overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route. This command is mutually exclusive with the **idle-timeout** and **log-only** commands.
Range	1 to 100
Introduced	23.7.R1
Platforms	All

Description Commands in this context configure the inclusion of SRv6 TLVs for specified peer and AFI combinations; unconfigured combinations do not receive the TLV.

If the referenced locator is operationally invalid, routes to that peer and AFI combination are advertised without the SRv6 TLV. The system does not substitute a locator from another level of the configuration hierarchy. RIB-OUT regeneration is triggered automatically when the locator becomes valid.

Introduced 26.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator-name *reference*

Synopsis SRv6 locator name

Context **configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* segment-routing-v6 route-advertisement family *keyword* add-srv6-tlvs locator-name *reference*

Tree locator-name

Description This command configures the locator used to identify routes for which to include SRv6 TLVs. When this command is configured, the router adds a prefix SID attribute containing an SRv6 TLV to the following:

- routes belonging to the family that are redistributed from another protocol and advertised to BGP peers
- BGP routes received from other peers without the SRv6 TLV and are propagated to other peers with next-hop-self applied

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon. This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP. Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the use of split-horizon is disabled.
Introduced	16.0.R1
Platforms	All

tcp-mss *(number | keyword)*

Synopsis	TCP maximum segment size override
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* tcp-mss *(number | keyword)*
Tree	tcp-mss
Description	This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The configured value controls two properties of the TCP connection as follows:

TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router.

TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

Range	384 to 9746
Options	ip-stack
Introduced	21.2.R1
Platforms	All

third-party-nexthop *boolean*

Synopsis	Apply third-party next-hop processing to EBGP peers
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* third-party-nexthop *boolean*
Tree	third-party-nexthop
Introduced	16.0.R1
Platforms	All

ttl-security *number*

Synopsis	Minimum TTL value for an incoming BGP packet
Context	**configure** router *named-item-64* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* ttl-security *number*
Tree	ttl-security
Description	This command configures the minimum TTL value that BGP will accept from an incoming packet. A packet with a TTL value less than the minimum configured TTL value is discarded. When unconfigured, the command inherits the value of the group-level setting.
Range	1 to 255
Introduced	16.0.R1
Platforms	All

neighbor-trust

Synopsis	Enter the **neighbor-trust** context
Context	**configure** router *named-item-64* bgp neighbor-trust
Tree	neighbor-trust
Description	Commands in this context enable a label security feature at an inter-AS boundary for the specified IP families. This label security feature allows the configuration of a router, acting in a PE or in an ASBR role, to accept packets of VPN-IP or EVPN prefixes only from direct EBGP neighbors to which it advertised a service label. The untrusted state identifies the participating interfaces. The router supports a maximum of 15 network interfaces that can participate in this feature. At a high level, BGP tracks each direct EBGP neighbor over an untrusted interface and to which it sent a prefix label. For each of those prefixes, BGP programs a bit map in the ILM record that indicates, on a per-untrusted interface basis, whether the matching received packets must be forwarded or dropped.
Introduced	16.0.R4
Platforms	All

evpn *boolean*

allow-static *boolean*

Synopsis	Allow static routes to resolve BGP next-hop
Context	**configure** router *named-item-64* bgp next-hop-resolution labeled-routes allow-static *boolean*
Tree	allow-static
Description	When configured to **true**, the BGP next-hop of label-IPv4, label-IPv6, VPN-IPv4, and VPN-IPv6 routes received from any EBGP or IBGP peer can be resolved using static routes, except for static default routes (0/0 and ::/0). A static route is less preferred than a local or interface route for resolving the BGP next-hop of labeled route but is more preferred than other IGP routes or tunnels. When configured to **false**, BGP next-hop resolution using static routes is not allowed. A label-IPv4 or label-IPv6 route can be resolved by a static blackhole route, even when this command is configured to **false**, but only if the static blackhole route is the longest prefix match (LPM) static route for the BGP next-hop address.
Default	false
Introduced	16.0.R1
Platforms	All

rr-use-route-table *boolean*

Synopsis	Use RTM to resolve BGP next-hop if TTM resolution fails
Context	**configure** router *named-item-64* bgp next-hop-resolution labeled-routes rr-use-route-table *boolean*
Tree	rr-use-route-table
Description	When configured to **true**, this command enables BGP to perform a lookup of IGP routes in the route table to resolve the BGP next-hop of label-IPv4 and label-IPv6 routes. This is useful for a Route Reflector (RR) that does not participate in tunnel signaling protocols such as LDP and RSVP and therefore, does not have tunnels to resolve the BGP next-hops of label-unicast routes. Disable route table installation (via the **route-table-install** command) before setting this command to **true**; otherwise, forwarding of label routes resolved in this way will be incorrect. When configured to **false**, RTM next-hop resolution is not enabled.
Default	false
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* allow-flex-algo-fallback *boolean*
Tree	allow-flex-algo-fallback
Description	When configured to **true**, a BGP router with a Flex-Algorithm action configured (via the **configure policy-options policy-statement entry action flex-algo** command) can resolve to a tunnel with algorithm 0 if no target Flex-Algorithm tunnel is available**.** When configured to **false**, the BGP router can resolve only to the intended Flex-Algorithm tunnel, which may cause traffic loss if no corresponding Flex-Algorithm tunnel is available.
Default	false
Introduced	20.10.R1
Platforms	All

enforce-strict-tunnel-tagging *boolean*

Synopsis	Consider only LSPs with an admin-tag for next hop
Context	**configure** router *named-item-64* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* enforce-strict-tunnel-tagging *boolean*
Tree	enforce-strict-tunnel-tagging
Description	When configured to **true**, the system only considers LSPs marked with an administrative tag for next-hop resolution. Untagged LSPs are not considered. When configured to **false**, matching admin-tagged RSVP or SR-TE LSPs are used in preference to other LSP types, whether tagged or untagged. If no eligible RSVP or SR-TE LSP exists, the system falls back to using tagged LSPs that are not explicitly excluded by a route admin tag policy and untagged LSPs of other types.
Default	false
Introduced	16.0.R1
Platforms	All

enforce-untagged-route *keyword*

Synopsis	Untagged route type enforcement
Context	**configure** router *named-item-64* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* enforce-untagged-route *keyword*
Tree	enforce-untagged-route
Description	This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services. If the **untagged-tunnel** option is configured, untagged routes only bind to LSPs with no administrative tag configured. If both tagged and untagged tunnels to the next hop exist,

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the system only considers the untagged tunnels. If no untagged tunnels to the next hop exist, the resolution of untagged routes fails.

The **untagged-tunnel** option can be used in combination with the **enforce-strict-tunnel-tagging** command configured to **true**, in which case tagged routes resolve to tagged LSPs, and untagged routes only resolve to untagged LSPs.

When unconfigured, untagged routes can bind to tagged or untagged LSPs.

Options	none – Untagged routes can bind to tagged or untagged LSPs untagged-tunnel – Untagged routes only bind to LSPs without an admin tag
Default	none
Introduced	24.10.R1

sr-policy *boolean*

Synopsis Use SR policies for next-hop resolution

Context **configure** router *named-item-64* bgp next-hop-resolution labeled-routes transport-tunnel family *keyword* resolution-filter sr-policy *boolean*

Tree sr-policy

Description When configured to **true**, this command enables the use of SR policies to resolve the next hop of BGP routes.

The SR policies are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73 or AFI 2/SAFI 73). BGP resolves a labeled IPv4 route with an IPv4 next-hop address or a labeled IPv6 route with IPv4-mapped IPv6 next-hop address using an SR policy selected by applying the following procedure in preference order:

- **IPv4 endpoint** - The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy.
- **null IPv4 endpoint (0.0.0.0)** - The highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.
- **null IPv6 endpoint (0::0)** - The highest numbered color extended community attached to the labeled IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

BGP resolves a labeled IPv6 route with an IPv6 next hop that is not an IPv4-mapped IPv6 address using an SR policy selected by applying the following procedure in preference order:

- **IPv6 endpoint** - The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy.
- **null IPv6 endpoint (0.::0)** - The highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.
- **null IPv4 endpoint (0.0.0.0)** - The highest numbered color extended community attached to the labeled IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

When configured to **false**, SR policies are not enabled for next-hop resolution.

Default false

Introduced 16.0.R1

Platforms All

sr-te *boolean*

Synopsis Use SR-TE tunneling for next-hop resolution

rsvp *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	**configure** router *named-item-64* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter rsvp *boolean*
Tree	rsvp
Description	When configured to **true**, this command enables the selection of RSVP tunneling for next-hop resolution and specifies RSVP tunnels in a tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID. When configured to **false**, this command disables the selection of RSVP tunneling for next-hop resolution.
Default	false
Introduced	16.0.R1
Platforms	All

sr-isis *boolean*

Synopsis	Use IS-IS SR tunneling for next-hop resolution
Context	**configure** router *named-item-64* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-isis *boolean*
Tree	sr-isis
Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by an IS-IS instance in the TTM for next-hop resolution of BGP routes. This command allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference IS-IS instance. In the case of a tie, the IS-IS instance with the lowest metric SR tunnel is selected over the lowest numbered IS-IS instance. When configured to **false**, the SR tunnel type programmed by an IS-IS instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-ospf *boolean*

Synopsis	Use OSPF SR tunneling for next-hop resolution
Context	**configure** router *named-item-64* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-ospf *boolean*
Tree	sr-ospf
Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by an OSPF instance in the TTM for next-hop resolution of BGP routes. This command allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference OSPF instance. In the case of a tie, the OSPF instance with the lowest metric SR tunnel is selected over the lowest numbered OSPF instance. When configured to **false**, the SR tunnel type programmed by an OSPF instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

sr-ospf3 *boolean*

Synopsis	Use OSPFv3 SR tunneling for next-hop resolution
Context	**configure** router *named-item-64* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-ospf3 *boolean*
Tree	sr-ospf3
Description	When configured to **true**, this command enables the selection of the IPv6 Segment Routing (SR) tunnel type programmed by an OSPFv3 instance in the TTMv6 for next-hop resolution of BGP routes. This command allows BGP to use the SR tunnel in the tunnel table submitted by the lowest preference OSPFv3 instance. In the case of a tie, the OSPFv3 instance with the lowest metric SR tunnel is selected over the lowest numbered OSPFv3 instance. When configured to **false**, the SR tunnel type programmed by an OSPFv3 instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R6
Platforms	All

sr-policy *boolean*

Synopsis Use SR policies for next-hop resolution

Context **configure** router *named-item-64* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-policy *boolean*

Tree sr-policy

Description When configured to **true**, this command enables the use of SR policies to resolve the next hop of BGP routes.

The SR policies are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73 or AFI 2/SAFI 73). BGP resolves an IPv4 route with an IPv4 next-hop address or an IPv6 route with IPv4-mapped IPv6 next-hop address using an SR policy selected by applying the following procedure in preference order:

- **IPv4 endpoint** - The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy.
- **null IPv4 endpoint (0.0.0.0)** - The highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.
- **null IPv6 endpoint (0::0)** - The highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

BGP resolves an IPv6 route with an IPv6 next hop that is not an IPv4-mapped IPv6 address using an SR policy selected by applying the following procedure in preference order:

- **IPv6 endpoint** - The next hop must match the endpoint of the SR policy and the highest numbered color extended community attached to the IPv6 route must match the color of the SR policy.
- **null IPv6 endpoint (0.::0)** - The highest numbered color extended community attached to the IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.
- **null IPv4 endpoint (0.0.0.0)** - The highest numbered color extended community attached to the IPv6 route must match the color of the SR policy and its color bits must be set to '01' or '10'.

When configured to **false**, SR policies are not enabled for next-hop resolution.

Default false

Introduced 16.0.R1

Platforms All

sr-te *boolean*

Synopsis Use SR-TE tunneling for next-hop resolution

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp next-hop-resolution shortcut-tunnel family *keyword* resolution-filter sr-te *boolean*
Tree	sr-te
Description	When configured to **true**, this command enables the selection of the Segment Routing (SR) tunnel type programmed by a traffic engineered (TE) instance in the TTM for next-hop resolution. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID. When configured to **false**, the SR tunnel type programmed by a TE instance in the TTM for next-hop resolution is not enabled for selection.
Default	false
Introduced	16.0.R1
Platforms	All

use-bgp-routes *boolean*

Synopsis	Use BGP routes to resolve BGP next hops
Context	**configure** router *named-item-64* bgp next-hop-resolution use-bgp-routes *boolean*
Tree	use-bgp-routes
Description	This command enables the use of BGP routes to resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface. A VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route. This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN).
Default	false
Introduced	16.0.R1
Platforms	All

use-leaked-routes

Synopsis	Enter the **use-leaked-routes** context
Context	**configure** router *named-item-64* bgp next-hop-resolution use-leaked-routes
Tree	use-leaked-routes
Introduced	23.7.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

static *boolean*

Synopsis	Use leaked static routes to resolve BGP next hop
Context	**configure** router *named-item-64* bgp next-hop-resolution use-leaked-routes static *boolean*
Tree	static
Description	When configured to **true**, the router allows any non-leaked unlabeled unicast IPv4 or IPv6 route in the BGP RIB to be resolved by a leaked static route with direct next hops. A BGP route resolved this way cannot resolve other routes (including BGP routes) and cannot be redistributed into non-BGP protocols, such as IGP. When configured to **false**, the router prevents the use of leaked static routes to resolve BGP routes.
Default	false
Introduced	23.7.R1
Platforms	All

vpn-family-policy *reference*

weighted-ecmp *boolean*

Synopsis	Use weighted ECMP for next-hop tunnel selection for 6PE
Context	**configure** router *named-item-64* bgp next-hop-resolution weighted-ecmp *boolean*
Tree	weighted-ecmp
Description	When configured to **true**, this command enables weighted ECMP for next-hop tunnel selection for 6PE. When weighted ECMP is enabled, the RSVP-TE tunnel used to forward 6PE packets to the ECMP next hop that is chosen according to the outcome of the hash on the packet at the normalized load-balancing weight of the tunnel. When configured to **false**, weighted ECMP is disabled for next-hop tunnel selection for 6PE.
Default	false

Platforms	All

location [location-id] *number*

Synopsis	Enter the **location** list instance
Context	**configure** router *named-item-64* bgp optimal-route-reflection location *number*
Tree	location
Description	Commands in this context configure the location ID for the route reflector. A BGP neighbor can be associated with a location if it is a route-reflector client. Up to three IPv4 addresses and three IPv6 addresses can be specified per location. If the TE DB is unable find a node in its topology database that matches a primary address of the location, it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address. The IP addresses specified for a location should be topologically “close” to a set of clients that should all receive the same optimal path for that location.
Introduced	16.0.R1
Platforms	All

[**location-id**] *number*

Synopsis	Optimal route reflection location ID
Context	**configure** router *named-item-64* bgp optimal-route-reflection location *number*

override-tunnel-elc *boolean*

Synopsis	Enable entropy label capability on BGP tunnels
Context	**configure** router *named-item-64* bgp override-tunnel-elc *boolean*
Tree	override-tunnel-elc

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description When configured to **true**, this command renders all far ends for BGP tunnels as entropy-label-capable, regardless of any received capability signaling. This ensures that the entropy label will be inserted on BGP tunnels in the absence of capability signaling support by the far end.

This is a system-wide configuration, since efficient entropy label operation requires that all LSRs in a network support entropy labels. This command should be used with care, particularly in inter-AS use cases, as entropy label capability may differ between domains.

When configured to **false**, this command disables all far ends for BGP tunnels as entropy-label-capable.

Default false

Introduced 16.0.R1

Platforms All

path-mtu-discovery *boolean*

Synopsis Enable Path MTU Discovery

Context **configure** router *named-item-64* bgp path-mtu-discovery *boolean*

Tree path-mtu-discovery

Description When configured to **true**, Path MTU Discovery (PMTUD) is activated toward an IPv4 BGP neighbor. The Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, the device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value to accomodate the IP MTU constraint.

When configured to **false**, PMTUD is disabled and there is no TCP MSS configuration to associate with a BGP neighbor (in either the BGP configuration or the first-hop IP interface configuration). The router advertises a TCP MSS option of only 1024 bytes, limiting the received TCP segments to that size.

Default false

Introduced 16.0.R1

Platforms All

peer-ip-tracking *boolean*

Synopsis Enable BGP peer tracking

peer-tracking-policy *reference*

Synopsis	Policy for BGP peer tracking on router instance
Context	**configure** router *named-item-64* bgp peer-tracking-policy *reference*
Tree	peer-tracking-policy
Description	This command specifies the name of a policy statement to use with the BGP peer-tracking function on BGP sessions where peer tracking is enabled. When unconfigured, the default peer-tracking policy allows any type of route to match the neighbor IP address except aggregate routes and LDP shortcut routes. Peer tracking should be used with caution. The peer-tracking policy should only permit one of direct-interface or direct routes to be advertised to a BGP peer. Advertising both routes causes the best route to oscillate.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	16.0.R1
Platforms	All

preference *number*

Synopsis	Route preference for routes learned from all peers
Context	**configure** router *named-item-64* bgp preference *number*
Tree	preference
Description	This command configures the route preference for routes learned from the configured peers. The lower the preference value, the higher the chance of the route being the active route. The router assigns BGP routes the highest default preference as compared to routes that are direct, static or learned via MPLS or OSPF.
Range	1 to 255
Default	170
Introduced	16.0.R1
Platforms	All

purge-timer *number*

Synopsis	Maximum time before stale routes are purged

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* bgp purge-timer *number*
Tree	purge-timer
Description	This command configures the maximum time before stale routes are purged. When a route refresh request is sent to a peer for VPN-IP routes received from that peer (in the RIB-IN), the routes are set to stale and the purge timer is started. If the routes are not updated (refreshed) before the purge timer expires, the routes are removed.
Range	1 to 60
Default	10
Introduced	16.0.R1
Platforms	All

rapid-update

Synopsis	Enter the **rapid-update** context
Context	**configure** router *named-item-64* bgp rapid-update
Tree	rapid-update
Description	Commands in this context specify the address families that are configured to support the rapid update functionality. The rapid update functionality overrides the remaining time on a peer's MRAI timer and immediately sends routes belonging the specified address families (and all other pending updates) to the peers receiving these routes.
Introduced	16.0.R1

policy-name *reference*

Synopsis	Name of policy that controls route importation into RIB
Context	**configure** router *named-item-64* bgp rib-management ipv4 route-table-import policy-name *reference*
Tree	policy-name
Description	This command specifies the name of a policy that controls the importation of active routes from the IP route table into one of the BGP RIBs. When this command is configured, routes dropped or rejected by the policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next hops of routes in that RIB. If the active route for a prefix is rejected by the policy, the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used. Aggregate routes are always imported into each RIB, independent of the specified policy. Route modifications specified in the actions of the policy are ignored and have no effect on the imported routes. When unconfigured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

rr-vpn-forwarding *boolean*

Synopsis	Allow route reflector to forward VPN-IP routes
Context	**configure** router *named-item-64* bgp rr-vpn-forwarding *boolean*
Tree	rr-vpn-forwarding
Description	When configured to **true**, the route reflector resolves VPN-IPv4 and VPN-IPv6 routes, sets itself as the next hop, and generates new labels for all the resolved routes. During this process, all received VPN-IP routes, regardless of route target, are imported into the dummy VRF, where the BGP next hops are resolved. The routes are resolved to next-hop-self, and BGP allocates new VPRN service-label values for the routes, which are then advertised to peers. The **transport-tunnel** command under the **configure router bgp next-hop-resolution labeled-routes** context determines what types of tunnels are eligible to resolve the next hops. If a received VPN-IP route from IBGP peer X is resolved and selected as the best path so that it can be re-advertised to an IBGP peer Y, and the BGP next-hop is modified toward peer Y (by using the **next-hop-self** command in Y's group or neighbor context or by using a next-hop action in an export policy applied to Y), BGP allocates a new VPRN service label value for the route, signals that new label value to Y, and programs the IOM to do the corresponding label swap operation. The supported combinations of X and Y are outlined below: • from X (client) to Y (client) • from X (client) to Y (non-client) • from X (non-client) to Y (client) When configured to **false**, the routes are re-advertised without signaling new VPRN labels, even if the BGP next hop is changed. Nokia recommends setting this command to **false** for scaling and convergence reasons.
Default	false

source-address *ipv6-unicast-address*

Synopsis	Source address used in SRv6 packet
Context	**configure** router *named-item-64* bgp segment-routing-v6 source-address *ipv6-unicast-address*
Tree	source-address
Description	When configured, this command specifies the source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet. When not configured, the source IPv6 address is inherited from the configuration of the global default address in the **router "base" segment-routing segment-routing-v6 source-address** context. A source IPv6 address must be configured in this context or in the base router context. The system does not check if the address entered is a valid local address.
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

selective-label-ip *keyword*

Synopsis	Label IP routes installed for local use on NHS router
Context	**configure** router *named-item-64* bgp selective-label-ip *keyword*
Tree	selective-label-ip
Description	This command enables selective installation of labeled unicast routes for resolution by local services and IP shortcuts on a labeled unicast Next-hop=self router. This command is supported for labeled unicast for both IPv4 and IPv6 routes. The **no-install** option installs labeled IP routes that are required by services. This option conserves labeled route table space in addition to RTM table space on BGP-LU next-hop-self route reflectors. The **route-table-install-only** option ensures that the labeled unicast routes are installed in the RTM in full. When **no-install** is specified, the download of labeled unicast routes for NHLFE resolution by services continues.
Options	no-install, route-table-install-only
Introduced	22.10.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

selective-label-ip-prioritization *boolean*

Synopsis	Enable BGP selective prioritization for labeled routes
Context	**configure** router *named-item-64* bgp selective-label-ip-prioritization *boolean*
Tree	selective-label-ip-prioritization
Description	When this command is set to **true**, every labeled IPv4 and IPv6 route that is received and potentially usable by a local service is automatically prioritized for fast control plane reconvergence. When the reachability of a BGP next-hop changes, the labeled IPv4 and IPv6 routes are updated into the route table first, along with other routes manually tagged as high priority by import policies. A /32 or /128 labeled unicast route (and associated BGP-LU tunnel) is determined to be potentially usable by a local service if one of the following conditions applies: • the route matches the far-end address of a user-provisioned SDP of a Layer 2 service and the SDP is configured to use BGP tunnels as transport • the route matches the BGP next-hop address of a BGP-EVPN or IP VPN route, and this VPN route is either imported into a local service or readvertised by the router acting as a next-hop-self route reflector or a model-B ASBR When this command is set to **false,** selective-label IP prioritization for BGP is not used.
Default	false
Introduced	21.10.R1

Tree	ipv6
Default	false
Introduced	19.7.R1
Platforms	All

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** router *named-item-64* bgp split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary.

When configured to **false**, the use of split-horizon is disabled.

Default false

Introduced 16.0.R1

Platforms All

sr-policy-import *boolean*

Synopsis Import all segment routing policies into the BGP RIB

Context **configure** router *named-item-64* bgp sr-policy-import *boolean*

Tree sr-policy-import

Description When configured to **true**, statically-configured non-local segment routing policies from the segment routing database are imported into the BGP RIB so that they can be advertised as originated routes toward BGP peers supporting segment routing policies (**sr-policy-ipv4** IP family type).

When configured to **false**, the SR policies are not imported into the BGP RIB.

Default false

Introduced 16.0.R1

Platforms All

subconfed-vpn-forwarding *boolean*

Synopsis Allow subconfed route resolution, next hop and labels

Context **configure** router *named-item-64* bgp subconfed-vpn-forwarding *boolean*

Tree subconfed-vpn-forwarding

Description When this is set to **true**, the base router BGP instance retains all received VPN-IPv4 and VPN-IPv6 routes, including those with route targets not matching any VRF import policy of any locally configured VPRN. In addition, when the base router BGP is configured to apply a **next-hop-self** command to a peer of any type (EBGP, IBGP, or confed-EBGP), VPN-IPv4 and VPN-IPv6 routes are advertised to the peer with a new BGP label, next hop, and label-swap forwarding entry.

These behaviors described above are applied when the **enable-inter-as-vpn** or **enable-rr-vpn-forwarding** commands are enabled in the **configure router bgp context**, in the same BGP instance. This applies regardless of whether the base router has a confederation configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is set to **false**, subconfederation VPN forwarding is not used.

Default false

Introduced 21.10.R1

Platforms All

tcp-mss *number*

Synopsis TCP maximum segment size override

Context **configure** router *named-item-64* bgp tcp-mss *number*

Tree tcp-mss

Description This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router.

TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

Range 384 to 9746

Introduced 21.2.R1

Platforms All

third-party-nexthop *boolean*

Synopsis Apply third-party next-hop processing to EBGP peers

Context **configure** router *named-item-64* bgp third-party-nexthop *boolean*

Tree third-party-nexthop

Description When configured to **true**, this command enables the router to send third-party next hop to EBGP peers in the same subnet as the source peer. The address family of the transport must match the address family of the route.

When an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next hop is left unchanged.

When configured to **false**, third-party next-hop processing is disabled and the next hop carries the IP address of the interface used to establish the TCP connection to the peer.

Default false

Introduced 16.0.R1

ignore-mclt-on-takeover *boolean*

Synopsis	Ignore maximum client lead during takeover from partner
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* failover ignore-mclt-on-takeover *boolean*
Tree	ignore-mclt-on-takeover
Description	When configured to **true**, the remote IP address range can be taken over immediately when the intercommunication link enters the PARTNER-DOWN state, without having to wait for the MCLT to expire.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the DHCP lease time for new clients is restricted to the MCLT during a failure. For existing clients, the lease time is gradually reduced over time to the MCLT by consecutive DHCP renewals.

Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-client-lead-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.
Range	600 to 86399
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* failover partner-down-delay *number*
Tree	partner-down-delay

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds
Default	86399
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer [address] *reference*

Synopsis	Enter the **peer** list instance
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* failover peer *reference*
Tree	peer
Description	Commands in this context define the peer-related parameters for DHCP failover. DHCP leases can be synchronized at the level of the DHCP server or pool. The pair of synchronizing servers or pools is identified by a tag. The synchronization information is carried over the Multi-Chassis Synchronization (MCS) link between the two peers. The MCS link is a logical IP or MPLS link. MCS runs over TCP port 45067, using either data traffic or keepalives to detect failure on the communication link between the two nodes. In the absence of any MCS data traffic for more than 0.5 seconds, MCS sends its own keepalive to the peer. If a reply is not received within 3 seconds, MCS declares its operational state as down and the DB sync state as out-of-sync. MCS consequently notifies its clients, including the DHCP server. It can take up to 3 seconds before the DHCP client realizes that the inter-chassis link has failed. The link failure does not necessarily imply the same failed state for the access links. It is possible, although unlikely, that both access links are operational while the inter-chassis communication link is broken. In this case, the two redundant nodes can become isolated from each other in the network. For this reason, it is important that the MCS link be highly redundant.
Max. instances	1

failover

Synopsis	Enter the **failover** context
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* failover
Tree	failover
Description	Commands in this context define DHCP failover where two DHCP servers manage the same pool of addresses, enabling them to share the load to assign leases for pool and provide backup for each in the event of network outages.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the failover mechanism
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* failover admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ignore-mclt-on-takeover *boolean*

Synopsis	Ignore maximum client lead during takeover from partner
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* failover ignore-mclt-on-takeover *boolean*
Tree	ignore-mclt-on-takeover
Description	When configured to **true**, the remote IP address range can be taken over immediately when the intercommunication link enters the PARTNER-DOWN state, without having to wait for the MCLT to expire. When configured to **false**, the DHCP lease time for new clients is restricted to the MCLT during a failure. For existing clients, the lease time is gradually reduced over time to the MCLT by consecutive DHCP renewals.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-client-lead-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.
Range	600 to 86399
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* failover partner-down-delay *number*
Tree	partner-down-delay
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds
Default	86399
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer [address] *reference*

Synopsis	Enter the **peer** list instance
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* failover peer *reference*
Tree	peer
Description	Commands in this context configure peer-related parameters for DHCP failover. DHCP leases can be synchronized at the level of the DHCP server or pool. The pair of synchronizing servers or pools is identified by a tag. The synchronization information is carried over the Multi-Chassis Synchronization (MCS) link between the two peers. The MCS link is a logical IP or MPLS link. MCS runs over TCP port 45067, using either data traffic or keepalives to detect failure on the communication link between the two nodes. In the absence of any MCS data traffic for more than 0.5 seconds, MCS sends its own keepalive to the peer. If a reply is not received within 3 seconds, MCS declares its operational state as down and the DB sync state as out-of-sync. MCS consequently notifies its clients, including the DHCP server. It can take up to 3 seconds before the DHCP client realizes that the inter-chassis link has failed.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The link failure does not necessarily imply the same failed state for the access links. It is possible, although unlikely, that both access links are operational while the inter-chassis communication link is broken. In this case, the two redundant nodes can become isolated from each other in the network. For this reason, it is important that the MCS link be highly redundant.

Max. instances	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**address**] *reference*

Synopsis	IP address of the failover peer
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* failover peer *reference*
Tree	peer
Reference	**configure** redundancy multi-chassis peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sync-tag *named-item*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Tag that identifies synchronizing server or pool pairs

Range	10 to 315446399
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

minimum-free

Synopsis	Enter the **minimum-free** context
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* minimum-free
Tree	minimum-free
Description	Commands in this context specify the minimum number of free addresses in this pool.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

absolute *number*

Synopsis	Minimum number of free addresses in this pool or subnet
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* minimum-free absolute *number*
Tree	absolute
Range	0 to 255
Default	1
Notes	The following elements are part of a choice: **absolute** or **percent**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

event-when-depleted *boolean*

Synopsis	Generate notification when addresses are depleted
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* minimum-free event-when-depleted *boolean*
Tree	event-when-depleted
Description	When configured to **true**, a system-generated event is generated when all available addresses in the pool or subnet of a local DHCP server are depleted.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, no action is taken when all available addresses in the pool or subnet of a local DHCP server are depleted.

Default false

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

percent *number*

Synopsis Minimum free addresses as a percentage

Context **configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* minimum-free percent *number*

Tree percent

Range 0 to 100

Default 1

Notes The following elements are part of a choice: **absolute** or **percent**.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nak-non-matching-subnet *boolean*

Synopsis Send NAK if no match for request address pool range

Context **configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* nak-non-matching-subnet *boolean*

Tree nak-non-matching-subnet

Description When configured to **true**, a NAK response when the local DHCPv4 server receives a DHCP request with option 50 (the client is trying to request a previously allocated message). If the address-allocation algorithm uses a pool that does not contain the requested address, the system returns the DHCP NAK.

When configured to **false** or unconfigured, the system drops the DHCP packet.

Default false

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

offer-time *number*

Synopsis Time interval during which a DHCP offer remains valid

Tree	exclude-addresses
Description	This command specifies the end of a range of IP addresses that are excluded from the pool of IP addresses in this subnet.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-declined *number*

Synopsis	Maximum number of declined addresses allowed

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* maximum-declined *number*
Tree	maximum-declined
Max. range	0 to 4294967295
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

minimum-free

Synopsis	Enter the **minimum-free** context
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* minimum-free
Tree	minimum-free
Description	Commands in this context specify the minimum number of free addresses in this pool.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

absolute *number*

Synopsis	Minimum number of free addresses in this pool or subnet
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* minimum-free absolute *number*
Tree	absolute
Range	0 to 255
Default	1
Notes	The following elements are part of a choice: **absolute** or **percent**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

event-when-depleted *boolean*

Synopsis	Generate notification when addresses are depleted
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* minimum-free event-when-depleted *boolean*
Tree	event-when-depleted

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, a system-generated event is generated when all available addresses in the pool or subnet of a local DHCP server are depleted. When configured to **false**, no action is taken when all available addresses in the pool or subnet of a local DHCP server are depleted.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

percent *number*

Synopsis	Minimum free addresses as a percentage
Context	**configure** router *named-item-64* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* minimum-free percent *number*
Tree	percent
Range	0 to 100
Default	1
Notes	The following elements are part of a choice: **absolute** or **percent**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure gateway interface (GI) address matching. When configured, the pool can be used for address matching even if a subnet is not found. If the local user database name is not used, addresses are provided only by GI. If a user must be blocked from getting an address, the server maps to a local user database and configures the user with no address. A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface, the pool can provide IP addresses from any of the subnets included when the GI is matched to one of its subnets. This allows a pool to be created that represents a sub-net.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preferred-lifetime *number*

Synopsis	Time this lease remains preferred
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* defaults preferred-lifetime *number*
Tree	preferred-lifetime
Description	This command configures the preferred lifetime of the IPv6 lease address or prefix. When the preferred lifetime expires, any derived addresses are deprecated. The preferred lifetime must be less than or equal to the valid lifetime. Each address or prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).
Range	300 to 315446399
Units	seconds
Default	3600
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rebind-time *number*

Synopsis	Rebind time for the lease
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* defaults rebind-time *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	rebind-time
Description	This command configures the rebind time, known as T2, at which the client contacts the addressing authority to extend the lifetimes of its leases. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew or reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses or prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured rebind timer value should always be less than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 1209600
Units	seconds
Default	2880
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

renew-time *number*

Synopsis	Renew time for the lease
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* defaults renew-time *number*
Tree	renew-time
Description	This command configures the renew time, known as T1, at which the client makes a transition to the lease-renewal state. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew/reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured renew timer value should always be shorter than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 604800
Units	seconds

Default	1800
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime *number*

Synopsis	Time for the lease to remain valid
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* defaults valid-lifetime *number*
Tree	valid-lifetime
Description	This command configures a valid lifetime for a DHCPv6 lease address or prefix. The valid lifetime is the length of time an address and prefix remains in the valid state. The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address and prefix becomes invalid and must not be used in communications. RFC 2461 recommends a default value of 30 days. Each address and prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address and prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).
Range	300 to 315446399
Units	seconds
Default	86400
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.
Range	600 to 86399
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* failover partner-down-delay *number*
Tree	partner-down-delay
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds

interface-id-mapping *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Map hosts within interface-to-prefix combinations
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* interface-id-mapping *boolean*
Tree	interface-id-mapping
Description	When configured to **true**, this command specifies an interface-mapping method that uses a combination of unique /64 prefixes and interface IDs. A /64 prefix is allocated to each interface ID, and all clients with the same interface ID are assigned an address from the prefix. This method is used for bridging clients in the same local loop and SAP, so that sharing the prefix allows communication to stay local. For SLAAC-based assignment, downstream neighbor discovery is automatically enabled to resolve the assigned address.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lease-hold

Synopsis	Enter the **lease-hold** context

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

additional-scenarios

Synopsis	Enter the **additional-scenarios** context
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* lease-hold additional-scenarios
Tree	additional-scenarios
Description	Commands in this context configure additional types of leases or triggers that cause the system to hold up leases.
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

fwa-address-assignment *boolean*

Synopsis	Apply lease hold timer to FWA session
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* lease-hold additional-scenarios fwa-address-assignment *boolean*
Tree	fwa-address-assignment
Description	When configured to **true**, the router applies the lease hold timer to non-deferred IP addresses or SLAAC prefixes assigned to FWA sessions. This command, in the DHCPv4 context, applies the lease hold timer to non-deferred IP addresses assigned to FWA sessions. This command, in the DHCPv6 context, applies the lease hold timer to SLAAC prefixes assigned to FWA sessions.
Default	false
Introduced	26.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

internal-lease-ipsec *boolean*

Synopsis	Apply the lease hold timer to local IPsec clients
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* lease-hold additional-scenarios internal-lease-ipsec *boolean*
Tree	internal-lease-ipsec
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

solicited-release *boolean*

Synopsis	Apply lease hold timer for solicited releases
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* lease-hold additional-scenarios solicited-release *boolean*
Tree	solicited-release
Description	This command enables the server to hold up a lease even for a solicited release, for example, when the server receives a normal DHCP release message.
Default	false

preferred-lifetime *number*

Synopsis	Time this lease remains preferred
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* pool *named-item* prefix *ipv6-prefix* preferred-lifetime *number*
Tree	preferred-lifetime
Description	This command configures the preferred lifetime of the IPv6 lease address or prefix. When the preferred lifetime expires, any derived addresses are deprecated. The preferred lifetime must be less than or equal to the valid lifetime. Each address or prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).
Range	300 to 315446399
Units	seconds
Default	3600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

rebind-time *number*

Synopsis	Rebind time for the lease
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* pool *named-item* prefix *ipv6-prefix* rebind-time *number*
Tree	rebind-time
Description	This command configures the rebind time, known as T2, at which the client contacts the addressing authority to extend the lifetimes of its leases. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew or reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses or prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured rebind timer value should always be less than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 1209600
Units	seconds

Default	2880
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

renew-time *number*

Synopsis	Renew time for the lease
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* pool *named-item* prefix *ipv6-prefix* renew-time *number*
Tree	renew-time
Description	This command configures the renew time, known as T1, at which the client makes a transition to the lease-renewal state. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew/reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured renew timer value should always be shorter than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 604800
Units	seconds
Default	1800
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

valid-lifetime *number*

Synopsis	Time for the lease to remain valid
Context	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item* pool *named-item* prefix *ipv6-prefix* valid-lifetime *number*
Tree	valid-lifetime
Description	This command configures a valid lifetime for a DHCPv6 lease address or prefix. The valid lifetime is the length of time an address and prefix remains in the valid state. The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address and prefix becomes invalid and must not be used in communications. RFC 2461 recommends a default value of 30 days.

ecmp *number*

Synopsis	Maximum equal-cost routes for routing table instance
Context	**configure** router *named-item-64* ecmp *number*
Tree	ecmp
Description	This command configures ECMP and defines the number of routes for path sharing. ECMP can be used only for routes learned with the same preference and the same protocol. If available ECMP routes at the best preference exceed the maximum ECMP routes allowed, the system selects the route using the following criteria: **1.** The system selects the lowest next hop router ID. **2.** If the next hop goes to the same neighbor, the system selects the next hop with the lowest interface index.
Range	1 to 128
Default	1
Introduced	16.0.R1

Use subject to Terms available at: www.nokia.com/terms.

Platforms All

entropy-label *boolean*

Synopsis Use entropy label

Context **configure** router *named-item-64* entropy-label *boolean*

Tree entropy-label

Description When configured to **true**, this command enables the use of entropy labels.

The entropy label and indicator (EL/ELI) are inserted on relevant packets. Applicable packets are those for which at least one LSP in the stack at the far end has advertised the entropy-label capability. These LSPs are in LDP or RSVP tunnels used by an IGP or BGP shortcut. If the tunnel is of type RSVP, the entropy-label capability must also be enabled under the **configure router mpls** or **configure router mpls lsp** context.

This command also results in other traffic that is forwarded over an LDP or RSVP LSP for which this router is the LER, and for which there is no explicit service endpoint on this router, to have the EL/ELI enabled, subject to the LSP far-end advertising entropy-label-capability. An example of such traffic includes packets arriving on a stitched LDP LSP forwarded over an RSVP LSP.

The entropy label and the hash label features are mutually exclusive. The entropy label cannot be configured on a spoke SDP or service where the hash label feature has already been configured.

When configured to **false**, the use of entropy labels is disabled.

Default false

Introduced 16.0.R1

Platforms All

evpn-neighbor-synchronization

Synopsis Enable the **evpn-neighbor-synchronization** context

Context **configure** router *named-item-64* evpn-neighbor-synchronization

admin-state *keyword*

Synopsis Administrative state of EVPN synchronization

Context **configure** router *named-item-64* evpn-neighbor-synchronization admin-state *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Description	This command configures local **static** and **dynamic** ARP and ND entries to be advertised using an EVPN MAC/IP advertisement route. On reception of those routes, ARP and ND entries are created on the routing context and interface identified by the EVI route target and the ESI. When unconfigured, local **static** and **dynamic** ARP and ND entries are not advertised.
Options	enable, disable
Default	disable
Introduced	26.3.R1
Platforms	All

evi-route-target *evi-route-target*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	EVI route target to use for EVPN neighbor synchronization
Context	**configure** router *named-item-64* evpn-neighbor-synchronization evi-route-target *evi-route-target*
Tree	evi-route-target
Description	This command configures the EVI route target used on the MAC/IP routes advertised for the routing context. On reception, the EVI route target is used to identify the routing context in which the ARP and ND entries are installed.
String length	10 to 28
String format	'evi-route-target-32' must be evi-target:(IPv4:comm|AS pairs|IEEE MAC) per ext-community rules
Introduced	26.3.R1
Platforms	All

retention-timer *number*

Synopsis	Time that an EVPN ARP or ND entry is retained
Context	**configure** router *named-item-64* evpn-neighbor-synchronization retention-timer *number*
Tree	retention-timer
Description	This command sets the timer that determines how long an EVPN ARP or ND entry is retained after the remote PE withdraws the MAC/IP route that originated it. The behavior for a synchronized ARP and ND entry is as follows:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

1. When the originating EVPN MAC/IP route is withdrawn, the retention timer starts, and the entry remains present until the timer expires.
2. While the retention timer is active, the system attempts to refresh the entry by sending an ARP Request or Neighbor Solicitation to the IP owner. This refresh may occur at any point from the start of the timer until 30 seconds before it expires.
3. ARP Requests and Neighbor Solicitations are staggered within the timeout period to prevent overloading the CPM transmitter when many entries require refreshing.

Range	1 to 65535
Units	seconds
Introduced	26.3.R1
Platforms	All

route-distinguisher *vpn-route-distinguisher*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Route distinguisher used for synchronization
Context	**configure** router *named-item-64* evpn-neighbor-synchronization route-distinguisher *vpn-route-distinguisher*
Tree	route-distinguisher
Description	This command configures the route distinguisher of the MAC/IP routes used for synchronization.
String format	'vpn-route-distinguisher' must be IP:comm or AS-number pair per RD rules
Introduced	26.3.R1
Platforms	All

route-tag *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	BGP route tag for MAC/IP routes synchronization
Context	**configure** router *named-item-64* evpn-neighbor-synchronization route-tag *number*
Tree	route-tag
Description	This command applies the BGP route tag to MAC/IP routes generated from local ARP and ND entries. This tag can be matched by any export policy.

Range	1 to 255
Introduced	26.3.R1
Platforms	All

fib-priority *keyword*

Synopsis	FIB priority for VPRN BGP routes
Context	**configure** router *named-item-64* fib-priority *keyword*
Tree	fib-priority
Description	This command prioritizes the order in which BGP FIB entries across different routing instances are pushed to the IOM for updating. This allows BGP route updates for higher priority router instances to occur as quickly as possible by assigning a FIB priority to the associated router instances (base and VPRN instances). If routing updates are available for multiple router instances, the IOMs or IMMs update the FIB with entries with **high** priority router instances before entries with **standard** priority router instances.
Options	standard – Standard FIB priority for routing instances high – High FIB priority for routing instances
Default	standard
Introduced	16.0.R1
Platforms	All

Introduced	20.7.R1
Platforms	All

ip-filter-max-size *number*

Synopsis	Maximum number of FlowSpec rule entries in IPv4 filter
Context	**configure** router *named-item-64* flowspec ip-filter-max-size *number*
Tree	ip-filter-max-size
Description	This command configures the maximum number of IPv4 FlowSpec routes, or rules, that can be entered in the autocreated embedded filter, fSpec-X. FlowSpec filter entries embedded in a filter policy in this routing instance use filter entries from the range between the embedding offset and (offset + **ip-filter-max-size** - 1). The maximum size can be configured to a higher or lower value at any time. If the current number of FlowSpec rules is greater than the new configured limit, the extra rules are removed immediately but retained in the BGP RIB. If the limit is increased, new rules are embedded only as they are received in new BGP updates. The sum of this command and the highest offset in any IP filter that embeds FlowSpec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.
Range	0 to 262143
Default	512
Introduced	16.0.R1
Platforms	All

upf-data-endpoint

Synopsis	Enable the **upf-data-endpoint** context
Context	**configure** router *named-item-64* gtp upf-data-endpoint

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	upf-data-endpoint
Description	Commands in this context configure a GTP - User Plane (GTP-U) endpoint used by BNG CUPS FWA sessions.
Introduced	21.2.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

fpe *reference*

Synopsis	FPE used to encapsulate and decapsulate GTP-U traffic
Context	**configure** router *named-item-64* gtp upf-data-endpoint fpe *reference*
Tree	fpe
Reference	**configure** fwd-path-ext fpe *number*
Notes	This element is mandatory.
Introduced	21.5.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface *reference*

Synopsis	Interface on which the GTP-U packets terminate
Context	**configure** router *named-item-64* gtp upf-data-endpoint interface *reference*
Tree	interface
Reference	**configure** router *named-item-64* interface *interface-name*
Introduced	21.2.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

secondary-interface *reference*

Synopsis	Secondary interface on which GTP traffic terminates
Context	**configure** router *named-item-64* gtp upf-data-endpoint secondary-interface *reference*
Tree	secondary-interface
Description	This command configures a secondary interface to terminate GTP-U traffic. To instruct the UPF to use this interface as the data endpoint, configure the MAG-c CPF with the special S1-u or N3 network-realm setting "Base#%secondary". See the *MAG-c Control Plane Function Guide* for more information about configuring the MAG-c CPF.
Reference	**configure** router *named-item-64* interface *interface-name*

© 2026 Nokia.

Introduced	24.7.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

uplink

Synopsis	Enable the **uplink** context
Context	**configure** router *named-item-64* gtp uplink
Tree	uplink
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

apn *string*

Synopsis	Network identifier part of the APN for the uplink
Context	**configure** router *named-item-64* gtp uplink apn *string*
Tree	apn
String length	1 to 80
String format	'apn' must match APN format (e.g. internet.mnc123.mcc456.gprs)
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

pdn-type *keyword*

Synopsis	Default PDN to be signaled in GTP
Context	**configure** router *named-item-64* gtp uplink pdn-type *keyword*
Tree	pdn-type
Options	ipv4, ipv6, ipv4v6
Default	ipv4
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer-profile-map

Synopsis	Enter the **peer-profile-map** context
Context	**configure** router *named-item-64* gtp uplink peer-profile-map

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	peer-profile-map
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

prefix [peer-prefix] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Enter the **prefix** list instance
Context	**configure** router *named-item-64* gtp uplink peer-profile-map prefix *(ipv4-prefix | ipv6-prefix)*
Tree	prefix
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**peer-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	IP prefix and prefix length for the subnet
Context	**configure** router *named-item-64* gtp uplink peer-profile-map prefix *(ipv4-prefix | ipv6-prefix)*
Tree	prefix
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer-profile *reference*

Synopsis	GTP peer profile associated with the address prefix
Context	**configure** router *named-item-64* gtp uplink peer-profile-map prefix *(ipv4-prefix | ipv6-prefix)* peer-profile *reference*
Tree	peer-profile
Reference	**configure** subscriber-mgmt gtp peer-profile *named-item*
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

import-policy *reference*

Synopsis	Import policy that filters IGMP packets
Context	**configure** router *named-item-64* igmp forwarding-group-interface forwarding-service *service-name* group-interface-name *reference* import-policy *reference*
Tree	import-policy
Description	This command configures the IGMP import policy, or filter, for an interface subscriber or a group interface. An IGMP filter is also known as a black or white list, and it is defined as a router policy option. When redirection is applied, only the import policy from the subscriber is in effect. The import policy under the group interface is applicable only for IGMP states received directly on the SAP (AN in IGMP proxy mode).
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-number-group-sources *number*

Synopsis	Maximum number of group sources for this interface
Context	**configure** router *named-item-64* igmp forwarding-group-interface forwarding-service *service-name* group-interface-name *reference* maximum-number-group-sources *number*
Tree	maximum-number-group-sources
Description	This command configures the maximum number of group sources for which IGMP or MLD can have local receiver information based on received IGMP or MLD reports on this interface. When this configuration is changed dynamically to a lower value than the currently accepted number of group sources, the group sources that are already accepted are not deleted. Only new group sources are not allowed.
Range	1 to 32000
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

maximum-number-groups *number*

Synopsis	Maximum number of groups for this interface
Context	**configure** router *named-item-64* igmp forwarding-group-interface forwarding-service *service-name* group-interface-name *reference* maximum-number-groups *number*
Tree	maximum-number-groups

Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).
Reference	**configure** mcac policy *string*
Introduced	21.7.R1

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

query-source-address *ipv4-unicast-address*

Synopsis	Source address for IGMP queries
Context	**configure** router *named-item-64* igmp group-interface *reference* query-source-address *ipv4-unicast-address*
Tree	query-source-address
Description	This command configures the query source IP address for the group interface. This IP address overrides the source IP address configured at the router level.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

router-alert-check *boolean*

Synopsis	Enable router alert checking for IGMP or MLD messages
Context	**configure** router *named-item-64* igmp group-interface *reference* router-alert-check *boolean*
Tree	router-alert-check
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sub-hosts-only *boolean*

Synopsis	Allow IGMP traffic from known hosts only
Context	**configure** router *named-item-64* igmp group-interface *reference* sub-hosts-only *boolean*
Tree	sub-hosts-only
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subnet-check *boolean*

Synopsis	Allow subnet checking
Context	**configure** router *named-item-64* igmp group-interface *reference* subnet-check *boolean*
Tree	subnet-check
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

version *keyword*

Synopsis	IGMP protocol version
Context	**configure** router *named-item-64* igmp group-interface *reference* version *keyword*
Tree	version
Options	1, 2, 3
Default	3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

interface [ip-interface-name] *interface-name*

Synopsis	Enter the **interface** list instance
Context	**configure** router *named-item-64* igmp interface *interface-name*
Tree	interface
Introduced	16.0.R1
Platforms	All

[**ip-interface-name**] *interface-name*

Synopsis	IP interface name
Context	**configure** router *named-item-64* igmp interface *interface-name*
Tree	interface
Description	This command configures the interface name, which must be unique within the group of defined IP interfaces for the context. If the IP interface name does not exist or does not have an IP address configured, an error message is returned. If the IP interface exists in a different area, it is moved to this area.

	An interface name cannot be in the form of an IP address.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R2
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of IGMP
Context	**configure** router *named-item-64* igmp interface *interface-name* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

import-policy *reference*

Synopsis	Import policy that filters IGMP packets
Context	**configure** router *named-item-64* igmp interface *interface-name* import-policy *reference*
Tree	import-policy
Description	This command configures the IGMP import policy, or filter, for an interface subscriber or a group interface. An IGMP filter is also known as a black or white list, and it is defined as a router policy option. When redirection is applied, only the import policy from the subscriber is in effect. The import policy under the group interface is applicable only for IGMP states received directly on the SAP (AN in IGMP proxy mode).
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	16.0.R1
Platforms	All

maximum-number-group-sources *number*

Synopsis	Maximum number of group sources for this interface
Context	**configure** router *named-item-64* igmp interface *interface-name* maximum-number-group-sources *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	maximum-number-group-sources
Description	This command configures the maximum number of group sources for which IGMP or MLD can have local receiver information based on received IGMP or MLD reports on this interface. When this configuration is changed dynamically to a lower value than the currently accepted number of group sources, the group sources that are already accepted are not deleted. Only new group sources are not allowed.
Range	1 to 32000
Introduced	16.0.R1
Platforms	All

maximum-number-groups *number*

Synopsis	Maximum number of groups for this interface
Context	**configure** router *named-item-64* igmp interface *interface-name* maximum-number-groups *number*
Tree	maximum-number-groups
Range	1 to 16000
Introduced	16.0.R1
Platforms	All

maximum-number-sources *number*

Synopsis	Maximum number of sources that are allowed per group
Context	**configure** router *named-item-64* igmp interface *interface-name* maximum-number-sources *number*
Tree	maximum-number-sources
Range	1 to 1000

level *number*

Synopsis	Level ID to associate with number of down LAG ports
Context	**configure** router *named-item-64* igmp interface *interface-name* mcac mc-constraints number-down *number* level *number*
Tree	level
Description	This command specifies the bandwidth for a given level. Level 1 has the highest priority and level 8 has the lowest priority.
Range	1 to 8
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

use-lag-port-weight *boolean*

Synopsis	Use LAG port weight in calculating MCAC constraints
Context	**configure** router *named-item-64* igmp interface *interface-name* mcac mc-constraints use-lag-port-weight *boolean*
Tree	use-lag-port-weight
Description	When configured to **true**, port weight is used when determining available bandwidth per level when LAG ports go down or come up. This command is required for proper operation on mixed port-speed LAGs and can also be used for unmixed port-speed LAGs.
Default	false
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** router *named-item-64* igmp interface *interface-name* mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface when redirection is configured
- subscriber level and group-interface level when redirection is unconfigured

In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).

Reference	**configure** mcac policy *string*
Introduced	16.0.R1
Platforms	All

query-interval *number*

Synopsis	Time between two consecutive host-query messages
Context	**configure** router *named-item-64* igmp interface *interface-name* query-interval *number*

static

Synopsis	Enter the **static** context
Context	**configure** router *named-item-64* igmp interface *interface-name* static
Tree	static
Description	Commands in this context configure the testing of multicast forwarding on an interface without a receiver host.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

group [group-address] *ipv4-multicast-address*

Synopsis	Enter the **group** list instance
Context	**configure** router *named-item-64* igmp interface *interface-name* static group *ipv4-multicast-address*
Tree	group
Description	Commands in this context configure a static multicast group as either a starg (*,G), or one or more SSM (S,G) records. IGMP static group memberships are used to test multicast forwarding without a receiver host. When a static IGMP group is configured, data is forwarded to an interface without receiving membership reports from host members. When the group entries are configured on point-to-point links that connect routers to a rendezvous point (RP), the static IGMP group entries do not generate join messages toward the RP.
Introduced	16.0.R1
Platforms	All

[**group-address**] *ipv4-multicast-address*

Synopsis	Group address of static IGMP multicast channel
Context	**configure** router *named-item-64* igmp interface *interface-name* static group *ipv4-multicast-address*
Tree	group
Description	This command configures an address that receives data on an interface. The IP address must be unique for each static group.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id) 'ipv4-multicast-address' must be in 224.0.0.0-239.255.255.255 range with valid dotted-quad form
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

source [source-address] *ipv4-unicast-address*

Platforms	All

static

Synopsis	Enter the **static** context
Context	**configure** router *named-item-64* igmp tunnel-interface ldp-p2mp-root *reference* sender-address *reference* static
Tree	static
Description	Commands in this context configure static multicast receiver hosts on a tunnel interface associated with an RSVP P2MP LSP. When a static IGMP group is configured, data is forwarded to an interface without receiving membership reports from host members.
Introduced	16.0.R1
Platforms	All

group [group-address] *ipv4-multicast-address*

Synopsis	Enter the **group** list instance
Context	**configure** router *named-item-64* igmp tunnel-interface ldp-p2mp-root *reference* sender-address *reference* static group *ipv4-multicast-address*
Tree	group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure a static multicast group as either a starg (*,G), or one or more SSM (S,G) records. Static multicast group joins can be assigned to a tunnel interface associated with an RSVP P2MP LSP. A given <*,G> or <S,G> can only be associated with a single tunnel interface. A multicast packet which is received on an interface and which succeeds the RPF check for the source address will be replicated and forwarded to all OIFs which correspond to the branches of the P2MP LSP. The packet is sent on each OIF with the label stack indicated in the NHLFE of this OIF. The packets will also be replicated and forwarded natively on all OIFs which have received IGMP or PIM joins for this <S,G>. The multicast packet can be received over a PIM or IGMP interface which can be an IES interface, a spoke SDP terminated IES interface, or a network interface.
Introduced	16.0.R1
Platforms	All

[**group-address**] *ipv4-multicast-address*

Synopsis	Group address of static IGMP multicast channel
Context	**configure** router *named-item-64* igmp tunnel-interface ldp-p2mp-root *reference* sender-address *reference* static group *ipv4-multicast-address*
Tree	group
Description	This command configures an address that receives data on an interface. The IP address must be unique for each static group.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id) 'ipv4-multicast-address' must be in 224.0.0.0-239.255.255.255 range with valid dotted-quad form
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

source [source-address] *ipv4-unicast-address*

Synopsis	Add a list entry for **source**

interface [interface-name] *interface-name*

Synopsis	Enter the **interface** list instance
Context	**configure** router *named-item-64* interface *interface-name*
Tree	interface
Description	Commands in this context create a logical IP routing or unnumbered MPLS-TP interface. An IP address, port, or system can then be associated with the IP interface.
Introduced	16.0.R1
Platforms	All

[**interface-name**] *interface-name*

Synopsis	Router interface name
Context	**configure** router *named-item-64* interface *interface-name*
Tree	interface
Description	This command specifies the name of the router interface. When a user enters a new name, the system creates a new logical interface and the context changes to that interface for more command processing. When an existing interface name is entered, the user enters the router interface context for editing and configuration.

Use subject to Terms available at: www.nokia.com/terms.

Nokia recommends using names that are meaningful and unique to remove ambiguity when displaying the state associated with IP interfaces either via show commands or model-driven interfaces.

See "Router configuration overview" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about the interface name.

String length	1 to 32
Notes	This element is part of a list key.

dist-cpu-protection *reference*

Synopsis	DCP policy name for interface
Context	**configure** router *named-item-64* interface *interface-name* dist-cpu-protection *reference*
Tree	dist-cpu-protection
Description	This command configures a Distributed CPU Protection (DCP) policy for the associated IP interface or SAP. The user can only assign a valid created DCP policy to a SAP or network interface (this rule does not apply to templates such as an MSAP policy). If the operator does not assign a DCP policy to a router interface, the system uses the default network DCP policy. See "Distributed CPU protection" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
Reference	**configure** system security dist-cpu-protection policy *named-item*

Synopsis	TLV to ignore on reception
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* ccm-tlv-ignore *keyword*
Tree	ccm-tlv-ignore
Description	This command configures the receiving MEP to ignore the specified TLVs in the CCM PDU. The ignored TLVs are reported as absent and have no impact on the MEP state machine. When unconfigured, the MEP processes all the recognized TLVs.
Options	interface-status, port-status
Max. instances	2

© 2026 Nokia.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-fc-stats

Synopsis	Enter the **collect-lmm-fc-stats** context
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-fc-stats
Tree	collect-lmm-fc-stats
Description	Commands in this context configure per forwarding class (FC) LMM information collection. The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively. This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

fc *keyword*

Synopsis	Forwarding class name for profile-unaware counter
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-fc-stats fc *keyword*
Tree	fc
Description	This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

fc-in-profile *keyword*

Synopsis	Forwarding class name for profile-aware counter
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-fc-stats fc-in-profile *keyword*
Tree	fc-in-profile
Description	This command configures individual counters for the specified FCs with regard to profile. The system includes all countable packets that match a configured FC and that are deemed to be in-profile in this counter. An FC specified as part of this command and for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the **collect-lmm-fc-stats** context. When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.
Options	be, l2, af, l1, h2, ef, h1, nc
Max. instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-lmm-stats *boolean*

Synopsis	Collect statistics for loss measurement message tests
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* collect-lmm-stats *boolean*
Tree	collect-lmm-stats
Description	When configured to **true**, the router instantiates the statistical counter to transmit and receive packets for the LAG facility MEP bindings. The **show eth-cfm collect-lmm-stats** command displays entities that have been enabled to collect transit and receive counters. When configured to **false**, the router does not instantiate the counter and the LMM PDU associated with the MEP does not populate the counters in the packet.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

description *description*

Synopsis	Text description
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-test

Synopsis	Enable the **eth-test** context
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test
Tree	eth-test
Description	Commands in this context configure information used by the Ethernet Test (ETH-TST) packet. The commands must be configured on both the sender and the receiver nodes. The test packets are used with the **oam eth-cfm eth-test** command.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

bit-error-threshold *number*

Synopsis	Lowest priority defect allowed to generate fault alarm
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test bit-error-threshold *number*
Tree	bit-error-threshold
Range	0 to 11840
Units	bit errors
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

test-pattern

Synopsis	Enter the **test-pattern** context
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern
Tree	test-pattern
Description	Commands in this context specify the test pattern for the ETH-TST frames. The pattern does not have to be the same on the sender and the receiver.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

crc-tlv *boolean*

Synopsis	Generate a CRC checksum
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern crc-tlv *boolean*
Tree	crc-tlv
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

pattern *keyword*

Synopsis	Test pattern for Ethernet Test frames
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* eth-test test-pattern pattern *keyword*
Tree	pattern
Description	This command specifies the test pattern of the Ethernet Test (ETH-TST) frames. This does not have to be configured the same on the sender and the receiver.
Options	all-zeros, all-ones
Default	all-zeros
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

facility-fault *boolean*

Synopsis	Allow the facility MEP to generate a network action
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* facility-fault *boolean*
Tree	facility-fault
Description	When configured to **true**, the system facility MEP responds to a fault with a network-actionable function instead of just reporting the defect condition. When configured to **false**, the system monitors transmissions and reports fault conditions.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

grace

Synopsis	Enter the **grace** context
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace
Tree	grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function and the ITU-T Y.1731 Ethernet Expected Default (ETH-ED) function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-ed

Synopsis	Enter the **eth-ed** context
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed
Tree	eth-ed
Description	Commands in this context configure the ITU-T Y.1731 ETH-ED function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-rx-defect-window *number*

Synopsis	Maximum received ETH-ED expected defect window duration
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed max-rx-defect-window *number*
Tree	max-rx-defect-window
Range	1 to 86400
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

priority *number*

Synopsis	Transmission priority for ETH-ED PDUs
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed priority *number*
Tree	priority
Range	0 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-eth-ed *boolean*

Synopsis	Receive and process ETH-ED ITU-T Y.1731 PDUs on the MEP
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed rx-eth-ed *boolean*
Tree	rx-eth-ed
Description	This command enables the reception and processing of the ITU-T Y.1731 ETH-ED PDU on the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tx-eth-ed *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-ed tx-eth-ed *boolean*
Tree	tx-eth-ed
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

eth-vsm-grace

Synopsis	Enter the **eth-vsm-grace** context
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace
Tree	eth-vsm-grace
Description	Commands in this context configure the Nokia ETH-CFM Grace function.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rx-eth-vsm-grace *boolean*

Synopsis	Receive and process Nokia ETH-CFM Grace PDU on the MEP
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace rx-eth-vsm-grace *boolean*
Tree	rx-eth-vsm-grace
Description	When configured to **true**, the router enables the Nokia Grace function, which is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. When configured to **false**, the router disables the Nokia Grace function.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tx-eth-vsm-grace *boolean*

Synopsis	Transmit ETH-ED PDUs from the MEP
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* grace eth-vsm-grace tx-eth-vsm-grace *boolean*
Tree	tx-eth-vsm-grace
Description	When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards. The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect. The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED). When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lbm-svc-act-responder *boolean*

Synopsis	Process service activation streams in ETH-CFM LBM
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* lbm-svc-act-responder *boolean*
Tree	lbm-svc-act-responder
Description	When configured to **true**, the router enables the MEP to process service activation streams encapsulated in ETH-CFM LBM frames that are directed to it. When configured to **false**, this command reverts to MEP LBM standard processing. There is interaction between this command and the **tools perform service id loopback eth** command. Nokia recommends that either the **lbm-svc act-responder** or the **tools perform service id loopback eth** command be used within a service. If both commands must be configured, and the target reflection point is the MAC Swap Loopback function, the inbound stream of data must not include ETH-CFM traffic that is equal to or lower than the domain level of any configured MEP that would otherwise extract and process the ETH-CFM message. See "Promiscuous ETH-LBM mode of operation" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Services Overview Guide* for more information.
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

low-priority-defect *keyword*

Synopsis	Lowest priority defect for fault alarm generation
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* low-priority-defect *keyword*
Tree	low-priority-defect
Description	This command specifies the lowest priority defect that generates a fault alarm and also configures the fault state of the MEP that causes a network reaction.
Options	all-def, mac-rem-err-xcon, rem-err-xcon, err-xcon, xcon, no-xcon
Default	mac-rem-err-xcon
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

mac-address *mac-unicast-address-no-zero*

Synopsis	MAC address of the MEP
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* mac-address *mac-unicast-address-no-zero*
Tree	mac-address
Description	This command specifies the MAC address of the MEP. When unconfigured, the MAC address of the port (if the MEP is on a SAP) or the MAC address of a bridge (if the MEP is on a spoke) is used.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

one-way-delay-threshold *number*

Synopsis	Threshold time limit for the one-way delay test
Context	**configure** router *named-item-64* interface *interface-name* eth-cfm mep md-admin-name *reference* ma-admin-name *reference* mep-id *number* one-way-delay-threshold *number*
Tree	one-way-delay-threshold
Range	0 to 600
Units	seconds

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

external-reference

Synopsis	Enter the **external-reference** context
Context	**configure** router *named-item-64* interface *interface-name* external-reference
Tree	external-reference
Description	Commands in this context configure the external reference used to map a Nokia vendor-specific configuration and the OpenConfig state.
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

openconfig

Synopsis	Enter the **openconfig** context
Context	**configure** router *named-item-64* interface *interface-name* external-reference openconfig
Tree	openconfig
Description	Commands in this context configure the OpenConfig reference key used to map a Nokia vendor-specific configuration and the OpenConfig state.
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

subinterface *number*

Synopsis	Reference to the subinterface
Context	**configure** router *named-item-64* interface *interface-name* external-reference openconfig subinterface *number*
Tree	subinterface
Description	This command configures the subinterface used to map a Nokia vendor-specific configuration and the OpenConfig state. This command configures the ability to query the OpenConfig state through NETCONF, gRPC, and the MD-CLI from any configuration mode, without having to add any Open Config model configuration. As part of the configuration, a user must also add a port to the Layer 3 interface.
Range	0 to 4294967295

dynamic

Synopsis	Enter the **dynamic** context
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic
Tree	dynamic
Description	Commands in this context configure dynamic link delay measurement options for the interface.
Introduced	21.7.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

lag-ip-measurement

Synopsis	Enter the **lag-ip-measurement** context
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic lag-ip-measurement
Tree	lag-ip-measurement
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lag-ip-measurement-template *reference*

Synopsis	LAG IP measurement template for the interface
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic lag-ip-measurement lag-ip-measurement-template *reference*
Tree	lag-ip-measurement-template
Reference	**configure** test-oam lag-ip-measurement lag-ip-measurement-template *named-item-64*
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

link-measurement

Synopsis	Enter the **link-measurement** context
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic link-measurement
Tree	link-measurement
Description	Commands in this context configure link measurement on the interface.
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lag-micro-sessions *boolean*

Synopsis	Use LAG micro sessions on this interface
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic link-measurement lag-micro-sessions *boolean*
Tree	lag-micro-sessions
Description	When configured to **true**, the router uses individual test sessions per LAG member port to collect link measurement information on the IP interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The IP interface must be configured over a LAG to configure the value **true**.

When configured to **false**, the router uses a single test session in which one LAG member port represents all links in the LAG.

Default false

Introduced 26.3.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

link-measurement-template *reference*

Synopsis Link measurement template name

Context **configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic link-measurement link-measurement-template *reference*

Tree link-measurement-template

Description This command configures the link measurement template name used on the interface. The template associated with the interface can be changed without disabling the test protocol used to carry the test packet. Changing or removing the template associated with the IP interface stops the test and removes all test results for the IP interface.

Reference **configure** test-oam link-measurement measurement-template *named-item-64*

Introduced 26.3.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

twamp-light

Synopsis Enter the **twamp-light** context

Context **configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light

Tree twamp-light

Introduced 21.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ipv4

Synopsis Enter the **ipv4** context

Context **configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light ipv4

Tree ipv4

Introduced 21.7.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of IPv4 TWAMP Light packets
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light ipv4 admin-state *keyword*
Tree	admin-state
Description	This command specifies the administrative state of the IPv4 encapsulated TWAMP Light measurement packets.
Options	enable, disable
Default	disable
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

destination *ipv4-unicast-address*

Synopsis	TWAMP Light measurement packet destination IPv4 address
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light ipv4 destination *ipv4-unicast-address*
Tree	destination
Description	This command specifies the unicast destination address to be associated with the IPv4 TWAMP Light measurement packet.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source *ipv4-unicast-address*

Synopsis	TWAMP Light measurement packets source IPv4 address
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light ipv4 source *ipv4-unicast-address*
Tree	source
Description	This command specifies the unicast source address to be associated with the IPv4 TWAMP Light measurement packet.
String format	'ipv4-address' must use only digits and dots (no %zone)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ipv6

Synopsis	Enter the **ipv6** context
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light ipv6
Tree	ipv6
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of IPv6 TWAMP Light packets
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light ipv6 admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

destination *ipv6-unicast-or-linklocal-address*

Synopsis	TWAMP Light measurement packet destination IPv6 address
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light ipv6 destination *ipv6-unicast-or-linklocal-address*
Tree	destination
Description	This command specifies the unicast destination address to be associated with the IPv6 TWAMP Light measurement packet. Globally routable and Link Local addressing is supported.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

© 2026 Nokia.

source *ipv6-unicast-or-linklocal-address*

Synopsis	TWAMP Light measurement packets source IPv6 address
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay dynamic twamp-light ipv6 source *ipv6-unicast-or-linklocal-address*
Tree	source
Description	This command specifies the unicast source address to be associated with the IPv6 TWAMP Light measurement packet. Globally routable and Link Local addressing is supported.
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

static *number*

Synopsis	Unidirectional link delay static information
Context	**configure** router *named-item-64* interface *interface-name* if-attribute delay static *number*
Tree	static
Description	This command configures the unidirectional link delay. By default there is no configured delay, and the link delay metric TLV is pruned in the IGP.
Range	1 to 16777214
Units	microseconds
Introduced	20.7.R1
Platforms	All

srlg-group [name] *reference*

Synopsis	Add a list entry for **srlg-group**
Context	**configure** router *named-item-64* interface *interface-name* if-attribute srlg-group *reference*
Tree	srlg-group
Description	Commands in this context add a list entry for a Shared Risk Link Group (SRLG) that can be associated with an IP or MPLS interface to tag IP or MPLS interfaces that share a specific outcome with the same identifier. For example, an SRLG group identifier could represent all links that use separate fibers but are carried in the same fiber conduit. The name and identifier of each SRLG group must be configured locally on each router before the user configures the SRLG membership of an interface. A maximum of 1024 SRLGs can be configured per system. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to an interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

See "Shared Risk Link Groups" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR MPLS Guide* for more information about SRLGs.

Introduced 16.0.R1

Platforms All

[**name**] *reference*

Synopsis SRLG name

Context **configure** router *named-item-64* interface *interface-name* if-attribute srlg-group *reference*

Tree srlg-group

ingress

Synopsis Enter the **ingress** context

Context **configure** router *named-item-64* interface *interface-name* ingress

Tree ingress

Description Commands in this context configure ingress network filter policies for the IP interface. If an ingress filter is not defined, the system performs no filtering.

Introduced 16.0.R1

Platforms All

destination-class-lookup *boolean*

Synopsis Enable BGP destination class lookup

Context **configure** router *named-item-64* interface *interface-name* ingress destination-class-lookup *boolean*

Tree destination-class-lookup

Description When configured to **true**, the router performs a destination class lookup. This command is supported on FP3-based cards and later and is used in combination with the **destination-class** match criterion for an IP filter policy to filter egress traffic based on BGP destination classes.

When configured to **false**, destination class lookup is not enabled.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	20.7.R1
Platforms	All

filter

Synopsis	Enter the **filter** context
Context	**configure** router *named-item-64* interface *interface-name* ingress filter
Tree	filter
Description	Commands in this context associate an IP filter policy with an IP interface. Filter policies control packet forwarding and dropping based on IP match criteria.
Introduced	16.0.R1
Platforms	All

ip *reference*

Synopsis	IPv4 filter policy name
Context	**configure** router *named-item-64* interface *interface-name* ingress filter ip *reference*
Tree	ip
Reference	**configure** filter ip-filter *filter-name*
Introduced	16.0.R1

Context	**configure** router *named-item-64* interface *interface-name* ingress policy-accounting *reference*
Tree	policy-accounting
Reference	**configure** routing-options policy-accounting policy-acct-template *named-item*
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

ingress-stats *boolean*

Synopsis	Collect ingress statistics
Context	**configure** router *named-item-64* interface *interface-name* ingress-stats *boolean*
Tree	ingress-stats
Description	When configured to **true**, the router configures the collection of IPv4 and IPv6 offered packets and octets. This only applies to IP statistics, not to uRPF statistics. Octet statistics for IPv4 and IPv6 bytes at IP interfaces include the Layer 2 frame overhead. When configured to **false**, the router does not collect the statistics.
Default	false
Introduced	16.0.R1
Platforms	All

ip-mtu *number*

Synopsis	Interface IP MTU
Context	**configure** router *named-item-64* interface *interface-name* ip-mtu *number*
Tree	ip-mtu
Description	This command configures the IP maximum transmission unit (MTU) for the associated router IP interface. The operational IP MTU used for the interface is based on the configured IP MTU and the port MTU of the port bound to this interface; that is, the operational MTU is set to the lesser of the values configured by this command and the port MTU value less the Ethernet header size. If the interface supports IPv6 packets, this command must be set to at least 1280, in accordance with RFC 2460 *Internet Protocol, Version 6 (IPv6) Specification*.
Range	512 to 9786
Units	bytes
Introduced	16.0.R1

dynamic

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **dynamic** context
Context	**configure** router *named-item-64* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange dynamic
Tree	dynamic
Notes	The following elements are part of a choice: **dynamic** or **manual**.
Introduced	22.7.R1
Platforms	VSR

auto-establish *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Attempt to establish a phase 1 exchange automatically

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange dynamic auto-establish *boolean*
Tree	auto-establish
Description	When configured to **true**, the system automatically attempts to establish a phase 1 exchange. The system automatically establishes phase 1 SA as soon as the tunnel is provisioned and enabled. This command should only be configured on one side of the tunnel. Static routes that use the **auto-establish** tunnel as the next hop are brought down when the tunnel goes down. When configured to **false**, the system does not automatically attempt to establish a phase 1 exchange.
Default	false
Introduced	22.7.R1
Platforms	VSR

auto-establish-sustain *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable sustain mode for auto-establish tunnels
Context	**configure** router *named-item-64* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange dynamic auto-establish-sustain *boolean*
Tree	auto-establish-sustain
Description	When configured to **true**, the tunnel initiator keeps the IKE_SA and CHILD_SA up to prevent phase 2 expiry when there is no traffic, and starts a new exchange to establish a replacement when the peer deletes the SA. When configured to **false**, the tunnel initiator does not prevent the SA from expiring and does not establish a replacement when the peer deletes the SA.
Default	false
Introduced	26.7.R1
Platforms	VSR

pre-shared-key *encrypted-leaf*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Pre-shared key for authentication
Context	**configure** router *named-item-64* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange dynamic pre-shared-key *encrypted-leaf*
Tree	pre-shared-key
Description	This command specifies the pre-shared key for authentication in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 166
Introduced	22.7.R1
Platforms	VSR

reverse-route-injection

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **reverse-route-injection** context
Context	**configure** router *named-item-64* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange dynamic reverse-route-injection
Tree	reverse-route-injection
Description	Commands in this context configure reverse route injection for IPsec tunnels. When reverse route injection is enabled, the system injects routes into the service based on the final TSr. One route is created for each TS in the TSr, with the prefix length as the longest number that covers the address range in the TS. The system removes the reverse route when the corresponding CHILD_SA is removed.

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	**configure** router *named-item-64* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy strict-match *boolean*
Tree	strict-match
Description	When configured to **true**, this command enables strict match of the security policy entry. When a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry. If there is no match, the setup fails, and TS_UNACCEPTABLE is sent. If there is a match, but there is an existing CHILD_SA for the matched security policy, the setup fails, and NO_PROPOSAL_CHOSEN is sent. If there is a match, and there is not a CHILD_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD_SA is created.

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4
Tree	ipv4
Description	Commands in this context configure the IPv4 command options for the interface.
Introduced	16.0.R1
Platforms	All

allow-directed-broadcasts *boolean*

Synopsis	Forward directed broadcasts
Context	**configure** router *named-item-64* interface *interface-name* ipv4 allow-directed-broadcasts *boolean*
Tree	allow-directed-broadcasts
Description	When configured to **true**, the router forwards packets received on a local router interface to the subnet broadcast address of another IP interface. When configured to **false**, this router does not allow directed broadcasts and the packets are discarded. Allowing directed broadcasts is a well-known mechanism used for denial-of-service attacks.
Default	false
Introduced	16.0.R1
Platforms	All

bfd

Synopsis	Enter the **bfd** context

gi-address *ipv4-unicast-address*

Synopsis	GI address for the DHCP relay
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp gi-address *ipv4-unicast-address*
Tree	gi-address
Description	This command configures the GI address to distinguish between the different subscriber interfaces (and potentially group interfaces) defined when the router functions as a DHCP relay. By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	All

option-82

Synopsis	Enter the **option-82** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82
Tree	option-82
Description	Commands in this context configure the processing required when the router receives a DHCP request that already has an Option 82 field in the packet.
Introduced	16.0.R1

Notes	The following elements are part of a choice: **ascii-tuple**, **if-name**, **ifindex**, **none**, **port-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

vlan-ascii-tuple

Synopsis	Include the VLAN ID and dot1p bits in the ASCII tuple
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 circuit-id vlan-ascii-tuple
Tree	vlan-ascii-tuple
Description	When configured, the router includes the VLAN ID and dot1p bits with the ASCII-tuple information. This only occurs on dot1q and QinQ-encapsulated ports. When the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of the outgoing packet. When unconfigured, the router leaves the circuit ID sub-option of the DHCP packet empty.
Notes	The following elements are part of a choice: **ascii-tuple**, **if-name**, **ifindex**, **none**, **port-id**, or **vlan-ascii-tuple**.
Introduced	16.0.R1
Platforms	All

remote-id

Synopsis	Enter the **remote-id** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 remote-id
Tree	remote-id
Description	Commands in this context configure the remote IP sub-option of the DHCP packet with the identity of the remote host end (typically the DHCP client).
Introduced	16.0.R1
Platforms	All

ascii-string *string-not-all-spaces*

Synopsis	User-defined ASCII string for the remote ID
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp option-82 remote-id ascii-string *string-not-all-spaces*
Tree	ascii-string

relay-plain-bootp *boolean*

Synopsis	Relay plain BOOTP messages
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp relay-plain-bootp *boolean*
Tree	relay-plain-bootp
Description	When configured to **true**, the system relays plain BOOTP messages. When configured to **false**, the system considers the plain BOOTP packets as malformed DHCP packets; therefore, the system does not relay the messages.
Default	false
Introduced	16.0.R1
Platforms	All

release-include-gi-address *boolean*

Synopsis	Include gateway IP address in DHCP Release messages
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp release-include-gi-address *boolean*
Tree	release-include-gi-address
Default	false
Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

server *ipv4-unicast-address*

Synopsis	IP addresses for DHCP server requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp server *ipv4-unicast-address*
Tree	server
Description	This command configures a list of servers that this interface forwards requests to. The operator can enter the list of servers as either IP addresses or fully qualified domain names. The operator must specify at least one server specified for DHCP relay to work. If there are multiple servers, the system forwards the request to all the servers in the list.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Max. instances	8

Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

src-ip-addr *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp src-ip-addr *keyword*
Tree	src-ip-addr
Options	auto, gi-address
Default	auto
Introduced	16.0.R1
Platforms	All

trusted *boolean*

Synopsis	Relay untrusted packets
Context	**configure** router *named-item-64* interface *interface-name* ipv4 dhcp trusted *boolean*
Tree	trusted
Description	When configured to **true**, the router enables the trusted mode on the interface. When enabled, the relay agent changes the existing GI address (of the request) to the ingress interface, and forwards the request. A DHCP request that contains a GI address of 0.0.0.0 and an Option 82 field in the packet is discarded unless it arrives on a trusted circuit. This behavior only applies if the Relay Agent Information Option action is to keep the existing information. When the Option 82 field is replaced by the relay agent, the original Option 82 information is lost, and there is no reason to enable the trusted option.
Default	false
Introduced	16.0.R1
Platforms	All

gre-termination *boolean*

Synopsis	Configure GRE termination in the virtual router for the primary subnet of this interface.
Context	**configure** router *named-item-64* interface *interface-name* ipv4 gre-termination *boolean*
Tree	gre-termination

Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery learn-unsolicited *boolean*
Tree	learn-unsolicited
Description	When configured to **true**, the router can learn neighbor entries from received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited (S) flag set. The command can be enabled for global addresses, link-local addresses, or for both. When configured to **false**, the router follows standard behavior for learning neighbor entries. • If an unsolicited NA (regardless of the S flag) is received from a neighbor that is not yet in the Neighbor Discovery (ND) cache, the NA is ignored. • If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the cache to store the received Link Layer MAC. The neighbor is put in the STALE state.

Default	false
Introduced	16.0.R1
Platforms	All

limit

Synopsis	Enter the **limit** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery limit
Tree	limit
Description	Commands in this context configure the maximum number of dynamic neighbor entries that can be learned on the interface When the number of entries reaches the threshold (the configured percentage) of this limit, the system sends an SNMP trap. When the limit is exceeded, the system learns no new entries until an entry expires and traffic to these destinations is dropped. Already learned entries are refreshed.
Introduced	16.0.R1
Platforms	All

log-only *boolean*

Synopsis	Generate log entries only if limit is reached
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery limit log-only *boolean*
Tree	log-only
Default	false
Introduced	16.0.R1

local-proxy-arp *boolean*

Synopsis	Enable local proxy ARP on interface
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery local-proxy-arp *boolean*
Tree	local-proxy-arp
Description	When configured to **true**, the router enables local proxy ARP on the interface. When configured to **false**, the router does not respond to ARP requests for addresses on the same subnet.
Introduced	16.0.R1
Platforms	All

proactive-refresh *boolean*

Synopsis	Send a single refresh message before entry timeout
Context	**configure** router *named-item-64* interface *interface-name* ipv4 neighbor-discovery proactive-refresh *boolean*
Tree	proactive-refresh
Description	When configured to **true**, the router always sends a refresh message 30 seconds before the timeout of the entry (a single refresh message with no retries). When configured to **false**, the router marks an entry as stale 30 seconds before age-out, and the router only sends an ARP request to refresh the entry if the IOM receives traffic

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

that uses it. Then, the IOM asks the ARP application to send a refresh message. With ARP proactive refresh enabled, the ARP module sends a refresh message regardless of the IOM receiving traffic.

admin-state *keyword*

Synopsis Administrative state of VRRP

Context **configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* admin-state *keyword*

Tree admin-state

Description The command determines the administrative state of non-owner virtual router instances.

Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes.

When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing.

Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated.

An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.

Options enable, disable

Default enable

backup *ipv4-unicast-address*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* backup *ipv4-unicast-address*
Tree	backup
Description	This command associates virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instances create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance. For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is advertising to backup virtual routers receiving the messages. The specified *unicast-ipv4-address* must be equal to one of the existing IP addresses in the parental IP interface (primary or secondary) or this command fails. See "Owner and non-owner VRRP" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about owner and non-owner virtual router instances.

bfd-liveness

Synopsis	Enable the **bfd-liveness** context
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* bfd-liveness
Tree	bfd-liveness
Description	Commands in this context assign a Bidirectional Forwarding Detection (BFD) session to a specific VRRP or SRRP instance. This BFD session provides a heartbeat mechanism that speeds up the transition of the standby VRRP router to an active state. If the associated BFD session fails, the VRRP routers immediately send a VRRP advertisement message. In addition, the standby VRRP routers transition to a master state to speed up convergence. The VRRP election process takes place based on the advertisement messages sent by all VRRP routers. Only one BFD session can be assigned to any VRRP or SRRP instance, but multiple SRRP or VRRP sessions can use the same BFD session.
Introduced	16.0.R1
Platforms	All

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* mac *mac-unicast-address*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address. Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC. An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	16.0.R1
Platforms	All

master-int-inherit *boolean*

Synopsis	Allow master instance to dictate the master down timer
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* master-int-inherit *boolean*
Tree	master-int-inherit
Description	When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 16.0.R1

Platforms All

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

Context **configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* message-interval *number*

Tree message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

The usage of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

monitor-oper-group *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	VRRP instance to follow a specified operational group
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* monitor-oper-group *reference*
Tree	monitor-oper-group
Description	This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router, the operational group is up and the operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	22.2.R1
Platforms	All

ntp-reply *boolean*

Synopsis	Allow processing of NTP requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* ntp-reply *boolean*
Tree	ntp-reply
Description	When configured to **true**, the router redirects NTP requests to the VRRP virtual IP address. This behavior only applies to the router acting as the master VRRP router. When configured to **false**, the router does not process NTP requests.
Default	false
Introduced	20.2.R1
Platforms	All

oper-group *reference*

Synopsis	Operational group name associated with the VRRP
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* oper-group *reference*
Tree	oper-group

© 2026 Nokia.

Description	This command configures an operational group to associate with the VRRP. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up. The operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	16.0.R1
Platforms	All

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1
Platforms	All

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down).

When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.

Default false

Introduced 16.0.R1

Platforms All

ping-reply *boolean*

Synopsis Allow non-owner master to reply to ICMP echo requests

Context **configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* ping-reply *boolean*

Tree ping-reply

Description When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address).

When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.

Default false

Introduced 16.0.R1

Platforms All

policy *reference*

Synopsis VRRP priority control policy

Context **configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* policy *reference*

Tree policy

Description This command configures a VRRP priority control policy to associate with the virtual router instance.

VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis.

An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.

For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.

Reference **configure** vrrp policy *number*

Introduced 16.0.R1

Platforms All

preempt *boolean*

Synopsis Allow the VRRP to override an existing non-owner master

Context **configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* preempt *boolean*

Tree preempt

Description When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router.

When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

Default true

Introduced 16.0.R1

Platforms All

priority *number*

Synopsis Base priority for the VRRP

Context **configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* priority *number*

Tree priority

Description This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process.

The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.

Range 1 to 255

Platforms	All

ssh-reply *boolean*

Synopsis	Allow the non-owner master to reply to SSH requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* ssh-reply *boolean*
Tree	ssh-reply
Description	When configured to **true**, the router allows the non-owner master to reply to SSH requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the SSH request. SSH cannot be disabled at the management security level (either on the parental IP interface or on the SSH source host address). When configure to **false**, SSH requests to non-owner master virtual IP addresses are silently discarded.
Default	false
Introduced	16.0.R1
Platforms	All

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	16.0.R1
Platforms	All

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	16.0.R1
Platforms	All

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** router *named-item-64* interface *interface-name* ipv4 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	16.0.R1
Platforms	All

ipv6

Synopsis	Enable the **ipv6** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6
Tree	ipv6
Description	Commands in this context configure the IPv6 command options for the interface.

address [ipv6-address] *ipv6-address*

Synopsis	Enter the **address** list instance
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address*
Tree	address
Description	Commands in this context assign an IPv6 address to the interface. A global IPv6 address and *prefix-length* combined create a locally configured interface IPv6 prefix and subnet. The defined global IP prefix must be unique within the context of a routing instance. It cannot overlap with any other existing global IP prefix defined on another IP interface within the same routing context. This overlap restriction is not applicable for IPv6 host addresses configured on loopback interfaces. For example, an IPv6 loopback host address configured on a loopback interface may overlap with another prefix subnet configured on another IP interface within the same routing context.
Introduced	16.0.R1
Platforms	All

[**ipv6-address**] *ipv6-address*

Synopsis	IPv6 address assigned to the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address*

Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

duplicate-address-detection *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Enable Duplicate Address Detection
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.

Default	true
Introduced	16.0.R1
Platforms	All

eui-64 *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Form IPv6 address from prefix and 64-bit interface ID
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* eui-64 *boolean*
Tree	eui-64
Description	When configured to **true**, the router forms a complete IPv6 address from the supplied prefix and 64-bit interface identifier. The 64-bit interface identifier is derived from the MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, use the base MAC address of the chassis.
Default	false
Introduced	16.0.R1
Platforms	All

prefix-length *number*

Synopsis	IPv6 address prefix length
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* prefix-length *number*
Tree	prefix-length
Range	4 to 128
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

primary-preference *number*

Synopsis	Index assigned to the IPv6 address of the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* primary-preference *number*
Tree	primary-preference
Description	This command assigns a primary preference index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications that require a fixed address of the interface, such as LDP and Segment Routing. In cases where a fixed address is required when originating packets from the interface, the IPv6 address with the lowest primary preference index is selected. If the selected address is removed, the next IPv6 address with the next lowest primary preference index is selected. If this index is not specified for the IPv6 address, the system assigns the next available index value to the address. The address index space is unique across all addresses of a given interface.
Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

tag *(number | keyword)*

Synopsis	Route tag to be matched by BGP export policy rules
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* tag *(number | keyword)*
Tree	tag
Description	This command associates an administrative tag value with an interface IP address. This tag value is added to the IP FIB entries corresponding to the subnet route and host route created by IP address configuration. This tag can be used to filter these routes when they are processed by a BGP export policy, a BGP RIB-management route table import policy, as IS-IS export policy or an OSPF export policy.
Range	1 to 4294967295
Options	no-tag
Default	no-tag
Introduced	26.3.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

track-srrp *number*

Synopsis	SRRP ID whose state is tracked on this IP address
Context	**configure** router *named-item-64* interface *interface-name* ipv6 address *ipv6-address* track-srrp *number*
Tree	track-srrp
Range	1 to 4294967295

type *keyword*

Synopsis	Local termination point for the BFD session
Context	**configure** router *named-item-64* interface *interface-name* ipv6 bfd type *keyword*
Tree	type
Options	cpm-np – Terminate on the CPM network processor auto – Terminate on the system-selected termination point fp – Terminate on the forwarding plane
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

duplicate-address-detection *boolean*

Synopsis	Enable Duplicate Address Detection
Context	**configure** router *named-item-64* interface *interface-name* ipv6 duplicate-address-detection *boolean*
Tree	duplicate-address-detection

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router enables Duplicate Address Detection (DAD) on the interface. When configured to **false**, the router disables DAD on a per-interface basis. This prevents the router from performing a DAD check on the interface. All IPv6 addresses on an interface with DAD disabled, immediately enter a preferred state, without checking for uniqueness on the interface. This is useful for interfaces that enter a looped state during troubleshooting and are operationally disabled when the loop is detected, requiring manual intervention to clear the DAD violation.
Default	true
Introduced	16.0.R1
Platforms	All

forward-ipv4-packets *boolean*

Synopsis	Forward unencapsulated IPv4 packets
Context	**configure** router *named-item-64* interface *interface-name* ipv6 forward-ipv4-packets *boolean*
Tree	forward-ipv4-packets
Description	When configured to **true**, the router can use an IPv6-only interface, with no configured IPv4 addresses, to forward IPv4 packets that originate or terminate locally. The interface reports that its IPv4 operational state is up if its IPv6 operational state is up. Not all protocols observe the interface as up from an IPv4 perspective. This command mostly supports BGP routing use cases; see RFC 5549 for details. When configured to **false**, the router prevents IPv4 packets from being forwarded if there are no configured IPv4 subnets.
Default	false
Introduced	19.5.R1
Platforms	All

gre-termination *boolean*

Synopsis	Enable IPv6 GRE termination on a loopback interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 gre-termination *boolean*
Tree	gre-termination
Description	When configured to **true**, the system allows the termination of PW-encapsulated (MPLS-over-GRE) packets transported over IPv6 GRE. This command is only supported on a single loopback interface in the Base router with an IPv6 address and a /128 prefix.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This configuration is intended exclusively for tunneling traffic over Layer 3 redundant interfaces within the subscriber management context.

This configuration is not supported for terminating traffic associated with Layer 2 services or regular Layer 3 spoke SDP VPRN interfaces.

Default	false
Introduced	25.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

link-local-address

Synopsis	Enter the **link-local-address** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6 link-local-address
Tree	link-local-address
Description	Commands in this context configure the IPv6 link-local address that is used as a virtual SRRP IPv6 address by the master SRRP node. This address is sent in the Router Advertisements initiated by the master SRRP node. Clients use this address as IPv6 default-gateway. Both SRRP nodes, master and backup, must be configured with the same link-local address. Only one link-local address is allowed per interface. **Caution**: Removing a manually configured link-local address may impact routing protocols or static routes that have a dependency on that address. Nokia does not recommend removing a link-local address when there are active IPv6 subscriber hosts on an IES or VPRN interface.
Introduced	16.0.R1
Platforms	All

duplicate-address-detection *boolean*

Synopsis	Enable Duplicate Address Detection

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* ipv6 link-local-address duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD) on the interface. When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.
Default	true
Introduced	16.0.R1
Platforms	All

local-dhcp-server *reference*

Synopsis	DHCP server for the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 local-dhcp-server *reference*
Tree	local-dhcp-server
Description	This command instantiates a local DHCP server. A local DHCP server can serve multiple interfaces but is limited to the routing context in which it was created.
Reference	**configure** router *named-item-64* dhcp-server dhcpv6 *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

neighbor-discovery

Synopsis	Enter the **neighbor-discovery** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery
Tree	neighbor-discovery
Introduced	16.0.R1
Platforms	All

learn-unsolicited *keyword*

Synopsis	Type of entries learned from unsolicited NA messages
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery learn-unsolicited *keyword*
Tree	learn-unsolicited

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited flag set. When unconfigured, the router follows standard RFC 4861 behavior for learning of neighbor entries. The neighbor is put in the stale state. This is the standard RFC behavior.
Options	global, link-local, both
Introduced	16.0.R1
Platforms	All

limit

Synopsis	Enter the **limit** context
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery limit
Tree	limit
Description	Commands in this context configure the maximum amount of dynamic IPv6 neighbor entries that can be learned on an IP interface. When the number of dynamic neighbor entries reaches the configured percentage of this limit the system sends an SNMP trap. When the limit is exceeded, no new entries are learned until an entry expires and traffic to these destinations is dropped. Entries that have already been learned are refreshed.
Introduced	16.0.R1
Platforms	All

log-only *boolean*

Synopsis	Generate log entries when limit is reached
Context	**configure** router *named-item-64* interface *interface-name* ipv6 neighbor-discovery limit log-only *boolean*
Tree	log-only
Description	When configured to **true**, the router sends the warning message at the specified threshold percentage or upon exceeding the specified limit. Entries that exceed the limit are learned. When configured to **false**, the router does not send the warning message.
Default	false
Introduced	16.0.R1
Platforms	All

qos-route-lookup *keyword*

Synopsis	IP address for QoS route lookup for ingress IP packets
Context	**configure** router *named-item-64* interface *interface-name* ipv6 qos-route-lookup *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	qos-route-lookup
Description	This command specifies the IP address type used for QPPB enabled per-packet QoS handling (in terms of FC and priority). When using QPPB, routes are associated with a QoS treatment (FC and optionally priority) through either explicit configuration or the route policy. If an IPv4 or IPv6 packet arrives on an interface where the configuration of this command applies to the packet, the QoS treatment of the packet is based on the route that matched the destination IP address or the route that matched the source IP address. See "Enabling QPPB on an IP interface" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about QPPB.
Options	destination, source, source-and-dest
Introduced	16.0.R1

Platforms	All

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated. An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.
Options	enable, disable
Default	enable
Introduced	16.0.R1
Platforms	All

backup *ipv6-address*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* backup *ipv6-address*
Tree	backup
Description	This command associates router IPv6 virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instance create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance.

For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. The specified IPv6 address must be equal to one of the existing parental IP addresses in the parental IP interface (primary or secondary) or this command fails.

See "Owner and non-owner VRRP" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about owner and non-owner virtual router instances.

Introduced 16.0.R1

Platforms All

bfd-liveness

Synopsis Enable the **bfd-liveness** context

Context **configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* bfd-liveness

Tree bfd-liveness

Description Commands in this context assign a bidirectional forwarding detect (BFD) session to a specific VRRP or SRRP instance. This BFD session provides a heartbeat mechanism for use in speeding up the transition of the standby VRRP router to an active state. If the associated BFD session fails, the VRRP routers immediately send a VRRP Advertisement message. In addition, the standby VRRP routers transition to a Master state to speed convergence.

The normal VRRP election process takes place based on the Advertisement messages sent by all VRRP routers.

There can be only one BFD session assigned to any specific VRRP or SRRP instance, but there can be multiple SRRP or VRRP sessions using the same BFD session.

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* mac *mac-unicast-address*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address. Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC. An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	16.0.R1
Platforms	All

master-int-inherit *boolean*

Synopsis	Allow master instance to dictate the master down timer
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* master-int-inherit *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	master-int-inherit
Description	When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer. When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.
Introduced	16.0.R1
Platforms	All

message-interval *number*

Synopsis	Interval for sending VRRP advertisement messages
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* message-interval *number*
Tree	message-interval
Description	This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command. The use of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command: • When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as the master. • When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement. • When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.
Range	10 to 4095
Units	centiseconds
Default	100
Introduced	16.0.R1
Platforms	All

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1
Platforms	All

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down).

When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.

Default false

Introduced 16.0.R1

Platforms All

ping-reply *boolean*

Synopsis Allow non-owner master to reply to ICMP echo requests

Context **configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* ping-reply *boolean*

Tree ping-reply

Description When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address).

When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.

Default false

Introduced 16.0.R1

Platforms All

policy *reference*

Synopsis VRRP priority control policy

Context **configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* policy *reference*

Tree policy

Description This command configures a VRRP priority control policy to associate with the virtual router instance.

VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis.

An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.

For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.

Reference **configure** vrrp policy *number*

Introduced 16.0.R1

Platforms All

preempt *boolean*

Synopsis Allow the VRRP to override an existing non-owner master

Context **configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* preempt *boolean*

Tree preempt

Description When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router.

When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

Default true

Introduced 16.0.R1

Platforms All

priority *number*

Synopsis Base priority for the VRRP

Context **configure** router *named-item-64* interface *interface-name* ipv6 vrrp *number* priority *number*

Tree priority

Description This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process.

The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.

Range 1 to 255

Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	16.0.R1
Platforms	All

lag

Synopsis	Enter the **lag** context
Context	**configure** router *named-item-64* interface *interface-name* lag
Tree	lag
Introduced	16.0.R1
Platforms	All

link-map-profile *number*

Synopsis	LAG link map profile for a SAP or network interface
Context	**configure** router *named-item-64* interface *interface-name* lag link-map-profile *number*
Tree	link-map-profile
Description	This command assigns a preconfigured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. After an operator assigns a LAG link map profile, the system rehashes the SAP or network interface egress traffic over the LAG as required by the new configuration. If the LAG link map profile for a SAP or network interface is deleted, the system reverts back to per-flow hashing.
Range	1 to 64
Introduced	16.0.R1
Platforms	All

per-link-hash

Synopsis	Enter the **per-link-hash** context
Context	**configure** router *named-item-64* interface *interface-name* lag per-link-hash

Use subject to Terms available at: www.nokia.com/terms.

flow-label-load-balancing *boolean*

Synopsis	Enable flow label load balancing
Context	**configure** router *named-item-64* interface *interface-name* load-balancing flow-label-load-balancing *boolean*
Tree	flow-label-load-balancing
Description	When configured to **true**, the router enables load balancing in ECMP and LAG based on the output of a hash performed on the triplet (SA, DA, flow label) in the header of an IPv6 packet received on an IES, VPRN, R-VPLS, CSC, or network interface. When configured to **false**, the router disables load balancing in ECMP and LAG.
Default	false
Introduced	21.5.R1
Platforms	All

ip-load-balancing *keyword*

Synopsis	IP load-balancing algorithm
Context	**configure** router *named-item-64* interface *interface-name* load-balancing ip-load-balancing *keyword*
Tree	ip-load-balancing
Description	This command specifies whether to include the source address, destination address, or both in LAG or ECMP hash on IP interfaces. Additionally, when the **l4-load-balancing** command is enabled, this command also includes the source or destination port in the hash inputs.
Options	both, destination, source, inner-ip
Default	both
Introduced	16.0.R3
Platforms	All

lsr-load-balancing *keyword*

Synopsis	LSR load-balancing algorithm
Context	**configure** router *named-item-64* interface *interface-name* load-balancing lsr-load-balancing *keyword*
Tree	lsr-load-balancing
Description	This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per-interface setting.

Use subject to Terms available at: www.nokia.com/terms.

Options	lbl-only, lbl-ip, ip-only, eth-encap-ip, lbl-ip-l4-teid
Introduced	16.0.R1
Platforms	All

spi-load-balancing *boolean*

Synopsis	Enable SPI use in hashing
Context	**configure** router *named-item-64* interface *interface-name* load-balancing spi-load-balancing *boolean*
Tree	spi-load-balancing
Description	When configured to **true**, the router uses the Security Parameter Index (SPI) in hashing for ESP and AH encrypted IPv4 and IPv6 traffic. This is a per-interface setting.
Default	false
Introduced	16.0.R1
Platforms	All

teid-load-balancing *boolean*

Synopsis	Enable use of TEID in hashing
Context	**configure** router *named-item-64* interface *interface-name* load-balancing teid-load-balancing *boolean*
Tree	teid-load-balancing
Default	false
Introduced	16.0.R1
Platforms	All

loopback

Synopsis	Use interface as a loopback interface
Context	**configure** router *named-item-64* interface *interface-name* loopback
Tree	loopback
Description	When configured, this interface is used as a loopback interface. This command and the **vas-if-type** command are mutually exclusive.
Notes	The following elements are part of a choice: **loopback** or **port**.
Introduced	16.0.R1

© 2026 Nokia.

Platforms	All

mac *mac-unicast-address*

Synopsis	MAC address of the interface
Context	**configure** router *named-item-64* interface *interface-name* mac *mac-unicast-address*
Tree	mac
Description	This command assigns a specific MAC address to an IP interface. Only one MAC address can be assigned to an IP interface. When multiple **mac** commands are entered, the last command overwrites the previous command.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	16.0.R1
Platforms	All

mac-accounting *boolean*

Synopsis	Enable MAC accounting functionality
Context	**configure** router *named-item-64* interface *interface-name* mac-accounting *boolean*
Tree	mac-accounting
Description	When configured to **true**, the router enables MAC accounting functionality.
Default	false
Introduced	16.0.R1
Platforms	All

network-domains

Synopsis	Enter the **network-domains** context
Context	**configure** router *named-item-64* interface *interface-name* network-domains
Tree	network-domains
Introduced	16.0.R4
Platforms	All

network-domain [domain-name] *reference*

Synopsis	Add a list entry for **network-domain**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* interface *interface-name* network-domains network-domain *reference*
Tree	network-domain
Description	Commands in this context assign an interface to a network domain. The router then takes the network domain into account during SAP ingress queue allocation for VPLS SAP. The network domain association can only be done in the base routing context. An operator can associate a network domain with an interface without a physical port being specified, but the configuration has no effect until a corresponding port, or LAG, is defined. Single interfaces can be associated with multiple network domains.
Max. instances	5
Introduced	16.0.R4
Platforms	All

[**domain-name**] *reference*

Synopsis	Network domain name
Context	**configure** router *named-item-64* interface *interface-name* network-domains network-domain *reference*
Tree	network-domain

Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

port *(port-and-encap | keyword)*

Synopsis	Port to bind to this interface
Context	**configure** router *named-item-64* interface *interface-name* port *(port-and-encap | keyword)*
Tree	port
Description	This command creates an association between a logical IP interface and a physical port. An operator can also associate an interface with the system (loopback address).
String length	1 to 45
Options	system
Notes	The following elements are part of a choice: **loopback** or **port**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	All

ptp-hw-assist

Synopsis	Enter the **ptp-hw-assist** context
Context	**configure** router *named-item-64* interface *interface-name* ptp-hw-assist
Tree	ptp-hw-assist
Description	Commands in this context enable the port-based timestamping assist of PTP packets at the physical interface. This capability is supported on specific hardware. The command may be blocked if not all hardware has the required level of support. Only one interface per physical port can have port-based timestamping assist enabled. This feature cannot be enabled if the physical port supporting the interface is configured as a PTP port.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

admin-state *keyword*

Synopsis	Administrative state of the PTP timestamping assist
Context	**configure** router *named-item-64* interface *interface-name* ptp-hw-assist admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

qos

Synopsis	Enter the **qos** context
Context	**configure** router *named-item-64* interface *interface-name* qos
Tree	qos
Description	Commands in this context associate a network QoS policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

egress-instance *number*

Synopsis	Port egress queue group instance for this interface
Context	**configure** router *named-item-64* interface *interface-name* qos egress-instance *number*
Tree	egress-instance
Description	This command specifies which instance to associate with this specific network IP interface since multiple instances of the same egress queue-group can be applied to the same port.
Range	1 to 65535
Introduced	16.0.R1
Platforms	All

egress-port-redirect-group *reference*

Synopsis	QoS queue group name
Context	**configure** router *named-item-64* interface *interface-name* qos egress-port-redirect-group *reference*
Tree	egress-port-redirect-group
Description	This command configures the egress queue group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified queue group name must exist as an egress queue group applied to the egress context of the port associated with the IP interface.
Reference	**configure** qos queue-group-templates egress queue-group *named-item*
Introduced	16.0.R1
Platforms	All

ingress-fp-redirect-group *reference*

Synopsis	Forwarding plane queue group policy for the interface
Context	**configure** router *named-item-64* interface *interface-name* qos ingress-fp-redirect-group *reference*
Tree	ingress-fp-redirect-group
Description	This command configures the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified queue group name must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

- network ports
- IPv4
- IPv6

Default false

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tos-marking-state *keyword*

Synopsis TOS marking state

Context **configure** router *named-item-64* interface *interface-name* tos-marking-state *keyword*

Tree tos-marking-state

Description This command configures the ToS marking state.

This command is used to alter the default trusted state to a non-trusted state. When configured to **trusted** or default, the ToS field is not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interfaces as untrusted.

When configured to **untrusted**, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking defintions on each network interface.

Options trusted, untrusted

Default trusted

Introduced 16.0.R1

Platforms All

untrusted

Synopsis Enable the **untrusted** context

Context **configure** router *named-item-64* interface *interface-name* untrusted

Tree untrusted

Description Commands in this context configure the untrusted state for a network IP interface.

The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature.

The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface.

Introduced 16.0.R4

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms All

default-forwarding *keyword*

Synopsis Default action for selective ILM

Context **configure** router *named-item-64* interface *interface-name* untrusted default-forwarding *keyword*

Tree default-forwarding

Description This command specifies the default forwarding behavior of labeled packets received on this interface.

This command sets the default behavior for an untrusted interface in the datapath and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding away from the default for those VPRN ILMs.

When the default behavior is to forward packets, the router checks labeled packets in the normal way against the table of programmed ILMs to decide if packets are dropped or forwarded in a GRT, a VRF, or a L2 service context.

When the specified behavior is to drop packets, all labeled packets received on the interface are automatically dropped.

Options forward, drop

Default forward

Introduced 16.0.R4

Platforms All

urpf-selected-vprns *boolean*

Synopsis Enable uRPF checking of incoming traffic on interface

Context **configure** router *named-item-64* interface *interface-name* urpf-selected-vprns *boolean*

Tree urpf-selected-vprns

Description When configured to **true**, the router performs uRPF checks of incoming traffic on the network interface for the following:

- Packets associated with the global routing table (base router) context
- Packets associated with VPRNs that have enabled the uRPF check using the **configure service vprn network ingress urpf-check** command

When configured to **false**, the router performs uRPF checks for all ingress traffic on the network interface (associated with the base router and all VPRNs) based on the IPv4 and IPv6 **urpf-check** command configuration options of the network interface.

Default false

Introduced 16.0.R1

nd-router-preference *keyword*

Synopsis	Default router preference for Router Advertisements
Context	**configure** router *named-item-64* ipv6 router-advertisement interface *interface-name* nd-router-preference *keyword*
Tree	nd-router-preference
Description	This command configures the default router preference for Router Advertisements (RAs) and allows IPv6 hosts to discover and select a default gateway address by listening to RAs. This feature provides basic traffic engineering functionality for host devices. When this command is applied, the router advertises the respective router preference to the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

connected host to assist in its selection of the most appropriate default gateway on a link.

This extension is backward compatible, both for routers (setting the router preference bits) and hosts (interpreting the router preference bits). These bits are ignored by hosts that do not implement the RFC 4191 functionality by configuring this command. Similarly, hosts that do not implement the RFC 4191 functionality interpret the values sent by devices that do not implement the RFC 4191 extension as a medium preference.

value *number*

Synopsis	BGP-LS ID sent in the BGP-LS NLRI
Context	**configure** router *named-item-64* isis *number* database-export bgp-ls-identifier value *number*
Tree	value
Description	This command configures the BGP-LS ID to export. If an NRC-P network domain has multiple IGP domains, a user must configure BGP-LS speakers within each IGP domain with the same unique ASN, BGP-LS ID tuple. The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain. **Note:** If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command configuration is not strictly required because enabling the extended TE-DB populates this information automatically. However, Nokia recommends enabling the **traffic-engineering** command to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.
Max. range	0 to 4294967295
Default	0
Introduced	16.0.R1
Platforms	All

igp-identifier *number*

Synopsis	IGP instance ID in the BGP-LS NLRI
Context	**configure** router *named-item-64* isis *number* database-export igp-identifier *number*
Tree	igp-identifier
Description	This command configures the unique identifier for the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. The concept of instance ID defined in IS-IS (RFC 6822) is unique within a routing domain. A user can remove any overlap by configuring the new identifier value to be unique within an IGP domain when this router sends the IGP link-state information using BGP-LS.
Max. range	0 to 18446744073709551615
Introduced	16.0.R1
Platforms	All

reachable-ls-only *boolean*

Synopsis	Encode only reachable link-state information

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* database-export reachable-ls-only *boolean*
Tree	reachable-ls-only
Description	When configured to **true**, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged. When configure to **false**, the router continues to send link-state objects even for links that fail an IGP reachability check.
Default	false
Introduced	24.10.R1
Platforms	All

Synopsis	Export policies that determine exported routes
Context	**configure** router *named-item-64* isis *number* export-policy *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS. If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied. Routing policies are created in the **configure router policy-options** context.

fast-flooding

Synopsis	Enter the **fast-flooding** context
Context	**configure** router *named-item-64* isis *number* fast-flooding
Tree	fast-flooding
Description	Commands in this context configure IS-IS fast flooding, as specified in RFC 9681. A configuration in this context applies to interfaces that belong to the instance unless it is overridden under an interface.
Introduced	26.10.R1
Platforms	All

lsp-receiver

Synopsis	Enable the **lsp-receiver** context
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-receiver
Tree	lsp-receiver
Description	Commands in this context configure how the router receives LSPs and how it acknowledges them. The router can also advertise its flooding values to neighbors.
Introduced	26.10.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

advertise-flooding-tlv *boolean*

Synopsis	Enable the advertise-flooding-tlv context
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-receiver advertise-flooding-tlv *boolean*
Tree	advertise-flooding-tlv
Default	false
Introduced	26.10.R1
Platforms	All

burst-size *number*

Synopsis	Maximum number of LSPs receivable without an intervening delay
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-receiver burst-size *number*
Tree	burst-size
Range	1 to 200
Default	30
Introduced	26.10.R1
Platforms	All

lsp-per-psnp *number*

Synopsis	Number of received LSPs that triggers the immediate sending of a PSNP
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-receiver lsp-per-psnp *number*
Tree	lsp-per-psnp
Range	1 to 90
Default	15
Introduced	26.10.R1
Platforms	All

lsp-transmit-interval *number*

Synopsis	Interval between LSP transmissions that can be sustained on reception

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-receiver lsp-transmit-interval *number*
Tree	lsp-transmit-interval
Range	1 to 1000
Units	milliseconds
Default	100
Introduced	26.10.R1
Platforms	All

psnp-interval *number*

Synopsis	Interval between periodic transmissions of Partial Sequence Number PDUs (PSNPs)
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-receiver psnp-interval *number*
Tree	psnp-interval
Range	50 to 1000
Units	milliseconds
Default	200
Introduced	26.10.R1
Platforms	All

receive-window *number*

Synopsis	Maximum receive window
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-receiver receive-window *number*
Tree	receive-window
Range	10 to 1000
Default	30
Introduced	26.10.R1
Platforms	All

lsp-sender

Synopsis	Enable the **lsp-sender** context
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-sender

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	lsp-sender
Description	Commands in this context configure how the router transmits LSPs. The sender can use flooding values received from a neighbor, PSNP acknowledgments, and locally configured defaults to control the number and rate of transmitted LSPs.
Introduced	26.10.R1
Platforms	All

enforce-burst-size *boolean*

Synopsis	Enforce to not exceed the advertised LSP burst size
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-sender enforce-burst-size *boolean*
Tree	enforce-burst-size
Default	false
Introduced	26.10.R1
Platforms	All

enforce-receive-window *boolean*

Synopsis	Enforce the advertised receive window
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-sender enforce-receive-window *boolean*
Tree	enforce-receive-window
Default	false
Introduced	26.10.R1
Platforms	All

local-defaults

Synopsis	Enter the **local-defaults** context
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-sender local-defaults
Tree	local-defaults
Introduced	26.10.R1
Platforms	All

receive-window *number*

Synopsis	Default receive window.
Context	**configure** router *named-item-64* isis *number* fast-flooding lsp-sender local-defaults receive-window *number*
Tree	receive-window
Range	10 to 1000
Default	30
Introduced	26.10.R1
Platforms	All

flexible-algorithms

Synopsis	Enter the **flexible-algorithms** context
Context	**configure** router *named-item-64* isis *number* flexible-algorithms
Tree	flexible-algorithms
Description	Commands in this context configure IS-IS parameters for flexible algorithm participation.
Introduced	20.7.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of flexible algorithm support
Context	**configure** router *named-item-64* isis *number* flexible-algorithms admin-state *keyword*
Tree	admin-state
Description	This command specifies the administrative state of the support of flexible algorithm IGP LSDB extensions.
Options	enable, disable
Default	disable
Introduced	20.7.R1
Platforms	All

advertise-admin-group *keyword*

Synopsis	Administrative group TLV to advertise

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* flexible-algorithms advertise-admin-group *keyword*
Tree	advertise-admin-group
Description	This command configures the type of Administrative Group TLV the router advertises as an IGP link attribute. This command is configured for this IGP instance.
Options	prefer-ag, eag-only, ag-eag
Default	prefer-ag
Introduced	23.3.R1
Platforms	All

flex-algo [flex-algo-id] *number*

Synopsis	Enter the **flex-algo** list instance
Context	**configure** router *named-item-64* isis *number* flexible-algorithms flex-algo *number*
Tree	flex-algo
Description	Commands in this context configure an IS-IS flexible algorithm. When flexible algorithm is configured in an IS-IS instance, the IS-IS instance is configured for all levels (Level 1 and Level 2).
Max. instances	7
Introduced	20.7.R1
Platforms	All

[**flex-algo-id**] *number*

Synopsis	Flexible algorithm ID
Context	**configure** router *named-item-64* isis *number* flexible-algorithms flex-algo *number*
Tree	flex-algo
Range	128 to 255
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	All

advertise *reference*

Synopsis	Flexible Algorithm Definition advertisement

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* flexible-algorithms flex-algo *number* advertise *reference*
Tree	advertise
Description	This command enables the advertisement of a locally configured Flexible Algorithm Definition (FAD). The winning FAD that a router uses must be consistent with the winning FAD on all other routers, which avoids routing loops and traffic blackholing. The winning FAD is selected using a tiebreaker algorithm that first selects the highest advertised FAD priority followed by the highest system ID.
Reference	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item*
Introduced	20.7.R1
Platforms	All

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context
Context	**configure** router *named-item-64* isis *number* flexible-algorithms flex-algo *number* loopfree-alternate
Tree	loopfree-alternate
Introduced	20.7.R1
Platforms	All

micro-loop-avoidance

Synopsis	Enable the **micro-loop-avoidance** context
Context	**configure** router *named-item-64* isis *number* flexible-algorithms flex-algo *number* micro-loop-avoidance
Tree	micro-loop-avoidance
Description	This command configure flexible-algorithms-aware microloop avoidance. When enabled, the microloop configuration parameters are inherited from the base SPF. This command enables microloop avoidance with flexible algorithms for MT0. Microloop avoidance with flexible algorithms for MT2 is enabled when this command is enabled along with SR-MPLS MT2 using the **configure router isis segment-routing multi-topology mt2** command.
Introduced	21.7.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

participate *boolean*

Synopsis	Allow participation in the Flexible Algorithm
Context	**configure** router *named-item-64* isis *number* flexible-algorithms flex-algo *number* participate *boolean*
Tree	participate
Description	When configured to **true**, the router advertises the capability to participate in a flexible algorithm within the IS-IS Router Capability TLV. A router only advertises participation when the winning FAD can be supported, which includes segment routing support. When configured to **false**, flexible algorithm participation is not enabled.
Default	false
Introduced	20.7.R1
Platforms	All

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** router *named-item-64* isis *number* graceful-restart
Tree	graceful-restart
Introduced	16.0.R1
Platforms	All

helper-mode *boolean*

Synopsis	Enable the Graceful Restart helper for IS-IS
Context	**configure** router *named-item-64* isis *number* graceful-restart helper-mode *boolean*
Tree	helper-mode
Default	true
Introduced	16.0.R1
Platforms	All

hello-authentication *boolean*

Synopsis	Authenticate Hello type IS-IS protocol packets
Context	**configure** router *named-item-64* isis *number* hello-authentication *boolean*
Tree	hello-authentication

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	true
Introduced	16.0.R1
Platforms	All

hello-padding *keyword*

Synopsis	IS-IS Hello message padding
Context	**configure** router *named-item-64* isis *number* hello-padding *keyword*
Tree	hello-padding
Options	adaptive, loose, strict, none
Introduced	16.0.R1
Platforms	All

ignore-attached-bit *boolean*

Synopsis	Ignore attached bit on received Layer 1 LSPs
Context	**configure** router *named-item-64* isis *number* ignore-attached-bit *boolean*
Tree	ignore-attached-bit
Default	false
Introduced	16.0.R1
Platforms	All

ignore-lsp-errors *boolean*

Synopsis	Ignore LSP packets with errors
Context	**configure** router *named-item-64* isis *number* ignore-lsp-errors *boolean*
Tree	ignore-lsp-errors
Default	false
Introduced	16.0.R1
Platforms	All

ignore-narrow-metric *boolean*

Synopsis	Ignore links with narrow metrics
Context	**configure** router *named-item-64* isis *number* ignore-narrow-metric *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ignore-narrow-metric
Default	false
Introduced	16.0.R1
Platforms	All

igp-shortcut

Synopsis	Enter the **igp-shortcut** context
Context	**configure** router *named-item-64* isis *number* igp-shortcut
Tree	igp-shortcut
Introduced	16.0.R1
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of RSVP-TE or SR-TE shortcut
Context	**configure** router *named-item-64* isis *number* igp-shortcut admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	All

allow-sr-over-srte *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable SR over SR-TE LSPs
Context	**configure** router *named-item-64* isis *number* igp-shortcut allow-sr-over-srte *boolean*
Tree	allow-sr-over-srte
Description	When configured to **true**, the router only allows SR-MPLS SRv4 and SRv6 IGP shortcuts to use SR-TE LSPs with **allow-sr-over-srte** explicitly enabled with an adjacency SID as top SID in the SR-TE LSP. IPv4 and IPv6 addresses can use all available SR-TE LSPs as IGP shortcuts regardless of the explicit **allow-sr-over-srte** configuration.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Under ECMP, when this command is configured to **true**, preference is given to the SR-TE LSPs with **allow-sr-over-srte** explicitly configured over the LSPs that do not have **allow-sr-over-srte** configured.

Default	false
Introduced	23.3.R1
Platforms	All

tunnel-next-hop

WARNING:

Context	**configure** router *named-item-64* isis *number* interface *interface-name* bfd-liveness ipv6 include-bfd-tlv *boolean*
Tree	include-bfd-tlv
Default	false
Introduced	16.0.R1
Platforms	All

conditional-advertise-prefix *reference*

Synopsis	Policy to conditionally advertise interface prefixes
Context	**configure** router *named-item-64* isis *number* interface *interface-name* conditional-advertise-prefix *reference*
Tree	conditional-advertise-prefix
Description	This command specifies the policy that allows IS-IS, OSPF, and OSPFv3 to selectively advertise system or loopback interface prefixes (including associated SIDs and SRv6 locators) only when conditions defined in the route policy are met. The route policy evaluates the presence or absence of specific routes in the routing table, typically using constructs like route-exists. If the policy evaluates to accept, the interface prefix is advertised; if not, the prefix is suppressed.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	25.10.R1
Platforms	All

csnp-interval *number*

Synopsis	Time interval between successive CSN PDUs sent

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* interface *interface-name* csnp-interval *number*
Tree	csnp-interval
Range	1 to 65535
Units	seconds
Default	10
Introduced	16.0.R1
Platforms	All

default-instance *boolean*

Synopsis	Allow non-MI capable router to establish an adjacency
Context	**configure** router *named-item-64* isis *number* interface *interface-name* default-instance *boolean*

multi-homed-prefix

Synopsis	Enable the **multi-homed-prefix** context
Context	**configure** router *named-item-64* isis *number* loopfree-alternate multi-homed-prefix
Tree	multi-homed-prefix
Description	Commands in this context enable multihomed prefix LFA for IS-IS routes (IP FRR), SR-ISIS tunnels, and SRv6-ISIS tunnels.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This feature uses the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes.

This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of intra-area anycast prefixes.

The computed IP next hop-based backup path is added to IS-IS routes of external /32 prefixes or /128 prefixes and intra-area /32 or /128 anycast prefixes in the RTM if the prefix is not protected by the base LFA or if the user set leaf preference command option is configured to all. The user must enable the **configure routing-options ip-fast-reroute** command to have these backup paths programmed into the FIB in the datapath.

The computed IP next hop or repair tunnel-based backup path is also programmed for:

- SR-ISIS node SID tunnels of external /32 IPv4 prefixes and /128 IPv6 prefixes, and node SID tunnels of intra-area /32 IPv4 anycast prefixes and /128 anycast IPv6 prefixes, in both algorithm 0 and flexible-algorithms
- SRv6-ISIS locator routes and tunnels of external prefixes and of intra-area anycast prefixes of any size, in both algorithm 0 and flexible algorithm numbers.

As a result, an SR-TE LSP, an SR-MPLS policy, or an SRv6 policy which uses an SR-ISIS SID or an SRv6-ISIS SID of those same prefixes in its configured or computed SID list benefits from the multihomed prefix LFA protection.

Once the IP next-hop based multihomed prefix LFA is enabled, the extensions to compute an SR-TE repair tunnel for the multihomed prefix LFA in the case of SR-ISIS and SRv6-ISIS are automatically enabled if the user also enabled TI-LFA or Remote LFA. The computation reuses the SID list of the primary path or of the TI-LFA or Remote LFA backup path of the alternate ABR or ASBR or alternate owner router.

Units	seconds
Default	600
Introduced	16.0.R1
Platforms	All

max-ecmp-routes *number*

Synopsis	Maximum ECMP value for IS-IS
Context	**configure** router *named-item-64* isis *number* max-ecmp-routes *number*
Tree	max-ecmp-routes
Description	This command configures the IS-IS instance maximum ECMP value, which sets the maximum number of IP and tunnel ECMP next hops for an IPv4 or IPv6 prefix of an IS-IS route. **Note:** LDP-over-RSVP using LSP endpoint remains limited to a maximum of 64 tunnel next hops. MD-CLI enforces that enabling **ldp-over-rsvp** under an IGP instance restricts the range of this command leaf in that same IGP instance to 64. Conversely, increasing the range of this command leaf to a value higher than 64 in an IGP instance results in blocking the enabling of the **ldp-over-rsvp** leaf in that same IGP instance.
Range	1 to 128
Default	64
Introduced	26.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

mru-mismatch-detection *boolean*

Synopsis	Enable detection of MRU mismatch
Context	**configure** router *named-item-64* isis *number* mru-mismatch-detection *boolean*
Tree	mru-mismatch-detection
Description	When configured to **true**, this command verifies that the received IS-IS Hello (IIH) packet size does not exceed the configured maximum port MTU size. The received IIH packet is dropped when its size exceeds the maximum port MTU size.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the IS-IS router instance will not drop oversized IIH packets.

By default, FP-based hardware can receive oversized packets but it will not originate them.

Default	false
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

multi-part-tlv

Tree	overload-fib-error-notify-only
Description	Commands in this context configure the IS-IS router to send a notification when an overload condition occurs while programming the FIB, instead of advertising the overload condition of the router in the IS-IS LSP. **Note**: Nokia recommends being careful using this command. When you configure the router not to advertise the IS-IS overload state in the IS-IS LSP, other routers are not instructed to take the overloaded router out of the IS-IS forwarding topology and this will cause suboptimal forwarding and non-deterministic behavior on the overloaded router. To avoid changing the default IS-IS overflow behavior, leave this command disabled. When this command is configured, the IS-IS router enters a suboptimal state where it sends only a notification trap; transit traffic can still use the router in this state. The IS-IS router tracks the segment routing prefix SIDs where FIB programming failed. With the **retry** command configured, the router retries programming the segment routing prefix SIDs in the FIB using this tracked information. When this command is not configured, during normal operation, the system may force the router to enter an overload state because of a lack of FIB resources. In this state, the router is used to terminate traffic and is not used to transit traffic.
Introduced	23.7.R1
Platforms	All

retry *number*

Synopsis	Time to retry programming failed entries in the FIB
Context	**configure** router *named-item-64* isis *number* overload-fib-error-notify-only retry *number*
Tree	retry
Description	This command configures the time the router uses to retry programming the failed entries in the FIB. The **overload-fib-error-notify-only** command must be configured to use the retry timer. The removal of the **overload-fib-error-notify-only** configuration causes the system to program the failed entries in the FIB by triggering an immediate SPF.
Range	10 to 1800
Units	seconds
Default	10
Introduced	23.7.R1
Platforms	All

overload-include-locators *boolean*

Synopsis	Advertise SRv6 locators if IS-IS instance overloads

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* overload-include-locators *boolean*
Tree	overload-include-locators
Description	When configured to **true**, if the IS-IS instance goes into overload (because of resource depletion or manual configuration), the router includes SRv6 locators when it advertises links and prefixes with **max-metric**.
Default	false
Introduced	23.10.R1
Platforms	All

overload-on-boot

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* segment-routing adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency. When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection. • IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV. • The adjacency SID hold timer starts. • The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges. • If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value. • If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value. • A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.
Range	1 to 1800
Units	seconds
Options	none
Default	15
Introduced	16.0.R1
Platforms	All

adjacency-set [id] *number*

tunnel-table-pref *number*

Synopsis	Preference of SR tunnels created by the IGP instance
Context	**configure** router *named-item-64* isis *number* segment-routing tunnel-table-pref *number*
Tree	tunnel-table-pref

Description

This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

adj-sid-hold *(number | keyword)*

Synopsis	Adjacency SID hold time
Context	**configure** router *named-item-64* isis *number* segment-routing-v6 adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command specifies the length of time the system holds the SRv6 adjacency route and tunnel entries programmed in datapath while the adjacency is down.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its SRv6 End.X SID sub-TLV

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- The adjacency SID hold timer starts.
- The route table, FIB, and tunnel table entries are kept for as long as the adjacency SID hold timer is running. This is allows packets to flow over the LFA backup path, if the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of a SRv6 policy after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change when a new LFA SPF is run while the adjacency SID hold timer is running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the SID value returned into the locator subnet where it was drawn from. Users of the adjacency (for example, SRv6 policy) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static SID value or a new dynamic SID value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by tunnel of the local adjacency SID and of all remote locator routes that resolve to a next hop over this adjacency.

Each IS-IS instance runs a single timer per adjacency that IPv4 SR-MPLS, IPv6 SR-MPLS, and SRv6 adjacency SIDs share. When you enable both SR-MPLS (**configure router isis segment-routing**) and SRv6 (**configure router isis segment-routing-v6**) in the IS-IS instance, the system programs the higher of the two timer values for all SIDs on the adjacency.

Range	1 to 1800
Units	seconds
Options	none

Platforms	All

spf-initial-wait *number*

Synopsis	Initial SPF calculation delay after topology change
Context	**configure** router *named-item-64* isis *number* timers spf-wait spf-initial-wait *number*
Tree	spf-initial-wait
Range	10 to 100000
Units	milliseconds
Default	1000
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

spf-max-wait *number*

Synopsis	Maximum interval amid two consecutive SPF calculations
Context	**configure** router *named-item-64* isis *number* timers spf-wait spf-max-wait *number*
Tree	spf-max-wait
Range	10 to 120000
Units	milliseconds
Default	10000
Introduced	16.0.R1
Platforms	All

spf-second-wait *number*

Synopsis	Hold time between first and second SPF calculations
Context	**configure** router *named-item-64* isis *number* timers spf-wait spf-second-wait *number*
Tree	spf-second-wait
Range	10 to 100000
Units	milliseconds
Default	1000
Introduced	16.0.R1
Platforms	All

traffic-engineering *boolean*

Synopsis	Enable traffic engineering for the router
Context	**configure** router *named-item-64* isis *number* traffic-engineering *boolean*
Tree	traffic-engineering
Default	false
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.

traffic-engineering-options

Synopsis	Enter the **traffic-engineering-options** context
Context	**configure** router *named-item-64* isis *number* traffic-engineering-options
Tree	traffic-engineering-options
Introduced	19.10.R1
Platforms	All

advertise-delay *boolean*

Synopsis	Enable the advertisement of link delay for TE
Context	**configure** router *named-item-64* isis *number* traffic-engineering-options advertise-delay *boolean*
Tree	advertise-delay
Description	When configured to **true**, the router advertises link delay in the IGP LSDB within legacy Traffic Engineering (TE) attributes in IS-IS or within the Application-Specific Link Attribute (ASLA) when ASLA is enabled for SR-TE or RSVP-TE applications. When the **application-link-attributes legacy** command is configured for SR-TE or RSVP-TE, link delay is advertised as a legacy TE TLV with the ASLA legacy bit set. When configured to **false**, the router disables link delay advertisement.
Default	false
Introduced	22.10.R1
Platforms	All

application-link-attributes

Synopsis	Enable the **application-link-attributes** context
Context	**configure** router *named-item-64* isis *number* traffic-engineering-options application-link-attributes
Tree	application-link-attributes
Introduced	19.10.R1
Platforms	All

legacy *boolean*

Synopsis	Advertise legacy TE attributes

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* isis *number* traffic-engineering-options application-link-attributes legacy *boolean*
Tree	legacy
Description	When configured to **true**, the router supports the legacy mode of advertising TE attributes. When configured to **false**, legacy mode is disabled.
Default	false
Introduced	19.10.R1
Platforms	All

ipv6 *boolean*

Synopsis	Advertise IS-IS IPv6 Traffic Engineering
Context	**configure** router *named-item-64* isis *number* traffic-engineering-options ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	19.10.R1
Platforms	All

unicast-import

Synopsis	Enter the **unicast-import** context
Context	**configure** router *named-item-64* isis *number* unicast-import
Tree	unicast-import
Introduced	16.0.R1
Platforms	All

ipv4 *boolean*

Synopsis	Submit IPv4 routes into unicast RTM
Context	**configure** router *named-item-64* isis *number* unicast-import ipv4 *boolean*
Tree	ipv4
Default	true
Introduced	16.0.R1
Platforms	All

ipv6 *boolean*

Synopsis	Submit IPv6 routes into unicast RTM
Context	**configure** router *named-item-64* isis *number* unicast-import ipv6 *boolean*
Tree	ipv6
Default	true
Introduced	16.0.R1
Platforms	All

l2tp

Synopsis	Enter the **l2tp** context
Context	**configure** router *named-item-64* l2tp
Tree	l2tp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of L2TP
Context	**configure** router *named-item-64* l2tp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

avp-hiding *keyword*

Synopsis	Attribute of the Value Pair (AVP) hiding algorithm
Context	**configure** router *named-item-64* l2tp avp-hiding *keyword*
Tree	avp-hiding
Options	sensitive, always
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

challenge *boolean*

Synopsis	Use challenge-response authentication
Context	**configure** router *named-item-64* l2tp challenge *boolean*
Tree	challenge
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

destruct-timeout *number*

Synopsis	Destruction timeout
Context	**configure** router *named-item-64* l2tp destruct-timeout *number*
Tree	destruct-timeout
Range	60 to 86400
Units	seconds
Default	60
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ethernet-tunnel

Synopsis	Enter the **ethernet-tunnel** context
Context	**configure** router *named-item-64* l2tp ethernet-tunnel
Tree	ethernet-tunnel
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

reconnect-timeout *(number | keyword)*

Synopsis	Timeout for a session setup retry
Context	**configure** router *named-item-64* l2tp ethernet-tunnel reconnect-timeout *(number | keyword)*
Tree	reconnect-timeout
Range	10 to 3600

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Units	seconds
Options	infinite
Default	infinite
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

exclude-avps

Synopsis	Enter the **exclude-avps** context
Context	**configure** router *named-item-64* l2tp exclude-avps
Tree	exclude-avps
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

calling-number *boolean*

Synopsis	Calling Number AVP to exclude
Context	**configure** router *named-item-64* l2tp exclude-avps calling-number *boolean*
Tree	calling-number
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

initial-rx-lcp-conf-req *boolean*

Synopsis	Exclude the Initial Received LCP CONFREQ AVP
Context	**configure** router *named-item-64* l2tp exclude-avps initial-rx-lcp-conf-req *boolean*
Tree	initial-rx-lcp-conf-req
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

failover

Synopsis	Enter the **failover** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp failover
Tree	failover
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-max-session-lifetime *number*

Synopsis	Subset of sessions that this system attempts to synchronize in the Session State Synchronization phase
Context	**configure** router *named-item-64* l2tp failover recovery-max-session-lifetime *number*
Tree	recovery-max-session-lifetime
Range	2 to 4294967295
Units	centiseconds
Default	2
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-method *keyword*

Synopsis	Recovery method of the sequence numbers after failover
Context	**configure** router *named-item-64* l2tp failover recovery-method *keyword*
Tree	recovery-method
Options	mcs, recovery-tunnel
Default	mcs
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-time *number*

Synopsis	Time requested from the L2TP peer before assuming failover as failed
Context	**configure** router *named-item-64* l2tp failover recovery-time *number*
Tree	recovery-time
Range	0 to 900
Units	seconds
Default	0

Synopsis	New sessions for L2TP ISA MDA
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns load-balance-method *keyword*
Tree	load-balance-method
Options	per-session, per-tunnel
Default	per-session
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mlppp

Synopsis	Enter the **mlppp** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp
Tree	mlppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

admin-state *keyword*

Synopsis	Administrative state of MLPPP in the L2TP tunnel group
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

endpoint

Synopsis	Enter the **endpoint** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp endpoint
Tree	endpoint

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ip *(ipv4-address | keyword)*

Synopsis	Endpoint ID as an IP address
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp endpoint ip *(ipv4-address | keyword)*
Tree	ip
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

mac *(mac-address | keyword)*

Synopsis	Endpoint ID as a MAC address
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp endpoint mac *(mac-address | keyword)*
Tree	mac
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

interleave *boolean*

Synopsis	Enable link fragmentation and interleaving
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp interleave *boolean*
Tree	interleave
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-fragment-delay *(number | keyword)*

Synopsis	Maximum fragment delay caused by transmission on a link
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp max-fragment-delay *(number | keyword)*
Tree	max-fragment-delay
Range	5 to 1000
Units	milliseconds
Options	no-fragmentation
Default	no-fragmentation
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-links *number*

Synopsis	Maximum MLPPP links
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp max-links *number*
Tree	max-links
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

reassembly-timeout *number*

Synopsis	Reassembly timeout
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp reassembly-timeout *number*
Tree	reassembly-timeout
Range	100 | 1000
Units	milliseconds
Default	1000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

short-sequence-numbers *boolean*

Synopsis	Request a peer to send short sequence numbers
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns mlppp short-sequence-numbers *boolean*
Tree	short-sequence-numbers
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ppp

Synopsis	Enter the **ppp** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp
Tree	ppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication *keyword*

Synopsis	PPP authentication protocol to negotiate
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp authentication *keyword*
Tree	authentication
Options	pap, chap, pref-chap, pref-pap
Default	pref-chap
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication-policy *named-item*

Synopsis	Authentication policy when a DHCP message is received
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp authentication-policy *named-item*
Tree	authentication-policy
String length	1 to 32

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

chap-challenge-length

Synopsis	Enter the **chap-challenge-length** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp chap-challenge-length
Tree	chap-challenge-length
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the PPP CHAP challenge length
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp chap-challenge-length end *number*
Tree	end
Range	8 to 64
Units	octets
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the PPP CHAP challenge length
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp chap-challenge-length start *number*
Tree	start
Range	8 to 64
Units	octets
Default	32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

default-group-interface

Synopsis	Enter the **default-group-interface** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp default-group-interface
Tree	default-group-interface
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface *named-item*

Synopsis	Group interface
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp default-group-interface interface *named-item*
Tree	interface
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

service-name *service-name*

Synopsis	Administrative service name
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp default-group-interface service-name *service-name*
Tree	service-name
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipcp-subnet-negotiation *boolean*

Synopsis	Allow IPCP subnet negotiation for PPPoE hosts
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp ipcp-subnet-negotiation *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	ipcp-subnet-negotiation
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keepalive

Synopsis	Enter the **keepalive** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp keepalive
Tree	keepalive
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interval *number*

Synopsis	PPP keepalive interval
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp keepalive interval *number*
Tree	interval
Range	10 to 300
Units	seconds
Default	30
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

multiplier *number*

Synopsis	PPP keepalive multiplier
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp keepalive multiplier *number*
Tree	multiplier
Range	1 to 5
Default	3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

lcp-force-ack-accm *boolean*

Synopsis	Force acknowledgement of the LCP Asynchronous Control Character Map (ACCM) option
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp lcp-force-ack-accm *boolean*
Tree	lcp-force-ack-accm
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lcp-ignore-magic-numbers *boolean*

Synopsis	Check magic number in echo request and reply messages
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp lcp-ignore-magic-numbers *boolean*
Tree	lcp-ignore-magic-numbers
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu *number*

Synopsis	Maximum PPP MTU size
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp mtu *number*
Tree	mtu
Range	512 to 9212
Units	octets
Default	1500
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-authentication *boolean*

Synopsis	Use authentication AVPs that are received from LAC

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp proxy-authentication *boolean*
Tree	proxy-authentication
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-lcp *boolean*

Synopsis	Proxy LCP AVPs that are received from LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp proxy-lcp *boolean*
Tree	proxy-lcp
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reject-disabled-ncp *boolean*

Synopsis	Force LCP Protocol Reject for IPv6CP Configure Request
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp reject-disabled-ncp *boolean*
Tree	reject-disabled-ncp
Default	false
Introduced	16.0.R6
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

user-db *named-item*

Synopsis	Local user database for PPP PAP and CHAP authentication
Context	**configure** router *named-item-64* l2tp group *named-item-64* lns ppp user-db *named-item*
Tree	user-db
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

local-address *ipv4-unicast-address*

Synopsis	Local address
Context	**configure** router *named-item-64* l2tp group *named-item-64* local-address *ipv4-unicast-address*
Tree	local-address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-name *host-name*

Synopsis	Local host name used to distinguish tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* local-name *host-name*
Tree	local-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-not-estab *number*

Synopsis	Maximum retries for unestablished tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* max-retries-not-estab *number*
Tree	max-retries-not-estab
Range	2 to 7

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *encrypted-leaf*

Synopsis	Password between L2TP LAC and LNS
Context	**configure** router *named-item-64* l2tp group *named-item-64* password *encrypted-leaf*
Tree	password
Description	This command specifies the password between L2TP LAC and LNS in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 166
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

protocol *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Protocol version
Context	**configure** router *named-item-64* l2tp group *named-item-64* protocol *keyword*
Tree	protocol
Options	v2, v3, v3draft
Default	v2
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy *reference*

Synopsis	RADIUS accounting policy
Context	**configure** router *named-item-64* l2tp group *named-item-64* radius-accounting-policy *reference*
Tree	radius-accounting-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Reference	**configure** aaa radius l2tp-accounting-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

receive-window-size *number*

Synopsis	L2TP receive window size
Context	**configure** router *named-item-64* l2tp group *named-item-64* receive-window-size *number*
Tree	receive-window-size
Range	4 to 1024
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-assign-method *keyword*

Synopsis	Session assignment method
Context	**configure** router *named-item-64* l2tp group *named-item-64* session-assign-method *keyword*
Tree	session-assign-method
Options	existing-first, weighted, weighted-random
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit *(number | keyword)*

Synopsis	Session limit
Context	**configure** router *named-item-64* l2tp group *named-item-64* session-limit *(number | keyword)*
Tree	session-limit
Range	1 to 250000
Options	unlimited
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

tunnel [tunnel-name] *named-item*

Synopsis	Enter the **tunnel** list instance
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item*
Tree	tunnel
Max. instances	31
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**tunnel-name**] *named-item*

Synopsis	Tunnel name
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item*
Tree	tunnel
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

admin-state *keyword*

Synopsis	Administrative state of the L2TP tunnel
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

auto-establish *boolean*

Synopsis	Allow the tunnel to be automatically set up by the system

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* auto-establish *boolean*
Tree	auto-establish
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

avp-hiding *keyword*

Synopsis	The AVP hiding algorithm
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* avp-hiding *keyword*
Tree	avp-hiding
Options	never, sensitive, always
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

challenge *keyword*

Synopsis	Enable use of challenge-response authentication
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* challenge *keyword*
Tree	challenge
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

destruct-timeout *number*

Synopsis	Destruction timeout
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* destruct-timeout *number*
Tree	destruct-timeout
Range	60 to 86400
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

failover

Synopsis	Enter the **failover** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* failover
Tree	failover
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-method *keyword*

Synopsis	Recovery method of the sequence numbers after failover
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* failover recovery-method *keyword*
Tree	recovery-method
Options	mcs, recovery-tunnel
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

recovery-time *number*

Synopsis	Time requested from the L2TP peer before assuming failover as failed
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* failover recovery-time *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	recovery-time
Range	0 to 900
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hello-interval *(number | keyword)*

Synopsis	Hello interval
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* hello-interval *(number | keyword)*
Tree	hello-interval
Range	10 to 3600
Units	seconds
Options	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

idle-timeout *(number | keyword)*

Synopsis	Idle timeout
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* idle-timeout *(number | keyword)*
Tree	idle-timeout
Range	0 to 3600
Units	seconds
Options	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tpv3

Synopsis	Enter the **l2tpv3** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* l2tpv3
Tree	l2tpv3
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

private-tcp-mss-adjust *(number | keyword)*

Synopsis	TCP maximum segment size (MSS) on private network
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* l2tpv3 private-tcp-mss-adjust *(number | keyword)*
Tree	private-tcp-mss-adjust
Range	512 to 9000
Units	octets
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

public-tcp-mss-adjust *(number | keyword)*

Synopsis	TCP maximum segment size (MSS) on public network
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* l2tpv3 public-tcp-mss-adjust *(number | keyword)*
Tree	public-tcp-mss-adjust
Range	512 to 9000
Units	octets
Options	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lac

Synopsis	Enter the **lac** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lac
Tree	lac
Introduced	16.0.R1

df-bit *keyword*

Synopsis	DF (do not fragment) bit in data traffic transmitted as LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lac df-bit *keyword*
Tree	df-bit
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lns

Synopsis	Enter the **lns** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns
Tree	lns
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lns-group *reference*

Synopsis	ISA LNS group
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns lns-group *reference*
Tree	lns-group
Reference	**configure** isa lns-group *number*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

load-balance-method *keyword*

Synopsis	New sessions for L2TP ISA MDA
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns load-balance-method *keyword*
Tree	load-balance-method
Options	per-session, per-tunnel
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mlppp

Synopsis	Enter the **mlppp** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp
Tree	mlppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

admin-state *keyword*

Synopsis	Administrative state of MLPPP in the L2TP tunnel
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp admin-state *keyword*
Tree	admin-state
Options	enable, disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

endpoint

Synopsis	Enter the **endpoint** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp endpoint
Tree	endpoint
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

ip *(ipv4-address | keyword)*

Synopsis	Endpoint ID as an IP address
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp endpoint ip *(ipv4-address | keyword)*
Tree	ip

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

mac *(mac-address | keyword)*

Synopsis	Endpoint ID as a MAC address
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp endpoint mac *(mac-address | keyword)*
Tree	mac
Options	system
Notes	The following elements are part of a choice: **ip** or **mac**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

interleave *keyword*

Synopsis	Use of Link fragmentation and interleaving
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp interleave *keyword*
Tree	interleave
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-fragment-delay *number*

Synopsis	Maximum fragment delay caused by transmission on a link
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp max-fragment-delay *number*
Tree	max-fragment-delay
Range	5 to 1000
Units	milliseconds

© 2026 Nokia.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-links *number*

Synopsis	Maximum MLPPP links
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp max-links *number*
Tree	max-links
Range	1 to 8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

reassembly-timeout *number*

Synopsis	Reassembly timeout
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp reassembly-timeout *number*
Tree	reassembly-timeout
Range	100 | 1000
Units	milliseconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

short-sequence-numbers *keyword*

Synopsis	Request a peer to send short sequence numbers
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns mlppp short-sequence-numbers *keyword*
Tree	short-sequence-numbers
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ppp

Synopsis	Enter the **ppp** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp
Tree	ppp
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication *keyword*

Synopsis	PPP authentication protocol to negotiate
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp authentication *keyword*
Tree	authentication
Options	pap, chap, pref-chap, pref-pap
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

authentication-policy *named-item*

Synopsis	Authentication policy when a DHCP message is received
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp authentication-policy *named-item*
Tree	authentication-policy
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

chap-challenge-length

Synopsis	Enter the **chap-challenge-length** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp chap-challenge-length
Tree	chap-challenge-length
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

end *number*

Synopsis	Upper bound of the PPP CHAP challenge length
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp chap-challenge-length end *number*
Tree	end
Range	8 to 64
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

start *number*

Synopsis	Lower bound of the PPP CHAP challenge length
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp chap-challenge-length start *number*
Tree	start
Range	8 to 64
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-group-interface

Synopsis	Enter the **default-group-interface** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp default-group-interface
Tree	default-group-interface
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interface *named-item*

Synopsis	Group interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp default-group-interface interface *named-item*
Tree	interface
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

service-name *service-name*

Synopsis	Administrative service name
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp default-group-interface service-name *service-name*
Tree	service-name
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipcp-subnet-negotiation *keyword*

Synopsis	Use of IPCP subnet negotiation for PPPoE hosts
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp ipcp-subnet-negotiation *keyword*
Tree	ipcp-subnet-negotiation
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

keepalive

Synopsis	Enter the **keepalive** context
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp keepalive
Tree	keepalive
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

interval *number*

Synopsis	PPP keepalive interval
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp keepalive interval *number*
Tree	interval
Range	10 to 300
Units	seconds
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

multiplier *number*

Synopsis	PPP keepalive multiplier
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp keepalive multiplier *number*
Tree	multiplier
Range	1 to 5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

lcp-force-ack-accm *keyword*

Synopsis	Forced acknowledgement of the LCP Asynchronous Control Character Map (ACCM) option
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp lcp-force-ack-accm *keyword*
Tree	lcp-force-ack-accm
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

lcp-ignore-magic-numbers *keyword*

Synopsis	Magic-Number field in LCP Echo-Request and LCP Echo-Reply messages that are checked
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp lcp-ignore-magic-numbers *keyword*
Tree	lcp-ignore-magic-numbers
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

mtu *number*

Synopsis	Maximum PPP MTU size
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp mtu *number*
Tree	mtu
Range	512 to 9212
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-authentication *keyword*

Synopsis	Authentication AVPs that are received from LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp proxy-authentication *keyword*
Tree	proxy-authentication
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-lcp *keyword*

Synopsis	Use the Proxy LCP AVPs that are received from the LAC
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp proxy-lcp *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	proxy-lcp
Options	false, true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reject-disabled-ncp *keyword*

Synopsis	Force LCP Project Reject for IPv6CP Configure Request
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp reject-disabled-ncp *keyword*
Tree	reject-disabled-ncp
Options	false, true
Introduced	16.0.R6
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

user-db *named-item*

Synopsis	Local user database for PPP PAP and CHAP authentication
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* lns ppp user-db *named-item*
Tree	user-db
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-address *ipv4-unicast-address*

Synopsis	Local address
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* local-address *ipv4-unicast-address*
Tree	local-address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

local-name *host-name*

Synopsis	Local host name used to distinguish tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* local-name *host-name*
Tree	local-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-not-estab *number*

Synopsis	Maximum retries for unestablished tunnels
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* max-retries-not-estab *number*
Tree	max-retries-not-estab
Range	2 to 7
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *encrypted-leaf*

Synopsis	Password between L2TP LAC and LNS
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* password *encrypted-leaf*
Tree	password

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the password between L2TP LAC and LNS in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 166
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer *ipv4-unicast-address*

Synopsis	Peer address
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* peer *ipv4-unicast-address*
Tree	peer
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

preference *number*

Synopsis	Tunnel preference number with its group
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* preference *number*
Tree	preference
Range	0 to 16777215
Default	50
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy *reference*

Synopsis	RADIUS accounting policy
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* radius-accounting-policy *reference*
Tree	radius-accounting-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Reference	**configure** aaa radius l2tp-accounting-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

receive-window-size *number*

Synopsis	L2TP receive window size
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* receive-window-size *number*
Tree	receive-window-size
Range	4 to 1024
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

remote-name *host-name*

Synopsis	Remote tunnel host name
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* remote-name *host-name*
Tree	remote-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session-limit *(number | keyword)*

Synopsis	L2TP session limit for each tunnel of this router
Context	**configure** router *named-item-64* l2tp group *named-item-64* tunnel *named-item* session-limit *(number | keyword)*
Tree	session-limit
Range	1 to 65534
Options	unlimited
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

group-session-limit *number*

Synopsis	L2TP session limit for each group of this router
Context	**configure** router *named-item-64* l2tp group-session-limit *number*
Tree	group-session-limit
Range	1 to 250000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

hello-interval *(number | keyword)*

Synopsis	Hello interval
Context	**configure** router *named-item-64* l2tp hello-interval *(number | keyword)*
Tree	hello-interval
Range	10 to 3600
Units	seconds
Options	infinite
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

idle-timeout *(number | keyword)*

Synopsis	Idle timeout
Context	**configure** router *named-item-64* l2tp idle-timeout *(number | keyword)*
Tree	idle-timeout
Range	0 to 3600
Units	seconds
Options	infinite
Default	infinite
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

ignore-avps

Synopsis	Enter the **ignore-avps** context
Context	**configure** router *named-item-64* l2tp ignore-avps
Tree	ignore-avps
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sequencing-required *boolean*

Synopsis	Ignore Sequencing Required AVP
Context	**configure** router *named-item-64* l2tp ignore-avps sequencing-required *boolean*
Tree	sequencing-required
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

l2tpv3

Synopsis	Enter the **l2tpv3** context
Context	**configure** router *named-item-64* l2tp l2tpv3
Tree	l2tpv3
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cookie-length *number*

Synopsis	Cookie field length
Context	**configure** router *named-item-64* l2tp l2tpv3 cookie-length *number*
Tree	cookie-length
Range	4 | 8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

digest-type *keyword*

Synopsis	Hashing algorithm that calculates the message digest
Context	**configure** router *named-item-64* l2tp l2tpv3 digest-type *keyword*
Tree	digest-type
Options	md5, sha1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

nonce-length *number*

Synopsis	Length of the local L2TPv3 nonce (random number)
Context	**configure** router *named-item-64* l2tp l2tpv3 nonce-length *number*
Tree	nonce-length
Range	0 | 16 to 64
Default	0
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

password *encrypted-leaf*

Synopsis	L2TPv3 password
Context	**configure** router *named-item-64* l2tp l2tpv3 password *encrypted-leaf*
Tree	password
Description	This command specifies the L2TPv3 password in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 166
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

private-tcp-mss-adjust *number*

Synopsis	TCP maximum segment size (MSS) on private network

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp l2tpv3 private-tcp-mss-adjust *number*
Tree	private-tcp-mss-adjust
Range	512 to 9000
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

public-tcp-mss-adjust *number*

Synopsis	TCP maximum segment size (MSS) on public network
Context	**configure** router *named-item-64* l2tp l2tpv3 public-tcp-mss-adjust *number*
Tree	public-tcp-mss-adjust
Range	512 to 9000
Units	octets
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

transport-type

Synopsis	Enter the **transport-type** context
Context	**configure** router *named-item-64* l2tp l2tpv3 transport-type
Tree	transport-type
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ip *boolean*

Synopsis	Use IP as the transport type for the L2TPv3 tunnel
Context	**configure** router *named-item-64* l2tp l2tpv3 transport-type ip *boolean*
Tree	ip
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

lac

Synopsis	Enter the **lac** context
Context	**configure** router *named-item-64* l2tp lac
Tree	lac
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

calling-number-format *ascii-specification*

Synopsis	Calling Number AVP for L2TP control messages
Context	**configure** router *named-item-64* l2tp lac calling-number-format *ascii-specification*
Tree	calling-number-format
String length	1 to 255
String format	'calling-number-format' must use text with %S %c %r %s %l escapes only
Default	%S %s
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

cisco-nas-port

Synopsis	Enter the **cisco-nas-port** context
Context	**configure** router *named-item-64* l2tp lac cisco-nas-port
Tree	cisco-nas-port
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ethernet *binary-specification*

Synopsis	L2TP Cisco NAS port AVP with binary patterns for Ethernet
Context	**configure** router *named-item-64* l2tp lac cisco-nas-port ethernet *binary-specification*
Tree	ethernet
String length	1 to 255
String format	'ethernet' must be 0/1 or *N(s|m|p|o|i) bit-spec
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

df-bit *boolean*

Synopsis	Send all L2TP packets with DF bit set to 1
Context	**configure** router *named-item-64* l2tp lac df-bit *boolean*
Tree	df-bit
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

fragmentation

Synopsis	Enable the **fragmentation** context
Context	**configure** router *named-item-64* l2tp lac fragmentation
Tree	fragmentation
Introduced	25.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-action *keyword*

Synopsis	Default action for L2TP sessions
Context	**configure** router *named-item-64* l2tp lac fragmentation default-action *keyword*
Tree	default-action
Description	This command configures the default action for L2TP sessions. This setting can be overwritten in the LUDB by using the **configure subscriber-mgmt local-user-db ppp host l2tp lac-fragmentation** command.
Options	deny – Deny packet fragmentation for L2TP sessions permit – Permit packet fragmentation for L2TP sessions
Default	deny
Introduced	25.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

fpe *reference*

Synopsis	FPE that constructs the data endpoints

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* l2tp lac fragmentation fpe *reference*
Tree	fpe
Description	This command configures the association between the FPE and the data endpoints.
Reference	**configure** fwd-path-ext fpe *number*
Notes	This element is mandatory.
Introduced	25.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

local-address *ipv4-unicast-address*

Synopsis	Local address
Context	**configure** router *named-item-64* l2tp local-address *ipv4-unicast-address*
Tree	local-address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

local-name *host-name*

Synopsis	Local host name
Context	**configure** router *named-item-64* l2tp local-name *host-name*
Tree	local-name
String length	1 to 64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

max-retries-estab *number*

Synopsis	Maximum retries for established tunnels
Context	**configure** router *named-item-64* l2tp max-retries-estab *number*
Tree	max-retries-estab
Range	2 to 7
Default	5
Introduced	16.0.R1

© 2026 Nokia.

Tree	fec-prefix

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description Commands in this context configure statistics in the egress datapath at the ingress LER or LSR for an LDP FEC. The egress datapath counters are updated for both originating and transit packets. Originating packets may be service packets or IP user and control packets forwarded over the LDP LSP when used as an IGP shortcut. Transit packets of the FEC are packets that are label switched on this node.

When ECMP is enabled and multiple paths exist for an FEC, the same set of counters is updated for each packet forwarded over any NHLFE associated with this FEC, and for as long as this FEC is active.

The statistics can be enabled on FEC prefixes imported from both LDP neighbors and T-LDP neighbors (LDP over RSVP). LDP sets up egress statistics collection for LDP tunnels whose FECs match the exact prefix specified in this command. Service FECs, that is, FEC 128 and FEC 129, are not valid. LDP FEC egress statistics are collected at the PHP node for an LDP FEC using an implicit null egress label.

Introduced 16.0.R1

interface *named-item-or-empty*

Synopsis	Interface name for this static FEC prefix
Context	**configure** router *named-item-64* ldp fec-originate *(ipv4-prefix | ipv6-prefix)* interface *named-item-or-empty*
Tree	interface
String length	0 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

next-hop *(ipv4-address-no-zone \| ipv6-address-no-zone)*

Synopsis	IP address of the next hop
Context	**configure** router *named-item-64* ldp fec-originate *(ipv4-prefix | ipv6-prefix)* next-hop *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	next-hop
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

pop *boolean*

Synopsis	Pop the label and transmit without the label
Context	**configure** router *named-item-64* ldp fec-originate *(ipv4-prefix | ipv6-prefix)* pop *boolean*
Tree	pop
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

swap-label *number*

Synopsis	Value mapped to egress label associated with next-hop entry that LSR uses to swap incoming label
Context	**configure** router *named-item-64* ldp fec-originate *(ipv4-prefix* | *ipv6-prefix)* swap-label *number*
Tree	swap-label
Range	6 to 1048575
Notes	The following elements are part of a choice: (**interface**, **next-hop**, and **swap-label**) or **pop**.
Introduced	16.0.R1
Platforms	All

generate-basic-fec-only *boolean*

Synopsis	Enable mLDP to generate a basic FEC
Context	**configure** router *named-item-64* ldp generate-basic-fec-only *boolean*
Tree	generate-basic-fec-only
Description	When configured to **true**, mLDP generates a basic FEC even if the actual root node is resolved using BGP. This functionality is useful when a connected router does not support the mLDP recursive FEC type. This command only operates with recursive opaque type 7 FECs and non-recursive type 1 FECs. When configured to **false**, mLDP generates a recursive FEC if the actual root node is resolved using BGP.
Default	false
Introduced	16.0.R1
Platforms	All

graceful-restart

Synopsis	Enter the **graceful-restart** context
Context	**configure** router *named-item-64* ldp graceful-restart
Tree	graceful-restart
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

helper-mode *boolean*

Synopsis	Enable graceful restart helper
Context	**configure** router *named-item-64* ldp graceful-restart helper-mode *boolean*
Tree	helper-mode
Default	false
Introduced	16.0.R1
Platforms	All

maximum-recovery-time *number*

Synopsis	Value for the local maximum recovery time
Context	**configure** router *named-item-64* ldp graceful-restart maximum-recovery-time *number*
Tree	maximum-recovery-time
Range	15 to 1800
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	All

neighbor-liveness-time *number*

Synopsis	Value for the neighbor liveness timer
Context	**configure** router *named-item-64* ldp graceful-restart neighbor-liveness-time *number*
Tree	neighbor-liveness-time
Range	5 to 300
Units	seconds
Default	120
Introduced	16.0.R1
Platforms	All

implicit-null-label *boolean*

Synopsis	Signal the implicit null label value for all LDP FECs for which the node is the egress LER
Context	**configure** router *named-item-64* ldp implicit-null-label *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	implicit-null-label
Default	false
Introduced	16.0.R1
Platforms	All

import-mcast-policy *reference*

Synopsis	Import policy for mLDP FECs arriving on the node
Context	**configure** router *named-item-64* ldp import-mcast-policy *reference*
Tree	import-mcast-policy
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	19.5.R1
Platforms	All

import-pmsi-routes

Synopsis	Enter the **import-pmsi-routes** context
Context	**configure** router *named-item-64* ldp import-pmsi-routes
Tree	import-pmsi-routes
Introduced	19.5.R1
Platforms	All

mvpn *boolean*

Synopsis	Import BGP MVPN inter-AS routes
Context	**configure** router *named-item-64* ldp import-pmsi-routes mvpn *boolean*
Tree	mvpn
Default	false
Introduced	19.5.R1
Platforms	All

Platforms	All

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source address in LSP ping and BFD control packets
Context	**configure** router *named-item-64* ldp lsp-bfd *reference* source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Introduced	16.0.R1
Platforms	All

max-ecmp-routes *number*

Synopsis	Maximum ECMP value for LDP
Context	**configure** router *named-item-64* ldp max-ecmp-routes *number*
Tree	max-ecmp-routes
Description	This command sets the maximum number of ECMP routes that LDP may use to resolve the next hop for a FEC as permitted by the RTM or TTM. The system-wide maximum number of ECMP routes is set by the **configure router ecmp** command; therefore, the operational maximum number used by LDP is set to the lesser of the values configured by this command and the **configure router ecmp** command. **Note:** The system-wide maximum number of ECMP routes is limited by the **configure router ecmp** command. This command, under the LDP context, simply allows LDP to use more than 32 next hops if they are available in the RTM or TTM.
Range	1 to 128
Default	32
Introduced	19.10.R1
Platforms	All

mcast-upstream-asbr-frr *boolean*

Synopsis	Enable ASBR MoFRR to allow local leaf to perform MoFRR for multiple ASBRs
Context	**configure** router *named-item-64* ldp mcast-upstream-asbr-frr *boolean*
Tree	mcast-upstream-asbr-frr
Default	false
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

mcast-upstream-frr *boolean*

Synopsis	Use fast upstream switchover for mLDP FECs
Context	**configure** router *named-item-64* ldp mcast-upstream-frr *boolean*
Tree	mcast-upstream-frr
Description	When configured to **true**, the router uses mLDP fast upstream switchover for mLDP FECs to switch to a backup upstream LSR in case of failure of the upstream LSR that is the primary next hop of the root LSR for the P2MP FEC. When configured to **false**, the router does not use mLDP fast upstream switchover, and instead waits for IGP and LDP to converge before switching to a backup upstream LSR in case of failure.
Default	false
Introduced	16.0.R1
Platforms	All

mp-mbb-time *number*

Synopsis	MP MBB time
Context	**configure** router *named-item-64* ldp mp-mbb-time *number*
Tree	mp-mbb-time
Range	0 to 10
Units	seconds
Default	3
Introduced	16.0.R1
Platforms	All

prefer-mcast-tunnel-in-tunnel *boolean*

Synopsis	Use T-LDP session to the peer for FEC resolution
Context	**configure** router *named-item-64* ldp prefer-mcast-tunnel-in-tunnel *boolean*
Tree	prefer-mcast-tunnel-in-tunnel
Default	true
Introduced	21.2.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

prefer-protocol-stitching *boolean*

Synopsis	Stitch LDP ILM to SR NHLFE even if LDP NHLFE exists
Context	**configure** router *named-item-64* ldp prefer-protocol-stitching *boolean*
Tree	prefer-protocol-stitching
Description	When configured to **true**, an LDP ILM stitches to an SR NHLFE, even if an LDP NHLFE exists. When configured to **false**, the stitching preference of an LDP ILM is to an LDP NHLFE.
Default	false
Introduced	21.7.R1
Platforms	All

prefer-tunnel-in-tunnel *boolean*

Synopsis	Preference tunnel-in-tunnel over a simple LDP tunnel
Context	**configure** router *named-item-64* ldp prefer-tunnel-in-tunnel *boolean*
Tree	prefer-tunnel-in-tunnel
Default	true
Introduced	16.0.R1
Platforms	All

resolve-root-using *keyword*

Synopsis	Resolution route table for multicast FECs
Context	**configure** router *named-item-64* ldp resolve-root-using *keyword*
Tree	resolve-root-using
Options	ucast-rtm, mcast-rtm
Default	ucast-rtm
Introduced	16.0.R1
Platforms	All

session-parameters

Synopsis	Enter the **session-parameters** context
Context	**configure** router *named-item-64* ldp session-parameters

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	session-parameters
Introduced	16.0.R1
Platforms	All

peer [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **peer** list instance
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Introduced	16.0.R1
Platforms	All

[**ip-address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the LDP peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	peer
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

adv-adj-addr-only *boolean*

Synopsis	Distribute only the local addresses used to establish the Hello adjacencies with a peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* adv-adj-addr-only *boolean*
Tree	adv-adj-addr-only
Default	false
Introduced	16.0.R1
Platforms	All

adv-local-lsr-id *boolean*

Synopsis	Advertise local LSR ID over a specified LDP session

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* adv-local-lsr-id *boolean*
Tree	adv-local-lsr-id
Default	false
Introduced	16.0.R1
Platforms	All

community *policy-string*

Synopsis	Community string associated with a session to a specified peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* community *policy-string*
Tree	community
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

dod-label-distribution *boolean*

Synopsis	Use LDP Downstream-on-Demand (DoD) label distribution procedures
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* dod-label-distribution *boolean*
Tree	dod-label-distribution
Default	false
Introduced	16.0.R1
Platforms	All

export-addresses *reference*

Synopsis	Export policies to determine which local addresses should be distributed to this peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* export-addresses *reference*
Tree	export-addresses
Reference	**configure** policy-options policy-statement *named-item-64*

Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

fec-limit

Synopsis	Enter the **fec-limit** context
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-limit
Tree	fec-limit
Introduced	16.0.R1
Platforms	All

limit *number*

Synopsis	Maximum number of FECs to be accepted from this peer LSR
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-limit limit *number*
Tree	limit
Range	0 | 1 to 4294967295

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	0
Introduced	16.0.R1
Platforms	All

log-only *boolean*

Synopsis	Trap and syslog message to generate when reaching the threshold and limit
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-limit log-only *boolean*
Tree	log-only
Default	false
Introduced	16.0.R1
Platforms	All

threshold *number*

Synopsis	Threshold that generates trap and warning when reached
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-limit threshold *number*
Tree	threshold
Range	1 to 100
Default	90
Introduced	16.0.R1
Platforms	All

fec-type-capability

Synopsis	Enter the **fec-type-capability** context
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-type-capability
Tree	fec-type-capability
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

p2mp *boolean*

Synopsis	Enable P2MP FEC capability for the session
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-type-capability p2mp *boolean*
Tree	p2mp
Default	true
Introduced	16.0.R1
Platforms	All

prefix-ipv4 *boolean*

Synopsis	Enable IPv4 prefix FEC capability for the session
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-type-capability prefix-ipv4 *boolean*
Tree	prefix-ipv4
Default	true
Introduced	16.0.R1
Platforms	All

prefix-ipv6 *boolean*

Synopsis	Enable IPv6 prefix FEC capability
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec-type-capability prefix-ipv6 *boolean*
Tree	prefix-ipv6
Default	true
Introduced	16.0.R1
Platforms	All

fec129-cisco-interop *boolean*

Synopsis	Allow translation between non-compliant FEC 129 formats of Cisco
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* fec129-cisco-interop *boolean*
Tree	fec129-cisco-interop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

import-prefixes *reference*

Synopsis	FEC prefixes to be redistributed to this LDP peer
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* import-prefixes *reference*
Tree	import-prefixes
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	All

pe-id-mac-flush-interop *boolean*

Synopsis	Send PE-ID TLV in LDP MAC withdrawal message
Context	**configure** router *named-item-64* ldp session-parameters peer *(ipv4-address-no-zone | ipv6-address-no-zone)* pe-id-mac-flush-interop *boolean*
Tree	pe-id-mac-flush-interop
Default	false
Introduced	16.0.R1
Platforms	All

shortcut-local-ttl-propagate *boolean*

Synopsis	Propagate TTL over LSP shortcut for local packets
Context	**configure** router *named-item-64* ldp shortcut-local-ttl-propagate *boolean*
Tree	shortcut-local-ttl-propagate
Default	true
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

shortcut-transit-ttl-propagate *boolean*

Synopsis	Enable TTL propagation over LSP shortcut
Context	**configure** router *named-item-64* ldp shortcut-transit-ttl-propagate *boolean*
Tree	shortcut-transit-ttl-propagate
Default	true
Introduced	16.0.R1
Platforms	All

targeted-session

Synopsis	Enter the **targeted-session** context
Context	**configure** router *named-item-64* ldp targeted-session
Tree	targeted-session
Introduced	16.0.R1
Platforms	All

auto-rx

Synopsis	Enter the **auto-rx** context
Context	**configure** router *named-item-64* ldp targeted-session auto-rx
Tree	auto-rx
Description	Commands in this context specify the LDP session configuration to accept targeted Hello messages from any peer.
Introduced	20.10.R1
Platforms	All

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** router *named-item-64* ldp targeted-session auto-rx ipv4

admin-state *keyword*

Synopsis	Administrative state of IPv4 capabilities for peers
Context	**configure** router *named-item-64* ldp targeted-session auto-rx ipv4 admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	20.10.R1
Platforms	All

tunneling *boolean*

Synopsis	Enable tunneling for targeted peers
Context	**configure** router *named-item-64* ldp targeted-session auto-rx ipv4 tunneling *boolean*
Tree	tunneling
Description	When configured to **true**, this command enables the local system to use the targeted LDP session to send FEC label bindings that are advertised to other LDP peers. For LDP rLFA, the source node requires the PQ node's label binding information in order to reach the destination. If the **auto-rx** and **auto-tx** contexts are both administratively enabled, this command must be set to **true** for LDP rLFA to function properly. When configured to **false**, FEC label bindings are not sent via the LDP session.
Default	false
Introduced	20.10.R1
Platforms	All

auto-tx

Synopsis	Enter the **auto-tx** context
Context	**configure** router *named-item-64* ldp targeted-session auto-tx
Tree	auto-tx
Description	Commands in this context specify the LDP session configuration to send targeted Hello messages toward PQ nodes determined by the rLFA algorithm.
Introduced	20.10.R1
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD tracking of T-LDP peer session
Context	**configure** router *named-item-64* ldp targeted-session peer-template *named-item* bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, the router uses BFD to track the selected T-LDP session. By enabling BFD for a selected targeted session, the state of that session is tied to the state of the underneath BFD session between the two nodes. The command options used for the BFD are configured under the IP interface. When configured to **false**, the router does not use the central BFD session to track the T-LDP session operational state.
Default	false
Introduced	16.0.R1
Platforms	All

authentication-key *encrypted-leaf*

Synopsis	Authentication key between LDP peers
Context	**configure** router *named-item-64* ldp tcp-session-parameters authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command specifies the authentication key used to establish a session between LDP peers. Authentication uses the MD-5 message-based digest. The peer address used in authentication must be the TCP session transport address. If one or more transport addresses used in the Hello adjacencies to the same peer LSR are different from the LSR ID value, the user must add each transport address to the authentication key configuration as a separate peer. As a result, when the TCP connection is bootstrapped

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

by a specific Hello adjacency, the authentication can operate over that TCP connection by using its specific transport address.

The per-peer authentication configuration takes precedence over global authentication configuration, and authentication keychain configuration takes precedence over authentication key configuration.

This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.

tunnel-table-pref *number*

Synopsis Tunnel table preference value for address FECs

Context **configure** router *named-item-64* ldp tunnel-table-pref *number*

Tree tunnel-table-pref

Description This command configures the tunnel table preference for an LDP tunnel type.

The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

Range 1 to 255

Default 9

Introduced 21.10.R1

Platforms All

weighted-ecmp *boolean*

Synopsis Allow weighted ECMP load-balancing

Context **configure** router *named-item-64* ldp weighted-ecmp *boolean*

Tree weighted-ecmp

Description When configured to **true**, the system allows weighted ECMP on LDP using RSVP LSPs or SR-TE LSPs. LDP labeled packets are sprayed across the RSVP or SR-TE LSP ECMP set in proportion to the configured load-balancing weight of LSPs.

When configured to **false**, the system removes weighted ECMP load-balancing.

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** router *named-item-64* mld forwarding-group-interface forwarding-service *service-name* group-interface-name *reference* mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).

tunnel-table-pref *number*

Synopsis	Tunnel table preference
Context	**configure** router *named-item-64* mpls forwarding-policies forwarding-policy *named-item-64* tunnel-table-pref *number*
Tree	tunnel-table-pref
Description	This command configures the TTM preference value of an MPLS forwarding policy. It is used by applications to select one tunnel type to bind to in TTM when multiple tunnel types are enabled for the application. It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255
Default	255
Introduced	16.0.R4
Platforms	All

interface [interface-name] *reference*

Synopsis	Enter the **interface** list instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* mpls interface *reference*
Tree	interface
Description	Commands in this context configure the attributes for MPLS protocol support on an IP interface. MPLS commands are not executed on an IP interface where MPLS is not enabled. An MPLS interface must be explicitly enabled (admin-state enabled). The MPLS interface must be admin-state disabled to delete the interface definition. A corresponding RSVP interface must also be configured. The MPLS interface cannot be deleted without also deleting the RSVP interface.
Introduced	16.0.R1
Platforms	All

Platforms	All

admin-group *reference*

Synopsis	Administrative groups supported by the interface
Context	**configure** router *named-item-64* mpls interface *reference* admin-group *reference*
Tree	admin-group
Description	This command specifies the administrative groups that the interface supports. This information is advertised as part of OSPF and IS-IS to help CSPF compute constrained LSPs that must include or exclude certain administrative groups. An MPLS interface is assumed to belong to all the administrative groups unless this command is issued under the interface configuration. With this command configured, the interface is assumed to belong to only the groups specifically configured in this command. Only the administrative groups bound to an MPLS interface are advertised in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

monitor-bandwidth *boolean*

Synopsis	Collect and display auto-bandwidth measurements for LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth monitor-bandwidth *boolean*
Tree	monitor-bandwidth
Description	When configured to **true**, passive monitoring for auto-bandwidth is enabled on the system. This prevents the system from performing any automatic bandwidth adjustments, but does not affect the collection and display of bandwidth measurements. When configured to **false**, passive monitoring is disabled, which allows the system to perform auto-bandwidth adjustments.
Default	false
Introduced	16.0.R1
Platforms	All

multipliers

Synopsis	Enter the **multipliers** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth multipliers
Tree	multipliers
Description	Commands in this context configure the sample multiplier and adjust multiplier for the LSP.
Introduced	16.0.R1
Platforms	All

adjust-multiplier *number*

Synopsis	Number of collection intervals in the adjust interval
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth multipliers adjust-multiplier *number*
Tree	adjust-multiplier
Description	This command configures the number of collection intervals between periodic evaluations by the ingress LER about whether to adjust the LSP bandwidth. The router keeps track of the maximum average data rate of each LSP since the last reset of the adjust count. The maximum of this average data rate over multiple sample intervals is the measured bandwidth input to the auto-bandwidth adjustment algorithms. Setting this to a value less than the sample multiplier is not allowed. Nokia recommends setting the adjust multiplier to a multiple of the sample multiplier.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is not configured, the router uses the value configured for the **configure router mpls auto-bandwidth-multipliers** command.

Range 1 to 16383

Introduced 16.0.R1

Platforms All

sample-multiplier *number*

Synopsis Multiplier for collection intervals in a sample interval

Context **configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth multipliers sample-multiplier *number*

Tree sample-multiplier

Description This command configures the number of collection intervals between periodic computations of the data rate of the LSP. The byte count includes the Layer 2 encapsulation of MPLS packets and represents traffic of all forwarding classes and priorities (in-profile versus out-of-profile) belonging to the LSP. The router calculates the average data rate (in bits per second) over each sample interval.

When this command is not configured, the router uses the value configured for the **configure router mpls auto-bandwidth-multipliers** command.

Range 1 to 511

Introduced 16.0.R1

Platforms All

overflow-limit

Synopsis Enable the **overflow-limit** context

Context **configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth overflow-limit

Tree overflow-limit

Description Commands in this context configure the overflow-triggered auto-bandwidth adjustment. The bandwidth adjustment is initiated when the configured **number** of overflow samples is reached, regardless of how much time remains until the adjust interval ends.

A sample interval is counted as an overflow if the average data rate during the sample interval is higher than the currently reserved bandwidth by at least the configured thresholds.

If overflow-triggered auto-bandwidth adjustment is successful, the overflow count, maximum average data rate, and adjust count are reset. If overflow-triggered auto-bandwidth adjustment fails, the overflow count is reset but the maximum average data rate and adjust count maintain the current values.

Introduced 16.0.R1

Tree	threshold

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) for counting an overflow or underflow sample.
Range	0 to 100
Units	percent
Default	0
Introduced	16.0.R1
Platforms	All

underflow-limit

Synopsis	Enable the **underflow-limit** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth underflow-limit
Tree	underflow-limit
Description	Commands in this context configure the underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust-interval; it is triggered when the number of consecutive underflow samples reaches the configured threshold **number**. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last **number** of consecutive underflow samples. A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the configured thresholds.
Introduced	16.0.R1
Platforms	All

Context	**configure** router *named-item-64* mpls lsp *named-item-64* auto-bandwidth use-last-adj-bw secondary-retry-limit *(number | keyword)*
Tree	secondary-retry-limit
Description	This command configures the maximum number of retry attempts for secondary paths. After each successful attempt, the counter is reset to zero.
Range	1 to 10000
Options	infinite – Allow an unlimited number of retry attempts
Default	5
Introduced	16.0.R5
Platforms	All

bfd

Synopsis	Enter the **bfd** context
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd
Tree	bfd
Description	Commands in this context configure BFD on LSPs. These commands apply to BFD on RSVP LSPs and S-BFD on SR-TE LSPs.
Introduced	16.0.R1
Platforms	All

allow-bfd-transit *boolean*

Synopsis	Allow BFD transit packets on this SR-TE LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd allow-bfd-transit *boolean*
Tree	allow-bfd-transit

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the system enables locally originated BFD traffic and transit traffic whose top SID matches the binding SID, if a binding SID is configured, to be forwarded on the LSP regardless of the S-BFD session state and the **failure-action** configuration. This allows S-BFD packets from a remotely originated S-BFD session using a controlled return path to be forwarded on the LSP even if its local S-BFD session is down. The state of the S-BFD session on the return path LSP does not affect the state of the forward path LSP. When configured to **false**, the system disables this behavior.
Default	false
Introduced	26.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

bfd-liveness *boolean*

Synopsis	Enable BFD on the LSP
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, the system enables LSP BFD on the LSP. LSP BFD must also be configured under the **configure router** context. The named BFD template provides the configuration settings for the BFD session, which must be configured and associated with the service using the BFD template. When configured to **false**, the system disables LSP BFD on the LSP. This command applies to BFD on RSVP LSPs and S-BFD on SR-TE LSPs.
Default	false
Introduced	16.0.R1
Platforms	All

bfd-template *reference*

Synopsis	BFD template to be used by LSP BFD sessions
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd bfd-template *reference*
Tree	bfd-template
Reference	**configure** bfd bfd-template *named-item*
Introduced	16.0.R1
Platforms	All

failure-action *keyword*

Synopsis	Action when LSP BFD fails
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd failure-action *keyword*
Tree	failure-action
Description	This command specifies the action when LSP BFD fails on a LSP. Regardless of the failure action specified, when the BFD session goes down on the LSP, the system generates an SNMP trap.
Options	none, down, failover, failover-or-down
Default	none
Introduced	16.0.R1
Platforms	All

lsp-ping-interval *(number | keyword)*

Synopsis	Interval for periodic LSP ping for BFD bootstrapping
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd lsp-ping-interval *(number | keyword)*
Tree	lsp-ping-interval
Range	60 to 300
Units	seconds
Options	none
Default	60
Introduced	16.0.R1
Platforms	All

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* mpls lsp *named-item-64* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.

Range 32 to 1048575

Introduced 22.2.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis Source address for the S-BFD packets

Context **configure** router *named-item-64* mpls lsp *named-item-64* bfd source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Tree source-address

Description This command configures a source address for the S-BFD packets sent on the SR-TE LSP. If this command is not configured, the system uses the LSP **from** address, where applicable. Otherwise, the system uses the system IPv4 address for IPv4 SR-TE LSPs or the IPv6 address corresponding to the IPv6 TE router ID for IPv6 SR-TE LSPs.

Introduced 24.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis Time to wait for BFD to become operationally available

Context **configure** router *named-item-64* mpls lsp *named-item-64* bfd wait-for-up-timer *number*

Tree wait-for-up-timer

Description This command configures the time to wait for BFD to become operationally up.

For RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up
- the initial administrative state of the LSP
- the retry signaling of non-standby secondary paths

The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs.

For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. After expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer.

Range 1 to 60

Units seconds

Default 4

Synopsis	Maximum label stack size
Context	**configure** router *named-item-64* mpls lsp *named-item-64* max-sr-labels label-stack-size *number*
Tree	label-stack-size
Description	This command configures the maximum label stack size of the primary path of the SR-TE LSP.
Range	1 to 11
Introduced	16.0.R1
Platforms	All

metric *number*

Synopsis	LSP metric that forces to a constant value
Context	**configure** router *named-item-64* mpls lsp *named-item-64* metric *number*
Tree	metric
Description	This command allows the user to override the LSP operational metric with a constant administrative value that does not change regardless of the actual path the LSP uses over its lifetime. The LSP operational metric matches the metric that the active path of this LSP uses at any specific time. For a CSPF LSP, this metric represents the cumulative IGP metric of all links the active path uses. If CSPF for this LSP is configured to use the TE metric, the LSP operational metric is set to the maximum value. For a non-CSPF LSP, the operational metric is the shortest IGP cost to the destination of the LSP. The LSP operational metric is used by some applications to select an LSP among a set of LSPs that are destined to the same egress router. The LSP with the lowest

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

operational metric is selected. If more than one LSP has the same lowest LSP metric, the LSP with the lowest tunnel index is selected. The configuration of a constant metric by the user ensures that the LSP always maintains its preference in this selection regardless of the path it uses at any given time. Applications that use the LSP operational metric include LDP-over-RSVP, VPRN auto-bind, IGP, BGP, and static route shortcuts.

This command and the **use-computed-metric** command are mutually exclusive.

Range	0 to 16777215
Introduced	16.0.R1
Platforms	All

metric-type *keyword*

Synopsis	Metric type used for LSP path computation
Context	**configure** router *named-item-64* mpls lsp *named-item-64* metric-type *keyword*

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048575
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference* bfd source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures a source address for the S-BFD packets sent on the SR-TE LSP path. The system uses the LSP **from** address, where applicable. Otherwise, the system uses the system IPv4 address for IPv4 SR-TE LSPs or the IPv6 address corresponding to the IPv6 TE router ID for IPv6 SR-TE LSPs.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis	Time to wait for BFD to become operationally available

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* mpls lsp *named-item-64* primary *reference* bfd wait-for-up-timer *number*
Tree	wait-for-up-timer
Description	This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs. For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer. For RSVP-TE LSPs, the timer controls the following: • a path undergoing MBB when BFD is up • the initial administrative state of the LSP • the retry signaling of non-standby secondary paths
Range	1 to 60
Units	seconds

secondary [path-name] *reference*

Synopsis	Enter the **secondary** list instance
Context	**configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference*
Tree	secondary
Description	Commands in this context configure an alternative path that the LSP uses if the primary path is not available. This command is optional and is not required when the **configure router mpls lsp primary** command is specified. After the switchover from the primary to the secondary, the system continuously tries to revert to the primary path. The switch back to the primary path is based on the retry-timer interval. The system does not switch among secondary paths. The system starts the signaling (RSVP-TE) or programming (SR-TE) of all non-standby secondary paths at the same time. Retry counters are maintained for each unsuccessful attempt. After the retry limit is reached on a path, the system does not attempt to signal the path and administratively disables the path. The first successfully established non-standby secondary path is made the active path for the LSP. For RSVP-TE LSPs, up to eight secondary paths can be specified (or seven if a primary is configured). For SR-TE LSPs, up to three paths of any type (with a maximum of one primary) can be configured. By default, a secondary path is non-standby unless the **standby** keyword is configured. All non-standby secondary paths are considered equal, and the first available path is used.

return-path-label *number*

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048575
Introduced	22.2.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis Source address for S-BFD packets

Context **configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference* bfd source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Tree source-address

Description This command configures a source address for the S-BFD packets sent on the SR-TE LSP path. The system uses the LSP **from** address, where applicable. Otherwise, the system uses the system IPv4 address for IPv4 SR-TE LSPs or the IPv6 address corresponding to the IPv6 TE router ID for IPv6 SR-TE LSPs.

Introduced 24.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

Synopsis Time to wait for BFD to become operationally available

Context **configure** router *named-item-64* mpls lsp *named-item-64* secondary *reference* bfd wait-for-up-timer *number*

Tree wait-for-up-timer

Description This command configures the time to wait for BFD to become operationally up. The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs.

For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. Upon expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer.

For RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up
- the initial administrative state of the LSP
- the retry signaling of non-standby secondary paths

Range 1 to 60

Units seconds

Default 4

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Initial average traffic rate per member LSP
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* initial-member-lsp-bw *number*
Tree	initial-member-lsp-bw

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the bandwidth reserved by each member LSP when the LSP container transitions to being administratively up.
Range	0 to 6400000
Units	megabps
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

initial-member-lsps *number*

Synopsis	Initial number of member LSPs in the LSP container
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* initial-member-lsps *number*
Tree	initial-member-lsps
Range	1 to 64
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

max-member-lsps *number*

Synopsis	Maximum number of member LSPs in the LSP container
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* max-member-lsps *number*
Tree	max-member-lsps
Range	1 to 64
Default	64
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

member-lsp-template *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	LSP template that creates member LSPs in LSP container
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* member-lsp-template *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	member-lsp-template
Reference	**configure** router *named-item-64* mpls lsp-template *named-item*
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

metric *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Metric override for member LSPs of the LSP container
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* metric *number*
Tree	metric
Description	This command configures the operational metric of all the LSP members of the container with a constant administrative value. Defining a metric at the container level overrides the value configured in the LSP template. Configuring a metric within the LSP template remains mandatory. Changing the metric requires the container to be administratively down.
Range	1 to 16777215
Introduced	26.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

min-member-lsps *number*

Synopsis	Minimum number of member LSPs in the LSP container
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* min-member-lsps *number*
Tree	min-member-lsps
Range	1 to 64
Default	1
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

optimization

Synopsis	Enter the **optimization** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* optimization
Tree	optimization
Description	Commands in this context configure the optimization parameters for the LSP container.
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ad-hoc *boolean*

Synopsis	Enable ad hoc optimization
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* optimization ad-hoc *boolean*
Tree	ad-hoc
Description	When configured to **true**, the router enables ad hoc optimization. An LSP container is notified if certain events occur that affect the overall bandwidth an LSP container provides.
Default	false
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

max-avg-rate *number*

Synopsis	Maximum allowed average traffic rate per member LSP
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* optimization max-avg-rate *number*
Tree	max-avg-rate
Description	This command configures the average rate above which the container increases the number of its member LSPs.
Range	0 to 6400000
Units	megabps
Default	6400000
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

min-avg-rate *number*

Synopsis	Minimum allowed average traffic rate per member LSP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* optimization min-avg-rate *number*
Tree	min-avg-rate
Description	This command configures the average rate below which the container reduces the number of its member LSPs.
Range	0 to 6400000
Units	megabps
Default	0
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

optimization-timer *number*

Synopsis	Timer-based optimization interval of the LSP container
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* optimization optimization-timer *number*
Tree	optimization-timer
Description	This command configures the optimization timer, which defines the period at which the container analyzes its member LSPs and decides if an optimization is needed.
Range	15 to 44640
Units	minutes
Default	2880
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

suffix *string-not-all-spaces*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Suffix used to name member LSPs of the LSP container
Context	**configure** router *named-item-64* mpls lsp-container *named-item-64* suffix *string-not-all-spaces*
Tree	suffix
String length	1 to 24
String format	'string-not-all-spaces' must contain at least one non-space character

Introduced	22.10.R1
Platforms	All

lsp-init-retry-timeout *number*

Synopsis	LSP initial retry timeout
Context	**configure** router *named-item-64* mpls lsp-init-retry-timeout *number*
Tree	lsp-init-retry-timeout
Range	10 to 600
Units	seconds
Default	30
Introduced	16.0.R1
Platforms	All

lsp-self-ping

Synopsis	Enter the **lsp-self-ping** context
Context	**configure** router *named-item-64* mpls lsp-self-ping
Tree	lsp-self-ping
Description	Commands in this context configure LSP Self Ping parameters. LSP Self Ping checks that the datapath of an RSVP LSP has been programmed by all LSRs along its path before switching the traffic to it. If enabled, LSP Self Ping packets are sent periodically at a configurable interval following the receipt of the RESV message for an RSVP LSP path following an MBB or other event where the active path changes while the previous active path stayed up. The router will not switch traffic to the new path until an LSP Self Ping reply is received from the far-end LER. When configured under the MPLS context, LSP Self Ping is enabled for all RSVP LSPs, unless it is explicitly disabled for a given LSP.
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

interval *number*

Synopsis	MPLS periodic LSP Self Ping interval
Context	**configure** router *named-item-64* mpls lsp-self-ping interval *number*
Tree	interval

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the interval at which LSP Self Ping packets are periodically sent on a candidate path of an RSVP LSP. This value is used for all LSPs that have LSP Self Ping enabled.
Range	1 to 10
Units	seconds
Default	1
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

rsvp-te *boolean*

Synopsis	Activate LSP Self Ping on RSVP-TE LSPs
Context	**configure** router *named-item-64* mpls lsp-self-ping rsvp-te *boolean*
Tree	rsvp-te
Description	When configured to **true**, this command enables LSP Self Ping on all RSVP-TE LSPs, unless an individual LSP has this explicitly disabled under the **configure router mpls lsp lsp-self-ping** command or in the LSP template. When configured to **false**, this command disables LSP Self Ping on all RSVP-TE LSPs.
Default	false
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

timeout *number*

Synopsis	MPLS LSP Self Ping timeout
Context	**configure** router *named-item-64* mpls lsp-self-ping timeout *number*
Tree	timeout
Description	This command configures a timeout value for the LSP Self Ping timer. The LSP Self Ping timer starts when the RESV message is received for an LSP. The system periodically sends LSP Self Ping packets until the timer expires or the first LSP Self Ping reply is received, whichever comes first. If the timer expires before an LSP Self Ping packet is received, the configured timeout action is performed.
Range	3 to 3600
Units	seconds
Default	300
Introduced	19.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

timeout-action *keyword*

Synopsis	Action taken when LSP Self Ping timer expires
Context	**configure** router *named-item-64* mpls lsp-self-ping timeout-action *keyword*
Tree	timeout-action
Options	retry, switch
Default	retry
Introduced	20.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lsp-template [template-name] *named-item*

Synopsis	Enter the **lsp-template** list instance
Context	**configure** router *named-item-64* mpls lsp-template *named-item*
Tree	lsp-template
Description	Commands in this context configure the attributes of an LSP template that can be referenced by a client application when dynamic LSPs must be created.
Max. instances	4096
Introduced	16.0.R1
Platforms	All

[**template-name**] *named-item*

Synopsis	LSP template name
Context	**configure** router *named-item-64* mpls lsp-template *named-item*
Tree	lsp-template
Description	This command specifies the name of the LSP template. An LSP template name and LSP name must not be the same.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1

max-bandwidth *number*

Synopsis	Maximum bandwidth to request for an LSP
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth max-bandwidth *number*
Tree	max-bandwidth
Description	This command configures the maximum bandwidth that the auto-bandwidth allocation can request for an LSP. This maximum bandwidth applies regardless of how the bandwidth adjustment is triggered. The maximum bandwidth must be greater than the minimum bandwidth.
Range	0 to 6400000
Units	megabps
Default	100000
Introduced	16.0.R1
Platforms	All

min-bandwidth *number*

Synopsis	Minimum bandwidth to request for an LSP
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth min-bandwidth *number*
Tree	min-bandwidth
Description	This command configures the minimum bandwidth that the auto-bandwidth allocation is allowed to request for an LSP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	This minimum bandwidth applies regardless of how the bandwidth adjustment is triggered.
Range	0 to 6400000
Units	megabps
Default	0
Introduced	16.0.R1
Platforms	All

monitor-bandwidth *boolean*

Synopsis	Collect and display auto-bandwidth measurements for LSP
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth monitor-bandwidth *boolean*
Tree	monitor-bandwidth
Description	When configured to **true**, passive monitoring for auto-bandwidth is enabled on the system. This prevents the system from performing any automatic bandwidth adjustments, but does not affect the collection and display of bandwidth measurements. When configured to **false**, passive monitoring is disabled, which allows the system to perform auto-bandwidth adjustments.
Default	false
Introduced	16.0.R1
Platforms	All

multipliers

Synopsis	Enter the **multipliers** context
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth multipliers
Tree	multipliers
Description	Commands in this context configure the sample multiplier and adjust multiplier for the LSP.
Introduced	16.0.R1
Platforms	All

adjust-multiplier *number*

Synopsis	Number of collection intervals in the adjust interval

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth multipliers adjust-multiplier *number*
Tree	adjust-multiplier
Description	This command configures the number of collection intervals between periodic evaluations by the ingress LER about whether to adjust the LSP bandwidth. The router keeps track of the maximum average data rate of each LSP since the last reset of the adjust count. The maximum of this average data rate over multiple sample intervals is the measured bandwidth input to the auto-bandwidth adjustment algorithms. Setting this to a value less than the sample multiplier is not allowed. Nokia recommends setting the adjust multiplier to a multiple of the sample multiplier. When this command is not configured, the router uses the value configured for the **configure router mpls auto-bandwidth-multipliers** command.
Range	1 to 16383
Introduced	16.0.R1
Platforms	All

sample-multiplier *number*

Synopsis	Multiplier for collection intervals in a sample interval
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth multipliers sample-multiplier *number*
Tree	sample-multiplier
Description	This command configures the number of collection intervals between periodic computations of the data rate of the LSP. The byte count includes the Layer 2 encapsulation of MPLS packets and represents traffic of all forwarding classes and priorities (in-profile versus out-of-profile) belonging to the LSP. The router calculates the average data rate (in bits per second) over each sample interval. When this command is not configured, the router uses the value configured for the **configure router mpls auto-bandwidth-multipliers** command.
Range	1 to 511
Introduced	16.0.R1
Platforms	All

overflow-limit

Synopsis	Enable the **overflow-limit** context
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth overflow-limit
Tree	overflow-limit

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the overflow-triggered auto-bandwidth adjustment. The bandwidth adjustment is initiated when the configured number of overflow samples is reached, regardless of how much time remains until the adjust interval ends. A sample interval is counted as an overflow if the average data rate during the sample interval is higher than the currently reserved bandwidth by at least the configured thresholds. If the overflow-triggered auto-bandwidth adjustment is successful, the overflow count, maximum average data rate, and adjust count are reset. If overflow-triggered auto-bandwidth adjustment fails, the overflow count is reset but the maximum average data rate and adjust count maintain the current values.
Introduced	16.0.R1
Platforms	All

bw *number*

Synopsis	Minimum difference in absolute bandwidth
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth overflow-limit bw *number*
Tree	bw
Description	This command configures the minimum difference between the current bandwidth of the LSP and the sampled data rate relative to the current bandwidth, for counting an overflow or underflow sample.
Range	1 to 6400000
Units	megabps
Introduced	16.0.R1
Platforms	All

number *number*

Synopsis	Number of samples to trigger auto-bandwidth adjustment
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth overflow-limit number *number*
Tree	number
Description	This command configures the number of overflow or underflow samples that trigger an overflow or underflow auto-bandwidth adjustment attempt.
Range	1 to 10
Notes	This element is mandatory.
Introduced	16.0.R1

© 2026 Nokia.

Platforms	All

threshold *number*

Synopsis	Minimum difference in percentage of bandwidth
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth overflow-limit threshold *number*
Tree	threshold
Description	This command configures the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) for counting an overflow or underflow sample.
Range	0 to 100
Units	percent
Default	0
Introduced	16.0.R1
Platforms	All

underflow-limit

Synopsis	Enable the **underflow-limit** context
Context	**configure** router *named-item-64* mpls lsp-template *named-item* auto-bandwidth underflow-limit
Tree	underflow-limit
Description	Commands in this context configure the underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust-interval; it is triggered when the number of consecutive underflow samples reaches the configured threshold **number**. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last **number** of consecutive underflow samples. A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the configured thresholds.
Introduced	16.0.R1
Platforms	All

bfd

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **bfd** context
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd
Tree	bfd

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure BFD on LSPs. These commands apply to BFD on RSVP LSPs and S-BFD on SR-TE LSPs.
Introduced	16.0.R1
Platforms	All

allow-bfd-transit *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Allow BFD transit packets on template SR-TE LSPs
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd allow-bfd-transit *boolean*
Tree	allow-bfd-transit
Description	When configured to **true**, the system enables locally originated BFD traffic and transit traffic whose top SID matches the binding SID, if a binding SID is configured, to be forwarded on SR-TE LSPs created using the LSP template, regardless of the S-BFD session state and the **failure-action** configuration. This allows control packets from a remotely originated S-BFD session using a controlled return path to be forwarded on the LSP even if its local S-BFD session is down. The state of the S-BFD session on the return path LSP does not affect the state of the forward path LSP. When configured to **false**, the system disables this behavior.
Default	false
Introduced	26.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

bfd-liveness *boolean*

Synopsis	Enable BFD on the LSP
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, the system enables LSP BFD on the LSP. LSP BFD must also be configured under the **configure router** context. The named BFD template provides the configuration settings for the BFD session, which must be configured and associated with the service using the BFD template. When configured to **false**, the system disables LSP BFD on the LSP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command applies to BFD on RSVP LSPs and S-BFD on SR-TE LSPs.

Default	false
Introduced	16.0.R1
Platforms	All

bfd-template *reference*

Synopsis	BFD template to be used by LSP BFD sessions

return-path-label *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048575
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Source address for S-BFD packets
Context	**configure** router *named-item-64* mpls lsp-template *named-item* bfd source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures a source address for the S-BFD packets sent on the SR-TE LSP path instantiated according to the LSP template. The system uses the LSP **from** address, where applicable. Otherwise, the system uses the system IPv4 address for

© 2026 Nokia.

IPv4 SR-TE LSPs or the IPv6 address corresponding to the IPv6 TE router ID for IPv6 SR-TE LSPs.

Introduced 24.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

wait-for-up-timer *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis Time to wait for BFD to become operationally available

Context **configure** router *named-item-64* mpls lsp-template *named-item* bfd wait-for-up-timer *number*

Tree wait-for-up-timer

Description This command configures the time to wait for BFD to become operationally up.

For RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up
- the initial administrative state of the LSP
- the retry signaling of non-standby secondary paths

The timer is applicable to SR-TE LSPs, including auto LSPs and PCE-initiated LSPS, as well RSVP-TE LSPs.

For SR-TE LSPs, the timer takes effect when BFD is first enabled on a path or when BFD transitions from up to down. After expiration, if BFD is not up, the path is torn down, removed from the TTM and the IOM, and the system starts the retry timer.

Range 1 to 60

Units seconds

Default 4

Introduced 19.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

collect-stats *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Collect LSP statistics
Context	**configure** router *named-item-64* mpls lsp-template *named-item* egress-statistics collect-stats *boolean*
Tree	collect-stats
Description	When configured to **true**, this command enables LSP statistics collection. When you apply accounting policies, the forwarding engine collects data in the appropriate records and by default the CPU obtains and writes the results to the designated billing file. When configured to **false**, the forwarding engine still accumulates statistics. However, the CPU does not write them to the billing file. If you subsequently re-enable this command, the counters written to the billing file include all the traffic collected while the command was disabled.

metric *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	LSP template metric
Context	**configure** router *named-item-64* mpls lsp-template *named-item* metric *number*
Tree	metric
Description	This command allows the user to override the LSP operational metric with a constant administrative value that does not change regardless of the actual path the LSP uses over its lifetime. The LSP operational metric matches the metric that the active path of this LSP uses at any specific time. For a CSPF LSP, this metric represents the cumulative IGP metric of all links the active path uses. If CSPF for this LSP is configured to use the TE metric, the LSP operational metric is set to the maximum value. For a non-CSPF LSP, the operational metric is the shortest IGP cost to the destination of the LSP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The LSP operational metric is used by some applications to select an LSP among a set of LSPs that are destined to the same egress router. The LSP with the lowest operational metric is selected. If more than one LSP has the same lowest LSP metric, the LSP with the lowest tunnel index is selected. The configuration of a constant metric by the user ensures that the LSP always maintains its preference in this selection regardless of the path it uses at any given time. Applications that use the LSP operational metric include LDP-over-RSVP, VPRN auto-bind, IGP, BGP, and static route shortcuts.

This command and the **use-computed-metric** command are mutually exclusive.

mbb-prefer-current-hops *boolean*

Synopsis	Select preference to use the current hops for MBB
Context	**configure** router *named-item-64* mpls mbb-prefer-current-hops *boolean*
Tree	mbb-prefer-current-hops

Description

When configured to **true**, the router instructs CSPF to select an MBB path of a RSVP-TE LSP which has the most overlapping links with the current path.

When MPLS performs an MBB for the primary or secondary path of a P2P LSP, or the S2L path of a P2MP LSP, and this command is enabled in the MPLS context, CSPF selects a path, among equal-cost candidate paths, with the most overlapping links with the current path. Normally, CSPF selects the path randomly.

The procedures for the MBB CSPF path selection apply to LSP without the **least-fill** command enabled. If the least-fill rule results in a different path, the LSP path is moved. Users can still favor stability over the least-fill condition by applying a larger value to the **least-fill-min-thd** command, under the MPLS context, such that a path is only moved when the difference of the least-available bandwidth becomes significant enough between the most used links in the equal-cost paths. If that difference is not significant enough, CSPF selects the path with the most overlapping links instead of selecting a path randomly.

The procedures when this command is enabled apply to the following MBB types:

- RSVP P2P LSP:
- global revertive MBB
- autobandwidth MBB
- configuration change MBB
- soft preemption MBB
- TE graceful shutdown MBB
- delayed retry MBB (for SRLG secondary LSP path)
- path change MBB
- timer resignal MBB

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- manual resignal MBB
- S2L path of a RSVP P2MP LSP:
- global revertive MBB
- soft preemption MBB
- TE graceful shutdown MBB

During the FRR global revertive MBB, CSPF selects a random link from those available between the PLR node and the Merge Point node, including the failed link if it has restored in the meantime. These links cannot be checked for overlap with the current path.

The TE graceful shutdown MBB still avoids the link or node that is in maintenance and the soft preemption MBB still avoids the link that is overbooked.

For an inter-area LSP, this feature applies to the subset of the path from the ingress LER to the exit ABR.

The procedures of this feature are not applied to a zero-bandwidth CSPF LSP, including an autobandwidth CSPF LSP while its operational bandwidth is zero, and to a non-CSPF LSP.

resignal-on-igp-event *boolean*

Synopsis	Reoptimize RSVP LSP paths upon IGP events
Context	**configure** router *named-item-64* mpls resignal-on-igp-event *boolean*
Tree	resignal-on-igp-event
Description	When configured to **true**, the system enables the ad hoc reoptimization of the active CSPF path of all RSVP-TE LSPs at the receipt of an IGP link event. The following link events are supported:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- link down
- link up
- IGP or TE metric change
- SRLG change
- admin group change

The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates the active paths of all RSVP-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops, and computing a new CSPF path. MPLS signals and programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

Default false

Introduced 24.10.R1

Context **configure** router *named-item-64* mpls resignal-on-igp-overload *boolean*

Tree resignal-on-igp-overload

Description When configured to **true**, the receipt of the IS-IS overload bit in the TE-DB triggers the immediate resignaling of all RSVP-TE LSPs. MPLS forces the expiry of the resignal timer and the TE-DB computes a new CSPF for each RSVP-TE LSP active path. The re-optimization causes the immediate transition of RSVP-TE LSP paths away from the IS-IS node in overload using the MBB operation.

This command cannot be configured to **true** when the **retry-on-igp-overloa**d command is configured to **true**.

When configured to **false**, the default behavior is maintained where MBB re-optimization occurs only when a timer-based resignal is performed or a manual resignal is executed.

Default false

Introduced 20.10.R1

resignal-on-igp-event *boolean*

Synopsis	Reoptimize SR-TE LSPs upon IGP link events
Context	**configure** router *named-item-64* mpls sr-te-resignal resignal-on-igp-event *boolean*
Tree	resignal-on-igp-event
Description	When configured to **true**, the system enables the ad hoc reoptimization of all CSPF paths in the operational UP state of all SR-TE LSPs at the receipt of an IGP link event. The following link events are supported: • link down • link up • IGP or TE metric change • SRLG change • admin group change The ad hoc reoptimization follows the same behavior as in the timer-based resignal Make-Before-Break (MBB) feature. MPLS reevaluates all the paths in the operational UP state of all SR-TE LSPs. The reevaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops and labels, and computing

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

a new CSPF path. MPLS programs the new path only if its total metric is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be the most optimal and retained.

This feature does not require that the timer-based resignal (**configure router mpls sr-te-resignal resignal-timer**) command be enabled. If enabled, the resignal timer is aborted and an ad hoc reoptimization is performed.

Default false

Introduced 19.10.R1

Platforms All

resignal-on-igp-overload *boolean*

Synopsis Enable resignaling of SR-TE LSPs upon IGP overload

Context **configure** router *named-item-64* mpls sr-te-resignal resignal-on-igp-overload *boolean*

Tree resignal-on-igp-overload

Description When configured to **true**, the system enables ad-hoc re-optimzation of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router.

When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up.

The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the **configure router mpls sr-te-resignal resignal-timer** command to configure the resignal timer for the SR-TE application.

When configured to **false**, MPLS does not act immediately on an IS-IS overload bit from a remote router. MPLS acts on it at the next timer-based or manual re-optimization of the SR-TE LSPs.

Default false

Introduced 23.3.R1

metric *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	MPLS static LSP metric to select an LSP
Context	**configure** router *named-item-64* mpls static-lsp *named-item-64* metric *number*
Tree	metric
Description	This command allows the user to override the LSP operational metric with a constant administrative value that does not change regardless of the actual path the LSP uses over its lifetime. The LSP operational metric matches the metric that the active path of this LSP uses at any specific time. For a CSPF LSP, this metric represents the cumulative IGP metric of all links the active path uses. If CSPF for this LSP is configured to use the TE metric, the LSP operational metric is set to the maximum value. For a non-CSPF LSP, the operational metric is the shortest IGP cost to the destination of the LSP. The LSP operational metric is used by some applications to select an LSP among a set of LSPs that are destined to the same egress router. The LSP with the lowest operational metric is selected. If more than one LSP has the same lowest LSP metric, the LSP with the lowest tunnel index is selected. The configuration of a constant metric by the user ensures that the LSP always maintains its preference in this selection regardless of the path it uses at any given time. Applications that use the LSP operational metric include LDP-over-RSVP, VPRN auto-bind, IGP, BGP, and static route shortcuts. This command and the **use-computed-metric** command are mutually exclusive.

strict-ero-nhop-direct-resolution *boolean*

Synopsis	Resolves RSVP-TE LSP ERO to local and host routes only
Context	**configure** router *named-item-64* mpls strict-ero-nhop-direct-resolution *boolean*
Tree	strict-ero-nhop-direct-resolution
Description	When configured to **true**, the router enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table. This command applies to an ERO when all of the following conditions are met: • the ERO next hop is an IPv4 address • the ERO object is a strict hop

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- the IPv4 address matches the primary subnet of a local numbered interface

If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2).

When configured to **false**, the router disables the strict ERO next-hop direct resolution.

Default	false
Introduced	22.5.R1

rsvp-te *number*

Synopsis	RSVP-TE tunnel table preference
Context	**configure** router *named-item-64* mpls tunnel-table-pref rsvp-te *number*
Tree	rsvp-te
Description	This command configures the tunnel table preference for RSVP-TE LSP tunnel type. The tunnel table preference applies to next-hop resolution of BGP routes for: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPV6 in the tunnel table. This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The service manager controls and fixes the tunnel preference in such an SDP. The tunnel table preference configuration does not modify the SDP behavior, nor the services that bind to it. Nokia recommends that tunnel types have unique preference values. In a situation where two or more tunnel types are set to the same preference value, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.
Range	1 to 255

bgp-labels-hold-timer *number*

Synopsis BGP labels hold timer for the ingress router

Context **configure** router *named-item-64* mpls-labels bgp-labels-hold-timer *number*

Tree bgp-labels-hold-timer

Description This command configures the number of seconds the IOM retains a BGP per-next-hop label forwarding entry (ILM entry) after BGP determines the label is no longer associated with any best or best-external path. Retaining the entry for a short period allows in-flight traffic bearing the old label to continue forwarding while upstream routers converge to the new label value, enabling MBB behavior during primary path reoptimization.

A non-zero delay is useful in the following situations:

- a label-unicast route is readvertised with a new label by an ABR/ASBR operating in label-per-next-hop mode after it selects a new primary path
- an IP VPN route is readvertised with a new label by an ABR/ASBR operating in label-per-next-hop mode after it selects a new primary path
- an IP VPN route is readvertised with a new label by a VPRN with best-external enabled when its best-external path changes
- an IP VPN route is readvertised with a new label by a VPRN in label-per-next-hop mode after the CE next hop changes

In the preceding situations, configure the hold timer to be large enough to account for the propagation delay of the route withdrawal to all ingress routers.

This command applies to the Base router BGP instance and all VPRN BGP instances. It affects per-next-hop labels for labeled-IPv4 routes, VPN-IPv4 and VPN-IPv6 routes, including best-external, and LPN-mode VPRN per-CE labels.

When set to zero, label forwarding entries are deleted immediately when BGP no longer requires them.

Range 0 to 255

Default 0

import-policy *reference*

Synopsis	Policy to import source-active states into MSDP
Context	**configure** router *named-item-64* msdp group *named-item* import-policy *reference*
Tree	import-policy
Description	This command specifies the policy used to import SA states from the SA list into MSDP. If multiple policy names are specified, the router evaluates the policies in the order they are specified, and applies the first policy that matches. If an import policy is configured at the global level, each individual peer inherits the global policy. If an import policy is configured at the group level, each individual peer in a group inherits the group policy. If an import policy is configured at the peer level, the policy only applies to the peer where it is configured.
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	19.10.R1
Platforms	All

local-address *ipv4-unicast-address*

Synopsis	Local end IP address of the MSDP group
Context	**configure** router *named-item-64* msdp group *named-item* local-address *ipv4-unicast-address*
Tree	local-address
Description	This command configures the local end address of an MSDP session. For MSDP to function, at least one peer with a local address must be configured. This address must be present on the node and is used to validate incoming connections to the peer and to establish connections to the remote peer. The specified IP address is validated and used as the local address for MSDP peers from that point. If a subsequent address is configured, it replaces the existing configuration and terminates any existing sessions When a session is terminated, all information pertaining to and learned from that peer is removed. When a new peering session is created or a peering session is lost, an event message is generated.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	19.10.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mode *keyword*

Synopsis	Topology of the group of peers
Context	**configure** router *named-item-64* msdp group *named-item* mode *keyword*
Tree	mode
Description	This command configures the MSDP group topology. MSDP peers can be grouped in a full-mesh topology to prevent excessive flooding of SA messages to neighboring peers. In a mesh group, SA messages received from a mesh group member are always accepted but are not flooded to other members of the same mesh group. These SA messages are only flooded to non-mesh group peers or members of other mesh groups. **Note:** In a meshed configuration, all members of the group must have a peer connection with every other mesh group member. If this rule is not adhered to, unpredictable results may occur.
Options	standard, mesh-group
Default	standard
Introduced	19.10.R1
Platforms	All

peer [ip-address] *ipv4-unicast-address*

Synopsis	Enter the **peer** list instance
Context	**configure** router *named-item-64* msdp group *named-item* peer *ipv4-unicast-address*
Tree	peer
Description	Commands in this context configure an MSDP group peer. For MSDP to function, at least one peer with a local address must be configured. After peer relationships are established, the MSDP peers exchange messages to advertise active multicast sources. By default, the options applied to a peer are inherited from the global or group level. To override these inherited options, configure the peer-specific options within this context.
Introduced	19.10.R1
Platforms	All

[**ip-address**] *ipv4-unicast-address*

authentication-key *encrypted-leaf*

Synopsis	MD5 authentication key for the MSDP peering session
Context	**configure** router *named-item-64* msdp group *named-item* peer *ipv4-unicast-address* authentication-key *encrypted-leaf*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	authentication-key
Description	This command configures a Message Digest 5 (MD5) authentication key to be used with a specific MSDP peering session. The authentication key is not inherited from the global or group level and must be configured per peer. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 422
Introduced	19.10.R1
Platforms	All

default-peer *boolean*

Synopsis	Set the peer as a default MSDP peer
Context	**configure** router *named-item-64* msdp group *named-item* peer *ipv4-unicast-address* default-peer *boolean*
Tree	default-peer
Description	When configured to **true**, the system sets the peer as a default MSDP peer. All SA messages from a default peer are accepted without the usual peer-reverse-path-forwarding (RPF) check. Unlike the normal multicast RPF checks, the peer-RPF check stops SA messages from looping. When configured to **false**, the system sets the peer as a non-default peer, which forces all SA messages from the peer to be RPF checked. See "Peer-RPF check" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Multicast Routing Protocols Guide* for information about the peer-RPF check rules.
Default	false
Introduced	19.10.R1
Platforms	All

export-policy *reference*

Synopsis	Policy to export source-active states into MSDP
Context	**configure** router *named-item-64* msdp group *named-item* peer *ipv4-unicast-address* export-policy *reference*
Tree	export-policy
Description	This command specifies the policy used to export SA states from the SA list into MSDP. If multiple policy names are specified, the router evaluates the policies in the order they are specified, and applies the first policy that matches.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* msdp source-active-cache-lifetime *number*
Tree	source-active-cache-lifetime
Description	This command configures the timeout interval for the SA entries in the cache. If these entries are not refreshed within the timeout interval, they are removed from the cache. Normally, the entries are refreshed at least once per minute, but under high load with many MSDP peers, the refresh cycle could be incomplete. Configuring a higher timeout value is useful to prevent instabilities in the MSDP cache.
Range	90 to 600
Units	seconds
Default	90
Introduced	19.10.R1
Platforms	All

mss-adjust

Synopsis	Enable the **mss-adjust** context
Context	**configure** router *named-item-64* mss-adjust
Tree	mss-adjust
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

endpoint [address] *ipv6-address*

Synopsis	Enter the **endpoint** list instance
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address*
Tree	endpoint
Max. instances	128
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[**address**] *ipv6-address*

Synopsis	Dual Stack Lite IPv6 address
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address*
Tree	endpoint
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ip-fragmentation *keyword*

Synopsis	Fragmentation control of the AFTR originated downstream IPv6 traffic
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address* ip-fragmentation *keyword*
Tree	ip-fragmentation

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	fragment-ipv6, fragment-ipv6-unless-ipv4-df-set
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

min-first-fragment-size-rx *number*

Synopsis	Minimum MTU size for upstream packets
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address* min-first-fragment-size-rx *number*
Tree	min-first-fragment-size-rx
Description	This command configures the minimum MTU size for the first fragment in the upstream direction. This command can be used to enable processing of first IPv6 fragments smaller than 1280 bytes. RFC 8200 recommends the minimum MTU in IPv6 be 1280 bytes which allows fragmentation only for packets that are larger than 1280 bytes. If a first fragment is smaller than 1280 bytes, DS-lite implementation in the SR OS, by default, drops the first fragment.
Range	512 to 1280
Default	1280
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

reassembly *boolean*

Synopsis	Reassembly of IPv6 payload datagrams
Context	**configure** router *named-item-64* nat inside large-scale dual-stack-lite endpoint *ipv6-address* reassembly *boolean*
Tree	reassembly
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

selector-mappings

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **selector-mappings** context
Context	**configure** router *named-item-64* nat inside large-scale nat44 deterministic prefix-map *ipv4-unicast-prefix* nat-policy *reference* selector-mappings
Tree	selector-mappings
Description	Commands in this context configure deterministic NAT mappings via selector bits. This command enables deterministic NAT mappings based on the IP address and port selector bits derived from the host portion of the configured prefix. The selector bits (for both IP address and port) fully occupy the available host bit space.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this context is enabled, the source IP addresses are interleaved across the outside IP addresses. The stride between these interleaved source addresses that are mapped to the same outside IP address is determined by the configured selector bits.

Deterministic port blocks can be assigned in either ascending (forward) or descending (reverse) order.

This behavior contrasts with the legacy sequential-fill mapping, where source IP addresses are mapped sequentially to each outside IP address until it is fully used, before moving to the next. In the legacy mode, deterministic port block allocation is only supported in ascending (forward) order.

Deleting this context disables selector-based mappings and reverts the configuration to the legacy sequential-fill mode.

Introduced 26.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

port-selector-length *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis Port selector length for deterministic prefix mapping

Context **configure** router *named-item-64* nat inside large-scale nat44 deterministic prefix-map *ipv4-unicast-prefix* nat-policy *reference* selector-mappings port-selector-length *number*

Tree port-selector-length

Description This command configures the number of bits in the host portion of the prefix that are used to select the deterministic port block assigned to each subscriber (source IPv4 address). These bits are referred to as P-bits (for ports), and they are positioned immediately following the prefix part of the source IPv4 address.

For more information, see "Parameterized deterministic NAT44 mapping" in the *7450 ESS, 7750 SR, and VSR Multiservice ISA and ESA Guide*.

This selection mechanism defines how port blocks are allocated and supports two allocation orders:

- ascending (forward) - port blocks assigned in increasing order
- descending (reverse) - port blocks assigned in decreasing order

The number of configured P-bits determines the number of subscribers per outside IP address, according to the following formula:

subscribers per outside IP = 2^p

The value of 2^p must correspond to the subscriber-limit command option configured in the associated NAT pool.

The bits immediately following the port selector bits are the IP address selector bits. They select the outside IP address for a specified source IP address. These bits are referred to as O-bits (for *outside* address selection).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Such a selection mechanism (based on the selector bits) enables interleaving of source IP addresses across the available outside IP addresses. The stride, that is, the distance between consecutive source IP addresses mapped to the same outside IP is determined by the formula:

stride = 2°

For example, if o = 10, then the stride between source IP addresses mapped to the same outside IP address is 1024.

hash-mask

Synopsis	Enable the **hash-mask** context
Context	**configure** router *named-item-64* nat inside large-scale nat44 hash-mask
Tree	hash-mask
Description	Commands in this context configure deterministic NAT with mappings based on selector bits. This command must be configured only when the selector bits under the deterministic prefix are used for mappings. By default, the hash mask is disabled, which means that all bits in the source IP address are eligible for hashing. The hash mask identifies the range between the port selector bits in the source IP address that are ignored in hashing. These bits are between the smallest and largest deterministic prefix length within a specific inside routing context plus the port selector bits length configured under the prefix with the largest prefix length. By masking source IP address bits in this way, traffic for a specific source IP address is steered to the ESA-VM with the corresponding (pre-mapped) outside IP address.
Introduced	26.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-selector-end-prefix-length *number*

Synopsis	Maximum prefix and port selector length for hash mask
Context	**configure** router *named-item-64* nat inside large-scale nat44 hash-mask max-selector-end-prefix-length *number*
Tree	max-selector-end-prefix-length
Description	This command configures the longest prefix length among all prefixes configured within an inside routing context and its port selector bits length for deterministic NAT based on selector bits. Together with the shortest prefix, this command defines the range of bits excluded from the ingress hashing function. This exclusion is required to ensure that ingress traffic on the inside is distributed across ESA-VMs in such a way that packets with a given source IP address are directed to the ESA-VM hosting the corresponding outside IP address (as pre-mapped in deterministic NAT).
Range	0 to 31
Default	0
Introduced	26.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

min-prefix-length *number*

Synopsis	Minimum prefix length for hash mask
Context	**configure** router *named-item-64* nat inside large-scale nat44 hash-mask min-prefix-length *number*
Tree	min-prefix-length
Description	This command configures the shortest prefix length among all prefixes configured within an inside routing context for deterministic NAT based on selector bits. Together with the longest prefix and its associated port-selector bits length, this command defines the range of bits excluded from the ingress hashing function. This exclusion is required to ensure that ingress traffic on the inside is distributed across ESA-VMs in such a way that packets with a specific source IP address are directed to the ESA-VM hosting the corresponding outside IP address (as pre-mapped in deterministic NAT).
Range	0 to 31
Default	0
Introduced	26.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

max-subscriber-limit *number*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Ingress hashing for load distribution across ESA-VMs
Context	**configure** router *named-item-64* nat inside large-scale nat44 max-subscriber-limit *number*
Tree	max-subscriber-limit
Description	This command configures the maximum number of classic LSN subscribers within a consecutive range of IP addresses that are processed by the same ESA-VM. It directly defines the granularity of upstream traffic distribution across ESA-VMs within the scope of an inside routing context. The ingress hashing mechanism used for traffic distribution is based on source IPv4 addresses or prefixes. For more information, see "Parameterized deterministic NAT44 mapping" in the *7450 ESS, 7750 SR, and VSR Multiservice ISA and ESA Guide*. A more granular distribution is achieved when traffic is distributed by individual IPv4 addresses, while a less granular distribution occurs when traffic is distributed by IPv4 prefixes, the size of which is determined by the configured prefix length. The /32 and /24 prefix examples are as follows:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- A prefix length of /32 distributes individual IPv4 addresses across multiple ESA-VMs within an ESA-VM group.
- A prefix length of /24 distributes subscribers in groups of 256 addresses (/24) across ESA-VMs

The prefix length used for distribution is derived as follows.

prefix length = 32 - n

Where:

n = log 2 (max-subscriber-limit)

or

max-subscriber-limit = 2^n

For example, when traffic distribution is based on individual IPv4 addresses (/32), n = 0, and therefore, max-subscriber-limit = 1

This is the default value and is recommended for non-deterministic and non-DNAT-only configurations.

This indirect relationship between this command and the prefix length originates from deterministic NAT, where the command was first introduced.

- In classic deterministic NAT (non-selector-mapping), this command must be configured to match the largest subscriber-limit value among all deterministic NAT pools referenced by the same inside routing context. This ensures consistent prefix-length computation for ingress hashing and correct route segmentation on the outside.
- In deterministic NAT with selector-based mappings, set this command according to the required aggregation level of NAT pool routes installed in the outside routing context.

The primary use of this command is in deterministic NAT and Destination NAT without Source NAT (DNAT-only).

In these cases, it also determines the number and prefix length of NAT pool routes installed in the outside routing context, ensuring that downstream (return) traffic is steered to the correct ESA-VM.

In DNAT-only configurations, where source IP addresses are not translated and remain visible in the outside routing context, this command affects the aggregation of source routes in the outside routing table.

For this command, the following configuration rules must be observed:

- The command must be configured before any deterministic NAT prefix is defined.
- This command can only be modified when no deterministic prefixes are currently configured under deterministic NAT.

Range	1 | 2 | 4 | 8 | 16 | 32 | 64 | 128 | 256 | 512 | 1024 | 2048 | 4096 | 8192 | 16384 | 32768 | 65536

nat-import *reference*

Synopsis	Import BGP-VPN routes in NAT inside routing context
Context	**configure** router *named-item-64* nat inside large-scale nat44 nat-import *reference*
Tree	nat-import
Description	This command references an import policy to determine the routes that should be installed in the routing table as NAT routes, which are used to steer traffic to NAT. A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route is associated with a NAT policy that maps traffic destined into a NAT pool and outside routing context. If the NAT policy is not explicitly configured in the import route-policy, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context. All BGP-VPN routes that are destined to be imported into NAT inside routing context must be configured with action-type accept in the route policy.

Synopsis	Prefix length used for ingress traffic load balancing
Context	**configure** router *named-item-64* nat inside large-scale nat66 hash-prefix-length *number*
Tree	hash-prefix-length
Description	This command configures the router to control how IPv6 subscriber traffic subject to IPv6 large scale stateful inbound filtering is distributed across ESA-VMs on ingress. By default, ingress hashing is performed per subscriber, providing the most granular distribution. In cases such as IPv6 large scale stateful inbound filtering where the source IPv6 address is not translated, per-subscriber hashing results in individual subscriber routes being created in the outside routing context. These routes ensure that return (downstream) traffic is directed to the correct ESA-VM that maintains the state of the subscriber. To prevent excessive route entries, this command allows grouping subscribers into larger IPv6 sub-prefixes. In this mode, traffic is load-balanced across ESA-VMs at the prefix level, instead of per subscriber, so that aggregated routes are installed in the outside routing context instead of individual subscriber routes. In other words, this command optimizes the outside routing table by reducing route granularity, trading fine-grained hashing for a more scalable route distribution. Subscriber grouping is derived from the main prefix configured within the firewall domain. See the following commands for more information:
Range	32 to 64 | 128

Synopsis	Prefix length under which resources are aggregated
Context	**configure** router *named-item-64* nat inside large-scale nat66 subscriber-prefix-length *number*
Tree	subscriber-prefix-length
Description	This command configures the router to enable the aggregation of watermarks and other scaling limits, such as session limits. The IPv6 large scale stateful inbound filtering does not translate IP addresses or ports, but it can maintain these parameters per prefix. For example, in a bridged home environment where multiple IPv6 addresses are exposed, resource control can be applied per home (for example, /64) prefix instead of per individual IPv6 address.
Range	32 to 64 | 128
Default	128
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

redundancy

Synopsis	Enter the **redundancy** context
Context	**configure** router *named-item-64* nat inside large-scale redundancy
Tree	redundancy

peer6 *ipv6-unicast-address*

Synopsis	IPv6 address of NAT redundancy peer for VR instance
Context	**configure** router *named-item-64* nat inside large-scale redundancy peer6 *ipv6-unicast-address*
Tree	peer6
Description	This command configures the IPv6 address of the NAT redundancy peer. The configured peer6 address is an IPv6 address configured under an interface on the peering NAT64 node (active or standby). This IPv6 interface address is advertised via routing on the inside in order to attract traffic from the standby to the active NAT64 node. Under normal circumstances, the NAT64 prefix is advertised only from the active NAT64 node. Consequently, upstream traffic for NAT64 is attracted to the active NAT64 node. The NAT action in the IPv6 filter on the active NAT64 node forwards traffic to the local MS-ISA where the NAT64 function is performed. However, in that case, that upstream traffic arrives on the standby NAT64 node, the NAT action in the IPv6 filter forwards traffic to the peer6 address (active NAT64 node).
Introduced	16.0.R1

prefix [ip-prefix] *ipv6-unicast-prefix*

Synopsis	Enter the **prefix** list instance
Context	**configure** router *named-item-64* nat outside domain *named-item* prefix *ipv6-unicast-prefix*
Tree	prefix
Description	Commands in this context configure the source IP prefix of the subscribers. This command is required for large scale stateful filtering scenarios where there is no address translation involved. The configured prefix represents the source IPv6 prefix for traffic originating from the inside network, where subscribers within this prefix are protected by the firewall. This prefix serves two main purposes: • to perform hashing of the ingress traffic on the inside. Subscribers can be grouped into subprefixes derived from the main configured prefix. The group size (or subprefix) is determined by the **hash-prefix-length** command under one of the following contexts (**configure service vprn nat inside large-scale-nat66** and **configure router nat inside large-scale-nat66**) • to allow return (downstream) traffic to be routed to the correct ESA-VM, where the session state of the subscriber is maintained, the prefix or its subprefixes are also included in the outside routing context. The **route-limit** command sets the upper limit for the maximum number of subprefixes that can be installed in the routing table on the outside.
Max. instances	8192

Synopsis	Outside IP address allocation mode for a NAT subscriber
Context	**configure** router *named-item-64* nat outside pool *named-item* address-pooling *keyword*
Tree	address-pooling
Description	This command configures address pooling which defines a relationship between the NAT subscriber and its outside IP address(es). The behavior in NAT, as defined in RFC 7857, strongly recommends that the NAT subscribers be mapped to a single outside IP address. If this outside IP address runs out of ports, no new ports for the subscriber are allocated. This behavior is called paired address pooling. The alternative behavior is arbitrary address pooling, where a NAT subscriber is mapped to multiple IP addresses when the current outside IP address runs out of ports. This way, the subscriber becomes associated with multiple outside IP addresses. While this results in better resource utilization in NAT, it may negatively affect the behavior of some applications.
Options	paired, arbitrary
Default	paired
Introduced	23.3.R1

Tree	exclude
Description	Commands in this context exclude the specified range of IPv4 addresses from the NAT pool without impacting the traffic associated with the remaining addresses. Excluded IP addresses are withdrawn from the routing table, ensuring that downstream traffic destined for them does not reach the ESA-VM. Instead, such traffic is dropped at the forwarding plane level. This approach offloads drop processing from the ESA-VM, which significantly improves system performance by reducing CPU overhead related to packet drops. While exclusion of IPv4 addresses from the NAT pool may introduce some routing churn (for example, remicroneting), the user can aggregate NAT routes to limit the impact to the local node. If routing changes are allowed to propagate upstream, the benefit is that unwanted traffic is dropped earlier at an upstream router, thereby reducing the load on the downstream network. IPv4 addresses excluded from the NAT pool using this command are returned to the pool when this command is deleted. The following applies when an address is excluded: • All NAT sessions associated with that public IP are removed. • Any static port-forward actions tied to that address transition to the **down** state. • Subscribers mapped to the excluded public IP can be reassigned to a new NAT address. This command is supported for non-deterministic LSN44, NAT64 and DS-Lite.

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

icmp-echo-reply *boolean*

Synopsis	Allow NAT pool IP addresses to respond to ICMP PINGs
Context	**configure** router *named-item-64* nat outside pool *named-item* icmp-echo-reply *boolean*
Tree	icmp-echo-reply
Description	This command allows IP addresses in the NAT pool to respond to ICMP Echo requests (PINGs). The configuration can be toggled while the pool is in use. In L2-aware NAT when port-block-extensions is disabled, the reply from an outside IP address is generated only when this IP address has at least one host (binding) behind it. In L2-aware NAT when port-block-extensions is enabled, the reply from an outside IP address is generated regardless if a binding is present. In LSN, the reply from an outside IP address is generated regardless if a binding is present.
Default	false
Introduced	21.10.R1

Context	**configure** router *named-item-64* nat outside pool *named-item* l2-aware
Tree	l2-aware
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

default-host

Synopsis	Enable the **default-host** context
Context	**configure** router *named-item-64* nat outside pool *named-item* l2-aware default-host
Tree	default-host
Description	Commands in this context configure the default DMZ host options. A default DMZ host is a node on the inside to which all unknown traffic is redirected by changing the destination IPv4 address in the traffic header. During this operation, the checksums in the Layer 3 and Layer 4 header (UDP and TCP) are recalculated. Unknown traffic in NAT represent all unmatched traffic arriving from the outside (where there is no pinhole or a matching flow record created by traffic initiated from the inside). The purpose of the default DMZ host is to capture and analyze the unknown traffic as part of threat analysis. The rate of redirected unknown traffic can be restricted by configuration.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

inside-router-instance *string*

Synopsis	Router instance of the DMZ
Context	**configure** router *named-item-64* nat outside pool *named-item* l2-aware default-host inside-router-instance *string*
Tree	inside-router-instance
Description	This command configures the router instance on the inside where the default DMZ host resides.

subscriber-limit *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Number of L2-Aware NAT subscribers per outside address
Context	**configure** router *named-item-64* nat outside pool *named-item* l2-aware port-block-extension subscriber-limit *number*
Tree	subscriber-limit
Description	When port-block extensions for the L2-Aware subscribers are enabled, the port space for an outside IP address is divided into the following: • well-known port (this is a fixed and permanently allocated block of ports for all NAT types) • static port-forwarding range (if enabled by configuration) • port range allocated for initial port blocks of each L2-Aware subscriber • port range allocated for extended port blocks for the remainder after the three previous port ranges

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The number of L2-Aware NAT subscribers per an outside IP address multiplied by the size of the initial port-block size determines the size of the port range reserved for initial port-blocks of each subscriber.

The lower boundary of the extended port range is determined by adding the upper boundary of the configured port forwarding range and the size of the port range allocated for initial port blocks.

Range	2 to 2000
Notes	This element is mandatory.

Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

monitor-oper-group *reference*

Synopsis	Monitor operational group associated with a NAT pool
Context	**configure** router *named-item-64* nat outside pool *named-item* monitor-oper-group *reference*
Tree	monitor-oper-group
Description	This command configures an operational group monitored by a NAT pool. Although a NAT pool lacks its own operational state, it can track the status of another entity via the operational group associated with that entity. When an operational group monitored by a NAT pool transitions to the down state, the route of the pool is withdrawn from the routing table. In effect, when the monitored operational group goes down, the NAT pool becomes unreachable. Deterministic NAT is where NAT policy selection is defined in a deterministic prefix or address map. In this case, internal destination prefixes or filter entries not explicitly assigned a NAT policy are withdrawn from the routing and forwarding tables only if all NAT pools referenced by all NAT policies in the deterministic configuration become inactive. In other words, all monitored operational groups are down.
Reference	**configure** service oper-group *named-item*
Introduced	25.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

dynamic-block-reservation *boolean*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Reserve dynamic block for subscriber
Context	**configure** router *named-item-64* nat outside pool *named-item* port-forwarding dynamic-block-reservation *boolean*
Tree	dynamic-block-reservation
Description	When configured to **true**, the system reserves dynamic port block when the first port forward for the subscriber is created. The dynamic port block allocation is logged only if the block is being used and mappings are created. Dynamic port block reservation due to the port forward creation but without any dynamic mapping, is not logged. The reserved port block is released only when the last mapping in the block expires and there are no port forwards associated with the subscriber. The de-allocation log (syslog or RADIUS) is generated when the dynamic port block is completely released. Dynamic port block reservations can be enabled only if the configured maximum number of subscribers per outside IP addresses are less than or equal to the maximum number of configured port blocks per outside IP address. When configured to **false**, dynamic port blocks are not reserved when the first port forward for the subscriber is created.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Use subject to Terms available at: www.nokia.com/terms.

range-end *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	End of the wildcard range for port forwards
Context	**configure** router *named-item-64* nat outside pool *named-item* port-forwarding range-end *number*
Tree	range-end
Description	This command configures the upper boundary of the wildcard port range dedicated to port forwarding in a NAT pool, whereas the **range-start** command configures the lower boundary (the starting port) of the wildcard port range dedicated to port forwarding in a NAT pool. If unconfigured, the **range-end** implicit value is set to 1023, that represents the end of the well-known port range that is always enabled. Port forwards are supported only in pools in NAPT mode. Pools in 1:1 mode do not support port-forwards.
Range	0 | 1023 to 65535
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

range-start *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Start of the wildcard range for port forwards
Context	**configure** router *named-item-64* nat outside pool *named-item* port-forwarding range-start *number*
Tree	range-start
Description	This command configures the lower boundary (the starting port) of the wildcard port range dedicated to port forwarding in a NAT pool, whereas the **range-end** command configures the upper boundary of the wildcard port range dedicated to port forwarding in a NAT pool. Port 0 is always excluded from the port forwarding range.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Port forwards are supported only in pools in Network Address and Port Translation (NAPT) mode. Pools in 1:1 mode do not support configured port forwards.

Range	0 | 1 | 1025 to 65535
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port-reservation

Synopsis	Enter the **port-reservation** context
Context	**configure** router *named-item-64* nat outside pool *named-item* port-reservation

port-blocks *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Port block size for NAT subscribers
Context	**configure** router *named-item-64* nat outside pool *named-item* port-reservation port-blocks *number*
Tree	port-blocks
Description	In CGN, this command specifies the number of port-blocks per outside IP address in the NAT pool. The available ports per outside IP address (the end port minus the upper bound value of the static port-forwarding range) are divided into the number of port blocks specified in this command. This implicitly determines the size of each port block. For L2-aware NAT, this command can be configured only if the port block extensions (extended port blocks) are disabled. You must disable the **l2-aware port-block-extension** hierarchy in the NAT pool.
Range	0 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

ports *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Size of the port block for NAT subscribers
Context	**configure** router *named-item-64* nat outside pool *named-item* port-reservation ports *number*
Tree	ports
Description	For carrier-grade NAT (CGN), this command specifies the size of port blocks for NAT subscribers in the NAT pool. For Layer 2 aware NAT, this command specifies the size of the initial port block of a subscriber in the pool. Additional port blocks (extended port blocks) for the Layer 2 aware subscriber must be explicitly enabled under the **l2-aware port-block-extension** hierarchy in the NAT pool. This command does not affect the size of extended port blocks. For deterministic pools, the port range begins with zero. However, for non-deterministic pools, the port range begins with one.
Range	0 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

rpki-session [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **rpki-session** list instance
Context	**configure** router *named-item-64* origin-validation rpki-session *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	rpki-session
Description	This command configures a session with an RPKI local cache server by using the RPKI to Router (RPKI-RTR) protocol. Using these sessions, the router learns dynamic VRP entries expressing valid origin AS and prefix associations. SR OS supports the RPKI-RTR protocol over TCP/IPv4 or TCP/IPv6 transport. The router can set up an RPKI-RTR session using the base routing table (in-band) or the management router (out-of-band). Use the **configure router management** command to configure a session using the management port.
Introduced	19.5.R1
Platforms	All

Unless they are explicitly configured, interfaces are not activated by default in any interior gateway protocol such as OSPF.

Introduced 16.0.R1

Platforms All

[**interface-name**] *interface-name*

Synopsis Router interface name

Context **configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name*

Tree interface

Description This command specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **configure router interface** and **configure service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be a string composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured, an error message is returned.

If the IP interface exists in a different area it is moved to this area.

String length 1 to 32

Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness remain-down-on-failure *boolean*
Tree	remain-down-on-failure
Default	false
Introduced	16.0.R1
Platforms	All

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	23.3.R1
Platforms	All

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds
Introduced	23.3.R1

conditional-advertise-prefix *reference*

Synopsis	Policy to conditionally advertise interface prefixes
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* conditional-advertise-prefix *reference*
Tree	conditional-advertise-prefix
Description	This command specifies the policy that allows IS-IS, OSPF, and OSPFv3 to selectively advertise system or loopback interface prefixes (including associated SIDs and SRv6 locators) only when conditions defined in the route policy are met. The route policy evaluates the presence or absence of specific routes in the routing table, typically using constructs like route-exists. If the policy evaluates to accept, the interface prefix is advertised; if not, the prefix is suppressed.
Reference	**configure** policy-options policy-statement *named-item-64*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the interface type. **broadcast** - Broadcast network To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet. **non-broadcast** - Non-broadcast network **point-to-point** - Point-to-point link Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point. **p2mp-nbma** - Point-to-multipoint on a link without broadcast or multicast support No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type. **secondary** - Multiple secondary adjacencies allowed A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.
Options	broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma
Introduced	16.0.R1

node-sid

Synopsis	Enable the **node-sid** context
Context	**configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* node-sid
Tree	node-sid
Description	Commands in this context configure a node SID index or label value for the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address. In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary. This command fails if the network interface is not a loopback type or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node. The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required because the index and, therefore, the label ranges of IGP instances are not allowed to overlap. The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS resolves to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

Introduced 16.0.R1

Platforms All

clear-n-flag *boolean*

Synopsis Clear the N-flag in an OSPF prefix

Context **configure** router *named-item-64* ospf *number* area *ipv4-address* interface *interface-name* node-sid clear-n-flag *boolean*

Tree clear-n-flag

Description When configured to **true**, this command allows the user to clear the N-flag in an OSPF prefix SID sub-TLV originated for the prefix of a loopback interface on the system.

When configured to **false**, the N-flag in an OSPF prefix SID sub-TLV originated for the prefix of a loopback interface on the system is not cleared.

When the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

Default false

Introduced 16.0.R1

Context	**configure** router *named-item-64* ospf *number* database-export bgp-ls-identifier value *number*
Tree	value
Description	This command configures the BGP-LS ID to export. If an NRC-P network domain has multiple IGP domains, a user must configure BGP-LS speakers within each IGP domain with the same unique ASN, BGP-LS ID tuple. The

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain.

Note: If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command configuration is not strictly required because enabling the extended TE-DB populates this information automatically. However, Nokia recommends enabling the **traffic-engineering** command to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.

Max. range	0 to 4294967295
Default	0
Introduced	16.0.R1
Platforms	All

igp-identifier *number*

Synopsis	IGP instance in the BGP-LS NLRI
Context	**configure** router *named-item-64* ospf *number* database-export igp-identifier *number*
Tree	igp-identifier
Description	This command identifies the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. The concept of an instance ID specified for OSPF is local subnet significant (RFC 6549). An IGP identifier value can be configured to be unique within a specified IGP domain when the router sends the IGP link state information using BGP-LS.
Max. range	0 to 18446744073709551615
Introduced	16.0.R1
Platforms	All

reachable-ls-only *boolean*

Synopsis	Encode only reachable link-state information
Context	**configure** router *named-item-64* ospf *number* database-export reachable-ls-only *boolean*
Tree	reachable-ls-only
Description	When configured to **true**, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configure to **false**, the router continues to send link-state objects even for links that fail an IGP reachability check.

Default	false
Introduced	24.10.R1

Description	This command enables the advertisement of a locally configured Flexible Algorithm Definition (FAD). The winning FAD that a router uses must be consistent with the winning FAD on all other routers, which avoids routing loops and traffic blackholing. The winning FAD is selected using a tiebreaker algorithm that first selects the highest advertised FAD priority followed by the highest system ID.
Reference	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item*

micro-loop-avoidance

Synopsis	Enable the **micro-loop-avoidance** context
Context	**configure** router *named-item-64* ospf *number* flexible-algorithms flex-algo *number* micro-loop-avoidance
Tree	micro-loop-avoidance
Description	When configured, the system enables micro-loop avoidance for an SR-OSPF flexible algorithm, and consequently, inherits the FIB delay timer from the SR-OSPF **configure router ospf segment-routing** context. When this command is configured, FIB updates are delayed before the system programs new primary next hops to avoid micro-loops. When configured, the feature applies to the following contexts: • OSPFv2 SR-OSPF IPv4 tunnel (node SID) • IPv4 and IPv6 SR-TE LSPs that use a node SID in their segment list • IPv4 and IPv6 SR policies that use a node SID in their segment list When micro-loop-avoidance is disabled (by removing this command from the configuration), the system forces any running FIB delay to expire immediately and programs the new next hops for all impacted node SIDs. When disabled, micro-loop avoidance is disabled instantaneously and will be disabled for the next SPF runs. Micro-loop avoidance remains disabled until it is re-enabled.

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** router *named-item-64* ospf *number* graceful-restart
Tree	graceful-restart
Description	Commands in this context enable OSPF graceful restart (GR) to minimize service interruption. When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve OSPF forwarding information. Traffic continues to be forwarded to the restarting router using the last-known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal OSPF operation. If the grace period expires, the restarting router is presumed inactive and the OSPF topology is recalculated to route traffic around the failure.
Introduced	16.0.R1
Platforms	All

helper-mode *boolean*

Synopsis	Enable graceful restart helper for OSPF
Context	**configure** router *named-item-64* ospf *number* graceful-restart helper-mode *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	helper-mode
Description	When configured to **true**, the router operates in OSPF graceful restart helper mode and assists restarting neighbors by maintaining adjacencies and forwarding state during their graceful restart interval. When configured to **false**, the router does not provide helper support and does not preserve adjacency or forwarding state for neighbors performing a graceful restart.
Default	true
Introduced	16.0.R1
Platforms	All

helper-resync-timeout *number*

Synopsis	Maximum resynchronization period
Context	**configure** router *named-item-64* ospf *number* graceful-restart helper-resync-timeout *number*
Tree	helper-resync-timeout
Description	This command configures the maximum resynchronization period. If the resynchronization takes longer than the configured value, the graceful restart process stops, and the OSPF neighbor session falls back to the ExStart state for normal adjacency establishment.
Range	120 to 900
Units	seconds
Default	120
Introduced	26.3.R1
Platforms	All

protocol

Synopsis	Enter the **protocol** context
Context	**configure** router *named-item-64* ospf *number* graceful-restart protocol
Tree	protocol
Description	Commands in this context configure which RFC is used for OSPF graceful restart signaling. If both protocols are enabled, the OSPF interface automatically uses the method indicated by the first received graceful restart signaling packet on that interface.
Introduced	26.3.R1
Platforms	All

Default	disable
Introduced	16.0.R1
Platforms	All

allow-sr-over-srte *boolean*

Synopsis	Enable SR over SR-TE LSPs
Context	**configure** router *named-item-64* ospf *number* igp-shortcut allow-sr-over-srte *boolean*
Tree	allow-sr-over-srte
Description	When configured to **true**, the router only allows SR-MPLS SRv4 and SRv6 IGP shortcuts to use SR-TE LSPs with **allow-sr-over-srte** explicitly enabled with an adjacency SID as top SID in the SR-TE LSP. IPv4 and IPv6 addresses can use all available SR-TE LSPs as IGP shortcuts regardless of the explicit **allow-sr-over-srte** configuration. Under ECMP, when this command is configured to **true**, preference is given to the SR-TE LSPs with **allow-sr-over-srte** explicitly configured over the LSPs that do not have **allow-sr-over-srte** configured.
Default	false
Introduced	23.3.R1
Platforms	All

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate
Tree	loopfree-alternate
Description	Commands in this context enable Loop-Free Alternate (LFA) computation by SPF under the IS-IS routing protocol level or under the OSPF routing protocol instance. When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary next hop and an LFA next hop for every learned prefix. IS-IS computes the primary SPF first and then computes the LFA SPF. The LFA backup next hop is only

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

available after the LFA SPF is completed. When found, the LFA next hop is populated into the routing table along with the primary next hop for the prefix.

Introduced 16.0.R1

Platforms All

augment-route-table *boolean*

Synopsis Attach remote LFA information to RTM entries

Context **configure** router *named-item-64* ospf *number* loopfree-alternate augment-route-table *boolean*

Tree augment-route-table

Description When configured to **true**, this command enables IS-IS to attach remote LFA-specific information to RTM entries for use by protocols such as LDP.

When configured to **false**, rLFA-specific information is not added to RTM entries.

Default false

Introduced 21.10.R1

multi-homed-prefix

Synopsis	Enable the **multi-homed-prefix** context
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate multi-homed-prefix
Tree	multi-homed-prefix
Description	Commands in this context configure a multihomed prefix LFA for both RTM routes (IP FRR) and SR-OSPF tunnels. SR-OSPF tunnels enable multihomed prefix extension in both algorithm 0 and flexible-algorithm numbers. This feature makes use of the multihomed prefix model described in RFC 8518 to compute a backup IP next hop using an alternate ABR or ASBR for external prefixes and to an alternate router owner for local anycast prefixes. This feature further enhances the multihomed prefix backup path calculation beyond RFC 8518 with the addition of repair tunnels that make use of a PQ node or a P-Q set to reach the alternate exit ABR or ASBR of external prefixes or the alternate owner router of local anycast prefixes. The computed IP next-hop based backup path is added to OSPF routes of external /32 prefixes (OSPFv2 routes types 3, 4, 5, and 7) and local /32 anycast prefixes in the RTM if the prefix is not protected by base LFA or if the user set leaf preference value to all. The user must enable the ip-fast-reroute leaf to have these backup paths programmed into the FIB in datapath. The computed IP next hop or repair tunnel based backup path is also programmed for SR-OSPF node SID tunnels of external /32 prefixes and to /32 prefixes in same area as the computing node S and which are advertised by multiple routers (anycast prefix) in both algorithm 0 and flexible-algorithm numbers.

ti-lfa

Synopsis	Enable the **ti-lfa** context
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate ti-lfa
Tree	ti-lfa
Description	Commands in this context enable the use of the Topology Independent Loop-Free Alternate (TI-LFA) algorithm used in the LFA Shortest Path First (SPF) calculation for this OSPF instance.
Introduced	16.0.R1
Platforms	All

max-sr-frr-labels *number*

Synopsis	Maximum number of labels the TI-LFA backup path can use
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate ti-lfa max-sr-frr-labels *number*
Tree	max-sr-frr-labels
Description	This command configures the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.
Range	0 to 3
Default	2
Introduced	16.0.R1
Platforms	All

neighbor-path-expand *boolean*

Synopsis	Expand the neighbor path
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate ti-lfa neighbor-path-expand *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	neighbor-path-expand
Description	When configured to **true**, the router uses the TI-LFA backup path computation algorithm for the protection of an IPv4 SR-OSPF node SID of a neighbor and of an adjacency SID over a link to that neighbor to avoid traffic loops when the neighbor node fails. The SR-OSPF TI-LFA expanded neighbor backup path expands the path from the Q node to the destination node, which is the neighbor node in this case, by first visiting the penultimate node and then riding an unprotected adjacency SID over a link to the destination node. When applied to the backup path of a neighbor IPv4 SR-OSPF node SID or of an adjacency SID over a link to this neighbor, it forces the traffic to drop at the penultimate node and does not loop in case of neighbor node failure.
Default	false
Introduced	26.7.R1
Platforms	All

node-protect

Synopsis	Enable the **node-protect** context
Context	**configure** router *named-item-64* ospf *number* loopfree-alternate ti-lfa node-protect
Tree	node-protect
Introduced	16.0.R5
Platforms	All

max-ecmp-routes *number*

Synopsis	Maximum ECMP value for the OSPF instance
Context	**configure** router *named-item-64* ospf *number* max-ecmp-routes *number*
Tree	max-ecmp-routes
Description	This command configures the OSPFv2 or OSPFv3 instance maximum ECMP value, which sets the maximum number of IP and tunnel ECMP next hops for an IPv4 prefix of an OSPFv2 or OSPFv3 route. **Note:** LDP-over-RSVP using LSP endpoint remains limited to a maximum of 64 tunnel next hops. CLI enforces that enabling **ldp-over-rsvp** under an IGP instance restricts the range of this command leaf in that same IGP instance to 64. Conversely, increasing the range of this command leaf to a value higher than 64 in an IGP instance results in blocking the enabling of the **ldp-over-rsvp** leaf in that same IGP instance.
Range	1 to 128
Default	64
Introduced	26.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

adj-sid-hold *(number | keyword)*

Synopsis Adjacency SID hold time

Context **configure** router *named-item-64* ospf *number* segment-routing adj-sid-hold *(number | keyword)*

Tree adj-sid-hold

Description This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

Use subject to Terms available at: www.nokia.com/terms.

Tree	allocate-dual-sids
Description	When configured to **true**, the router supports two SR-MPLS adjacency SIDs per interface. A protected and unprotected adjacency SID is instantiated and advertised. If an SR-MPLS adjacency SID already exists, an additional complementary (protected or unprotected) adjacency SID is created on the interface. When configured to **false**, the router disables the support of two SR-MPLS adjacency SIDs per interface.
Default	false
Introduced	22.7.R1

Context	**configure** router *named-item-64* ospf *number* segment-routing micro-loop-avoidance
Tree	micro-loop-avoidance
Description	Commands in this context configure micro-loop avoidance for SR-OSPF.
Introduced	24.3.R1
Platforms	All

fib-delay *number*

Synopsis	FIB delay
Context	**configure** router *named-item-64* ospf *number* segment-routing micro-loop-avoidance fib-delay *number*
Tree	fib-delay
Description	This command configures the FIB delay before programming new primary next hops. Configure the FIB delay timer to a value that corresponds to the worst-case IGP convergence in a network domain. The default FIB delay timer value corresponds to a network with a nominal convergence time. When configured, the feature applies to the following contexts: • SPFv2 SR-OSPF IPv4 tunnel (node SID) • IPv4 and IPv6 SR-TE LSPs that use a node SID in their segment list • IPv4 and IPv6 SR policies that use a node SID in their segment list When micro-loop avoidance is disabled, the system forces any running FIB delay to expire immediately and the system programs new next hops for all impacted node SIDs. When disabled, micro-loop avoidance is disabled instantaneously and will be disabled for the next SPF runs. Micro-loop avoidance remains disabled until it is re-enabled.
Range	1 to 300
Units	deciseconds
Default	15
Introduced	24.3.R1
Platforms	All

tunnel-table-pref *number*

Synopsis Preference of SR tunnels created by the IGP instance

Context **configure** router *named-item-64* ospf *number* segment-routing tunnel-table-pref *number*

Tree tunnel-table-pref

Description This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel type explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note: The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10
- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Nokia recommends not to set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

advertise-delay *boolean*

Synopsis	Enable the advertisement of link delay for TE
Context	**configure** router *named-item-64* ospf *number* traffic-engineering-options advertise-delay *boolean*
Tree	advertise-delay
Description	When configured to **true**, the router advertises link delay in the IGP LSDB within the OSPF-TE TLV attribute or when the Application-Specific Link Attribute (ASLA) is enabled within SR-TE ASLA. When the router is configured under the **configure router ospf traffic-engineering-options sr-te application-specific-link-attributes** command to generate SR-TE ASLA attributes, link delay is advertised as a legacy RFC 3630 TLV when RSVP-TE is enabled and as an ASLA RFC 8920 TLV for SR-TE when MPLS is enabled for an interface.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

SR OS accepts and handles both legacy RSVP-TE TLVs and ASLAs for the RSVP application. However, SR OS only advertises RFC 3630 legacy RSVP-TE TLVs (as recommended by RFC 8920) to avoid compatibility issues.

When configured to **false**, the router disables link delay advertisement.

Default	false
Introduced	22.10.R1

[**interface-name**] *interface-name*

Synopsis	Router interface name
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name*
Tree	interface
Description	This command specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **configure router interface** and **configure service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be a string composed of printable, 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message is returned. If the IP interface exists in a different area it is moved to this area.
String length	1 to 32
Notes	This element is part of a list key.
Introduced	16.0.R1

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	23.3.R1
Platforms	All

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds
Introduced	23.3.R1
Platforms	All

conditional-advertise-prefix *reference*

Synopsis	Policy to conditionally advertise interface prefixes
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* conditional-advertise-prefix *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	conditional-advertise-prefix
Description	This command specifies the policy that allows IS-IS, OSPF, and OSPFv3 to selectively advertise system or loopback interface prefixes (including associated SIDs and SRv6 locators) only when conditions defined in the route policy are met. The route policy evaluates the presence or absence of specific routes in the routing table, typically using constructs like route-exists. If the policy evaluates to accept, the interface prefix is advertised; if not, the prefix is suppressed.

interface-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Interface type
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* interface-type *keyword*
Tree	interface-type
Description	This command specifies the interface type. **broadcast** - Broadcast network To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet. **non-broadcast** - Non-broadcast network **point-to-point** - Point-to-point link Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point. **p2mp-nbma** - Point-to-multipoint on a link without broadcast or multicast support No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type. **secondary** - Multiple secondary adjacencies allowed A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.
Options	broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma
Introduced	16.0.R1
Platforms	All

node-sid

Synopsis	Enable the **node-sid** context
Context	**configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* node-sid
Tree	node-sid
Description	Commands in this context configure a node SID index or label value for the prefix representing the primary address of a network interface of type system or loopback. A separate SID value can be configured for each IPv4 and IPv6 primary address of the interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address. In OSPFv2 and OSPFv3, the node SID is configured in the primary area but is inherited in any other area in which the interface is added as secondary. This command fails if the network interface is not a loopback type or if the interface is defined in an IES or VPRN context. Assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, the segment routing module checks that the same index or label value is not assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required because the index and, therefore, the label ranges of IGP instances are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an OSPF or OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system. By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID; that is, it belongs to this node only. However, to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receive end and accepts duplicate prefix SIDs with the N-flag set or clear. SR OS resolves to the closest owner, or owners if ECMP, of the prefix SID cost-wise.

Introduced 16.0.R4

Platforms All

clear-n-flag *boolean*

Synopsis Clear the N-flag in an OSPF3 prefix

Context **configure** router *named-item-64* ospf3 *number* area *ipv4-address* interface *interface-name* node-sid clear-n-flag *boolean*

Tree clear-n-flag

Description When configured to **true**, this command allows the user to clear the N-flag in an OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system.

When configured to **false**, the N-flag in an OSPF3 prefix SID sub-TLV originated for the prefix of a loopback interface on the system is not cleared.

When the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, the user must clear the N-flag to assure interoperability with third-party implementations. This may perform a strict check on the receive end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

Default false

database-export

Synopsis Enable the **database-export** context

Context **configure** router *named-item-64* ospf3 *number* database-export

Tree database-export

Description Commands in this context enable the population of the extended TE Database (TE-DB) with the link-state information from a specific IGP instance.

This information includes the IGP, TE, and the SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.

Introduced 16.0.R4

Platforms All

bgp-ls-identifier

Synopsis Enable the **bgp-ls-identifier** context

Context **configure** router *named-item-64* ospf3 *number* database-export bgp-ls-identifier

Tree bgp-ls-identifier

Description Commands in this context correlate, along with the Autonomous System Number (ASN), the BGP-LS NLRI advertisements of multiple BGP-LS speakers of the same IGP domain.

Introduced 16.0.R4

Platforms All

value *number*

Synopsis BGP-LS ID sent in the BGP-LS NLRI

Context **configure** router *named-item-64* ospf3 *number* database-export bgp-ls-identifier value *number*

Tree value

Description This command configures the BGP-LS ID to export.

If an NRC-P network domain has multiple IGP domains, a user must configure BGP-LS speakers within each IGP domain with the same unique ASN, BGP-LS ID tuple. The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain.

Note: If this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** command configuration is not strictly required because enabling the

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

extended TE-DB populates this information automatically. However, Nokia recommends enabling the **traffic-engineering** command to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.

Max. range 0 to 4294967295

Default 0

Introduced 16.0.R4

Platforms All

igp-identifier *number*

Synopsis IGP instance in the BGP-LS NLRI

Context **configure** router *named-item-64* ospf3 *number* database-export igp-identifier *number*

Tree igp-identifier

Description This command identifies the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. The concept of an instance ID specified for OSPF is local subnet significant (RFC 6549). An IGP identifier value can be configured to be unique within a specified IGP domain when the router sends the IGP link state information using BGP-LS.

Max. range 0 to 18446744073709551615

Introduced 16.0.R4

Platforms All

reachable-ls-only *boolean*

Synopsis Encode only reachable link-state information

Context **configure** router *named-item-64* ospf3 *number* database-export reachable-ls-only *boolean*

Tree reachable-ls-only

Description When configured to **true**, the router, acting as a BGP-LS producer, must withdraw all link-state objects it has advertised in BGP, in accordance with section 5.9 of RFC 9552. This withdrawal occurs when the node that originated the corresponding LSPs is determined to be unreachable in the IGP based on the failure of a reachability check for that node. This withdrawal operation assists network controllers in assessing a reachable IGP topology, even in networks with segmented areas. For backward compatibility, the default behavior remains unchanged.

When configure to **false**, the router continues to send link-state objects even for links that fail an IGP reachability check.

Default false

Introduced 24.10.R1

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** router *named-item-64* ospf3 *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.

If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied.

Routing policies are created in the **configure router policy-options** context.

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** router *named-item-64* ospf3 *number* graceful-restart

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	graceful-restart
Description	Commands in this context enable OSPF graceful restart (GR) to minimize service interruption. When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve OSPF forwarding information. Traffic continues to be forwarded to the restarting router using the last-known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal OSPF operation. If the grace period expires, the restarting router is presumed inactive and the OSPF topology is recalculated to route traffic around the failure.
Introduced	16.0.R1
Platforms	All

helper-mode *boolean*

Synopsis	Enable graceful restart helper for OSPF
Context	**configure** router *named-item-64* ospf3 *number* graceful-restart helper-mode *boolean*
Tree	helper-mode
Description	When configured to **true**, the router operates in OSPF graceful restart helper mode and assists restarting neighbors by maintaining adjacencies and forwarding state during their graceful restart interval. When configured to **false**, the router does not provide helper support and does not preserve adjacency or forwarding state for neighbors performing a graceful restart.
Default	true
Introduced	16.0.R1

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context
Context	**configure** router *named-item-64* ospf3 *number* loopfree-alternate
Tree	loopfree-alternate
Description	Commands in this context enable Loop-Free Alternate (LFA) computation by SPF under the IS-IS routing protocol level or under the OSPF routing protocol instance. When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary next hop and an LFA next hop for every learned prefix. IS-IS computes the primary SPF first and then computes the LFA SPF. The LFA backup next hop is only available after the LFA SPF is completed. When found, the LFA next hop is populated into the routing table along with the primary next hop for the prefix.
Introduced	16.0.R1
Platforms	All

max-ecmp-routes *number*

Synopsis	Maximum ECMP value for the OSPF instance
Context	**configure** router *named-item-64* ospf3 *number* max-ecmp-routes *number*
Tree	max-ecmp-routes
Description	This command configures the OSPFv2 or OSPFv3 instance maximum ECMP value, which sets the maximum number of IP and tunnel ECMP next hops for an IPv4 prefix of an OSPFv2 or OSPFv3 route. **Note:** LDP-over-RSVP using LSP endpoint remains limited to a maximum of 64 tunnel next hops. CLI enforces that enabling **ldp-over-rsvp** under an IGP instance restricts the range of this command leaf in that same IGP instance to 64. Conversely, increasing the range of this command leaf to a value higher than 64 in an IGP instance results in blocking the enabling of the **ldp-over-rsvp** leaf in that same IGP instance.
Range	1 to 128
Default	64

Synopsis	Adjacency SID hold time
Context	**configure** router *named-item-64* ospf3 *number* segment-routing adj-sid-hold *(number | keyword)*
Tree	adj-sid-hold
Description	This command configures a timer to hold the ILM or LTN of an adjacency SID following a failure of the adjacency.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When an adjacency to a neighbor fails, the following procedure is followed for both an LFA protected and the LFA unprotected SID of this adjacency in SR-MPLS. An adjacency can have both types of SIDs assigned by configuration. An LFA protected adjacency SID is eligible for LFA protection, however, the following procedure applies even if an LFA backup is not programmed at the time of the failure. An LFA unprotected adjacency SID is not eligible for LFA protection.

- IGP withdraws the advertisement of the link TLV as well as its adjacency SID sub-TLV.
- The adjacency SID hold timer starts.
- The LTN and ILM records of the adjacency are kept in the datapath for as long as the adjacency SID hold time is running. This allows packets to flow over the LFA backup path, when the adjacency is protected, and allows the ingress LER or PCE time to compute a new path of the SR-TE LSP after IGP converges.
- If the adjacency is restored while the adjacency SID hold timer is running, the timer is aborted, and the adjacency SID remains programmed in the datapath with the retained SID values. However, the backup NHLFE may change if a new LFA SPF runs while the adjacency SID hold timer running. An update to the backup NHLFE is performed immediately following the LFA SPF. In all cases, the adjacency keeps its assigned SID label value.
- If the adjacency SID hold timer expires before the adjacency is restored, the SID is deprogrammed from the datapath and the label returned into the common pool where it was drawn from. Users of the adjacency (for example, SR policy and SR-TE LSP) are also informed. When the adjacency is subsequently restored, it gets assigned its allocated static-label value or a new dynamic-label value.
- A new PG-ID is assigned each time an adjacency comes back up. This PG-ID is used by the ILM and LTN of the adjacency SID and of all downstream node SIDs that resolve to a next hop over this adjacency.

tunnel-table-pref *number*

Synopsis	Preference of SR tunnels created by the IGP instance
Context	**configure** router *named-item-64* ospf3 *number* segment-routing tunnel-table-pref *number*
Tree	tunnel-table-pref

Description

This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel type explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

Note: The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE_PREF_RSVP 7
- ROUTE_PREF_SR_TE 8
- ROUTE_PREF_LDP 9
- ROUTE_PREF_OSPF_TTM 10

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- ROUTE_PREF_ISIS_TTM 11
- ROUTE_PREF_BGP_TTM 12
- ROUTE_PREF_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more instances of that protocol programmed a tunnel for the same prefix. The selection of a SR tunnel in this case is based on the lowest preference IGP instance. In the case of a tie, the instance with the lowest metric SR tunnel is selected over the lowest numbered IGP instance. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

Nokia recommends not to set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

sid-action *keyword*

Synopsis	SID action for the replication segment
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-mpls sid-action *keyword*
Tree	sid-action
Options	none, push, pop, swap
Default	none
Introduced	24.3.R1
Platforms	All

segment-routing-v6

Synopsis	Enter the **segment-routing-v6** context
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6
Tree	segment-routing-v6
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

downstream-nodes [downstream-node-index] *number*

Synopsis	Enter the **downstream-nodes** list instance
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 downstream-nodes *number*
Tree	downstream-nodes
Description	Commands in this context configure the downstream node entry for the replication segment. The downstream node is equivalent to an outgoing interface. On a replication node, a replication segment can have multiple downstream nodes, each of which has outgoing interfaces or protection next hops.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

[**downstream-node-index**] *number*

Synopsis	Downstream node index

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 downstream-nodes *number*
Tree	downstream-nodes
Range	1 to 4096
Notes	This element is part of a list key.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

admin-state *keyword*

Synopsis	Administrative state of the downstream next-hop entries
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 downstream-nodes *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

replication-sid *ipv6-unicast-address*

Synopsis	Replication SID for next-hop entries
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 downstream-nodes *number* replication-sid *ipv6-unicast-address*
Tree	replication-sid
Description	This command configures the outgoing replication Segment Identifier (SID) for the next hop of the P2MP SR tree SRv6 replication segment. The SRv6 replication SID does not currently support a SID list. The IPv6 address specifies the replication SID, including the locator and function. SR OS supports the 16-bit function from bit 64 to bit 80, with the locator configurable from bit 0 to 64 of the IPv6 address.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

incoming-sid

Synopsis	Enter the **incoming-sid** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid
Tree	incoming-sid
Description	Commands in this context configure the incoming replication SID for the P2MP SR tree replication segment entry.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator

Synopsis	Enter the **locator** context
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid locator
Tree	locator
Description	Commands in this context configure the incoming replication SID locator for the P2MP SR tree replication segment entry.
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

function *keyword*

Synopsis	Function of the incoming replication SID
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid locator function *keyword*
Tree	function
Options	end-replicate – Use the incoming SID to find the replication state
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

function-value *number*

Synopsis	Incoming SID function value
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid locator function-value *number*
Tree	function-value
Range	1 to 1048575
Introduced	24.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator-name *reference*

Synopsis	Incoming SID locator name
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 incoming-sid locator locator-name *reference*
Tree	locator-name
Reference	**configure** router *named-item-64* segment-routing segment-routing-v6 locator *named-item-64*
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

role *keyword*

Synopsis	Role of the SRv6 replication segment entry
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* segment-routing-v6 role *keyword*
Tree	role
Options	none – Do not use a role for this segment root – Use the neighbor root role for this segment leaf – Use the leaf area role for this segment transit – Use the transit role for this segment
Default	none
Introduced	24.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

tree-id *number*

Synopsis	Tree ID for the replication segment of the P2MP SR tree
Context	**configure** router *named-item-64* p2mp-sr-tree replication-segment *named-item* tree-id *number*
Tree	tree-id
Range	0 | 8193 to 16286
Default	0

capability-advertisement

Synopsis	Enter the **capability-advertisement** context
Context	**configure** router *named-item-64* pcep pcc capability-advertisement
Tree	capability-advertisement
Description	Commands in this context configure the advertisement of PCEP PCC capabilities in the Open message.
Introduced	26.3.R2
Platforms	All

multi-path *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable advertising multipath capability in Open message
Context	**configure** router *named-item-64* pcep pcc capability-advertisement multi-path *boolean*
Tree	multi-path
Description	When configured to **true**, the router advertises the multipath capability in the Open message, which allows PCEP speakers to signal their ability to support and handle multiple paths or segment lists for an SR policy. This is needed for proper negotiation and operation of SR policies in relation to load sharing. When configured to **false**, the router disables the advertisement of the multipath capability in the Open message. **Note:** For SR policy MPLS, **sr-policy** must be enabled. If multipath is required, both **sr-policy** and **multi-path** must be enabled. For SR policy SRv6, **sr-policy** and **srv6** must be enabled together, because PCEP extensions for SRv6 are only supported with SR policy. If multipath is required, **sr-policy**, **srv6** and **multi-path** must be enabled.
Default	false
Introduced	26.3.R2
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sr-policy *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable advertising SR-policy capability in Open message
Context	**configure** router *named-item-64* pcep pcc capability-advertisement sr-policy *boolean*
Tree	sr-policy
Description	When configured to **true**, the router advertises the SR-policy capability in the Open message, which allows the PCCs to signal their support for SR policies during PCEP session establishment. When configured to **false**, the router disables the advertisement of the SR policy in the Open message. **Note:** For SR policy MPLS, **sr-policy** must be enabled. If multipath is required, both **sr-policy** and **multi-path** must be enabled. For SR policy SRv6, **sr-policy** and **srv6** must be enabled together, because PCEP extensions for SRv6 are only supported with SR policy. If multipath is required, **sr-policy**, **srv6** and **multi-path** must be enabled.
Default	false
Introduced	26.3.R2
Platforms	All

srv6 *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable advertising of SRv6 capability in Open message
Context	**configure** router *named-item-64* pcep pcc capability-advertisement srv6 *boolean*
Tree	srv6
Description	When configured to **true**, the router advertises the PCEP SRv6 capability in the Open message, which allows PCEP speakers to signal their support for SRv6 functionalities. This command is needed to establish an SRv6-enabled PCEP session and for PCE to correctly compute and manage SRv6 paths. By exchanging this information, PCEP ensures that network devices and the centralized controller collaborate to optimize services over an SRv6-enabled network. When configured to **false**, the router disables the advertisement of the PCEP SRv6 capability in the Open message.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For SR policy SRv6, **sr-policy** and **srv6** must be enabled together, because PCEP extensions for SRv6 are only supported with SR policy. If multipath is required, **sr-policy**, **srv6** and **multi-path** must be enabled.

Default	false
Introduced	26.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

disjointness-reference *boolean*

Synopsis	Configure P-flag in the disjointness configuration TLV
Context	**configure** router *named-item-64* pcep pcc pce-associations diversity *named-item* disjointness-reference *boolean*
Tree	disjointness-reference

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router sets the P-flag in the disjointness configuration TLV. When the P-flag is set, it indicates that this LSP path is the reference path for the disjoint set of paths. The PCE must first compute the path of this LSP and then apply the requested disjointness type to compute the path of all other paths in the same diversity association ID. When configured to **false**, the router does not set the P-flag in the disjointness configuration TLV.
Default	false
Introduced	22.5.R1

use-lag-port-weight *boolean*

Synopsis	Use LAG port weight in calculating MCAC constraints
Context	**configure** router *named-item-64* pim interface *interface-name* mcac mc-constraints use-lag-port-weight *boolean*
Tree	use-lag-port-weight
Description	When configured to **true**, port weight is used when determining available bandwidth per level when LAG ports go down or come up. This command is required for proper operation on mixed port-speed LAGs and can also be used for unmixed port-speed LAGs.
Default	false
Introduced	16.0.R1
Platforms	All

policy *reference*

Synopsis	Multicast CAC policy name
Context	**configure** router *named-item-64* pim interface *interface-name* mcac policy *reference*
Tree	policy
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment. Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode. If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect. Hierarchical MCAC (HMCAC) is supported on two levels simultaneously: • subscriber level and redirected interface when redirection is configured • subscriber level and group-interface level when redirection is unconfigured In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).
Reference	**configure** mcac policy *string*

pim-ssm-scaling *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable PIM-SSM scaling
Context	**configure** router *named-item-64* pim pim-ssm-scaling *boolean*
Tree	pim-ssm-scaling
Description	When configured to **true**, this command enables an increase of PIM SSM (S,G) scaling to a maximum of 256000 per system. The total maximum multicast capacity is, however, constrained by the lowest-performance FP. When the maximum link capacity from the fabric to the lowest-performance FP is reached, the link to that FP is overloaded, resulting in packet loss for all FPs. This capacity constraint is independent of whether the lowest-performance FP has a receiver on it or not. If the multicast management chassis per-plane total capacity is configured to an explicit value larger than that supported by the lowest-performance FP, then IMPM believes that there is more plane capacity available than there actually is and the result is (S,G) packet loss instead of blackholing. By setting the multicast management chassis per-plane total capacity to **dynamic**, the system automatically sets the switch fabric multicast plane capacity to the minimum value supported by the fabric and all line cards in the system. When PIM SSM scaling is enabled, the following multicast features are disabled: • DM • MoFRR • JP policy • InBand features (BIER and MLDP) • Extranet • ASM When configured to **false**, there is no increase of PIM SSM (S,G) scaling.
Default	false
Introduced	19.7.R1

attribute-type *number*

Synopsis	RADIUS attribute type to cache for this RADIUS proxy server
Context	**configure** router *named-item-64* radius proxy *named-item* cache key attribute-type *number*
Tree	attribute-type
Range	1 to 255
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

packet-type *keyword*

Synopsis	Packet type of the RADIUS messages
Context	**configure** router *named-item-64* radius proxy *named-item* cache key packet-type *keyword*
Tree	packet-type
Options	access-request, access-accept
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

vendor *(number | keyword)*

Synopsis	RADIUS Vendor ID
Context	**configure** router *named-item-64* radius proxy *named-item* cache key vendor *(number | keyword)*
Tree	vendor
Range	1 to 16777215
Options	nokia
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

timeout *number*

Synopsis	Idle timeout value

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* radius proxy *named-item* cache timeout *number*
Tree	timeout
Range	60 to 3600
Units	seconds
Default	300
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

track-accounting

Synopsis	Enter the **track-accounting** context
Context	**configure** router *named-item-64* radius proxy *named-item* cache track-accounting
Tree	track-accounting
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

accounting-off *boolean*

Synopsis	Remove all ESM hosts associated with the RADIUS client
Context	**configure** router *named-item-64* radius proxy *named-item* cache track-accounting accounting-off *boolean*
Tree	accounting-off
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

accounting-on *boolean*

Synopsis	Remove all ESM hosts associated with the RADIUS client
Context	**configure** router *named-item-64* radius proxy *named-item* cache track-accounting accounting-on *boolean*
Tree	accounting-on
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

vendor *(number | keyword)*

Synopsis	Vendor-Id attribute
Context	**configure** router *named-item-64* radius proxy *named-item* load-balance-key attribute-5 vendor *(number | keyword)*
Tree	vendor
Range	1 to 16777215
Options	nokia
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

source-ip-udp

Synopsis	Key to consist of the source IP address and source UDP port of the RADIUS message
Context	**configure** router *named-item-64* radius proxy *named-item* load-balance-key source-ip-udp
Tree	source-ip-udp
Notes	The following elements are part of a choice: (**attribute-1**, **attribute-2**, **attribute-3**, **attribute-4**, and **attribute-5**) or **source-ip-udp**.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

purpose *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Purpose of the RADIUS proxy
Context	**configure** router *named-item-64* radius proxy *named-item* purpose *keyword*
Tree	purpose
Options	accounting, authentication, accounting-authentication
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

python-policy *reference*

Synopsis	Python policy
Context	**configure** router *named-item-64* radius proxy *named-item* python-policy *reference*
Tree	python-policy
Reference	**configure** python python-policy *named-item*
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

require-message-authenticator *boolean*

Synopsis	Require Message-Authenticator in Access-Request
Context	**configure** router *named-item-64* radius proxy *named-item* require-message-authenticator *boolean*
Tree	require-message-authenticator
Description	When configured to **true**, the RADIUS proxy silently drops Access-Requests received from the RADIUS client without a Message-Authenticator attribute. This command is ignored when configured for a distributed RADIUS proxy running on ISA/ESA.
Default	false
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

secret *encrypted-leaf*

Synopsis	Format of the secret key to access the RADIUS proxy server
Context	**configure** router *named-item-64* radius proxy *named-item* secret *encrypted-leaf*
Tree	secret
Description	This command specifies the secret key to access the RADIUS proxy server in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 166
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

send-accounting-response *boolean*

Synopsis	Allow RADIUS proxy server to respond to Accounting-Response messages
Context	**configure** router *named-item-64* radius proxy *named-item* send-accounting-response *boolean*
Tree	send-accounting-response
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

wlan-gw

Synopsis	Enter the **wlan-gw** context
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw
Tree	wlan-gw
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

add-attributes

Synopsis	Enter the **add-attributes** context
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw add-attributes
Tree	add-attributes
Description	Commands in this context define attributes to be added to proxied messages.
Introduced	26.3.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

proxy-source-ip-address *boolean*

Synopsis	Adds proxy source IP or IPv6 address for RADIUS
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw add-attributes proxy-source-ip-address *boolean*
Tree	proxy-source-ip-address
Description	When configured to **true**, the router adds the Alc-Proxy-Source-IP-Address, the Alc-Proxy-Source-IPv6-Address VSAs, or both to proxied RADIUS messages.
Default	false

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	26.3.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

address *ipv4-unicast-address*

Synopsis	IPv4 address of the distributed RADIUS proxy server
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw address *ipv4-unicast-address*
Tree	address
Description	This command configures the IPv4 address of the distributed RADIUS proxy server for use by the access points.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

ipv6-address *ipv6-unicast-without-local-address*

Synopsis	IPv6 address of the distributed RADIUS proxy server
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw ipv6-address *ipv6-unicast-without-local-address*
Tree	ipv6-address
Description	This command configures the IPv6 address of the distributed RADIUS proxy server for use by the access points.
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

wlan-gw-group *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	ISA WLAN gateway group
Context	**configure** router *named-item-64* radius proxy *named-item* wlan-gw-group *reference*
Tree	wlan-gw-group
Reference	**configure** isa wlan-gw-group *number*

Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

server [name] *named-item*

Synopsis	Enter the **server** list instance
Context	**configure** router *named-item-64* radius server *named-item*
Tree	server
Max. instances	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[**name**] *named-item*

Synopsis	External RADIUS server name
Context	**configure** router *named-item-64* radius server *named-item*
Tree	server
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

accept-coa *boolean*

Synopsis	Process Change of Authorization (CoA) messages
Context	**configure** router *named-item-64* radius server *named-item* accept-coa *boolean*
Tree	accept-coa
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

© 2026 Nokia.

acct-port *number*

Synopsis	UDP port number of the RADIUS for accounting events
Context	**configure** router *named-item-64* radius server *named-item* acct-port *number*
Tree	acct-port
Range	1 to 65535
Default	1813
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the RADIUS server
Context	**configure** router *named-item-64* radius server *named-item* address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	address
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

auth-port *number*

Synopsis	UDP port number of the RADIUS to be used as match criteria
Context	**configure** router *named-item-64* radius server *named-item* auth-port *number*
Tree	auth-port
Range	1 to 65535
Default	1812
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

description *description*

Synopsis	Text description
Context	**configure** router *named-item-64* radius server *named-item* description *description*
Tree	description

© 2026 Nokia.

String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

insert-message-authenticator *boolean*

Synopsis	Insert Message-Authenticator in Access-Request
Context	**configure** router *named-item-64* radius server *named-item* insert-message-authenticator *boolean*
Tree	insert-message-authenticator
Description	When configured to **true**, the router inserts a Message-Authenticator attribute as the first attribute in Access-Request messages.
Default	false
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pending-requests-limit *number*

Synopsis	Limit of the number for pending RADIUS requests
Context	**configure** router *named-item-64* radius server *named-item* pending-requests-limit *number*
Tree	pending-requests-limit
Range	1 to 4096
Default	4096
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

python-policy *reference*

Synopsis	Python script policy to modify CoA messages
Context	**configure** router *named-item-64* radius server *named-item* python-policy *reference*
Tree	python-policy
Reference	**configure** python python-policy *named-item*
Introduced	16.0.R1

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

require-message-authenticator *boolean*

Synopsis	Require Message-Authenticator in Access-Request reply
Context	**configure** router *named-item-64* radius server *named-item* require-message-authenticator *boolean*
Tree	require-message-authenticator
Description	When configured to **true**, the router silently drops responses to Access-Requests without a Message-Authenticator attribute.
Default	false
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

secret *encrypted-leaf*

Synopsis	Secret key associated with this RADIUS server
Context	**configure** router *named-item-64* radius server *named-item* secret *encrypted-leaf*
Tree	secret
Description	This command specifies the secret key associated with this RADIUS server in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 166
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tls-client-profile *reference*

Synopsis	Use the TLS client profile for RADIUS over TLS
Context	**configure** router *named-item-64* radius server *named-item* tls-client-profile *reference*
Tree	tls-client-profile
Description	When configured, the router uses the TLS client profile to encrypt RADIUS communication and RADIUS messages are sent using TLS.

authentication-key *encrypted-leaf*

Synopsis	Authentication password passed between RIP neighbors
Context	**configure** router *named-item-64* rip authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command sets the authentication password to be passed between RIP neighbors. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication password from the configuration and disables authentication. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 102

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	16.0.R4
Platforms	All

authentication-type *keyword*

Synopsis	Authentication type used between RIP neighbors
Context	**configure** router *named-item-64* rip authentication-type *keyword*
Tree	authentication-type
Description	This command sets the type of authentication to be used between RIP neighbors. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication type from the configuration and effectively disables authentication.
Options	none, password, md5, md20
Default	none
Introduced	16.0.R4
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD to control the state of protocol adjacency
Context	**configure** router *named-item-64* rip bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, this command enables BFD to control the state of the associated protocol adjacency. When configured to **false**, this command removes BFD from the associated protocol adjacency.
Default	false
Introduced	16.0.R4
Platforms	All

check-zero *boolean*

Synopsis	Enable checking of mandatory zero fields
Context	**configure** router *named-item-64* rip check-zero *boolean*
Tree	check-zero

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, this command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages. When configured to **false**, this command disables the check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.
Default	false
Introduced	16.0.R4
Platforms	All

Description	This command sets the authentication password to be passed between RIP neighbors. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication password from the configuration and disables authentication. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 102
Introduced	16.0.R4
Platforms	All

authentication-type *keyword*

Synopsis	Authentication type
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* authentication-type *keyword*
Tree	authentication-type
Description	This command configures the type of authentication to be used. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication type from the configuration and effectively disables authentication.
Options	none, password, md5, md20
Introduced	16.0.R4
Platforms	All

bfd-liveness *boolean*

Synopsis	Enable BFD to control the state of protocol adjacency
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, this command enables BFD to control the state of the associated protocol adjacency. When configured to **false**, this command removes BFD from the associated protocol adjacency.

Introduced	16.0.R4
Platforms	All

check-zero *boolean*

Synopsis	Enable checking of mandatory zero fields
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* check-zero *boolean*
Tree	check-zero
Description	When configured to **true**, this command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages. When configured to **false**, this command disables the check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.
Introduced	16.0.R4
Platforms	All

description *description*

Synopsis	Text description
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R4

Synopsis	RIP version and method used to send RIP updates
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* send *keyword*
Tree	send
Options	none, version-1, broadcast, multicast, unicast
Introduced	16.0.R4
Platforms	All

split-horizon *boolean*

Synopsis	Enable split horizon and poison reverse
Context	**configure** router *named-item-64* rip group *named-item* neighbor *interface-name* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity). When configured to **false**. this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.
Introduced	16.0.R4
Platforms	All

timers

Synopsis	Enable the **timers** context

split-horizon *boolean*

Synopsis	Enable split horizon and poison reverse
Context	**configure** router *named-item-64* ripng group *named-item* neighbor *interface-name* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity). When configured to **false**. this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

authentication-over-bypass *boolean*

Synopsis	Enable MD5 authentication over bypass LSP of PLR and MP
Context	**configure** router *named-item-64* rsvp authentication-over-bypass *boolean*
Tree	authentication-over-bypass
Description	When configured to **true**, this command configures the MD5 authentication over the bypass LSP of all Point of Local Repairs (PLRs) and Merge Points (MPs) on the router. Only enable this command when the TE interfaces in the RSVP-TE network use the same MD5 authentication parameters. When a Point of Local Repair (PLR) activates a bypass LSP towards a Merge Point (MP), by default, the INTEGRITY object corresponding to the bypass LSP interface is not added to a transmitted RSVP message except for packets of routed RSVP messages (Resv, Srefresh, and ACK), and only when the packet is intended for a bypass LSP endpoint (PLR or MP) that is a directly connected neighbor. When this command is enabled, the INTEGRITY object of the interface corresponding to the bypass LSP is added to a transmitted RSVP message regardless of whether the bypass LSP endpoint (PLR or MP) is a directly connected RSVP neighbor. The INTEGRITY object is included with the following RSVP messages: Path, PathTear, Path Err, Resv, ResvTear, ResvErr, Srefresh, and ACK. In all cases, an RSVP message received from a PLR or a MP (sender address in the SenderTemplate oe FilterSpec is different from an Extended Tunnel Id in a Session Object), and which includes the INTEGRITY object is authenticated against the bypass LSP interface. An RSVP message received from a PLR or MP without the INTEGRITY object is also accepted. When configured to **false**, the router disables MD5 authentication over bypass LSP of the PLRs and MPs.
Default	false
Introduced	22.10.R1
Platforms	All

authentication-key *encrypted-leaf*

Synopsis	Authentication or hash key string
Context	**configure** router *named-item-64* rsvp interface *reference* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command configures the authentication key for use between RSVP neighbors to authenticate RSVP messages. Authentication uses the MD5 message-based digest. When enabled on an RSVP interface, authentication of RSVP messages operates in both directions of the interface. A router maintains a security association using one authentication key for each interface to an RSVP neighbor. An RSVP neighbor transmits an authenticating digest of the RSVP message that is computed using the shared authentication key and a keyed-hash algorithm. The message digest is included in an INTEGRITY object, which also contains a flags field, a key identifier field, and a sequence number field. An RSVP neighbor uses the key together with the authentication algorithm to process received RSVP messages. The RSVP MD5 authentication complies to the procedures for RSVP message generation in RFC 2747, *RSVP Cryptographic Authentication*. The MD5 implementation does not support the authentication challenge procedures in RFC 2747. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.

admin-state *keyword*

Synopsis	Administrative state of the maintenance policy
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* admin-state *keyword*
Tree	admin-state
Description	This command sets the administrative state of the maintenance policy. A maintenance policy must be administratively disabled to change any of the parameters. When a maintenance template is administratively disabled, all applicable candidate paths are removed from the data path.
Options	enable, disable
Default	disable
Introduced	20.10.R1
Platforms	All

bfd-liveness *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable seamless BFD for segment lists of candidate path

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, this command enables seamless BFD on every segment list of an SR policy candidate path to which the maintenance policy is applied. The BFD template configures the parameters for the BFD session. When configured to **false**, seamless BFD is disabled.
Default	false
Introduced	20.10.R1
Platforms	All

bfd-template *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	BFD template to be used by seamless BFD
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* bfd-template *reference*
Tree	bfd-template
Description	This command references a named BFD template to be used by seamless BFD. A BFD template must exist on the system before being referenced from a maintenance policy. The template specifies parameters that are used by the BFD session, such as the minimum transmit and receive control packet timer intervals.
Reference	**configure** bfd bfd-template *named-item*
Introduced	20.10.R1
Platforms	All

hold-down-timer *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Hold down timer for SR policy candidate paths
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* hold-down-timer *number*
Tree	hold-down-timer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the hold down timer for the maintenance policy. The purpose of the timer is to prevent bouncing of the SR policy path state if S-BFD sessions associated with the segment lists flap, causing the threshold to be repeatedly crossed in a short period of time. The timer is started when the number of up S-BFD sessions drops below the threshold. The SR policy path is not considered to be up again until the hold down timer has expired and the number of up S-BFD sessions reaches or exceeds the threshold and the internal hold timer is not running. If the revert timer is also configured, the revert timer is not started until after the number of up S-BFD sessions equals or exceeds the threshold and the hold down timer for the primary candidate path has expired.
Range	0 to 5000
Units	deciseconds
Default	0
Introduced	20.10.R1
Platforms	All

return-path-label *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	S-BFD return-path label
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* return-path-label *number*
Tree	return-path-label
Description	This command configures the S-BFD session to echo mode and adds an additional MPLS label to the bottom of the label stack for the S-BFD packet. The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path. If the command is deleted, S-BFD returns to asynchronous mode and no return-path label is pushed by the initiator node. Any S-BFD packets for this LSP or path that the reflector receives are routed through the IGP path.
Range	32 to 1048575
Introduced	22.10.R1
Platforms	All

revert-timer *number*

Synopsis	Revert timer for SR policy candidate paths
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* revert-timer *number*
Tree	revert-timer
Description	This command configures the revert timer for SR Policy candidate paths. The revert timer is started when the primary path recovers (the number of S-BFD sessions that are up equals or exceeds the threshold value and the hold down timer has expired). When the timer expires, the system reverts to the primary path.
Range	0 to 4320
Units	minutes
Introduced	20.10.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

threshold *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Minimum number of up S-BFD sessions for up path status
Context	**configure** router *named-item-64* segment-routing maintenance-policy *named-item* threshold *number*
Tree	threshold
Description	This command configures the minimum number of S-BFD sessions that must be up for the SR policy candidate path to be considered up. If the number of up sessions is below this threshold value, the policy candidate path is marked as BFD degraded by the system. This command is only valid in the **ecmp-protected** mode.
Range	1 to 32
Default	1
Introduced	20.10.R1
Platforms	All

end-x [value] *number*

Synopsis	Enter the **end-x** list instance
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 base-routing-instance locator *reference* function end-x *number*
Tree	end-x
Description	Commands in this context configure the attributes of the End.X SID function associated with a P2P interface. A static function value can be configured for each combination of SRH mode and protection type. For a specific interface, the static function value associated with the same combination of protection type and SRH mode overrides any corresponding function value that is automatically allocated (**end.x-auto-allocate** list configuration). If more than one value is configured for an interface and combination of SRH mode and protection type, they are all advertised in IS-IS.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When used in remote TI-LFA repair tunnel programming, IS-IS uses rules to select one End.X value from the multiple values received in IS-IS link advertisements.

Values assigned to loopback and system interfaces are not advertised in IS-IS.

End.X SID functions for adjacencies over broadcast interfaces are always automatically allocated based on the configuration of the **end.x-auto-allocate** list.

Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

end-x-auto-allocate [srh-mode] *keyword* protection *keyword*

Synopsis	Add a list entry for **end-x-auto-allocate**
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 base-routing-instance locator *reference* function end-x-auto-allocate *keyword* protection *keyword*
Tree	end-x-auto-allocate
Description	This command adds a list entry for the automatic allocation of the End.X SID function for all adjacencies over all network interfaces on the router (P2P and broadcast interfaces). A list entry is a combination of the protection type and the SRH mode. Any combinations in addition to the maximum supported by this command must be allocated statically under each P2P interface (**end.x** configuration). When no list entries are configured, no End.X function values are automatically allocated by default for a locator.
Max. instances	2
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

label-block *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Reserved label block
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* label-block *reference*
Tree	label-block
Description	This command associates a pre-configured reserved label block with the micro-SID block.
Reference	**configure** router *named-item-64* mpls-labels reserved-label-block *named-item-64*
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

prefix

Synopsis	Enter the **prefix** context
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* prefix
Tree	prefix
Description	Commands in this context configure the IPv6 prefix for an SRv6 micro-segment locator.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

ip-prefix *ipv6-unicast-prefix*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	SRv6 locator prefix
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* prefix ip-prefix *ipv6-unicast-prefix*
Tree	ip-prefix
Description	This command configures the IPv6 prefix for the locator.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For regular SRv6, the locator prefix length range is the sum of the length of the block field and the length of the node ID field. For micro-segment SRv6, the locator prefix length must be equal to the micro-SID block length.

Introduced 22.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

static-function

Synopsis Enter the **static-function** context

Context **configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* static-function

Tree static-function

Description Commands in this context configure the function field parameters of a static uA or service micro-SID assignment.

Introduced 22.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

max-entries *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis Maximum number of static SID functions

Context **configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* static-function max-entries *number*

Tree max-entries

Description This command configures the maximum number of values that are reserved from the function field to assign to static SID functions.

Range 1 to 1048575

Default 1

Introduced 22.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

termination-fpe *reference*

Synopsis FPE ID for SRv6 termination

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64* termination-fpe *reference*
Tree	termination-fpe
Description	This command associates the FPE ID with the locator for SRv6 termination in local services.
Reference	**configure** fwd-path-ext fpe *number*
Max. instances	1
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

block-length *number*

Synopsis	Micro-SID block length
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block-length *number*
Tree	block-length
Range	8 | 16 | 24 | 32 | 40 | 48 | 56 | 64
Default	32
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

global-sid-entries *number*

Synopsis	Maximum number of micro-segment locators network wide
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment global-sid-entries *number*
Tree	global-sid-entries
Description	This command defines the maximum number of unique micro-segment locators that can be configured network wide. The value is expressed in multiples of 1024 and must be the same on every platform network wide.
Range	4 to 60
Default	16
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

sid-length *number*

Synopsis	Micro-SID length
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment sid-length *number*
Tree	sid-length
Description	This command configures the length of the micro-SIDs.
Range	16
Default	16
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

micro-segment-locator [locator-name] *named-item-64*

Synopsis	Enter the **micro-segment-locator** list instance
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64*
Tree	micro-segment-locator
Max. instances	16
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

[**locator-name**] *named-item-64*

Synopsis	SRv6 locator name
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64*
Tree	micro-segment-locator
String length	1 to 64
String format	'string-not-all-spaces' must contain at least one non-space character 'locator-name' must not contain @ (use @param@ in policy)
Notes	This element is part of a list key.
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

admin-state *keyword*

Synopsis	Administrative state of the locator
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

algorithm *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	IGP flexible algorithm ID
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* algorithm *number*
Tree	algorithm
Description	This command configures an IGP flexible algorithm for a locator. A locator can only be part of one algorithm but it can be used in multiple IGP instances.
Range	128 to 255
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

block *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Pre-defined micro-SID block
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* block *reference*
Tree	block

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command associates a pre-defined micro-SID block with the micro-segment SRv6 locator.
Reference	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment block *named-item-64*
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

un

Synopsis	Enter the **un** context
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* un
Tree	un
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

srh-mode *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Segment Routing Header (SRH) mode
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* un srh-mode *keyword*
Tree	srh-mode
Description	This command configures the popping mode for the SID.
Options	psp, usp, psp-usd, usp-usd, psp-usp-usd
Default	psp
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

value *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Synopsis	SRv6 function value
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 micro-segment-locator *named-item-64* un value *number*
Tree	value
Range	1 to 1048575
Introduced	22.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

origination-fpe *reference*

Synopsis	List of the SRv6 origination FPEs
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 origination-fpe *reference*
Tree	origination-fpe
Description	This command configures the origination Forwarding Path Extension (FPE) for SRv6 tunnels on local services. The origination FPE must be different from any of the SRv6 termination FPEs.
Reference	**configure** fwd-path-ext fpe *number*
Max. instances	1
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

source-address *ipv6-unicast-address*

Synopsis	Source address used in the SRv6 packet
Context	**configure** router *named-item-64* segment-routing segment-routing-v6 source-address *ipv6-unicast-address*
Tree	source-address
Description	This command specifies the global default source IPv6 address used in the SA field of the outerIPv6 header of the SRv6 encapsulated packet. The value is inherited in the BGP and services contexts (for example, **configure router "base" bgp segment-routing-v6 source-address** and **configure service vprn bgp-ipvpn segment-routing-v6 source-address**), but is overwritten by the value configured in those contexts. A source IPv6 address must be configured in the global context or in the BGP or services context. The system does not check if the entered address is a valid local address.

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Unique value for a policy
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* distinguisher *number*
Tree	distinguisher
Description	This command configures a distinguisher value to associate with a statically defined SR policy. This is a mandatory command for non-local SR policies. Every non-local SR policy must have a unique distinguisher value. When a non-local static SR policy is imported into BGP and originated as a BGP route, the configured distinguisher value is copied into the NLRI of the route.

Range	1 to 4294967295
Introduced	16.0.R1
Platforms	All

dynamic

Synopsis	Enable the **dynamic** context
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* dynamic
Tree	dynamic
Description	Commands in this context configure a dynamically computed candidate path for the static SR policy. The candidate path and its segment list are computed using PCEP. If this context is configured, an explicit segment list cannot be provisioned. This context and the **segment-list** context are mutually exclusive. This context can be removed without administratively disabling the static SR policy.
Introduced	26.10.R1
Platforms	All

optimization-objective

Synopsis	Enter the **optimization-objective** context
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* dynamic optimization-objective
Tree	optimization-objective
Description	Commands in this context configure the optimization objective used for dynamic path computation.
Introduced	26.10.R1
Platforms	All

metric *number*

Synopsis	Static metric for the candidate path
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* dynamic optimization-objective metric *number*
Tree	metric
Description	This command configures a static metric for the dynamic candidate path. If configured to a nonzero value, this metric is used in the tunnel table instead of the metric returned by the PCE.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

A value of 0 means that no static metric is configured. The metric returned by the PCE is used in the tunnel table.

Range 0 to 16777215

endpoint *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Destination of the source-routed path
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* endpoint *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	endpoint
Description	This command associates an IPv4 or IPv6 endpoint address with a statically defined SR policy. This association is mandatory when enabling an SR policy.
Introduced	16.0.R1
Platforms	All

head-end *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Head-end address for this static policy
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* head-end *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)*
Tree	head-end
Description	This command associates a head-end location with a statically defined SR policy. The head end identifies the target router to install the policy. This is a mandatory command for enabling the SR policy. The **local** keyword must be specified to associate a static policy with the local router as the head end. The static policy is associated with another (non-local) router if this command is configured for any IPv4 address or IPv6 address. When a non-local, static SR policy that originates as a BGP route is imported into BGP, the configured head-end address is converted to an IPv4 or IPv6 address-specific route-target extended community that is automatically added to the route.
Options	local
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

maintenance-policy *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Policy name
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* maintenance-policy *reference*

Synopsis	Enable reporting of SR policy candidate path via PCEP
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* pce-report *boolean*
Tree	pce-report
Description	When configured to **true**, the router reports the SR policy candidate path to a PCE through PCEP. **Note:** A user can only enable reporting of an SR policy candidate path when a user configures the **configure router segment-routing sr-policies static-policy head-end** command to **local**.
Default	false
Introduced	26.3.R1
Platforms	All

preference *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Preference value of this static policy
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* preference *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	preference
Description	This command configures a preference value to associate with a statically defined SR policy. When there are multiple policies for the same (color, endpoint) combination that are targeted for local installation, only one is selected as the active path for the (color, endpoint). In this selection process, which considers both static local policies and BGP-signaled policies, the policy with the highest preference value is preferred over all policies with a lower preference value.
Max. range	0 to 4294967295
Default	100
Introduced	16.0.R1
Platforms	All

segment-list [seg-list-index] *number*

Synopsis	Enter the **segment-list** list instance
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number*
Tree	segment-list
Description	Commands in this context configure a segment list for the statically defined segment routing policy. The **dynamic** context and the **segment-list** context are mutually exclusive.
Max. instances	32
Introduced	16.0.R1
Platforms	All

[**seg-list-index**] *number*

segment [segment-index] *number*

Synopsis	Enter the **segment** list instance
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number*
Tree	segment
Description	Commands in this context configure a segment inside a segment-list of a statically-defined segment routing policy candidate path. A segment list of a statically-defined SR policy candidate path of type **sr-mpls** can only accept a segment of type **mpls-label**. A segment list of a statically-defined SR policy candidate path of type **srv6** can only accept a segment of type **srv6-sid**. However, you can mix SRv6 segments derived from both classic SRv6 and micro-segment SRv6 locators.
Max. instances	24
Introduced	16.0.R1
Platforms	All

[**segment-index**] *number*

Synopsis	Index for identifying a segment in a segment list
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number*
Tree	segment
Description	This command configures the index for identifying a segment in a segment list.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	Each segment list can have up to 11 segments for SR-MPLS policies, and 24 segments for an SRv6 segment list which only includes micro-segments. For an SRv6 segment list that mixes regular and micro-segments, up to 7 regular segments can be configured.
Range	1 to 24
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

behavior-and-structure

Synopsis	Enable the **behavior-and-structure** context
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number* behavior-and-structure
Tree	behavior-and-structure
Description	Commands in this context configure the behavior and structure of the SRv6 policy micro-segment. Behavior and structure are necessary (but not sufficient) for the SRv6 policy micro-segment to be compressed by a head-end.
Introduced	23.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

behavior *keyword*

Synopsis	Behavior of the SRv6 uSID
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-list *number* segment *number* behavior-and-structure behavior *keyword*
Tree	behavior
Description	This command configures the behavior of the SRv6 policy micro-segment (uSID). The only allowed values are flavorless behaviors of NEXT-CSID. The compression algorithm however supports all flavors. Although END.T with NEXT-CSID is a configurable value, SR OS does not support this behavior for locally-instantiated SIDs. However, configuring this value allows a traffic-engineered path to be built that includes nodes that would support such behavior.
Options	end-next-csid, end-x-next-csid, end-t-next-csid, end-b6-encaps-next-csid, end-b6-encaps-red-next-csid
Notes	This element is mandatory.

ip-address *ipv6-address*

Synopsis	Remote SRv6 binding SID
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-routing-v6 binding-sid *number* ip-address *ipv6-address*
Tree	ip-address
Description	This command configures an SRv6 binding SID for a remote SRv6 policy. The command cannot be used with a local head-end location (**configure router segment-routing sr-policies static-policy head-end local**). This command and the **configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid locator** command or the **configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid micro-segment-locator** command are mutually exclusive. If the remote head-end is an SR OS system, the binding SID can either be a regular SID or uSID. If it is a uSID, it must be configured with a node ID in the following format: <block><uN><uB6>::) The format of the binding SID is a 128-bit IPv6 address.
Notes	The following elements are part of a choice: **ip-address** or (**locator** and **micro-segment-locator**).
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator

Synopsis	Enable the **locator** context
Context	**configure** router *named-item-64* segment-routing sr-policies static-policy *named-item-64* segment-routing-v6 binding-sid *number* locator
Tree	locator
Description	Commands in this context configure a binding SID locator for a local SRv6 policy. This command and the **configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid ip-address** command for a non-local SRv6 policy are mutually exclusive.
Notes	The following elements are part of a choice: **ip-address** or (**locator** and **micro-segment-locator**).
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

hold-down

Synopsis	Enable the **hold-down** context
Context	**configure** router *named-item-64* static-routes hold-down
Tree	hold-down
Description	Commands in this context enable the hold-down time feature globally for static routes in the system. The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap. The commands in this context apply to all static routes in the VPRN and the base router instance in which this hold-down time is configured in.
Introduced	16.0.R1
Platforms	All

initial *number*

Synopsis	Value for the initial hold-down time
Context	**configure** router *named-item-64* static-routes hold-down initial *number*
Tree	initial
Description	This command specifies the initial value of the hold-down time globally for static routes in the system. When a static route is ready to become active, it remains inactive for the hold-down time before activating the static-route. If, during this hold-down period, the static route becomes inactive again because of factors such as interface failure, the hold-down timer is reset, effectively postponing the activation of the route until the next opportunity.
Range	1 to 65535
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

max-value *number*

Synopsis	Maximum value of the hold-down time
Context	**configure** router *named-item-64* static-routes hold-down max-value *number*
Tree	max-value
Description	This command specifies the maximum value of the hold-down time globally for static routes in the system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	1 to 65535
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

multiplier *number*

Synopsis	Multiplier of the previous hold-down time
Context	**configure** router *named-item-64* static-routes hold-down multiplier *number*
Tree	multiplier
Description	This command specifies the multiplier value by which the previous hold-down time is multiplied to calculate the new one. This value applies globally for static routes in the system.
Range	1 to 10
Notes	This element is mandatory.
Introduced	16.0.R1
Platforms	All

route [ip-prefix] *(ipv4-prefix | ipv6-prefix)* route-type *keyword*

Synopsis	Enter the **route** list instance
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword*
Tree	route
Description	Commands in this context create a static route entry. A prefix and netmask must be specified. After the static route context for the specified prefix and netmask has been created, additional options associated with the static route or routes may be specified through the inclusion of additional static route commands.
Introduced	16.0.R1
Platforms	All

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	IP prefix and prefix length for the static routes

backup-tag *number*

Synopsis	Static route backup tag
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* backup-tag *number*
Tree	backup-tag
Description	This command associates a 4-byte backup route tag with the static route when the backup next-hop functionality is activated. The tag value is used in route policies to control distribution of the static route into other protocols when the backup next-hop function is activated for the associated static route. The tag specified at this level of the static route causes the tag values that are configured under the **next-hop**, **black-hole**, and **indirect** contexts of the static route to be ignored.
Range	1 to 4294967295
Introduced	21.2.R1
Platforms	All

Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)* cpe-check *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	cpe-check
Description	When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device. This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route. **Note**: A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.

Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* ipsec-tunnel *named-item* tag *number*
Tree	tag
Description	This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols. If a tag is specified at the prefix level of the static route entry, this command is ignored.
Range	1 to 4294967295
Introduced	22.7.R1
Platforms	VSR

leak-destination

Synopsis	Enter the **leak-destination** context
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* leak-destination
Tree	leak-destination
Description	Commands in this context configure a list of VPRNs that receive a leaked copy of the static route. When a VPRN service is added to this list, the static route is leaked into that VPRN if the following conditions are met: • all the configured next hops of the static route are direct next hops • the static route is an active route, or it is capable of immediately becoming an active route when a more-preferred route for the same prefix is removed Static routes leaked using this method appear as "VPN Leak" protocol routes in the route table of the VPRN.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When a packet received by a VPRN matches a "VPN Leak" route leaked using this method, the packet is forwarded according to the configuration of the static route in the GRT, even if the static route is currently non-best in the GRT.

Introduced 24.10.R1

Tree	address
Description	This command specifies the backup IP forwarding address that is used for static route Fast ReRoute (FRR). The configured address, if reachable, acts as pre-installed backup forwarding information that can be used when the primary IP next-hop suddenly fails. The configured backup next-hop IP address can be directly or indirectly connected (using an IGP or tunnel) to the node. The backup next-hop forwarding information or the Next-hop Label Forwarding Entry (NHLFE) tunnel forwarding information from the IP Routing Table Manager (RTM) is used to preconfigure an IP fast-reroute backup path. One backup next-hop address can protect a single primary static route entry next-hop address without ECMP and it is only activated when the primary next-hop has no active ECMP. The configured IP address can be either on the network or the access side.
Introduced	21.2.R1
Platforms	All

bfd-liveness *boolean*

Synopsis	Use Bidirectional Forwarding Detection on this static route

cpe-check [address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **cpe-check** list instance
Context	**configure** router *named-item-64* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)* cpe-check *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	cpe-check
Description	When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device. This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route. **Note**: A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.

sr-mpls-local *keyword*

Synopsis	TTL propagation for local CPM generated IP packets
Context	**configure** router *named-item-64* ttl-propagate sr-mpls-local *keyword*
Tree	sr-mpls-local
Description	This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy. This command enables or disables propagation of the TTL or hop-limit field value of CPM originated IP packet to all labels in the segment routing transport label stack. Use the **sr-mpls-transit** command to configure TTL or hop-limit propagation for transit IP packets.
Options	none – Do not propagate TTL or hop-limit field value all – Propagate TTL or hop-limit field value
Default	all
Introduced	24.7.R1
Platforms	All

sr-mpls-transit *keyword*

Synopsis	TTL propagation for in-transit user IP packets
Context	**configure** router *named-item-64* ttl-propagate sr-mpls-transit *keyword*
Tree	sr-mpls-transit
Description	This command configures TTL or hop-limit propagation for all segment routing MPLS tunnels carrying IPv4 or IPv6 packets. This applies to IPv4 and IPv6 packets of IGP, BGP unlabelled (except 6PE), and static routes in the base router whose next hop is resolved to a Segment Routing MPLS (SR-MPLS) tunnel of any of the following types: SR-ISIS, SR-OSPF, SR-OSPF3, SR-TE LSP, and SR policy. This command enables or disables propagation of the TTL or hop-limit field value for transit IP packets to all labels in the segment routing transport label stack. Transit IP packets are packets of base router prefixes received on an access interface or a network interface (with or without tunnel encapsulation) and whose FIB lookup results in forwarding them over an SR-MPLS tunnel. Use the **sr-mpls-local** command to configure TTL or hop-limit propagation for CPM originated IP packets.
Options	none – Do not propagate TTL or hop-limit field value all – Propagate TTL or hop-limit field value
Default	all
Introduced	24.7.R1

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

type *keyword*

Synopsis	Processing behavior type for the reflector
Context	**configure** router *named-item-64* twamp-light reflector type *keyword*
Tree	type
Description	This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light** the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet. In mixed environments where different types of Session-Senders may be targeting a common TWAMP Light reflector, set the value to **stamp**. When the reflector is operating in **stamp** mode, the primary parsing is based on STAMP, checking and processing known TLVs, or determining if the arriving PDU is a TWAMP Light PDU. A Session-Sender launching a TWAMP Light-based packet must use all zeros padding pattern when the pad size is non zero.
Options	stamp – Reflector finds and processes supported STAMP TLVs twamp-light – Reflector does not check received PDU
Default	twamp-light
Introduced	22.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ntf-logout-retry-count *number*

Synopsis	Number of retransmissions of an NTF_LOGOUT message
Context	**configure** router *named-item-64* wpp portal *named-item* ntf-logout-retry-count *number*
Tree	ntf-logout-retry-count
Range	0 to 5
Default	5
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

port-format *keyword*

Synopsis	Format of the port in the ACK_INO message
Context	**configure** router *named-item-64* wpp portal *named-item* port-format *keyword*
Tree	port-format
Options	standard, vendor-specific
Default	standard
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

retry-interval *number*

Synopsis	Time between two consecutive retransmissions
Context	**configure** router *named-item-64* wpp portal *named-item* retry-interval *number*
Tree	retry-interval
Range	10 to 2000
Units	milliseconds
Default	2000

Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

secret *encrypted-leaf*

Synopsis	Message authentication between portal and BRAS by applying the secret used by WPPv2
Context	**configure** router *named-item-64* wpp portal *named-item* secret *encrypted-leaf*
Tree	secret
Description	This command specifies the secret key for WPPv2 message authentications in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide* for more information.
String length	1 to 166
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

version *number*

Synopsis	Protocol version to be expected by the WPP portal
Context	**configure** router *named-item-64* wpp portal *named-item* version *number*
Tree	version
Range	1 | 2
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Platforms	All

flex-algo-class-forwarding

Synopsis	Enter the **flex-algo-class-forwarding** context
Context	**configure** routing-options flex-algo-class-forwarding
Tree	flex-algo-class-forwarding
Description	Commands in this context configure SRv6 IS-IS class-based forwarding entries, each of which maps a flexible algorithm identifier to a pair of numbers (the source class and destination class) that are derived, per-packet, from the IP FIB lookup process. The

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

flexible algorithm ID is used to select an SRv6 IS-IS flexible algorithm tunnel bundle member for forwarding.

The programming of these types of tunnels is enabled with the **configure router isis segment-routing-v6 flex-algo-class-forwarding** command. However, these tunnels are only used to resolve BGP-IPVPN routes and only when **configure service vprn bgp-ipvpn segment-routing-v6 flex-algo-class-forwarding** is configured to **true**. Also note that lookup into the table of **map** entries only happens for IPv4 or IPv6 packets that arrive on a VPRN IP interface with **flex-algo-cbf-lookup** enabled for the respective protocol.

[

Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

map [source-class] *number* destination-class *number*

Synopsis	Enter the **map** list instance
Context	**configure** routing-options flex-algo-class-forwarding map *number* destination-class *number*
Tree	map
Description	Commands in this context create a mapping from a specific pair of source class and destination class numbers to a flexible algorithm ID.
Max. instances	4096
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

[**source-class**] *number*

Synopsis	Source class for the mapping
Context	**configure** routing-options flex-algo-class-forwarding map *number* destination-class *number*
Tree	map
Description	This command configures the source class to map to the algorithm.
Range	1 to 255
Notes	This element is part of a list key.
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

destination-class *number*

Synopsis	Destination class for the mapping
Context	**configure** routing-options flex-algo-class-forwarding map *number* destination-class *number*
Tree	map
Description	This command configures the destination class to map to the algorithm.
Range	1 to 255
Notes	This element is part of a list key.
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

algorithm *number*

Synopsis	Algorithm to be used for the mapping
Context	**configure** routing-options flex-algo-class-forwarding map *number* destination-class *number* algorithm *number*
Tree	algorithm
Range	128 to 255
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

tunnel-set-size *number*

Synopsis	Size of the tunnel set
Context	**configure** routing-options flex-algo-class-forwarding tunnel-set-size *number*
Tree	tunnel-set-size
Description	This command controls the maximum number of tunnels that IS-IS is allowed to include in a single flexible algorithm bundle of tunnels. The algorithm 0 tunnel is always included in this count so the maximum number of non-zero-algorithm tunnels toward any remote router is **tunnel-set-size** minus 1. A commit is rejected if the number of unique algorithms across all configured **map** entries greater than **tunnel-set-size** minus 1.
Range	2 to 8
Introduced	26.3.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

flexible-algorithm-definitions

Synopsis	Enter the **flexible-algorithm-definitions** context
Context	**configure** routing-options flexible-algorithm-definitions
Tree	flexible-algorithm-definitions
Description	Commands in this context enable locally-configured algorithm definitions and configure administrative groups.
Introduced	20.7.R1
Platforms	All

flex-algo [flex-algo-name] *named-item*

Synopsis	Enter the **flex-algo** list instance
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item*
Tree	flex-algo
Description	Commands in this context configure the definition context for a Flexible Algorithm Definition (FAD).
Max. instances	256
Introduced	20.7.R1
Platforms	All

[**flex-algo-name**] *named-item*

Synopsis	Flexible Algorithm Definition (FAD) name
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item*
Tree	flex-algo
Description	This command specifies the name of the flexible algorithm definition that is used as a reference anchor for the configuration.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	20.7.R1
Platforms	All

exclude

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **exclude** context
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* exclude
Tree	exclude
Description	Commands in this context define administrative groups that are used to exclude links from the Flexible Algorithm topology graph. Administrative groups, also known as link colors, are attributes associated with a link. The exclude rule that is part of the FAD specifies that links with the named administrative groups set are to be excluded from the topology graph.
Introduced	20.7.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

admin-group [group-name] *reference*

Synopsis	Add a list entry for **admin-group**
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* exclude admin-group *reference*
Tree	admin-group
Introduced	20.7.R1

flags-tlv *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Advertise the FAD Flags TLV
Context	**configure** routing-options flexible-algorithm-definitions flex-algo *named-item* flags-tlv *boolean*
Tree	flags-tlv
Description	When configured to **true**, the router advertises the FAD Flags TLV within the FAD. The M-flag within the TLV is set to 1, specifying the use of a Flex-Algorithm specific prefix metric. A router receiving the TLV modifies the constrained SPF (cSPF) based on the M-flag status. When configured to **false**, the FAD Flags TLV is not included with the FAD advertisement.

Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** routing-options policy-accounting policy-acct-template *named-item* destination-class *number*
Tree	destination-class
Range	1 to 255
Notes	This element is part of a list key.
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

policer *reference*

Synopsis	Policer ID
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* destination-class *number* policer *reference*
Tree	policer
Reference	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number*
Introduced	21.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

policer [policer-id] *number*

Synopsis	Enter the **policer** list instance
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number*
Tree	policer
Description	Commands in this context configure the policer definition for the instance. Policing by action of a policy accounting template is only supported by cards and systems that are FP4 and later.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

[**policer-id**] *number*

Synopsis	Policer ID
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number*
Tree	policer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	1 to 63
Notes	This element is part of a list key.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

max-burst-size *(number | keyword)*

Synopsis	Exceed threshold to drop packets from PIR leaky bucket
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number* max-burst-size *(number | keyword)*
Tree	max-burst-size
Description	This command specifies the maximum burst size for the policer. When this value is exceeded, packets are considered violating and are dropped.
Range	0 to 16777216
Units	bytes
Options	auto
Default	auto
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

peak-rate *(number | keyword)*

Synopsis	Peak rate of the policy accounting policer
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* policer *number* peak-rate *(number | keyword)*
Tree	peak-rate
Description	This command configures the peak rate of the policy accounting policer, which is the fill or drain rate of the bucket.
Range	1 to 6400000000
Options	max
Default	max
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

source-class [index] *number*

Synopsis	Add a list entry for **source-class**
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* source-class *number*
Tree	source-class
Max. instances	255
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

[**index**] *number*

Synopsis	Source-class index
Context	**configure** routing-options policy-accounting policy-acct-template *named-item* source-class *number*
Tree	source-class
Range	1 to 255
Notes	This element is part of a list key.
Introduced	19.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

route-next-hop-policy

Synopsis	Enter the **route-next-hop-policy** context
Context	**configure** routing-options route-next-hop-policy
Tree	route-next-hop-policy
Introduced	16.0.R1
Platforms	All

template [template-name] *named-item*

Synopsis	Enter the **template** list instance
Context	**configure** routing-options route-next-hop-policy template *named-item*
Tree	template
Introduced	16.0.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

[**template-name**] *named-item*

Synopsis	Template name
Context	**configure** routing-options route-next-hop-policy template *named-item*
Tree	template
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

description *description*

Synopsis	Text description
Context	**configure** routing-options route-next-hop-policy template *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	16.0.R1
Platforms	All

exclude-group [group-name] *reference*

Synopsis	Add a list entry for **exclude-group**
Context	**configure** routing-options route-next-hop-policy template *named-item* exclude-group *reference*
Tree	exclude-group
Max. instances	32
Introduced	16.0.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**group-name**] *reference*

Synopsis	Administrative group name
Context	**configure** routing-options route-next-hop-policy template *named-item* exclude-group *reference*
Tree	exclude-group
Description	This command specifies the name of the administrative group. If the same group name is part of both include and exclude statements, the exclude statement wins. In other words, the exclude statement can be viewed as having an implicit preference value of 0.
Reference	**configure** routing-options if-attribute admin-group *named-item*
Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

include-group [group-name] *reference*

Synopsis	Enter the **include-group** list instance
Context	**configure** routing-options route-next-hop-policy template *named-item* include-group *reference*
Tree	include-group
Max. instances	32
Introduced	16.0.R1
Platforms	All

[**group-name**] *reference*

Synopsis	Administrative group name
Context	**configure** routing-options route-next-hop-policy template *named-item* include-group *reference*
Tree	include-group
Description	This command specifies the name of the administrative group. If the same group name is part of both include and exclude statements, the exclude statement wins. In other words, the exclude statement can be viewed as having an implicit preference value of 0.
Reference	**configure** routing-options if-attribute admin-group *named-item*

Notes	This element is part of a list key.
Introduced	16.0.R1
Platforms	All

preference *number*

Synopsis	Preference number for the admin group
Context	**configure** routing-options route-next-hop-policy template *named-item* include-group *reference* preference *number*
Tree	preference
Range	1 to 255
Default	255
Introduced	16.0.R1
Platforms	All

nh-type *keyword*

Synopsis	Preferred next hop
Context	**configure** routing-options route-next-hop-policy template *named-item* nh-type *keyword*
Tree	nh-type
Options	ip, tunnel
Default	ip
Introduced	16.0.R1
Platforms	All

protection-type *keyword*

Synopsis	Protection type used
Context	**configure** routing-options route-next-hop-policy template *named-item* protection-type *keyword*
Tree	protection-type
Options	link, node
Default	node
Introduced	16.0.R1
Platforms	All

4.40.1 saa command descriptions

saa

Synopsis	Enter the **saa** context
Context	**configure** saa
Tree	saa
Description	Commands in this context configure the Service Assurance Agent (SAA) tests.
Introduced	16.0.R4
Platforms	All

owner [owner-name] *named-item* test *named-item*

Synopsis	Enter the **owner** list instance
Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
Introduced	16.0.R4
Platforms	All

[**owner-name**] *named-item*

Synopsis	Optional owner name of the SAA operation
Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
Description	This command configures the owner associated with the SAA operation.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
MD-CLI default	TiMOS CLI
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

test *named-item*

Synopsis	SAA test name
Context	**configure** saa owner *named-item* test *named-item*
Tree	owner
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	16.0.R4
Platforms	All

accounting-policy *reference*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Accounting policy associated with the SAA test
Context	**configure** saa owner *named-item* test *named-item* accounting-policy *reference*
Tree	accounting-policy
Reference	**configure** log accounting-policy *number*
Introduced	16.0.R4
Platforms	All

admin-state *keyword*

Synopsis	Administrative state of the SAA test
Context	**configure** saa owner *named-item* test *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	16.0.R4
Platforms	All

continuous *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Execute the SAA tests as continuous
Context	**configure** saa owner *named-item* test *named-item* continuous *boolean*
Tree	continuous
Description	When configured to **true**, the SAA test execution is continuous, that is, it cannot be started or stopped with the **oam saa test start** or **stop** commands. The SAA test types supported by this command include the following: • **cpe-ping** • **dns** • **eth-cfm-loopback** • **eth-cfm-two-way-delay** • **eth-cfm-two-way-slm** • **icmp-ping** (not applicable to **rapid** type) • **lsp-ping** • **mac-ping** • **sdp-ping** • **vccv-ping** • **vprn-ping**
Default	false
Introduced	16.0.R4
Platforms	All

threshold *number*

Synopsis	Threshold jitter value
Context	**configure** saa owner *named-item* test *named-item* jitter-event *keyword* threshold-type *keyword* threshold *number*
Tree	threshold
Description	This command specifies the threshold jitter value. The system generates an SAA threshold event when the jitter value of the test run crosses the threshold value.
Range	0 to 2147483647
Units	microseconds
Notes	This element is mandatory.
Introduced	16.0.R4
Platforms	All

latency-event [direction] *keyword* threshold-type *keyword*

Synopsis	Enter the **latency-event** list instance
Context	**configure** saa owner *named-item* test *named-item* latency-event *keyword* threshold-type *keyword*
Tree	latency-event
Description	Commands in this context configure the latency event thresholds used to evaluate the latency event value at the termination of an SAA test probe. The system generates SAA threshold events as required.
Introduced	16.0.R4
Platforms	All

[**direction**] *keyword*

Synopsis	Direction for OAM ping responses for OAM ping test run

dns

Synopsis	Enable the **dns** context
Context	**configure** saa owner *named-item* test *named-item* type dns
Tree	dns
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	22.10.R1
Platforms	All

count *number*

Synopsis	Number of messages to send in a sample window
Context	**configure** saa owner *named-item* test *named-item* type dns count *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	count
Description	This command specifies the number of messages to send. Each message request must either time out or receive a reply before the next message request is sent.
Range	1 to 100
Units	packets
Default	1
Introduced	22.10.R1
Platforms	All

interval *number*

Synopsis	Minimum time before the next message request is sent
Context	**configure** saa owner *named-item* test *named-item* type dns interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	1
Introduced	22.10.R1
Platforms	All

name-server *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the DNS name server used for the test
Context	**configure** saa owner *named-item* test *named-item* type dns name-server *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	name-server
Notes	This element is mandatory.
Introduced	22.10.R1
Platforms	All

record-type *keyword*

Synopsis	Record type
Context	**configure** saa owner *named-item* test *named-item* type dns record-type *keyword*
Tree	record-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	ipv4-a-record, ipv6-aaaa-record
Default	ipv4-a-record
Introduced	22.10.R1
Platforms	All

router-instance *string*

Synopsis	Router name or VPRN service name
Context	**configure** saa owner *named-item* test *named-item* type dns router-instance *string*
Tree	router-instance
Default	_Base_and_management
Introduced	22.10.R1
Platforms	All

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address on the local system
Context	**configure** saa owner *named-item* test *named-item* type dns source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures the IP address on the local system. If unconfigured, the router uses a system selected local IP address.
Introduced	22.10.R1
Platforms	All

target-address *string-not-all-spaces*

Synopsis	DNS name to be resolved to an IP address
Context	**configure** saa owner *named-item* test *named-item* type dns target-address *string-not-all-spaces*
Tree	target-address
String length	1 to 255
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	22.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

timeout *number*

Synopsis	Maximum time to wait for a reply message
Context	**configure** saa owner *named-item* test *named-item* type dns timeout *number*
Tree	timeout
Description	This command specifies the maximum time the router waits for a message response after sending the message request. When the timeout expires, the requesting router assumes the message response is not received. Any response received after the request times out is silently discarded.
Range	1 to 120
Units	seconds
Default	5
Introduced	22.10.R1
Platforms	All

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation
Tree	trap-generation
Introduced	22.10.R1
Platforms	All

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	22.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	22.10.R1
Platforms	All

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	22.10.R1
Platforms	All

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	22.10.R1
Platforms	All

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type dns trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	22.10.R1
Platforms	All

eth-cfm-loopback

Synopsis	Enable the **eth-cfm-loopback** context
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback
Tree	eth-cfm-loopback
Description	Commands in this context configure an Ethernet CFM loopback test in SAA.
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	24.10.R1
Platforms	All

count *number*

Synopsis	Number of packets to send
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback count *number*
Tree	count

© 2026 Nokia.

Range	1 to 100
Units	packets
Default	1
Introduced	24.10.R1
Platforms	All

destination *(mac-unicast-address-no-zero | number)*

Synopsis	Destination MAC address or remote MEP ID of the peer
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback destination *(mac-unicast-address-no-zero | number)*
Tree	destination
Description	This command specifies the Layer 2 unicast MAC address of the destination MEP or, alternatively, the remote MEP ID. When the remote MEP ID option is used instead of the MAC address, the domain and association information of the source MEP for the test is used to check for a locally stored unicast MAC address for the peer. The local MEP must be administratively enabled.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Range	1 to 8191
Notes	This element is mandatory.
Introduced	24.10.R1
Platforms	All

interval *number*

Synopsis	Interval between packets sent
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	5
Introduced	24.10.R1
Platforms	All

© 2026 Nokia.

Use subject to Terms available at: www.nokia.com/terms.

size *number*

Synopsis	Size of the value field in the sent frames
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback size *number*
Tree	size
Range	0 to 1500
Units	bytes
Default	0
Introduced	24.10.R1
Platforms	All

timeout *number*

Synopsis	Maximum time to wait for a reply packet
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback timeout *number*
Tree	timeout
Description	This command configures the maximum time the router waits for a reply packet after sending the last probe for the test. When the timeout expires, the test is marked complete and no more packets are processed.
Range	1 to 10
Units	seconds
Default	5
Introduced	24.10.R1
Platforms	All

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation
Tree	trap-generation
Introduced	24.10.R1
Platforms	All

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	24.10.R1
Platforms	All

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	24.10.R1
Platforms	All

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	24.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	All

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	24.10.R1
Platforms	All

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type eth-cfm-loopback trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	24.10.R1
Platforms	All

icmp-ping

Synopsis	Enable the **icmp-ping** context
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping
Tree	icmp-ping
Description	Commands in this context configure an ICMP ping test.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	16.0.R4
Platforms	All

bypass-routing *boolean*

Synopsis	Bypass routing table for directly connected interfaces
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping bypass-routing *boolean*
Tree	bypass-routing
Default	false
Notes	The following elements are part of a choice: **bypass-routing**, **interface**, or **next-hop-address**.
Introduced	16.0.R4
Platforms	All

count *number*

Synopsis	ICMP Echo Request packets to send in a sample window
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping count *number*
Tree	count
Range	1 to 100000
Units	packets
Default	5
Introduced	16.0.R4
Platforms	All

destination-address *(ipv4-address-no-zone | ipv6-address-no-zone | string-not-all-spaces)*

Synopsis	Destination IP address or DNS name to send ping request
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping destination-address *(ipv4-address-no-zone | ipv6-address-no-zone | string-not-all-spaces)*
Tree	destination-address
String length	1 to 128

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	16.0.R4
Platforms	All

do-not-fragment *boolean*

Synopsis	Do not fragment echo request packets (valid for IPv4)
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping do-not-fragment *boolean*
Tree	do-not-fragment
Description	This command sets the Do Not Fragment (DF) bit in the IPv4 header. This prevents packet fragmentation along the path when there is an MTU mismatch.
Default	false
Introduced	16.0.R4
Platforms	All

interface *interface-name*

Synopsis	Interface name
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping interface *interface-name*
Tree	interface
String length	1 to 32
Notes	The following elements are part of a choice: **bypass-routing**, **interface**, or **next-hop-address**.
Introduced	16.0.R4
Platforms	All

interval *(number | decimal-number)*

Synopsis	Minimum time to expire before message request is sent
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping interval *(number | decimal-number)*
Tree	interval
Range	1 to 10000

size *number*

Synopsis	Packet padding size
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping size *number*
Tree	size
Description	This command configures the number of bytes in the combined ICMP Header (8 bytes) and ICMP Payload (variable size) of the ICMP Echo Request packets.
Range	0 to 16384
Units	bytes
Default	56
Introduced	16.0.R4
Platforms	All

source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source IP address
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping source-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-address
Description	This command configures the source IP address to be loaded into the IP header of the ICMP Echo Request packet. If unconfigured, the router uses a system-selected local address.
Introduced	16.0.R4
Platforms	All

timeout *number*

Synopsis	Time router waits for a reply after sending last probe
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping timeout *number*
Tree	timeout
Range	1 to 10
Units	seconds
Default	5
Introduced	16.0.R4
Platforms	All

trap-generation

Synopsis	Enter the **trap-generation** context
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation
Tree	trap-generation
Introduced	22.10.R1
Platforms	All

probe-fail *boolean*

Synopsis	Enable the generation of probe fail notifications
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation probe-fail *boolean*
Tree	probe-fail
Description	When configured to **true**, the system generates an SNMP trap if the consecutive probe failure threshold is reached during the execution of the SAA ping test. This command is not applicable to SAA traceroute tests.
Default	false
Introduced	22.10.R1
Platforms	All

probe-fail-threshold *number*

Synopsis	Consecutive probe failure count
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation probe-fail-threshold *number*
Tree	probe-fail-threshold
Description	This command configures the number of consecutive ping probe failures required to generate a trap. This command has no effect if the **probe-fail** command is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	22.10.R1
Platforms	All

test-complete *boolean*

Synopsis	Enable generation of test complete notifications
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation test-complete *boolean*
Tree	test-complete
Default	false
Introduced	22.10.R1
Platforms	All

test-fail *boolean*

Synopsis	Enable the generation of test fail notifications
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation test-fail *boolean*
Tree	test-fail
Description	When configured to **true**, the system generates a trap if a test fails. In the case of a ping test, the test is considered to have failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** setting.
Default	false
Introduced	22.10.R1
Platforms	All

test-fail-threshold *number*

Synopsis	Total probe failures for trap generation
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping trap-generation test-fail-threshold *number*
Tree	test-fail-threshold
Description	This command configures the number of consecutive test failures required to generate a trap. This command has no effect when **test-fail** is set to **false**. This command is not applicable to SAA traceroute tests.
Range	0 to 15
Default	1
Introduced	22.10.R1

Platforms	All

ttl *number*

Synopsis	Time to live in the IP header
Context	**configure** saa owner *named-item* test *named-item* type icmp-ping ttl *number*
Tree	ttl
Range	1 to 128
Default	64
Introduced	16.0.R4
Platforms	All

lsp-ping

Synopsis	Enable the **lsp-ping** context
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping
Tree	lsp-ping
Description	Commands in this context configure the command options to perform in-band LSP connectivity tests. LSP ping uses the protocol and data structures defined in RFC 8029, *Detecting Multiprotocol Label Switched (MPLS) Data-Plane Failures*.
Notes	The following elements are part of a choice: **dns**, **eth-cfm-loopback**, **icmp-ping**, **lsp-ping**, **sdp-ping**, or **vccv-ping**.
Introduced	22.10.R1
Platforms	All

interval *number*

Synopsis	Minimum time before the next lsp-ping request is sent
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping interval *number*
Tree	interval
Range	1 to 10
Units	seconds
Default	1
Introduced	22.10.R1

Platforms	All

qos

Synopsis	Enter the **qos** context
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping qos
Tree	qos
Introduced	22.10.R1
Platforms	All

fc *keyword*

Synopsis	Forwarding class
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping qos fc *keyword*
Tree	fc
Options	be – Best Effort l2 – Low 2 (best effort) af – Assured Forwarding (assured) l1 – Low 1 (assured) h2 – High 2 (high priority) ef – Expedited Forwarding (high priority) h1 – High 1 (high priority) nc – Network Control (high priority)
Default	be
Introduced	22.10.R1
Platforms	All

profile *keyword*

Synopsis	Profile
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping qos profile *keyword*
Tree	profile
Options	in – In profile out – Out of profile
Default	out
Introduced	22.10.R1
Platforms	All

send-count *number*

Synopsis	Number of request packets to send in a sample window
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping send-count *number*
Tree	send-count
Range	1 to 100
Units	packets
Default	1
Introduced	22.10.R1
Platforms	All

size *number*

Synopsis	Packet pad size
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping size *number*
Tree	size
Range	1 to 9786
Units	bytes
Default	1
Introduced	22.10.R1
Platforms	All

source-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Source IP address
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping source-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	source-ip-address
Introduced	22.10.R1
Platforms	All

sub-type

Synopsis	Enter the **sub-type** context
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	sub-type
Introduced	22.10.R1
Platforms	All

bgp-label

Synopsis	Enable the **bgp-label** context
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type bgp-label
Tree	bgp-label
Notes	The following elements are part of a choice: **bgp-label**, **ldp**, **rsvp-te**, **sr-isis**, **sr-ospf**, **sr-ospf3**, **sr-policy**, or **sr-te**.
Introduced	22.10.R1
Platforms	All

path-destination

Synopsis	Enter the **path-destination** context
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type bgp-label path-destination
Tree	path-destination
Introduced	22.10.R1
Platforms	All

interface *interface-name*

Synopsis	Egress router interface used with the path destination
Context	**configure** saa owner *named-item* test *named-item* type lsp-ping sub-type bgp-label path-destination interface *interface-name*
Tree	interface
String length	1 to 32
Notes	The following elements are part of a choice: **interface** or **next-hop**.
Introduced	22.10.R1
Platforms	All
