AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies either the preferred (protected) or the alternate (protecting) OC-3 port) which together constitutes the ring node.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<AID1>,<AID2>: :WTSDEL=<value>"]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID1	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC3 AID, identifies the preferred (protected) OC-3 port.
AID2	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC3 AID, identifies the alternate (protecting) OC-3 port.

WTDSEL= {DELAY, IMMED}
Wait to Switch Delay. Determines if the path switching on the paths within the OC-3 is being delayed by a set amount determined by the hardware or if it is immediate. Values are:

DELAY	The path switching is being delayed by approximately 25 milliseconds after the fault is detected.
IMMED	The path switching is occurring immediately upon detection of the fault.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*RNG Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/ /*TPidToAidStr() Error: <ERROR-STRING>*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the ring protection pair is retrieved for OC-3 port OC3-13 (preferred line).

```
RTRV-RNG-OC3::OC3-13;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"OC3-13,OC3-14::WTDSEL=DELAY"
/* RTRV-RNG-OC3::OC3-14 [Pad567] (2) */
;
```

RELATED COMMANDS

```

COMMAND CODE: **RTRV-ROLL-ALL**
COMMAND NAME: **RETRIEVE ROLL ALL**

PURPOSE

The RTRV-ROLL-ALL command displays one line of information for each Roll provisioned in the 1631 SX LMC system. This command is executed regardless of the state of the ports, but the command will return an output only for ports in a ROLL secondary state.

A RTRV-ROLL-ALL command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ROLL-ALL:[TID]:[AID]:[CTAG]:[CLEVEL];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	{ALL} Default: ALL Addressing: None Description: Retrieves ALL active Rolls existing in the database.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CLEVEL	{T1} Default: T1 Addressing: None Description: Connection Level. Specifies the type of Roll connections that are to be retrieved. Currently, the only CLEVEL value is T1. When this T1 value is entered for this parameter, it will extract all the Rolls of T1 and VT1 connections.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["RFROM=<VALUE>, RTO=<VALUE>, OTHER=<VALUE>, TYPE=<VALUE>,
STATUS=<VALUE>"]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

RFROM	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	DS1 or VT1 AID; indicates the roll "FROM" port id associated with the rolling operation that remains fixed through the roll.	
RTO	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	DS1 or VT1 AID; indicates the roll "TO" port id associated with the rolling operation which is the new end of the connection after the rolling.	
OTHER	DS1_AID	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	DS1 or VT1 AID; indicates the roll "OTHER" port id associated with the rolling operation which is the old connection from which the traffic is being rolled.	
TYPE	{AUTO, FMAN1, FMAN2, MAN}	
	Identifies the mode of rolling operation being performed. The valid values are:	
	AUTO	Automatic mode; old broadcast tail shall be automatically dropped on detection of a valid signal on the new path.
	FMAN1	Fully Manual mode part 1; broadcast tail is set up and monitoring for valid signal begins. No action taken on valid signal detection.
	FMAN2	Fully manual mode part 2; Connection established from RTO to RFROM ports.
	MAN	Manual mode; old broadcast tail to be retained on detection of a valid signal on the new path.

STATUS	{BROADCASTING, MONITORING, BROADCASTING&MONITORING, WAITING, BROADCASTING&WAITING, ROLLED&BROADCASTING}
	Identifies the current status of the rolling operation. The valid values are:
BROADCASTING	The RFROM port is connected to both OTHER and RTO ports.
MONITORING	The receive end of the RTO port is being monitored for a valid signal.
BROADCASTING&MONITORING	Both of the above.
WAITING	The receive side of the RTO port is no longer being monitored for a valid signal and the system is waiting for ENT-ROLL-T1 command with RMODE set to FMAN2.
BROADCASTING&WAITING	Broadcasting and Waiting.
ROLLED&BROADCASTING	The system is in Rolled/broadcasting state where in it is waiting for a final DLT-ROLL-T1 command to be issued.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */

COMMAND CODE: **RTRV-ROLL-T1**
COMMAND NAME: **RETRIEVE ROLL T1**

PURPOSE

The RTRV-ROLL-T1 command retrieves the information regarding the roll status between the port specified by the AID parameter that is a DS1 and any other port which may be either a DS1 or a VT1.5. This command is executed regardless of the state of the DS1 port, but the command will return an output only if the port specified by the AID is in a ROLL secondary state. In addition, the command is executed with no line of parsable output data provided if the specified DS1 is embedded within a protection OC3.

A RTRV-ROLL-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ROLL-T1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID: {T1-{1-59392}} (T1-DS1#) {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#) {EC1T1-{1-3840}-{1-28}} (EC1T1-EC1/STS1/DS3#-DS1#) {OC3T1-{1-2240}-{1-3}-{1-28}} (OC3T1-OC3#-STS1/DS3#-DS1#) {OC12T1-{1-560}-{1-4}-{1-3}-{1-28}} (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the DS1 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "RFROM=<VALUE>,RTO=<VALUE>,OTHER=<VALUE>,TYPE=<VALUE>,STATUS=<VALUE>"

	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	DS1 or VT1 AID; indicates the roll "OTHER" port id associated with the rolling operation which is the old connection from which the traffic is being rolled.	
TYPE	{AUTO, FMAN1, FMAN2, MAN}	
	Identifies the mode of rolling operation being performed. The valid values are:	
	AUTO	Automatic mode; old broadcast tail shall be automatically dropped on detection of a valid signal on the new path.
	FMAN1	Fully Manual mode part 1; broadcast tail is set up and monitoring for valid signal begins. No action taken on valid signal detection.
	FMAN2	Fully manual mode part 2; Connection established from RTO to RFROM ports.
	MAN	Manual mode; old broadcast tail to be retained on detection of a valid signal on the new path.

STATUS {BROADCASTING, MONITORING, BROADCASTING&MONITORING, WAITING, BROADCASTING&WAITING, ROLLED&BROADCASTING}
Identifies the current status of the rolling operation. The valid values are:

BROADCASTING	The RFROM port is connected to both OTHER and RTO ports.
MONITORING	The receive end of the RTO port is being monitored for a valid signal.
BROADCASTING&MONITORING	Both of the above.
WAITING	The receive side of the RTO port is no longer being monitored for a valid signal and the system is waiting for ENT-ROLL-T1 command with RMODE set to FMAN2.
BROADCASTING&WAITING	Broadcasting and Waiting.
ROLLED&BROADCASTING	The system is in Rolled/broadcasting state where in it is waiting for a final DLT-ROLL-T1 command to be issued.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */

	Identifies the mode of rolling operation being performed. The valid values are:	
	AUTO	Automatic mode; old broadcast tail shall be automatically dropped on detection of a valid signal on the new path.
	FMAN1	Fully Manual mode part 1; broadcast tail is set up and monitoring for valid signal begins. No action taken on valid signal detection.
	FMAN2	Fully manual mode part 2; Connection established from RTO to RFROM ports.
	MAN	Manual mode; old broadcast tail to be retained on detection of a valid signal on the new path.

STATUS {BROADCASTING, MONITORING, BROADCASTING&MONITORING, WAITING, BROADCASTING&WAITING, ROLLED&BROADCASTING}
Identifies the current status of the rolling operation. The valid values are:

BROADCASTING	The RFROM port is connected to both OTHER and RTO ports.
MONITORING	The receive end of the RTO port is being monitored for a valid signal.
BROADCASTING&MONITORING	Both of the above.
WAITING	The receive side of the RTO port is no longer being monitored for a valid signal and the system is waiting for ENT-ROLL-VT1 command with RMODE set to FMAN2.
BROADCASTING&WAITING	Broadcasting and Waiting.
ROLLED&BROADCASTING	The system is in Rolled/broadcasting state where in it is waiting for a final DLT-ROLL-VT1 command to be issued.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* RIP Database Error: <ERROR-STRING> for record number <RECORD-NUMBER> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, a one-way VT1 cross-connection is being rolled from an existing connection from port T3T1-2-2 (FROM) to port T3T1-3-3 (TO) to a new connection from port EC1VT1-4-4-1 (RTO) to port T3T1-3-3 (RFROM) and the system is waiting for a good signal at the RTO port EC1VT1-4-4-1.

```
RTRV-ROLL-VT1::EC1VT1-4-4-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "RFROM=T3T1-3-3,RTO=EC1VT1-4-4-1,OTHER=T3T1-3-3,TYPE=AUTO,STATUS=MON-
  ITORING"
  /* RTRV-ROLL-VT1::EC1VT1-4-4-1 [Pad567] (2) */
;

```

COMMAND CODE: **RTRV-STATE-EQPT**
COMMAND NAME: **RETRIEVE STATE EQUIPMENT**

PURPOSE

The RTRV-STATE-EQPT command retrieves the current primary state, and any associated secondary state, of the specified equipment entity.

A RTRV-STATE-EQPT command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-STATE-EQPT: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {ACL-1-2-{9-28, 37-56, 65-84, 93-112}} {ACM-1-2-{3-7, 10-14}} {CDA-{4, 5, 10, 11, 16, 17, 22, 23, 102, 103 }-3-1} {CDB-{5}-{1, 3}-{1, 2}} CDB-{2-43, 104-111 ,112-135, 136-141 }-{1, 3}-{1, 2} {SI36: CDB-{6-9, 12-15, 18-21, 24-43}-{1, 3}-{1-2}, SI48: CDB-{2-43, 104-111 ,112-135, 136-141 }-{1, 3}-{1, 2} {CIM-1-2-{3-7, 10-14}} {CKB-{1-63, 101, 102-111 , 112-135, 136-141 }-{0}-{1-2}} {CPU-1-2-{1-2}} {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} {DSI-{44-63}-{1-4}-{1-32}} {DSK-1-3-1, DSK-1-4-2} {EOB-{5}-{1, 3}-{1-5}} {SI48: EOB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}, EOC: EOB-{4-5, 10-11, 16-17, 22-23, 102, 103 }-1-{1-7, 9-15}} {SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110, 136-141 }-{1, 3}-{1-18}, EP3-{9, 21, 35, 43, 107 }-3-{1-18}, EP3-{15, 27, 31, 39, 111 }-1-{1-18}} {SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}} {SI48: ES1-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110,136-141 }-{1, 3}-{1-18}, ES1-{9, 21, 35, 43, 107 }-3-{1-18}, ES1-{15, 27, 31, 39, 111 }-1-{1-18}} {SI36: ES1-{6-8, 12-14}-{1, 3}-{1-14}, ES1-9-3-{1-14}, ES1-15-1-{1-14}} {ESA-{44-63}-{1-4}-{1-2}}

Default:	Entry Required
Addressing:	None
Description:	Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics. Name-defined values are:
ALL	All equipment entities.
ACL	All Administration Communication Links.
CDA	All Clock Distribution A circuit packs.
ACM	All Administrative Communications Modules.
CDB	All Clock Distribution B circuit packs.
CIM	All Communications Interface Module circuit packs.
CKB	All Circuit Breakers, bay/rack circuit breakers in the PDU/RSP.
CPU	All Central Processing Unit circuit packs.
DSB	All DCC Server Board circuit packs.
DSI	All DS1 I/O circuit packs.
DSK	All Disk Drives.
EOB	All Electrical to Optical conversion Board circuit packs.
EP3	All Electrical Plesiochronous DS3/STS1 Interface circuit packs.
ES1	All Electrical STS1 Interface circuit packs.
ESA	All External DS1 Signal Adapter circuit packs.
FAN	All Fan/Blower assemblies.
FUSE	All Fuses, PDU fuses.
HMU	All LMU I/O circuit packs.
ICM	All Intelligent Communications Module circuit packs.
IOB	All Inter-rack Optics Board circuit packs.
IPB	All Internal Protection Board circuit packs.
IPU	All Interface Processing Unit circuit packs.
LMU	All LMU I/O circuit packs.
LT1	All Level 1 Translator (RS-232) circuit packs.
LT2	All Level 2 Translator (RS-449) circuit packs.
LT4	All Level 4 Translator (ACL) circuit packs.
LT5	All Level 5 Translator (RS-449/LAN) circuit packs.
LT8	All Level 8 Translator (ACL) circuit packs.
M16	All Matrix End Stage 16 circuit packs.
M32	All Matrix End State 32 circuit packs.
M40	All Matrix End/Center Stage 40 circuit packs.
MCB	All Master Clock Board circuit packs.
O1B	All Optical Interface Level 1 (OC-3) Board circuit packs.
O4M	All Optical Interface Level 1 (OC-12) Board circuit packs.
OPD	All Optical Disk Drives.
AXB	All Optical Transceiver Board circuit packs.
P39	All Power Supply, 3.9V circuit packs.
P56	All Power Supply, 5.6V circuit packs.
PDU	All Power Distribution Units.
PRT	All DSI Protect circuit packs.
PSF	All Power Supply, 5V circuit packs.
PST	All Power Supply, 12V circuit packs.
QUAD	All DS1 Shelf Quadrants.
RDU	All Rack Distribution Units.
RPB	All Rack Status Panels.
RSP	All Ring Protection Board circuit packs.
S3M	All STS-3C circuit packs.

SBT	All System Bus Termination circuit packs.
SHELF	All (non-APS) Shelves.
SIO	All Serial Input/Output circuit packs.
SPB	All Satellite Processor Board circuit packs.
SWI	All DSI Switch circuit packs.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

 Equipment AID, identifies the equipment entity.

PST	{IS, IS-ANR, OOS-AU, OOS-AUMA, OOS-MA} Primary State, indicates the current primary state of the specified equipment entity. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:
	IS In Service
	IS-ANR In Service-Abnormal
	OOS-AU Out Of Service-Autonomous
	OOS-AUMA Out Of Service-Autonomous and Management
	OOS-MA Out Of Service-Management
SST	{ASI, MEA, MT, PRI, PSI, PWR, SDEE, STBYC, STBYH, UAS, UEQ} Secondary State, indicates any secondary states associated with the equipment entity. Multiple SST values may be shown combined with an ampersand (&) if more than one value applies. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:
	ASI Automatic Switch Inhibited
	MEA Mismatch of Equipment and Attributes
	MT Maintenance
	PRI Protection Release Inhibited
	PSI Protection Switching Inhibited
	PWR Power
	SDEE Supported Entity Exists
	STBYC Standby-Cold
	STBYH Standby-Hot
	UAS Unassigned
	UEQ Unequipped

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier /* Specified bay does not exist in present system configuration */ /* There are no IO_QUADS in this <BAY SHELF> */ /* There are no <CARD TYPE> cards in this <BAY SHELF> */ /* There are no <CARD TYPES or CARD_TYPE cards> cards in this system. */ /* The specified bay is an APS bay. */ /* The specified bay is an MDF bay. */ /* Error printing report file. */
SDBE	Status, internal Data Base Error /* I/O quad data base access error. */ /* Platform equipment configuration data base access failure. */ /* Error obtaining report file name. */ /* Error opening report file. */

EXAMPLES

In the following example, the state of the power supply P56-7-1-5 is retrieved.

```
RTRV-STATE-EQPT: : P56-7-1-5 ;  
  <SID> <YY-MM-DD> <HH:MM:SS>  
M  Pad567 COMPLD  
  "P56-7-1-5:::IS-ANR"  
  /* RTRV-STATE-EQPT: : P56-7-1-5 [Pad567] (2) */  
;

RTRV-EQPT

COMMAND CODE: **RTRV-STs1**
COMMAND NAME: **RETRIEVE STS1**

PURPOSE

The RTRV-STs1 command retrieves the provisioned parameter values, supporting I/O circuit pack AID, near end and far end facility alarm conditions, and current PST,SST state for the specified STS1 port. The STS1 port's current provisioned values and conditions (if provisioned), and state are retrieved from the system database. The command is executed regardless of the state of the STS1.

The successful response for a RTRV-STs1 command contains one line of parsable output data, in ascending order (from lowest specified STS1 AID to largest specified STS1 AID), for each STS1 AID specified. Values for NENDALM and FENDALM are only displayed if a condition exists. Only <AID> and <PST,SST> are displayed for a retrieve of an unprovisioned STS1 or if the entered AID specifies an STS1 embedded within a protection OC-3 which is in normal linear mode. In ring mode (refer to ENT-RNG-OC3), the RTRV-STs1 command displays all of the output data for STS1s that are part of an odd-numbered or even-numbered ring OC-3 or OC-12.

A RTRV-STs1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-STs1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	Identifies the STS1 port or a range of ports.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SUCCESSFUL RESPONSE FORMAT

AUTOVTRINGAIS=	<p>{3, 4, DISABLE}</p> <p>Automatic transmit VT path AIS, specifies the level of EBER on the addressed STS1 (that is terminated) which causes Automatic transmit VT path AIS to be sent. Values are:</p> <p>3 On reaching a 10-3 BER threshold, send AIS on all of its constituent VT1.5s.</p> <p>4 On reaching a 10-4 BER threshold, send AIS on all of its constituent VT1.5s.</p> <p>DISABLE Path AIS on all of the VT1.5s within the addressed STS1 is not to be sent on EBER on STS1.</p>
CARDID=	<p>EQUIPMENT_AID:</p> <p>{SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42}-{1, 3}-{1-18}, EP3-{9, 21, 35, 43}-3-{1-18}, EP3-{15, 27, 31, 39}-1-{1-18}, SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}}</p> <p>{SI48: ES1-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42}-{1, 3}-{1-18}, ES1-{9, 21, 35, 43}-3-{1-18}, ES1-{15, 27, 31, 39}-1-{1-18}, SI36: ES1-{6-8, 12-14}-{1, 3}-{1-14}, ES1-9-3-{1-14}, ES1-15-1-{1-14}}</p> <p>{O1B-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{2-9, 11-18}}</p> <p>{O4M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{2-3, 11-12}}</p> <p>{S3M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{4-9, 13-18}}</p> <p>I/O Equipment Card ID, identifies the STS1 port's supporting I/O equipment AID using the equipment AID format.</p>
EXPTRC=	<p><0-62 ASCII printable characters LF ></p> <p>Expected path trace message. This consists of 1-62 ASCII printable characters. If this field is a null string then only "" is displayed.</p>
FENDALM=	<p>{RFI}</p> <p>Far End STS1 Alarm Condition, identifies any far end STS1 alarm conditions that exist on the STS1. A FENDALM value is only reported if a FENDALM condition exists. Value is:</p> <p>RFI Far End Remote Failure Indication detected</p>

FESCP=	OC12_AID:	
	{OC12-{1-560}}	(OC12-OC12#)
	OC3_AID:	
	{OC3-{1-2240}}	(OC3-OC3#)
	EC1_AID:	
	{EC1-{1-3840} }	(EC1-EC1/STS1#)
	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
T3_AID:		
	{T3-{1-4800}}	(T3-DS3#)
	T1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	Fault Escalating Port, identifies the facility AID of the receive-side port that is causing a FLTESC alarm to be reported. A FESCP value is only reported when a NEND value of FLTESC exists. Only the AID corresponding to first FLTESC alarm found by the system is reported (i.e., if more than one port is causing a FLTESC, then only the first port found in the system's search is reported).	
NENDALM=	{AIS, FLTESC, IDLE, IDMISMATCH, LOP, SLMF, PDI}	
	Near End STS1 Alarm Condition, identifies any near end STS1 alarm conditions that exist on the STS1. A NENDALM value is only reported when a NENDALM condition exists. Values may be shown combined with an ampersand (&) if more than one value applies to the STS1 at the time of the RTRV-STs1 (i.e., if a RCV and TRMT alarm both exist). Values are:	
	AIS	Alarm Indication Signal detected.
	FLTESC	Facility Fault Escalation activated.
	IDLE	Idle Signal (Unequipped payload) detected.
	IDMISMATCH	Path trace Mismatch exists.
	LOP	Loss of Pointer detected.
	SLMF	Signal Label Mismatch detected.
	PDI	Incoming PDI signal detected on STS1
PDIINS=	{Y, N}	
	Payload Defect Indication INsersion (Transmit/outgoing direction only). Indicates whether or not PDI values are inserted into the outgoing signal label (C2) bytes. If Fault Escalation is disabled on the STS1 (default of FLTPRO=N via the ED-FLTPRO-STs1 command), PDI insertion is per GR-253. If Fault Escalation is enabled (FLTPRO=Y), PDI insertion is based on Alcatel's Fault Escalation type payload defects. Values are:	
	Y	Yes, insertion of appropriate PDI into the outgoing signal label occurs when payload defects exist.
	N	No, PDI values are not inserted into the outgoing signal label when payload defects exist.
STSMAP=	{ALL, ASYNC, VTFLOAT}	
	STS1 Payload Type. Determines the expected STS1 payload type and the value of the expected path signal label (C2). Used for comparison for the Signal Label Mismatch function. This value also determines the transmitted signal label. Values are:	
	ALL	Match ALL incoming signal labels, without creating a SLMF condition, and disallow mappings (i.e., terminating) at this STS1.
	ASYNC	Asynchronous mapping for DS3 (i.e. C2=04 hex)
	VTFLOAT	Floating mode VTs (i.e. C2=02 hex).

STSPTYEL=	{N} STS path yellow behavior. Identifies whether STS path yellow or RDI is sent/received. Values are: N No. RDI is sent/received on appropriate defect states.
TACC	{N, Y} Test Access port, indicates that this STS1 port (specified by AID) and the AID+1 STS1 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are: N No, the specified STS1 port is not a Test Access port. Y Yes, STS1 ports specified by AID and AID+1 are Test Access ports.
TAPPOOL	{PRIVATE-<USER NAME>, PUBLIC} TAP port Pool, defines whether the TAP port that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool. Values are: PRIVATE-<USERNAME> Private-User name. The TAP port pair that has been created is private to the user who created the TAP pair-Name of the user who owns the pool. PUBLIC Public. The TAP pair belongs to the public pool of the system. It can be accessed by any user who has access to the Test Access commands.
TRC=	<0-62 ASCII printable characters > Path trace message to be transmitted (Provisioned via ENT-STs1). This consists of 0-62 ASCII printable characters. If this field is a null string then only "" is displayed.
PST	{IS, OOS-AU, OOS-AUMA, OOS-MA} Primary State, indicates the current primary state of the STS1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: IS In-Service OOS-AU Out-Of-Service-Autonomous OOS-AUMA Out-Of-Service-Autonomous and Management OOS-MA Out-Of-Service-Management
SST	{ACT, BUSY, DSBLD, FAF, LPBK, MT, PMI, SDEE, SGEO, STBY, TRM, TS, UAS, WRK} Secondary State, indicates any secondary states associated with the STS1. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the STS1 at the time of the RTRV-STs1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: ACT Active BUSY Busy DSBLD Disabled FAF Facility Failure LPBK Loopback MT Maintenance PMI Performance Monitoring Inhibited SDEE Supported Entity Exists SGEO Supporting Entity Outage STBY Standby TRM Terminated TS Test Access UAS Unassigned WRK Working

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* GetAidEntry() Error: <ERROR-STRING> */
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* TPidToAidStr() Error: <ERROR-STRING> */
	/* TPidToTbss() Error: <ERROR-STRING> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the provisioning data for STS1 port EC1STS1-1 is retrieved.

```
RTRV-STs1::EC1STS1-1;

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"EC1STS1-1::CARDID=ES1-13-1-9, STSPTYEL=N, STSMAP=ASYNc,
AUTOVTRINGAIS=DISABLE, PDIINS=N, TACC=N, EXPTRC="\\", TRC="\":IS, TRM&BUSY"
/* RTRV-STs1::EC1STS1-1 [Pad567] (2) */
;
```

In the following example, the provisioning data for STS1 ports EC1STS1-10 through EC1STS1-14 is retrieved.

```
RTRV-STs1::EC1STS1-10&&-14;

The output response, shown below, assumes CID 6 was used to enter the command and a system generated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-ST3C**
COMMAND NAME: **RETRIEVE ST3C**

PURPOSE

The RTRV-ST3C command retrieves the provisioned parameter values, supporting I/O circuit pack AID, near end and far end facility alarm conditions, and current PST,SST state for the specified ST3C port. The ST3C port's current provisioned values and conditions (if provisioned), and state are retrieved from the system database. The command is executed regardless of the state of the ST3C.

The successful response for a RTRV-ST3C command contains one line of parsable output data, in ascending order (from lowest specified ST3C AID to largest specified ST3C AID), for each ST3C AID specified. Values for NENDALM and FENDALM are only displayed if a condition exists. Only <AID> and <PST,SST> are displayed for a retrieve of an unprovisioned ST3C or if the entered AID specifies an ST3C embedded within a protection OC-3 or OC-12.

A RTRV-ST3C command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ST3C: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.

SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the provisioning data for STS3C port OC3STS3C–1 is retrieved.

```

RTRV–STS3C: :OC3STS3C–1;

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "OC3STS3C–1: :CARDID=01B–6–1–2, STSMAP=ALL, EXPTRC=\ " \ " , TRC=\ " \ " : IS"
  /* RTRV–STS3C: :OC3STS3C–1 [Pad567] (2) */
;

```

In the following example, the provisioning data for STS3C ports OC3STS3C-10 through OC3STS3C-14 is retrieved.

```
RTRV-STSC: :OC3STS3C-10&&-14;
```

The output response, shown below, assumes CID 6 was used to enter the command and a system generated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-STWR-VSN**
COMMAND NAME: **RETRIEVE SOFTWARE VERSION**

PURPOSE

The RTRV-STWR-VSN command retrieves the version number and associated date and time stamp of the software executable files stored on the system disk.

Two software file directories (Current and New) are used by Alcatel as an aid during system integration and test. Alcatel uses the New directory to test a new software executable file without rebuilding the entire software load.

The software load delivered from the factory has all software executable files in the Current directory; the New directory is empty. Only an Alcatel account user is able to load a file from optical disk to the New directory.

A RTRV-STWR-VSN command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-STWR-VSN: [TID] :: [CTAG] :: [DID] , [PNAM] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DID	{CPUOS, CURRENT, L2P, L3P, NEW, RUN} Default: {RUN} Addressing: None Description: Directory Identifier, specifies the software file directory. Values are: CPUOS CPU Operating System File Name, specifies the file name of the CPU Operating System (OS) from the system's Root directory is to be retrieved. CURRENT Current Directory File Names, specifies the file names from the system's Current directory are to be retrieved. L2P Level 2 Processor File Names, specifies the file names pertaining to the IPU and SPB circuit packs from the system's Current and New directories are to be retrieved. L3P Level 3 Processor File Names, specifies the file names pertaining to the DSB, EP3, ES1, IPB, M16, M32, M40, MCB, O1B, OXB and RPB circuit packs from the system's Current and New directories are to be retrieved. NEW New Directory File Names, specifies the file names from the system's New directory are to be retrieved. RUN Running File Names, specifies the file names that are running from the system's Current or New directories are to be retrieved.
PNAM	< 1-12 Character Valid Software File Name > Default: <All software file names within the specified directory> Addressing: None Description: Process File Name, specifies the software file name from the specified directory.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <FILENAME> <VERSION> <DATE> <TIME> */
/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

OUTPUT PARAMETERS

FILENAME	< 25 Character Directory Path and File Name > Directory Path and File Name, identifies the software file name.
VERSION	{<5 Character Version Number>, NONE} File Version Number, identifies the version number of the software file name.
DATE	{MM/DD/YY:{ {01-12}/{01-31}/{00-99} }, NONE} Date, identifies the date stamp on the software file name. The format of DATE is <MM> – <DD> – <YY> where <MM> is the month, <DD> is the day, and <YY> is the year.
TIME	{HH:MM:SS:{ {0-23}:{0-59}:{0-59} }, NONE} Time, identifies the time stamp on the software file name. The format of TIME is <HH>:<MM>:<SS> where <HH> is the hour, <MM> is the minute, and <SS> is the second.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
/* <Informational Error Description Text> */
/* <Expanded Error Code Description> */
/* <Optional Suggested Action Text> */
/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid
	/* Illegal DID */
	/* PNAME nonexistent */

EXAMPLES

In the following example, the version number and the date and time stamps for the running software file names are retrieved.

```
RTRV-STWR-VSN;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P80278. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-SYSTMSG-OC12**
COMMAND NAME: **RETRIEVE SYNCHRONIZATION STATUS
MESSAGE FROM OC-12**

PURPOSE

The RTRV-SYSTMSG-OC12 command retrieves the synchronization status message that is being transmitted on the S1 byte of the specified OC-12 port. The synchronization status message is defined as a nibble (bits 5 through 8) in the S1 byte of the SONET line overhead and is used for synchronization purposes. The command is executed regardless of the state of the OC-12.

The successful response for a RTRV-SYSTMSG-OC12 command contains the S1 byte being sent out on the specified OC-12 port. The S1 byte is displayed as a three letter mnemonic converted from bits 5 through 8 of the received S1 byte. If the S1 byte does not convert to any of the valid mnemonics, the hex value of bits 5 through 8 of the S1 byte is displayed instead.

If the system times out (defined by SIGTO) before a valid S1 byte can be read, an "S1UNREADABLE" error message is displayed in place of the synchronization status message in the successful response. If DIRN is specified as OUTGOING and AIS is being transmitted on the addressed OC-12, an "AIS" message is displayed in place of the synchronization status message in the successful response.

A RTRV-SYSTMSG-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-SYSTMSG-OC12 : [TID] : AID : [CTAG] : : [DIRN] [, SIGTO] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Identifies the OC-12 of which the S1 byte is to be retrieved. Either working or protection OC-12 is valid.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DIRN	{ OUTGOING } Default: { OUTGOING } Addressing: None Description: Direction, determines whether the incoming or outgoing S1 byte is to read. Values are: OUTGOING Reads the synchronization status message being sent out on the S1 byte of the addressed OC-12. If AIS is being sent out on the addressed OC-12, the system declares an "AIS" message (in the parsable field).

SIGTO	{ 2–20 }
Default:	{ 2 }
Addressing:	None
Description:	Signal TimeOut, specifies the time, in seconds, for which the system looks for a valid S1 byte before the system declares an “S1UNREAD-ABLE” error message (in the parsable field). A value of 2 seconds is the default.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>: [SYSTMSG=<value>] "
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

AID	OC12_AID: {OC12-{1–560}} (OC12–OC12#) OC12 AID, indicates the OC–12 port to which the S1 byte output data pertains.
AIS	{AIS} Alarm Indication Signal, identifies AIS is being sent out on the specified OC–12 port. If DIRN is specified as OUTGOING and AIS is being transmitted on the specified OC–12 port, an “AIS” message is displayed in place of the synchronization status message in the successful response. Values is: AIS Alarm Indication Signal
SYSTMSG=	{ DUS, PRS, RES, SMC, ST2, ST3, ST4, STU } Synchronization Status Message, identifies the three letter mnemonic (acronym) converted from the S1 byte of the specified OC–12. If the S1 byte does not convert to any of the valid mnemonics, the system displays the Hex value of bits 5 through 8 of the S1 byte. Values are: DUS DON'T USE for Synchronization (S1 bits 5–8=1111). Quality level 7. PRS Stratum 1 Traceable (S1 bits 5–8=0001). Quality level 1. RES Reserved for Network Synchronization use (S1 bits 5–8=1110). Quality level: User assignable. SMC SONET minimum clock traceable (S1 bits 5–8=1100). Quality level 5. ST2 Stratum 2 Traceable (S1 bits 5–8=0111). Quality level 3. ST3 Stratum 3 Traceable (S1 bits 5–8=1010). Quality level 4. STU Synchronized – Traceability unknown (S1 bits 5–8=0000). Quality level 2.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRT0	Status, Reply Timeout Occurred
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the S1 byte data for OC-12 port OC12-1 is retrieved.

```
RTRV-SYSTMSG-OC12::::OC12-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pad567 COMPLD  
"OC12-1:SYSTMSG=ST2"  
/* RTRV-SYSTMSG-OC12::::OC12-1 [Pad567] (2) */  
;
```

RELATED COMMANDS

None

COMMAND CODE: **RTRV-SYSTMSG-OC3**
COMMAND NAME: **RETRIEVE SYNCHRONIZATION STATUS MESSAGE FROM OC-3**

PURPOSE

The RTRV-SYSTMSG-OC3 command retrieves the synchronization status message that is being transmitted on the S1 byte of the specified OC-3 port. The synchronization status message is defined as a nibble (bits 5 through 8) in the S1 byte of the SONET line overhead and is used for synchronization purposes.

The successful response for a RTRV-SYSTMSG-OC3 command contains the S1 byte being sent out on the specified OC-3 port. The S1 byte is displayed as a three letter mnemonic converted from bits 5 through 8 of the received S1 byte. If the S1 byte does not convert to any of the valid mnemonics, the hex value of bits 5 through 8 of the S1 byte is displayed instead.

If the system times out (defined by SIGTO) before a valid S1 byte can be read, an "S1UNREADABLE" error message is displayed in place of the synchronization status message in the successful response. If DIRN is specified as OUTGOING and AIS is being transmitted on the addressed OC-3, an "AIS" message is displayed in place of the synchronization status message in the successful response.

A RTRV-SYSTMSG-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-SYSTMSG-OC3 : [TID] : AID : [CTAG] : : [DIRN] [, SIGTO] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: None Description: Identifies the OC-3 of which the S1 byte is to be retrieved. Either working or protection OC-3 is valid.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DIRN	{ OUTGOING } Default: { OUTGOING } Addressing: None Description: Direction, determines whether the incoming or outgoing S1 byte is to read. Values are: OUTGOING Reads the synchronization status message being sent out on the S1 byte of the addressed OC-3. If AIS is being sent out on the addressed OC-3, the system declares an "AIS" message (in the parsable field).

SIGTO	{ 2–20 }
Default:	{ 2 }
Addressing:	None
Description:	Signal TimeOut, specifies the time, in seconds, for which the system looks for a valid S1 byte before the system declares an “S1UNREAD-ABLE” error message (in the parsable field). A value of 2 seconds is the default.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>: [SYSTMSG=<value>]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	OC3_AID: {OC3–{1–2240}} (OC3–OC3#) OC3 AID, indicates the OC–3 port to which the S1 byte output data pertains.
AIS	{AIS} Alarm Indication Signal, identifies AIS is being sent out on the specified OC–3 port. If DIRN is specified as OUTGOING and AIS is being transmitted on the specified OC–3 port, an “AIS” message is displayed in place of the synchronization status message in the successful response. Values is:
SYSTMSG=	{ DUS, PRS, RES, SMC, ST2, ST3, ST4, STU } Synchronization Status Message, identifies the three letter mnemonic (acronym) converted from the S1 byte of the specified OC–3. If the S1 byte does not convert to any of the valid mnemonics, the system displays the Hex value of bits 5 through 8 of the S1 byte. Values are:
	DUS DON'T USE for Synchronization (S1 bits 5–8=1111). Quality level 7.
	PRS Stratum 1 Traceable (S1 bits 5–8=0001). Quality level 1.
	RES Reserved for Network Synchronization use (S1 bits 5–8=1110). Quality level: User assignable.
	SMC SONET minimum clock traceable (S1 bits 5–8=1100). Quality level 5.
	ST2 Stratum 2 Traceable (S1 bits 5–8=0111). Quality level 3.
	ST3 Stratum 3 Traceable (S1 bits 5–8=1010). Quality level 4.
	STU Synchronized – Traceability unknown (S1 bits 5–8=0000). Quality level 2.

RTRV-DFLT-OC3
SET-DFLT-OC3

COMMAND CODE: **RTRV-SYSTMSG-T1**
COMMAND NAME: **RETRIEVE SYNCHRONIZATION STATUS
MESSAGE FROM T1**

PURPOSE

The RTRV-SYSTMSG-T1 command retrieves the synchronization status message that is being received as a bit-oriented message in the ESF data link of the addressed reference clock.

The successful response for a RTRV-SYSTMSG-T1 command contains the synchronization status message being received in the specified clock reference signal. The synchronization status message, the bit-oriented message in the ESF data link of the reference clock, is converted to a three letter mnemonic and is displayed if the conversion is successful. If the bit-oriented message in the ESF data link does not convert to any of the valid mnemonics, the hex value of the message is displayed.

If RTRV-SYSTMSG-T1 is issued on a clock reference source which is defined with FMT of SF, or is defined with FMT of ESF but does not support synchronization status messages (SYNCMSG=N in ENT-T1 command), the command completes with no output data displayed. If the system times out (defined by SIGTO) before a valid synchronization status message can be read, an "SYUNREADABLE" error message is displayed in place of the synchronization status message in the successful response.

A RTRV-SYSTMSG-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-SYSTMSG-T1 : [TID] : AID : [CTAG] : : [SIGTO] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	TMG_AID: {TMG-{0, 1}} Default: Entry Required Addressing: None Description: Identifies the clock reference signal (timing reference source) from which the synchronization status message is to be read.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
SIGTO	{ 2-20 } Default: { 2 } Addressing: None Description: Signal TimeOut, specifies the time, in seconds, for which the system looks for a valid synchronization status message before the system declares an "SYUNREADABLE" error message (in the parsable field). A value of 2 seconds is the default.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    "<AID>: [SYSTMSG=<value>]"
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

RTRV-T1
```

COMMAND CODE: **RTRV-T1**
COMMAND NAME: **RETRIEVE T1**

PURPOSE

The RTRV-T1 command retrieves the provisioned parameter values, supporting I/O circuit pack AID, near end and far end facility alarm conditions, and current PST,SST state for the specified DS1 port. The DS1 port's current provisioned values and conditions (if provisioned), and state are retrieved from the system database. It also will show whether or not the DS1 is assigned to a Fractional DS3 (F3). The command is executed regardless of the state of the DS1.

The successful response for a RTRV-T1 command contains one line of parsable output data, in ascending order (from lowest specified DS1 AID to highest specified DS1 AID), for each DS1 AID specified. A value for LINECDE is only displayed if the DS1 is a terminated electrical DS1 port. Values for NENDALM and FENDALM are only displayed if a condition exists. Only <AID> and <PST,SST> are displayed for a retrieve of an unprovisioned DS1 or if the entered AID specifies a T1 embedded within a protection OC3/OC12 which is in normal linear mode. In ring mode (refer to ENT-RNG-OC3 or ENT-RNG-OC12), the RTRV-T1 command displays all of the output data for T1s that are part of an odd-numbered or even-numbered ring OC3/OC12. Output data for both Test Access Port Pairs are displayed for a retrieve on a Test Access port.

RTRV-T1 also retrieves the provisioned parameter values for only the provisioned (Internal and External) Idle Signal Source ports in the system if AID of ALL and SRC=INTXT is entered. If an Idle Signal Source port has not been provisioned, then no parsable output data is provided.

The RTRV-T1 command only displays the output values other than CIECRA, SXECRA, IDLE, LINECDE, TAP-POOL, and TMGREF if the entered AID specifies a T1 embedded within a VT1.5, since these values cannot be provisioned with this type of port.

The RTRV-T1 command also retrieves the provisioned parameter values and the current PST,SST state values for the specified external timing reference source (TMG).

A RTRV-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-T1 : [TID] : AID : [CTAG] : : : [SRC=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)

	TMG_AID:	
	{TMG-{0, 1}}	
	ALL_AID:	
	{ALL}	
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	Identifies the DS1 port or a range of ports. This may also identify an external reference timing source. Name-defined values are:
	ALL	All Internal and External Idle Signal Source ports are retrieved.
	Restrictions:	RTRV-T1 is denied if AID of ALL and no SRC value is entered.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
SRC=	{INTEXT, <NoVal>}	
	Default:	<NoVal>
	Addressing:	None
	Description:	Idle Signal Source port, specifies whether only the provisioned Internal and External Idle Signal Source ports are to be retrieved. Values are:
	INTEXT	Internal and External Idle Signal Source, specifies that only the Internal and External Idle Signal Source ports are to be retrieved.
	<NoVal>	No Value, specifies that the output is not filtered for only the Idle Signal Source ports.
	Restrictions:	RTRV-T1 is denied if a SRC value is entered and AID1 of ALL is not entered.

SUCCESSFUL RESPONSE FORMAT

If the AID specifies a DS1 port, then the output response format is:

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<AID>.: [AINSTH=<value>] [,AISC=<value>] [,AISF=<value>] [,CARDID=<value>]
  [,CIECRA=<value>] ,ES=<value> [, F3=<value>] [,FEMETHOD=<value>]
  [,FENDALM=<value>] [,FENDNTE=<value> [, FMT=<value>] [,IDLE=<value>]
  [,LINECDE=<value>] [,NENDALM=<value>
  [,SRC=<value>] [,SXCRA=<value>] [,TACC=<value>]
  [,TAPPOOL=<value>]:<PST> [,<SST>]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

If the AID specifies a TMG reference source, then the output response format is:

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"AID: :FMT=<value>,LINECDE=<value>,TMGREF=<value>
[,SYNCMSG=<value>] [,NENDALM=<value>]:PST,SST"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)	
	TMG_AID:	
	{TMG-{0, 1}}	
	DS1 AID, indicates the DS1 port to which this line of output data pertains and TMG AID indicates the Timing source to which this line of output data pertains.	
AINSTH	{HH-MM:{00-48} - {00-59} }	
	Automatic In-Service Threshold. Specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the the facility into the In-Service state. The factory default is 8 hours. The valid value is:	
	HH-MM	Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively.
AISC=	{LOF, LOFLOS, LOS}	
	Alarm Indication Signal insertion Criteria, identifies the condition necessary for insertion of AIS into a failed DS1 signal path. Values are:	
	LOF	Automatic AIS insertion on detection of LOF.
	LOFLOS	Automatic AIS insertion on detection of LOF or LOS.
	LOS	Automatic AIS insertion on detection of LOS.
AISF=	{N, Y}	
	Alarm Indication Signal Failure substitution, identifies whether a failed upstream signal (as defined by the AISC parameter) should have AIS inserted in the downstream path. Values are:	
	N	No, AIS is not inserted in the downstream path of a failed signal, the failed signal passes through the system.
	Y	Yes, AIS is inserted in the downstream path of a failed signal.

CARDID=	<p>EQUIPMENT_AID:</p> <p>{SI36: CDB-{6-9, 12-15, 18-21, 24-43}-{1, 3}-{1-2}, {SI48: CDB-{2-43, 104-111, 112-135, 136-141}-{1, 3}-{1, 2} {DSI-{44-63}-{1-4}-{1-32}} {SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42}-{1, 3}-{1-18}, EP3-{9, 21, 35, 43}-3-{1-18}, EP3-{15, 27, 31, 39}-1-{1-18}, SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}} {LMU-{44-53}-{1-4}-{1-32}} {O1B-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{2-9, 11-18}} {O4M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{2-3, 11-12}} {S3M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{4-9, 13-18}} I/O Equipment Card ID, identifies the DS1 port's supporting I/O equipment AID using the equipment AID format.</p>								
CIECRA=	<p>{A, B, Y, Z}</p> <p>Customer Installation Equipment Circuit Record Address. Used to identify the customer installation equipment relative to an AT&T TR-54016 facility data link protocol. This is significant only if the far end performance monitoring data collection is being performed via the POLL or ANSIPOLL method. The valid values are:</p> <table> <tr> <td>A or Z</td><td>Used when requesting information from terminating equipment such as DSU/PBX/MUXs and NCTEs.</td></tr> <tr> <td>B or Y</td><td>Used when requesting information from CSUs.</td></tr> </table>	A or Z	Used when requesting information from terminating equipment such as DSU/PBX/MUXs and NCTEs.	B or Y	Used when requesting information from CSUs.				
A or Z	Used when requesting information from terminating equipment such as DSU/PBX/MUXs and NCTEs.								
B or Y	Used when requesting information from CSUs.								
ES=	<p>{1-32}</p> <p>The first stage M16 module to which the addressed DS1 is connected to. Values are:</p> <table> <tr> <td>1-32</td><td>An integer between 1 and 32 indicating the end stage number.</td></tr> </table>	1-32	An integer between 1 and 32 indicating the end stage number.						
1-32	An integer between 1 and 32 indicating the end stage number.								
F3=	<p>F3_AID:</p> <p>{T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#)</p> <p>Fractional T3 that the T1 has been assigned to. This field is displayed only if the T1 has been assigned to a F3.</p>								
FEMETHOD=	<p>{ANSI, ATTPOLL, NONE}</p> <p>Defines far-end PM collection method. Values are:</p> <table> <tr> <td>ANSI</td><td>Basic ANSI T1.403 PM data collection.</td></tr> <tr> <td>ATTPOLL</td><td>Poll for PM data using AT&T 54016 protocol to poll the data and convert into ANSI format for reporting. (ALCATEL method).</td></tr> <tr> <td>NONE</td><td>None. The far end PM is not collected on this DS1.</td></tr> </table>	ANSI	Basic ANSI T1.403 PM data collection.	ATTPOLL	Poll for PM data using AT&T 54016 protocol to poll the data and convert into ANSI format for reporting. (ALCATEL method).	NONE	None. The far end PM is not collected on this DS1.		
ANSI	Basic ANSI T1.403 PM data collection.								
ATTPOLL	Poll for PM data using AT&T 54016 protocol to poll the data and convert into ANSI format for reporting. (ALCATEL method).								
NONE	None. The far end PM is not collected on this DS1.								
FENDALM=	<p>{RAI}</p> <p>Far End DS1 Alarm Condition, identifies any far end DS1 alarm conditions that exist on the DS1. A FENDALM value is only reported if a FENDALM condition exists. Value is:</p> <table> <tr> <td>RAI</td><td>Far End Remote Alarm Indication signal detected</td></tr> </table>	RAI	Far End Remote Alarm Indication signal detected						
RAI	Far End Remote Alarm Indication signal detected								
FENDNTE=	<p>{ANSI, ANSIATT, ATT, NONE}</p> <p>Far End NTE performance monitoring terminal type, identifies whether the far end network terminal supports standard ANSI performance monitoring (PM) collection and reporting or AT&T TR-54016 polled PM reporting for ESF DS1 signal formats. Values are:</p> <table> <tr> <td>ANSI</td><td>ANSI, the far-end NTE supports the ANSI PM standard.</td></tr> <tr> <td>ANSIATT</td><td>ANSI and AT&T, the far-end NTE supports the ANSI PM standard and the AT&T TR-54016 polled PM reporting standard.</td></tr> <tr> <td>ATT</td><td>AT&T TR-54016, the far-end NTE supports the AT&T TR-54016 polled PM reporting standard. (Refer to RTRV-FEDATA-T1)</td></tr> <tr> <td>NONE</td><td>None, the far-end NTE does not support either the ANSI PM standard or the AT&T TR-54016 standard.</td></tr> </table>	ANSI	ANSI, the far-end NTE supports the ANSI PM standard.	ANSIATT	ANSI and AT&T, the far-end NTE supports the ANSI PM standard and the AT&T TR-54016 polled PM reporting standard.	ATT	AT&T TR-54016, the far-end NTE supports the AT&T TR-54016 polled PM reporting standard. (Refer to RTRV-FEDATA-T1)	NONE	None, the far-end NTE does not support either the ANSI PM standard or the AT&T TR-54016 standard.
ANSI	ANSI, the far-end NTE supports the ANSI PM standard.								
ANSIATT	ANSI and AT&T, the far-end NTE supports the ANSI PM standard and the AT&T TR-54016 polled PM reporting standard.								
ATT	AT&T TR-54016, the far-end NTE supports the AT&T TR-54016 polled PM reporting standard. (Refer to RTRV-FEDATA-T1)								
NONE	None, the far-end NTE does not support either the ANSI PM standard or the AT&T TR-54016 standard.								

FMT=	<p>{ESF, SF, UNFR}</p> <p>DS1 Format, identifies the DS1 signal format for this port. The DS1 FMT parameter determines the type of signal format used for performance monitoring data collection and transmission condition detection, or the format of the Idle Signal Source port if SRC=INTSRC. Values are:</p> <table><tr><td>ESF</td><td>Extended SuperFrame</td></tr><tr><td>SF</td><td>SuperFrame</td></tr><tr><td>UNFR</td><td>Unframed</td></tr></table>	ESF	Extended SuperFrame	SF	SuperFrame	UNFR	Unframed				
ESF	Extended SuperFrame										
SF	SuperFrame										
UNFR	Unframed										
IDLE=	<p>{AIS, QRSF, QRSU}</p> <p>Idle signal transmit type, identifies the type of Idle signal to be transmitted by this port when it is disconnected, or determines the type of QRSF or QRSU Idle signal of the Idle Signal Source port. Values are:</p> <table><tr><td>AIS</td><td>AIS (Alarm Indication Signal)</td></tr><tr><td>QRSF</td><td>Framed QRS (Quasi-Random Signal)</td></tr><tr><td>QRSU</td><td>Unframed QRS (Quasi-Random Signal)</td></tr></table>	AIS	AIS (Alarm Indication Signal)	QRSF	Framed QRS (Quasi-Random Signal)	QRSU	Unframed QRS (Quasi-Random Signal)				
AIS	AIS (Alarm Indication Signal)										
QRSF	Framed QRS (Quasi-Random Signal)										
QRSU	Unframed QRS (Quasi-Random Signal)										
LINECDE=	<p>{AMI, B8ZS}</p> <p>DS1 Line Code, identifies the type of DS1 line code for a terminated electrical DS1 or for a TMG. A LINECDE value is only reported for terminated electrical DS1s or TMGs. Values are:</p> <table><tr><td>AMI</td><td>Alternate Mark Insertion</td></tr><tr><td>B8ZS</td><td>Bipolar with Eight Zero Substitution</td></tr></table>	AMI	Alternate Mark Insertion	B8ZS	Bipolar with Eight Zero Substitution						
AMI	Alternate Mark Insertion										
B8ZS	Bipolar with Eight Zero Substitution										
NENDALM=	<p>{AIS, EOC, LOF, LOS, SLTMSIG}</p> <p>Near End DS1 or TMG Alarm Condition, identifies any near end DS1 or TMG alarm conditions that exist on the DS1 or TMG. A NENDALM value is reported only when a NENDALM condition exists. Values are:</p> <table><tr><td>AIS</td><td>Alarm Indication Signal detected (DS1 or timing source).</td></tr><tr><td>EOC</td><td>ESF Embedded Operations Channel failure detected (DS1 only).</td></tr><tr><td>LOF</td><td>Loss of Frame detected (DS1 or timing source).</td></tr><tr><td>LOS</td><td>Loss of Signal detected (terminated electrical DS1 or timing source).</td></tr><tr><td>SLTMSIG</td><td>Slipping Timing Reference Signal (timing source only).</td></tr></table>	AIS	Alarm Indication Signal detected (DS1 or timing source).	EOC	ESF Embedded Operations Channel failure detected (DS1 only).	LOF	Loss of Frame detected (DS1 or timing source).	LOS	Loss of Signal detected (terminated electrical DS1 or timing source).	SLTMSIG	Slipping Timing Reference Signal (timing source only).
AIS	Alarm Indication Signal detected (DS1 or timing source).										
EOC	ESF Embedded Operations Channel failure detected (DS1 only).										
LOF	Loss of Frame detected (DS1 or timing source).										
LOS	Loss of Signal detected (terminated electrical DS1 or timing source).										
SLTMSIG	Slipping Timing Reference Signal (timing source only).										
SRC=	<p>{EXTSRC, INTSRC, NONE}</p> <p>Idle Signal Source port, indicates whether this DS1 port is to be used as QRSF or QRSU Idle signal source. Values are:</p> <table><tr><td>EXTSRC</td><td>External Idle signal Source, indicates external equipment is connected to the Signal Source port for generating an Idle signal.</td></tr><tr><td>INTSRC</td><td>Internal Idle signal source, indicates the Signal Source port is to use internal generators to provide a QRS signal (as provisioned by the IDLE parameter value).</td></tr><tr><td>NONE</td><td>None, indicates the specified DS1 port is not an Idle Signal Source port.</td></tr></table>	EXTSRC	External Idle signal Source, indicates external equipment is connected to the Signal Source port for generating an Idle signal.	INTSRC	Internal Idle signal source, indicates the Signal Source port is to use internal generators to provide a QRS signal (as provisioned by the IDLE parameter value).	NONE	None, indicates the specified DS1 port is not an Idle Signal Source port.				
EXTSRC	External Idle signal Source, indicates external equipment is connected to the Signal Source port for generating an Idle signal.										
INTSRC	Internal Idle signal source, indicates the Signal Source port is to use internal generators to provide a QRS signal (as provisioned by the IDLE parameter value).										
NONE	None, indicates the specified DS1 port is not an Idle Signal Source port.										
SXECRA=	<p>{C-X}</p> <p>1631SX Equipment Circuit Record Address. Used to identify the T1 port relative to an AT&T TR-54016 facility data link protocol. This is significant mainly when the far end performance monitoring data collection is being performed via the POLL or ANSIPOLL methods. The valid values are:</p> <table><tr><td>C to X</td><td>Local T1 port address.</td></tr></table>	C to X	Local T1 port address.								
C to X	Local T1 port address.										

SYNCMSG=	{N, Y}	Synchronization Message, indicates if the addressed timing reference clock supports synch status messages. Values are:
	N	No, the addressed reference clock does not support synch status messages.
	Y	Yes, the addressed reference clock supports synch status messages.
TACC=	{N, Y}	Test Access port, indicates whether this DS1 port is part of a Test Access Port Pair (TAPP). Values are:
	N	No, the specified DS1 port is not a Test Access port.
	Y	Yes, the specified DS1 port is a Test Access port.
TAPPOOL=	{PRIVATE-USERNAME, PUBLIC}	This parameter defines whether the TAP port that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool.
	PRIVATE-USERNAME	Private-Name of the User. The TAP port pair that has been created is private to the user who created the TAP pair. If any other user tries to use this TAP pair (by means of CONN-TACC-T1), the command will be denied.
	PUBLIC	The TAP pair belongs to the Public pool of the system. It can be accessed by any user that has access to the test access commands.
TMGREF=	{PRI, SEC}	Identifies whether the external reference source is primary or secondary. This parameter is only displayed when the AID specifies a Timing Reference port (i.e., the AID is either a TMG-0 or TMG-1).
	PRI	Primary. The addressed external reference source is to be used as a primary source.
	SEC	Secondary. The addressed external reference source is to be used as a secondary source.
PST	{IS, OOS-AU, OOS-AUMA, OOS-MA}	Primary State, indicates the current primary state of the DS1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:
	IS	In-Service
	OOS-AU	Out-Of-Service-Autonomous
	OOS-AUMA	Out-Of-Service-Autonomous and Management
	OOS-MA	Out-Of-Service-Management

SST {ACT, AINS, BUSY, DSBLD, FAF, LPBK, MT, PMI, ROLL, SGEO, STBY, TS, UAS, WRK}
Secondary State, indicates any secondary states associated with the DS1. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the DS1 at the time of the RTRV-T1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:

ACT	Active
AINS	The DS1 is under Automatic IN-Service state.
BUSY	Busy
DSBLD	Disabled
FAF	Facility Failure
LPBK	Loopback
MT	Maintenance
PMI	Performance Monitoring Inhibited
ROLL	The DS1 is under roll operation.
SGEO	Supporting Entity Outage
STBY	Standby
TS	Test
UAS	Unassigned
WRK	Working. If set on Working path, the Working path is carrying service. If set on Protection path, the Protection path is carrying service.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* GetAidEntry() Error: <ERROR-STRING> */
	/* QRS Database Error: <ERROR-STRING> */
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* TPidToAidStr() Error: <ERROR-STRING> */
	/* TPidToTbss() Error: <ERROR-STRING> */
	/* pfo_get_state (<PART-NUMBER>) Error: <ERROR-STRING> */
	/* TAPP DataBase Error: <ERROR-STRING> for record number <RECORD-NUMBER> */
	/* GetSptgTPid() Error: <ERROR-STRING> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the provisioning data for DS1 port T3T1-1-1 is retrieved.

```
RTRV-T1::T3T1-1-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "T3T1-1-1::AINSTH=05-30,AISC=LOF,FENDNTE=ANSI,FEMETHOD=NONE,CIE-
CRA=A,SXECRA=X,FMT=ESF,IDLE=QRSF,SRC=NONE,TACC=N,AISF=Y,CARDID=EP3-3-1,
ES=ES=5:IS,BUSY"
/* RTRV-T1::T3T1-1-1 [Pad567] (2) */
;
```

In the following example, the provisioning data for DS1 ports T3T1-1-10 through T3T1-1-16 is retrieved.

```
RTRV-T1::T3T1-1-10&&-16;

The output response, shown below, assumes CID 6 was used to enter the command and a system gener-
ated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system,
and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-T3**
COMMAND NAME: **RETRIEVE T3**

PURPOSE

The RTRV-T3 command retrieves the provisioned parameter values, supporting I/O circuit pack AID, near-end and far-end facility conditions, and current PST,SST state for the specified DS3 port. The DS3's current provisioned values and conditions (if provisioned), and state are retrieved from the system database. The command is executed regardless of the state of the DS3.

The successful response for a RTRV-T3 command contains one line of parsable output data, in ascending order (from lowest specified DS3 AID to largest specified DS3 AID) for each DS3 AID specified. Values for NENDALM and FENDALM are only displayed if a condition exists. A value for TAPPOOL is only displayed if the specified DS3 is a test access port. Only <AID> and <PST,SST> are displayed for a retrieve on an unprovisioned DS3 or if the entered AID specifies a T3 embedded within a protection OC3 or OC12 which is in normal linear mode. In ring mode (refer to ENT-RNG-OC3 or ENT-RNG-OC12), the RTRV-T3 command displays all of the output data for T3s that are part of an odd-numbered or even-numbered ring OC3 or OC12.

A RTRV-T3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-T3 : [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) {EC1T3-{1-3840}} (EC1T3-EC1/STS1/DS3#) {OC3T3-{1-2240}-{1-3}} (OC3T3-OC3#-STS1/DS3#) {OC12T3-{1-560}-{1-4}-{1-3}} (OC12T3-OC12#-STM1#-STS1/DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS3 AID, identifies the DS3 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD

```

OUTPUT PARAMETERS

AID	<p>DS3_AID:</p> <p>{T3-{1-4800}} (T3-DS3#)</p> <p>{EC1T3-{1-3840}} (EC1T3-EC1/STS1/DS3#)</p> <p>{OC3T3-{1-2240}-{1-3}} (OC3T3-OC3#-STS1/DS3#)</p> <p>{OC12T3-{1-560}-{1-4}-{1-3}} (OC12T3-OC12#-STM1#-STS1/DS3#)</p> <p>DS3 AID. Indicates the DS3 port to which this line of output data pertains.</p>
AINSTH	<p>{HH-MM:{00-48} - {00-59} }</p> <p>Automatic In-Service Threshold. Specifies how long a customer signal must be present on the facility without a 7LOF, ISD, AICMISM, LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is:</p> <p>HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively.</p>
AISC=	<p>{LOFLOS, LOS}</p> <p>Alarm Indication Signal insertion Criteria. Indicates the condition at the input of a DS3 intact cross connect necessary for AIS insertion into the output of the DS3 intact cross connect. Values are:</p> <p>LOS Loss of Signal. Automatic AIS insertion upon detection of LOS.</p> <p>LOFLOS Loss of Frame-Loss of Signal. Automatic AIS insertion upon detection of LOFLOS.</p>
AISPASS=	<p>{Y, N }</p> <p>Alarm Indication Signal Passed. Indicates whether the AIS generated by the input port which is connected to the output port is passed through the output port, or whether AIS is generated by the output port itself. Values are:</p> <p>Y The AIS generated by the input port is passed through the output port.</p> <p>N AIS is regenerated by the output port instead of being passed through the output port.</p>
AIST=	<p>{NAS, ONES, OAIS}</p> <p>Alarm Indication Signal Type. Indicates the system default provisioning value for the input AIS signal and generated output AIS signal for the DS3 port should a failure condition exist. Values are:</p> <p>NAS North American Standard.</p> <p>ONES Unframed All Ones (Nonstandard).</p> <p>OAIS Old AIS, the same sequence of information bits as North American Standard but with no regard to how the C-bits are set.</p>
CARDID=	<p>EQUIPMENT_AID:</p> <p>{SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42}-{1, 3}-{1-18}, EP3-{9, 21, 35, 43}-3-{1-18}, EP3-{15, 27, 31, 39}-1-{1-18}, SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}} {HMU-{44-53}-{1-4}-{1-8}} {O1B-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{2-9, 11-18}} {O4M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{2-3, 11-12}} {S3M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{4-9, 13-18}}}</p> <p>Card Identification. I/O Equipment Card ID, identifies the DS3 port's supporting I/O equipment AID using the equipment AID format.</p>

DS3PTYEL=	{N, Y}	
	DS3 Yellow behavior. Indicates whether DS3 path yellow or RDI (remote defect indication) will be sent and detected. Values are:	
	N	RDI will be sent/detected by the DS3.
	Y	DS3 path yellow will be sent/detected by the DS3.
FEAC=	{N, Y}	
	Far End Alarm and Control. Indicates the system default provisioning value for the far end alarm and control enable setting for C-bit parity format. Values are:	
	N	FEAC inhibited.
	Y	FEAC enabled.
FENDALM=	{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI}	
	Far End Alarm. Identifies any far end DS3 alarm conditions that exist on the DS3. A FENDALM value is reported only if a FENDALM condition exists. Values are:	
	AIS	Far End Alarm Indication Signal failure signal detected.
	DS2YEL	DS2 Yellow (Remote Alarm Indication) signal detected.
	FEACEQPT	Far End Equipment failure signal detected.
	ISD	Far End Idle Signal Detect failure signal detected.
	LOF	Far End Loss of Frame failure signal detected.
	LOS	Far End Loss of Signal failure signal detected.
	RAI	Far End Remote Alarm Indication signal detected.
FESCP=	EC1_AID:	
	{EC1-{1-3840} }	(EC1-EC1/STS1#)
	OC3_AID:	
	{OC3-{1-2240}}	(OC3-OC3#)
	OC12_AID:	
	{OC12-{1-560}}	(OC12-OC12#)
	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	Fault Escalating Port, identifies the facility AID of the receive-side port that is causing a FLTESC alarm to be reported. A FESCP value is only reported when a NEND value of FLTESC exists. Only the AID corresponding to first FLTESC alarm found by the system is reported (i.e., if more than one port is causing a FLTESC, then only the first port found in the system's search is reported).	
FMT=	{ASYNC, CBIT, FRCC, UNCBIT, UNFR}	
	Format. DS3 Format. Indicates the system default provisioning value for the DS3 signal format for this port. Values are:	
	ASYNC	Asynchronous (M13 format)
	CBIT	C-Bit parity format
	FRCC	Framed Clear Channel
	UNCBIT	Unchannelized C-Bit parity format
	UNFR	Unframed format
LINECDE=	{B3ZS}	
	DS3 Line Code, indicates the DS3 line coding type. Only B3ZS code is supported. Value is:	
	B3ZS	Bipolar with Three Zero Substitution.

NENDALM=	<p>{1TO6LOF, 7LOF, AICMIS, AIS, FLTESC, ISD, LOF, LOS}</p> <p>Near End Alarm. Identifies any near end DS3 alarm conditions that exist on the DS3. A NENDALM value is reported only when a NENDALM condition exists. Values may be shown combined with an ampersand (&) if more than one value applies to the T3 at the time of the RTRV-T3 (i.e., if a RCV and TRMT alarm both exist). Values are:</p> <table> <tr> <td>1TO6LOF</td><td>1 to 6 embedded DS2s with Loss of Frame detected.</td></tr> <tr> <td>7LOF</td><td>All Seven DS2s in the DS3 with Loss of Frame detected.</td></tr> <tr> <td>AICMIS</td><td>Application Identification Code signal Mismatch detected.</td></tr> <tr> <td>AIS</td><td>Alarm Indication Signal detected.</td></tr> <tr> <td>FLTESC</td><td>Facility Fault Escalation activated.</td></tr> <tr> <td>ISD</td><td>Idle Signal Detected.</td></tr> <tr> <td>LOF</td><td>Loss of Frame detected.</td></tr> <tr> <td>LOS</td><td>Loss of Signal detected.</td></tr> </table>	1TO6LOF	1 to 6 embedded DS2s with Loss of Frame detected.	7LOF	All Seven DS2s in the DS3 with Loss of Frame detected.	AICMIS	Application Identification Code signal Mismatch detected.	AIS	Alarm Indication Signal detected.	FLTESC	Facility Fault Escalation activated.	ISD	Idle Signal Detected.	LOF	Loss of Frame detected.	LOS	Loss of Signal detected.														
1TO6LOF	1 to 6 embedded DS2s with Loss of Frame detected.																														
7LOF	All Seven DS2s in the DS3 with Loss of Frame detected.																														
AICMIS	Application Identification Code signal Mismatch detected.																														
AIS	Alarm Indication Signal detected.																														
FLTESC	Facility Fault Escalation activated.																														
ISD	Idle Signal Detected.																														
LOF	Loss of Frame detected.																														
LOS	Loss of Signal detected.																														
PMMETHOD=	<p>{CP, FM, FMA, P, NONE}</p> <p>Performance Monitoring Method, indicates the system default provisioning value for the type of performance monitoring that is performed on the DS3. Values are:</p> <p>If FMT=ASYNCR (M13 format):</p> <table> <tr> <td>FM</td><td>F&M bit monitoring.</td></tr> <tr> <td>FMA</td><td>F&M bit adjusted monitoring.</td></tr> <tr> <td>P</td><td>P-bit monitoring.</td></tr> </table> <p>If FMT=CBIT (C-Bit parity format):</p> <table> <tr> <td>CP</td><td>Only CP-bit monitoring.</td></tr> <tr> <td>FM</td><td>F&M bit and CP-bit monitoring.</td></tr> <tr> <td>FMA</td><td>F&M bit adjusted and CP-bit monitoring.</td></tr> <tr> <td>P</td><td>P-bit and CP-bit monitoring.</td></tr> </table> <p>If FMT=FRCC (Framed Clear Channel):</p> <table> <tr> <td>FM</td><td>F&M bit monitoring</td></tr> <tr> <td>FMA</td><td>F&M bit adjusted monitoring</td></tr> <tr> <td>P</td><td>P-bit monitoring</td></tr> </table> <p>If FMT=UNCBIT (Unchannelized C-Bit parity format):</p> <table> <tr> <td>CP</td><td>Only CP-bit monitoring</td></tr> <tr> <td>FM</td><td>F&M bit and CP-bit monitoring</td></tr> <tr> <td>FMA</td><td>F&M bit adjusted and CP-bit monitoring</td></tr> <tr> <td>P</td><td>P-bit and CP-bit monitoring</td></tr> </table> <p>If FMT=UNFR (Unframed):</p> <table> <tr> <td>NONE</td><td>Null value specified for PMMETHOD</td></tr> </table>	FM	F&M bit monitoring.	FMA	F&M bit adjusted monitoring.	P	P-bit monitoring.	CP	Only CP-bit monitoring.	FM	F&M bit and CP-bit monitoring.	FMA	F&M bit adjusted and CP-bit monitoring.	P	P-bit and CP-bit monitoring. ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
SROF	Status, Requested Operation Failed

EXAMPLES

The following example illustrates the command and associated response for DS3 port T3-3.

```
RTRV-T3::T3-3;

The output response, shown below, assumes CID 6 was used to enter the command and a system gener-
ated CTAG value of Pab123. The response header would contain the provisioned Site ID of the system,
and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>
M Pab123 COMPLD
  "T3-3::AINSTH=05-30,AISC=LOS,AISPASS=Y,AIST=NAS,DS3PTYEL=Y,FMT=ASYN,

RST-T3
RTRV-DFLT-T3
SET-DFLT-T3

COMMAND CODE: **RTRV-TACC**
COMMAND NAME: **RETRIEVE TEST ACCESS**

PURPOSE

The RTRV-TACC command retrieves the DS3, DS1, STS1, and/or VT1 port AIDs for Test Access Port Pairs (TAPPs) within the specified range of AIDs, or within all AIDs if the keyword ALL is entered for AID. If the TAPPs are connected for test access, the Equipment side port AID, any Facility side port AID, the test access mode, and the terminate-and-leave status for any A-side or B-side connection is also retrieved. The command is executed regardless of the provisioning of the specified ports.

If the specified AID is a TAP that is involved in testing a port that is within a ring OC-3/OC-12, the Facility side port AID or the Equipment side port AID is the preferred side of the ring.

The successful response for a RTRV-TACC contains one line of parsable output data, in ascending order, for each Test Access Port Pair within the specified range of AIDs.

A RTRV-TACC command is denied if:

- A SONET embedded DS1 or DS3 AID is entered.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-TACC: [TID]:AID:[CTAG]:: [MODE=] [, STATE=] [, TYPE=] [, UID=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T1-{1-59392}}	(T1-DS1#)	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	DS3_AID:		
	{T3-{1-4800}}	(T3-DS3#)	
	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)

	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	ALL_AID:		
	{ALL}		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	DS1, DS3, STS1, or VT1 Test Access Port AID, identifies a Test Access port. A report is generated for each Test Access port within the specified range. Name-defined values are:	
	ALL	All Test Access ports are reported.	
	Restrictions:	RTRV-TACC is denied if the specified type of AID does not match with the specified TYPE value, unless an AID of ALL is entered. The AID of an STS1 entity embedded in an OC12, OC3, or EC1, except the 3rd STS1 within an OC3 and the {4-3}th STS1 within an OC12. Refer to Appendix B, Access Identifiers (AIDs).	

The AIDs of VT1 entities embedded in an STS1 which can be embedded in an OC12, OC3, or EC1, except the {7–4}th VT1 within an STS1. Refer to Appendix B, Access Identifiers (AIDs).

CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MODE=	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF, <NoVal>} Default: <NoVal> (All test access modes) Addressing: None Description: Test Access Mode, report Test Access ports performing a test of the specified Mode. Values are:
LOOPE	Loop Equipment–side, only TAPPs that are performing a LOOPE test are reported. LOOPE is a test which loops the equipment–side incoming signal to its output and monitors the looped signal with FAD A. If a facility–side port is connected to the equipment–side port, the A and B side transmission paths are split, unframed QRS is inserted into the outgoing facility–side signal, and the incoming facility–side signal is terminated.
LOOPF	Loop Facility–side, only TAPPs that are performing a LOOPF test are reported. LOOPF is a test which loops the facility–side incoming signal to its output and monitors the looped signal with FAD A. If an equipment–side port is connected to the facility–side port, the A and B side transmission paths are split, unframed QRS is inserted into the outgoing equipment–side signal, and the incoming equipment–side signal is terminated.
MONE	Monitor Equipment–side, only TAPPs that are performing a MONE test are reported. MONE is a test which monitors the equipment–side port with FAD A.
MONEF	Monitor Equipment–side and Facility–side, only Test Access ports that are performing a MONEF test are reported. MONEF is a test which monitors the equipment–side port with FAD A and the facility–side port with FAD B.
MONF	Monitor Facility–side, only TAPPs that are performing a MONF test are reported. MONF is a test which monitors the facility–side port with FAD A.
SPLTA	Split A–side, only Test Access ports that are performing a SPLTA test are reported. SPLTA is a test which splits the A–side signal path and connects it both to and from FAD A.
SPLTB	Split B–side, only Test Access ports that are performing a SPLTB test are reported. SPLTB is a test which splits the B–side signal path and connects it both to and from FAD A.
SPLTE	Split Equipment–side, only TAPPs that are performing a SPLTE test are reported. SPLTE is a test where the equipment–side port is connected both to and from FAD A. If a facility–side port is connected to the equipment–side port, the A and B side transmission paths are split, unframed QRS inserted into the outgoing facility–side signal, and the incoming facility–side signal is terminated.
SPLTEF	Split Equipment–side and Facility–side, only Test Access ports that are performing a SPLTEF test are reported. SPLTEF is a test which splits the A and B transmission paths (if existing) and connects the equipment–side port both to and from FAD A and the facility–side

	port both to and from FAD B.
SPLTF	Split Facility–side, only TAPPs that are performing a SPLTF test are reported. SPLTF is a test where the facility–side port is connected both to and from FAD A. If an equipment–side port is connected to the facility–side port, the A and B side transmission paths are split, unframed QRS inserted into the outgoing equipment–side signal, and the incoming equipment–side signal is terminated.
<NoVal>	No Value, report all TAPPs regardless of any test access mode being used.
STATE=	{BUSY, IDLE, <NoVal>} Default: <NoVal> (All TAPPs regardless of whether it's in use) Addressing: None Description: State, report TAPPs in the specified state. Values are: BUSY Busy, report only TAPPs being used for a test. IDLE Idle, report only TAPPs not being used for a test. <NoVal> No Value, report all TAPPs regardless of whether they are in use.
TYPE=	{DS1, DS3, STS1, VT1, <NoVal>} Default: <NoVal> Addressing: None Description: Type, report Test Access ports of the specified type. Values are: DS1 Report all electrical DS1 and DS1 embedded within an electrical DS3 TAPPs. DS3 Report all electrical DS3 TAPPs. STS1 Report all STS1 TAPPs embedded within EC1s, OC3s or OC12s. VT1 Report all VT1 TAPPs embedded within EC1STS1s, OC3STS1s, or OC12STS1s. <NoVal> No Value, report on all applicable Test Access ports. Restrictions: RTRV–TACC is denied if the specified type of AID does not match with the specified TYPE value, unless an AID of ALL is entered.
UID=	{ALL, MYSELF, PRIVATE, PUBLIC} Default: {MYSELF} Addressing: None Description: User Identifier, report Test Access Ports associated with the specified type of UID. Values are: ALL Report all TAPPs. Reports all TAPPs in all pools (both private and public). MYSELF Report all TAPPs owned by myself. Reports all TAPPs in the user's private pool and all TAPPs in the public pool that are in use by the user. PRIVATE Report private pool TAPPs. Reports all TAPPs in the user's private pool. PUBLIC Report public pool TAPPs. Reports all TAPPs in the public pool.

SUCCESSFUL RESPONSE FORMAT

The generic successful output response message format is:

```

        <SID> <YY-MM-DD> <HH:MM:SS>
M   <CTAG> COMPLD
    "<TYPE>,<FADA>,<FADB>,<EQPT>,<FAC>,<MODE>,<TLISA>,<TLISB>,<STATE>,<UID>"
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

If any Test Access ports are assigned and selected by the specified input parameter values the output response message format is:

```

        <SID> <YY-MM-DD> <HH:MM:SS>
M   <CTAG> COMPLD
    "<TYPE>,<FADA>,<FADB>,<EQPT>,<FAC>,<MODE>,<TLISA>,<TLISB>,<STATE>,<UID>"
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

If no Test Access ports are assigned, or no Test Access ports are selected by the specified input parameter values, the output response message format is:

```

        <SID> <YY-MM-DD> <HH:MM:SS>
M   <CTAG> COMPLD
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

If any Test Access ports are assigned and the test access connection is link associated, the output response message format is:

```

        <SID> <YY-MM-DD> <HH:MM:SS>
M   <CTAG> COMPLD
    "<TYPE>,<FADA>,<FADB>,<EQPT>,<FAC>,<MODE>,<TLISA>,<TLISB>,<STATE>,<UID>,<LA>"
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

TYPE	{DS1,DS3}
	TYPE. Type of ports being displayed. Values are:
	DS1 DS1 type TACC port.
	DS3 DS3 type TACC port.
	STS1 STS1 type TACC port.
	VT1 VT1 type TACC port.

	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	<NoVal>	
	Facility side AID, indicates the facility side port connected to the equipment side port, if the Test Access port is being used, otherwise no value is displayed. Name defined values are:	
	<NoVal>	No value is displayed, a facility side port is not connected to the equipment side port or the Test Access port is not in use.
MODE	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF, <NoVal>}	
	Test Access Mode, indicates the test mode of the Test Access port. Values are:	
	LOOPE	Loop Equipment-side, indicates a test which loops the equipment-side incoming signal to its output and monitors the looped signal with FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, unframed QRS is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.

LOOPF	Loop Facility-side, indicates a test which loops the facility-side incoming signal to its output and monitors the looped signal with FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, unframed QRS is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.						
MONE	Monitor Equipment-side, indicates a test which monitors the equipment-side port with FAD A.						
MONEF	Monitor Equipment-side and Facility-side, indicates a test which monitors the equipment-side port with FAD A and the facility-side port with FAD B.						
MONF	Monitor Facility-side, indicates a test which monitors the facility-side port with FAD A.						
SPLTA	Split A-side, indicates a test which splits the A-side signal path and connects it both to and from FAD A.						
SPLTB	Split B-side, indicates a test which splits the B-side signal path and connects it both to and from FAD A.						
SPLTE	Split Equipment-side, indicates a test where the equipment-side port is connected both to and from FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, unframed QRS inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.						
SPLTEF	Split Equipment-side and Facility-side, indicates a test which splits the A and B transmission paths (if existing) and connects the equipment-side port both to and from FAD A and the facility-side port both to and from FAD B.						
SPLTF	Split Facility-side, indicates a test where the facility-side port is connected both to and from FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, unframed QRS inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.						
<NoVal>	No value is displayed, the Test Access port is not in use.						
TLSA	<p>{NORM, TERM, <NoVal>}</p> <p>Terminate and Leave Status of the A side port, indicates whether the A side port being tested is in a terminate and leave status as a result of a previous CHG-TL-DIG command. Values are:</p> <table> <tr> <td>NORM</td><td>Normal, the A side port is not in a terminate and leave state, or the Test Access port is not being used for a test.</td></tr> <tr> <td>TERM</td><td>Terminated, the A side port is in a terminate and leave state.</td></tr> <tr> <td><NoVal></td><td>No value is displayed, the A side connection does not exist or the Test Access port is not being used.</td></tr> </table>	NORM	Normal, the A side port is not in a terminate and leave state, or the Test Access port is not being used for a test.	TERM	Terminated, the A side port is in a terminate and leave state.	<NoVal>	No value is displayed, the A side connection does not exist or the Test Access port is not being used.
NORM	Normal, the A side port is not in a terminate and leave state, or the Test Access port is not being used for a test.						
TERM	Terminated, the A side port is in a terminate and leave state.						
<NoVal>	No value is displayed, the A side connection does not exist or the Test Access port is not being used.						
TLSB	<p>{NORM, TERM, <NoVal>}</p> <p>Terminate and Leave Status of the B side port, indicates whether the B side port being tested is in a terminate and leave status as a result of a previous CHG-TL-DIG command. Values are:</p> <table> <tr> <td>NORM</td><td>Normal, the B side port is not in a terminate and leave state, or the Test Access port is not being used for a test.</td></tr> <tr> <td>TERM</td><td>Terminated, the B side port is in a terminate and leave state.</td></tr> <tr> <td><NoVal></td><td>No value is displayed, the B side connection does not exist or the Test Access port is not being used.</td></tr> </table>	NORM	Normal, the B side port is not in a terminate and leave state, or the Test Access port is not being used for a test.	TERM	Terminated, the B side port is in a terminate and leave state.	<NoVal>	No value is displayed, the B side connection does not exist or the Test Access port is not being used.
NORM	Normal, the B side port is not in a terminate and leave state, or the Test Access port is not being used for a test.						
TERM	Terminated, the B side port is in a terminate and leave state.						
<NoVal>	No value is displayed, the B side connection does not exist or the Test Access port is not being used.						

STATE	{BUSY, IDLE} State, indicates the state of the TAPP. Values are: BUSY Busy, the Test Access port is being used for a test. IDLE Idle, the Test Access port is not being used for a test.
UID	{<5–12 VALID UID CHARACTERS>, <NoVal>} User ID, indicates the UID of the user who owns or (in the case of PUBLIC pool ports) is in control of the specified TAPP. Name–defined values are: <5–12 VALID UID CHARACTERS> UID of user in control of TAPP <NoVal> No value is displayed, the port is a PUBLIC pool TAPP that is not being used by anyone.
LA	{LA, <NoVal>} Link Association, specifies whether the test access connection is to be associated with the communication link being used by the user. Values are: LA Link Associated, specifies that the test access connection is to be disconnected if the user logs off, if the user enters a REPT–INITZN command, if the communication link timer is enabled and expires, or if the APS control system re–boots. <NoVal> No value is displayed, specifies that the test access connection is not disconnected regardless if the user logs off, the user enters a REPT–INITZN command, the communication link timer expires, or if the APS control system re–boots.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* AID and UID are not consistent */
IIAC	Input, Invalid ACcess identifier
IPNV	Input, Parameter Not Valid
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR–STRING> for <AID–STRING> */ /* TAPP Database Error: <ERROR–STRING> for record number <RECORD–NUMBER> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, all Test Access ports between DS1 ports 2–1–1 and 2–1–28 that are owned by this user and are not currently in use are reported.

```
RTRV-TACC::2-1-1&&-28:::STATE=IDLE;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes there are two Test Access Port Pairs that are not in use and are owned by this user (“MYUID”) within the specified range of ports (i.e., are in MYUID’s PRIVATE pool).

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "DS1,2-1-6,2-1-7,,,,NORM,NORM,IDLE,MYUID"
  "DS1,2-1-12,2-1-13,,,,NORM,NORM,IDLE,MYUID"
/* RTRV-TACC::2-1-1&&-28:::STATE=IDLE [Pad567] (2) */
;
```

In the following example, all Test Access ports between DS1 ports 2-1-1 and 2-1-28 for all users are reported regardless of whether the Test Access port is in use or the test mode of any TACC port.

```
RTRV-TACC::2-1-1&&-28:::UID=ALL;
```

The output response, shown below, assumes X.25 virtual channel 2 on CID port 3 was used to enter the command and a system generated CTAG value of Pad568. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes there are five Test Access Port Pairs within the specified range of ports and all of them belong to the PUBLIC pool. Two are in use by "MYUID", one of which is link associated, and one is in use by "HISUID".

COMMAND CODE: **RTRV-TARPADJ-DCC**
COMMAND NAME: **RETRIEVE TARP ADJACENCY TABLE**
ENTRY OF DCC

PURPOSE

The RTRV-TARPADJ-DCC command retrieves the manually provisioned TID Address Resolution Protocol (TARP) adjacency table entries on the Data Communication Channel (DCC).

If the specified OC-3 is not provisioned, i.e., it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-TARPADJ-DCC command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-TARPADJ-DCC: [TID] :AID: [CTAG] :: [DCCTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3/OC-3 whose DCC adjacency table entries are being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DCCTYPE	{BOTH, LDCC, SDCC} Default: {SDCC} Addressing: None Description: DCC Type, specifies which DCC type is retrieved in the adjacency table. BOTH Both, specifies both the SDCC and LDCC types are retrieved in the adjacency table. LDCC Line DCC, specifies the LDCC type is retrieved in the adjacency table. SDCC Section DCC, specifies the SDCC type is retrieved in the adjacency table.

SUCCESSFUL RESPONSE FORMAT

The following successful response format is one response line for each entry in the adjacency table.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<1>,<AID>,<SDCC|LDCC>:ISLEVEL=<value>,NSAP=<value>,ENABLE=<value>
[:<DUP>] ""
  "<2>,<AID>,<SDCC|LDCC>:ISLEVEL=<value>,NSAP=<value>,ENABLE=<value>
[:<DUP>] ""
  "<n>,<AID>,<SDCC|LDCC>:ISLEVEL=<value>,NSAP=<value>,ENABLE=<value>
[:<DUP>] ""
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

DCCTYPE	{BOTH, LDCC, SDCC}	DCC Type, specifies which DCC type is retrieved in the adjacency table.
	BOTH	Both, specifies both the SDCC and LDCC types are modified in the adjacency table.
	LDCC	Line DCC, specifies the LDCC type is retrieved in the adjacency table.
	SDCC	Section DCC, specifies the SDCC type is retrieved in the adjacency table.
ENABLE=	{N, Y}	Enable, determines if the TARP propagation to the NE specified by the NSAP parameter is enabled or disabled. Values are:
	N	No, specifies the TARP propagation to the NE in the NSAP parameter is disabled.
	Y	Yes, specifies the TARP propagation to the NE in the NSAP parameter is enabled.
ISLEVEL=	{1, 2, BOTH}	Intermediate System Level, determines the IS Level for which the TARP adjacency table is being modified.
	1	NSAP is a level 1 adjacency.
	2	NSAP is a level 2 adjacency.
	BOTH	NSAP is both level 1 and level 2 adjacency.
NSAP=	<40 ASCII HEXADECIMAL VALUES>	Network Service Access Point, specifies the Network Service Access Point (NSAP) address. Values are 20 octets long encoded as 40 ASCII hexadecimals.

UNSUCCESSFUL RESPONSE FORMAT

SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the TARP adjacency table entries of the network layer are retrieved.

RTRV-TARPADJ-DCC::OC3-109;

For this example, the output response shown assumes CID 3 was used to enter the command and a system generated CTAG value of P4f922. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

M          <SID> <YY-MM-DD> <HH:MM:SS>          P4f922          COMPLD
  1,OC3-109,SDCC:ISLEVEL=2,NSAP=79840F20000000000000000000000004072005E6100,EN-
  ABLE=Y"
RTRV-TARPAJ-DCC: :OC3-109          [P4F922]          (8-4)          */
  i

```

RELATED COMMANDS

DLT-TARPAJ-DCC
ED-TARPAJ-DCC
ENT-TARPAJ-DCC

COMMAND CODE: **RTRV-TARPADJ-LAN**
COMMAND NAME: **RETRIEVE TARP ADJACENCY TABLE
ENTRY OF LAN**

PURPOSE

The RTRV-TARPADJ-LAN command retrieves the manually provisioned TID Address Resolution Protocol (TARP) adjacency table entries for the DSB's LAN.

If the specified DSB is not provisioned, i.e., it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-TARPADJ-LAN command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-TARPADJ-LAN: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB whose adjacency table entries are being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The following successful response format is one response line for each entry in the adjacency table.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<1>,<AID>:<ISLEVEL>,<ENABLE>,<NSAP> [ :<DUP>] "
  "<2>,<AID>:<ISLEVEL>,<ENABLE>,<NSAP> [ :<DUP>] "
  ...
  "<n>,<AID>:<ISLEVEL>,<ENABLE>,<NSAP> [ :<DUP>] "
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

ENABLE=	{N, Y} Enable, determines if the TARP propagation to the NE specified by the NSAP/ISLEVEL parameters is enabled or disabled. Values are: N No, specifies the TARP propagation to the NE in the ISLEVEL/NSAP parameters is disabled. Y Yes, specifies the TARP propagation to the NE in the ISLEVEL/NSAP parameters is enabled.
---------	---

ISLEVEL= {1, 2}
Intermediate System Level, determines the IS Level for which the TARP adjacency table is being modified.

NSAP= <40 ASCII HEXADECIMAL VALUES>
Network Service Access Point, specifies the Network Service Access Point (NSAP) address. Values are 20 octets long encoded as 40 ASCII hexadecimal.

UNSUCCESSFUL RESPONSE FORMAT

```

M <SID> <YY-MM-DD> <HH:MM:SS>
  <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]

```

COMMAND CODE: **RTRV-TARPLDB**
COMMAND NAME: **RETRIEVE TARP LOOP DETECTION
BUFFER**

PURPOSE

The RTRV-TARPLDB command retrieves all the entries in the TID Address Resolution Protocol (TARP) Loop Detection Buffer (LDB) on the DSB.

If the specified DSB is not provisioned, i.e., it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-TARPLDB command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-TARPLDB: [TID] :AID: [CTAG] :: [TARPSYSID] [, TARPSEQ] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB whose TARP loop detection buffer is being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
TARPSYSID	<0-12 ASCII HEXADECIMAL VALUES> Default: <Any System ID> Addressing: None Description: TID Address Resolution Protocol (TARP) System ID, identifies the TARP protocol address of the originator. Only the entry in the LDB that matches this field is retrieved. Values are 6 octets long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal. Restrictions: RTRV-TARPLDB is denied if the specified TARPSYSID entered is less than 12 characters.
TARPSEQ	{0-65535} Default: <Any Sequence Number> Addressing: None Description: TID Address Resolution Protocol (TARP) Sequence Number. Only the entry in the LDB that matches this field is retrieved.

SUCCESSFUL RESPONSE FORMAT

The following successful response format is used if the name-defined parameters, TARPSYSID and TARPSEQ, are not specified. There is one response line for each entry in the LDB and all the entries in the LDB is displayed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<1>:TARPSYSID=<value>,TARPSEQ=<value>"
  "<2>:TARPSYSID=<value>,TARPSEQ=<value>"
  . . .
  "<n>:TARPSYSID=<value>,TARPSEQ=<value>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following successful response format is used if either of the the name-defined parameters, TARPSYSID and/or TARPSEQ, are specified. If TARPSYSID and/or TARPSEQ are specified and an entry that matches the given parameter(s) is not found in the LDB, then the COMPLD message is sent.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<1>:TARPSYSID=<value>,TARPSEQ=<value>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

TARPSYSID= <0-12 ASCII HEXADECEMAL VALUES>
TID Address Resolution Protocol (TARP) System ID, identifies the TARP protocol address of the originator. Only the entry in the LDB that matches this field is retrieved. Values are 6 octets long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.

TARPSEQ= {0-65535}
TID Address Resolution Protocol (TARP) Sequence Number. Only the entry in the LDB that matches this field is retrieved.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

;
```

RELATED COMMANDS

DLT-TARPLDB

COMMAND CODE: **RTRV–TH–EC1**
COMMAND NAME: **RETRIEVE THRESHOLD EC1**

PURPOSE

The RTRV–TH–EC1 command retrieves the threshold level setting corresponding to the specified PM collection register (identified by MONTYPE, LOCN, and TMPER) and the specified EC1 port.

The successful response for a RTRV–TH–EC1 command contains one line of parsable output data for each parameter threshold level setting being reported, in ascending order (from the lowest specified EC1 AID to the highest specified EC1 AID) for each EC1 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT–EC1).

A RTRV–TH–EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV–TH–EC1 : [TID] : AID : [CTAG] : : [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1–{1–3840} } (EC1–EC1/STS1#) Default: Entry Required Addressing: &&–ranging and &–grouping Description: EC1 AID, specifies the EC1 port.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, LOSS, LOSS-S, SEFS, SEFS-S, SES-L, SESL, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, ES-L, ESL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
	Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
	ALL All monitored parameter PM registers. AISS, AISS-L, AISSL Alarm Indication Signal Seconds – Line, AISS register. (Far-end only.) CV-L, CVL Coding Violations – Line, CV-L register. (Near-end only.) ES-L, ESL Errored Seconds – Line, ES-L register. ESA-L, ESAL Errored Seconds type A – Line, ESA-L register. (Near-end only.) ESB-L, ESBL Errored Seconds type B – Line, ESB-L register. (Near-end only.) FC-L, FCL Failure Counts – Line, FC-L register. (Far-end only.) LOSS, LOSS-S Loss Of Signal Seconds – Section, LOSS register. (Near-end only.) SEFS, SEFS-S Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.) SES-L, SESL Severely Errored Seconds – Line, SES-L register. UAS-L, UASL Unavailable Seconds – Line, UAS-L register.
	Restrictions: RTRV-TH-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
LOCN	{FEND, NEND}
	Default: < All applicable locations for the selected monitored parameters > Addressing: None Description: Location, specifies whether threshold levels for near-end or far-end monitored parameters are to be retrieved. Values are:
	FEND Far-End NEND Near-End
	Restrictions: RTRV-TH-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN} Addressing: None Description: Time Period, specifies whether threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN 15-Minute PM collection register 1-DAY 1-Day (24 hour) PM collection register

SUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid time period in request message. */ /* Invalid montype in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM EC1 record. */ /* Failed to set file ptr to EC1 threshold database. */
SROF	Status, Requested Operation Failed /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */ /* Unable to convert montype <MONTYPE> to string. */ /* Unable to process montype <MONTYPE>. */ /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* Could not write to report file. */

EXAMPLES

In the following example, the coding violations, line (CV–L) threshold level settings for the near–end15–Minute PM register is retrieved for EC1 port EC1–481.

```
RTRV-TH-EC1::EC1-481:::CV-L,,15-MIN;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"EC1-481,EC1:CVL,NEND,,13340,15-MIN"
/* RTRV-TH-EC1::EC1-481:::CV-L,,15-MIN [P71042] (1) */
;
```

COMMAND CODE: **RTRV-TH-OC12**
COMMAND NAME: **RETRIEVE THRESHOLD OC-12**

PURPOSE

The RTRV-TH-OC12 command retrieves the threshold level setting corresponding to the specified PM collection register (identified by MONTYPE, LOCN, and TMPER) and the specified OC12 port.

The successful response for a RTRV-TH-OC12 command contains one line of parsable output data for each parameter threshold level setting being reported, in ascending order (from the lowest specified OC12 AID to the highest specified OC12 AID) for each OC12 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-OC12).

A RTRV-TH-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-TH-OC12 : [TID] : AID : [CTAG] : : [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	OC12_AID:		
	{OC12-{1-560}}		(OC12-OC12#)
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	OC12 AID, specifies the OC-12 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}																																				
	Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid time period in request message. */ /* Invalid montype in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM OC12 record. */ /* Failed to set file ptr to OC12 threshold database. */
SROF	Status, Requested Operation Failed /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */ /* Unable to convert montype <MONTYPE> to string. */ /* Unable to process montype <MONTYPE>. */ /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* Could not write to report file. */

EXAMPLES

In the following example, the coding violations, line (CV-L) threshold level settings for the near-end 15-Minute PM register is retrieved for OC12 port OC12-193.

```
RTRV-TH-OC12::OC12-193:::CV-L,NEND,15-MIN;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71022. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71042 COMPLD  
"OC12-193,OC12:CVL,NEND,,13340,15-MIN"  
/* RTRV-TH-OC12::OC12-193:::CV-L,,15-MIN [P71042] (1) */  
;

COMMAND CODE: **RTRV-TH-OC3**
COMMAND NAME: **RETRIEVE THRESHOLD OC-3**

PURPOSE

The RTRV-TH-OC3 command retrieves the threshold level setting corresponding to the specified PM collection register (identified by MONTYPE, LOCN, and TMPER) and the specified OC3 port.

The successful response for a RTRV-TH-OC3 command contains one line of parsable output data for each parameter threshold level setting being reported, in ascending order (from the lowest specified OC3 AID to the highest specified OC3 AID) for each OC3 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-OC3).

A RTRV-TH-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-TH-OC3 : [TID] : AID : [CTAG] : : [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, specifies the OC-3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}																																				
	Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:																																				
	<table> <tr> <td>ALL</td><td>All monitored parameter PM registers.</td></tr> <tr> <td>AISS, AISS-L, AISSL</td><td>Alarm Indication Signal Seconds – Line, AISS register.</td></tr> <tr> <td>CV-L, CVL</td><td>Coding Violations – Line, CV-L register.</td></tr> <tr> <td>CV-S, CVS</td><td>Coding Violations – Section, CV-S register. ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid time period in request message. */ /* Invalid montype in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM OC3 record. */ /* Failed to set file ptr to OC3 threshold database. */
SROF	Status, Requested Operation Failed /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */ /* Unable to convert montype <MONTYPE> to string. */ /* Unable to process montype <MONTYPE>. */ /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* Could not write to report file. */

EXAMPLES

In the following example, the coding violations, line (CV-L) threshold level settings for the near-end 15-Minute PM register is retrieved for OC3 port OC3-193.

```
RTRV-TH-OC3::OC3-193:::CV-L,NEND,15-MIN;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71022. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71042 COMPLD  
"OC3-193,OC3:CVL,NEND,,13340,15-MIN"  
/* RTRV-TH-OC3::OC3-193:::CV-L,,15-MIN [P71042] (1) */  
;

COMMAND CODE: **RTRV–TH–STS1**
COMMAND NAME: **RETRIEVE THRESHOLD STS–1**

PURPOSE

The RTRV–TH–STS1 command retrieves the threshold level setting corresponding to the specified PM collection register (identified by MONTYPE, LOCN, and TMPER) and the specified STS–1 port.

The successful response for a RTRV–TH–STS1 command contains one line of parsable output data for each parameter threshold level setting being reported, in ascending order (from the lowest specified STS–1 AID to the highest specified STS–1 AID) for each STS–1 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT–STS1). In addition, no line of parsable output data is displayed if the specified STS–1 is embedded within a protection OC–3 or OC–12.

A RTRV–TH–STS1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV–TH–STS1 : [TID] : AID : [CTAG] : : [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1–{1–3840}}	(EC1STS1–EC1/STS1#)	
	{OC3STS1–{1–2240}–{1–3}}	(OC3STS1–OC3#–STS1#)	
	{OC12STS1–{1–560}–{1–4}–{1–3}}	(OC12STS1–OC12#–STM1#–STS1#)	
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	STS1 AID, specifies the STS–1 port.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}, FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}																		
	Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:																		
	<table> <tr> <td>ALL</td><td>All monitored parameter PM registers.</td></tr> <tr> <td>ALS-P, ALSP</td><td>Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.</td></tr> <tr> <td>CV-P, CVP</td><td>Coding Violations – Path, CV-P register.</td></tr> <tr> <td>ES-P, ESP</td><td>Errored Seconds – Path, ES-P register.</td></tr> <tr> <td>ESA-P, ESAP</td><td>Errored Seconds type A – Path, ESA-P register.</td></tr> <tr> <td>ESB-P, ESBP</td><td>Errored Seconds type B – Path, ESB-P register.</td></tr> <tr> <td>FC-P, FCP</td><td>Failure Counts – Path, FC-P register.</td></tr> <tr> <td>SES-P, SESP</td><td>Severely Errored Seconds – Path, SES-P register.</td></tr> <tr> <td>UAS-P, UASP</td><td>Unavailable Seconds – Path, UAS-P register.</td></tr> </table>	ALL	All monitored parameter PM registers.	ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.	CV-P, CVP	Coding Violations – Path, CV-P register.	ES-P, ESP	Errored Seconds – Path, ES-P register.	ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.	ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.	FC-P, FCP	Failure Counts – Path, FC-P register.	SES-P, SESP	Severely Errored Seconds – Path, SES-P register.	UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.
ALL	All monitored parameter PM registers.																		
ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.																		
CV-P, CVP	Coding Violations – Path, CV-P register.																		
ES-P, ESP	Errored Seconds – Path, ES-P register.																		
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.																		
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.																		
FC-P, FCP	Failure Counts – Path, FC-P register.																		
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.																		
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.																		
LOCN	{FEND, NEND}																		
	Default: < All applicable locations for the selected monitored parameters > Addressing: None Description: Location, specifies whether threshold levels for near-end or far-end monitored parameters are to be retrieved. Values are:																		
	<table> <tr> <td>FEND</td><td>Far-End</td></tr> <tr> <td>NEND</td><td>Near-End</td></tr> </table>	FEND	Far-End	NEND	Near-End														
FEND	Far-End																		
NEND	Near-End																		
TMPER	{15-MIN, 1-DAY}																		
	Default: {15-MIN} Addressing: None Description: Time Period, specifies whether threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:																		
	<table> <tr> <td>15-MIN</td><td>15-Minute PM collection register</td></tr> <tr> <td>1-DAY</td><td>1-Day (24 hour) PM collection register</td></tr> </table>	15-MIN	15-Minute PM collection register	1-DAY	1-Day (24 hour) PM collection register														
15-MIN	15-Minute PM collection register																		
1-DAY	1-Day (24 hour) PM collection register																		

SUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **RTRV–TH–STS3C**
COMMAND NAME: **RETRIEVE THRESHOLD STS–3C**

PURPOSE

The RTRV–TH–STS3C command retrieves the threshold level setting corresponding to the specified PM collection register (identified by MONTYPE, LOCN, and TMPER) and the specified STS–3C port.

The successful response for a RTRV–TH–STS3C command contains one line of parsable output data for each parameter threshold level setting being reported, in ascending order (from the lowest specified STS–3C AID to the highest specified STS–3C AID) for each STS–3C AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT–STS3C). In addition, no line of parsable output data is displayed if the specified STS–3C is embedded within a protection OC–3 or OC–12.

A RTRV–TH–STS3C command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV–TH–STS3C: [TID] :AID: [CTAG] :: [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.																		
AID	STS3C_AID: {OC3STS3C–{1–2240}} (OC3STS3C–OC3#/STS3C#) {OC12STS3C–{1–560}–{1–4}} (OC12STS3C–OC12#–STM1/STS3C#) Default: Entry Required Addressing: &&–ranging and &–grouping Description: STS3C AID, specifies the STS–3C port.																		
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.																		
MONTYPE	{ALL}, NEAR_END_PARAMETERS:{ALS–P, ALSP, CV–P, CVP, ES–P, ESP, ESA–P, ESAP, ESB–P, ESBP, FC–P, FCP, SES–P, SESP, UAS–P, UASP}, FAR_END_PARAMETERS:{ALS–P, ALSP, CV–P, CVP, ES–P, ESP, ESA–P, ESAP, ESB–P, ESBP, FC–P, FCP, SES–P, SESP, UAS–P, UASP} Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (–). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are: <table> <tr> <td>ALL</td><td>All monitored parameter PM registers.</td></tr> <tr> <td>ALS–P, ALSP</td><td>Alarm Indication Signal/Loss of Pointer – Path, ALS–P register.</td></tr> <tr> <td>CV–P, CVP</td><td>Coding Violations – Path, CV–P register.</td></tr> <tr> <td>ES–P, ESP</td><td>Errored Seconds – Path, ES–P register.</td></tr> <tr> <td>ESA–P, ESAP</td><td>Errored Seconds type A – Path, ESA–P register.</td></tr> <tr> <td>ESB–P, ESBP</td><td>Errored Seconds type B – Path, ESB–P register.</td></tr> <tr> <td>FC–P, FCP</td><td>Failure Counts – Path, FC–P register.</td></tr> <tr> <td>SES–P, SESP</td><td>Severely Errored Seconds – Path, SES–P register.</td></tr> <tr> <td>UAS–P, UASP</td><td>Unavailable Seconds – Path, UAS–P register.</td></tr> </table>	ALL	All monitored parameter PM registers. ```

OUTPUT PARAMETERS

AID	STS3C_AID:
	{OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#)
	{OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#)
	STS3C AID, identifies the STS-3C port.
MONTYPE	NEAR_END_PARAMETERS:{ALS-P, CVP, ESP, ESA-P, ESB-P, FC-P, SESP, UASP},
	FAR_END_PARAMETERS:{ALS-P, CVP, ESP, ESA-P, ESB-P, FC-P, SESP, UASP}
	Monitored Parameter Type, identifies the monitored parameter. Refer to Appendix F,
	Monitored PM Parameters for a list of all monitored PM parameters. Values are:
	ALS-P Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.
	CVP Coding Violations – Path, CV-P register.
	ESP Errored Seconds – Path, ES-P register.
	ESA-P Errored Seconds type A – Path, ESA-P register.
	ESB-P Errored Seconds type B – Path, ESB-P register.
	FC-P Failure Counts – Path, FC-P register.
LOCN	SESP Severely Errored Seconds – Path, SES-P register.
	UASP Unavailable Seconds – Path, UAS-P register.
	{FEND, NEND}
	Location, indicates whether threshold levels for near-end or far-end monitored parameters are being reported. Values are:
	FEND Far-End
	NEND Near-End
THLEV	{0-4294967295}
	Threshold Level, indicates the value of the threshold level for the indicated parameter. A value of zero (0) indicates PM threshold crossings are not autonomously reported.

TMPER {15-MIN, 1-DAY}
Time Period, identifies the accumulation time period for the indicated parameter. Values are:

15-MIN	15-Minute PM collection register
1-DAY	1-Day (24 hour) PM collection register

COMMAND CODE: **RTRV-TH-T1**
COMMAND NAME: **RETRIEVE THRESHOLD T1**

PURPOSE

The RTRV-TH-T1 command retrieves the threshold level setting corresponding to the specified PM collection register (identified by MONTYPE, LOCN, and TMPER) and the specified DS1 port.

The successful response for a RTRV-TH-T1 command contains one line of parsable output data for each parameter threshold level setting being reported, in ascending order (from the lowest specified DS1 AID to the highest specified DS1 AID) for each DS1 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-T1). In addition, no line of parsable output data is displayed if the specified DS1 is embedded within a protection OC3.

A RTRV-TH-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)
	DS1 AID, identifies the DS1 port.	

MONTYPE	NEAR_END_PARAMETERS:{AISS, CVL, CVP, ESA-P, ESB-P, ESL, ESP, FC-P, LOSS, QRSSS-P, SAS-P, SESL, SESP, UASP}, FAR_END_PARAMETERS:{CSS, CVP, ESA-P, ESB-P, ESL, ESP, FC-P, SEFS, SESP, UASP}
---------	--

Monitored Parameter Type, identifies the monitored parameter. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

AISS	AIS Seconds – Path, AISS register.
CSS	Controlled Slip Seconds – Path, CSS register.
CVL	Coding Violations – Line, CV-L register.
CVP	Coding Violations – Path, CV-P register.
ESA-P	Errored Seconds type A – Path, ESA-P register.
ESB-P	Errored Seconds type B – Path, ESB-P register.
ESL	Errored Seconds – Line, ES-L register.
ESP	Errored Seconds – Path, ES-P register.
FC-P	Failure Count – Path, FC-P register.
LOSS	Loss of Signal Seconds – Line, LOSS register.
QRSSS-P	QRSSS – Path, QRSSS-P register.
SAS-P	Severe AIS Seconds – Path, SAS-P register.
SEFS	Severely Errored Frame Seconds, SEFS register.
SESL	Severely Errored Seconds – Line, SES-L register.
SESP	Severely Errored Seconds – Path, SES-P register.
UASP	Unavailable Seconds – Path, UAS-P register.

LOCN	{FEND, NEND} Location, indicates whether threshold levels for near-end or far-end monitored parameters are being reported. Values are: FEND Far-End NEND Near-End
THLEV	{0-4294967295} Threshold Level, indicates the value of the threshold level for the indicated parameter. A value of zero (0) indicates PM threshold crossings are not autonomously reported.
TMPER	{15-MIN, 1-DAY} Time Period, identifies the accumulation time period for the indicated parameter. Values are: 15-MIN 15-Minute PM collection register 1-DAY 1-Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid time period in request message. */ /* Invalid montype in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM T1 record. */ /* Error reading T1 threshold database. */

SROF Status, Requested Operation Failed
 /* rpt_file error – <ERRNO>, status = <STATUS> */
 /* Cannot open <FILENAME> */
 /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */
 /* rpt_print error – <ERRNO>, status = <STATUS> */
 /* Failed to convert TPid to an AID string. */
 /* Unable to convert montype <MONTYPE> to string. */
 /* Unable to process montype <MONTYPE>. */
 /* Unable to determine supporting facility entity. */
 /* Unable to determine facility type. */
 /* Could not write to report file. */

EXAMPLES

In the following example, the coding violations, path (CV-P) threshold level settings for the near-end and far-end 15-Minute PM registers are retrieved for DS1 port T3T1-1492-4.

```
RTRV-TH-T1::T3T1-1492-4::CVP,,15-MIN;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71042 COMPLD  
  "T3T1-1492-4,T1:CVP,NEND,,13340,15-MIN"  
  "T3T1-1492-4,T1:CVP,FEND,,13340,15-MIN"  
  /* RTRV-TH-T1::T3T1-1492-4::CVP,,15-MIN [P71042] (1) */  
;
```

COMMAND CODE: **RTRV–TH–T3**
COMMAND NAME: **RETRIEVE THRESHOLD T3**

PURPOSE

The RTRV–TH–T3 command retrieves the threshold level setting corresponding to the specified PM collection register (identified by MONTYPE, LOCN, and TMPER) and the specified DS3 port.

The successful response for a RTRV–TH–T3 command contains one line of parsable output data for each parameter threshold level setting being reported, in ascending order (from the lowest specified DS3 AID to the highest specified DS3 AID) for each DS3 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT–T3). In addition, no line of parsable output data is displayed if the specified DS3 is embedded within a protection OC3.

A RTRV–TH–T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV–TH–T3 : [TID] : AID : [CTAG] : : [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS3_AID:		
	{T3–{1–4800}}		(T3–DS3#)
	{EC1T3–{1–3840}}		(EC1T3–EC1/STS1/DS3#)
	{OC3T3–{1–2240}–{1–3}}		(OC3T3–OC3#–STS1/DS3#)
	{OC12T3–{1–560}–{1–4}–{1–3}}		(OC12T3–OC12#–STM1#–STS1/DS3#)
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	DS3 AID, specifies the DS3 port.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, CVCP-P, CVCPP, ES-L, ESL, ES-P, ESP, ESA-L, ESAL, ESA-P, ESAP, ESACP-P, ESACPP, ESB-L, ESDL, ESB-P, ESBP, ESBGP-P, ESBGPP, ESCP-P, ESCPP, FC-P, FCP, LOSS, LOSS-L, LOSSL, SAS-P, SASP, SES-L, SESL, SES-P, SESP, SESCP-P, SESCOP, UAS-P, UASP, UASCP-P, UASCOP}, FAR_END_PARAMETERS:{CVCP-P, CVCPP, ESACP-P, ESACPP, ESBGP-P, ESBGPP, ESCP-P, ESCPP, FCCP-P, FCCPP, SASCP-P, SASCPP, SESCO-P, SESCOP, UASCP-P, UASCOP}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end electrical T3 only.)
CV-P, CVP	Coding Violations – Path, CV-P register. (Near-end only.)
CVCP-P, CVCPP	Code Violations, CP-bit parity – Path, CVCP-P register.
ES-L, ESL	Errorred Seconds – Line, ES-L register. (Near-end electrical T3 only.)
ES-P, ESP	Errorred Seconds – Path, ES-P register. (Near-end only.)
ESA-L, ESAL	Errorred Seconds type A – Line, ESA-L register. (Near-end electrical T3 only.)
ESA-P, ESAP	Errorred Seconds type A – Path, ESA-P register. (Near-end only.)
ESACP-P, ESACPP	Errorred Seconds type A, CP-bit parity – Path, ESACP-P register.
ESB-L, ESDL	Errorred Seconds type B – Line, ESB-L register. (Near-end electrical T3 only.)
ESB-P, ESBP	Errorred Seconds type B – Path, ESB-P register. (Near-end only.)
ESBGP-P, ESBGPP	Errorred Seconds type B, CP-bit parity – Path, ESBGP-P register.
ESCP-P, ESCPP	Errorred Seconds, CP-bit parity – Path, ESCP-P register.
FC-P, FCP	Failure Counts – Path, FC-P register. (Near-end only.)
FCCP-P, FCCPP	Failure Counts, CP-bit parity – Path, FCCP-P register. (Far-end only.)
LOSS, LOSS-L, LOSSL	Loss Of Signal Seconds – Line, LOSS register. (Near-end electrical T3 only.)
SAS-P, SASP	Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
SASCP-P, SASCPP	Severe AIS Seconds, CP-bit parity – Path, SASCP-P register. (Far-end only.)
SES-L, SESL	Severely Errorred Seconds – Line, SES-L register. (Near-end electrical T3 only.)
SES-P, SESP	Severely Errorred Seconds – Path, SES-P register. (Near-end only.)
SESCP-P, SESCOP	Severely Errorred Seconds, CP-bit parity – Path, SESCO-P register.

		P register.
	UAS-P, UASP	Unavailable Seconds – Path, UAS-P register. (Near-end only.)
	UASCP-P, UASCPP	Unavailable Seconds, CP-bit parity – Path, UASCP-P register.
	Restrictions:	RTRV-TH-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).
LOCN	{FEND, NEND}	
	Default:	< All applicable locations for the selected monitored parameters >
	Addressing:	None
	Description:	Location, specifies whether threshold levels for near-end or far-end monitored parameters are to be retrieved. Values are:
	FEND	Far-End
	NEND	Near-End
	Restrictions:	RTRV-TH-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid time period in request message. */ /* Invalid montype in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM T3 record. */ /* Failed to set file ptr to T3 threshold database. */
SROF	Status, Requested Operation Failed /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */ /* Unable to convert montype <MONTYPE> to string. */ /* Unable to process montype <MONTYPE>. */ /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* Could not write to report file. */

EXAMPLES

In the following example, the coding violations, path (CV-P) threshold level settings for the near-end and far-end 15-Minute PM registers are retrieved for DS3 port T3-1537.

```
RTRV-TH-T3::T3-1537:::CV-P,,15-MIN;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71022. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
  "T3-1537,T3:CVP,NEND,,13340,15-MIN"
/* RTRV-TH-T3::T3-1537:::CV-P,,15-MIN [P71042] (1) */
;

COMMAND CODE: **RTRV–TH–VT1**
COMMAND NAME: **RETRIEVE THRESHOLD VT1**

PURPOSE

The RTRV–TH–VT1 command retrieves the threshold level setting corresponding to the specified PM collection register (identified by MONTYPE, LOCN, and TMPER) and the specified VT1.5 port.

The successful response for a RTRV–TH–VT1 command contains one line of parsable output data for each parameter threshold level setting being reported, in ascending order (from the lowest specified VT1.5 AID to the highest specified VT1.5 AID) for each VT1.5 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT–VT1). In addition, no line of parsable output data is displayed if the specified VT1.5 is embedded within a protection OC–3/OC–12.

A RTRV–TH–VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV–TH–VT1 : [TID] : AID : [CTAG] : : [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.		
AID	VT1_AID: {EC1VT1–{1–3840}–{1–7}–{1–4}} (EC1VT1–EC1/STS1#–VTGrp#–VT1.5#) {OC3VT1–{1–2240}–{1–3}–{1–7}–{1–4}} (OC3VT1–OC3#–STS1#–VTGrp#–VT1.5#) {OC12VT1–{1–560}–{1–4}–{1–3}–{1–7}–{1–4}} (OC12VT1–OC12#–STM1#–STS1#–VTGrp#–VT1.5#) Default: Entry Required Addressing: &&–ranging and &–grouping Description: VT1 AID, specifies the VT1.5 port.		
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.		

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV, ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV}, FAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV, ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV}																		
	Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:																		
	<table> <tr> <td>ALL</td><td>All monitored parameter PM registers.</td></tr> <tr> <td>ALS-V, ALSV</td><td>Alarm Indication Signal/Loss of Pointer – VT Path, ALS-V register.</td></tr> <tr> <td>CV-V, CVV</td><td>Coding Violations – VT Path, CV-V register.</td></tr> <tr> <td>ES-V, ESV</td><td>Errored Seconds – VT Path, ES-V register.</td></tr> <tr> <td>ESA-V, ESAV</td><td>Errored Seconds type A – VT Path, ESA-V register.</td></tr> <tr> <td>ESB-V, ESBV</td><td>Errored Seconds type B – VT Path, ESB-V register.</td></tr> <tr> <td>FC-V, FCV</td><td>Failure Counts – VT Path, FC-V register.</td></tr> <tr> <td>SES-V, SESV</td><td>Severely Errored Seconds – VT Path, SES-V register.</td></tr> <tr> <td>UAS-V, UASV</td><td>Unavailable Seconds – VT Path, UAS-V register.</td></tr> </table>	ALL	All monitored parameter PM registers.	ALS-V, ALSV	Alarm Indication Signal/Loss of Pointer – VT Path, ALS-V register.	CV-V, CVV	Coding Violations – VT Path, CV-V register.	ES-V, ESV	Errored Seconds – VT Path, ES-V register.	ESA-V, ESAV	Errored Seconds type A – VT Path, ESA-V register.	ESB-V, ESBV	Errored Seconds type B – VT Path, ESB-V register.	FC-V, FCV	Failure Counts – VT Path, FC-V register.	SES-V, SESV	Severely Errored Seconds – VT Path, SES-V register.	UAS-V, UASV	Unavailable Seconds – VT Path, UAS-V register.
ALL	All monitored parameter PM registers.																		
ALS-V, ALSV	Alarm Indication Signal/Loss of Pointer – VT Path, ALS-V register.																		
CV-V, CVV	Coding Violations – VT Path, CV-V register.																		
ES-V, ESV	Errored Seconds – VT Path, ES-V register.																		
ESA-V, ESAV	Errored Seconds type A – VT Path, ESA-V register.																		
ESB-V, ESBV	Errored Seconds type B – VT Path, ESB-V register.																		
FC-V, FCV	Failure Counts – VT Path, FC-V register.																		
SES-V, SESV	Severely Errored Seconds – VT Path, SES-V register.																		
UAS-V, UASV	Unavailable Seconds – VT Path, UAS-V register.																		
LOCN	{FEND, NEND}																		
	Default: < All applicable locations for the selected monitored parameters > Addressing: None Description: Location, specifies whether threshold levels for near-end or far-end monitored parameters are to be retrieved. Values are:																		
	<table> <tr> <td>FEND</td><td>Far-End</td></tr> <tr> <td>NEND</td><td>Near-End</td></tr> </table>	FEND	Far-End	NEND	Near-End														
FEND	Far-End																		
NEND	Near-End																		
TMPER	{15-MIN, 1-DAY}																		
	Default: {15-MIN} Addressing: None Description: Time Period, specifies whether threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:																		
	<table> <tr> <td>15-MIN</td><td>15-Minute PM collection register</td></tr> <tr> <td>1-DAY</td><td>1-Day (24 hour) PM collection register</td></tr> </table>	15-MIN	15-Minute PM collection register	1-DAY	1-Day (24 hour) PM collection register														
15-MIN	15-Minute PM collection register																		
1-DAY	1-Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	<p>Input, Data Not Valid</p> <p>/* Invalid location in request message. */</p> <p>/* Invalid time period in request message. */</p> <p>/* Invalid montype in request message. */</p>
IIAC	<p>Input, Invalid ACcess identifier</p> <p>/* Invalid AID entered. */</p> <p>/* AID not in Partition. */</p>
IIPG	<p>Input, Invalid Parameter Grouping</p> <p>/* Invalid location for requested montype. */</p>
SDBE	<p>Status, internal Data Base Error</p> <p>/* Failed to set pointer to FM VT1 record. */</p> <p>/* Failed to set file ptr to VT1 threshold database. */</p>

```
SROF      Status, Requested Operation Failed
          /* rpt_file error – <ERRNO>, status = <STATUS> */
          /* Cannot open <FILENAME> */
          /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */
          /* rpt_print error – <ERRNO>, status = <STATUS> */
          /* Failed to convert TPid to an AID string. */
          /* Unable to convert montype <MONTYPE> to string. */
          /* Unable to process montype <MONTYPE>. */
          /* Unable to determine supporting facility entity. */
          /* Unable to determine facility type. */
          /* Could not write to report file. */
```

EXAMPLES

In the following example, the coding violations, VT path (CV-V) threshold level settings for the near-end and far-end 15-Minute PM registers are retrieved for VT1.5 port EC1VT1-577-5-2.

```
RTRV-TH-VT1::EC1VT1-577-5-2::CV-V,,15-MIN;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71022. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M  P71042  COMPLD
   "EC1VT1-577-5-2,VT1:CVV,NEND,,4666,15-MIN"

COMMAND CODE: **RTRV-ULCOMPMPR**
COMMAND NAME: **RETRIEVE UPPER LAYER COMMON
PARAMETERS**

PURPOSE

The RTRV-ULCOMPMPR command retrieves the Layer 3 (network layer) parameters of the SONET Data Communication Channel (DCC) network. This command retrieves the OSI upper layer stack (Layer 3) parameters common to both DCC and LAN.

If the specified DSB is not provisioned, i.e. it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-ULCOMPMPR command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ULCOMPMPR: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB whose upper layer common OSI stack parameters are being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

    TARPLDBENTTMR=<value>"]
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

On successful completion of RTRV-ULCOMPMD if the DSB is not in an OOS-MA state, the system will compare the Upper Layer Common OSI stack parameters in the database with those on the hardware and if any of the parameters are different, the system will print the parameters on the hardware in the second line, shown as optional above. If the DSB is in an OOS-MA state, only the parameters in the database will be displayed.

OUTPUT PARAMETERS

L3CSNPINTTMR= {1-600}
Layer 3 Complete SNP Interval Timer, specifies the complete SNP Interval Timer in seconds.

L3DRISISHT= {1-665535}
Layer 3 drISIS Hello Timer, specifies the drISIS Hello Timer in seconds.

L3ER= {N, Y}
Layer 3 Error Report, specifies whether an Error Report PDU is generated when a Data PDU is discarded. Values are:

N	No, specifies an Error Report PDU is not generated when a Data PDU is discarded.
Y	Yes, specifies an Error Report PDU is generated when a Data PDU is discarded.

L3IS1LSPBS= {512-1492}
Layer 3 Intermediate System Level 1 LSP Buffer Size, specifies originating IS Level 1 LSP Buffer Size in octets. Changes to this parameter take effect only when the OSI protocol stack is (re)initialized.

L3IS2LSPBS= {512-1492}
Layer 3 Intermediate System Level 2 LSP Buffer Size, specifies originating IS Level 2 LSP Buffer Size in octets. Changes to this parameter take effect only when the OSI protocol stack is (re)initialized.

L3ISPRTREP= {N, Y}
Layer 3 Intermediate System Partition Repair, indicates if the IS Partition Repair function is supported. Changes to this parameter take effect only when the OSI protocol stack is (re)initialized. Values are:
 N No, specifies the IS Partition Repair is not supported.
 Y Yes, specifies the IS Partition Repair is supported.

L3LC= {1–255}
Layer 3 Lifetime Control, sets the Layer 3 Lifetime Control time in units of 500 milliseconds.

L3MAXLSPGENINT= {1–65535}
Layer 3 Maximum LSP Transmission Interval, specifies the maximum LSP Transmission Interval in hundredths of seconds.

L3MINBLSPXMTINT= {1–65535}
Layer 3 Minimum Broadcast LSP Transmission Interval, specifies the minimum broadcast LSP Transmission Interval in seconds.

L3MINLSPXMTINT= {1–255}
Layer 3 Minimum LSP Transmission Interval, specifies the minimum LSP Transmission Interval in seconds.

L3POLLESHRT= {1–65535}
Layer 3 Poll ESH Rate, specifies the Poll ESH rate in seconds.

L3PSNPINTTMR= {1–65535}
Layer 3 Partial SNP Timer Interval, specifies the partial SNP Interval Timer in seconds.

L3ISLEVEL= {1, 2}
Layer 3 Intermediate System Level, specifies the IS Level Provisioning. Changes to this parameter take effect only when the OSI protocol stack is (re)initialized.

L3WAITTM= {1–65535}
Layer 3 Waiting Time, specifies the Waiting Time in seconds.

TARPLDBFLSHTMR= {0–1440}
TID Address Resolution Protocol (TARP) LDB Flush Timer, specifies the TARP LDB Flush Timer in minutes.

TARPLDBENTTMR= {1–10}
TID Address Resolution Protocol (TARP) LDB Entry Timer, specifies the TARP LDB Entry Timer in minutes.

;
```

RELATED COMMANDS

ED-ULCOMPMR

COMMAND CODE: **RTRV-ULLAN**
COMMAND NAME: **RETRIEVE UPPER LAYER LAN
PARAMETERS**

PURPOSE

The RTRV-ULLAN command retrieves the Layer 3 (network layer) parameters of the SONET Data Communication Channel (DCC) network. This command retrieves the OSI upper layer stack (Layer 3) parameters pertaining to the LAN.

If the specified DSB is not provisioned, i.e. it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-ULLAN command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ULLAN: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB–{6–9, 12–15, 18–21, 24–43, 104–111 , 112–135, 136–141 }–{1, 3}–{1–2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB on the LAN whose lower layer parameters are being retrieved.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    "<AID>.:L3DL1ISP=<value>,L3DL2ISP=<value>,
L3ESCTMR=<value>,L3ESISHTMR=<value>,L3ISCTMR=<value>,L3ISISHTMR=<value>,
L3RDTMR=<value>"
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    ["<AID>.:L3DL1ISP=<value>,L3DL2ISP=<value>,
L3ESCTMR=<value>,L3ESISHTMR=<value>,L3ISCTMR=<value>,L3ISISHTMR=<value>,
L3RDTMR=<value>"]
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

On successful completion of RTRV-ULLAN if the DSB is not in an OOS-MA state, the system will compare the Upper Layer LAN parameters in the database with those on the hardware and if any of the parameters are different, the system will print the parameters on the hardware in the second line, shown as optional above. If the DSB is not in an OOS-MA state, only the parameters in the database will be displayed.

OUTPUT PARAMETERS

L3DL1ISP=	{1-127} Layer 3 Designated Level 1 Intermediate System Priority, specifies Designated Level 1 IS Priority.
L3DL2ISP=	{1-127} Layer 3 Designated Level 2 Intermediate System Priority, specifies Designated Level 2 IS Priority.
L3ESCTMR=	{1-200} Layer 3 End System Configuration Timer, specifies ISO 9542 Suggested ES Configuration Timer (ESCT) in seconds.
L3ESISHTMR=	{2-63} Layer 3 End System/Intermediate System Holding Time Multiplier, is used to specify ISO 9542 Holding Time. The value of L3ESISHTMR entered is multiplied by the ISO 9542 IS Configuration Timer, L3ISCTMR, to specify the ISO 9542 Holding Time. (i.e. The L3ESISHTMR factory default of 3 multiplied by the L3ISCTMR factory default of 10 yields a holding time of 30 seconds).
L3ISCTMR=	{1-200} Layer 3 Intermediate System Configuration Timer, specifies ISO 9542 IS Configuration Timer in seconds.
L3ISISHTMR=	{1-65535} Layer 3 Intermediate System/Intermediate System Hello Timer, specifies IS-IS Hello Timer in seconds.
L3RDTMR=	{1-500} Layer 3 Redirect Timer, specifies ISO 9542 Redirect Timer in seconds.

```

EXAMPLES

In the following example, the upper layer parameters pertaining to the LAN for DSB are being retrieved.

```
RTRV-ULLAN: :DSB-9-1-2;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"DSB-9-1-2: :L3DL1ISP=64,L3DL2ISP=64,L3ESCTMR=50,
L3ESISHTMR=25,L3ISCTMR=10,L3ISISHTMR=3,L3RDTMR=180"
/* RTRV-ULLAN: :DSB-9-1-2 [Pad567] (2) */
;
```

RELATED COMMANDS

```
ED-ULLAN
```

COMMAND CODE: **RTRV-ULLDCC**
COMMAND NAME: **RETRIEVE UPPER LAYER LINE DCC**

PURPOSE

The RTRV-ULLDCC command retrieves all the provisioned parameter values supporting Layer 3 (network layer) of the SONET Data Communication Channel (DCC) network. This command retrieves all the provisioned upper layer stack (Layer 3) parameters of the Line DCC.

If the specified OC-3/OC-12 is not provisioned, i.e. it is in UAS secondary state, or if the protection OC-3/OC-12 is specified, the command completes successfully without producing any output.

A RTRV-ULLDCC command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ULLDCC: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3/OC-12 whose upper layer Line DCC parameters are being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>::L3ESCTMR=<value>,L3ESISHTMR=<value>,
L3ISCTMR=<value>,L3ISISHTMR=<value>"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<AID>::L3ESCTMR=<value>,L3ESISHTMR=<value>,
L3ISCTMR=<value>,L3ISISHTMR=<value>"]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

On successful completion of RTRV-ULLDCC if the Line DCC is enabled, the system will compare the Upper Layer Line DCC parameters in the database with those on the hardware and if any of the parameters are different, the system will print the parameters on the hardware in the second line, shown as optional above. If the Line DCC is disabled, only the parameters in the database will be displayed.

OUTPUT PARAMETERS

AID	OC3_AID: {OC3-{1-2240}} OC12_AID: {OC12-{1-560}} Optical Carrier AID, identifies the OC-3/OC-12 port.	(OC3-OC3#) (OC12-OC12#)
L3ESCTMR=	{1-200} Layer 3 End System Configuration Timer, specifies ISO 9542 Suggested ES Configuration Timer (ESCT) in seconds.	
L3ESISHTMR=	{2-63} Layer 3 End System/Intermediate System Holding Time Multiplier, is used to specify ISO 9542 Holding Time. The value of L3ESISHTMR entered is multiplied by the ISO 9542 IS Configuration Timer, L3ISCTMR, to specify the ISO 9542 Holding Time. (i.e. The L3ESISHTMR factory default of 3 multiplied by the L3ISCTMR factory default of 10 yields a holding time of 30 seconds).	
L3ISCTMR=	{1-200} Layer 3 Intermediate System Configuration Timer, specifies ISO 9542 IS Configuration Timer in seconds.	
L3ISISHTMR=	{1-65535} Layer 3 Intermediate System/Intermediate System Hello Timer, specifies IS-IS Hello Timer in seconds.	

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*DCC Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/ /*TPidToAidStr() Error: <ERROR-STRING>*/
SROF	Status, Requested Operation Failed /*Could not communicate with the SPB.*/ /*Bad response code returned from SPB (<RESPONSE_CODE>)*/
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the provisioned data of the Line DCC for port OC-3 port OC3-1 is being retrieved.

```
RTRV-ULLDCC: :OC3-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"OC3-1::L3ESCTMR=50,L3ESISHTMR=25,L3ISCTMR=10,L3ISISHTMR=3"
/* RTRV-ULLDCC::OC3-1 [Pad567] (2) */
;
```

RELATED COMMANDS

ED-ULLDCC

COMMAND CODE: **RTRV-ULSDCC**
COMMAND NAME: **RETRIEVE UPPER LAYER SECTION DCC**

PURPOSE

The RTRV-ULSDCC command retrieves all the provisioned parameter values supporting Layer 3 (network layer) of the SONET Data Communication Channel (DCC) network. This command retrieves all the provisioned upper layer stack (Layer 3) parameters of the Section DCC.

If the specified OC-3/OC-12 is not provisioned, i.e., it is in UAS secondary state, or if the protection OC-3/OC-12 is specified, the command completes successfully without producing any output.

A RTRV-ULSDCC command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ULSDCC: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3/OC-12 whose upper layer Section DCC parameters are being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>::L3ESCTMR=<value>,L3ESISHTMR=<value>,
L3ISCTMR=<value>,L3ISISHTMR=<value>"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

On successful completion of RTRV-ULSDCC if the Section DCC is enabled, the system will compare the Upper Layer Section DCC parameters in the database with those on the hardware and if any of the parameters are different, the system will print the parameters on the hardware in the second line, shown as optional above. If the Section DCC is disabled, only the parameters in the database will be displayed.

OUTPUT PARAMETERS

AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Optical Carrier AID, identifies the OC-3/OC-12 port.
-----	---

L3ESCTMR= {1–200}
Layer 3 End System Configuration Timer, specifies ISO 9542 Suggested ES Configuration Timer (ESCT) in seconds.

L3ESISHTMR= {2–63}
Layer 3 End System/Intermediate System Holding Time Multiplier, is used to specify ISO 9542 Holding Time. The value of L3ESISHTMR entered is multiplied by the ISO 9542 IS Configuration Timer, L3ISCTMR, to specify the ISO 9542 Holding Time (i.e., the L3ESISHTMR factory default of 3 multiplied by the L3ISCTMR factory default of 10 yields a holding time of 30 seconds).

L3ISCTMR= {1–200}
Layer 3 Intermediate System Configuration Timer, specifies ISO 9542 IS Configuration Timer in seconds.

L3ISISHTMR= {1–65535}
Layer 3 Intermediate System/Intermediate System Hello Timer, specifies IS–IS Hello Timer in seconds.

;
```

RELATED COMMANDS

ED-ULSDCC

COMMAND CODE: **RTRV-VT1**
COMMAND NAME: **RETRIEVE VT1**

PURPOSE

The RTRV-VT1 command retrieves the provisioned parameter values, supporting I/O circuit pack AID, near end and far end facility alarm conditions, and current PST,SST state for the specified VT1.5 port. The VT1.5 port's current provisioned values and conditions (if provisioned), and state are retrieved from the system database. The command is executed regardless of the state of the port.

The successful response for a RTRV-VT1 command contains one line of parsable output data, in ascending order (from lowest specified VT1 AID to largest specified VT1 AID), for each VT1 AID specified. Values for NEN-DALM and FENDALM are only displayed if a condition exists. Only <AID> and <PST,SST> are displayed for a retrieve of an unprovisioned VT1.5 port or if the specified AID identifies a VT1.5 port embedded within a protection OC-3 or OC-12 which is in normal linear mode. In ring mode (refer to ENT-RNG-OC3 or ENT-RNG-OC12), the RTRV-VT1 command displays all of the output data for VT1.5 ports that are part of an odd-numbered or even-numbered ring OC-3 or OC-12.

A RTRV-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-VT1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the VT1.5 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>.: [CARDID=<value>, ES=<value> [ , FENDALM=<value>] [ , NENDALM=<value>] ,
VTMAP=<value>, VTPTYEL=<value> [ , TACC=<value>] [ , TAPPPOOL=<value>] :
<PST> [ , <SST> ] ] "
  [ /* <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */ ]
;
```

OUTPUT PARAMETERS

AID	<p>VT1_AID:</p> <p>{EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)</p> <p>{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)</p> <p>{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)</p> <p>VT1 AID indicates the VT1.5 port to which this line of output data pertains.</p>
CARDID=	<p>EQUIPMENT_AID:</p> <p>{SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42}-{1, 3}-{1-18}, EP3-{9, 21, 35, 43}-3-{1-18}, EP3-{15, 27, 31, 39}-1-{1-18}, SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}}</p> <p>{SI48: ES1-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42}-{1, 3}-{1-18}, ES1-{9, 21, 35, 43}-3-{1-18}, ES1-{15, 27, 31, 39}-1-{1-18}, SI36: ES1-{6-8, 12-14}-{1, 3}-{1-14}, ES1-9-3-{1-14}, ES1-15-1-{1-14}}</p> <p>{O1B-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{2-9, 11-18}}</p> <p>{O4M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{2-3, 11-12}}</p> <p>{S3M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{4-9, 13-18}}</p> <p>I/O Equipment Card ID, identifies the VT1.5 port's supporting I/O equipment AID using the equipment AID format.</p>
ES=	<p>{1-32}</p> <p>The first stage M16 module to which the addressed VT1.5 port is connected. Values are:</p> <p>1-32 An integer between 1 and 32 indicating the end stage number.</p>
FENDALM=	<p>{RFI}</p> <p>Far End VT1.5 Alarm Condition, identifies any far end VT1.5 alarm conditions that exist on the VT1.5 port. A FENDALM value is reported only if a FENDALM condition exists. Value is:</p> <p>RFI Far End Remote Failure Indication detected</p>
NENDALM=	<p>{AIS, FLTESC, IDLE, LOP, SLMF}</p> <p>Near End VT1.5 Alarm Condition, identifies any near end VT1.5 alarm conditions that exist on the VT1.5 port. A NENDALM value is reported only when a NENDALM condition exists. Values may be shown combined with an ampersand (&) if more than one value applies to the VT1.5 port at the time of the RTRV-VT1 (i.e., if a RCV and TRMT alarm both exist). Values are:</p> <p>AIS Alarm Indication Signal detected</p> <p>FLTESC Facility Fault Escalation activated</p> <p>IDLE Idle Signal (Unequipped payload) detected</p> <p>LOP Loss of Pointer detected</p> <p>SLMF Signal Label Mismatch detected</p>
VTMAP=	<p>{ALL, ASYNC, VTBYTE}</p> <p>Determines the expected VT1.5 payload type and the value of the expected path signal label. Used for comparison for the Signal Label Mismatch function. Valid values are:</p> <p>ALL Generic VT1.5 format. Contains payload of any mapping format (L1-L3 ≠ 000 bin). Since this value will match all signal label values, mismatch alarms can never be generated.</p> <p>ASYNC VT Asynchronous mapping – VTFLOAT mode. (L1-L3 = 010 bin).</p> <p>VTBYTE VT byte synchronous mapping, applicable for DS0s being mapped into VT SPE – VTFLOAT mode (L1-L3 = 100 hex).</p>

VTPTYEL=	{N, Y} VT1.5 path yellow behavior. Identifies whether VT path yellow or RDI will be sent/received. Valid values are: N No. RDI will be sent/received on appropriate defect state. Y Yes. VT path yellow will be sent/received on appropriate fault condition.
TACC	{N, Y} Test Access port, indicates that this VT1 port (specified by AID) and the AID+1 VT1 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are: N No, the specified VT1 port is not a Test Access port. Y Yes, VT1 ports specified by AID and AID+1 are Test Access ports.
TAPPOOL	{PRIVATE-<USER NAME>, PUBLIC} TAP port Pool, defines whether the TAP port that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool. Values are: PRIVATE-<USER NAME> Private—User name. The TAP port pair that has been created is private to the user who created the TAP pair—Name of the user who owns the pool. PUBLIC Public. The TAP pair belongs to the public pool of the system. It can be accessed by any user who has access to the Test Access commands.
PST	{IS, OOS-AU, OOS-AUMA, OOS-MA} Primary State, indicates the current primary state of the VT1.5 port. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: IS In-Service OOS-AU Out-Of-Service—Autonomous OOS-AUMA Out-Of-Service—Autonomous and Management OOS-MA Out-Of-Service—Management
SST	{ACT, BUSY, DSBLD, FAF, LPBK, MT, PMI, STBY, TRM, UAS, WRK} Secondary State, indicates any secondary states associated with the VT1.5 port. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the VT1.5 port at the time of the RTRV-VT1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: ACT Active BUSY Busy DSBLD Disabled FAF Facility Failure LPBK Loopback MT Maintenance PMI Performance Monitoring Inhibited ROLL Roll Operation in-progress SDEE Supported Entity Exists SGEO Supporting Entity Outage STBY Standby TRM Terminated TS Test in-progress UAS Unassigned WRK Working. If set on Working path, the Working path is carrying service. If set on Protection path, the Protection path is carrying service.

UNSUCCESSFUL RESPONSE FORMAT

  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* GetAidEntry() Error: <ERROR-STRING> */
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* TPidToAidStr() Error: <ERROR-STRING> */
	/* TPidToTbss() Error: <ERROR-STRING> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the provisioning data for VT1.5 port EC1VT1-1-1-1 is retrieved.

```
RTRV-VT1::EC1VT1-1-1-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"EC1VT1-1-1-1::CARDID=EP3-6-1-2,VTPTYEL=N,VTMAP=ASYNC,TACC=N,ES=9:IS"
/* RTRV-VT1::EC1VT1-1-1-1 [Pad567] (2) */
;
```

In the following example, the provisioning data for VT1.5 ports EC1VT1-10-1-1 through EC1VT1-10-1-4 is retrieved.

```
RTRV-VT1::EC1VT1-10-1-1&&-4;
```

The output response, shown below, assumes CID 6 was used to enter the command and a system generated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pab124 COMPLD
"EC1VT1-10-1-1::CARDID=EP3-6-3-5,VTPTYEL=N,VTMAP=ASYNC,TACC=N,ES=3:IS"
"EC1VT1-10-1-2::CARDID=EP3-6-3-5,VTPTYEL=N,VTMAP=ASYNC,TACC=N,
NENDALM=LOF,ES=3:OOS-AU,FAF"
"EC1VT1-10-1-3::OOS-MA,UAS"

COMMAND CODE: **RTRV-XIDMISM**
COMMAND NAME: **RETRIEVE CONNECT ID MISMATCH**

PURPOSE

The RTRV-XIDMISM command retrieves the cross-connected facility AIDs (FROM and TO) for each port in an I/O shelf or I/O quad for which an internal Connection ID Mismatch currently exists, or retrieves any historical Connection ID Mismatch data that is stored in the Connection ID Mismatch (circular) log file.

When a XIDMISM (Connection ID Mismatch) condition is set, the RTRV-XIDMISM command is used to identify the FROM and TO facility AIDs of the associated cross-connection so that a FLTLOC-PATH-rr (where rr is STS1, STS3C, T1, T3, or VT1) command can be used to obtain fault isolation data pertaining to the XIDMISM condition.

If RTRVTYPE of CURR is entered, the successful response for a RTRV-XIDMISM command contains one line of non-parsable output data, in ascending order (from lowest TO AID to largest TO AID), for each cross-connected port in the specified I/O shelf or I/O Quad for which an internal Connection ID Mismatch currently exists. No line of non-parsable output data is provided for ports that are not cross-connected or are not detecting a Connection ID Mismatch.

If RTRVTYPE of HIST is entered, the successful response for a RTRV-XIDMISM command contains two or more lines of non-parsable output data for each occurrence of Connection ID Mismatch being reported from the Connection ID Mismatch log file – one line for the time-stamp associated with the Connection ID Mismatch being reported and one line for each cross-connected port in the specified I/O shelf or I/O Quad for which an internal Connection ID Mismatch was logged.

A RTRV-XIDMISM command is denied if:

- The specified I/O Shelf or I/O Quad is not provisioned.
- The specified RTRVTYPE is CURR and DISPTYPE of CLRDATA is entered.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-XIDMISM: [TID] :AID: [CTAG] :: [RTRVTYPE] , [DISPTYPE] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {SHELF-{6–9, 12–15, 18–21, 24–43, 104–111, 136–141 }-{1, 3}-1} {QUAD-{44–63}-{1–4}-{1–4}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment entity.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

RTRVTYPE	{CURR, HIST}
	Default: {CURR}
	Addressing: None
	Description: Retrieval Type, specifies whether current or historical XIDMISM data is retrieved. Values are:
	<div style="display: flex; justify-content: space-between;"> <div style="width: 150px;">CURR</div> <div>Current, specifies current XIDMISM data is retrieved.</div> </div> <div style="display: flex; justify-content: space-between;"> <div style="width: 150px;">HIST</div> <div>Historical, specifies historical XIDMISM data is retrieved.</div> </div>
	Restrictions: RTRV-XIDMISM is denied if the specified RTRVTYPE is CURR and DISPTYPE of CLRDATA is entered.
DISPTYPE	{ALLDATA, CLRDATA, CNTONLY}
	Default: {ALLDATA}
	Addressing: None
	Description: Display Type, specifies whether only the count of the various XIDMISMs are displayed, all the information about the XIDMISMs are displayed, or the XIDMISM data is cleared. Values are:
	<div style="display: flex; justify-content: space-between;"> <div style="width: 150px;">ALLDATA</div> <div>All Data, specifies the entire data about the XIDMISM is displayed.</div> </div> <div style="display: flex; justify-content: space-between;"> <div style="width: 150px;">CLRDATA</div> <div>Clear Data, specifies all the data in the XIDMISM database for the specified AID is cleared.</div> </div> <div style="display: flex; justify-content: space-between;"> <div style="width: 150px;">CNTONLY</div> <div>Count Only, specifies only the count of the XIDMISM is displayed.</div> </div>
	Restrictions: RTRV-XIDMISM is denied if DISPTYPE of CLRDATA is entered and the specified RTRVTYPE is CURR.

SUCCESSFUL RESPONSE FORMAT

The following successful response format is generated when DISPTYPE=ALLDATA:

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <OCR_DAT_TM> */]
  [/ * ORIG0CNT=<ORIG0_CNT>,ORIG1CNT=<ORIG1_CNT>,XIDOCNT=<XIDO_CNT>,
XID1CNT=<XID1_CNT> */]
  [/ * <FROM>,<TO>,<FROMTYPE>,<TOTYPE>,<FROM_EQPT>,<TO_EQPT>,
<XID0>,<XID1> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

The following successful response format is generated when DISPTYPE=CLRDATA:

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

The following successful response format is generated when DISPTYPE=CNTONLY:

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <OCR_DAT_TM> */]
  [/ * ORIG0CNT=<ORIG0_CNT>,ORIG1CNT=<ORIG1_CNT>,XIDOCNT=<XIDO_CNT>,
XID1CNT=<XID1_CNT> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

OCR_DAT_TM {YY-MM-DD HH:MM:SS{ {00-99}-{1-12}-{1-31} {00-23}:{00-59}:{00-59} } }

Occurrence Date and Time, identifies the date and time when a Connection ID Mismatch is logged in the Connection ID Mismatch (circular) log file. The format for OCR_DAT_TM is <YEAR> - <MONTH> - <DAY>^<HOUR>:<MINUTE>:<SECOND> (where ^ indicates a space). This line of output is only reported if RTRVTYPE of HIST is entered.

 To Equipment AID, identifies the I/O equipment detecting the Connection ID Mismatch
 (i.e., associated with the TO port).

XID0 {XID0, <NoVal>
 Connection ID Mismatch, Copy 0, indicates whether a Copy 0 Connection ID mismatch
 was detected. Values are:
 XID0 Copy 0 Connection ID mismatch was detected.
 <NoVal> No Value, Copy 0 Connection ID mismatch was not detected.

XID1 {XID1, <NoVal>
 Connection ID Mismatch, Copy 1, indicates whether a Copy 1 Connection ID mismatch
 was detected. Values are:
 XID1 Copy 1 Connection ID mismatch was detected.
 <NoVal> No Value, Copy 1 Connection ID mismatch was not detected.

ORIG0_CNT= {0-1344}
 Origination Count, Copy 0, indicates the number of connections originating on Copy 0 in
 the I/O shelf or quad that are bad.

ORIG1_CNT= {0–1344}
Origination Count, Copy 1, indicates the number of connections originating on Copy 1 in the I/O shelf or quad that are bad.

XID0_CNT= {0–1344}
Connection ID Mismatch, Copy 0, Count, indicates the number of connections terminating on Copy 0 in the I/O shelf or quad that are bad.

XID1_CNT= {0–1344}
Connection ID Mismatch, Copy 1, Count, indicates the number of connections terminating on Copy 1 in the I/O shelf or quad that are bad.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENRE	Equipage, Not Recognized Equipage /* The command was rejected. */ /* Invalid or unassigned equipment identifier specified. */
IDNV	Input, Data Not Valid /* The command was rejected. */ /* Invalid parameter or option specified in command. */ /* Unable to retrieve RTRVTYPE parameter. */
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* Unable to create RTRV-XIDMISM report file. */ /* Unable to open RTRV-XIDMISM report file. */ /* Unable to print RTRV-XIDMISM report file. */ /* Unable to get XIDMISM database index. */ /* Unable to read XIDMISM database record <DB record num>, err=<error num>. */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed /* Invalid or unassigned equipment identifier specified. */ /* Memory allocation error */ /* Timeout waiting for response from level two processor. */ /* Invalid number of I/O cards (<number of I/O cards>) in upload message. */ /* Invalid number of T1/VT1 (<number of T1/VT1>) per card in upload message. */ /* Failed to convert T1 GlbTPNum=0 of SPB/IPU=<level 2 processor adrs> to TPNum. */ /* Failed to get shelf information for T1 TPNum <T1 Termination Point number>. */ /* Unable to retrieve XIDMISM database index for eqpt id <eqpt_id>. */
SSRE	Status, System Resources Exceeded

EXAMPLES

The following example illustrates the command and associated response when an XIDMISM condition is set on QUAD-62-2-1.

```
RTRV-XIDMISM: :QUAD-62-2-1;
```

The output response, shown below, assumes CID 9–1 was used to enter the command and a system generated CTAG value of P49250. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P42950 COMPLD
/* ORIG0CNT=1,ORIG1CNT=0, XID0CNT=1,XID1CNT=0 */
/* T1-46945,T1-55568,T1,T1,DSI-59-4-13,DSI-62-2-2,XID0, */
/* RTRV-XIDMISM::QUAD-62-2-1 [P49250] (9-1) */
;
```

The following example illustrates the command and associated response when historical Connection ID Mismatch data is retrieved for QUAD-62-2-1.

```
RTRV-XIDMISM::QUAD-62-2-1::HIST;
```

The output response, shown below, assumes CID 9–1 was used to enter the command and a system generated CTAG value of P49261. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P49261 COMPLD
/* 00-04-20 04:43:06 */
/* ORIG0CNT=0,ORIG1CNT=2,XID0CNT=0,XID1CNT=7 */

RELATED AUTONOMOUS RESPONSES

REPT^ALM^EQPT

REPT^EVT^EQPT

COMMAND CODE: **SCHED-PMREPT-ALL**
COMMAND NAME: **SCHEDULE PERFORMANCE
MONITORING REPORT ALL**

PURPOSE

The SCHED-PMREPT-ALL command enables or disables a 1-DAY PM report for all monitored PM parameters and sets the time-of-day the autonomous REPT^PM^rr messages containing the 1-DAY PM report is generated. Only monitored PM parameters that have PM reporting enabled (ports without an INHPMREPT condition type – refer to ALW-PMREPT-rr) are reported in the REPT^PM^rr messages.

A SCHED-PMREPT-ALL command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SCHED-PMREPT-ALL: [TID] : : [CTAG] : : [PMMODE] , [RPTIME] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
PMMODE	{OFF, ON} Default: {OFF} Addressing: None Description: PM Mode, specifies whether a 1-DAY PM report is created and reported in a REPT^PM^rr autonomous message. Values are: OFF Off, specifies that a 1-DAY PM report is not generated. ON On, specifies that a 1-DAY PM report is to be created and reported in a REPT^PM^rr autonomous message at the time specified by the RPTIME parameter. Restrictions: SCHED-PMREPT-ALL is denied if PMMODE of OFF (or no value) is entered and a value is entered for RPTIME.
RPTIME	{HOUR-MINUTE:{00-23} – {00-59} } Default: {00-00} (Midnight) Addressing: None Description: Report Time, specifies the time of day the autonomous REPT^PM^rr message containing the scheduled PM report is generated. The format of RPTIME is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> where {00-00} represents midnight. Restrictions: SCHED-PMREPT-ALL is denied if a value is entered for RPTIME and PMMODE of OFF (or no value) is entered.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <PMMODE>,<RPTIME> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

PMMODE	{OFF, ON} PM Mode, identifies whether a 1-DAY PM report is created and reported in a REPT^PM^rr autonomous message. Values are: OFF Off, indicates that the 1-DAY PM report is not generated. ON On, indicates that a 1-DAY PM report is to be created and reported in a REPT^PM^rr autonomous message at the time specified by the RPTIME parameter.
RPTIME	{ <small>HOUR</small> - <small>MINUTE</small> :{00-23} - {00-59} } Report Time, identifies the time of day the autonomous REPT^PM^rr message containing the scheduled PM report is generated. The format of RPTIME is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> where {00-00} represents midnight.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid /* If PMMODE=OFF or blank, REPORT TIME must be blank */
SROF	Status, Requested Operation Failed /* error canceling cmd with ON = <ORDER>, status = <STATUS> */ /* upcron error, status = <STATUS> */ /* Cannot read crontab, status = <STATUS> */

EXAMPLES

In the following example, the autonomous REPT^PM^rr messages containing a PM report for all monitored PM parameters are scheduled to be generated daily at 6:30 pm.

```
SCHED-PMREPT-ALL: : : : ON, 18-30 ;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71042 COMPLD  
/* ON, 18-30 */  
/* SCHED-PMREPT-ALL: : : : ON, 18-30 [P71042] (1) */  
;
```

COMMAND CODE: **SCHED-PMREPT-EC1**
COMMAND NAME: **SCHEDULE PERFORMANCE
MONITORING REPORT EC1**

PURPOSE

The SCHED-PMREPT-EC1 command enables or disables the generation of Performance Monitoring (PM) report messages for provisioned EC1 ports. If enabled, only monitored EC1 PM parameters that have event counts above or below the threshold level specified by MONLEV are reported in the PM report messages.

A SCHED-PMREPT-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SCHED-PMREPT-EC1 : [TID] : AID : [CTAG] : : [REPTINVL] , , [NUMREPT] , ,
[MONLEV] , , , [TMPER] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
REPTINVL	{15-MIN, 1-DAY} Default: {15-MIN} Addressing: None Description: Report Interval, specifies the reporting interval of the PM report messages. Values are: 15-MIN 15 Minute Intervals, specifies EC1 PM reports are generated every 15 minutes. 1-DAY 1-Day (24 hour) Intervals, indicates EC1 PM reports are generated daily. Restrictions: SCHED-PMREPT-EC1 is denied if the value of REPTINVL is not the same as the TMPER value.
NUMREPT	{0-254, <NoVal>} Default: <Value as set by SET-DFLTPMREPT-EC1 command> Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-EC1 command. <NoVal> No Value (Null), PM report messages continue to be generated every REPTINVL until disabled via a NUMREPT value of 0.

MONLEV	{LEVEL-DIRECTION:{0-4294967295} – {DN, UP} }	
	Default:	<Value as set by SET-DFLTPMREPT-EC1 command>
	Addressing:	None
	Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0-4294967295}-DN	Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported.
TMPER	{0-4294967295}-UP	Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN	15-Minute PM collection registers are reported.
	1-DAY	1-Day (24 hour) PM collection registers are reported.
	Restrictions:	SCHED-PMREPT-EC1 is denied if the value of TMPER is not the same as the REPTINVL value.

NUMREPT	{0-254, <NoVal>} Default: <Value as set by SET-DFLTPMREPT-OC3 command> Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-OC3 command. <NoVal> No Value (Null), PM report messages continue to be generated every REPTINVL until disabled via a NUMREPT value of 0.

MONLEV	{LEVEL-DIRECTION:{0-4294967295} – {DN, UP} }	
	Default:	<Value as set by SET-DFLTPMREPT-OC3 command>
	Addressing:	None
	Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0-4294967295}-DN	Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported.
TMPER	{0-4294967295}-UP	Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN	15-Minute PM collection registers are reported.
	1-DAY	1-Day (24 hour) PM collection registers are reported.
	Restrictions:	SCHED-PMREPT-OC3 is denied if the value of TMPER is not the same as the REPTINVL value.

```

COMMAND CODE: SCHED-PMREPT-STS1
COMMAND NAME: SCHEDULE PERFORMANCE
MONITORING REPORT STS-1

PURPOSE

The SCHED-PMREPT-STS1 command enables or disables the generation of Performance Monitoring (PM) report messages for provisioned STS-1 ports. If enabled, only monitored STS-1 PM parameters that have event counts above or below the threshold level specified by MONLEV are reported in the PM report messages.

A SCHED-PMREPT-STS1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SCHED-PMREPT-STS1 : [TID] : AID : [CTAG] : : [REPTINVL] , , [NUMREPT] , ,
[MONLEV] , , , [TMPER] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS1 AID, identifies the STS-1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	
REPTINVL	{15-MIN, 1-DAY}		
	Default:	{15-MIN}	
	Addressing:	None	
	Description:	Report Interval, specifies the reporting interval of the PM report messages. Values are:	
	15-MIN	15 Minute Intervals, specifies STS-1 PM reports are generated every 15 minutes.	
	1-DAY	1-Day (24 hour) Intervals, indicates STS-1 PM reports are generated daily.	
	Restrictions:	SCHED-PMREPT-STS1 is denied if the value of REPTINVL is not the same as the TMPER value.	

NUMREPT	{0–254, <NoVal>}	
	Default:	<Value as set by SET–DFLTPMREPT–STS1 command>
	Addressing:	None
	Description:	Number of Reports, specifies the number of PM report messages that are generated. Values are:
	0	Zero, scheduled PM reporting is disabled.
	1–254	1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH–PMREPT–STS1 command.
	<NoVal>	No Value (Null), PM report messages continue to be generated every REPTINVL until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, UP} }	
	Default:	<Value as set by SET–DFLTPMREPT–STS1 command>
	Addressing:	None
	Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295}–DN	Only PM data for monitored PM parameters that are less–than or equal–to (<) the value of <LEVEL> are reported.
	{0–4294967295}–UP	Only PM data for monitored PM parameters that are greater–than or equal–to (>) the value of <LEVEL> are reported.
TMPER	{15–MIN, 1–DAY}	
	Default:	{15–MIN}
	Addressing:	None
	Description:	Time Period, specifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15–MIN	15–Minute PM collection registers are reported.
	1–DAY	1–Day (24 hour) PM collection registers are reported.
	Restrictions:	SCHED–PMREPT–STS1 is denied if the value of TMPER is not the same as the REPTINVL value.

```

COMMAND CODE: **SCHED-PMREPT-STS3C**
COMMAND NAME: **SCHEDULE PERFORMANCE
MONITORING REPORT STS-3C**

PURPOSE

The SCHED-PMREPT-STS3C command enables or disables the generation of Performance Monitoring (PM) report messages for provisioned STS-3C ports. If enabled, only monitored STS-3C PM parameters that have event counts above or below the threshold level specified by MONLEV are reported in the PM report messages.

A SCHED-PMREPT-STS3C command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SCHED-PMREPT-STS3C: [TID] :AID: [CTAG] :: [REPTINVL] , , [NUMREPT] , ,
[MONLEV] , , , [TMPER] [,] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS3C_AID		
	{OC3STS3C–{1–2240}}	(OC3STS3C–OC3#/STS3C#)	
	{OC12STS3C–{1–560}–{1–4}}	(OC12STS3C–OC12#–STM1/STS3C#)	
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	STS3C AID, identifies the STS–3C port.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	
REPTINVL	{15–MIN, 1–DAY}		
	Default:	{15–MIN}	
	Addressing:	None	
	Description:	Report Interval, specifies the reporting interval of the PM report messages. Values are:	
	15–MIN	15 Minute Intervals, specifies STS–3C PM reports are generated every 15 minutes.	
	1–DAY	1–Day (24 hour) Intervals, indicates STS–3C PM reports are generated daily.	
	Restrictions:	SCHED–PMREPT–STS3C is denied if the value of REPTINVL is not the same as the TMPER value.	

NUMREPT	{0–254, <NoVal>}	
	Default:	<Value as set by SET–DFLTPMREPT–STS3C command>
	Addressing:	None
	Description:	Number of Reports, specifies the number of PM report messages that are generated. Values are:
	0	Zero, scheduled PM reporting is disabled.
	1–254	1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH–PMREPT–STS3C command.
	<NoVal>	No Value (Null), PM report messages continue to be generated every REPTINVL until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, UP} }	
	Default:	<Value as set by SET–DFLTPMREPT–STS3C command>
	Addressing:	None
	Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295}–DN	Only PM data for monitored PM parameters that are less–than or equal–to (<) the value of <LEVEL> are reported.
	{0–4294967295}–UP	Only PM data for monitored PM parameters that are greater–than or equal–to (>) the value of <LEVEL> are reported.
TMPER	{15–MIN, 1–DAY}	
	Default:	{15–MIN}
	Addressing:	None
	Description:	Time Period, specifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15–MIN	15–Minute PM collection registers are reported.
	1–DAY	1–Day (24 hour) PM collection registers are reported.
	Restrictions:	SCHED–PMREPT–STS3C is denied if the value of TMPER is not the same as the REPTINVL value.

```

COMMAND CODE: **SCHED-PMREPT-T1**
COMMAND NAME: **SCHEDULE PERFORMANCE
MONITORING REPORT T1**

PURPOSE

The SCHED-PMREPT-T1 command enables or disables the generation of Performance Monitoring (PM) report messages for provisioned DS1 ports. If enabled, only monitored DS1 PM parameters that have event counts above or below the threshold level specified by MONLEV are reported in the PM report messages.

A SCHED-PMREPT-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SCHED-PMREPT-T1 : [TID] : AID : [CTAG] : : [REPTINVL] , , [NUMREPT] , ,
[MONLEV] , , , [TMPER] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID {T1-{1-59392}} (T1-DS1#) {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#) {EC1T1-{1-3840}-{1-28}} (EC1T1-EC1/STS1/DS3#-DS1#) {EC1T1-{1-3840}-{1-7}-{1-4}} (EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#) {OC3T1-{1-2240}-{1-3}-{1-28}} (OC3T1-OC3#-STS1/DS3#-DS1#) {OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#) {OC12T1-{1-560}-{1-4}-{1-3}-{1-28}} (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#) {OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS1 AID, identifies the DS1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
REPTINVL	{15-MIN, 1-DAY} Default: {15-MIN} Addressing: None Description: Report Interval, specifies the reporting interval of the PM report messages. Values are: 15-MIN 15 Minute Intervals, specifies DS1 PM reports are generated every 15 minutes. 1-DAY 1-Day (24 hour) Intervals, indicates DS1 PM reports are generated daily. Restrictions: SCHED-PMREPT-T1 is denied if the value of REPTINVL is not the same as the TMPER value.

NUMREPT	{0–254, <NoVal>}	
	Default:	<Value as set by SET–DFLTPMREPT–T1 command>
	Addressing:	None
	Description:	Number of Reports, specifies the number of PM report messages that are generated. Values are:
	0	Zero, scheduled PM reporting is disabled.
MONLEV	1–254	1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH–PMREPT–T1 command.
	<NoVal>	No Value (Null), PM report messages continue to be generated every REPTINVL until disabled via a NUMREPT value of 0.
	{LEVEL–DIRECTION:{0–4294967295} – {DN, UP} }	
TMPER	Default:	<Value as set by SET–DFLTPMREPT–T1 command>
	Addressing:	None
	Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295}–DN	Only PM data for monitored PM parameters that are less–than or equal–to (<) the value of <LEVEL> are reported.
	{0–4294967295}–UP	Only PM data for monitored PM parameters that are greater–than or equal–to (>) the value of <LEVEL> are reported.
	{15–MIN, 1–DAY}	
	Default:	{15–MIN}
	Addressing:	None
	Description:	Time Period, specifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15–MIN	15–Minute PM collection registers are reported.
	1–DAY	1–Day (24 hour) PM collection registers are reported.
	Restrictions:	SCHED–PMREPT–T1 is denied if the value of TMPER is not the same as the REPTINVL value.

COMMAND CODE: SCHED-PMREPT-VT1
COMMAND NAME: SCHEDULE PERFORMANCE
MONITORING REPORT VT1

PURPOSE

The SCHED-PMREPT-VT1 command enables or disables the generation of Performance Monitoring (PM) report messages for provisioned VT1.5 ports. If enabled, only monitored VT1.5 PM parameters that have event counts above or below the threshold level specified by MONLEV are reported in the PM report messages.

A SCHED-PMREPT-VT1 command is denied if:

- An invalid parameter value combination of parameter values is entered.

INPUT FORMAT

SCHED-PMREPT-VT1: [TID] :AID: [CTAG] :: [REPTINVL] , , [NUMREPT] , ,
[MONLEV] , , , [TMPER] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	VT1_AID	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	VT1 AID, identifies the VT1.5 port.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
REPTINVL	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Report Interval, specifies the reporting interval of the PM report messages. Values are:
	15-MIN	15 Minute Intervals, specifies VT1.5 PM reports are generated every 15 minutes.
	1-DAY	1-Day (24 hour) Intervals, indicates VT1.5 PM reports are generated daily.
	Restrictions:	SCHED-PMREPT-VT1 is denied if the value of REPTINVL is not the same as the TMPER value.

NUMREPT	{0–254, <NoVal>}
Default:	<Value as set by SET–DFLTPMREPT–VT1 command>
Addressing:	None
Description:	Number of Reports, specifies the number of PM report messages that are generated. Values are:
0	Zero, scheduled PM reporting is disabled.
1–254	1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH–PMREPT–VT1 command.
<NoVal>	No Value (Null), PM report messages continue to be generated every REPTINVL until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, UP} }
Default:	<Value as set by SET–DFLTPMREPT–VT1 command>
Addressing:	None
Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
{0–4294967295}–DN	Only PM data for monitored PM parameters that are less–than or equal–to (<) the value of <LEVEL> are reported.
{0–4294967295}–UP	Only PM data for monitored PM parameters that are greater–than or equal–to (>) the value of <LEVEL> are reported.
TMPER	{15–MIN, 1–DAY}
Default:	{15–MIN}
Addressing:	None
Description:	Time Period, specifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
15–MIN	15–Minute PM collection registers are reported.
1–DAY	1–Day (24 hour) PM collection registers are reported.
Restrictions:	SCHED–PMREPT–VT1 is denied if the value of TMPER is not the same as the REPTINVL value.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>

;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
	/* Invalid TMPER entered. */
	/* Invalid NUMREPT entered. */
	/* Invalid REPTINVL entered. */
	/* Invalid MONLEV entered. */
SDBE	Status, internal Data Base Error
	/* Error reading VT1 pm sched database. */
	/* Error updating VT1 pm sched database. */
SROF	Status, Requested Operation Failed
	/* Unable to determine facility type. */

EXAMPLES

In the following example, 15-minute PM report messages are enabled for monitored VT1.5 PM parameters with event counts greater-than or equal-to sixteen.

```
SCHED-PMREPT-VT1: : EC1VT1-1-1-4: : , , , , 16-UP;
```

RELATED COMMANDS

RTRV-PMSCHED-ALL  
RTRV-PMSCHED-VT1  
SCHED-PMREPT-ALL  
SET-DFLTPMREPT-VT1
```

COMMAND CODE: **SELECT-COPY**
COMMAND NAME: **SELECT COPY TO USE**

PURPOSE

The SELECT-COPY command is used during a matrix upgrade from a 672-port matrix to a 1344-port matrix, a 1344-port matrix to a 2688-port matrix, or a 2688-port matrix to a 3360-port matrix.

SELECT-COPY causes the system to lock to data copy 0, to lock to data copy 1, or to re-enable data copy switching.

If SELECT-COPY with ACTION of {LOCKCOPY0, LOCKCOPY1}, MODE of NORM is entered, and a UPGRD1344, UPGRAD2688 or UPGRAD3360 condition has been set, then all I/O circuit packs in the Shelf/Quad are locked to that data copy if there are no errors in the connection. If data errors are detected for any I/O circuit packs in a Shelf/Quad, then those I/O circuit packs with errored connections revert back to the good copy of data and a DTLCKCPYFL condition is set on the particular I/O Shelf or Quad with errors.

If SELECT-COPY with ACTION of {LOCKCOPY0, LOCKCOPY1}, MODE of FRCD is entered, and a UPGRD1344, UPGRAD2688 or UPGRAD3360 condition has *not* been set, then all I/O circuit packs in the Shelf/Quad are locked to the specified data copy whether or not any data errors are detected on any or all of the individual I/O circuit packs. Additionally, if good data is not being received by an I/O circuit pack on the specified copy of data, the I/O circuit pack does not revert back to the non-specified copy of data (to the good copy of data).

If SELECT-COPY with ACTION of ENABLE is entered, then data copy switching is enabled for all I/O Shelves/Quads for which either both copies of data are good or for which both copies of data are bad. Data copy switching is not enabled if one copy, but not both copies, of data is bad. An informational text indicating data copy switching is not enabled on some data paths due to failures is sent. In this case, manual copy switching is enabled but the data is locked to one copy automatically.

Executing a SELECT-COPY command with ACTION of {LOCKCOPY0, LOCKCOPY1} causes a MANSELDATAACPY0 or MANSELDATAACPY1, respectively, condition type to be set, and a DATALCK0 or DATALCK1 condition type to be set on each I/O Shelf and/or I/O Quad.

If SELECT-COPY with ACTION of {LOCKCOPY0, LOCKCOPY1} and MODE of NORM is executed *and* data selection for an I/O Shelf/Quad is *not* locked (because a data error is detected), then the command completes with errors and no alarms are set.

Executing a SELECT-COPY command with ACTION of ENABLE clears the respective MANSELDATAACPY0 or MANSELDATAACPY1 condition type, and clears all DATALCK0 or DATALCK1 condition types for all I/O Shelves/Quads (if no automatic action locks an I/O Shelf/Quad to a copy). If an automatic action locks an I/O Shelf/Quad to a copy, the DATALCK0 or DATALCK1 condition type remains set.

If a SELECT-COPY command is issued with ACTION of {LOCKCOPY0, LOCKCOPY1} while the system is already lock to the requested copy, the command is denied. It is possible, however, to re-issue a SELECT-COPY command after one has been issued if the first SELECT-COPY command has been fully completed and a UPGRD1344, UPGRAD2688 or UPGRAD3360 condition has been set.

A SELECT-COPY command is denied if:

- ACTION of {LOCKCOPY0, LOCKCOPY1} and MODE of NORM is entered and the system is not capable of switching and locking to the specified copy of data due to unavailable system resources.
- ACTION of {LOCKCOPY0, LOCKCOPY1} and MODE of NORM is specified, an UPGRD1344, UPGRAD2688, or UPGRAD3360 condition is *not* set, and the system is not capable of switching and locking to the specified copy of data due to data errors.
- ACTION of {LOCKCOPY0, LOCKCOPY1} and MODE of NORM is entered and the system is already locked automatically to the specified copy of data due to a failure.
- MODE of FRCD is entered and a UPGRD1344, UPGRAD2688 or UPGRAD3360 condition is set in the system.
- ACTION of ENABLE is entered and a UPGRD1344, UPGRAD2688 or UPGRAD3360 condition is set in the system.

- ACTION of ENABLE is entered and a MANSELDATAcopy0 or MANSELDATAcopy1 condition is *not* set in the system.
- An AID is specified and the locked copy is different than remaining shelves.
- An AID is specified, ACTION is specified as {LOCKCOPY0, LOCKCOPY1}, and the system is already locked to a different copy.
- A SELECT-COPY, VRFY-COPY, or START-UPGRADE command is currently in-progress.
- The system is currently declaring any GTI alarms.
- An I/O AID is entered and the upgrade condition (UPGRDxxxx) is not set.
- An invalid parameter value is entered.

INPUT FORMAT

SELECT-COPY : [TID] : [AID] : [CTAG] : : ACTION, [MODE] ;

INPUT PARAMETERS

TID	<p>< 1-20 VALID TID CHARACTERS ></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>						
AID	<p>EQUIPMENT_AID:</p> <p>{SHELF-{6-9, 12-15, 18-21, 24-43, 104-111, 136-141}-{1, 3}-1}</p> <p>{QUAD-{44-63}-{1-4}-{1-4}}</p> <p>Default: <NoVal></p> <p>Addressing: None</p> <p>Description: Equipment AID, identifies the I/O Shelf or Quad.</p>

LOCKCOPY0	Lock the system to data Copy 0.	LOCKCOPY1	Lock the system to data Copy 1.
ENABLE	Enable data copy switching.						
LOCKCOPY0	Lock the system to data Copy 0.						
LOCKCOPY1	Lock the system to data Copy 1.						
MODE	<p>{NORM, FRCD}</p> <p>Default: {NORM}</p> <p>Addressing: None</p> <p>Description: Command Execution Mode. Values are:</p> <table> <tr> <td>NORM</td><td>Normal. The command is denied if the result of its execution is service-affecting. An entire I/O Shelf/Quad is locked to the specified copy of data only if all I/O circuit packs in the Shelf/Quad can be locked to that copy of data.</td></tr> <tr> <td>FRCD</td><td>Forced. The command is executed regardless of any errors existing in the system. All I/O circuit packs in the I/O Shelf/Quad are locked to the specified copy of data whether or not the I/O circuit pack detects data errors on that copy of data. The command is not executed, however, if system resources are not available.</td></tr> </table>	NORM	Normal. The command is denied if the result of its execution is service-affecting. An entire I/O Shelf/Quad is locked to the specified copy of data only if all I/O circuit packs in the Shelf/Quad can be locked to that copy of data.	FRCD	Forced. The command is executed regardless of any errors existing in the system. All I/O circuit packs in the I/O Shelf/Quad are locked to the specified copy of data whether or not the I/O circuit pack detects data errors on that copy of data. The command is not executed, however, if system resources are not available.		
NORM	Normal. The command is denied if the result of its execution is service-affecting. An entire I/O Shelf/Quad is locked to the specified copy of data only if all I/O circuit packs in the Shelf/Quad can be locked to that copy of data.						
FRCD	Forced. The command is executed regardless of any errors existing in the system. All I/O circuit packs in the I/O Shelf/Quad are locked to the specified copy of data whether or not the I/O circuit pack detects data errors on that copy of data. The command is not executed, however, if system resources are not available.						

SUCCESSFUL RESPONSE FORMAT

If ACTION is specified as {LOCKCOPY0, LOCKCOPY1}, then the output response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* Automatic data copy switching is disabled. */
  /* Future data path failures will not be protected. */
```

For all other cases, the output response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Free Form Informational Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Currently no SELECT Lock to Copy is in progress. */ /* Currently not Locked to a side. */ /* Unable to read aux buffer for <AID>. */
IIAC	Input, Invalid ACcess identifier /* Invalid parameters in the input command. */ /* Invalid command requested. */
SARB	Status, All Resources Busy /* SELECT COPY is in progress. */ /* VRFY COPY is in progress. */ /* SELECT COPY or START-UPGRADE is in progress. */ /* Manual or automatic action is in progress for <AID>. */ /* INIT-SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Error opening report file. */ /* Error accessing report file. */ /* Error reading database for <AID> */ /* Error reading database for <AID> or its mate. */ /* Unable to read system configuration file. */
SNVS	Status, Not in Valid State /* Matrix is locked to a side. */ /* ENABLE is not valid while processing an upgrade. */ /* An IO AID is valid only when processing an upgrade. */ /* Already locked to the requested side. */ /* ACTION is not consistent with the rest of the shelves. */ /* FRCD is not valid while processing an upgrade. */ /* System is currently in ITM mode. */ /* Currently copy <copy_type> has GTI alarms on the matrix modules. */

SROF Status, Requested Operation Failed

```
/* Center Stage matrix sides have different card types. */
/* Unable to allocate USI response buffer. */
/* Card type (<card_type>) not supported. */
/* Power modules are unable to provide power */
/* Power card unable to provide power. */
/* Error reading matrix shelf. */
/* <AID> is not available. */
/* <AID> and <AID> are not available. */
/* <AID>, <AID>, <AID>, and <AID> are not available */
/* <AID> and <AID> cannot provide clock. */
/* Error reading database for <AID>. */
/* Error reading database for <AID> or its mate. */
/* One or more provisioned shelves did not respond to the CAN-YOU-SWITCH
query. */
```

EXAMPLES

In the following example, the system is requested to switch to copy1. Since the mode parameter is defaulted to NORM, the command is denied if the copy1 has errors.

```
SELECT-COPY::::LOCKCOPY1;
<SID> <YY-MM-DD> <HH:MM:SS>
M P71162 COMPLD
/* The SELECT-COPY was completed. */
/* Automatic data copy switching is disabled. */
/* Future data path failures will not be protected. */
/* SELECT-COPY::::LOCKCOPY0, [P71162] (1) */
```

RELATED COMMANDS

```
RTRV-COND-ALL
RTRV-COND-EQPT
RTRV-MTX
START-UPGRADE
STOP-UPGRADE
VRFY-COPY
```

COMMAND CODE: **SET-ACO-ALL**
COMMAND NAME: **SET AUDIBLE ALARM CUTOFF ALL**

PURPOSE

The SET-ACO-ALL command sets the system-wide Audible Alarm Cutoff (ACO) mode of operation. The three modes of ACO operation are:

- Delayed ACO Mode: Any audible alarm is generated for five seconds and then automatically silenced by the system.
- Immediate ACO Mode: No audible alarms are generated; all audible alarms are automatically cutoff immediately.
- Manual ACO Mode: Audible alarms are not automatically silenced by the system. Audible alarms are only cutoff manually by executing an OPR-ACO-ALL command, manually actuating an ACO switch, or by clearing the alarm condition.

The ACO mode applies to all alarmed conditions in the system. The ACO mode does not affect visual alarm indications (lamps or contact closures) or alarm reporting through the man-machine interface.

A SET-ACO-ALL command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-ACO-ALL: [TID] : : [CTAG] : : ACOMODE;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ACOMODE	{DELD, IMED, MAN} Default: Entry Required Addressing: None Description: ACO Mode, specifies the Alarm Cutoff mode. Values are: DELD Delayed ACO, an audible alarm cutoff is automatically generated five seconds after the detection of an alarm (the audible alarm is automatically silenced after five seconds). IMED Immediate ACO, an audible alarm cutoff is automatically generated immediately upon detection of an alarm (no audible alarm occurs). MAN Manual ACO, an audible alarm cutoff is not automatically generated. Audible alarms are only silenced manually by executing an OPR-ACO-ALL command, manually actuating an ACO switch, or by clearing the alarm condition.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* ACO MODE has been set to <ACOMODE> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

ACOMODE	{DELD, IMED, MAN}
	ACO Mode, indicates the Alarm Cutoff mode. Values are:
DELD	Delayed ACO, an audible alarm cutoff is automatically generated five seconds after the detection of an alarm (the audible alarm is automatically silenced after five seconds).
IMED	Immediate ACO, an audible alarm cutoff is automatically generated immediately upon detection of an alarm (no audible alarm occurs).
MAN	Manual ACO, an audible alarm cutoff is not automatically generated. Audible alarms are only silenced manually by executing an OPR-ACO-ALL command, manually actuating an ACO switch, or by clearing the alarm condition.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid ACO MODE specified. */
SDBE	Status, internal Data Base Error /* Error reading the system configuration database. */ /* Error updating the system configuration database. */

EXAMPLES

In the following example, the audible alarm cutoff (ACO) mode is set to manual mode.

```
SET-ACO-ALL::::MAN;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P18004. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P18004 COMPLD
/* ACO MODE has been set to MAN */
/* SET-ACO-ALL::::MAN [P18004] (2) */
;
```

RELATED COMMANDS

```

RTRV-ACO-ALL
```

COMMAND CODE: **SET-ATTR-COM**
COMMAND NAME: **SET ATTRIBUTE COMMON**

PURPOSE

The SET-ATTR-COM command sets the notification code generated by the system for non-service affecting and service affecting common (no specific entity) condition types.

Upon execution of the SET-ATTR-COM command, any condition that exists for the specified condition type and service effect combination is updated with the new notification code.

A SET-ATTR-COM command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-ATTR-COM: [TID] : [AID] : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , , , , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.												
AID	{COM} Default: {COM} Addressing: None Description: Common AID, used when a specific AID is not identified.												
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.												
NTFCNCDE	{CR, DFLT, MJ, MN, NA, NR} Default: {NA} Addressing: None Description: Notification Code, specifies the notification code that is generated by the system upon the occurrence of the event specified by CONDTYPE. Values are: <table> <tr> <td>CR</td><td>Critical Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>DFLT</td><td>Default, the notification code for the specified condition type and service effect combination is set to the system default value. (Refer to Appendix C for a list of default notification codes.)</td></tr> <tr> <td>MJ</td><td>Major Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>MN</td><td>Minor Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>NA</td><td>Not Alarmed (reported via REPT^EVT autonomous message).</td></tr> <tr> <td>NR</td><td>Not Reported.</td></tr> </table>	CR	Critical Alarm (reported via REPT^ALM autonomous message).	DFLT	Default, the notification code for the specified condition type and service effect combination is set to the system default value. (Refer to Appendix C for a list of default notification codes.)	MJ	Major Alarm (reported via REPT^ALM autonomous message).	MN	Minor Alarm (reported via REPT^ALM autonomous message).	NA	Not Alarmed (reported via REPT^EVT autonomous message).	NR	Not Reported.
CR	Critical Alarm (reported via REPT^ALM autonomous message).												
DFLT	Default, the notification code for the specified condition type and service effect combination is set to the system default value. (Refer to Appendix C for a list of default notification codes.)												
MJ	Major Alarm (reported via REPT^ALM autonomous message).												
MN	Minor Alarm (reported via REPT^ALM autonomous message).												
NA	Not Alarmed (reported via REPT^EVT autonomous message).												
NR	Not Reported.												
CONDTYPE	{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-ST51, GOS-ST53C, GOS-T1, GOS-T3, GOS-VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDATACPY0, MANSELDATACPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688, UPGRD3360} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types). Values are:												

DATAFLT	Data integrity Fault, CRC error detected during a database read.
EUA	Emergency User Access activated.
FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
GOS-ST1	Grade of Service-ST1, system-wide STS-1 GOS threshold reached.
GOS-ST3C	Grade of Service-ST3C, system-wide STS-3C GOS threshold reached.
GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
INIT	Initialization, system initialization in-process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
MANSELDATAOPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.

	UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
	UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
	UPGRD3360	2688 Port to 3360 Port Upgrade in Progress.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type for which the specified NTFNCODE is to be set. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
	/* Condition type is not consistent with COM. */
IDNV	Input, Data Not Valid
	/* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
	/* Invalid service effect specified: <SERVICE EFFECT STRING>. */
	/* Invalid condition type specified: <CONDITION TYPE STRING>. */
	/* Invalid Parameter Value. */
IIAC	Input, Invalid ACcess identifier
	/* AID must be COM. */
INUP	Input, Non-Null Unimplemented Parameter
	/* No matching attributes to update as requested by user. */
IPMS	Input, Parameter MiSsing
SDBE	Status, internal Data Base Error
	/* Unable to read file <FILENAME>, Error <ERROR NUMBER> */
	/* Unable to update file <FILENAME>, Error <ERROR NUMBER> */

EXAMPLES

In the following example, the notification code is set to minor (MN) for the non-service affecting INHFL condition type.

```
SET-ATTR-COM: : : : MN, INHFL, , , , NSA;
```

In the following example, the notification code for all service affecting and non-service affecting common condition types are set to the system default values.

```
SET-ATTR-COM: : : : DFLT;
```

COMMAND CODE: **SET-ATTR-EC1**
COMMAND NAME: **SET ATTRIBUTE EC1**

PURPOSE

The SET-ATTR-EC1 command sets the notification code generated by the system for non-service affecting and service affecting EC1 standing conditions pertaining to the specified EC1 port.

Upon execution of the SET-ATTR-EC1 command, any condition that exists for the specified EC1 port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-EC1 command is denied if:

- The specified EC1 port is not provisioned (via ENT-EC1).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-ATTR-EC1: [TID] :AID: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPEFF] , [SRVEFF] ;

INPUT PARAMETERS

TID	<p>< 1-20 VALID TID CHARACTERS ></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>												
AID	<p>EC1_AID:</p> <p>{EC1-{1-3840} }</p> <p>(EC1-EC1/STS1#)</p> <p>Default: Entry Required</p> <p>Addressing: &&-ranging and &-grouping</p> <p>Description: EC1 AID, identifies the EC1 port.</p>												
CTAG	<p>< 1-6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>												
NTFCNCDE	<p>{CR, DFLT, MJ, MN, NA, NR}</p> <p>Default: {NA}</p> <p>Addressing: None</p> <p>Description: Notification Code, specifies the notification code that is generated by the system upon the occurrence of the event specified by CONDTYPE. Values are:</p> <table> <tr> <td>CR</td><td>Critical Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>DFLT</td><td>Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-EC1).</td></tr> <tr> <td>MJ</td><td>Major Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>MN</td><td>Minor Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>NA</td><td>Not Alarmed (reported via REPT^EVT autonomous message).</td></tr> <tr> <td>NR</td><td>Not Reported.</td></tr> </table>	CR	Critical Alarm (reported via REPT^ALM autonomous message).	DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-EC1).	MJ	Major Alarm (reported via REPT^ALM autonomous message).	MN	Minor Alarm (reported via REPT^ALM autonomous message).	NA	Not Alarmed (reported via REPT^EVT autonomous message).	NR	Not Reported.
CR	Critical Alarm (reported via REPT^ALM autonomous message).												
DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-EC1).												
MJ	Major Alarm (reported via REPT^ALM autonomous message).												
MN	Minor Alarm (reported via REPT^ALM autonomous message).

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid Parameter Value. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
INUP	Input, Non-Null Unimplemented Parameter /* No matching attributes to update as requested by user. */
SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update file <FILENAME>, Error <ERROR NUMBER> */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */

EXAMPLES

In the following example, the notification code is set to major (MJ) for the near-end service affecting LOS condition type for EC1 port EC1-1.

```
SET-ATTR-EC1::EC1-1:::MJ,LOS,NEND,,SA;
```

In the following example, the notification code is set to not alarmed (NA) for both the non-service affecting and service affecting RFI condition type for EC1 ports EC1-1 through EC1-48.

```
SET-ATTR-EC1::EC1-1&-48:::RFI;
```

In the following example, the notification code for all service affecting and non-service affecting condition types is set to its system default value for EC1 port EC1-6.

```
SET-ATTR-EC1::EC1-6:::DFLT;
```

COMMAND CODE: **SET-ATTR-EQPT**
COMMAND NAME: **SET ATTRIBUTE EQUIPMENT**

PURPOSE

The SET-ATTR-EQPT command sets the notification code generated by the system for both non-service affecting and service affecting equipment condition types pertaining to the specified type of equipment entity.

The SET-ATTR-EQPT command is executed regardless of whether associated equipment entities are provisioned. Upon execution of the command, any condition that exists for the specified type of equipment, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-EQPT command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-ATTR-EQPT: [TID] :AID: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , , , , [SRVEFF] ;

INPUT PARAMETERS

TID	<1–20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	{ACM, ALL, CDA, CDB, CID, CIM, CKB, CPU, DSB, DSI, DSK, EOB, EP3, ES1, ESA, FAN, FUSE, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1M16, G1M32, G1M40, G1MRPB, G1O1B, G1O4M, G1S3M, G4EOB, G4IOB, G4OXB, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OPD, OXB, P39, P56, PDU, PRT, PSF, PST, QUAD, RDU, RPB, RSP, S3M, SBT, SHELF, SIO, SPB, SWI} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment entity name/type. Values are: ACM All Administrative Communications Module circuit packs. ALL All applicable AIDs pertaining to the specified CONDTYPE. CDA All Clock Distribution A circuit packs. CDB All Clock Distribution B circuit packs. CID All Communications Interface Devices (VDT, TTY, PRN). CIM All Communications Interface Module circuit packs. CKB All Circuit Breakers, circuit breakers in the PDU/RDU/RSP. CPU All Central Processing Unit circuit packs. DSB All DCC Server Boards. DSI All DS1 Input/Output circuit packs. DSK All Disk Drives. EOB All Electrical to Optical Board circuit packs. EP3 All Electrical Plesiochronous DS3/STS1 Interface circuit packs. ES1 All Electrical Plesiochronous STS1 Interface circuit packs. ESA All External DS1 Signal Adapter circuit packs. FAN All Fan/Blower assemblies. FUSE All Fuses, PDU fuses. G1EOB All GTI cables carrying an STM1 signal and terminating on an EOB. G1EP3 All GTI cables carrying an STM1 signal and terminating on an EP3. G1ES1 All GTI cables carrying an STM1 signal and terminating on an ES1. G1IOB All GTI cables coming into IOB module and carrying STM–1 signal.

G1IRPB	All GTI cables carrying an STM1 signal and terminating on the I/O side of the RPB circuit pack.
G1M16	All GTI cables carrying an STM1 signal and terminating on a M16.
G1M32	All GTI cables carrying an STM1 signal and terminating on a M32.
G1M40	All GTI cables carrying an STM1 signal and terminating on a M40.
G1MRPB	All GTI cables carrying an STM1 signal and terminating on the matrix side of the RPB circuit pack.
G1O1B	All GTI cables carrying an STM1 signal and terminating on an O1B.
G1O4M	All GTI cables carrying an STM1 signal and terminating on an O4M.
G1S3M	All GTI cables carrying an STM1 signal and terminating on an S3M.
G4EOB	All GTI cables carrying an STM4 signal and terminating on an EOB.
G4IOB	All GTI cables coming into IOB module and carrying STM-4 signal.
G4OXB	All GTI cables carrying an STM4 signal and terminating on an OXB.
HMU	All High Speed Muldem Unit (M23 multiplexing) circuit packs.
ICM	All Intelligent Communications Module circuit packs.
IOB	All Inter-rack Optics Board circuit packs.
IPB	All Internal Protection Board circuit packs.
IPU	All Interface Processing Unit circuit packs.
LMU	All Low Speed Muldem Unit (M12 multiplexing) circuit packs.
LT1	All Level 1 Translator (RS-232) circuit packs.
LT2	All Level 2 Translator (RS-449/422) circuit packs.
LT4	All Level 4 Translator (ACL) circuit packs.
LT5	All Level 5 Translator (RS449/423 & LAN) circuit packs.
LT8	All Level 8 Translator (ACL) circuit packs.
M16	All Matrix End/Center Stage 16 circuit packs.
M32	All Matrix End Stage 32 circuit packs.
M40	All Matrix End/Center Stage 40 circuit packs.
MCB	All Master Clock Board circuit packs.
O1B	All Optical Interface Level 1 (OC-3) Board circuit packs.
O4M	All Optical Interface Level 4 (OC-12) Board circuit packs.
OPD	All Optical Disk Drives.
OXB	All Optical Transceiver Board circuit packs.
P39	All Power Supply, 3.9V circuit packs.
P56	All Power Supply, 5.6V circuit packs.
PDU	All Power Distribution Units.
PRT	All DS1 Protect circuit packs.
PSF	All Power Supply, 5V circuit packs.
PST	All Power Supply, 12V circuit packs.
QUAD	All DS1 Shelf Quadrants.
RDU	All Rack Distribution Units.
RPB	All Ring Protection Board circuit packs.
RSP	All Rack Status Panels.
S3M	All STS-3C circuit packs.
SBT	All System Bus Termination circuit packs.
SHELF	All I/O, EOC, End Stage, or Center Stage Shelves.
SIO	All Serial Input/Output circuit packs.
SPB	All Satellite Processor Board circuit packs.
SWI	All DS1 Switch circuit packs.
Restrictions:	SET-ATTR-EQPT is denied if the specified AID is not valid for the specified CONDTYPE. (Refer to Appendix C and CONDTYPE below.) SET-ATTR-EQPT is denied if AID of ALL is entered and a value for NTFNCNDE and CONDTYPE is not entered.

SET-ATTR-EQPT is denied for a 240-port LMC system if an AID of CDA is entered.

DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed. (Valid for an AID of ALL, DSB.)
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified. (Valid for an AID of ALL, SHELF, QUAD.)
DUPMACADDR	Duplicate MAC Address detected on the LAN. (Valid for an AID of ALL, DSB.)
DUPTARPEENTRY	Duplicate TARP adjacency table. (Valid for an AID of ALL, DSB.)
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed. (Valid for an AID of ALL, CKB, FUSE.)
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed. (Valid for an AID of ALL, FAN.)
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database. (Valid for an AID of ALL, MCB.)
GT1	GTI Cable fault for GTI cable carrying an STM1 signal (Valid for an AID of ALL, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1M16, G1M32, G1M40, G1MRPB, G1S3M, G1O1B, G1O4M.)
GT4	GTI Cable fault for GTI cable carrying an STM4 signal (Valid for an AID of ALL, G4EOB, G4IOB, G4OXB.)
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal. (Valid for AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, EOB, EP3, ES1, ESA, FAN, HMU, ICM, IOB, IPB, IPU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PDU, PRT, PSF, PST, RDU, RPB, S3M, SBT, SIO, SPB, SWI.)
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited. (Valid for an AID of ALL, CPU, IPU,

	SPB.)
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
INHSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
INIT	Initialization, shelf initialization in-process. (Valid for an AID of ALL, SHELF.)
INTERR	Internal Error, internal error suspected on equipment. (Valid for an AID of ALL, CDA, CDB, DSI, EOB, EP3, ES1, HMU, IOB, IPB, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, RPB, S3M.)
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
LOTRI	Loss Of Offboard Timing Reference Input from mate Master Clock Board circuit pack. (Valid for an AID of ALL, MCB.)
MAN	Manual removal (logical removal was performed on a circuit pack). (Valid for an AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, DSK, EOB, EP3, ES1, HMU, ICM, IOB, IPB, IPU, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PSF, RPB, S3M, SIO, SPB.)
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
MISC-1	Miscellaneous Class-1, slave MCB is not ready. (Valid for an AID of ALL, MCB.)
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs. (Valid for an AID of ALL, DSB.)
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning. (Valid for an AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, EOB, EP3, ES1, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, OXB, O1B, O4M, P39, P56, PRT, RPB, S3M, SIO, SWI.)
PWR	Power, internal power failure detected. (Valid for an AID of ALL, P39, P56, PSF, PST, RSP.)
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem. (Valid for an AID of ALL, M16, M32, M40, SPB.)
SWFTDWN	Software Download is in process on a circuit pack. (Valid for an AID of ALL, ACM, CIM, DSB, EP3, ES1, ICM, IPU, M16, M32, M40, MCB, O1B, O4M, OXB, RPB, S3M, SPB.)
SYNCEQPT	Synchronization Equipment failure detected. (Valid for an AID of ALL, CDA, CDB, MCB.)
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure. (Valid for an AID of ALL, ES1.)
TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure. (Valid for an AID of ALL, O1B.)

	TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure. (Valid for an AID of ALL, O4M.)
	TERM-T1	Termination Equipment-T1, DSI circuit pack failure. (Valid for an AID of ALL, DSI.)
	TERM-T3	Termination Equipment-T3, HMU circuit pack failure. (Valid for an AID of ALL, HMU.)
	TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure. (Valid for an AID of ALL, EP3.)
	TSA	Test Session Active, maintenance test session active on the equipment. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU, M16, M32, O1B, O1B, O4M, S3M.)
	TSI	Time Slot Interchange equipment failure. (Valid for an AID of ALL, M16, M32, M40.)
	WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
	XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad. (Valid for an AID of ALL, QUAD, SHELF)
	Restrictions:	SET-ATTR-EQPT is denied if no value for CONDDTYPE is entered and AID of ALL is entered. SET-ATTR-EQPT is denied if the specified CONDDTYPE is not valid for the specified AID.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect attribute of the condition type for which the specified NTFNCODE is to be set. Values are:
	NSA	Non-Service Affecting.
	SA	Service Affecting.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IDNV      Input, Data Not Valid
          /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
          /* Invalid service effect specified: <SERVICE EFFECT STRING>. */
          /* Invalid condition type specified: <CONDITION TYPE STRING>. */
          /* Invalid Parameter Value. */

```

IIAC	Input, Invalid ACcess identifier /* Invalid card type specified: <CARD TYPE STRING>. */
INUP	Input, Non-Null Unimplemented Parameter /* No matching attributes to update as requested by user. */
IPMS	Input, Parameter MiSSing /* For AID = ALL, the notification code must be specified. */ /* For AID = ALL, the condition type must be specified. */
SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update file <FILENAME>, Error <ERROR NUMBER> */

EXAMPLES

In the following example, the notification code is set to minor (MN) for non-service affecting MAN condition types for all applicable equipment entities.

```
SET-ATTR-EQPT: :ALL: : :MN,MAN, , , ,NSA;
```

In the following example, the notification code for service affecting and non-service affecting IMPROPRMVL condition types is set to its system default value for all equipment entities.

```
SET-ATTR-EQPT: :ALL: : :DFLT, IMPROPRMVL;
```

COMMAND CODE: **SET-ATTR-F3**
COMMAND NAME: **SET ATTRIBUTE F3**

PURPOSE

The SET-ATTR-F3 command sets the notification code generated by the system for non-service affecting and service affecting F3 standing conditions pertaining to the specified F3 port.

Upon execution of the SET-ATTR-F3 command, any condition that exists for the specified F3 port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-F3 command is denied if:

- The specified F3 port is not provisioned (via ENT-F3).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-ATTR-F3 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.												
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the F3 port.												
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.												
NTFCNCDE	{CR, DFLT, MJ, MN, NA, NR} Default: {NA} Addressing: None Description: Notification Code, specifies the notification code that is generated by the system upon the occurrence of the event specified by CONDDTYPE. Values are: <table><tr><td>CR</td><td>Critical Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>DFLT</td><td>Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-F3).</td></tr><tr><td>MJ</td><td>Major Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>MN</td><td>Minor Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>NA</td><td>Not Alarmed (reported via REPT^EVT autonomous message).</td></tr><tr><td>NR</td><td>Not Reported.</td></tr></table>	CR	Critical Alarm (reported via REPT^ALM autonomous message).	DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-F3).	MJ	Major Alarm (reported via REPT^ALM autonomous message).	MN	Minor Alarm (reported via REPT^ALM autonomous message).	NA	Not Alarmed (reported via REPT^EVT autonomous message).	NR	Not Reported.
CR	Critical Alarm (reported via REPT^ALM autonomous message).												
DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-F3).												
MJ	Major Alarm (reported via REPT^ALM autonomous message).												
MN	Minor Alarm (reported via REPT^ALM autonomous message).												
NA	Not Alarmed (reported via REPT^EVT autonomous message).												
NR	Not Reported.												
CONDTYPE	{INHMPREPT} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are: <table><tr><td>INHMPREPT</td><td>Inhibit Performance Monitoring Report, PM report capability inhibited.</td></tr></table>	INHMPREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.										
INHMPREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.												

LOCN	{NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	NEND	Near-End, events occurring at the system.
DIRN	{NA, RCV}	
	Default:	{NA}
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-ATTR-F3 command.
	NA	Not Applicable
	RCV	Receive side
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the SET-ATTR-F3 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type for which the specified NTFCNCODE is to be set. Values are:
	NSA	Non-Service Affecting.
	SA	Service Affecting.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IDNC      Input, Data Not Consistent
          /* Condition type is not consistent with <FACILITY TYPE STRING>. */
          /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE
             STRING>. */
```

IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid Parameter Value. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
INUP	Input, Non-Null Unimplemented Parameter /* No matching attributes to update as requested by user. */
SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update file <FILENAME>, Error <ERROR NUMBER> */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */

EXAMPLES

In the following example, the notification code is set to major (MJ) for the near-end service affecting INHPM-REPT condition type for F3 port T3F3-2-1.

```
SET-ATTR-F3::T3F3-2-1::MJ, INHPMREPT, NEND, , , SA;
```

In the following example, the notification code for all service affecting and non-service affecting condition types is set to its system default value for F3 port T3F3-5-6.

```
SET-ATTR-F3::T3F3-5-6::DFLT;

COMMAND CODE: **SET-ATTR-OC12**
COMMAND NAME: **SET ATTRIBUTE OC-12**

PURPOSE

The SET-ATTR-OC12 command sets the notification code generated by the system for non-service affecting and service affecting OC-12 standing conditions pertaining to the specified OC-12 port.

Upon execution of the SET-ATTR-OC12 command, any condition that exists for the specified OC-12 port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-OC12 command is denied if:

- The specified OC-12 port is not provisioned (via ENT-OC12).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-ATTR-OC12: [TID] :AID: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.												
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port.												
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.												
NTFCNCDE	{CR, DFLT, MJ, MN, NA, NR} Default: {NA} Addressing: None Description: Notification Code, specifies the notification code that is generated by the system upon the occurrence of the event specified by CONDTYPE. Values are: <table> <tr> <td>CR</td><td>Critical Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>DFLT</td><td>Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-OC12).</td></tr> <tr> <td>MJ</td><td>Major Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>MN</td><td>Minor Alarm (reported via REPT^ALM autonomous message).</td></tr> <tr> <td>NA</td><td>Not Alarmed (reported via REPT^EVT autonomous message).</td></tr> <tr> <td>NR</td><td>Not Reported.</td></tr> </table>	CR	Critical Alarm (reported via REPT^ALM autonomous message).	DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-OC12).	MJ	Major Alarm (reported via REPT^ALM autonomous message).	MN	Minor Alarm (reported via REPT^ALM autonomous message).	NA	Not Alarmed (reported via REPT^EVT autonomous message).	NR	Not Reported.
CR	Critical Alarm (reported via REPT^ALM autonomous message).												
DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-OC12).												
MJ	Major Alarm (reported via REPT^ALM autonomous message).												
MN	Minor Alarm (reported via REPT^ALM autonomous message).												
NA	Not Alarmed (reported via REPT^EVT autonomous message).												
NR	Not Reported.												

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAIL, L2SCONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC-12 port is in loopback. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lockout of automatic revertive (OC-12) switching due to excessive switching. (Near-End only.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited. (Near-End only.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
L2SCONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
LOF	Loss Of Frame detected. (Near-End only.)
LOS	Loss Of Signal detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKS WBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKS WPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
WTR	Wait To Restore of protection facility. (Near-End only.)
Restrictions:	SET-ATTR-OC12 is denied if the specified CONDTYPE value is not supported for the specified LOCN value (e.g., CONDTYPE of RFI and LOCN of NEND is entered).

LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-ATTR-OC12 command.
	NA	Not Applicable
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the SET-ATTR-OC12 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type for which the specified NTFCNCDE is to be set. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

COMMAND CODE: **SET-ATTR-OC3**
COMMAND NAME: **SET ATTRIBUTE OC-3**

PURPOSE

The SET-ATTR-OC3 command sets the notification code generated by the system for non-service affecting and service affecting OC-3 standing conditions pertaining to the specified OC-3 port.

Upon execution of the SET-ATTR-OC3 command, any condition that exists for the specified OC-3 port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-OC3 command is denied if:

- The specified OC-3 port is not provisioned (via ENT-OC3).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-ATTR-OC3 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.												
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port.												
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.												
NTFCNCDE	{CR, DFLT, MJ, MN, NA, NR} Default: {NA} Addressing: None Description: Notification Code, specifies the notification code that is generated by the system upon the occurrence of the event specified by CONDTYPE. Values are: <table><tr><td>CR</td><td>Critical Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>DFLT</td><td>Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-OC3).</td></tr><tr><td>MJ</td><td>Major Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>MN</td><td>Minor Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>NA</td><td>Not Alarmed (reported via REPT^EVT autonomous message).</td></tr><tr><td>NR</td><td>Not Reported.</td></tr></table>	CR	Critical Alarm (reported via REPT^ALM autonomous message).	DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-OC3).	MJ	Major Alarm (reported via REPT^ALM autonomous message).	MN	Minor Alarm (reported via REPT^ALM autonomous message).	NA	Not Alarmed (reported via REPT^EVT autonomous message).	NR	Not Reported.
CR	Critical Alarm (reported via REPT^ALM autonomous message).												
DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-OC3).												
MJ	Major Alarm (reported via REPT^ALM autonomous message).												
MN	Minor Alarm (reported via REPT^ALM autonomous message).												
NA	Not Alarmed (reported via REPT^EVT autonomous message).												
NR	Not Reported.												

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAIL, L2SCONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type for which the specified NTFNCNDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC-3 port is in loopback. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lockout of automatic revertive (OC-3) switching due to excessive switching. (Near-End only.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)

COMMAND CODE: **SET-ATTR-SECUDFLT**
COMMAND NAME: **SET ATTRIBUTE SECURITY DEFAULT**

PURPOSE

The SET-ATTR-SECUDFLT command sets the system-wide values for the user security parameters PAGE (password aging), POUT (password deactivation on inactivity), and UOUT (user account deletion on inactivity).

The PAGE parameter is used to enforce periodic changing of user passwords. If PAGE is enabled (a provisioned value greater than zero), the system keeps track of the age of each user's password, except for user's with a UCAL of 31 (system administrator level) or higher. The system resets a user's password-age when the user logs-on (via ACT-USER) the first time as a new account user, and each time the user changes the user's password identifier (PID) via the ED-PID command. A user's password-age is compared to the provisioned PAGE value each time a user logs-on the system. If the user's password-age has reached the PAGE value, the system prompts the user (via the REPT^EVT^SESSION message) to change the existing user password. If a new password is not entered before the user exits the current session, the system deactivates the user's password when the user logs-off the system.

The POUT and UOUT parameters are used to deactivate a password (PID) or user account (UID), respectively, based on user inactivity (the user has not logged-on to the system). A provisioned POUT or UOUT value of zero disables the parameter. The system maintains a user inactivity timer for each user account, except for user's with a UCAL of 31 (system administrator level) or higher. The system resets a user's inactivity timer when the user account is created (via ENT-USER), and each time the user logs-on to the system. If POUT or UOUT is enabled (a provisioned value greater than zero) and a user does not log-on to the system for a period of time greater than the provisioned POUT or UOUT values, the system deactivates the user's password (PID) or the user's account (UID), respectively.

If a user password (PID) or user account (UID) is deactivated or removed, then only a system administrator account user or the Alcatel account user can enter a new user password or user account database entry.

A SET-ATTR-SECUDFLT command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-ATTR-SECUDFLT: [TID] :: [CTAG] :: : [PAGE=] [, POUT=] [, UOUT=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

PAGE=	{ 0–999 }	
	Default:	<Previously existing values> or {30} (Factory Default)
	Addressing:	None
	Description:	Password Aging Interval, specifies the number of days that a user's password (PID) is aged before the system prompts the user to change to a new password. The user receives this prompt only if the user password has not already been changed within this interval. A (non–system administrator or non–Alcatel account) user's PID is deactivated if a new PID is not entered (via ED–PID) before the session in which the user receives this prompt is terminated. Values are:
	0	Zero, password aging on user accounts is disabled. User passwords are not deactivated by password aging if 0 is entered.
	1–999	Password Aging Interval in days.
POUT=	{ 0–999 }	
	Default:	<Previously existing values> or {45} (Factory Default)
	Addressing:	None
	Description:	Password Out (Deactivation on Inactivity) Interval, specifies the number of days that a (non–system administrator or non–Alcatel account) user account can be inactive (the user has not logged–on to the system) before the system deactivates the user password identifier (PID). Values are:
	0	Zero, Password Out on user accounts is disabled. User passwords are not deactivated due to user log–in inactivity.
	1–999	Password Out interval in days.
UOUT=	{ 0–999 }	
	Default:	<Previously existing values> or {120} (Factory Default)
	Addressing:	None
	Description:	User Identification (UID) Out (Deactivation on Inactivity Interval, specifies the number of days that a (non–system administrator or non–Alcatel account) user account can be inactive (the user has not logged–on to the system) before the system deactivates the user account (UID). Values are:
	0	Zero, UOUT on user accounts is disabled. User accounts (UIDs) are not deactivated due to user log–in inactivity.
	1–999	User ID Out interval in days.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IPNV	Input, Parameter Not Valid
SDBE	Status, internal Data Base Error
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the password aging interval (PAGE) is set to 45 days, the password out interval (POUT) is set to 60 days, and the UID aging interval (UOUT) is set to 150 days.

COMMAND CODE: **SET-ATTR-STS1**
COMMAND NAME: **SET ATTRIBUTE STS-1**

PURPOSE

The SET-ATTR-STS1 command sets the notification code generated by the system for non-service affecting and service affecting STS-1 standing conditions pertaining to the specified STS-1 port.

Upon execution of the SET-ATTR-STS1 command, any condition that exists for the specified STS-1 port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-STS1 command is denied if:

- The specified STS-1 port is not provisioned (via ENT-STS1).
- The specified STS-1 port is embedded within a protection OC3 port.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-ATTR-STS1: [TID] :AID: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	STS1 AID, identifies the STS-1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, DFLT, MJ, MN, NA, NR}	
	Default:	{NA}
	Addressing:	None
	Description:	Notification Code, specifies the notification code that is generated by the system upon the occurrence of the event specified by CONDTYPE. Values are:
	CR	Critical Alarm (reported via REPT^ALM autonomous message).
	DFLT	Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-STS1).
	MJ	Major Alarm (reported via REPT^ALM autonomous message).
	MN	Minor Alarm (reported via REPT^ALM autonomous message).
	NA	Not Alarmed (reported via REPT^EVT autonomous message).
	NR	Not Reported.

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKS WBK, FRCDWKS WPR, IDLE, INHPMREPT, LOP, MAN, MANWKS WBK, MANWKS WPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK Active Loopback, the STS-1 port is in loop back. (Near-End only.)
	AIS Alarm Indication Signal, AIS detected. (Near-End only.)
	EBER Excessive Bit Error Rate detected. (Near-End only.)
	FLTESC Facility Fault Escalation active. (Near-End only.)
	FRCDWKS WBK Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
	FRCDWKS WPR Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
	IDLE Idle, incoming idle detected. (Near-End only.)
	INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	LOP Loss Of Pointer detected. (Near-End only.)
	MAN Manual removal (logical removal was performed on the facility). (Near-End only.)
	MANWKS WBK Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
	MANWKS WPR Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
	PDI Incoming PDI signal detected (STS1)
	RFI Remote Failure Indication detected. (Far-End only.)
	SDBER Signal Degrade Bit Error Rate detected. (Near-End only.)
	SLMF Signal Label Match Failure detected. (Near-End only.)
Restrictions:	SET-ATTR-STS1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).
LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	SET-ATTR-STS1 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).

DIRN	{NA, RCV, TRMT}					
	Default: < All applicable directions >					
	Addressing: None					
	Description: Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-ATTR-STS1 command.					
	<table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT
NA	Not Applicable					
RCV	Receive side					
TRMT	Transmit direction					
TMPER	{15-MIN, 1-DAY}					
	Default: {15-MIN}					
	Addressing: None					
	Description: Time Period. The value for TMPER is verified, but does not affect the function of the SET-ATTR-STS1 command.					
SRVEFF	{NSA, SA}					
	Default: < Both service effect values >					
	Addressing: None					
	Description: Service Effect, specifies the service effect of the condition type for which the specified NTFCNCDE is to be set. Values are:					
	<table> <tr> <td>NSA</td><td>Non-Service Affecting</td></tr> <tr> <td>SA</td><td>Service Affecting</td></tr> </table>	NSA	Non-Service Affecting	SA	Service Affecting	
NSA	Non-Service Affecting					
SA	Service Affecting

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
	/* Condition type is not consistent with <FACILITY TYPE STRING>. */
	/* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid
	/* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
	/* Invalid service effect specified: <SERVICE EFFECT STRING>. */
	/* Invalid condition type specified: <CONDITION TYPE STRING>. */
	/* Invalid location specified: <LOCATION STRING>. */
	/* Invalid Parameter Value. */
IIAC	Input, Invalid ACcess identifier
	/* Invalid Access ID specified. */

INUP	Input, Non-Null Unimplemented Parameter /* No matching attributes to update as requested by user. */
SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update file <FILENAME>, Error <ERROR NUMBER> */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */

EXAMPLES

In the following example, the notification code is set to major (MJ) for the near-end service affecting LOP condition type for STS-1 port EC1STS1-337.

```
SET-ATTR-STS1::EC1STS1-337:::MJ,LOP,NEND,,SA;
```

In the following example, the notification code is set to not alarmed (NA) for both the non-service affecting and service affecting RFI condition type for STS-1 ports EC1STS1-337 through EC1STS1-384.

```
SET-ATTR-STS1::EC1STS1-337&-384:::RFI;
```

In the following example, the notification code for all service affecting and non-service affecting condition types is set to its system default value for STS-1 port EC1STS1-102.

```
SET-ATTR-STS1::EC1STS1-102:::DFLT;

COMMAND CODE: **SET-ATTR-STS3C**
COMMAND NAME: **SET ATTRIBUTE STS-3C**

PURPOSE

The SET-ATTR-STS3C command sets the notification code generated by the system for non-service affecting and service affecting STS-3C standing conditions pertaining to the specified STS-3C port.

Upon execution of the SET-ATTR-STS3C command, any condition that exists for the specified STS-3C port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-STS3C command is denied if:

- The specified STS-3C port is not provisioned (via ENT-STS3C).
- The specified STS-3C port is embedded within a protection OC-3 or OC-12 port.
- An invalid parameter value or combination of parameter values is entered.

COMMAND CODE: **SET-ATTR-T1**
COMMAND NAME: **SET ATTRIBUTE T1**

PURPOSE

The SET-ATTR-T1 command sets the notification code generated by the system for non-service affecting and service affecting DS1 standing conditions pertaining to the specified DS1 or Timing Reference (TMG) port.

Upon execution of the SET-ATTR-T1 command, any condition that exists for the specified DS1 or TMG port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-T1 command is denied if:

- The specified DS1 or TMG port is not provisioned (via ENT-T1).
- The specified DS1 port is embedded within a protection OC3 port.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-ATTR-T1 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{EC1T1-{1-3840}-{1-7}-{1-4}}	(EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)

	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)
	TMG_AID:	
	{TMG-{0, 1}}	
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS1/TMG AID, identifies the DS1 or Timing Reference port.
	Restrictions:	SET-ATTR-T1 is denied if the specified AID does not support the specified CONDDTYPE (e.g., DS1 AID and CONDDTYPE of SYNCSEC).
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

NTFCNCDE	{CR, DFLT, MJ, MN, NA, NR}
	Default: {NA}
	Addressing: None
	Description: Notification Code, specifies the notification code that is generated by the system upon the occurrence of the event specified by CONDTYPE. Values are:
	CR Critical Alarm (reported via REPT^ALM autonomous message).
	DFLT Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-T1).
	MJ Major Alarm (reported via REPT^ALM autonomous message).
	MN Minor Alarm (reported via REPT^ALM autonomous message).
	NA Not Alarmed (reported via REPT^EVT autonomous message).
	NR Not Reported.
CONDTYPE	DS1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, DS1ISD, EOC, INHPMREPT, LOF, LOS, MAN, RCVCLPBK, ROLLMON, XMTCLPBK}, DS1_FAR-END_CONDTYPE:{RAI, RAI-CI}, TMG_NEAR-END_CONDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL}
	Default: < All applicable condition types listed above >
	Addressing: None
	Description: Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK Active Loopback, the DS1 port is in loop back. (DS1 Near-End only.)
	AIS Alarm Indication Signal, AIS detected. (DS1 or TMG Near-End only.)
	AIS-CI Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near-End)
	ALWCBLPBK Allow C-Bit Loopback. (DS1 Near-End only.)
	DS1ISD DS1 Idle Signal Detected, Incoming. (DS1 Near-End.)
	EOC Embedded Operations Channel, EOC failure detected. (DS1 Near-End only.)
	INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited. (DS1 Near-End only.)
	LOF Loss Of Frame detected. (DS1 or TMG Near-End only.)
	LOS Loss Of Signal detected. (DS1 or TMG Near-End only.)
	MAN Manual removal (logical removal was performed on the facility). (DS1 Near-End only.)
	RAI Remote Alarm Indication detected. (DS1 Far-End only.)
	RAI-CI Remote Alarm Indication for Customer Installation detected. (DS1 Far-End.)
	RCVCLPBK Receive (DS1) C-Bit Loopback. (DS1 Near-End only.)
	ROLLMON Roll Monitoring, receive-side RTO port being monitored for valid signal. (DS1 Near-End only.)
	SLTMSIG Slipping Timing Reference Signal detected. (TMG Near-End only.)
	SYNCPRI Primary Reference Synchronization failure. (TMG Near-End only.)
	SYNCSEC Secondary Reference Synchronization failure. (TMG Near-End only.)
	SYNCSTATQUAL Synchronization Status Quality. (TMG Near-End only.)
	XMTCLPBK Transmit (DS1) C-Bit Loopback. (DS1 Near-End only.)

	Restrictions:	SET-ATTR-T1 is denied if the specified CONDTYPE is not supported for the specified AID (e.g., CONDTYPE of SYNCSEC and DS1 AID). SET-ATTR-T1 is denied if the specified CONDTYPE value is not supported for the specified LOCN value (e.g., CONDTYPE of RAI and LOCN of NEND is entered). SET-AATTR-T1 is denied if the DS1 CI/NI Trouble Sectionalization Premium Feature Option (PFO) is not enabled and an input value of AIS-CI, DS1ISD or RAI-CI is entered.
LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
	Restrictions:	SET-ATTR-T1 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-ATTR-T1 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the SET-ATTR-T1 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type for which the specified NTFCNCDE is to be set. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

EFON	Equipage, Feature Option Not provided
IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */ /* The <LOCATION STRING> <CONDITION TYPE STRING> condition does not apply to this facility. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid Parameter Value. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
INUP	Input, Non-Null Unimplemented Parameter /* No matching attributes to update as requested by user. */
SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update file <FILENAME>, Error <ERROR NUMBER> */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine supporting facility entity. */

EXAMPLES

In the following example, the notification code is set to minor (MN) for the service affecting MAN condition type for DS1 port T3T1-1297-1.

```
SET-ATTR-T1::T3T1-1297-1::MN,MAN,NEND,,SA;
```

In the following example, the notification code is set to not alarmed (NA) for both the non-service affecting and service affecting EOC condition type for DS1 ports T3T1-1297-1 through T3T1-1297-28.

```
SET-ATTR-T1::T3T1-1297-1&&-28::,EOC;
```

In the following example, the notification code for all service affecting and non-service affecting condition types is set to its system default value for DS1 port T3T1-1062-20.

```
SET-ATTR-T1::T3T1-1062-20::DFLT;
```

COMMAND CODE: **SET-ATTR-T3**
COMMAND NAME: **SET ATTRIBUTE T3**

PURPOSE

The SET-ATTR-T3 command sets the notification code generated by the system for non-service affecting and service affecting DS3 standing conditions pertaining to the specified DS3 port.

Upon execution of the SET-ATTR-T3 command, any condition that exists for the specified DS3 port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-T3 command is denied if:

- The specified DS3 port is not provisioned (via ENT-T3).
- The specified DS3 port is embedded within a protection OC3 port.
- An invalid parameter value or combination of parameter values is entered.

SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine supporting facility entity. */

EXAMPLES

In the following example, the notification code is set to major (MJ) for the near-end service affecting LOS condition type for DS3 port T3-1297.

```
SET-ATTR-T3::T3-1297::MJ,LOS,NEND,,SA;
```

In the following example, the notification code is set to not alarmed (NA) for both the non-service affecting and service affecting DS2YEL condition type for DS3 ports T3-1297 through T3-1344.

```
SET-ATTR-T3::T3-1297&-1344::,DS2YEL;
```

In the following example, the notification code for all service affecting and non-service affecting condition types is set to its system default value for DS3 port EC1T3-102.

```
SET-ATTR-T3::EC1T3-102::DFLT;
```

COMMAND CODE: **SET-ATTR-VT1**
COMMAND NAME: **SET ATTRIBUTE VT1**

PURPOSE

The SET-ATTR-VT1 command sets the notification code generated by the system for non-service affecting and service affecting VT1.5 standing conditions pertaining to the specified VT1.5 port.

Upon execution of the SET-ATTR-VT1 command, any condition that exists for the specified VT1.5 port, condition type, and service effect combination is updated with the new notification code.

A SET-ATTR-VT1 command is denied if:

- The specified VT1.5 port is not provisioned (via ENT-VT1).
- The specified VT1.5 port is embedded within a protection OC3 port.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-ATTR-VT1: [TID] :AID: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies the VT1.5 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, DFLT, MJ, MN, NA, NR} Default: {NA} Addressing: None Description: Notification Code, specifies the notification code that is generated by the system upon the occurrence of the event specified by CONDTYPE. Values are: CR Critical Alarm (reported via REPT^ALM autonomous message). DFLT Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-VT1). MJ Major Alarm (reported via REPT^ALM autonomous message). MN Minor Alarm (reported via REPT^ALM autonomous message). NA Not Alarmed (reported via REPT^EVT autonomous message). NR Not Reported.

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF},	
	FAR-END_CONDDTYPE:{RFI}	
	Default:	< All applicable condition types listed above >
	Addressing:	None
	Description:	Condition Type, specifies the condition type for which the specified NTFNCNDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK	Active Loopback, the VT1.5 port is in loop back. (Near-End only.)
	AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
	EBER	Excessive Bit Error Rate detected. (Near-End only.)
	FLTESC	Facility Fault Escalation active. (Near-End only.)
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
	IDLE	Idle, incoming idle detected. (Near-End only.)
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	LOP	Loss Of Pointer detected. (Near-End only.)
	MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
	RFI	Remote Failure Indication detected. (Far-End only.)
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (Near-End only.)
	SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
	SLMF	Signal Label Match Failure detected. (Near-End only.)
	Restrictions:	SET-ATTR-VT1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).
LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
	Restrictions:	SET-ATTR-VT1 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).

DIRN	{NA, RCV, TRMT}					
	Default: < All applicable directions >					
	Addressing: None					
	Description: Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-ATTR-VT1 command.					
	<table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT
NA	Not Applicable					
RCV	Receive side					
TRMT	Transmit direction					
TMPER	{15-MIN, 1-DAY}					
	Default: {15-MIN}					
	Addressing: None					
	Description: Time Period. The value for TMPER is verified, but does not affect the function of the SET-ATTR-VT1 command.					
SRVEFF	{NSA, SA}					
	Default: < Both service effect values >					
	Addressing: None					
	Description: Service Effect, specifies the service effect of the condition type for which the specified NTFNCNDE is to be set. Values are:					
	<table> <tr> <td>NSA</td><td>Non-Service Affecting</td></tr> <tr> <td>SA</td><td>Service Affecting</td></tr> </table>	NSA	Non-Service Affecting	SA	Service Affecting	
NSA	Non-Service Affecting					
SA	Service Affecting

	/* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid
	/* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
	/* Invalid service effect specified: <SERVICE EFFECT STRING>. */
	/* Invalid condition type specified: <CONDITION TYPE STRING>. */
	/* Invalid location specified: <LOCATION STRING>. */
	/* Invalid Parameter Value. */
IIAC	Input, Invalid ACcess identifier
	/* Invalid Access ID specified. */

INUP	Input, Non-Null Unimplemented Parameter /* No matching attributes to update as requested by user. */
SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update file <FILENAME>, Error <ERROR NUMBER> */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */

EXAMPLES

In the following example, the notification code is set to major (MJ) for the near-end service affecting LOP condition type for VT1.5 port EC1VT1-337-4-2.

```
SET-ATTR-VT1::EC1VT1-337-4-2:::MJ,LOP,NEND,,SA;
```

In the following example, the notification code is set to not alarmed (NA) for both the non-service affecting and service affecting RFI condition type for VT1.5 ports EC1VT1-338-7-1 through EC1VT1-338-7-4.

```
SET-ATTR-VT1::EC1VT1-338-7-1&-4:::,RFI;
```

In the following example, the notification code for all service affecting and non-service affecting condition types is set to its system default value for VT1.5 port EC1VT1-102-3-1.

```
SET-ATTR-VT1::EC1VT1-102-3-1:::DFLT;

COMMAND CODE: **SET-DFLT-EC1**
COMMAND NAME: **SET DEFAULT EC1**

PURPOSE

The SET-DFLT-EC1 command changes the system default values for EC1 port parameters specified in the ENT-EC1 command. The parameter system default values, as set by this command, are used for provisioning of EC1 ports when a parameter value is not explicitly specified in the ENT-EC1 command.

Only those parameters specified in the command result in a change to the system database. Parameters not specified retain the value as provided from the factory or as set with a previously executed SET-DFLT-EC1 command. Previously provisioned EC1 ports are not affected by this command. All subsequently provisioned EC1 ports assume the parameter default value entered with the last executed SET-DFLT-EC1 command unless a different value is explicitly specified in the ENT-EC1 command.

The EC1 parameter default database is not affected (changed) by a system restart. The EC1 parameter default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLT-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLT-EC1 : [TID] : : [CTAG] : : : [AINSTH=] : [PST] [, SST] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH-MM:{00–48} – {00–59} } Default: Default = Previously existing value Factory Default = 8 hours Addressing: None Description: Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is: <div style="margin-left: 40px;">HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively.</div> Restrictions: If 48 is specified in HH, then MM has to be 00.
PST	{IS, OOS} Default: < Previously existing value > or {IS} (Factory Default) Addressing: None Description: Primary State, specifies the primary state to provision the EC1. Values are: <div style="margin-left: 40px;">IS In-Service OOS Out-Of-Service</div> Restrictions: SET-DFLT-EC1 is denied if PST of OOS and SST of AINS is entered.

SST	{AINS, AINS-DEA}
Default:	< Previously existing value > or <Null> (Unpopulated – Factory Default)
Addressing:	None
Description:	Secondary State, specifies the secondary state to provision the EC1. Values are: AINS Automatic In-Service, the SST database value is set to AINS. AINS-DEA Automatic In-Service-Deactivate, the SST database value is set to <NoVal> (unpopulated).
Restrictions:	SET-DFLT-EC1 is denied if SST of AINS and PST of OOS is entered. SET-DFLT-EC1 is denied if SST of AINS-DEA is entered and the current SST database value is not set AINS.

COMMAND CODE: **SET-DFLT-OC12**
COMMAND NAME: **SET DEFAULT OC-12**

PURPOSE

The SET-DFLT-OC12 command changes the system default values for OC-12 port parameters specified in the ENT-OC12 command. The parameter system default values, as set by this command, are used for provisioning of OC-12 ports when a parameter value is not explicitly specified in the ENT-OC12 command.

Only those parameters specified in the command result in a change to the system database. Parameters not specified retain the value as provided from the factory or as set with a previously executed SET-DFLT-OC12 command. Previously provisioned OC-12 ports are not affected by this command. All subsequently provisioned OC-12 ports assume the parameter default value entered with the last executed SET-DFLT-OC12 command unless a different value is explicitly specified in the ENT-OC12 command.

The OC-12 parameter default database is not affected (changed) by a system restart. The OC-12 parameter default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLT-OC12 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLT-OC12: [TID] :: [CTAG] :: [AINSTH=] [, S1TRANS=] [, SDTHSW=] : [PST] [, SST] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH-MM:{00-48} – {00-59} } Default: Default = Previously existing value Factory Default = 8 hours Addressing: None Description: Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is: HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively. Restrictions: If 48 is specified in HH, then MM has to be 00.
S1TRANS=	{ DUS, ACT } Default: <Previously existing value> or {DUS} (Factory Default) Addressing: None Description: S1 byte to be transmitted, determines if the S1 byte transmitted will have the "DUS" message or will have the actual traceability of the signal. Values are: DUS Don't USE. The S1 byte is set to "DON'T USE for Synchronization" message. ACT ACTual. The S1 byte is set to the actual traceability of the signal.

SDTHSW=	{5, 6, 7, 8, 9}	
	Default:	<Previously existing value> or {6} (Factory Default)
	Addressing:	None
	Description:	Signal Degrade Threshold Switching level, indicates the signal degrade threshold over which the Signal Degrade protection switching is initiated. Values are:
	5	BER threshold of 10E-5.
	6	BER threshold of 10E-6
	7	BER threshold of 10E-7
	8	BER threshold of 10E-8
	9	BER threshold of 10E-9
PST	{IS, OOS}	
	Default:	< Previously existing value > or {IS} (Factory Default)
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the OC-12. Values are:
	IS	In-Service
	OOS	Out-Of-Service
	Restrictions:	SET-DFLT-OC12 is denied if PST of OOS and SST of AINS is entered.
SST	{AINS, AINS-DEA}	
	Default:	< Previously existing value > or <Null> (Unpopulated – Factory Default)
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the OC-12. Values are:
	AINS	Automatic In-Service, the SST database value is set to AINS.
	AINS-DEA	Automatic In-Service-Deactivate, the SST database value is set to <NoVal> (unpopulated).
	Restrictions:	SET-DFLT-OC12 is denied if SST of AINS and PST of OOS is entered. SET-DFLT-OC12 is denied is SST of AINS-DEA is entered and the current SST database value is not set AINS.

COMMAND CODE: **SET-DFLT-OC3**
COMMAND NAME: **SET DEFAULT OC-3**

PURPOSE

The SET-DFLT-OC3 command changes the system default values for OC-3 port parameters specified in the ENT-OC3 command. The parameter system default values, as set by this command, are used for provisioning of OC-3 ports when a parameter value is not explicitly specified in the ENT-OC3 command.

Only those parameters specified in the command result in a change to the system database. Parameters not specified retain the value as provided from the factory or as set with a previously executed SET-DFLT-OC3 command. Previously provisioned OC-3 ports are not affected by this command. All subsequently provisioned OC-3 ports assume the parameter default value entered with the last executed SET-DFLT-OC3 command unless a different value is explicitly specified in the ENT-OC3 command.

The OC-3 parameter default database is not affected (changed) by a system restart. The OC-3 parameter default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLT-OC3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLT-OC3 : [TID] : : [CTAG] : : : [AINSTH=] [, S1TRANS=] [, SDTHSW=] : [PST] [, SST] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH	{HH-MM:{00-48} – {00-59} } Default: Default = Previously existing value Factory Default = 8 hours Addressing: None Description: Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is: HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively. Restrictions: If 48 is specified in HH, then MM has to be 00.
S1TRANS=	{ DUS, ACT } Default: <Previously existing value> or {DUS} (Factory Default) Addressing: None Description: S1 byte to be transmitted, determines if the S1 byte transmitted will have the "DUS" message or will have the actual traceability of the signal. Values are: DUS Don't USE. The S1 byte is set to "DON'T USE for Synchronization" message. ACT ACTual. The S1 byte is set to the actual traceability of the signal.

SDTHSW=	{5, 6, 7, 8, 9}	
	Default:	<Previously existing value> or {6} (Factory Default)
	Addressing:	None
	Description:	Signal Degrade Threshold Switching level, indicates the signal degrade threshold over which the Signal Degrade protection switching is initiated. Values are:
	5	BER threshold of 10E-5.
	6	BER threshold of 10E-6
	7	BER threshold of 10E-7
	8	BER threshold of 10E-8
	9	BER threshold of 10E-9
PST	{IS, OOS}	
	Default:	< Previously existing value > or {IS} (Factory Default)
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the OC-3. Values are:
	IS	In-Service
	OOS	Out-Of-Service
	Restrictions:	SET-DFLT-OC3 is denied if PST of OOS and SST of AINS is entered.
SST	{AINS, AINS-DEA}	
	Default:	< Previously existing value > or <Null> (Unpopulated – Factory Default)
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the OC-3. Values are:
	AINS	Automatic In-Service, the SST database value is set to AINS.
	AINS-DEA	Automatic In-Service-Deactivate, the SST database value is set to <NoVal> (unpopulated).
	Restrictions:	SET-DFLT-OC3 is denied if SST of AINS and PST of OOS is entered. SET-DFLT-OC3 is denied if SST of AINS-DEA is entered and the current SST database value is not set AINS.

COMMAND CODE: **SET-DFLT-STS1**
COMMAND NAME: **SET DEFAULT STS-1**

PURPOSE

The SET-DFLT-STS1 command changes the system default values for STS1 port parameters specified in the ENT-STS1 command. The parameter system default values, as set by this command, are used for provisioning of STS-1 ports when a parameter value is not explicitly specified in the ENT-STS1 command.

Only those parameters specified in the command result in a change to the system database. Parameters not specified retain the value as provided from the factory or as set with a previously executed SET-DFLT-STS1 command. Previously provisioned STS-1 ports are not affected by this command. All subsequently provisioned STS-1 ports assume the parameter default value entered with the last executed SET-DFLT-STS1 command unless a different value is explicitly specified in the ENT-STS1 command.

The STS1 parameter default database is not affected (changed) by a system restart. The STS1 parameter default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLT-STS1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

```
SET-DFLT-STS1: [TID] :: [CTAG] :: [EXPTRC=] [, STSMAP=] [, STSPTYEL=] [, TRC=]  
[, PDIINS=] : [PST] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
EXPTRC=	< 0-62 ASCII printable characters followed by CR and LF> Default: <Previously existing value> Factory default = 62 null characters followed by CR and LF Addressing: None Description: Expected Path Trace message, specifies the expected path trace message. Value consists of 0-62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the EXPTRC message is filled with ASCII nulls followed by CR and LF. The EXPTRC value must be enclosed within double-quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the EXPTRC message is 62 ASCII nulls followed by a CR and LF.

STSMAP=	{ALL, ASYNC, VTFLOAT}	
	Default:	<Previously existing value> Factory default = VTFLOAT
	Addressing:	None
	Description:	STS payload Mapping, specifies the expected STS-1 payload type and the value of the expected path signal label (C2). The value of STSMAP is used for comparison in the Signal Label Mismatch function. Values are:
	ALL	Generic STS-1 format. Contains payload of any mapping format (C2 ≠ 000 bin). Since this value matches all signal label values, mismatch alarms can never be generated. The transmitted signal label however depends on how the cross connect has been made.
	ASYNC	Asynchronous mapping for DS3 (i.e. C2=04 hex)
	VTFLOAT	Floating mode VTs (i.e. C2=02 hex).
STSPTYEL=	{N}	
	Default:	{N} (Factory default)
	Addressing:	None
	Description:	STS Path Yellow behavior, specifies whether STS path Yellow or Remote Defect Indicator (RDI) is transmitted/received. Values are:
	N	No. RDI is transmitted/received on appropriate defect states.
TRC=	< 0–62 ASCII printable characters followed by CR and LF >	
	Default:	<Previously existing value> Factory default = 62 null characters followed by CR and LF
	Addressing:	None
	Description:	Path Trace message, specifies the path trace message transmitted when the STS-1 is provisioned. Value consists of 0–62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the TRC message is filled with ASCII nulls followed by CR and LF. The TRC value must be enclosed within double-quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the TRC message is 62 ASCII nulls followed by a CR and LF.
PDIINS=	{N,Y}	
	Default:	<Previously existing value> Factory default = N
	Addressing:	None
	Description:	Payload Defect Insertion, specifies whether or not PDI-P values are inserted into the outgoing STS1 upon detection of DS3/VT1.5 failures. Values are:
	N	No. PDI-P values are not inserted into the outgoing signal label when payload defects exist.
	Y	Yes, appropriate PDI-P values are inserted into the outgoing signal label when payload defects exist.
	Restrictions:	If FLTPRO=N is set in the ED-FLTPRO-STs1 command, PDI is inserted per GR-253. If FLTPRO=Y is set in the ED-FLTPRO-STs1 command, PDI is inserted per Alcatel's Fault Escalation type payload defects.

PST	{IS, OOS}	
	Default:	<Previously existing value> Factory Default = IS
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the STS-1. Values are:
	IS	In-Service
	OOS	Out-Of-Service

COMMAND CODE: **SET-DFLT-STS3C**
COMMAND NAME: **SET DEFAULT STS-3C**

PURPOSE

The SET-DFLT-STS3C command changes the system default values for STS-3C port parameters specified in the ENT-STS3C command. The parameter system default values, as set by this command, are used for provisioning of STS-3C ports when a parameter value is not explicitly specified in the ENT-STS3C command.

Only those parameters specified in the command result in a change to the system database. Parameters not specified retain the value as provided from the factory or as set with a previously executed SET-DFLT-STS3C command. Previously provisioned STS-3C ports are not affected by this command. All subsequently provisioned STS-3C ports assume the parameter default value entered with the last executed SET-DFLT-STS3C command unless a different value is explicitly specified in the ENT-STS3C command.

The STS-3C parameter default database is not affected (changed) by a system restart. The STS-3C parameter default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLT-STS3C command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLT-STS3C: [TID] : : [CTAG] : : : [EXPTRC=] [, STSMAP=] [, TRC=] : [PST] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
EXPTRC=	< 0-62 ASCII printable characters followed by CR and LF> Default: <Previously existing value> or {62 null characters followed by CR and LF} (Factory default) Addressing: None Description: Expected Path Trace message, specifies the expected path trace message. Value consists of 0-62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the EXPTRC message is filled with ASCII nulls followed by CR and LF. The EXPTRC value must be enclosed within double-quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the EXPTRC message is 62 ASCII nulls followed by a CR and LF.

STSMAP=	{ALL, ATM, DQDB, DS4NA, FDDI}
	Default: <Previously existing value> or {ALL} (Factory default)
	Addressing: None
	Description: STS payload Mapping, determines the expected STS-3C payload type and the value of the expected path signal label (C2). Used for comparison for the Signal Label Mismatch function. Values are:
	ALL Generic STS-3C format. Contains payload of any mapping format (C2≠000 bin). Since this value will match ALL signal label values, mismatch alarms are never generated.
	ATM STS-3C contains ATM payload (provisioned (C2=13)).
	DQDB STS-3C contains DQDB payload (provisioned (C2=14)).
	DS4NA STS-3C contains DS4NA payload (provisioned (C2=12)).
	FDDI STS-3C contains FDDI payload (provisioned (C2=15)).
TRC=	< 0-62 ASCII printable characters followed by CR and LF >
	Default: <Previously Existing Value>
	Addressing: None
	Description: Path Trace message. Specifies the path trace message to be transmitted when the STS-3c is provisioned. Value consists of 0-62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the TRC message is filled with ASCII nulls followed by CR and LF. The TRC value must be enclosed within double-quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the TRC message is 62 ASCII nulls followed by a CR and LF.
PST	{IS, OOS}
	Default: <Previously existing value> or {IS} (Factory Default)
	Addressing: None
	Description: Primary State, specifies the primary state to provision the STS-3C. Values are:
	IS In-Service
	OOS Out-Of-Service

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIFM	Input, Invalid data ForMat
	/* TRC and/or EXPTRC text string is too long */
SDBE	Status, internal Data Base Error
	/* DFLT Database Error: <ERROR-STRING> */

EXAMPLES

The following example changes the default STS-3C provisioning parameter values for EXPTRC to Null character string, STSMAP to ATM, and PST to OOS. After this command is executed, all subsequent provisioning of STS-3C ports with the ENT-ST3C command is provisioned with these default values unless a different value is explicitly specified in the ENT-ST3C command.

```
SET-DFLT-ST3C: : : : : EXPTRC="" , STSMAP=ATM, TRC="" : OOS ;
```

COMMAND CODE: **SET-DFLT-T1**
COMMAND NAME: **SET DEFAULT T1**

PURPOSE

The SET-DFLT-T1 command changes the system default values for DS1 port parameters specified in the ENT-T1 command. The parameter system default values, as set by this command, are used for provisioning of DS1 ports when a parameter value is not explicitly specified in the ENT-T1 command.

Only those parameters specified in the command result in a change to the system database. Parameters not specified retain the value as provided from the factory or as set with a previously executed SET-DFLT-T1 command. Previously provisioned DS1 ports are not affected by this command. All subsequently provisioned DS1 ports assume the parameter default value entered with the last executed SET-DFLT-T1 command unless a different value is explicitly specified in the ENT-T1 command.

The DS1 parameter default database is not affected (changed) by a system restart. The DS1 parameter default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

If the default PST,SST is set to IS, AINS, then in order to provision an embedded DS1, the ENT-T1 command must specify the SST of AINS-DEA or else the ENT-T1 command will be denied.

A SET-DFLT-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
SET-DFLT-T1: [TID] :: [CTAG] :: [AINSTH=] [, AISC=] [, AISF=] [, FEMETHOD=]  
[, FENDNTE=] [, FMT=] [, IDLE=] [, LINECDE=] : [PST] [, SST] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH-MM:{00-48} – {00-59} } Default: Default= Previously existing value Factory Default = 8 hours Addressing: None Description: Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is: <div>HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively.</div> Restrictions: If 48 is specified in HH, then MM has to be 00.

AISC=	{LOF, LOFLOS, LOS}
Default:	<Previously existing value> or {LOS} (Factory Default)
Addressing:	None
Description:	Alarm Indication Signal insertion Criteria, specifies the condition necessary for insertion of AIS into a failed DS1 signal path. Values are:
LOF	Automatic AIS insertion on detection of LOF.
LOFLOS	Automatic AIS insertion on detection of LOF or LOS.
LOS	Automatic AIS insertion on detection of LOS. LOS only applies to a terminated electrical DS1.
AISF=	{N, Y}
Default:	<Previously existing value> or {Y} (Factory Default)
Addressing:	None
Description:	Alarm Indication Signal Failure substitution, specifies whether a failed upstream signal (as defined by the AISC parameter) should have AIS inserted in the downstream path. Values are:
N	No, AIS is not inserted in the downstream path of a failed signal, the failed signal passes through the system.
Y	Yes, AIS is inserted in the downstream path of a failed signal.
FEMETHOD=	{ANSI, ATTPOLL, NONE}
Default:	<Previously existing value> or {NONE} (Factory Default)
Addressing:	None
Description:	Far-End PM collection Method, specifies the PM collection method for far-end PM data. Values are:
ANSI	Basic ANSI T1.403 PM data collection.
ATTPOLL	Poll for PM data using the AT&T 54016 protocol to poll the data and convert into ANSI format for reporting. (ALCATEL method).
NONE	None, far-end PM is not collected on the DS1.
Restrictions:	SET-DFLT-T1 is denied if FEMETHOD=ANSI and either FENDNTE={ATT, NONE} or FMT={SF,UNFR}. SET-DFLT-T1 is denied if FEMETHOD=ATTPOLL and either FENDNTE={ANSI, NONE} or FMT={SF,UNFR}.
FENDNTE=	{ANSI, ANSIATT, ATT, NONE}
Default:	<Previously existing value> or {NONE} (Factory Default)
Addressing:	None
Description:	Far-End NTE performance monitoring terminal type, specifies whether the far-end network terminal supports standard ANSI performance monitoring (PM) collection and reporting or AT&T TR-54016 polled PM reporting for ESF DS1 signal formats. Values are:
ANSI	ANSI, the far-end NTE supports the ANSI T1.403 PM standard.
ANSIATT	ANSI and AT&T, the far-end NTE supports the ANSI T1.403 PM standard and the AT&T TR-54016 polled PM reporting standard.
ATT	AT&T TR-54016, the far-end NTE supports the AT&T TR-54016 polled PM reporting standard. (Refer to RTRV-FEDATA-T1)
NONE	None, the far-end NTE does not support either the ANSI T1.403 PM standard or the AT&T TR-54016 standard.
Restrictions:	SET-DFLT-T1 is denied if FENDNTE={ANSI} and FEMETHOD={ATT-POLL}. SET-DFLT-T1 is denied if FENDNTE={ATT} and FEMETHOD={ANSI}.

FMT=	{ESF, SF, UNFR}	
	Default:	<Previously existing value> or {UNFR} (Factory Default)
	Addressing:	None
	Description:	DS1 Format, specifies the DS1 signal format for this port. The DS1 FMT parameter determines the type of signal format used for performance monitoring data collection and transmission condition detection, or the format of the Idle Signal Source port if SRC=INTSRC in the ENT-T1 command. Values are:
	ESF	Extended SuperFrame
IDLE=	SF	SuperFrame
	UNFR	Unframed
	Restrictions:	SET-DFLT-T1 is denied if FMT={SF, UNFR} and FEMETHOD= {ANSI, ATTPOLL}. SET-DFLT-T1 is denied if FMT=UNFR and IDLE=QRSF.
LINECDE=	{AIS, QRSF, QRSU}	
	Default:	<Previously existing value> or {AIS} (Factory Default)
	Addressing:	None
	Description:	Idle signal transmit type, specifies the type of Idle signal to be transmitted by this port when it is disconnected, or determines the type of Idle signal of the Idle Signal Source port if SRC={EXTSRC, INTSRC} in the ENT-T1 command. Values are:
	AIS	AIS (Alarm Indication Signal)
PST	QRSF	Framed QRS (Quasi-Random Signal)
	QRSU	Unframed QRS (Quasi-Random Signal)
	Restrictions:	SET-DFLT-T1 is denied if IDLE=QRSF and FMT=UNFR.
LINECDE=	{AMI, B8ZS}	
	Default:	<Previously existing value> or {AMI} (Factory Default for terminated electrical DS1s)
	Addressing:	None
	Description:	DS1 Line Code, specifies the type of DS1 line code for a terminated electrical DS1. Values are:
	AMI	Alternate Mark Insertion
PST	B8ZS	Bipolar with Eight Zero Substitution
PST	{IS, OOS}	
	Default:	<Previously existing value> or {IS} (Factory Default)
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the DS1. Values are:
	IS	In-Service
PST	OOS	Out-Of-Service
	Restrictions:	SET-DFLT-T1 is denied if PST of OOS and SST of AINS is entered.

SST	{AINS, AINS-DEA}
Default:	<Previously existing value> or <Null> (Unpopulated – Factory Default)
Addressing:	None
Description:	Secondary State, specifies the secondary state to provision the DS1. Values are:
	AINS Automatic In-Service, the SST database value is set to AINS.
	AINS-DEA Automatic In-Service-Deactivate, the SST database value is set to <NoVal> (unpopulated).
Restrictions:	SET-DFLT-T1 is denied if SST of AINS and PST of OOS is entered. SET-DFLT-T1 is denied if SST of AINS-DEA is entered and the current SST database value is not set AINS.

COMMAND CODE: **SET-DFLT-T3**
COMMAND NAME: **SET DEFAULT T3**

PURPOSE

The SET-DFLT-T3 command changes the system default values for DS3 port parameters specified in the ENT-T3 command. The parameter system default values, as set by this command, are used for provisioning of DS3 ports when a parameter value is not explicitly specified in the ENT-T3 command.

Only those parameters specified in the command result in a change to the system database. Parameters not specified retain the value as provided from the factory or as set with a previously executed SET-DFLT-T3 command. Previously provisioned DS3 ports are not affected by this command. All subsequently provisioned DS3 ports assume the parameter default value entered with the last executed SET-DFLT-T3 command unless a different value is explicitly specified in the ENT-T3 command.

The DS3 parameter default database is not affected (changed) by a system restart. The DS3 parameter default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RE-STORE-DB command is executed successfully).

If the default PST,SST is set to IS, AINS, then in order to provision an embedded DS3, the ENT-T3 command must specify the SST of AINS-DEA or else the ENT-T3 command will be denied.

A SET-DFLT-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
SET-DFLT-T3 : [TID] : : [CTAG] : : : [AINSTH=] [,AISC=] [,AISPASS=] [,AIST=]
              [,DS3PTYEL=] [,FEAC=] [,FMT=] [,LINECDE=] [,PMMETHOD=]
              [,XBITRCV=] [,XPOL=] : [PST] [,SST] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.
AINSTH=	{HH-MM:{00-48} – {00-59} }
Default:	Default = Previously existing value Factory Default = 8 hours
Addressing:	None
Description:	Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a 7LOF, ISD, AICMISM, LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is:
HH-MM	Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively.
Restrictions:	If 48 is specified in the HH, then MM has to be 00.

AISC=	{LOFLOS, LOS}	
	Default:	<Previously existing value> or {LOFLOS} (Factory Default)
	Addressing:	None
	Description:	Alarm Indication Signal insertion Criteria, specifies the condition at the input of a DS3 intact cross connect necessary for AIS insertion into the output of the DS3 intact cross connect. Values are:
	LOS	Loss of Signal. Automatic AIS insertion upon detection of LOS.
	LOFLOS	Loss of Frame—Loss of Signal. Automatic AIS insertion upon detection of LOFLOS.
AISPASS=	{Y, N }	
	Default:	<Previously existing value> or {Y} (Factory Default)
	Addressing:	None
	Description:	Alarm Indication Signal Passed, specifies whether the AIS generated by the input port which is connected to the output port is passed through the output port, or whether AIS is generated by the output port itself. Values are:
	Y	Yes, the AIS generated by the input port is passed through the output port.
	N	No, AIS is regenerated by the output port instead of being passed through the output port.
AIST=	{NAS, ONES, OAIS}	
	Default:	<Previously existing value> or {NAS} (Factory Default)
	Addressing:	None
	Description:	Alarm Indication Signal Type, specifies the expected input AIS signal and generated output AIS signal for the DS3 port should a failure condition exist. Values are:
	NAS	North American Standard
	ONES	Unframed All Ones (Nonstandard)
	OAIS	Old AIS, the same sequence of information bits as North American Standard but with no regard to how the C—bits are set.
DS3PTYEL=	{N, Y}	
	Default:	<Previously existing value> or {Y} (Factory Default)
	Addressing:	None
	Description:	DS3 Yellow behavior, identifies whether DS3 path yellow or RDI (remote defect indication) will be sent and detected. Values are:
	N	RDI will be sent/detected by the DS3.
	Y	DS3 path yellow will be sent/detected by the DS3.
FEAC=	{N, Y}	
	Default:	<Previously existing value> or {N} (Factory Default)
	Addressing:	None
	Description:	Far End Alarm and Control, specifies the far end alarm and control enable setting for C—bit parity format. Values are:
	N	FEAC inhibited
	Y	FEAC enabled
	Restrictions:	SET—DFLT—T3 is denied if FEAC=Y and FMT=ASYN.

FMT=	{ASYNC, CBIT, FRCC, UNCBIT, UNFR}
Default:	<Previously existing value> or {ASYNC} (Factory Default)
Addressing:	None
Description:	DS3 Format, specifies the DS3 signal format for this port. Values are: ASYNC Asynchronous (M13 format) CBIT C-Bit parity format FRCC Framed Clear Channel. UNCBIT Unchannelized C-Bit parity format UNFR Unframed format
Restrictions:	SET-DFLT-T3 is denied if FMT=ASYNC and FEAC=Y. SET-DFLT-T3 is denied if FMT=ASYNC and PMMETHOD=CP or NONE. SET-DFLT-T3 is denied if FMT=UNFR and PMMETHOD is any value other than NONE.
LINECDE=	{B3ZS}
Default:	{B3ZS}
Addressing:	None
Description:	DS3 Line Code, indicates the DS3 line coding type. Only B3ZS code is supported. B3ZS Bipolar with Three Zero Substitution.
PMMETHOD=	{CP, FM, FMA, NONE, P}
Default:	<Previously existing value> or {P} (Factory Default)
Addressing:	None
Description:	Performance Monitoring Method, specifies the type of performance monitoring to be performed on the DS3. Values are: If FMT=ASYNC (M13 format): FM F&M bit monitoring FMA F&M bit Adjusted monitoring P P-bit monitoring If FMT=CBIT (C-Bit parity format): CP Only CP-bit monitoring FM F&M bit and CP-bit monitoring FMA F&M bit Adjusted and CP-bit monitoring P P-bit and CP-bit monitoring If FMT=FRCC (Framed Clear Channel): FM F&M bit and CP-bit monitoring FMA F&M bit Adjusted and CP-bit monitoring P P-bit and CP-bit monitoring If FMT=UNCBIT (Unchannelized C-Bit parity format): CP Only CP-bit monitoring FM F&M bit and CP-bit monitoring FMA F&M bit adjusted and CP-bit monitoring P P-bit and CP-bit monitoring If FMT=UNFR (Unframed): NONE Null value specified for PMMTEHOD
Restrictions:	SET-DFLT-T3 is denied if PMMETHOD=CP and FMT=ASYNC, FRCC, or UNFR. SET-DFLT-T3 is denied if PMMETHOD=NONE and FMT=ASYNC, CBIT, FRCC, or UNCBIT.

XBITRCV=	{ALM0, ALM1, IGNORE}
	Default: <Previously existing value> or {ALM0} (Factory Default)
	Addressing: None
	Description: Receive X-Bit Translation, specifies how incoming DS3 and DS2 X-bits are translated. Values are: ALM0 Incoming X-bit of 0 indicates a remote alarm ALM1 Incoming X-bit of 1 indicates a remote alarm IGNORE Ignore incoming X-bits
XPOL=	{0, 1, ALM0, ALM1}
	Default: <Previously existing value> or {ALM0} (Factory Default)
	Addressing: None
	Description: Transmit X-bit Polarity, indicates the value to which outgoing DS3 and DS2 X-bits are set. Values are: 0 Force outgoing X-bits to 0 1 Force outgoing X-bits to 1 ALM0 Set X-bits to 0 for indicating alarm ALM1 Set X-bits to 1 for indicating alarm
PST	{IS, OOS}
	Default: <Previously existing value> or {IS} (Factory Default)
	Addressing: None
	Description: Primary State, specifies the primary state to provision the DS3. Values are: IS In-Service OOS Out-Of-Service
	Restrictions: SET-DFLT-T3 is denied if PST of OOS and SST of AINS is entered.
SST	{AINS, AINS-DEA}
	Default: < Previously existing value > or <Null> (Unpopulated – Factory Default)
	Addressing: None
	Description: Secondary State, specifies the secondary state to provision the DS3. Values are: AINS Automatic In-Service, the SST database value is set to AINS. AINS-DEA Automatic In-Service-Deactivate, the SST database value is set to <NoVal> (unpopulated).
	Restrictions: SET-DFLT-T3 is denied if SST of AINS and PST of OOS is entered. SET-DFLT-T3 is denied is SST of AINS-DEA is entered and the current SST database value is not set AINS.

COMMAND CODE: **SET-DFLT-VT1**
COMMAND NAME: **SET DEFAULT VT1**

PURPOSE

The SET-DFLT-VT1 command changes the system default values for VT1.5 port parameters specified in the ENT-VT1 command. The parameter system default values, as set by this command, are used for provisioning of VT1.5 ports when a parameter value is not explicitly specified in the ENT-VT1 command.

Only those parameters specified in the command result in a change to the system database. Parameters not specified retain the value as provided from the factory or as set with a previously executed SET-DFLT-VT1 command. Previously provisioned VT1.5 ports are not affected by this command. All subsequently provisioned VT1.5 ports assume the parameter default value entered with the last executed SET-DFLT-VT1 command unless a different value is explicitly specified in the ENT-VT1 command.

The VT1.5 parameter default database is not affected (changed) by a system restart. The VT1.5 parameter default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLT-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLT-VT1 : [TID] : : [CTAG] : : : [VTMAP=] [, VTPTYEL=] : [PST] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
VTMAP=	{ALL, ASYNC, VTBYTE} Default: <Previously existing value> or {ASYNC} (Factory default) Addressing: None Description: VT Map, specifies the system default provisioning for the expected VT1.5 payload type. Values are: ALL Generic VT1.5 format. Contains payload of any mapping format (L1–L3 ≠ 000 bin). Since this value will match all signal label values, mismatch alarms can never be generated. ASYNC VT Asynchronous mapping – VTFLOAT mode. (L1–L3 = 010 bin). VTBYTE VT Byte synchronous mapping, applicable for DS0s being mapped into VT SPE – VTFLOAT mode (L1–L3 = 100 hex).
VTPTYEL=	{N,Y} Default: <Previously existing value> or {N} (Factory default) Addressing: None Description: VT Path Yellow behavior, specifies whether VT1.5 path yellow or RDI will be transmitted/received. Values are: N No. RDI will be transmitted/received on appropriate defect states. Y Yes. VT1.5 path yellow will be transmitted/received on appropriate fault conditions.

PST	{IS, OOS}	
	Default:	< Previously existing value > or {IS} (Factory Default)
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the VT1.5. Values are:
	IS	In-Service
	OOS	Out-Of-Service

COMMAND CODE: **SET-DFLTATTR-EC1**
COMMAND NAME: **SET DEFAULT ATTRIBUTE EC1**

PURPOSE

The SET-DFLTATTR-EC1 command changes the system provisioning default EC1 condition type attributes (the default notification codes for non-service affecting and service affecting EC1 standing conditions).

An EC1 port is provisioned with the system default EC1 condition type attributes, as set by this command, when the EC1 port is assigned and provisioned via the ENT-EC1 command. After an EC1 port is provisioned, the EC1 port's condition type attributes can be set to any (valid) value via the SET-ATTR-EC1 command.

Only the system default EC1 notification code for the condition type and service effect (identified by NTFNCODE, CONDTYPE, LOCN, and SERVEFF) specified in the command is changed in the system database. System default EC1 condition type attributes that are not specified retain the value as provided from the factory (refer to Appendix C for factory default notification codes) or as set with a previously executed SET-DFLTATTR-EC1 command. Previously provisioned EC1 ports are not affected by this command. All subsequently provisioned EC1 ports assume the condition type attributes entered with the last executed SET-DFLTATTR-EC1 command when the EC1 port is provisioned (via ENT-EC1).

The EC1 default condition type database is not affected (changed) by a system restart. The EC1 default condition type database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTATTR-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTATTR-EC1 : [TID] : : [CTAG] : : [NTFCNCODE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPEFF] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCODE	{CR, MJ, MN, NA, NR} Default: <Previously Existing Value> Addressing: None Description: Notification Code, specifies the system default provisioning notification code (that is generated by the system upon the occurrence of the event specified by CONDTYPE). (Refer to Appendix C for a list of factory default notification codes for all condition types.) Values are: <div><div>CR</div><div>MJ</div><div>MN</div><div>NA</div><div>NR</div></div> <div><div>Critical Alarm (reported via REPT^ALM autonomous message).</div><div>Major Alarm (reported via REPT^ALM autonomous message).</div><div>Minor Alarm (reported via REPT^ALM autonomous message).</div><div>Not Alarmed (reported via REPT^EVT autonomous message).</div><div>Not Reported.</div></div>

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid parameter specified. */
INUP	Input, Non-Null Unimplemented Parameter /* No matching attributes to update as requested by user. */
SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update default attribute database. */

EXAMPLES

In the following example, the system default notification code for the near-end service affecting LOS condition type is set to major (MJ).

```
SET-DFLTATTR-EC1::::MJ,LOS,NEND,,SA;
```

In the following example, the system default notification code for both the non-service affecting and service affecting RFI condition type is set to not alarmed (NA).

```
SET-DFLTATTR-EC1::::,RFI;
```

COMMAND CODE: **SET-DFLTATTR-F3**
COMMAND NAME: **SET DEFAULT ATTRIBUTE F3**

PURPOSE

The SET-DFLTATTR-F3 command changes the system provisioning default F3 condition type attributes (the default notification codes for non-service affecting and service affecting F3 standing conditions).

An F3 port is provisioned with the system default F3 condition type attributes, as set by this command, when the F3 port is assigned and provisioned via the ENT-F3 command. After an F3 port is provisioned, the F3 port's condition type attributes can be set to any (valid) value via the SET-ATTR-F3 command.

Only the system default F3 notification code for the condition type and service effect (identified by NTFCNCDE, CONDTYPE, LOCN, and SERVEFF) specified in the command is changed in the system database. System default F3 condition type attributes that are not specified retain the value as provided from the factory (refer to Appendix C for factory default notification codes) or as set with a previously executed SET-DFLTATTR-F3 command. Previously provisioned F3 ports are not affected by this command. All subsequently provisioned F3 ports assume the condition type attributes entered with the last executed SET-DFLTATTR-F3 command when the F3 port is provisioned (via ENT-F3).

The F3 default condition type database is not affected (changed) by a system restart. The F3 default condition type database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTATTR-F3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTATTR-F3 : [TID] :: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: <Previously Existing Value> Addressing: None Description: Notification Code, specifies the system default provisioning notification code (that is generated by the system upon the occurrence of the event specified by CONDTYPE). (Refer to Appendix C for a list of factory default notification codes for all condition types.) Values are: <div><div>CR</div><div>MJ</div><div>MN</div><div>NA</div><div>NR</div></div> <div><div>Critical Alarm (reported via REPT^ALM autonomous message).</div><div>Major Alarm (reported via REPT^ALM autonomous message).</div><div>Minor Alarm (reported via REPT^ALM autonomous message).</div><div>Not Alarmed (reported via REPT^EVT autonomous message).</div><div>Not Reported.</div></div>

CONDTYPE	{INHMPREPT}	
	Default:	< All applicable condition types listed above >
	Addressing:	None
	Description:	Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
	INHMPREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
LOCN	{NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	NEND	Near-End, events occurring at the system.
DIRN	{NA, RCV}	
	Default:	{NA}
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTATTR-F3 command.
	NA	Not Applicable
	RCV	Receive side
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the SET-DFLTATTR-F3 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type for which the specified system default NTFCNCDE is to be set. Values are:
	NSA	Non-Service Affecting.
	SA	Service Affecting.

COMMAND CODE: **SET-DFLTATTR-OC12**
COMMAND NAME: **SET DEFAULT ATTRIBUTE OC-12**

PURPOSE

The SET-DFLTATTR-OC12 command changes the system provisioning default OC-12 condition type attributes (the default notification codes for non-service affecting and service affecting OC-12 standing conditions).

An OC-12 port is provisioned with the system default OC-12 condition type attributes, as set by this command, when the OC-12 port is assigned and provisioned via the ENT-OC12 command. After an OC-12 port is provisioned, the OC-12 port's condition type attributes can be set to any (valid) value via the SET-ATTR-OC12 command.

Only the system default OC-12 notification code for the condition type and service effect (identified by NTFNCNDE, CONDTYPE, LOCN, and SERVEFF) specified in the command is changed in the system database. System default OC-12 condition type attributes that are not specified retain the value as provided from the factory (refer to Appendix C for factory default notification codes) or as set with a previously executed SET-DFLTATTR-OC12 command. Previously provisioned OC-12 ports are not affected by this command. All subsequently provisioned OC-12 ports assume the condition type attributes entered with the last executed SET-DFLTATTR-OC12 command when the OC-12 port is provisioned (via ENT-OC12).

The OC-12 default condition type database is not affected (changed) by a system restart. The OC-12 default condition type database is replaced by the corresponding database on a backup media during a database restore (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTATTR-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
SET-DFLTATTR-OC12 : [TID] :: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,  
[TMPER] , [SRVEFF] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: <Previously Existing Value> Addressing: None Description: Notification Code, specifies the system default provisioning notification code (that is generated by the system upon the occurrence of the event specified by CONDTYPE). (Refer to Appendix C for a list of factory default notification codes for all condition types.) Values are: <div><div>CR</div><div>MJ</div><div>MN</div><div>NA</div><div>NR</div><div>Critical Alarm (reported via REPT^ALM autonomous message).</div><div>Major Alarm (reported via REPT^ALM autonomous message).</div><div>Minor Alarm (reported via REPT^ALM autonomous message).</div><div>Not Alarmed (reported via REPT^EVT autonomous message).</div><div>Not Reported.</div></div>

Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type for which the specified NTFNCODE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC-12 port is in loopback. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lockout of automatic revertive (OC-12) switching due to excessive switching. (Near-End only.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited. (Near-End only.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
L2S CONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
LOF	Loss Of Frame detected. (Near-End only.)
LOS	Loss Of Signal detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKS WBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKS WPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
WTR	Wait To Restore of protection facility. (Near-End only.)
Restrictions:	SET-DFLTATTR-OC12 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).

LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	SET-DFLTATTR-OC12 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RFI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTATTR-OC12 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the SET-DFLTATTR-OC12 command.
SRVEFF	{NSA, SA}
Default:	< Both service effect values >
Addressing:	None
Description:	Service Effect, specifies the service effect of the condition type for which the specified system default NTFCNCDE is to be set. Values are:
	NSA Non-Service Affecting.
	SA Service Affecting.

Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type for which the specified NTFNCODE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC-3 port is in loopback. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lockout of automatic revertive (OC-3) switching due to excessive switching. (Near-End only.)
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited. (Near-End only.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
L2SCONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
LOF	Loss Of Frame detected. (Near-End only.)
LOS	Loss Of Signal detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
WTR	Wait To Restore of protection facility. (Near-End only.)
Restrictions:	SET-DFLTATTR-OC3 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).

LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	SET-DFLTATTR-OC3 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RFI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTATTR-OC3 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the SET-DFLTATTR-OC3 command.
SRVEFF	{NSA, SA}
Default:	< Both service effect values >
Addressing:	None
Description:	Service Effect, specifies the service effect of the condition type for which the specified system default NTFCNCDE is to be set. Values are:
	NSA Non-Service Affecting.
	SA Service Affecting.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid parameter specified. */
INUP	Input, Non-Null Unimplemented Parameter /* No matching attributes to update as requested by user. */
SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update default attribute database. */

EXAMPLES

In the following example, the system default notification code for the near-end service affecting LOS condition type is set to major (MJ).

```
SET-DFLTATTR-OC3 : : : : MJ, LOS, NEND, , , SA;
```

In the following example, the system default notification code for both the non-service affecting and service affecting MAN condition type is set to not alarmed (NA).

```
SET-DFLTATTR-OC3 : : : : , MAN;

COMMAND CODE: **SET-DFLTATTR-STS1**
COMMAND NAME: **SET DEFAULT ATTRIBUTE STS-1**

PURPOSE

The SET-DFLTATTR-STS1 command changes the system provisioning default STS-1 condition type attributes (the default notification codes for non-service affecting and service affecting STS-1 standing conditions).

An STS-1 port is provisioned with the system default STS-1 condition type attributes, as set by this command, when the STS-1 port is assigned and provisioned via the ENT-STS1 command. After an STS-1 port is provisioned, the STS-1 port's condition type attributes can be set to any (valid) value via the SET-ATTR-STS1 command.

Only the system default STS-1 notification code for the condition type and service effect (identified by NTFNCNDE, CONDTYPE, LOCN, and SERVEFF) specified in the command is changed in the system database. System default STS-1 condition type attributes that are not specified retain the value as provided from the factory (refer to Appendix C for factory default notification codes) or as set with a previously executed SET-DFLTATTR-STS1 command. Previously provisioned STS-1 ports are not affected by this command. All subsequently provisioned STS-1 ports assume the condition type attributes entered with the last executed SET-DFLTATTR-STS1 command when the STS-1 port is provisioned (via ENT-STS1).

The STS-1 default condition type database is not affected (changed) by a system restart. The STS-1 default condition type database is replaced by the corresponding database on a backup media during a database restore (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTATTR-STS1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
SET-DFLTATTR-STS1 : [TID] :: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,  
[TMPER] , [SRVEFF] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: <Previously Existing Value> Addressing: None Description: Notification Code, specifies the system default provisioning notification code (that is generated by the system upon the occurrence of the event specified by CONDTYPE). (Refer to Appendix C for a list of factory default notification codes for all condition types.) Values are: <table><tr><td>CR</td><td>Critical Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>MJ</td><td>Major Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>MN</td><td>Minor Alarm (reported via REPT^ALM autonomous message).</td></tr><tr><td>NA</td><td>Not Alarmed (reported via REPT^EVT autonomous message).</td></tr><tr><td>NR</td><td>Not Reported.</td></tr></table>	CR	Critical Alarm (reported via REPT^ALM autonomous message).	MJ	Major Alarm (reported via REPT^ALM autonomous message).	MN	Minor Alarm (reported via REPT^ALM autonomous message).	NA	Not Alarmed (reported via REPT^EVT autonomous message).	NR	Not Reported.
CR	Critical Alarm (reported via REPT^ALM autonomous message).										
MJ	Major Alarm (reported via REPT^ALM autonomous message).										
MN	Minor Alarm (reported via REPT^ALM autonomous message).										
NA	Not Alarmed (reported via REPT^EVT autonomous message).										
NR	Not Reported.										

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKS WBK, FRCDWKS WPR, IDLE, INHPMREPT, LOP, MAN, MANWKS WBK, MANWKS WPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK Active Loopback, the STS-1 port is in loop back. (Near-End only.)
	AIS Alarm Indication Signal, AIS detected. (Near-End only.)
	EBER Excessive Bit Error Rate detected. (Near-End only.)
	FLTESC Facility Fault Escalation active. (Near-End only.)
	FRCDWKS WBK Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
	FRCDWKS WPR Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
	IDLE Idle, incoming idle detected. (Near-End only.)
	INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	LOP Loss Of Pointer detected. (Near-End only.)
	MAN Manual removal (logical removal was performed on the facility). (Near-End only.)
	MANWKS WBK Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
	MANWKS WPR Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
	PDI Incoming PDI signal detected (STS1)
	RFI Remote Failure Indication detected. (Far-End only.)
	SDBER Signal Degrade Bit Error Rate detected. (Near-End only.)
	SLMF Signal Label Match Failure detected. (Near-End only.)
Restrictions:	SET-DFLTATTR-STS1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).
LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	SET-DFLTATTR-STS1 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).

DIRN	{NA, RCV, TRMT}					
	Default: < All applicable directions >					
	Addressing: None					
	Description: Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTATTR-STS1 command.					
	<table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT
NA	Not Applicable					
RCV	Receive side					
TRMT	Transmit direction					
TMPER	{15-MIN, 1-DAY}					
	Default: {15-MIN}					
	Addressing: None					
	Description: Time Period. The value for TMPER is verified, but does not affect the function of the SET-DFLTATTR-STS1 command.					
SRVEFF	{NSA, SA}					
	Default: < Both service effect values >					
	Addressing: None					
	Description: Service Effect, specifies the service effect of the condition type for which the specified system default NTFNCODE is to be set. Values are:					
	<table> <tr> <td>NSA</td><td>Non-Service Affecting.</td></tr> <tr> <td>SA</td><td>Service Affecting.</td></tr> </table>	NSA	Non-Service Affecting.	SA	Service Affecting.	
NSA	Non-Service Affecting.					
SA	Service Affecting.

COMMAND CODE: **SET-DFLTATTR-STS3C**
COMMAND NAME: **SET DEFAULT ATTRIBUTE STS-3C**

PURPOSE

The SET-DFLTATTR-STS3C command changes the system provisioning default STS-3C condition type attributes (the default notification codes for non-service affecting and service affecting STS-3C standing conditions).

An STS-3C port is provisioned with the system default STS-3C condition type attributes, as set by this command, when the STS-3C port is assigned and provisioned via the ENT-STS3C command. After an STS-3C port is provisioned, the STS-3C port's condition type attributes can be set to any (valid) value via the SET-ATTR-STS3C command.

Only the system default STS-3C notification code for the condition type and service effect (identified by NTFNCDE, CONDTYPE, LOCN, and SERVEFF) specified in the command is changed in the system database. System default STS-3C condition type attributes that are not specified retain the value as provided from the factory (refer to Appendix C for factory default notification codes) or as set with a previously executed SET-DFLTATTR-STS3C command. Previously provisioned STS-3C ports are not affected by this command. All subsequently provisioned STS-3C ports assume the condition type attributes entered with the last executed SET-DFLTATTR-STS3C command when the STS-3C port is provisioned (via ENT-STS3C).

The STS-3C default condition type database is not affected (changed) by a system restart. The STS-3C default condition type database is replaced by the corresponding database on a backup media during a database restore (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTATTR-STS3C command is denied if:

- An invalid parameter value or combination of parameter values is entered.

COMMAND CODE: **SET-DFLTATTR-T1**
COMMAND NAME: **SET DEFAULT ATTRIBUTE T1**

PURPOSE

The SET-DFLTATTR-T1 command changes the system provisioning default DS1 condition type attributes (the default notification codes for non-service affecting and service affecting DS1 standing conditions).

A DS1 port is provisioned with the system default DS1 condition type attributes, as set by this command, when the DS1 port is assigned and provisioned via the ENT-T1 command. After a DS1 port is provisioned, the DS1 port's condition type attributes can be set to any (valid) value via the SET-ATTR-T1 command.

Only the system default DS1 notification code for the condition type and service effect (identified by NTFNCNDE, CONDTYPE, LOCN, and SERVEFF) specified in the command is changed in the system database. System default DS1 condition type attributes that are not specified retain the value as provided from the factory (refer to Appendix C for factory default notification codes) or as set with a previously executed SET-DFLTATTR-T1 command. Previously provisioned DS1 ports are not affected by this command. All subsequently provisioned DS1 ports assume the condition type attributes entered with the last executed SET-DFLTATTR-T1 command when the DS1 port is provisioned (via ENT-T1).

The DS1 default condition type database is not affected (changed) by a system restart. The DS1 default condition type database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTATTR-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTATTR-T1 : [TID] :: [CTAG] :: [NTFCNCNDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCNDE	{CR, MJ, MN, NA, NR} Default: <Previously Existing Value> Addressing: None Description: Notification Code, specifies the system default provisioning notification code (that is generated by the system upon the occurrence of the event specified by CONDTYPE). (Refer to Appendix C for a list of factory default notification codes for all condition types.) Values are: <div><div>CR</div><div>MJ</div><div>MN</div><div>NA</div><div>NR</div></div> <div><div>Critical Alarm (reported via REPT^ALM autonomous message).</div><div>Major Alarm (reported via REPT^ALM autonomous message).</div><div>Minor Alarm (reported via REPT^ALM autonomous message).</div><div>Not Alarmed (reported via REPT^EVT autonomous message).</div><div>Not Reported.</div></div>

CONDTYPE	DS1_NEAR-END_CONDDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, DS1ISD, EOC, INHPMREPT, LOF, LOS, MAN, RCVCLPBK, ROLLMON, XMTCLPBK}, DS1_FAR-END_CONDDTYPE:{RAI, RAI-CI}, TMG_NEAR-END_CONDDTYPE:{AIS, AIS-C, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the DS1 port is in loop back. (DS1 Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (DS1 or TMG Near-End only.)
AIS-CI	Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near-End)
ALWCBLPBK	Allow C-Bit Loopback. (DS1 Near-End only.)
DS1ISD	DS1 Idle Signal Detected, Incoming. (DS1 Near-End.)
EOC	Embedded Operations Channel, EOC failure detected. (DS1 Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (DS1 Near-End only.)
LOF	Loss Of Frame detected. (DS1 or TMG Near-End only.)
LOS	Loss Of Signal detected. (DS1 or TMG Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (DS1 Near-End only.)
RAI	Remote Alarm Indication detected. (DS1 Far-End only.)
RAI-CI	Remote Alarm Indication for Customer Installation detected. (DS1 Far-End.)
RCVCLPBK	Receive (DS1) C-Bit Loopback. (DS1 Near-End only.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (DS1 Near-End only.)
SLTMSIG	Slipping Timing Reference Signal detected. (TMG Near-End only.)
SYNCPRI	Primary Reference Synchronization failure. (TMG Near-End only.)
SYNCSEC	Secondary Reference Synchronization failure. (TMG Near-End only.)
SYNCSTATQUAL	Synchronization Status Quality. (TMG Near-End only.)
XMTCLPBK	Transmit (DS1) C-Bit Loopback. (DS1 Near-End only.)
Restrictions:	SET-DFLTATTR-T1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RAI and LOCN of NEND is entered). SET-DFLTATTR-T1 is denied if the DS1 CI/NI Trouble Sectionalization Premium Feature Option (PFO) is not enabled and an input value of AIS-CI, DS1ISD or RAI-CI is entered.

LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTATTR-T1 command.
	NA	Not Applicable
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the SET-DFLTATTR-T1 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type for which the specified system default NTFCNCDE is to be set. Values are:
	NSA	Non-Service Affecting.
	SA	Service Affecting.

SDBE	Status, internal Data Base Error /* Unable to read file <FILENAME>, Error <ERROR NUMBER> */ /* Unable to update default attribute database. */

EXAMPLES

In the following example, the system default notification code for the service affecting MAN condition type is set to minor (MN).

```
SET-DFLTATTR-T1::::MN,MAN,NEND,,SA;
```

In the following example, the system default notification code for both the non-service affecting and service affecting EOC condition type is set to not alarmed (NA).

```
SET-DFLTATTR-T1::::,EOC;
```

COMMAND CODE: **SET-DFLTATTR-T3**
COMMAND NAME: **SET DEFAULT ATTRIBUTE T3**

PURPOSE

The SET-DFLTATTR-T3 command changes the system provisioning default DS3 condition type attributes (the default notification codes for non-service affecting and service affecting DS3 standing conditions).

A DS3 port is provisioned with the system default DS3 condition type attributes, as set by this command, when the DS3 port is assigned and provisioned via the ENT-T3 command. After a DS3 port is provisioned, the DS3 port's condition type attributes can be set to any (valid) value via the SET-ATTR-T3 command.

Only the system default DS3 notification code for the condition type and service effect (identified by NTFNCNDE, CONDTYPE, LOCN, and SERVEFF) specified in the command is changed in the system database. System default DS3 condition type attributes that are not specified retain the value as provided from the factory (refer to Appendix C for factory default notification codes) or as set with a previously executed SET-DFLTATTR-T3 command. Previously provisioned DS3 ports are not affected by this command. All subsequently provisioned DS3 ports assume the condition type attributes entered with the last executed SET-DFLTATTR-T3 command when the DS3 port is provisioned (via ENT-T3).

The DS3 default condition type database is not affected (changed) by a system restart. The DS3 default condition type database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTATTR-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTATTR-T3 : [TID] :: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: <Previously Existing Value> Addressing: None Description: Notification Code, specifies the system default provisioning notification code (that is generated by the system upon the occurrence of the event specified by CONDTYPE). (Refer to Appendix C for a list of factory default notification codes for all condition types.) Values are: <div><div>CR</div><div>MJ</div><div>MN</div><div>NA</div><div>NR</div></div> <div><div>Critical Alarm (reported via REPT^ALM autonomous message).</div><div>Major Alarm (reported via REPT^ALM autonomous message).</div><div>Minor Alarm (reported via REPT^ALM autonomous message).</div><div>Not Alarmed (reported via REPT^EVT autonomous message).</div><div>Not Reported.</div></div>

CONDTYPE	<p>NEAR-END_CONDDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN}, FAR-END_CONDDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI}</p> <p>Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type for which the specified NTFCNCDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:</p> <table> <tr> <td>1TO6LOF</td><td>One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3. (Near-End only.)</td></tr> <tr> <td>7LOF</td><td>Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3. (Near-End only.)</td></tr> <tr> <td>ACTLPBK</td><td>Active Loopback, the DS3 port is in loop back. (Near-End only.)</td></tr> <tr> <td>AICMIS</td><td>Application Identification Channel Mismatch, AIC mismatch detected. FEND	Far-End, events occurring at a distant network element.																												
NEND	Near-End, events occurring at the system.																												
DIRN	<p>{NA, RCV, TRMT}</p> <p>Default: < All applicable directions > Addressing: None Description: Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTATTR-T3 command.</p> <table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT	Transmit direction																						
NA	Not Applicable																												
RCV	Receive side																												
TRMT	Transmit direction																												

TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the SET-DFLTATTR-T3 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type for which the specified system default NTFCNCDE is to be set. Values are:
	NSA	Non-Service Affecting.
	SA	Service Affecting.

SUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
	/* Condition type is not consistent with <FACILITY TYPE STRING>. */
	/* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid
	/* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
	/* Invalid service effect specified: <SERVICE EFFECT STRING>. */
	/* Invalid condition type specified: <CONDITION TYPE STRING>. */
	/* Invalid location specified: <LOCATION STRING>. */
	/* Invalid parameter specified. */
INUP	Input, Non-Null Unimplemented Parameter
	/* No matching attributes to update as requested by user. */
SDBE	Status, internal Data Base Error
	/* Unable to read file <FILENAME>, Error <ERROR NUMBER> */
	/* Unable to update default attribute database. */

EXAMPLES

In the following example, the system default notification code for the near-end service affecting LOS condition type is set to major (MJ).

```
SET-DFLTATTR-T3 : : : : MJ, LOS, NEND, , , SA;
```

In the following example, the system default notification code for both the non-service affecting and service affecting DS2YEL condition type is set to not alarmed (NA).

```
SET-DFLTATTR-T3::::,DS2YEL;
```

COMMAND CODE: **SET-DFLTATTR-VT1**
COMMAND NAME: **SET DEFAULT ATTRIBUTE VT1**

PURPOSE

The SET-DFLTATTR-VT1 command changes the system provisioning default VT1.5 condition type attributes (the default notification codes for non-service affecting and service affecting VT1.5 standing conditions).

A VT1.5 port is provisioned with the system default VT1.5 condition type attributes, as set by this command, when the VT1.5 port is assigned and provisioned via the ENT-VT1 command. After a VT1.5 port is provisioned, the VT1.5 port's condition type attributes can be set to any (valid) value via the SET-ATTR-VT1 command.

Only the system default VT1.5 notification code for the condition type and service effect (identified by NTFNCNDE, CONDTYPE, LOCN, and SERVEFF) specified in the command is changed in the system database. System default VT1.5 condition type attributes that are not specified retain the value as provided from the factory (refer to Appendix C for factory default notification codes) or as set with a previously executed SET-DFLTATTR-VT1 command. Previously provisioned VT1.5 ports are not affected by this command. All subsequently provisioned VT1.5 ports assume the condition type attributes entered with the last executed SET-DFLTATTR-VT1 command when the VT1.5 port is provisioned (via ENT-VT1).

The VT1.5 default condition type database is not affected (changed) by a system restart. The VT1.5 default condition type database is replaced by the corresponding database on a backup media during a database restore (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTATTR-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTATTR-VT1 : [TID] : : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: <Previously Existing Value> Addressing: None Description: Notification Code, specifies the system default provisioning notification code (that is generated by the system upon the occurrence of the event specified by CONDTYPE). (Refer to Appendix C for a list of factory default notification codes for all condition types.) Values are: <div><div>CR</div><div>MJ</div><div>MN</div><div>NA</div><div>NR</div></div> <div><div>Critical Alarm (reported via REPT^ALM autonomous message).</div><div>Major Alarm (reported via REPT^ALM autonomous message).</div><div>Minor Alarm (reported via REPT^ALM autonomous message).</div><div>Not Alarmed (reported via REPT^EVT autonomous message).</div><div>Not Reported.</div></div>

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI}	
	Default:	< All applicable condition types listed above >
	Addressing:	None
	Description:	Condition Type, specifies the condition type for which the specified NTFNCNDE is to be set. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK	Active Loopback, the VT1.5 port is in loop back. (Near-End only.)
	AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
	EBER	Excessive Bit Error Rate detected. (Near-End only.)
	FLTESC	Facility Fault Escalation active. (Near-End only.)
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
	IDLE	Idle, incoming idle detected. (Near-End only.)
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	LOP	Loss Of Pointer detected. (Near-End only.)
	MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
	RFI	Remote Failure Indication detected. (Far-End only.)
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (Near-End only.)
	SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
	SLMF	Signal Label Match Failure detected. (Near-End only.)
	Restrictions:	SET-DFLTATTR-VT1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).
LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
	Restrictions:	SET-DFLTATTR-VT1 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).

DIRN	{NA, RCV, TRMT}					
	Default: < All applicable directions >					
	Addressing: None					
	Description: Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTATTR-VT1 command.					
	<table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT
NA	Not Applicable					
RCV	Receive side					
TRMT	Transmit direction					
TMPER	{15-MIN, 1-DAY}					
	Default: {15-MIN}					
	Addressing: None					
	Description: Time Period. The value for TMPER is verified, but does not affect the function of the SET-DFLTATTR-VT1 command.					
SRVEFF	{NSA, SA}					
	Default: < Both service effect values >					
	Addressing: None					
	Description: Service Effect, specifies the service effect of the condition type for which the specified system default NTFNCODE is to be set. Values are:					
	<table> <tr> <td>NSA</td><td>Non-Service Affecting.</td></tr> <tr> <td>SA</td><td>Service Affecting.</td></tr> </table>	NSA	Non-Service Affecting.	SA	Service Affecting.	
NSA	Non-Service Affecting.					
SA	Service Affecting.

COMMAND CODE: **SET-DFLTPMREPT-EC1**
COMMAND NAME: **SET DEFAULT PERFORMANCE
MONITORING REPORT EC1**

PURPOSE

The SET-DFLTPMREPT-EC1 command sets the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of EC1 PM parameters.

A SET-DFLTPMREPT-EC1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTPMREPT-EC1 : [TID] :: [CTAG] :: [NUMREPT] , [MONLEV] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NUMREPT	{0-254, <NoVal>} Default: {<NoVal>} Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-EC1 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL-DIRECTION:{0-4294967295} - {DN, UP} } Default: {1-UP} Addressing: None Description: Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.

TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN 15-Minute PM collection registers are reported.
	1-DAY 1-Day (24 hour) PM collection registers are reported.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

SCHED-PMREPT-EC1
```

COMMAND CODE: **SET-DFLTPMREPT-F3**
COMMAND NAME: **SET DEFAULT PERFORMANCE
MONITORING REPORT F3**

PURPOSE

The SET-DFLTPMREPT-F3 command sets the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of F3 PM parameters.

A SET-DFLTPMREPT-F3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTPMREPT-F3 : [TID] :: [CTAG] :: [NUMREPT] , [MONLEV] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NUMREPT	{0-254, <NoVal>} Default: {<NoVal>} Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-F3 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL-DIRECTION:{0-4294967295} - {DN, UP} } Default: {1-UP} Addressing: None Description: Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.

TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN 15-Minute PM collection registers are reported.
	1-DAY 1-Day (24 hour) PM collection registers are reported.

SUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
SROF	Status, Requested Operation Failed
	/* Unable to determine facility type. */

EXAMPLES

In the following example, the current default provisioning pertaining to 15-minute scheduled Performance Monitoring (PM) reporting of F3 PM parameters is set.

```
SET-DFLTPMREPT-F3:::250,16-UP,15-MIN;
```

RELATED COMMANDS

```

ALW-PMREPT-F3
INH-PMREPT-F3
RTRV-DFLTPMREPT-F3
RTRV-PMSCHED-ALL
RTRV-PMSCHED-F3
SCHED-PMREPT-ALL
SCHED-PMREPT-F3
```

COMMAND CODE: **SET-DFLTPMREPT-OC12**
COMMAND NAME: **SET DEFAULT PERFORMANCE
MONITORING REPORT OC-12**

PURPOSE

The SET-DFLTPMREPT-OC12 command sets the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of OC-12 PM parameters.

A SET-DFLTPMREPT-OC12 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTPMREPT-OC12 : [TID] :: [CTAG] :: [NUMREPT] , [MONLEV] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NUMREPT	{0-254, <NoVal>} Default: {<NoVal>} Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-OC12 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.
MONLEV	{[LEVEL-DIRECTION:{0-4294967295} - {DN, UP} } Default: {1-UP} Addressing: None Description: Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.

TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN 15-Minute PM collection registers are reported.
	1-DAY 1-Day (24 hour) PM collection registers are reported.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **SET-DFLTPMREPT-OC3**
COMMAND NAME: **SET DEFAULT PERFORMANCE
MONITORING REPORT OC-3**

PURPOSE

The SET-DFLTPMREPT-OC3 command sets the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of OC-3 PM parameters.

A SET-DFLTPMREPT-OC3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTPMREPT-OC3 : [TID] :: [CTAG] :: [NUMREPT] , [MONLEV] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NUMREPT	{0-254, <NoVal>} Default: {<NoVal>} Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-OC3 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL-DIRECTION:{0-4294967295} - {DN, UP} } Default: {1-UP} Addressing: None Description: Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.

TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN 15-Minute PM collection registers are reported.
	1-DAY 1-Day (24 hour) PM collection registers are reported.

COMMAND CODE: **SET-DFLTPMREPT-STS1**
COMMAND NAME: **SET DEFAULT PERFORMANCE
MONITORING REPORT STS-1**

PURPOSE

The SET-DFLTPMREPT-STS1 command sets the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of STS-1 PM parameters.

A SET-DFLTPMREPT-STS1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTPMREPT-STS1 : [TID] :: [CTAG] :: [NUMREPT] , [MONLEV] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NUMREPT	{0-254, <NoVal>} Default: {<NoVal>} Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-STS1 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.
MONLEV	{[LEVEL-DIRECTION:{0-4294967295} - {DN, UP} } Default: {1-UP} Addressing: None Description: Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.

TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN 15-Minute PM collection registers are reported.
	1-DAY 1-Day (24 hour) PM collection registers are reported.

```

COMMAND CODE: **SET-DFLTPMREPT-STS3C**
COMMAND NAME: **SET DEFAULT PERFORMANCE
MONITORING REPORT STS-3C**

PURPOSE

The SET-DFLTPMREPT-STS3C command sets the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of STS-3C PM parameters.

A SET-DFLTPMREPT-STS3C command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTPMREPT-STS3C: [TID] :: [CTAG] :: [NUMREPT] , [MONLEV] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NUMREPT	{0-254, <NoVal>} Default: {<NoVal>} Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-STS3C command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL-DIRECTION:{0-4294967295} - {DN, UP} } Default: {1-UP} Addressing: None Description: Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.

TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN 15-Minute PM collection registers are reported.
	1-DAY 1-Day (24 hour) PM collection registers are reported.

COMMAND CODE: **SET-DFLTPMREPT-T1**
COMMAND NAME: **SET DEFAULT PERFORMANCE
MONITORING REPORT T1**

PURPOSE

The SET-DFLTPMREPT-T1 command sets the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of DS1 PM parameters.

A SET-DFLTPMREPT-T1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTPMREPT-T1 : [TID] :: [CTAG] :: [NUMREPT] , [MONLEV] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NUMREPT	{0-254, <NoVal>} Default: {<NoVal>} Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-T1 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL-DIRECTION:{0-4294967295} - {DN, UP} } Default: {1-UP} Addressing: None Description: Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.

TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN 15-Minute PM collection registers are reported.
	1-DAY 1-Day (24 hour) PM collection registers are reported.

COMMAND CODE: **SET-DFLTPMREPT-VT1**
COMMAND NAME: **SET DEFAULT PERFORMANCE
MONITORING REPORT VT1**

PURPOSE

The SET-DFLTPMREPT-VT1 command sets the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of VT1.5 PM parameters.

A SET-DFLTPMREPT-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTPMREPT-VT1: [TID] :: [CTAG] :: [NUMREPT] , [MONLEV] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NUMREPT	{0-254, <NoVal>} Default: {<NoVal>} Addressing: None Description: Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-VT1 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.
MONLEV	{LEVEL-DIRECTION:{0-4294967295} - {DN, UP} } Default: {1-UP} Addressing: None Description: Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.

TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15-MIN 15-Minute PM collection registers are reported.
	1-DAY 1-Day (24 hour) PM collection registers are reported.

```

COMMAND CODE: **SET-DFLTTH-EC1**
COMMAND NAME: **SET DEFAULT THRESHOLD EC1**

PURPOSE

The SET-DFLTTH-EC1 command changes the system provisioning default PM (Performance Monitoring) threshold level (THLEV) for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day).

A EC1 port is provisioned with the system default PM threshold level, as set by this command, when the EC1 port is assigned and provisioned by the ENT-EC1 command. After a EC1 port is provisioned (via ENT-EC1), the EC1 port's PM threshold level can be set to any (valid) value via the SET-TH-EC1 command.

Only the system default PM THLEV for the monitored parameter (identified by MONTYPE, LOCN, and TMPER) specified in the command is changed in the system database. System default threshold levels for monitored parameters that are not specified retain the value as provided from the factory or as set with a previously executed SET-DFLTTH-EC1 command. Previously provisioned EC1 ports are not affected by this command. All subsequently provisioned EC1 ports assume the THLEV default value entered with the last executed SET-DFLTTH-EC1 command when the EC1 port is provisioned (via ENT-EC1).

The EC1 THLEV default database is not affected (changed) by a system restart. The EC1 THLEV default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTTH-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTTH-EC1 : [TID] : : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE {ALL},
NEAR_END_PARAMETERS:{CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL,
LOSS, LOSS-S, SEFS, SEFS-S, SES-L, SESL, UAS-L, UASL},
FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, ES-L, ESL, FC-L, FCL, SES-L,
SESL, UAS-L, UASL}
Default: Entry Required
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register. (Far-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register. (Far-end only.)
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.

Restrictions: SET-DFLTTH-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).

THLEV {0-4294967295}
Default: Entry Required
Addressing: None
Description: System Default Threshold Level, specifies the system provisioning default threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0 Specifies no threshold-crossing events are generated.
THLEV values and the factory default for each MONTYPE are:

THLEV Values vs. MONTYPE				
MONTYPE	15-Minute Register		1-Day Register	
	Valid Values	Factory Default	Valid Values	Factory Default
ALL	{0-150}	–	{0-14400}	–
CV-L	{0-4294967295}	{4666}	{0-4294967295}	{44790}
FC-L	{0-150}	{5}	{0-14400}	{14}
<All other MONTYPES>	{0-900}	{9}	{0-65535}	{86}

Restrictions: SET-DFLTTH-EC1 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN	{FEND, NEND}	
	Default:	< All applicable locations for the selected monitored parameters >
	Addressing:	None
	Description:	Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be set. Values are:
	FEND	Far-End
DIRN	NEND	Near-End
	Restrictions:	SET-DFLTTH-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
TMPER	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTTH-EC1 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IDNV      Input, Data Not Valid
          /* Invalid direction in request message. */
          /* Invalid location in request message. */
          /* Invalid montype in request message. */
          /* Invalid time period in request message. */
          /* Invalid threshold level in request message. */
          /* Threshold level is out of range. */
```

IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Error reading EC1 PM Default database */ /* Error <ERRNO> updating EC1 PM Default database. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type. */

EXAMPLES

In the following example, the system provisioning default threshold level for the daily (1-Day) near-end coding violations, line (CV-L) PM register is set to 5000.

```
SET-DFLTTH-EC1::::CVL,5000,NEND,,1-DAY;
```

In the following example, the system provisioning default threshold level for all 15-Minute near-end and far-end monitored PM parameters is set to 0.

```
SET-DFLTTH-EC1::::ALL,0;

COMMAND CODE: **SET-DFLTTH-OC12**
COMMAND NAME: **SET DEFAULT THRESHOLD OC-12**

PURPOSE

The SET-DFLTTH-OC12 command changes the system provisioning default PM (Performance Monitoring) threshold level (THLEV) for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day).

An OC-12 port is provisioned with the system default PM threshold level, as set by this command, when the OC-12 port is assigned and provisioned by the ENT-OC12 command. After an OC-12 port is provisioned (via ENT-OC12), the OC-12 port's PM threshold level can be set to any (valid) value via the SET-TH-OC12 command.

Only the system default PM THLEV for the monitored parameter (identified by MONTYPE, LOCN, and TMPER) specified in the command is changed in the system database. System default threshold levels for monitored parameters that are not specified retain the value as provided from the factory or as set with a previously executed SET-DFLTTH-OC12 command. Previously provisioned OC-12 ports are not affected by this command. All subsequently provisioned OC-12 ports assume the THLEV default value entered with the last executed SET-DFLTTH-OC12 command when the OC-12 port is provisioned (via ENT-OC12).

The OC-12 THLEV default database is not affected (changed) by a system restart. The OC-12 THLEV default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RE-STORE-DB command is executed successfully).

A SET-DFLTTH-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTTH-OC12 : [TID] : : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	Entry Required
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-S, ESS	Errored Seconds – Section, ES-S register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register.
ESA-S, ESAS	Errored Seconds type A – Section, ESA-S register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register.
ESB-S, ESBS	Errored Seconds type B – Section, ESB-S register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register.
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
PSC, PSC-L, PSCL	Protection Switch Counts – Line, PSC-L register. (Near-end only.)
PSD, PSD-L, PSDL	Protection Switch Duration – Line, PSD-L register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	SET-DFLTTH-OC12 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

THLEV {0–4294967295}
Default: Entry Required
Addressing: None
Description: System Default Threshold Level, specifies the system provisioning default threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:
 0 Specifies no threshold-crossing events are generated.
 THLEV values and the factory default for each MONTYPE are:

THLEV Values vs. MONTYPE				
MONTYPE	15–Minute Register		1–Day Register	
	Valid Values	Factory Default	Valid Values	Factory Default
ALL	{0–150}	–	{0–14400}	–
CV–L, CV–S	{0–4294967295}	{4666}	{0–4294967295}	{44790}
FC–L	{0–150}	{5}	{0–14400}	{14}
<All other MONTYPES>	{0–900}	{9}	{0–65535}	{86}

Restrictions: SET–DFLTTH–OC12 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be set. Values are:
 FEND Far–End
 NEND Near–End
Restrictions: SET–DFLTTH–OC12 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV–S and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET–DFLTTH–OC12 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
 15–MIN 15–Minute PM collection register
 1–DAY 1–Day (24 hour) PM collection register

COMMAND CODE: **SET-DFLTTH-OC3**
COMMAND NAME: **SET DEFAULT THRESHOLD OC-3**

PURPOSE

The SET-DFLTTH-OC3 command changes the system provisioning default PM (Performance Monitoring) threshold level (THLEV) for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day).

An OC-3 port is provisioned with the system default PM threshold level, as set by this command, when the OC-3 port is assigned and provisioned by the ENT-OC3 command. After an OC-3 port is provisioned (via ENT-OC3), the OC-3 port's PM threshold level can be set to any (valid) value via the SET-TH-OC3 command.

Only the system default PM THLEV for the monitored parameter (identified by MONTYPE, LOCN, and TMPER) specified in the command is changed in the system database. System default threshold levels for monitored parameters that are not specified retain the value as provided from the factory or as set with a previously executed SET-DFLTTH-OC3 command. Previously provisioned OC-3 ports are not affected by this command. All subsequently provisioned OC-3 ports assume the THLEV default value entered with the last executed SET-DFLTTH-OC3 command when the OC-3 port is provisioned (via ENT-OC3).

The OC-3 THLEV default database is not affected (changed) by a system restart. The OC-3 THLEV default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTTH-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTTH-OC3 : [TID] : : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	Entry Required
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)

SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	SET-DFLTTH-OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

THLEV {0–4294967295}
Default: Entry Required
Addressing: None
Description: System Default Threshold Level, specifies the system provisioning default threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:
 0 Specifies no threshold-crossing events are generated.
 THLEV values and the factory default for each MONTYPE are:

THLEV Values vs. MONTYPE				
MONTYPE	15–Minute Register		1–Day Register	
	Valid Values	Factory Default	Valid Values	Factory Default
ALL	{0–150}	–	{0–14400}	–
CV–L, CV–S	{0–4294967295}	{4666}	{0–4294967295}	{44790}
FC–L	{0–150}	{5}	{0–14400}	{14}
<All other MONTYPES>	{0–900}	{9}	{0–65535}	{86}

Restrictions: SET–DFLTTH–OC3 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be set. Values are:
 FEND Far–End
 NEND Near–End
Restrictions: SET–DFLTTH–OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV–S and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET–DFLTTH–OC3 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
 15–MIN 15–Minute PM collection register
 1–DAY 1–Day (24 hour) PM collection register

COMMAND CODE: **SET-DFLTTH-STS1**
COMMAND NAME: **SET DEFAULT THRESHOLD STS-1**

PURPOSE

The SET-DFLTTH-STS1 command changes the system provisioning default PM (Performance Monitoring) threshold level (THLEV) for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day).

an STS-1 port is provisioned with the system default PM threshold level, as set by this command, when the STS-1 port is assigned and provisioned by the ENT-STS1 command. After an STS-1 port is provisioned (via ENT-STS1), the STS-1 port's PM threshold level can be set to any (valid) value via the SET-TH-STS1 command.

Only the system default PM THLEV for the monitored parameter (identified by MONTYPE, LOCN, and TMPER) specified in the command is changed in the system database. System default threshold levels for monitored parameters that are not specified retain the value as provided from the factory or as set with a previously executed SET-DFLTTH-STS1 command. Previously provisioned STS-1 ports are not affected by this command. All subsequently provisioned STS-1 ports assume the THLEV default value entered with the last executed SET-DFLTTH-STS1 command when the STS-1 port is provisioned (via ENT-STS1).

The STS-1 THLEV default database is not affected (changed) by a system restart. The STS-1 THLEV default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RE-STORE-DB command is executed successfully).

A SET-DFLTTH-STS1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTTH-STS1 : [TID] :: [CTAG] :: MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE {ALL},
NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP},
FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}
Default: Entry Required
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All monitored parameter PM registers.
ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.
CV-P, CVP	Coding Violations – Path, CV-P register.
ES-P, ESP	Errored Seconds – Path, ES-P register.
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.
FC-P, FCP	Failure Counts – Path, FC-P register.
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.

THLEV {0-4294967295}
Default: Entry Required
Addressing: None
Description: System Default Threshold Level, specifies the system provisioning default threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0	Specifies no threshold-crossing events are generated.
---	---

THLEV values and the factory default for each MONTYPE are:

THLEV Values vs. MONTYPE				
MONTYPE	15-Minute Register		1-Day Register	
	Valid Values	Factory Default	Valid Values	Factory Default
ALL	{0-150}	–	{0-14400}	–
CV-P	{0-4294967295}	{4666}	{0-4294967295}	{44790}
FC-P	{0-150}	{5}	{0-14400}	{14}
<All other MONTYPES>	{0-900}	{9}	{0-65535}	{86}

Restrictions: SET-DFLTTH-STS1 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be set. Values are:

FEND	Far-End
NEND	Near-End

DIRN	{NA, RCV, TRMT}					
	Default: < All applicable directions >					
	Addressing: None					
	Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTTH-STS1 command.					
	<table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT
NA	Not Applicable					
RCV	Receive side					
TRMT	Transmit direction					
TMPER	{15-MIN, 1-DAY}					
	Default: {15-MIN}					
	Addressing: None					
	Description: Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:					
	<table> <tr> <td>15-MIN</td><td>15-Minute PM collection register</td></tr> <tr> <td>1-DAY</td><td>1-Day (24 hour) PM collection register</td></tr> </table>	15-MIN	15-Minute PM collection register	1-DAY	1-Day (24 hour) PM collection register	
15-MIN	15-Minute PM collection register					
1-DAY	1-Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/* Invalid direction in request message. */
	/* Invalid location in request message. */
	/* Invalid montype in request message. */
	/* Invalid time period in request message. */
	/* Invalid threshold level in request message. */
	/* Threshold level is out of range. */
IIPG	Input, Invalid Parameter Grouping
	/* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error
	/* Error reading STS1 PM Default database */
	/* Error <ERRNO> updating STS1 PM Default database. */
SROF	Status, Requested Operation Failed
	/* Unable to determine facility type. */

EXAMPLES

In the following example, the system provisioning default threshold level for the daily (1-Day) near-end coding violations, path (CV-P) PM register is set to 5000.

```
SET-DFLTTH-STs1:::::CVP,5000,NEND,,1-DAY;
```

In the following example, the system provisioning default threshold level for all 15-Minute near-end and far-end monitored PM parameters is set to 0.

```
SET-DFLTTH-STs1:::::ALL,0;
```

COMMAND CODE: **SET-DFLTTH-STS3C**
COMMAND NAME: **SET DEFAULT THRESHOLD STS-3C**

PURPOSE

The SET-DFLTTH-STS3C command changes the system provisioning default PM (Performance Monitoring) threshold level (THLEV) for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day).

An STS-3C port is provisioned with the system default PM threshold level, as set by this command, when the STS-1 port is assigned and provisioned by the ENT-STS3C command. After an STS-3C port is provisioned (via ENT-STS3C), the STS-3C port's PM threshold level can be set to any (valid) value via the SET-TH-STS3C command.

Only the system default PM THLEV for the monitored parameter (identified by MONTYPE, LOCN, and TMPER) specified in the command is changed in the system database. System default threshold levels for monitored parameters that are not specified retain the value as provided from the factory or as set with a previously executed SET-DFLTTH-STS3C command. Previously provisioned STS-3C ports are not affected by this command. All subsequently provisioned STS-3C ports assume the THLEV default value entered with the last executed SET-DFLTTH-STS3C command when the STS-3C port is provisioned (via ENT-STS3C).

The STS-3C THLEV default database is not affected (changed) by a system restart. The STS-3C THLEV default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTTH-STS3C command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTTH-STS3C: [TID] : : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE {ALL},
NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP},
FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}
Default: Entry Required
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All monitored parameter PM registers.
ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.
CV-P, CVP	Coding Violations – Path, CV-P register.
ES-P, ESP	Errored Seconds – Path, ES-P register.
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.
FC-P, FCP	Failure Counts – Path, FC-P register.
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.

THLEV {0-4294967295}
Default: Entry Required
Addressing: None
Description: System Default Threshold Level, specifies the system provisioning default threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0	Specifies no threshold-crossing events are generated.
---	---

THLEV values and the factory default for each MONTYPE are:

THLEV Values vs. MONTYPE				
MONTYPE	15-Minute Register		1-Day Register	
	Valid Values	Factory Default	Valid Values	Factory Default
ALL	{0-150}	–	{0-14400}	–
CV-P	{0-4294967295}	{4666}	{0-4294967295}	{44790}
FC-P	{0-150}	{5}	{0-14400}	{14}
<All other MONTYPES>	{0-900}	{9}	{0-65535}	{86}

Restrictions: SET-DFLTTH-ST53C is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be set. Values are:

FEND	Far-End
NEND	Near-End

DIRN	{NA, RCV, TRMT}
	Default: < All applicable directions >
	Addressing: None
	Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTTH-STS3C command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
	15-MIN 15-Minute PM collection register
	1-DAY 1-Day (24 hour) PM collection register

COMMAND CODE: **SET-DFLTTH-T1**
COMMAND NAME: **SET DEFAULT THRESHOLD T1**

PURPOSE

The SET-DFLTTH-T1 command changes the system provisioning default PM (Performance Monitoring) threshold level (THLEV) for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day).

A DS1 port is provisioned with the system default PM threshold level, as set by this command, when the DS1 port is assigned and provisioned by the ENT-T1 command. After a DS1 port is provisioned (via ENT-T1), the DS1 port's PM threshold level can be set to any (valid) value via the SET-TH-T1 command.

Only the system default PM THLEV for the monitored parameter (identified by MONTYPE, LOCN, and TMPER) specified in the command is changed in the system database. System default threshold levels for monitored parameters that are not specified retain the value as provided from the factory or as set with a previously executed SET-DFLTTH-T1 command. Previously provisioned DS1 ports are not affected by this command. All subsequently provisioned DS1 ports assume the THLEV default value entered with the last executed SET-DFLTTH-T1 command when the DS1 port is provisioned (via ENT-T1).

The DS1 THLEV default database is not affected (changed) by a system restart. The DS1 THLEV default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTTH-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTTH-T1 : [TID] : : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, ES-L, ESL, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, LOSS, LOSS-L, LOSSL, QRSSS, QRSSS-P, QRSSSP, SAS-P, SASP, SES-L, SESL, SES-P, SESP, UAS-P, UASP}, FAR_END_PARAMETERS:{CSS, CSS-P, CSSP, CV-P, CVP, ES-L, ESL, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SEFS, SEFS-P, SESP, SEFSP, SES-P, SESP, UAS-P, UASP}
Default:	Entry Required
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near-end only.)
CSS, CSS-P, CSSP	Controlled Slip Seconds – Path, CSS register. (Far-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end only.)
CV-P, CVP	Coding Violations – Path, CV-P register.
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-P, ESP	Errored Seconds – Path, ES-P register.
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.
FC-P, FCP	Failure Count – Path, FC-P register.
LOSS, LOSS-L, LOSSL	Loss of Signal Seconds – Line, LOSS register. (Near-end only.)
QRSSS, QRSSS-P, QRSSSP	QRSS Seconds – Path, QRSSS-P register. (Near-end only.)
SAS-P, SASP	Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
SEFS, SEFS-P, SEFSP	Severely Errored Frame Seconds, SEFS register. (Far-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register. (Near-end only.)
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.
Restrictions:	SET-DFLTTH-T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

THLEV {0–4294967295}
Default: Entry Required
Addressing: None
Description: System Default Threshold Level, specifies the system provisioning default threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:
 0 Specifies no threshold-crossing events are generated.
 THLEV values and the factory default for each MONTYPE are:

THLEV Values vs. MONTYPE				
MONTYPE	15–Minute Register		1–Day Register	
	Valid Values	Factory Default	Valid Values	Factory Default
ALL	{0–150}	–	{0–14400}	–
CV–L, CV–P	{0–4294967295}	{13340}	{0–4294967295}	{133400}
ES–L, ES–P, QRSSS, QRSSS–P	{0–900}	{65}	{0–65535}	{648}
FC–P	{0–150}	{10}	{0–14400}	{100}
<All other MONTYPES>	{0–900}	{10}	{0–65535}	{100}

Restrictions: SET–DFLTTH–T1 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be set. Values are:
 FEND Far–End
 NEND Near–End
Restrictions: SET–DFLTTH–T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET–DFLTTH–T1 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
 15–MIN 15–Minute PM collection register
 1–DAY 1–Day (24 hour) PM collection register

COMMAND CODE: **SET-DFLTTH-T3**
COMMAND NAME: **SET DEFAULT THRESHOLD T3**

PURPOSE

The SET-DFLTTH-T3 command changes the system provisioning default PM (Performance Monitoring) threshold level (THLEV) for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day).

A DS3 port is provisioned with the system default PM threshold level, as set by this command, when the DS3 port is assigned and provisioned by the ENT-T3 command. After a DS3 port is provisioned (via ENT-T3), the DS3 port's PM threshold level can be set to any (valid) value via the SET-TH-T3 command.

Only the system default PM THLEV for the monitored parameter (identified by MONTYPE, LOCN, and TMPER) specified in the command is changed in the system database. System default threshold levels for monitored parameters that are not specified retain the value as provided from the factory or as set with a previously executed SET-DFLTTH-T3 command. Previously provisioned DS3 ports are not affected by this command. All subsequently provisioned DS3 ports assume the THLEV default value entered with the last executed SET-DFLTTH-T3 command when the DS3 port is provisioned (via ENT-T3).

The DS3 THLEV default database is not affected (changed) by a system restart. The DS3 THLEV default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTTH-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-DFLTTH-T3 : [TID] : : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONATYPE	{ALL},
	NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, CVCP-P, CVCPP, ES-L, ESL, ES-P, ESP, ESA-L, ESAL, ESA-P, ESAP, ESACP-P, ESACPP, ESB-L, ESBP, ESB-P, ESBP, ESBP-P, ESBP-P, ESCP-P, ESCPP, FC-P, FCP, LOSS, LOSS-L, LOSSL, SAS-P, SASP, SES-L, SESL, SES-P, SESP, SESCO-P, SESCO-P, UAS-P, UASP, UASCP-P, UASCPP},

	ESBPC-P, ESBPCPP Errored Seconds type B, CP-bit parity – Path, ESBPC-P register.
	ESCP-P, ESCPP Errored Seconds, CP-bit parity – Path, ESCP-P register.
	FC-P, FCP Failure Counts – Path, FC-P register. (Near-end only.)
	FCCP-P, FCCPP Failure Counts, CP-bit parity – Path, FC-P register. (Far-end only.)
	LOSS, LOSS-L, LOSSL Loss Of Signal Seconds – Line, LOSS register. (Near-end only.)
	SAS-P, SASP Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
	SASCP-P, SASCPP Severe AIS Seconds, CP-bit parity – Path, SASCP-P register. (Far-end only.)
	SES-L, SESL Severely Errored Seconds – Line, SES-L register. (Near-end only.)
	SES-P, SESP Severely Errored Seconds – Path, SES-P register. (Near-end only.)
	SESCP-P, SESCOPP Severely Errored Seconds, CP-bit parity – Path, SESCO-P register.
	UAS-P, UASP Unavailable Seconds – Path, UAS-P register. (Near-end only.)

UASCP-P, UASCPP Unavailable Seconds, CP-bit parity – Path, UASCP-P register.

Restrictions: SET-DFLTTH-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

THLEV

{0-4294967295}

Default: Entry Required

Addressing: None

Description: System Default Threshold Level, specifies the system provisioning default threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0 Specifies no threshold-crossing events are generated.

THLEV values and the factory default for each MONTYPE are:

THLEV Values vs. MONTYPE				
MONTYPE	15-Minute Register		1-Day Register	
	Valid Values	Factory Default	Valid Values	Factory Default
ALL	{0-150}	–	{0-14400}	–
CV-L, CV-P, CVCP-P	{0-4294967295}	{13340}	{0-4294967295}	{133400}
ES-L, ES-P, ESCP-P	{0-900}	{65}	{0-65535}	{648}
FC-P, FCCP-P	{0-150}	{5}	{0-14400}	{14}
<All other MONTYPES>	{0-900}	{10}	{0-65535}	{100}

Restrictions: SET-DFLTTH-T3 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN

{FEND, NEND}

Default: < All applicable locations for the selected monitored parameters >

Addressing: None

Description: Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be set. Values are:

FEND Far-End

NEND Near-End

Restrictions: SET-DFLTTH-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

DIRN

{NA, RCV, TRMT}

Default: < All applicable directions >

Addressing: None

Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTTH-T3 command.

NA Not Applicable

RCV Receive side

TRMT Transmit direction

TMPER	{15-MIN, 1-DAY} Default: {15-MIN} Addressing: None Description: Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are: <div style="margin-left: 40px;"> 15-MIN 15-Minute PM collection register 1-DAY 1-Day (24 hour) PM collection register </div>

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid direction in request message. */ /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid time period in request message. */ /* Invalid threshold level in request message. */ /* Threshold level is out of range. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Error reading T3 PM Default database */ /* Error <ERRNO> updating T3 PM Default database. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type. */

EXAMPLES

In the following example, the system provisioning default threshold level for the daily (1-Day) near-end coding violations, path (CV-P) PM register is set to 50000.

```
SET-DFLTTH-T3:::::CVP,50000,NEND,,1-DAY;
```

In the following example, the system provisioning default threshold level for all 15-Minute near-end and far-end monitored PM parameters is set to 0.

```
SET-DFLTTH-T3:::::ALL,0;
```

REPT^EVT^T3

COMMAND CODE: **SET-DFLTTH-VT1**
COMMAND NAME: **SET DEFAULT THRESHOLD VT1**

PURPOSE

The SET-DFLTTH-VT1 command changes the system provisioning default PM (Performance Monitoring) threshold level (THLEV) for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day).

A VT1.5 port is provisioned with the system default PM threshold level, as set by this command, when the VT1.5 port is assigned and provisioned by the ENT-VT1 command. After a VT1.5 port is provisioned (via ENT-VT1), the VT1.5 port's PM threshold level can be set to any (valid) value via the SET-TH-VT1 command.

Only the system default PM THLEV for the monitored parameter (identified by MONTYPE, LOCN, and TMPER) specified in the command is changed in the system database. System default threshold levels for monitored parameters that are not specified retain the value as provided from the factory or as set with a previously executed SET-DFLTTH-VT1 command. Previously provisioned VT1.5 ports are not affected by this command. All subsequently provisioned VT1.5 ports assume the THLEV default value entered with the last executed SET-DFLTTH-VT1 command when the VT1.5 port is provisioned (via ENT-VT1).

The VT1.5 THLEV default database is not affected (changed) by a system restart. The VT1.5 THLEV default database is replaced by the corresponding database on a backup media during a database restoral (i.e., RESTORE-DB command is executed successfully).

A SET-DFLTTH-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-DFLTTH-VT1 : [TID] : : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

MONTYPE {ALL},
NEAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV, ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV},
FAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV, ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV}
Default: Entry Required
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All monitored parameter PM registers.
ALS-V, ALSV	Alarm Indication Signal/Loss of Pointer – VT Path, ALS-V register.
CV-V, CVV	Coding Violations – VT Path, CV-V register.
ES-V, ESV	Errored Seconds – VT Path, ES-V register.
ESA-V, ESAV	Errored Seconds type A – VT Path, ESA-V register.
ESB-V, ESBV	Errored Seconds type B – VT Path, ESB-V register.
FC-V, FCV	Failure Counts – VT Path, FC-V register.
SES-V, SESV	Severely Errored Seconds – VT Path, SES-V register.
UAS-V, UASV	Unavailable Seconds – VT Path, UAS-V register.

THLEV {0-4294967295}
Default: Entry Required
Addressing: None
Description: System Default Threshold Level, specifies the system provisioning default threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TPER. Uniquely defined values are:

0	Specifies no threshold-crossing events are generated.
---	---

THLEV values and the factory default for each MONTYPE are:

THLEV Values vs. MONTYPE				
MONTYPE	15-Minute Register		1-Day Register	
	Valid Values	Factory Default	Valid Values	Factory Default
ALL	{0-150}	–	{0-14400}	–
CV-V	{0-4294967295}	4666	{0-4294967295}	44790
FC-V	{0-150}	5	{0-14400}	14
<All other MONTYPES>	{0-900}	15	{0-65535}	86

Restrictions: SET-DFLTTH-VT1 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be set. Values are:

FEND	Far-End
NEND	Near-End

DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET-DFLTTH-VT1 command.
	NA	Not Applicable
TMPER	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/* Invalid direction in request message. */
	/* Invalid location in request message. */
	/* Invalid montype in request message. */
	/* Invalid time period in request message. */
	/* Invalid threshold level in request message. */
	/* Threshold level is out of range. */
IIPG	Input, Invalid Parameter Grouping
	/* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error
	/* Error reading VT1 PM Default database */
	/* Error <ERRNO> updating VT1 PM Default database. */
SROF	Status, Requested Operation Failed
	/* Unable to determine facility type. */

EXAMPLES

In the following example, the system provisioning default threshold level for the daily (1–Day) near–end coding violations, VT path (CV–V) PM register is set to 5000.

```
SET-DFLTTH-VT1::::CVV,5000,NEND,,1-DAY;
```

In the following example, the system provisioning default threshold level for all 15–Minute near–end and far–end monitored PM parameters is set to 0.

```
SET-DFLTTH-VT1::::ALL,0;
```

COMMAND CODE: **SET-GOS-EC1**
COMMAND NAME: **SET GRADE-OF-SERVICE EC1**

PURPOSE

The SET-GOS-EC1 command sets the threshold level for the number of service affecting EC1 facility alarms required to generate a (system-level) common Grade-Of-Service-EC1 (GOS-EC1) condition.

The GOS-EC1 condition type attributes are set by the SET-ATTR-COM command. The factory default GOS-EC1 threshold level is zero (0).

A SET-GOS-EC1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-GOS-EC1 : [TID] :: [CTAG] :: THRESHOLD ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
THRESHOLD	{0-3072} Default: Entry Required Addressing: None Description: Threshold, specifies the number of service affecting EC1 facility alarms required to generate a (system-level) common GOS-EC1 condition. A value of zero (0) specifies no GOS-EC1 condition is generated. The factory default GOS-EC1 threshold level is zero (0).

COMMAND CODE: **SET-GOS-T1**
COMMAND NAME: **SET GRADE-OF-SERVICE T1**

PURPOSE

The SET-GOS-T1 command sets the threshold level for the number of service affecting DS1 facility alarms required to generate a (system-level) common Grade-Of-Service-T1 (GOS-T1) condition.

The GOS-T1 condition type attributes are set by the SET-ATTR-COM command. The factory default GOS-T1 threshold level is six (6).

A SET-GOS-T1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-GOS-T1 : [TID] : : [CTAG] : : THRESHOLD ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
THRESHOLD	{0-103936} Default: Entry Required Addressing: None Description: Threshold, specifies the number of service affecting DS1 facility alarms required to generate a (system-level) common GOS-T1 condition. A value of zero (0) specifies no GOS-T1 condition is generated. The factory default GOS-T1 threshold level is six (6).

COMMAND CODE: **SET-PMATTR-ALL**
COMMAND NAME: **SET PERFORMANCE MONITORING ATTRIBUTES ALL**

PURPOSE

The SET-PMATTR-ALL command sets the system-wide PM attributes for all facility types in the system. Threshold Crossing Alert (TCA) attributes and the REPTPMFILERDY attribute are supported.

If the TCA parameter is set to a value of R (restricted), autonomous threshold crossing messages (REPT^EVT^rr) that are affected by a facility failure are suppressed for the remainder of the 15-minute monitoring time period for which the failure exists. Threshold crossing alerts not affected by the facility failure continue to be generated when they occur.

When the Report Event for Common alarms is activated, the transient event PMFILERDY message is activated as well. Since this is not an alarming condition, users do not necessarily desire to see this event message generated once every 15 minutes. This event message is controlled by activating or deactivating the REPTPMFILERDY parameter in the SET-PMATTR-ALL command.

A SET-PMATTR-ALL command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-PMATTR-ALL: [TID] : : [CTAG] : : [TCA] [, REPTPMFILERDY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
TCA	{A, R} Default: {Already Existing Value} Addressing: None Description: Threshold Crossing Alert, specifies whether autonomous messages for the indicated threshold crossing alerts (TCAs) are allowed or restricted during the remainder of a 15-minute monitor period for which a corresponding facility failure is detected. The following TCAs are affected:

Facility Type	Facility Failure	Threshold Crossing Alerts (TCAs) Affected
OC12	LOS or LOF	T-CVS, T-ESS, T-ESA-S, T-ESB-S, T-LOSS, T-SEFS, T-SESS
	AIS-L	T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-FC-L, T-SESL, T-UASL
	RFI-L	(Far-End):T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-FC-L, T-SESL, T-UASL

Facility Type	Facility Failure	Threshold Crossing Alerts (TCAs) Affected
OC3	LOS or LOF	T-CVS, T-ESS, T-ESA-S, T-ESB-S, T-LOSS, T-SEFS, T-SESS
	AIS-L	T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-FC-L, T-SESL, T-UASL
	RFI-L	(Far-End):T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-FC-L, T-SESL, T-UASL
EC1	LOS or LOF	T-LOSS, T-SEFS
	AIS-L	T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-SESL, T-UASL
	RFI-L	(Far-End):T-ESL, T-FC-L, T-SESL, T-UASL
STS-1	AIS-P or LOP-P	T-ALS-P, T-CVP T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SESP, T-UASP
	RFI-P	(Far-End):T-ALS-P, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SESP, T-UASP
STS-3C	AIS-P or LOP-P	T-ALS-P, T-CVP T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SESP, T-UASP
	RFI-P	(Far-End):T-ALS-P, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SESP, T-UASP
VT1.5	AIS-V or LOP-V	T-ALS-V, T-CVV, T-ESV, T-ESA-V, T-ESB-V, T-FC-V, T-SESV, T-UASV
	RFI-V	(Far-End):T-ALS-V, T-CVV, T-ESV, T-ESA-V, T-ESB-V, T-FC-V, T-SESV, T-UASV
DS3	LOS	T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-LOSS, T-SESL
	LOF or AIS	T-AISS, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SAS-P, T-SESP, T-UASP, T-CVCP-P, T-ESCP-P, T-ESACP-P, T-ESBCP-P, T-SESCP-P, T-UASCP-P
	RAI	(Far-End):T-CVCP-P, T-ESCP-P, T-ESACP-P, T-ESBCP-P, T-FCCP-P, T-SASCP-P, T-SESCP-P, T-UASCP-P
DS1	LOS	T-CVL, T-ESL, T-LOSS, T-SESL
	LOF, AIS, or AIS-CI	T-AISS, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SAS-P, T-SESP, T-UASP, T-ESNP, T-SESNP, T-UASNP
	RAI or RAI-CI	(Far-End):T-CSS, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SEFS, T-SESP, T-UASP, T-ESNP, T-SESNP, T-UASNP

Other TCAs for other PM parameters are not affected. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

- | | |
|---|---|
| A | Allowed, specifies that threshold crossing alerts are to be generated regardless of whether the associated facility has failed. |
| R | Restricted, specifies that threshold crossing alerts for the affected PM parameters (see above) are not generated for the remainder of any 15-minute monitor period for which the associated facility has failed. |

REPTPMFILERDY {Y, N} Default: Addressing: Description:	REPORT PM FILE READY {Already Existing Value} None Report PM File Ready is a flag that indicates if the event message of PMFILERDY needs to be generated and displayed to the customer. Values are: Y Yes, the transient event PMFILERDY message needs to be generated and displayed. N No, the transient event PMFILERDY message does not need to be generated and displayed.

COMMAND CODE: **SET-PMMODE-EC1**
COMMAND NAME: **SET PERFORMANCE MONITORING
MODE EC1**

PURPOSE

The SET-PMMODE-EC1 command sets the mode of PM data collection for the specified EC1 port. The command enables or disables PM data collection for the specified type (Section, Line, or both) of PM data.

Executing a SET-PMMODE-EC1 command with PMSTATE of OFF specified sets an EC1 SST of PMI for the specified EC1 port. Executing a SET-PMMODE-EC1 command with PMSTATE of ON specified clears the EC1 SST of PMI for the specified EC1 port.

If the SET-PMMODE-EC1 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-EC1) for the previous 15-minute period *may not* be displayed as OFF.

A SET-PMMODE-EC1 command is denied if:

- The specified EC1 port is not provisioned (via ENT-EC1).
- PM data collection is already enabled for the specified EC1 port and PMSTATE of ON is entered, or PM data collection is already disabled (a EC1 SST of PMI) for the specified EC1 port and PMSTATE of OFF is entered, unless a range of EC1 ports is specified.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-PMMODE-EC1 : [TID] : AID : [CTAG] : : LOCN, MODETYPE, [PMSTATE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{ALL, FEND, NEND} Default: Entry Required Addressing: None Description: Location, specifies the location where the PM parameter is monitored. Values are: ALL All applicable locations FEND Far-End NEND Near-End Restrictions: SET-PMMODE-EC1 is denied if LOCN of FEND and MODETYPE of S is entered.

MODETYPE	{ALL, L, S}	
	Default:	Entry Required
	Addressing:	None
	Description:	Mode Type, specifies the type of PM parameters to be monitored for the entity. Values are:
	ALL	All applicable Line and Section PM parameters are to be monitored.
	L	Line, only Line PM parameters are to be monitored.
	S	Section, only Section PM parameters are to be monitored.
	Restrictions:	SET-PMMODE-EC1 is denied if MODETYPE of S and LOCN of FEND is entered.
PMSTATE	{OFF, ON}	
	Default:	{ON}
	Addressing:	None
	Description:	PM State, specifies whether the PM data collection for the specified mode type (MODETYPE) is enabled or disabled. Values are:
	ON	On, enable PM data collection for the specified MODETYPE.
	OFF	Off, disable PM data collection for the specified MODETYPE.

 /* Unable to process request for tp type <TP_TYPE>. */
 /* EC1 PMMODE Database updated. */
 /* Could not get controlling level 2 processor id. */
 /* Unable to allocate memory for user data. */

EXAMPLES

In the following example, the collection of all PM data is disabled for EC1 port EC1–340.

```
SET-PMODE-EC1::EC1-340:::ALL,ALL,OFF;
```

In the following example, the collection of near–end and far–end line PM data is enabled for EC1 port EC1–340.

```
SET-PMODE-EC1::EC1-340:::ALL,L,ON;
```

COMMAND CODE: **SET-PMMODE-F3**
COMMAND NAME: **SET PERFORMANCE MONITORING
MODE F3**

PURPOSE

The SET-PMMODE-F3 command sets the mode of PM data collection for the specified Fractional-T3 (F3). The command enables or disables PM data collection for the specified type (Line, Path, or both) of PM data.

Executing a SET-PMMODE-F3 command with PMSTATE of OFF specified sets a F3 SST of PMI for the specified Fractional-T3. Executing a SET-PMMODE-F3 command with PMSTATE of ON specified clears the F3 SST of PMI for the specified Fractional-T3.

If the SET-PMMODE-F3 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-F3) for the previous 15-minute period *may not* be displayed as OFF.

A SET-PMMODE-F3 command is denied if:

- The specified Fractional-T3 is not provisioned (via ENT-F3).
- PM data collection is already enabled for the specified Fractional-T3 and PMSTATE of ON is entered, or PM data collection is already disabled (a F3 SST of PMI) for the specified Fractional-T3 and PMSTATE of OFF is entered, unless a range of Fractional-T3s is specified.
- An invalid parameter value is entered.

INPUT FORMAT

SET-PMMODE-F3 : [TID] : AID : [CTAG] : : LOCN, MODETYPE, [PMSTATE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the Fractional-T3.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{ALL, NEND} Default: Entry Required Addressing: None Description: Location, specifies the location where the PM parameters are monitored. Value is: ALL All applicable locations NEND Near-End

MODETYPE	{ALL, N}	
	Default:	Entry Required
	Addressing:	None
	Description:	Mode Type, specifies the type of PM parameters to be monitored for the entity. Values are:
	ALL	All applicable Path PM parameters are to be monitored and summarized for all DS1s assigned to the F3.
	N	N T1 Path, Path PM parameters are to be monitored and summarized for all DS1s assigned to the F3.
PMSTATE	{OFF, ON}	
	Default:	{ON}
	Addressing:	None
	Description:	PM State, specifies whether the PM data collection for the specified mode type (MODETYPE) is enabled or disabled. Values are:
	ON	On, enable PM data collection for the specified MODETYPE.
	OFF	Off, disable PM data collection for the specified MODETYPE.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/* Invalid location in request message. */
	/* Invalid modetype in request message. */
	/* Location FEND is not valid for F3. */
	/* Modetype S is not valid for F3 */
	/* Modetype L is not valid for F3. */
	/* Invalid pmstate in request message. */
IIAC	Input, Invalid ACcess identifier
	/* AID not in Partition. */
	/* Invalid AID entered. */
SAIN	Status, Already INhibited
	/* PMSTATE is already OFF. */
SAOP	Status Already OPerated
	/* PMSTATE is already ON. */

SDBE	Status, internal Data Base Error /* Failed to set pointer to FM F3 record. */ /* Error <ERRNO> reading from PMMODE database. */ /* Error <ERRNO> writing to PMMODE database. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type.*/ /* Unable to determine supporting facility entity. */ /* Unable to process request for tp type <TP_TYPE>. */ /* F3 PMMODE Database updated. */ /* Could not get controlling level 2 processor id. */ /* Unable to allocate memory for user data. */

EXAMPLES

In the following example, the collection of all PM data is disabled for Fractional-T3 T3F3-1297-4.

```
SET-PMODE-F3::T3F3-1297-4:::ALL,ALL,OFF;
```

In the following example, the collection of PM data is enabled for Fractional-T3 T3F3-1297-4.

```
SET-PMODE-F3::T3F3-1297-4:::ALL,N,ON;
```

```

COMMAND CODE: SET-PMMODE-OC12
COMMAND NAME: SET PERFORMANCE MONITORING
MODE OC-12

PURPOSE

The SET-PMMODE-OC12 command sets the mode of PM data collection for the specified OC-12 port. The command enables or disables PM data collection for the specified type (Section, Line, or both) of PM data.

Executing a SET-PMMODE-OC12 command with PMSTATE of OFF specified sets an OC-12 SST of PMI for the specified OC-12 port. Executing a SET-PMMODE-OC12 command with PMSTATE of ON specified clears the OC-12 SST of PMI for the specified OC-12 port.

If the SET-PMMODE-OC12 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-OC12) for the previous 15-minute period *may not* be displayed as OFF.

A SET-PMMODE-OC12 command is denied if:

- The specified OC-12 port is not provisioned (via ENT-OC12).
- PM data collection is already enabled for the specified OC-12 port and PMSTATE of ON is entered, or PM data collection is already disabled (an OC-12 SST of PMI) for the specified OC-12 port and PMSTATE of OFF is entered, unless a range of OC-12 ports is specified.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-PMMODE-OC12 : [TID] : AID : [CTAG] : : LOCN, MODETYPE, [PMSTATE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{ALL, FEND, NEND} Default: Entry Required Addressing: None Description: Location, specifies the location where the PM parameter is monitored. Values are: ALL All applicable locations FEND Far-End NEND Near-End Restrictions: SET-PMMODE-OC12 is denied if LOCN of FEND and MODETYPE of S is entered.

MODETYPE	{ALL, L, S}	
	Default:	Entry Required
	Addressing:	None
	Description:	Mode Type, specifies the type of PM parameters to be monitored for the entity. Values are:
	ALL	All applicable Line and Section PM parameters are to be monitored.
	L	Line, only Line PM parameters are to be monitored.
	S	Section, only Section PM parameters are to be monitored.
	Restrictions:	SET-PMMODE-OC12 is denied if MODETYPE of S and LOCN of FEND is entered.
PMSTATE	{OFF, ON}	
	Default:	{ON}
	Addressing:	None
	Description:	PM State, specifies whether the PM data collection for the specified mode type (MODETYPE) is enabled or disabled. Values are:
	ON	On, enable PM data collection for the specified MODETYPE.
	OFF	Off, disable PM data collection for the specified MODETYPE.

COMMAND CODE: **SET-PMMODE-STS1**
COMMAND NAME: **SET PERFORMANCE MONITORING
MODE STS-1**

PURPOSE

The SET-PMMODE-STS1 command sets the mode of PM data collection for the specified STS-1 port. The command enables or disables PM data collection for the specified type (Path) of PM data.

Executing a SET-PMMODE-STS1 command with PMSTATE of OFF specified sets an STS-1 SST of PMI for the specified STS-1 port. Executing a SET-PMMODE-STS1 command with PMSTATE of ON specified clears the STS-1 SST of PMI for the specified STS-1 port.

If the SET-PMMODE-STS1 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-STS1) for the previous 15-minute period *may not* be displayed as OFF.

A SET-PMMODE-STS1 command is denied if:

- The specified STS-1 port is not provisioned (via ENT-STS1).
- The specified STS-1 port is embedded within a protection OC-3 or OC-12.
- PM data collection is already enabled for the specified STS-1 port and PMSTATE of ON is entered, or PM data collection is already disabled (an STS-1 SST of PMI) for the specified STS-1 port and PMSTATE of OFF is entered, unless a range of STS-1 ports is specified.
- An invalid parameter value is entered.

INPUT FORMAT

SET-PMMODE-STS1 : [TID] : AID : [CTAG] : : LOCN, MODETYPE, [PMSTATE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS1 AID, identifies the STS-1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	
LOCN	{ALL, FEND, NEND}		
	Default:	Entry Required	
	Addressing:	None	
	Description:	Location, specifies the location where the PM parameter is monitored. Values are:	
	ALL	All applicable locations	
	FEND	Far-End	
	NEND	Near-End	

MODETYPE	{ALL, P}	
	Default:	Entry Required
	Addressing:	None
	Description:	Mode Type, specifies the type of PM parameters to be monitored for the entity. Values are:
	ALL	All applicable Path PM parameters are to be monitored.
	P	Path, only Path PM parameters are to be monitored.
PMSTATE	{OFF, ON}	
	Default:	{ON}
	Addressing:	None
	Description:	PM State, specifies whether the PM data collection for the specified mode type (MODETYPE) is enabled or disabled. Values are:
	ON	On, enable PM data collection for the specified MODETYPE.
	OFF	Off, disable PM data collection for the specified MODETYPE.

COMMAND CODE: **SET-PMMODE-STS3C**
COMMAND NAME: **SET PERFORMANCE MONITORING
MODE STS-3C**

PURPOSE

The SET-PMMODE-STS3C command sets the mode of PM data collection for the specified STS-3C port. The command enables or disables PM data collection for the specified type (Path) of PM data.

Executing a SET-PMMODE-STS3C command with PMSTATE of OFF specified sets an STS-3C SST of PMI for the specified STS-3C port. Executing a SET-PMMODE-STS3C command with PMSTATE of ON specified clears the STS-3C SST of PMI for the specified STS-3C port.

If the SET-PMMODE-STS3C command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-STS3C) for the previous 15-minute period *may not* be displayed as OFF.

A SET-PMMODE-STS3C command is denied if:

- The specified STS-3C port is not provisioned (via ENT-STS3C).
- The specified STS-3C port is embedded within a protection OC-3 or OC-12.
- PM data collection is already enabled for the specified STS-3C port and PMSTATE of ON is entered, or PM data collection is already disabled (an STS-3C SST of PMI) for the specified STS-3C port and PMSTATE of OFF is entered, unless a range of STS-3C ports is specified.
- An invalid parameter value is entered.

INPUT FORMAT

SET-PMMODE-STS3C: [TID] :AID: [CTAG] : :LOCN,MODETYPE, [PMSTATE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID, identifies the STS-3C port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{ALL, FEND, NEND} Default: < All applicable locations > Addressing: None Description: Location, specifies the location where the PM parameter is monitored. Values are: ALL All applicable locations FEND Far-End NEND Near-End

MODETYPE	{ALL, P}	
	Default:	{ALL}
	Addressing:	None
	Description:	Mode Type, specifies the type of PM parameters to be monitored for the entity. Values are:
	ALL	All applicable Path PM parameters are to be monitored.
	P	Path, only Path PM parameters are to be monitored.
PMSTATE	{OFF, ON}	
	Default:	{ON}
	Addressing:	None
	Description:	PM State, specifies whether the PM data collection for the specified mode type (MODETYPE) is enabled or disabled. Values are:
	ON	On, enable PM data collection for the specified MODETYPE.
	OFF	Off, disable PM data collection for the specified MODETYPE.

COMMAND CODE: **SET-PMMODE-T1**
COMMAND NAME: **SET PERFORMANCE MONITORING
MODE T1**

PURPOSE

The SET-PMMODE-T1 command sets the mode of PM data collection for the specified DS1 port. The command enables or disables PM data collection for the specified type (Line, Path, or both) of PM data.

Executing a SET-PMMODE-T1 command with PMSTATE of OFF specified sets a DS1 SST of PMI for the specified DS1 port. Executing a SET-PMMODE-T1 command with PMSTATE of ON specified clears the DS1 SST of PMI for the specified DS1 port.

If the SET-PMMODE-T1 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-T1) for the previous 15-minute period *may not* be displayed as OFF.

A SET-PMMODE-T1 command is denied if:

- The specified DS1 port is not provisioned (via ENT-T1).
- The specified DS1 port is embedded within a protection OC3.
- PM data collection is already enabled for the specified DS1 port and PMSTATE of ON is entered, or PM data collection is already disabled (a DS1 SST of PMI) for the specified DS1 port and PMSTATE of OFF is entered, unless a range of DS1 ports is specified.
- An invalid parameter value or combination of parameter values is entered.

NOTE: If a LOCN of ALL or FEND, a MODETYPE of P or ALL and a PMSTATE of ON is selected, it is also necessary to execute an ENT-T1 command with an FEMETHOD value other than NONE (ie, either ANSI or ATPOLL) to enable collection of far end T1 PM data.

INPUT FORMAT

SET-PMMODE-T1 : [TID] : AID : [CTAG] : : LOCN, MODETYPE, [PMSTATE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{EC1T1-{1-3840}-{1-7}-{1-4}}	(EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS1 AID, identifies the DS1 port.
	Restrictions:	SET-PMMODE-T1 is denied if the specified AID identifies an embedded DS1 and MODETYPE of L is entered.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

LOCN	{ALL, FEND, NEND}	
	Default:	Entry Required
	Addressing:	None
	Description:	Location, specifies the location where the PM parameter is monitored. Values are:
	ALL	All applicable locations
MODETYPE	FEND	Far-End
	NEND	Near-End
	Restrictions:	SET-PMMODE-T1 is denied if a value of LOCN=FEND is used and the "FDL based Far End Performance Monitoring" PFO is not enabled.
	{ALL, L, P}	
	Default:	Entry Required
	Addressing:	None
	Description:	Mode Type, specifies the type of PM parameters to be monitored for the entity. Values are:
	ALL	All applicable Line and Path PM parameters are to be monitored.
	L	Line, only Line PM parameters are to be monitored.
	P	Path, only Path PM parameters are to be monitored.
PMSTATE	Restrictions:	SET-PMMODE-T1 is denied if MODETYPE of L is entered and the specified AID identifies an embedded DS1.
	{OFF, ON}	
	Default:	{ON}
	Addressing:	None
	Description:	PM State, specifies whether the PM data collection for the specified mode type (MODETYPE) is enabled or disabled. Values are:
	ON	On, enable PM data collection for the specified MODETYPE.
	OFF	Off, disable PM data collection for the specified MODETYPE.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid modetype in request message. */ /* Modetype S is not valid for T1. */ /* Modetype L with Location NEND is not valid for embedded T1. */ /* Invalid pmstate in request message. */ /* Invalid pm mode in request message. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
SAIN	Status, Already INhibited /* PMSTATE is already OFF. */
SAOP	Status Already OPerated /* PMSTATE is already ON. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM T1 record. */ /* Error <ERRNO> reading from PMMODE database. */ /* Error <ERRNO> writing to PMMODE database. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type.*/ /* Unable to determine supporting facility entity. */ /* Unable to process request for tp type <TP_TYPE>. */ /* T1 PMMODE Database updated. */ /* Could not get controlling level 2 processor id. */ /* Unable to allocate memory for user data. */

EXAMPLES

In the following example, the collection of all PM data is disabled for DS1 port T3T1-1297-4.

```
SET-PMODE-T1::T3T1-1297-4:::ALL,ALL,OFF;
```

In the following example, the collection of near-end and far-end path PM data is enabled for DS1 port T3T1-1297-4.

```
SET-PMODE-T1::T3T1-1297-4:::ALL,P,ON;

COMMAND CODE: **SET-PMMODE-T3**
COMMAND NAME: **SET PERFORMANCE MONITORING
MODE T3**

PURPOSE

The SET-PMMODE-T3 command sets the mode of PM data collection for the specified DS3 port. The command enables or disables PM data collection for the specified type (Line, Path, or both) of PM data.

Executing a SET-PMMODE-T3 command with PMSTATE of OFF specified sets a DS3 SST of PMI for the specified DS3 port. Executing a SET-PMMODE-T3 command with PMSTATE of ON specified clears the DS3 SST of PMI for the specified DS3 port.

If the SET-PMMODE-T3 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-T3) for the previous 15-minute period *may not* be displayed as OFF.

A SET-PMMODE-T3 command is denied if:

- The specified DS3 port is not provisioned (via ENT-T3).
- The specified DS3 port is embedded within a protection OC-3 or OC-12.
- PM data collection is already enabled for the specified DS3 port and PMSTATE of ON is entered, or PM data collection is already disabled (a DS3 SST of PMI) for the specified DS3 port and PMSTATE of OFF is entered, unless a range of DS3 ports is specified.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-PMMODE-T3 : [TID] : AID : [CTAG] : : LOCN, MODETYPE, [PMSTATE] ;

INPUT PARAMETERS

COMMAND CODE: **SET-PMMODE-VT1**
COMMAND NAME: **SET PERFORMANCE MONITORING
MODE VT1**

PURPOSE

The SET-PMMODE-VT1 command sets the mode of PM data collection for the specified VT1.5 port. The command enables or disables PM data collection for the specified type (Path) of PM data.

Executing a SET-PMMODE-VT1 command with PMSTATE of OFF specified sets a VT1.5 SST of PMI for the specified VT1.5 port. Executing a SET-PMMODE-VT1 command with PMSTATE of ON specified clears the VT1.5 SST of PMI for the specified VT1.5 port.

If the SET-PMMODE-VT1 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-VT1) for the previous 15-minute period *may not* be displayed as OFF.

A SET-PMMODE-VT1 command is denied if:

- The specified VT1.5 port is not provisioned (via ENT-VT1).
- The specified VT1.5 port is embedded within a protection OC-3 or OC-12.
- PM data collection is already enabled for the specified VT1.5 port and PMSTATE of ON is entered, or PM data collection is already disabled (a VT1.5 SST of PMI) for the specified VT1.5 port and PMSTATE of OFF is entered, unless a range of VT1.5 ports is specified.
- An invalid parameter value is entered.

INPUT FORMAT

COMMAND CODE: **SET-SID**
COMMAND NAME: **SET SITE IDENTIFIER**

PURPOSE

The SET-SID command is used to set the Site Identifier (SID) code that is compared to any Target Identifier (TID) value entered in a command.

The SID value can be entered as an upper or lower case value, but the system converts the entered SID value to upper case for comparison to any TID value (also converted to upper case) entered in a command.

The SET-SID command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-SID: [TID] :: [CTAG] :: SID;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
SID	<1–20 VALID SID CHARACTERS> Default: Entry Required Addressing: None Description: Site Identifier, specifies the new SID. The SID value can be up to 20 non–case sensitive alphanumeric characters, including the special dash (–) character. No other special characters are allowed. The SID must start with an alphabetic character and may include up to 4 non–consecutive dashes (–), but the SID cannot end with the special character dash (–). If a lower–case character string is entered for the SID, it is automatically converted to an upper–case character string for comparison to any TID value entered in a command.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <SID> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
```

OUTPUT PARAMETERS

SID	<1–20 VALID SID CHARACTERS> Site Identifier, indicates the new SID.
-----	--

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IBEX	Input, Block EXtra
IDNV	Input, Data Not Valid /* Illegal Input: SID */ /* Site ID must begin with a letter */
IISP	Input, Invalid Syntax or Punctuation /* Site ID must begin with a letter */ /* Illegal Input: SID length */
ISCH	Input, invalid Syntax invalid CHaracter /* Site ID must be alphanumeric or dash */ /* Illegal Input: <nnn> */
SDBE	Status, internal Data Base Error /* Unable to read plat_parm db record nnn – status = <status number> */
SROF	Status, Requested Operation Failed /* Platparm database error, status = <nnn> */ /* Unable to update plat_parm, db record nnn, status = <status number> */

EXAMPLES

In the following example, SET-SID is used to set the SID to AM1520.

```
SET-SID:::::AM1520;
```

The output response, shown below, assumes CID 1 was used to enter the command, a system generated CTAG value of P12010, and that the command was executed on 3/7/94 at 9:08:33 a.m.

```
AM1520 94-07-03 09:08:33
M P12010 COMPLD
/* AM1520 */
/* SET-SID:::::AM1520 [P12010] (1) */
;
```

RELATED COMMANDS

ED-DAT
RTRV-HDR

COMMAND CODE: **SET-SYNCN**
COMMAND NAME: **SET SYNCHRONIZATION MODE**

PURPOSE

The SET-SYNCN command sets the clock synchronization mode of the MCB clock subsystem.

A SET-SYNCN command is denied if:

- The MCB subsystem is provisioned for the internal timing reference mode of operation (refer to the MCB TMG parameter in the ED-EQPT command).
- An OPR-SYNCNSW command is currently active (OPR-SYNCNSW entered but not released via a RLS-SYNCNSW command).
- A SYNCMODE of FRNG, FST, or HLDOVR is entered and a FSTSYNC, FRNGSYNC, or HLDOVR-SYNC alarm / condition is already active.
- An invalid parameter value is entered.

INPUT FORMAT

SET-SYNCN: [TID] : AID: [CTAG] : : SYNCNMODE;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.								
AID	EQUIPMENT_AID {MCB-{2,3}–3–1} {MCB-{5}–{1, 3}–{1}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment entity. Either copy of MCB can be specified. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.								
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.								
SYNCNMODE	{FRNG, FST, HLDOVR, NORM} Default: Entry Required Addressing: None Description: Synchronization Mode, specifies the clock synchronization mode of the MCB clock subsystem. Values are: <table><tr><td>FRNG</td><td>Free Running, the master MCB operates in the Free Running clock synchronization mode and does not synchronize to any of the clock reference sources.</td></tr><tr><td>FST</td><td>Fast Acquisition, the master MCB operates in the Fast Acquisition clock synchronization mode to achieve fast synchronization to the Primary or Secondary clock reference source. The MCB remains in the Fast Acquisition mode until a SYNCNMODE of NORM is entered.</td></tr><tr><td>HLDOVR</td><td>Holdover, the master MCB operates in the Holdover clock synchronization mode maintaining the previously known clock frequency.</td></tr><tr><td>NORM</td><td>Normal, the master MCB operates in the Normal clock synchronization mode for slow tracking to the Primary or Secondary clock reference sources.</td></tr></table>	FRNG	Free Running, the master MCB operates in the Free Running clock synchronization mode and does not synchronize to any of the clock reference sources.	FST	Fast Acquisition, the master MCB operates in the Fast Acquisition clock synchronization mode to achieve fast synchronization to the Primary or Secondary clock reference source. The MCB remains in the Fast Acquisition mode until a SYNCNMODE of NORM is entered.	HLDOVR	Holdover, the master MCB operates in the Holdover clock synchronization mode maintaining the previously known clock frequency.	NORM	Normal, the master MCB operates in the Normal clock synchronization mode for slow tracking to the Primary or Secondary clock reference sources.
FRNG	Free Running, the master MCB operates in the Free Running clock synchronization mode and does not synchronize to any of the clock reference sources.								
FST	Fast Acquisition, the master MCB operates in the Fast Acquisition clock synchronization mode to achieve fast synchronization to the Primary or Secondary clock reference source. The MCB remains in the Fast Acquisition mode until a SYNCNMODE of NORM is entered.								
HLDOVR	Holdover, the master MCB operates in the Holdover clock synchronization mode maintaining the previously known clock frequency.								
NORM	Normal, the master MCB operates in the Normal clock synchronization mode for slow tracking to the Primary or Secondary clock reference sources.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENSI	Equipage, Not equipped for Setting specified Information
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
	/* The command was rejected. */
	/* Invalid or unassigned equipment identifier specified. */
	/* The command was aborted. */
	/* MCB data base access failure. */
IPNV	Input, Parameter Not Valid
SAOP	Status Already OPerated
	/* Current mode: <CLKMODE> */
SARB	Status, All Resources Busy
	/* Command already in progress on equipment. */
SDBE	Status, internal Data Base Error
	/* Error accessing auxiliary EM data area. */
	/* Error accessing TMG database */
	/* Error accessing data base for <AID> */
	/* Error accessing database for mate mcb <AID>. */
	/* Error accessing auxiliary EM data area for <AID>. */
	/* Error updating database for <AID> */
	/* Unable to access TMG database */
	/* MCB data base access failure. */
SNVS	Status, Not in Valid State
	/* Command not valid for current state of equipment.*/
SROF	Status, Requested Operation Failed
SSRD	Status, Switch Request Denied
	/* OPR-SYNCNSW:::PRI should be followed by RLS-SYNCNSW. */
	/* OPR-SYNCNSW:::SEC should be followed by RLS-SYNCNSW. */
	/* SET-SYNCN::%s::%s should be followed by SET-SYNCN::%s:::NORM */
	/* Current mode: <CLKMODE> */
	/* Unrecognized clock mode: <CLKMODE> */
	/* The SET-SYNCN for <AID> was rejected. */
SSRE	Status, System Resources Exceeded
	/* The command was rejected. */
	/* Unable to allocate USI response buffer. */

SWFA Status, Working unit FAiled
 /* <AID> has failed. */

EXAMPLES

In the following example, the MCB clock subsystem clock synchronization mode is set to Holdover.

RTRV-EQPT

COMMAND CODE: **SET-TH-EC1**
COMMAND NAME: **SET THRESHOLD EC1**

PURPOSE

The SET-TH-EC1 command sets the threshold level for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day), pertaining to the specified EC1 port to the value specified by THLEV.

A SET-TH-EC1 command is denied if:

- The specified EC1 port is not provisioned (via ENT-EC1).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-TH-EC1 : [TID] : AID : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	EC1_AID:		
	{EC1–{1–3840} }		(EC1–EC1/STS1#)
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	EC1 AID, identifies the EC1 port.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE {ALL},
NEAR_END_PARAMETERS:{CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL,
LOSS, LOSS-S, SEFS, SEFS-S, SES-L, SESL, UAS-L, UASL},
FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, ES-L, ESL, FC-L, FCL, SES-L,
SESL, UAS-L, UASL}
Default: Entry Required
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register. (Far-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register. (Far-end only.)
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.

Restrictions: SET-TH-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).

THLEV {0-4294967295, DFLT}
Default: Entry Required
Addressing: None
Description: Threshold Level, specifies the threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0	Specifies no threshold-crossing events are generated.
DFLT	Default, set the threshold level to the system-wide default value retrieved by the RTRV-DFLTTH-EC1 command.

THLEV values for each MONTYPE are shown below:

THLEV Values vs. MONTYPE		
MONTYPE	15-Minute Register	1-Day Register
ALL	{0-150, DFLT}	{0-14400, DFLT}
CV-L	{0-4294967295, DFLT}	{0-4294967295, DFLT}
FC-L	{0-150, DFLT}	{0-14400, DFLT}
<All other MONTYPES>	{0-900, DFLT}	{0-65535, DFLT}

Restrictions: SET-TH-EC1 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN	{FEND, NEND}	
	Default:	< All applicable locations for the selected monitored parameters >
	Addressing:	None
	Description:	Location, specifies whether threshold levels for near-end or far-end monitored parameters are to be set. Values are:
	FEND	Far-End
DIRN	NEND	Near-End
	Restrictions:	SET-TH-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
TMPER	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET-TH-EC1 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid threshold level in request message. */ /* Invalid montype in request message. */ /* Threshold level is out of range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM EC1 record. */ /* Error reading default database. */ /* Error <ERRNO> reading from EC1 Threshold database. */ /* Error <ERRNO> updating EC1 Threshold database. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* EC1 Threshold Database updated. */ /* Could not get controlling level 2 processor id. */ /* Unable to allocate memory for user data. */ /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */

EXAMPLES

In the following example, the threshold level for the daily (1-Day) near-end and far-end unavailable seconds, line (UAS-L) PM register for EC1 port EC1-626 is set to 46.

```
SET-TH-EC1::EC1-626:::UASL,46,,1-DAY;
```

In the following example, the threshold level for the 15-Minute near-end coding violations, line (CV-L) PM register for EC1 port EC1-626 is set to the system default value.

```
SET-TH-EC1::EC1-626:::CVL,DFLT;

COMMAND CODE: **SET-TH-OC12**
COMMAND NAME: **SET THRESHOLD OC-12**

PURPOSE

The SET-TH-OC12 command sets the threshold level for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day), pertaining to the specified OC-12 port to the value specified by THLEV.

A SET-TH-OC12 command is denied if:

- The specified OC-12 port is not provisioned (via ENT-OC12).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-TH-OC12 : [TID] : AID : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	OC12_AID:		
	{OC12–{1–560}}		(OC12–OC12#)
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	OC12 AID, identifies the OC–12 port.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	Entry Required
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-S, ESS	Errored Seconds – Section, ES-S register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register.
ESA-S, ESAS	Errored Seconds type A – Section, ESA-S register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register.
ESB-S, ESBS	Errored Seconds type B – Section, ESB-S register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register.
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
PSC, PSC-L, PSCL	Protection Switch Counts – Line, PSC-L register. (Near-end only.)
PSD, PSD-L, PSDL	Protection Switch Duration – Line, PSD-L register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	SET-TH-OC12 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

THLEV {0–4294967295, DFLT}
Default: Entry Required
Addressing: None
Description: Threshold Level, specifies the threshold level for which threshold–crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:
 0 Specifies no threshold–crossing events are generated.
 DFLT Default, set the threshold level to the system–wide default value retrieved by the RTRV–DFLTTH–OC12 command.
 THLEV values for each MONTYPE are shown below:

THLEV Values vs. MONTYPE		
MONTYPE	15–Minute Register	1–Day Register
ALL	{0–150, DFLT}	{0–14400, DFLT}
CV–L, CV–S	{0–4294967295, DFLT}	{0–4294967295, DFLT}
FC–L	{0–150, DFLT}	{0–14400, DFLT}
<All other MONTYPES>	{0–900, DFLT}	{0–65535, DFLT}

Restrictions: SET–TH–OC12 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether threshold levels for near–end or far–end monitored parameters are to be set. Values are:
 FEND Far–End
 NEND Near–End
Restrictions: SET–TH–OC12 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV–S and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET–TH–OC12 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether threshold levels for the 15–minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
 15–MIN 15–Minute PM collection register
 1–DAY 1–Day (24 hour) PM collection register

SUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **SET-TH-OC3**
COMMAND NAME: **SET THRESHOLD OC-3**

PURPOSE

The SET-TH-OC3 command sets the threshold level for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day), pertaining to the specified OC-3 port to the value specified by THLEV.

A SET-TH-OC3 command is denied if:

- The specified OC-3 port is not provisioned (via ENT-OC3).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-TH-OC3 : [TID] : AID : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	OC3_AID:	
	{OC3-{1-2240}}	(OC3-OC3#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	Entry Required
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-S, ESS	Errored Seconds – Section, ES-S register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register.
ESA-S, ESAS	Errored Seconds type A – Section, ESA-S register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register.
ESB-S, ESBS	Errored Seconds type B – Section, ESB-S register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register.
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
PSC, PSC-L, PSCL	Protection Switch Counts – Line, PSC-L register. (Near-end only.)
PSD, PSD-L, PSDL	Protection Switch Duration – Line, PSD-L register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	SET-TH-OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

THLEV {0–4294967295, DFLT}
Default: Entry Required
Addressing: None
Description: Threshold Level, specifies the threshold level for which threshold–crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0 Specifies no threshold–crossing events are generated.
DFLT Default, set the threshold level to the system–wide default value retrieved by the RTRV–DFLTTH–OC3 command.

THLEV values for each MONTYPE are shown below:

THLEV Values vs. MONTYPE		
MONTYPE	15–Minute Register	1–Day Register
ALL	{0–150, DFLT}	{0–14400, DFLT}
CV–L, CV–S	{0–4294967295, DFLT}	{0–4294967295, DFLT}
FC–L	{0–150, DFLT}	{0–14400, DFLT}
<All other MONTYPES>	{0–900, DFLT}	{0–65535, DFLT}

Restrictions: SET–TH–OC3 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether threshold levels for near–end or far–end monitored parameters are to be set. Values are:

FEND Far–End
NEND Near–End

Restrictions: SET–TH–OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV–S and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET–TH–OC3 command.

NA Not Applicable
RCV Receive side
TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether threshold levels for the 15–minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:

15–MIN 15–Minute PM collection register
1–DAY 1–Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/* Invalid location in request message. */
	/* Invalid direction in request message. */
	/* Invalid time period in request message. */
	/* Invalid threshold level in request message. */
	/* Invalid montype in request message. */
	/* Threshold level is out of range. */
IIAC	Input, Invalid ACcess identifier
	/* AID not in Partition. */
	/* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping
	/* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error
	/* Failed to set pointer to FM OC3 record. */
	/* Error reading default database. */
	/* Error <ERRNO> reading from OC3 Threshold database. */
	/* Error <ERRNO> updating OC3 Threshold database. */
SNVS	Status, Not in Valid State
	/* Facility is unprovisioned. */
	/* AID not as provisioned. */
SROF	Status, Requested Operation Failed
	/* OC3 Threshold Database updated. */
	/* Could not get controlling level 2 processor id. */
	/* Unable to allocate memory for user data. */
	/* Unable to determine supporting facility entity. */
	/* Unable to determine facility type. */

EXAMPLES

In the following example, the threshold level for the daily (1-Day) near-end and far-end unavailable seconds, line (UAS-L) PM register for OC-3 port OC3-98 is set to 46.

```
SET-TH-OC3::OC3-98:::UASL,46,,,1-DAY;
```

In the following example, the threshold level for the 15–Minute near–end coding violations, line (CV–L) PM register for OC–3 port OC3–98 is set to the system default value.

```
SET-TH-OC3 : : OC3-98 : : CVP, DFLT, NEND ;

COMMAND CODE: **SET-TH-STS1**
COMMAND NAME: **SET THRESHOLD STS-1**

PURPOSE

The SET-TH-STS1 command sets the threshold level for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day), pertaining to the specified STS-1 port to the value specified by THLEV.

A SET-TH-STS1 command is denied if:

- The specified STS-1 port is not provisioned (via ENT-STS1).
- The specified STS-1 port is embedded within a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-TH-STS1 : [TID] : AID : [CTAG] : : MONTYPE, THLEV, [LOCN], [DIRN], [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.																		
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies the STS-1 port.																		
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.																		
MONTYPE	{ALL}, NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}, FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP} Default: Entry Required Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are: <table> <tr> <td>ALL</td><td>All monitored parameter PM registers.</td></tr> <tr> <td>ALS-P, ALSP</td><td>Alarm Indication Signal/Loss of Pointer - Path, ALS-P register.</td></tr> <tr> <td>CV-P, CVP</td><td>Coding Violations - Path, CV-P register.</td></tr> <tr> <td>ES-P, ESP</td><td>Errored Seconds - Path, ES-P register.</td></tr> <tr> <td>ESA-P, ESAP</td><td>Errored Seconds type A - Path, ESA-P register.</td></tr> <tr> <td>ESB-P, ESBP</td><td>Errored Seconds type B - Path, ESB-P register.</td></tr> <tr> <td>FC-P, FCP</td><td>Failure Counts - Path, FC-P register.</td></tr> <tr> <td>SES-P, SESP</td><td>Severely Errored Seconds - Path, SES-P register.</td></tr> <tr> <td>UAS-P, UASP</td><td>Unavailable Seconds - Path, UAS-P register.</td></tr> </table>	ALL	All monitored parameter PM registers.	ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer - Path, ALS-P register.	CV-P, CVP	Coding Violations - Path, CV-P register.	ES-P, ESP	Errored Seconds - Path, ES-P register.	ESA-P, ESAP	Errored Seconds type A - Path, ESA-P register.	ESB-P, ESBP	Errored Seconds type B - Path, ESB-P register.	FC-P, FCP	Failure Counts - Path, FC-P register.	SES-P, SESP	Severely Errored Seconds - Path, SES-P register.	UAS-P, UASP	Unavailable Seconds - Path, UAS-P register.
ALL	All monitored parameter PM registers.																		
ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer - Path, ALS-P register.																		
CV-P, CVP	Coding Violations - Path, CV-P register.																		
ES-P, ESP	Errored Seconds - Path, ES-P register.																		
ESA-P, ESAP	Errored Seconds type A - Path, ESA-P register.																		
ESB-P, ESBP	Errored Seconds type B - Path, ESB-P register.																		
FC-P, FCP	Failure Counts - Path, FC-P register.																		
SES-P, SESP	Severely Errored Seconds - Path, SES-P register.																		
UAS-P, UASP	Unavailable Seconds - Path, UAS-P register.																		

THLEV {0–4294967295, DFLT}
Default: Entry Required
Addressing: None
Description: Threshold Level, specifies the threshold level for which threshold–crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:
 0 Specifies no threshold–crossing events are generated.
 DFLT Default, set the threshold level to the system–wide default value retrieved by the RTRV–DFLTTH–STS1 command.
 THLEV values for each MONTYPE are shown below:

THLEV Values vs. MONTYPE		
MONTYPE	15–Minute Register	1–Day Register
ALL	{0–150, DFLT}	{0–14400, DFLT}
CV–P	{0–4294967295, DFLT}	{0–4294967295, DFLT}
FC–P	{0–150, DFLT}	{0–14400, DFLT}
<All other MONTYPES>	{0–900, DFLT}	{0–65535, DFLT}

Restrictions: SET–TH–STS1 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether threshold levels for near–end or far–end monitored parameters are to be set. Values are:
 FEND Far–End
 NEND Near–End

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET–TH–STS1 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether threshold levels for the 15–minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
 15–MIN 15–Minute PM collection register
 1–DAY 1–Day (24 hour) PM collection register

REPT^EVT^STS1

COMMAND CODE: **SET-TH-STS3C**
COMMAND NAME: **SET THRESHOLD STS-3C**

PURPOSE

The SET-TH-STS3C command sets the threshold level for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day), pertaining to the specified STS-3C port to the value specified by THLEV.

A SET-TH-STS3C command is denied if:

- The specified STS-3C port is not provisioned (via ENT-STS3C).
- The specified STS-3C port is embedded within a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-TH-STS3C: [TID] :AID: [CTAG] : :MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS3C_AID:		
	{OC3STS3C–{1–2240}}	(OC3STS3C–OC3#/STS3C#)	
	{OC12STS3C–{1–560}–{1–4}}	(OC12STS3C–OC12#–STM1/STS3C#)	
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	STS3C AID, identifies the STS–3C port.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE {ALL},
NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP},
FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}
Default: Entry Required
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL All monitored parameter PM registers.
ALS-P, ALSP Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.
CV-P, CVP Coding Violations – Path, CV-P register.
ES-P, ESP Errored Seconds – Path, ES-P register.
ESA-P, ESAP Errored Seconds type A – Path, ESA-P register.
ESB-P, ESBP Errored Seconds type B – Path, ESB-P register.
FC-P, FCP Failure Counts – Path, FC-P register.
SES-P, SESP Severely Errored Seconds – Path, SES-P register.
UAS-P, UASP Unavailable Seconds – Path, UAS-P register.

THLEV {0-4294967295, DFLT}
Default: Entry Required
Addressing: None
Description: Threshold Level, specifies the threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0 Specifies no threshold-crossing events are generated.
DFLT Default, set the threshold level to the system-wide default value retrieved by the RTRV-DFLTTH-STS3C command.

THLEV values for each MONTYPE are shown below:

THLEV Values vs. MONTYPE		
MONTYPE	15-Minute Register	1-Day Register
ALL	{0-150, DFLT}	{0-14400, DFLT}
CV-P	{0-4294967295, DFLT}	{0-4294967295, DFLT}
FC-P	{0-150, DFLT}	{0-14400, DFLT}
<All other MONTYPES>	{0-900, DFLT}	{0-65535, DFLT}

Restrictions: SET-TH-STS3C is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether threshold levels for near-end or far-end monitored parameters are to be set. Values are:

FEND Far-End
NEND Near-End

DIRN	{NA, RCV, TRMT}					
	Default: {NA}					
	Addressing: None					
	Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET-TH-STS3C command.					
	<table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT
NA	Not Applicable					
RCV	Receive side					
TRMT	Transmit direction					
TMPER	{15-MIN, 1-DAY}					
	Default: {15-MIN}					
	Addressing: None					
	Description: Time Period, specifies whether threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:					
	<table> <tr> <td>15-MIN</td><td>15-Minute PM collection register</td></tr> <tr> <td>1-DAY</td><td>1-Day (24 hour) PM collection register</td></tr> </table>	15-MIN	15-Minute PM collection register	1-DAY	1-Day (24 hour) PM collection register	
15-MIN	15-Minute PM collection register					
1-DAY	1-Day (24 hour) PM collection register

COMMAND CODE: **SET-TH-T1**
COMMAND NAME: **SET THRESHOLD T1**

PURPOSE

The SET-TH-T1 command sets the threshold level for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day), pertaining to the specified DS1 port to the value specified by THLEV.

A SET-TH-T1 command is denied if:

- The specified DS1 port is not provisioned (via ENT-T1).
- The specified DS1 port is embedded within a protection OC3.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-TH-T1 : [TID] : AID : [CTAG] : : MONTYPE, THLEV, [LOCN], [DIRN], [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T1-{1-59392}}	(T1-DS1#)	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-7}-{1-4}}	(EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	DS1 AID, identifies the DS1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, ES-L, ESL, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, LOSS, LOSS-L, LOSSL, QRSSS, QRSSS-P, QRSSSP, SAS-P, SASP, SES-L, SESL, SES-P, SESP, UAS-P, UASP}, FAR_END_PARAMETERS:{CSS, CSS-P, CSSP, CV-P, CVP, ES-L, ESL, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SEFS, SEFS-P, SEFSP, SES-P, SESP, UAS-P, UASP}
Default:	Entry Required
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near-end only.)
CSS, CSS-P, CSSP	Controlled Slip Seconds – Path, CSS register. (Far-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end electrical T1 only.)
CV-P, CVP	Coding Violations – Path, CV-P register.
ES-L, ESL	Errored Seconds – Line, ES-L register. (Near-end electrical T1 or Far-end embedded T1.)
ES-P, ESP	Errored Seconds – Path, ES-P register.
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.
FC-P, FCP	Failure Count – Path, FC-P register.
LOSS, LOSS-L, LOSSL	Loss of Signal Seconds – Line, LOSS register. (Near-end electrical T1 only.)
QRSSS, QRSSS-P, QRSSSP	QRSS Seconds – Path, QRSSS-P register. (Near-end only.)
SAS-P, SASP	Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
SEFS, SEFS-P, SEFSP	Severely Errored Frame Seconds, SEFS register. (Far-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register. (Near-end electrical T1 only.)
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.
Restrictions:	SET-TH-T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

THLEV {0–4294967295, DFLT}
Default: Entry Required
Addressing: None
Description: Threshold Level, specifies the threshold level for which threshold–crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0 Specifies no threshold–crossing events are generated.
DFLT Default, set the threshold level to the system–wide default value retrieved by the RTRV–DFLTTH–T1 command.

THLEV values for each MONTYPE are shown below:

THLEV Values vs. MONTYPE		
MONTYPE	15–Minute Register	1–Day Register
ALL	{0–150, DFLT}	{0–14400, DFLT}
CV–L, CV–P	{0–4294967295, DFLT}	{0–4294967295, DFLT}
FC–P	{0–150, DFLT}	{0–14400, DFLT}
<All other MONTYPES>	{0–900, DFLT}	{0–65535, DFLT}

Restrictions: SET–TH–T1 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether threshold levels for near–end or far–end monitored parameters are to be set. Values are:

FEND Far–End
NEND Near–End

Restrictions: SET–TH–T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET–TH–T1 command.

NA Not Applicable
RCV Receive side
TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether threshold levels for the 15–minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:

15–MIN 15–Minute PM collection register
1–DAY 1–Day (24 hour) PM collection register

SUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid threshold level in request message. */ /* Invalid montype in request message. */ /* Threshold level is out of range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM T1 record. */ /* Error reading default database. */ /* Error <ERRNO> reading from T1 Threshold database. */ /* Error <ERRNO> updating T1 Threshold database. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* T1 Threshold Database updated. */ /* Could not get controlling level 2 processor id. */ /* Unable to allocate memory for user data. */ /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */

EXAMPLES

In the following example, the threshold level for the daily (1-Day) near-end coding violations, path (CV-P) PM register for DS1 port T3T1-1495-3 is set to 100.

```
SET-TH-T1::T3T1-1495-3::CVP,100,NEND,,1-DAY;
```

In the following example, the threshold level for the 15–Minute near–end and far–end coding violations, path (CV–P) PM register for DS1 port T3T1–1504–5 is set to the system default value.

```
SET-TH-T1::T3T1-1504-5::CV-P,DFLT;
```

COMMAND CODE: **SET-TH-T3**
COMMAND NAME: **SET THRESHOLD T3**

PURPOSE

The SET-TH-T3 command sets the threshold level for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day), pertaining to the specified DS3 port to the value specified by THLEV.

A SET-TH-T3 command is denied if:

- The specified DS3 port is not provisioned (via ENT-T3).
- The specified DS3 port is embedded within a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
SET-TH-T3: [TID] :AID: [CTAG] ::MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;
```

INPUT PARAMETERS

TID	<p>< 1–20 VALID TID CHARACTERS ></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>
AID	<p>DS3_AID:</p> <p>{T3–{1–4800}} (T3–DS3#)</p> <p>{EC1T3–{1–3840}} (EC1T3–EC1/STS1/DS3#)</p> <p>{OC3T3–{1–2240}–{1–3}} (OC3T3–OC3#–STS1/DS3#)</p> <p>{OC12T3–{1–560}–{1–4}–{1–3}} (OC12T3–OC12#–STM1#–STS1/DS3#)</p> <p>Default: Entry Required</p> <p>Addressing: &&–ranging and &–grouping</p> <p>Description: DS3 AID, identifies the DS3 port.</p>
CTAG	<p>< 1–6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
MONTYPE	<p>{ALL},</p> <p>NEAR_END_PARAMETERS:{AISS, AISS–P, AISSP, CV–L, CVL, CV–P, CVP, CVCP–P, CVCPP, ES–L, ESL, ES–P, ESP, ESA–L, ESAL, ESA–P, ESAP, ESACP–P, ESACPP, ESB–L, ESBP, ESB–P, ESBP, ESBP–P, ESBP–P, ESCP–P, ESCPP, FC–P, FCP, LOSS, LOSS–L, LOSSL, SAS–P, SASP, SES–L, SESL, SES–P, SESP, SESP–P, SESP–P, UAS–P, UASP, UASCP–P, UASCPP},</p> <p>FAR_END_PARAMETERS:{CVCP–P, CVCPP, ESACP–P, ESACPP, ESBP–P, ESBP–P, ESCP–P, ESCPP, FCCP–P, FCCPP, SASCP–P, SASCPP, SESP–P, SESP–P, UASCP–P, UASCPP}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (–). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:</p> <p>ALL All monitored parameter PM registers.</p>

AISS, AISS-P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end electrical T3 only.)
CV-P, CVP	Coding Violations – Path, CV-P register. (Near-end only.)
CVCP-P, CVCPP	Code Violations, CP-bit parity – Path, CVCP-P register.
ES-L, ESL	Errored Seconds – Line, ES-L register. (Near-end electrical T3 only.)
ES-P, ESP	Errored Seconds – Path, ES-P register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register. (Near-end electrical T3 only.)
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register. (Near-end only.)
ESACP-P, ESACPP	Errored Seconds type A, CP-bit parity – Path, ESACP-P register.
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register. (Near-end electrical T3 only.)
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register. (Near-end only.)
ESBCP-P, ESBCPP	Errored Seconds type B, CP-bit parity – Path, ESBCP-P register.
ESCP-P, ESCPP	Errored Seconds, CP-bit parity – Path, ESCP-P register.
FC-P, FCP	Failure Counts – Path, FC-P register. (Near-end only.)
FCCP-P, FCCPP	Failure Counts, CP-bit parity – Path, FC-P register. (Far-end only.)
LOSS, LOSS-L, LOSSL	Loss Of Signal Seconds – Line, LOSS register. (Near-end electrical T3 only.)
SAS-P, SASP	Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
SASCP-P, SASCPP	Severe AIS Seconds, CP-bit parity – Path, SASCP-P register. (Far-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register. (Near-end electrical T3 only.)
SES-P, SESP	Severely Errored Seconds – Path, SES-P register. (Near-end only.)
SESCP-P, SESCPP	Severely Errored Seconds, CP-bit parity – Path, SESCP-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register. (Near-end only.)
UASCP-P, UASCPP	Unavailable Seconds, CP-bit parity – Path, UASCP-P register.
Restrictions:	SET-TH-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

THLEV {0–4294967295, DFLT}
Default: Entry Required
Addressing: None
Description: Threshold Level, specifies the threshold level for which threshold–crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:
 0 Specifies no threshold–crossing events are generated.
 DFLT Default, set the threshold level to the system–wide default value retrieved by the RTRV–DFLTTH–T3 command.
 THLEV values for each MONTYPE are shown below:

THLEV Values vs. MONTYPE		
MONTYPE	15–Minute Register	1–Day Register
ALL	{0–150, DFLT}	{0–14400, DFLT}
CV–L, CV–P, CVCP–P	{0–4294967295, DFLT}	{0–4294967295, DFLT}
FC–P, FCCP–P	{0–150, DFLT}	{0–14400, DFLT}
<All other MONTYPES>	{0–900, DFLT}	{0–65535, DFLT}

Restrictions: SET–TH–T3 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether threshold levels for near–end or far–end monitored parameters are to be set. Values are:
 FEND Far–End
 NEND Near–End
Restrictions: SET–TH–T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET–TH–T3 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether threshold levels for the 15–minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
 15–MIN 15–Minute PM collection register
 1–DAY 1–Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid threshold level in request message. */ /* Invalid montype in request message. */ /* Threshold level is out of range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM T3 record. */ /* Error reading default database. */ /* Error <ERRNO> reading from T3 Threshold database. */ /* Error <ERRNO> updating T3 Threshold database. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* T3 Threshold Database updated. */ /* Could not get controlling level 2 processor id. */ /* Unable to allocate memory for user data. */ /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */

EXAMPLES

In the following example, the threshold level for the daily (1-Day) near-end unavailable seconds, path (UAS-P) PM register for DS3 port T3-1586 is set to 46.

```
SET-TH-T3::T3-1586:::UASP,46,,,1-DAY;
```

In the following example, the threshold level for the 15–Minute near–end coding violations, path (CV–P) PM register for DS3 port T3–1586 is set to the system default value.

```
SET-TH-T3::T3-1586::CVP,DFLT;

COMMAND CODE: **SET-TH-VT1**
COMMAND NAME: **SET THRESHOLD VT1**

PURPOSE

The SET-TH-VT1 command sets the threshold level for which a threshold-crossing event message is generated for the monitored parameter, identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day), pertaining to the specified VT1.5 port to the value specified by THLEV.

A SET-TH-VT1 command is denied if:

- The specified VT1.5 port is not provisioned (via ENT-VT1).
- The specified VT1.5 port is embedded within a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

SET-TH-VT1 : [TID] : AID : [CTAG] : : MONTYPE, THLEV, [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	VT1 AID, identifies the VT1.5 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE {ALL},
NEAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV, ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV},
FAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV, ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV}
Default: Entry Required
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose threshold level is to be set. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL All monitored parameter PM registers.
ALS-V, ALSV Alarm Indication Signal/Loss of Pointer – VT Path, ALS-V register.
CV-V, CVV Coding Violations – VT Path, CV-V register.
ES-V, ESV Errored Seconds – VT Path, ES-V register.
ESA-V, ESAV Errored Seconds type A – VT Path, ESA-V register.
ESB-V, ESBV Errored Seconds type B – VT Path, ESB-V register.
FC-V, FCV Failure Counts – VT Path, FC-V register.
SES-V, SESV Severely Errored Seconds – VT Path, SES-V register.
UAS-V, UASV Unavailable Seconds – VT Path, UAS-V register.

THLEV {0-4294967295, DFLT}
Default: Entry Required
Addressing: None
Description: Threshold Level, specifies the threshold level for which threshold-crossing event messages are generated for the monitored parameter identified by MONTYPE, LOCN, and TMPER. Uniquely defined values are:

0 Specifies no threshold-crossing events are generated.
DFLT Default, set the threshold level to the system-wide default value retrieved by the RTRV-DFLTTH-VT1 command.

THLEV values for each MONTYPE are shown below:

THLEV Values vs. MONTYPE		
MONTYPE	15-Minute Register	1-Day Register
ALL	{0-150, DFLT}	{0-14400, DFLT}
CV-V	{0-4294967295, DFLT}	{0-4294967295, DFLT}
FC-V	{0-150, DFLT}	{0-14400, DFLT}
<All other MONTYPES>	{0-900, DFLT}	{0-65535, DFLT}

Restrictions: SET-TH-VT1 is denied if the entered THLEV value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether threshold levels for near-end or far-end monitored parameters are to be set. Values are:

FEND Far-End
NEND Near-End

DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the SET-TH-VT1 command.
	NA	Not Applicable
TMPER	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be set. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register

SUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid	/* Invalid location in request message. */
		/* Invalid direction in request message. */
		/* Invalid time period in request message. */
		/* Invalid threshold level in request message. */
		/* Invalid montype in request message. */
		/* Threshold level is out of range. */
IIAC	Input, Invalid ACcess identifier	/* AID not in Partition. */
		/* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping	/* Invalid location for requested montype. */

SDBE	Status, internal Data Base Error /* Failed to set pointer to FM VT1 record. */ /* Error reading default database. */ /* Error <ERRNO> reading from VT1 Threshold database. */ /* Error <ERRNO> updating VT1 Threshold database. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* VT1 Threshold Database updated. */ /* Could not get controlling level 2 processor id. */ /* Unable to allocate memory for user data. */ /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */

EXAMPLES

In the following example, the threshold level for the daily (1-Day) near-end and far-end unavailable seconds, VT path (UAS-V) PM register for VT1.5 port EC1VT1-626-7-3 is set to 46.

```
SET-TH-VT1::EC1VT1-626-7-3::UASV,46,,1-DAY;
```

In the following example, the threshold level for the 15-Minute near-end coding violations, VT path (CV-V) PM register for VT1.5 port EC1VT1-626-7-3 is set to the system default value.

```
SET-TH-VT1::EC1VT1-626-7-3::CVV,DFLT,NEND;

COMMAND CODE: **SET-WARN-MSG**
COMMAND NAME: **SET WARNING MESSAGE**

PURPOSE

The SET-WARN-MSG command edits the warning message that is displayed in the autonomous REPT^EVT^SESSION message when a user logs-on (via ACT-USER) to the system.

The warning message can be up to 20 lines long and is edited one line at a time. Each text line can be seventy (70) characters long if the SET-WARN-MSG command is executed from the command line in the Direct Command Input Mode, or sixty (60) characters long if executed from the SET-WARN-MSG forms screen in the Command Input Forms Mode.

A SET-WARN-MSG command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

SET-WARN-MSG: [TID] : LINENUM: [CTAG] : : [TEXTLINE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
LINENUM	{1-20} Default: Entry Required Addressing: None Description: Message Line Number, specifies the line number of the warning message to be edited.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
TEXTLINE	<1-70 VALID CHARACTERS> Default: <NoVal> Addressing: None Description: Message Text Line, specifies the text to be displayed in the warning message for line LINENUM. If the TEXTLINE value consists of any non-alphanumeric characters other than _ (underscore), +, %, or #, then the entered TEXTLINE value must be enclosed within double-quotes ("..."). If the user wants to put a space character between words in the message line, then the TEXTLINE value must be enclosed in double quotes since the space character is non-alphanumeric. If no value is entered for TEXTLINE, then no text in the warning message for the specified LINENUM is displayed nor is a blank line displayed in its place.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIFM	Input, Invalid data ForMat
	/* Unable to read input parameter – status = <status number> */
	/* input parameter too long – status = <status number> */
	/* input parameter too long */
SDBE	Status, internal Data Base Error
	/* Unable to read security db – status = <status number> */
	/* Unable to update security db – status = <status number> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, line number 1 of the warning message is provisioned.

```
SET-WARN-MSG::1:::"WARNING - This is a secured system" ;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P2d010. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P2d010 COMPLD
/* SET-WARN-MSG::1:::"WARNING - This is a secured system" [P2d010] (1) */
;
```

ACT-USER

RELATED AUTONOMOUS RESPONSES

REPT^EVT^SESSION

COMMAND CODE: **STA-ISU**
COMMAND NAME: **START IN-SERVICE UPGRADE**

PURPOSE

The STA-ISU command performs the disk partitioning, download, database manipulation, and new generic and/or exception system software preparation for the in-service upgrade procedure. The command brings the system to an upgrade ready state and set appropriate indicators to their respective states. The system continues to remain in service on the current generic until the INIT-SYS-NEW command is executed.

The STA-ISU allows the abort capability. If the command is aborted, all command processes are terminated and an INIT-SYS:::1 command is executed. If INIT-SYS is performed during STA-ISU execution, all system generic indicators are reset.

Upon command failure, STA-ISU effectively backs itself out. It resets all indicators and halts all processes. All system generic indicators are reset to indicate that the previous software generic and database are still active. If the STA-ISU does not complete successfully or if an INIT-SYS command is issued prior to the INIT-SYS-NEW command, the STA-ISU must be re-issued to perform an upgrade.

The parameter P3 in the STA-ISU command specifies the ISU option. The STA-ISU command with P3=EX-UPG combines the loading an exception with an normal mode ISU. The STA-ISU command with P3=LDEXC loads an exception. The STA-ISU command with P3=LDGEN partitions the hard disk and copy the new generic disk image. The STA-ISU command with P3=CONT continues a generic upgrade only after an STA-ISU command with P3=LDGEN has been successfully completed. The STA-ISU command with P3=RTEXC is used to back out the exception loading (i.e., the STA-ISU command with P3=LDEXC).

A copy of the currently provisioned database is made during execution of the STA-ISU command and used in the upgrade processing. Subsequent changes to this database during command processing are not carried into the upgraded database.

During STA-ISU execution, the system remains in-service and continues to provide protection switching and alarm reporting functionality on the current release. Autonomous messages to indicate the start and subsequent completion of specific phases of the upgrade operation are issued to the user.

After the completion of the STA-ISU command with P3=CONT or UPGRD or EXUPG and before the issuing of INIT-SYS-NEW command, the issuing of the STA-ISU with P3=LDEXC or RTEXC or LDGEN would undo the previous upgrade cycle and start a new upgrade cycle.

A STA-ISU command is denied if:

- The upgrade medium, optical disk or tape, has not been loaded into the required drive.
- The system hard disk has not been upgraded to the required larger disk size
- A database backup (via ACT-DB-BACKUP command) or an in-service upgrade (via STA-ISU command) is currently in progress.
- The system has not achieved a system ready state.
- The inserted generic or exception disk is not valid.
- An attempt to record the optional parameters in this command or in its subsequent execution of a script command fails.
- The command is entered with P3=CONT when the previous STA-ISU command with P3=LDGEN was not successfully completed.
- A generic transfer is in progress between the client and the 1631 SX LMC system.
- Parameter 3 (P3) value SEXUPG, LDGEN or CONT is specified with a DSK AID.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
STA-ISU: [TID] :AID: [CTAG] : : P1=, P2=, P3=[, P4=] [, P5=] [, P6=] [, P7=] [, P8=]  
        [, P9=] [, P10=] [, P11=] [, P12=] [, P13=] [, P14=] [, P15=] [, P16=] [, P17=] [, P18=]  
        [, P19=] [, P20=] [, P21=] [, P22=] ;
```

INPUT PARAMETERS

TID	<p>< 1–20 VALID TID CHARACTERS ></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>
AID	<p>EQUIPMENT_AID:</p> <p>{DSK–1–3–1, DSK–1–4–2}</p> <p>{OPD–1–3–1, OPD–1–4–2}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: Equipment AID, identifies the equipment object entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics. DSK–1–3–1 is the AID for the Copy 0 hard disk drive. DSK–1–4–2 identifies the Copy 1 hard disk drive. If both DSKs are in service, either may be specified.</p> <p>Restrictions: STA–ISU will be denied if the DSK specified is not in the in service (IS) state.</p>
CTAG	<p>< 1–6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
P1=	<p><1 to 5 ALPHANUMERIC CHARACTERS></p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: Parameter 1, specifies the logical in–service upgrade reversion key (ISUKEY) which validates the active software generic that is to be backed up to the previous revision. Valid values for the ISUKEY of P1 are a string of 1 through 5 ASCII alphanumeric characters (case sensitive) from the set {0–9,A–Z,a–z}. Note that spaces and special characters are not included.</p>
P2=	<p>{0,1}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: Parameter 2, identifies the SCSI bus of the optical drive containing the generic media.</p>
P3=	<p>{EXUPG, LDEXC, LDGEN, CONT, UPGRD, RTEXC}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: Parameter 3, specifies the in–service upgrade (ISU) option. The valid values for the ISU options are (case sensitive): EXUPG – combine the loading of an exception with a normal mode ISU. LDEXC – load an exception. LDGEN – partition the hard disk and copy the new generic disk image. CONT – continue a generic upgrade (only after an STA–ISU command with ISU option LDGEN has been successfully completed) UPGRD – perform the normal mode in–service upgrade. RTEXC – back out the exception loading.</p> <p>Restrictions: EXUPG, LDGEN and CONT are not valid with a DSK AID. STA–ISU will be denied if the DSK specified is not in service.</p>

P4=	<1 to 5 Alphanumeric Characters>
Default:	Entry Required for upgrade involving an exception disk, otherwise not applicable.
Addressing:	None
Description:	Parameter 4, specifies the exception keyword (EXCKEY) used to identify the correct exception disk. Valid values for the EXCKEY of P4 are a string of 1 through 5 ASCII alphanumeric characters (case sensitive) from the set {0–9,A–Z,a–z}. Note that spaces and special characters are not included.
P5=...P22=	<UP TO 5 ALPHANUMERIC CHARACTERS>
Default:	<Previously Existing Value>
Addressing:	None
Description:	Parameter 5 through Parameter 22, specifies information taken from the existing database/software generic and is dependent upon the upgrade being installed. Valid values for P5–P22 are a string of up to a maximum of 5 ASCII alphanumeric characters from the set {0–9, A–Z, a–z}. Up to twenty two of these optional parameters can be entered in the command. Note that spaces, lower case letters, and special characters are not included. These parameters are specific to and used internally by the upgrade being installed and may differ from generic to generic.

RELATED COMMANDS

ACT-DB-BACKUP

INIT-SYS

INIT-SYS-NEW

STP-ISU

COMMAND CODE: **START-CID**
COMMAND NAME: **START COMMUNICATIONS INTERFACE
DEVICE**

PURPOSE

The START-CID command starts the output transmitted to the specified non-BINARY CPORT, non-X.25 CPORT, or specified X.25 virtual channel.

The resumed output begins with output corresponding to the point in time when the START-CID command is executed (any output that would have occurred while the CPORT or virtual channel was stopped is not transmitted when the output is started again).

A START-CID command is denied if:

- The specified CPORT has not previously been provisioned (via ENT-CID).
- The specified CPORT is already started (via a START-CID command).
- A VCNUM value of {1-8} is not entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is set to X25.
- A VCNUM value of {1-8} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is not set to X25.
- A VCNUM value of {1-32} is not entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is set to TCP.
- A VCNUM value of {1-32} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is not set to TCP.
- An invalid parameter value is entered.

INPUT FORMAT

START-CID: [TID] : CPORT, [VCNUM] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
CPORT	{1-12}	
	Default:	Entry Required
	Addressing:	None
	Description:	Control Port, specifies the physical communication port number on the APS control system.

VCNUM	{1–32}	
	Default:	Entry required for an X.25 or TCP CPORT (the CPORT's PROTOCOL parameter is set to X25 or TCP). No entry allowed for a non-X.25 or non-TCP CPORT (the CPORT's PROTOCOL parameter is not set to X25 or TCP).
	Addressing:	&&–ranging and &–grouping
	Description:	Virtual Channel Number, specifies the X.25 virtual channel within the specified CPORT or the TCP session number within a TCP CPORT (i.e. the CPORT refers to a LAN on the ICM). Values are:
	{1–8}	X.25 virtual channel number within the specified X.25 CPORT.
	{1–32}	TCP session number within the specified TCP CPORT.
	Restrictions:	START–CID is denied if VCNUM of {1–8} is not entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is set to X25. START–CID is denied if VCNUM of {1–8} is entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is not set to X25. START–CID is denied if VCNUM of {1–32} is not entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is set to TCP. START–CID is denied if VCNUM of {1–32} is entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is not set to TCP.
CTAG	< 1–6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* Output started on CID <CPORT>[-<VCNUM>] */
/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

OUTPUT PARAMETERS

CPORT	{1–12}	Control Port, identifies the physical control port number.
VCNUM	{1–32}	Virtual Channel Number, identifies the X.25 virtual channel within the specified X.25 CPORT or the TCP session number within a TCP CPORT. A value for VCNUM is only returned if the PROTOCOL parameter in the ENT–CID or ED–CID command is set to X25 or TCP.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
/* <Informational Error Description Text> */
/* <Expanded Error Code Description> */
/* <Optional Suggested Action Text> */
/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
IPNV	Input, Parameter Not Valid
	/* CID <CPORT> does not exist */
	/* X25 vc <VCNUM> does not exist */
SDBE	Status, internal Data Base Error
	/* Unable to read OSDB – status = <status number> */
	/* Unable to update OSDB – status = <status number> */
SROF	Status, Requested Operation Failed
	/* session <session> does not exist */
	/* Invalid CID <CPORT> entered */
	/* This CID is pending removal */
	/* The user on this CID is in the process of logging out */
	/* Output on this CID is already started */

EXAMPLES

In the following example, the output transmission to CPORT 1 is started again.

```
START-CID::1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P02018. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P02018 COMPLD
/* Output started on CID 1 */
/* START-CID::1 [P02018] (1) */
;
```

```

COMMAND CODE: **START-ITMMODE**
COMMAND NAME: **START INSTALLATION TEST AND
MAINTENANCE MODE**

PURPOSE

The START-ITMMODE command starts the Installation Test and Maintenance (ITM) mode. The ITM test supports the testing of the GTI matrix cables.

Upon successful completion of a START-ITMMODE command, the CONDTYPE of ITMIP is set against the AID of COM and the inactive matrix copy inherits a new pre-defined connection map to perform the ITM test.

A START-ITMMODE command is denied if:

- An inactive matrix copy does not exist (selected via SELECT-COPY).
- The ITM MODE has already been started.
- A flashcut process has been started.
- The system is configured as a 240-port system.
- An invalid parameter value is entered.

INPUT FORMAT

START-ITMMODE: [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
[/* <Command Echo> [<CTAG>] (<CID>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SNVS	Status, Not in Valid State /*START-ITMMODE already in progress.*/ /*STOP-ITMMODE currently in progress.*/
SRCN	Status, Requested CoNdition already exists /*ITM mode is currently active.*/
SROF	Status, Requested Operation Failed /*Unable to access memory for ITM auxiliary data.*/ /*Unable to send message to EM to start ITM mode.*/ /*Unable to queue START-ITMMODE aux buffer for EM request.*/ /*Unable to initiate ITM mode.*/ /*Timeout waiting for EM response to START-ITMMODE command.*/
SRQN	Status, invalid ReQuest /*Command not valid for 240 port system */

EXAMPLES

In the following example, the ITM mode is started.

```
START-ITMMODE;  
    <SID> <YY-MM-DD> <HH:MM:SS>  
M  P69238 COMPLD  
    /* ITM mode successfully initialized on matrix copy 0. */  
    /* START-ITMMODE [P69238] (1) */  
;
```

RELATED COMMANDS

```
RTRV-ITMRSLT  
SELECT-COPY  
START-ITMTEST  
STOP-ITMMODE  
STOP-ITMTEST
```

COMMAND CODE: **START-ITMTEST**
COMMAND NAME: **START INSTALLATION TEST AND
MAINTENANCE TEST**

PURPOSE

The START-ITMTEST command starts the Installation Test and Maintenance (ITM) test. The ITM test supports the testing of the GTI matrix cables. As part of the test all GTI errors such as loss of frame, loss of sync, and spills that are detected, no matter how transient they are, will be reported as GTI alarms. This may mean that intermittent GTI errors that are not reported as GTI alarms during normal system operation will be alarmed when this test is running.

If the response of the RTRV-ITMRSLT or the IP messages of the START-ITMTEST command show errors, then the RTRV-GTI-STATUS should be used to diagnose the problem.

Upon successful completion of a START-ITMTEST command, an In-Progress message is sent within the first two (2) seconds followed by an additional In-Progress message every elapsed 5 minutes. During the ITM test, all errors that are detected are not cleared until the test is finished. This means once a defect is detected, even if it clears, it will remain failed by the test. The In-Progress message will display the total number of errors (all types) detected by the test up to that point on a per-shelf basis.

A START-ITMTEST command is denied if:

- An ITM test is currently in progress.
- The ITM MODE has not been started (using START-ITMMODE).
- An invalid parameter value is entered.

INPUT FORMAT

START-ITMTEST: [TID] :: [CTAG] :: TESTTYPE, [TESTDURN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
TESTTYPE	{MTXCBL} Default: Entry Required Addressing: None Description: Test Type, specifies the type of test. Values are: MTXCBL Matrix Cable Test
TESTDURN	{1, 15, 120, 240, 1440} Default: {1} Addressing: None Description: Test Duration, specifies the duration of time to test. Values are: 1 1 Minute 15 15 Minutes 120 120 minutes = 2 Hours 240 240 minutes = 4 Hours 1440 1440 minutes = 24 Hours

SUCCESSFUL RESPONSE FORMAT

The following successful response format is generated when TESTTYPE=MTXCBL:

```

    [/*<Command Echo> [<CTAG>] (<CID[-VCNUM]>)*/]
;]
```

OUTPUT PARAMETERS

MTXCOPY	{COPY0, COPY1}
	Matrix Copy. Values are:
	COPY0 Matrix Copy 0
	COPY1 Matrix Copy 1
TESTTYPE	{MTXCBL}
	Test Type, specifies the type of test. Values are:
	MTXCBL Matrix Cable Test
ES1SHLF	AID of ES1 Shelf 5-3-1 or 4-3-1.
ES2SHLF	AID of ES2 Shelf 10-3-1 or 11-3-1.
ES3SHLF	AID of ES3 Shelf 16-3-1 or 17-3-1.
ES4SHLF	AID of ES4 Shelf 23-3-1 or 22-3-1.
ES5SHLF	AID of ES5 Shelf 102-3-1 or 103-3-1.
CS1SHLF	AID of CS1 Shelf 2-3-1 or 3-3-1.
CS2SHLF	AID of CS2 Shelf 2-1-1 or 3-1-1.
ES1ERR	{xxxxx, NAV}
	Cumulative number of errors detected in ES1 Shelf.
	xxxxx Cumulative number of Errors detected.
	It starts at 00000 and stops when maximum count of 65534 is reached.
	NAV Test Result is Not Available
ES2ERR	{xxxxx, NAV}
	Cumulative number of errors detected in ES2 Shelf.
	xxxxx Cumulative number of Errors detected.
	It starts at 00000 and stops when maximum count of 65534 is reached.
	NAV Test Result is Not Available

ES3ERR	{xxxxx, NAV} Cumulative number of errors detected in ES3 Shelf. xxxxx Cumulative number of Errors detected. It starts at 00000 and stops when maximum count of 65534 is reached. NAV Test Result is Not Available
ES4ERR	{xxxxx, NAV} Cumulative number of errors detected in ES4Shelf. xxxxx Cumulative number of Errors detected. It starts at 00000 and stops when maximum count of 65534 is reached. NAV Test Result is Not Available
ES5ERR	{xxxxx, NAV} Cumulative number of errors detected in ES5Shelf. xxxxx Cumulative number of Errors detected. It starts at 00000 and stops when maximum count of 65534 is reached. NAV Test Result is Not Available
CS1ERR	{xxxxx, NAV} Cumulative number of errors detected in CS1Shelf. xxxxx Cumulative number of Errors detected. It starts at 00000 and stops when maximum count of 65534 is reached. NAV Test Result is Not Available
CS2ERR	{xxxxx, NAV} Cumulative number of errors detected in CS2Shelf. xxxxx Cumulative number of Errors detected. It starts at 00000 and stops when maximum count of 65534 is reached. NAV Test Result is Not Available
ES1AID	Identifies the AID of a provisioned first stage ES module. Values are: {M16-{4, 5, 10, 11, 16, 17, 22, 23}-3-{1-4, 9-12}} {M32-{4, 5, 10, 11, 16-17, 22, 23, 102, 103}-3-{1-4, 9-12}}
ES1RSLT	{EQP, OK,NAV} ES1 Result, identifies the result of the equipment test on the ES1 module. Values are: EQP The ES1 module is Faulty or Unequipped. OK The module is okay. NAV Test Result is Not Available
GT2AID	Identifies the AID of the GTI cable between the first stage ES and a CS. Values are: {G1M16-{2,3}-3-{1-16}-{1-16}} {G1M40-{2, 3}-{1, 3}-{1-16}-{1-40}}
GT2RSLT	{EQP, CON, OK,NAV} GT2 Result, identifies the result of the GTI test on the connection between the first stage ES and the CS. Values are: EQP The module is faulty or unequipped. CON The connection is faulty. OK The connection is okay. NAV Test Result is Not Available
GT3AID	Identifies the AID of the GTI cable between a CS and the third stage ES. {G1M16-{4, 5, 10, 11, 16, 17, 22, 23}-3-{5-8, 13-16}-{1-16}} {G1M32-{4, 5, 10, 11, 16, 17, 22, 23, 102, 103}-3-{5-8, 13-16}-{1-32}}

GT3RSLT	{EQP, CON, OK, NAV}	GT3 Result, identifies the result of the GTI test on the connection between the CS and the third stage ES. Values are:
	EQP	The module is faulty or unequipped.
	CON	The connection is faulty.
	OK	The connection is okay.
	NAV	Test Result is Not Available
IDRSLT	{MM, OK, NAV}	Identification Result, identifies the result of the Identification test. Values are:
	MM	ID Mismatch.
	OK	The connection is okay.
	NAV	Test Result is Not Available
BERSLT	Bit Error (BE) Test Result. Identifies the number of bit errors detected.	
	OK	The connection is OK.
	NOK	The connection is not OK.
	NAV	Test Result is Not Available

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/*Unable to retrieve test duration parameter.*/
	/*Test duration parameter not found.*/
	/*Invalid test duration parameter specified.*/
SDBE	Status, internal Data Base Error
	/*Unable to create RTRV-ITMRSLT report file.*/
	/*Unable to open RTRV-ITMRSLT report file.*/
	/*Unable to print RTRV-ITMRSLT report file.*/
SNVS	Status, Not in Valid State
	/*STOP-ITMMODE command is currently in progress.*/
	/*START-ITMMODE command is currently in progress.*/
	/*ITM mode is not active.*/
SRCN	Status, Requested CoNdition already exists
	/*ITM test currently in progress.*/
SROF	Status, Requested Operation Failed
	/*Unable to access memory for ITM auxiliary buffer.*/
	/*Unable to initialize global I2p address array.*/
	/*Unable to queue ITM auxiliary buffer for in-progress status report.*/

EXAMPLES

In the following example, the ITM test is started and requested to execute for one minute.

```
START-ITMTEST:::MTXCBL,1;
```

```

COMMAND CODE: **START-MON-CPORT**
COMMAND NAME: **START MONITORING CONTROL PORT**

PURPOSE

The START-MON-CPORT command is used to enable monitoring of activities on one or more selected non-BINARY CPORTs. Selective CPORT Monitoring is disabled when the monitoring user is subscribed to the OSL W flag parameter (refer to the ENT-USER or ED-PRVG-USER commands).

Successive execution of the START-MON-CPORT command adds a new CPORT to the list of existing CPORTs being monitored. Any changes in the monitoring of CPORTs (i.e., adding a port to the existing list via START-MON-CPORT command, or if the monitoring user subscribes to the OSL W flag parameter) take effect immediately (i.e., it is not required to logout and login again for the change to take affect).

The list of CPORTs selected for CPORT monitoring survives a logout, i.e., if the user logs out and re-logs in, the previous set of CPORT values will be in affect. The CPORT selection (via the START-MON-CPORT and STOP-MON-CPORT TL1 commands) also survives a database restoral.

If a user wants to monitor all of the I/O activities (input and output) on one or more selected CPORTs other than one's own I/O activities, the user should be provisioned as follows:

- The monitoring user should not have the W flag in the user's OSL parameter value set.
The OSL W flag has precedence over selective CPORT monitoring.
- The monitoring user should have the O flag in the user's OSL parameter value set.
If O is not present in the monitoring user's OSL, the user will not receive the command echo line in any output response message.
- The monitoring user should have a UCFCO of Z.
The UCFCO parameter controls the set of TL1 commands executed by other users for which the user will receive an output response message.

Note that the output for a BINARY CPORT is not transmitted to a monitoring user, regardless if the monitoring user has included the BINARY CPORT in the list of monitored CPORTs.

The following limitations pertain to the monitoring of one or more selected CPORTs:

- The output response message on the monitored and the monitoring CPORTs may show different data if the user's individual UCFCO and OSL filters are not identical.
- Nested CPORT monitoring is not supported. Only response messages originating from a CPORT in the CPORT monitoring list will appear as an unsolicited message. For example, if CPORTs #1 and #2 are monitored by CPORT #3, and if CPORT #3 is monitored by CPORT #4, the unsolicited messages on CPORT #4 will not show the output related to a manual TL1 command originated by CPORTs #1 and #2. CPORT #4 will only display response messages for CPORTs #3 and #4.
- Autonomous KAM (Keep Alive Message) and "RUSURE" prompts are transmitted to the originator only and are not transmitted to the monitoring CPORT.
- A monitoring CPORT does not receive output response messages while a user on a monitored CPORT is executing commands in the "shell".
- If the CPORT's PROTOCOL is TCP or X.25, then all X.25 channels or TCP sessions are monitored.

A START-MON-CPORT command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

START-MON-CPORT: [TID] :CPORT: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

CPORT	{ {1–12}, ALL}	
	Default:	Entry Required
	Addressing:	&&–ranging and &–grouping
	Description:	Control Port, specifies the physical communication port number on the APS control system. The specified CPORT is added to the list of monitored CPORTs. CPORT values are not verified for system configuration or provisioning.
	{1–12}	CPORT Number
	ALL	All, specifies all CPORTs 1 –12 are added to the list of monitored CPORTs. Note that the output for a BINARY CPORT can not be monitored, regardless if the BINARY CPORT is in the list of monitored CPORTs.
CTAG	< 1–6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <CPORT> is already being Monitored */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

OUTPUT PARAMETERS

CPORT	{1–12}
	Control Port, identifies the physical control port number.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Optional Suggested Action Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIFM	Input, Invalid data ForMat /* Unable to read input parameter – status = <nnn> */
IPNV	Input, Parameter Not Valid /* Error in set CPORT Monitoring Flag – status = <nnn> */
SDBE	Status, internal Data Base Error /* Unable to read USDB – status = <status number> */ /* Unable to update USDB – status = <status number> */

EXAMPLES

In the following example, START-MON-CPORT is used to enable monitoring of CPORTs 3 through 6.

```
START-MON-CPORT: :3&&6;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of Pa8008. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pa8008 COMPLD
/* START-MON-CPORT::3 [Pa8008] (1) */
;

<SID> <YY-MM-DD> <HH:MM:SS>
M Pa8008 COMPLD
/* START-MON-CPORT::4 [Pa8008] (1) */
;

<SID> <YY-MM-DD> <HH:MM:SS>
M Pa8008 COMPLD
/* START-MON-CPORT::5 [Pa8008] (1) */
;

<SID> <YY-MM-DD> <HH:MM:SS>
M Pa8008 COMPLD
/* START-MON-CPORT::6 [Pa8008] (1) */
;
```

RTRV-PRVG-USER
STOP-MON-CPORT
```

COMMAND CODE: **START-OPS**
COMMAND NAME: **START OPERATIONS**

PURPOSE

The START-OPS command causes the system to exit the Limited Command Execution mode and enter the Normal Command Execution mode of operation. (The Limited Command Execution mode is entered by executing a STOP-OPS command.)

The execution of the START-OPS command is allowed by being in either the Limited Command Execution mode or the Normal Command Execution mode. If the START-OPS command is executed in the "normal" mode, the DBRID and DBSID are required. The DBRID and DBSID provide database restoral validation and "RU Sure" type handshaking as performed in the "limited" mode of the RESTORE-DB command and are displayed when the desired database is restored.

Execution of a START-OPS command is equivalent to execution of an INIT-SYS:::3 if a database restoral operation was performed (a RESTORE-DB command was executed), or equivalent to execution of an INIT-SYS:::1 if a database restoral operation was not performed (a RESTORE-DB command was not executed). The time required for execution of a START-OPS command varies depending on system size and whether a database restoral was performed.

When the system returns to the Normal Command Execution mode, via the START-OPS command, the system automatically returns CID1 and CID 6 to their pre-Limited mode of operation (e.g., the users that had been logged-in on CID 1 and CID 6 will automatically be logged-in on CID 1 and CID 6, respectively, when the system returns to the Normal Command Execution mode via the START-OPS command).

A START-OPS command is denied if:

- The system is already in the Normal Command Execution mode.
- A database restoral is in-progress (a RESTORE-DB command is in-progress).
- MODE of NORM is entered and the result of the command execution restores an un-initialized or un-populated database (restores a database that has not had any facility provisioning).
- The command is executed in the "normal" mode without the DBRID or DBSID.
- The command is executed in the "normal" mode and the DBRID or DBSID do not match the alternate database being restored.
- An invalid parameter value is entered.

INPUT FORMAT

START-OPS : [TID] : : [CTAG] : : [MODE] [,DBRID] [,DBSID] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
MODE	{FRCD, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	FRCD	Forced. The command is completed even if the result of its execution restores an un-initialized or un-populated database (a database that has not had any facility provisioning).
	NORM	Normal. The command is denied if the result of its execution restores an uninitialized or unpopulated database (a database that has not had any facility provisioning).

DBRID	{R07-00-00}	
	Default:	<Entry Required for Normal Command Execution mode>
	Addressing:	None
	Description:	Database Release Identification, identifies the Database Release ID as in the database label of the alternate database being restored. The format of DBRID is <RLSTYPE><RLSNUM><IREV><MREV> and is of the same format as returned in the RTRV-DB-LABEL. The values are:
	RLSTYPE	Release Type, identifies the software release type {F, P, R}.
	RLSNUM	Release Number, identifies the software release number {00-99}.
	IREV	Intermediate Revision, identifies the intermediate release revision {00-99}.
	MREV	Maintenance Revision, identifies the maintenance release revision {00-99}.
	Restrictions:	START-OPS is denied if the command is executed in the "normal" mode and DBRID is not entered. START-OPS is denied if the DBRID does not match the alternate database being restored.
DBSID	<1-20 CHARACTER SID>	
	Default:	<Entry Required for Normal Command Execution mode>
	Addressing:	None
	Description:	Database Site ID, identifies the Database Site ID as in the database label of the alternate database being restored. The format is of the same format as returned in the RTRV-DB-LABEL.
	Restrictions:	START-OPS is denied if the command is executed in the "normal" mode and DBSID is not entered. START-OPS is denied if the DBSID does not match the alternate database being restored.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* NORMAL OPERATIONS STARTING */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IPMS	Input, Parameter MiSsing
SROF	Status, Requested Operation Failed

/* Already in NORMAL operations mode */
/* START-OPS not allowed while RESTORE-DB in progress */
/* Database has NOT been populated after a CREATE31DB, must use FRCD mode */

EXAMPLES

In the following example, the Normal Command Execution mode is started by executing a START-OPS command while in the Limited Command Execution mode.

```
START-OPS;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P03016. The response header would contain the provisioned Site ID of the system, and the date and time the commands were executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P03016 COMPLD  
/* NORMAL OPERATIONS STARTING */  
/* START-OPS [P03016] (3) */  
;
```

RELATED COMMANDS

```

STOP-OPS
```

COMMAND CODE: **START-UPGRADE**
COMMAND NAME: **START UPGRADE**

PURPOSE

The START-UPGRADE command indicates to the system that a matrix upgrade procedure is going to be started.

If MODE=NORM, all IO shelves are queried if they detect any problems on either matrix side. If a problem is detected, the START-UPGRADE command is denied. Executing a START-UPGRADE command sets a UPGRD1344, UPGRD2688, or UPGRD3360 condition.

A START-UPGRADE command is denied if:

- A MODE of NORM or FRCD is issued and the system is data or clock locked to a copy.
- A MODE of NORM is issued and the system has any GTI alarms present.
- A MODE of NORM is issued and the result is service-affecting.
- A UPGRD1344, UPGRD2688, or UPGRD3360 condition is set.
- A SELECT-COPY, VRFY-COPY, or another START-UPGRADE command is already in progress.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

START-UPGRADE : [TID] :: [CTAG] :: [MODE] , TGTMTXSIZE ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MODE	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced. NORM Normal.
TGTMTXSIZE	{1344, 2688, 3360} Default: {1344} Addressing: None Description: Target Matrix Size, specifies the targeted size of the matrix after the upgrade. Values are: 1344 Specifies the targeted matrix size equals 1344 equivalent ports. 2688 Specifies the targeted matrix size equals 2688 equivalent ports. 3360 Specifies the targeted matrix size equals 3360 equivalent ports.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Optional Suggested Action Text> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Provisioned End Stage Type must be M32 in a 2688 system. */ /* Target matrix size must be larger than current matrix size. */ /* Must upgrade to a 1344 matrix size from a 672 matrix size. */ /* APS equipment is improperly configured. <card_type> not allowed in 2688. */ /* Must upgrade to a 1344 matrix size from a 240 matrix size. */
IIAC	Input, Invalid ACcess identifier /* Invalid parameters in the input command. */
SARB	Status, All Resources Busy /* SELECT-COPY or START-UPGRADE is in progress. */ /* VRFY-COPY is in progress. */ /* SELECT-COPY is in progress. */
SDBE	Status, internal Data Base Error /* Unable to update system configuration file. */ /* Error opening report file. */ /* Error accessing report file. */
SNVS	Status, Not in Valid State /* Upgrade is in progress.*/ /* Matrix is locked to a side. */ /* At least one matrix side is not available. */ /* CLKLCK0/CLKLCK1 alarm exists on the system. */ /* Power modules are unable to provide power */ /* Power card unable to provide power. */ /* Error reading matrix shelf. */ /* <AID> is not available. */ /* <AID> and <AID> are not available. */ /* <AID>, <AID>, <AID>, and <AID> are not available. */ /* <AID> and <AID> cannot provide clock. */ /* Error reading database for AID. */ /* Error reading database for <AID> or its mate. */ /* The switch currently has GTI alarms on the matrix modules. */ /* Emergency User Access is currently active. */
SROF	Status, Requested Operation Failed /* Unable to allocate USI response buffer. */ /* Invalid upgrade type is detected */ /* One or more provisioned shelves did not respond to the CAN-YOU-SWITCH query. */ /* Invalid upgrade size is detected */

EXAMPLES

In the following example, a matrix upgrade procedure is going to be started from a 1344 port matrix to a 2688 port matrix.

```
START-UPGRADE:::::,2688;
```

RELATED COMMANDS

```
SELECT-COPY  
STOP-UPGRADE  
VRFY-COPY
```

COMMAND CODE: **STOP-CID**
COMMAND NAME: **STOP COMMUNICATIONS INTERFACE
DEVICE**

PURPOSE

The STOP-CID command stops the output transmitted to the specified non-BINARY CPORT, non-SNIDER CPORT, non-TABS CPORT, non-X.25 CPORT, or specified X.25 virtual channel. Command input from a “stopped” CPORT or virtual channel is not affected by the command (a user can stop the output to the user's CID but still execute commands from the CID).

The output to a “stopped” CPORT or virtual channel can be resumed by executing a START-CID command. The resumed output begins with output corresponding to the point in time when the START-CID command is executed (any output that would have occurred while the CPORT or virtual channel was stopped is not transmitted when the output is started again).

A STOP-CID command is denied if:

- The specified CPORT has not previously been provisioned (via ENT-CID).
- The specified CPORT is already stopped (via a STOP-CID command).
- The specified CPORT is a Binary Port, SNIDER port or a TABS port.
- A VCNUM value of {1–8} is not entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is set to X25.
- A VCNUM value of {1–8} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is not set to X25.
- A VCNUM value of {1–32} is not entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is set to TCP.
- A VCNUM value of {1–32} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is not set to TCP.
- An invalid parameter value is entered.

INPUT FORMAT

STOP-CID: [TID] : CPORT, [VCNUM] : [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
CPORT	{1–12}	
	Default:	Entry Required
	Addressing:	None
	Description:	Control Port, specifies the physical communication port number on the APS control system.

VCNUM	{1–32}	
	Default:	Entry required for an X.25 or TCP CPORT (the CPORT's PROTOCOL parameter is set to X25 or TCP). No entry allowed for a non-X.25 or non-TCP CPORT (the CPORT's PROTOCOL parameter is not set to X25 or TCP).
	Addressing:	&&–ranging and &–grouping
	Description:	Virtual Channel Number, specifies the X.25 virtual channel within the specified CPORT or the TCP session number within a TCP CPORT (i.e. the CPORT refers to a LAN on the ICM). Values are:
	{1–8} X.25 virtual channel number within the specified X.25 CPORT. {1–32} TCP session number within the specified TCP CPORT.	
	Restrictions:	STOP–CID is denied if VCNUM of {1–8} is not entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is set to X25. STOP–CID is denied if VCNUM of {1–8} is entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is not set to X25. STOP–CID is denied if VCNUM of {1–32} is not entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is set to TCP.
CTAG	< 1–6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* Output stopped on CID <CPORT>[-<VCNUM>] */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

CPORT	{1–12}	Control Port, identifies the physical control port number.
VCNUM	{1–32}	Virtual Channel Number, identifies the X.25 virtual channel within the specified X.25 CPORT or the TCP session number within a TCP CPORT. A value for VCNUM is only returned if the PROTOCOL parameter in the ENT–CID or ED–CID command is set to X25 or TCP.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
IPNV	Input, Parameter Not Valid
	/* CID <CPORT> does not exist */
	/* X25 vc <VCNUM> does not exist */
SDBE	Status, internal Data Base Error
	/* Unable to read OSDB – status = <status number> */
	/* Unable to update OSDB – status = <status number> */
SROF	Status, Requested Operation Failed
	/* session <session> does not exist */
	/* Invalid CID <CPORT> entered */
	/* This CID is pending removal */
	/* The user on this CID is in the process of logging out */
	/* Output on this CID is already stopped */

EXAMPLES

In the following example, the output transmitted to CPORT 3 is stopped.

```
STOP-CID::3;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P03016. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P03016 COMPLD
/* Output stopped on CID 3 */
/* STOP-CID::3 [P03016] (3) */
;
```

STOP-OPS

COMMAND CODE: **STOP-ITMMODE**
COMMAND NAME: **STOP INSTALLATION TEST AND
MAINTENANCE MODE**

PURPOSE

The STOP-ITMMODE command stops the Installation Test and Maintenance (ITM) mode. The ITM test supports the testing of the GTI matrix cables.

Upon successful completion of a STOP-ITMMODE command, the CONDDTYPE of ITMIP which was set against the AID of COM is cleared and the inactive matrix copy inherits the connection map from the active matrix copy (if one exists).

A STOP-ITMMODE command is denied if:

- The ITM mode has not already been started (using START-ITMMODE).
- A START-ITMTEST is currently in progress.
- An invalid parameter value is entered.

INPUT FORMAT

STOP-ITMMODE: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
[/* <Command Echo> [<CTAG>] (<CID>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SNVS	Status, Not in Valid State /*STOP-ITMMODE command is currently in progress.*/ /*START-ITMMODE command is currently in progress.*/ /*ITM test is currently in progress.*/
------	---

SRCN	Status, Requested CoNdition already exists /*Not currently in ITM mode.*/
SROF	Status, Requested Operation Failed /*Unable to send STOP-ITMMODE command to EM.*/ /*Unable to queue STOP-ITMMODE aux buffer for EM request.*/ /*Unable to access memory for ITM auxiliary data.*/ /*Unable to queue ITM auxiliary buffer for STOP-ITMMODE request.*/ /*Unable to re-queue aux buffer for STOP-ITMMODE I2p response.*/ /*Unable to terminate ITMMODE.*/ /*Timeout on EM response to STOP-ITMMODE command. STOP-ITMMODE command not completed.*/ /*STOP-ITMMODE failed due to SPB address initialization error.*/

EXAMPLES

In the following example, the ITM mode is aborted.

```
STOP-ITMMODE;  
  
    <SID> <YY-MM-DD> <HH:MM:SS>  
M  P69251 COMPLD  
    /* STOP-ITMMODE [P69251] (1) */
```

RELATED COMMANDS

```

START-ITMMODE  
START-ITMTEST  
STOP-ITMTEST
```

COMMAND CODE: **STOP-ITMTEST**
COMMAND NAME: **STOP INSTALLATION TEST AND
MAINTENANCE TEST**

PURPOSE

The STOP-ITMTEST command stops the Installation Test and Maintenance (ITM) test. The ITM test supports the testing of the GTI matrix cables.

A STOP-ITMTEST command is denied if:

- A START-ITMTEST is not currently in progress.
- An invalid parameter value is entered.

INPUT FORMAT

STOP-ITMTEST: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
[/* <Command Echo> [<CTAG>] (<CID>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID>[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SNVS	Status, Not in Valid State /*ITM test termination in progress (duration expired).*/
SRCN	Status, Requested CoNdition already exists /*No ITM test in progress.*/
SROF	Status, Requested Operation Failed /*Unable to access memory for ITM auxiliary buffer.*/ /*Unable to queue ITM auxiliary buffer for in-progress status report.*/

EXAMPLES

In the following example, the ITM test is aborted.

```
STOP-ITMTEST;  
  
    <SID> <YY-MM-DD> <HH:MM:SS>  
M  P69240 COMPLD  
    /* STOP-ITMTEST [P69240] (1) */
```

RELATED COMMANDS

```
RTRV-ITMRSLT  
START-ITMMODE  
START-ITMTEST  
STOP-ITMMODE
```

COMMAND CODE: **STOP-MON-CPORT**
COMMAND NAME: **STOP MONITORING CONTROL PORT**

PURPOSE

The STOP-MON-CPORT command is used to disable the CPORT monitoring of activities on one or more selected CPORTs that were established with the START-MON-CPORT command. The successful completion of the command removes the existing selected CPORTs from the list of CPORTs being monitored. Selective CPORT Monitoring is also disabled when the monitoring user is subscribed to the OSL W flag parameter (refer to the ENT-USER or ED-PRVG-USER commands).

Successive execution of the STOP-MON-CPORT command removes the specified CPORT from the existing CPORTs being monitored. Any changes in the monitoring of CPORTs (i.e., adding a port to the existing list via START-MON-CPORT command, or if the monitoring user subscribes to the OSL W flag parameter) take effect immediately (i.e., it is not required to logout and login again for the change to take affect).

The list of CPORTs selected for CPORT monitoring survives a logout, i.e., if the user logs out and re-logs in, the previous set of CPORT values will be in affect. The CPORT selection (via the START-MON-CPORT and STOP-MON-CPORT TL1 commands) also survives a database restoral.

A successful response is returned (the command completes) even if the specified CPORT is not currently being monitored.

A STOP-MON-CPORT command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

STOP-MON-CPORT: [TID] : CPORT: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{ {1-12}, ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: Control Port, specifies the physical communication port number on the APS control system. The specified CPORT is deleted from the list of monitored CPORTs. CPORT values are not verified for system configuration or provisioning. {1-12} CPORT Number. ALL All, specifies all CPORTs 1 -12 are deleted from the list of monitored CPORTs.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <CPORT> is not being Monitored */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

CPORT {1–12}
 Control Port, identifies the physical control port number.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Optional Suggested Action Text> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIFM	Input, Invalid data ForMat
	/* Unable to read input parameter – status = <nnn> */
IPNV	Input, Parameter Not Valid
	/* Error in set CPORT Monitoring Flag – status = <status number> */
SDBE	Status, internal Data Base Error
	/* Unable to read USDB – status = <status number> */
	/* Unable to update USDB – status = <status number> */

EXAMPLES

In the following example, STOP-MON-CPORT is used to disable monitoring of CPORTs 2 and 6. The example assumes that CPORT 6 is not currently being monitored by the user.

```
STOP-MON-CPORT::2&6;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P73061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P73061 COMPLD
  /* STOP-MON-CPORT::2 [P73061] (1) */
;

<SID> <YY-MM-DD> <HH:MM:SS>
M P73061 COMPLD
  /* 6 is not being Monitored */
  /* STOP-MON-CPORT::6 [P73061] (1) */
;
```

RELATED COMMANDS

ENT-USER
ED-PRVG-USER
RTRV-MON-CPORT
RTRV-PRVG-USER
START-MON-CPORT

COMMAND CODE: **STOP-OPS**
COMMAND NAME: **STOP OPERATIONS SYSTEM**

PURPOSE

The STOP-OPS command causes the system to exit the Normal Command Execution mode and enter the Limited Command Execution mode of operation so that a database restoral can be performed. The system returns to the Normal Command Execution mode by executing a START-OPS command.

The Limited Command Execution mode limits the commands that can be executed during a database restoral so that a stable database is assured during the database restoral process. Only the following commands can be executed while the system is in the Limited Command Execution mode.

- RESTORE-DB
- RTRV-DB-LABEL
- START-OPS
- RMV-CID
- RST-CID
- RTRV-CID
- ACT-USER
- CANC-USER
- DLT-IP-FILTER
- DLT-IP-PRMTR
- DLT-IP-STATICRT
- ED-IP-STATICRT
- ED-IP-PRMTR
- ED-PRMTR-SITE
- ED-RIP-PRMTR
- ENT-IP-FILTER
- ENT-IP-PRMTR
- ENT-IP-STATICRT
- INIT-SYS-OLD
- RTRV-FTP-USER
- RTRV-IP-FILTER
- RTRV-IP-PRMTR
- RTRV-IP-STATICRT
- RTRV-PRMTR-SITE
- RTRV-RIP-PRMTR

When the system enters the Limited Command Execution mode (via a STOP-OPS command), the system administrator (UID of "system" or "SYSTEM") is automatically logged-in on CID 1 (CPORT 1) and the system printer (UID of "sysprint") is automatically logged-in on CID 6 (CPORT 6). (Note. When the system returns to the Normal Command Execution mode, via the START-OPS command, the system automatically returns CID1 and CID 6 to their pre-Limited mode of operation, i.e., the users that had been logged-in on CID 1 and CID 6 are automatically logged-in on CID 1 and CID 6, respectively, when the system returns to the Normal Command Execution mode via the START-OPS command.)

A STOP-OPS command is denied if:

- The system is already in the Limited Command Execution mode.
- An invalid parameter value is entered.

The STOP-OPS command is not inherently service-affecting, but execution of the command restricts the commands that can be executed. Commands to perform provisioning, cross-connections, manual protection switching, etc. are not allowed while the system is in the Limited Command Execution mode. However, automatic I/O protection switching still occurs while the system is in the Limited Command Execution mode.

INPUT FORMAT

STOP-OPS: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* NORMAL OPERATIONS STOPPING */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed
 /* Already in DB RESTORE operations mode */

EXAMPLES

In the following example, the Normal Command Execution mode is halted and the Limited Command Execution mode of operation is entered by executing a STOP-OPS command.

```
STOP-OPS;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P03016. The response header would contain the provisioned Site ID of the system, and the date and time the commands were executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P03016 COMPLD
/* NORMAL OPERATIONS STOPPING */
/* STOP-OPS [P03016] (3) */
;
```

RELATED COMMANDS

RESTORE-DB
RTRV-DB-LABEL
START-OPS

COMMAND CODE: **STOP-UPGRADE**
COMMAND NAME: **STOP UPGRADE**

PURPOSE

The STOP-UPGRADE command indicates to the system that an upgrade procedure is to be stopped.

Executing a STOP-UPGRADE command clears the UPGRD1344, UPGRD2688 or UPGRD3360 condition that is common to the system.

A STOP-UPGRADE command is denied if:

- A UPGRD1344, UPGRD2688 or UPGRD3360 condition is not set.
- One copy of the matrix is M16 while the other copy of the matrix is M40.
- One copy of the end stage matrix is M16 while the other copy of the matrix is M32, within a clover leaf.
- A RPB is present in a IPB slot of a shelf that is defined as a half bandwidth shelf or if an IPB is present in a slot of a shelf that is defined as a full bandwidth shelf.
- A SELECT-COPY, VRFY-COPY, or another STOP-UPGRADE command is already in progress.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

STOP-UPGRADE: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Optional Suggested Action Text> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier /* Invalid parameters in the input command. */
SARB	Status, All Resources Busy /* VRFY-COPY is in progress. */ /* SELECT-COPY is in progress. */ /* SELECT-COPY or START-UPGRADE is in progress. */
SDBE	Status, internal Data Base Error /* Unable to update system configuration file. */
SNVS	Status, Not in Valid State /* Upgrade is not in progress.*/
SROF	Status, Requested Operation Failed /* Unable to allocate USI response buffer. */ /* Invalid upgrade type is detected */ /* Center Stage matrix sides have different card types */

EXAMPLES

In the following example, the upgrade procedure is stopped.

```
STOP-UPGRADE;
```

RELATED COMMANDS

```
START-UPGRADE
```

COMMAND CODE: **STP-ISU**
COMMAND NAME: **STOP IN-SERVICE UPGRADE**

PURPOSE

The STP-ISU command performs an abort of the generic upgrade procedure (STA-ISU command) and sets the generic indicators to their appropriate state. The system continues to remain in service on the current generic. To perform an upgrade once this command has been issued, the upgrade must be restarted from the beginning. A new STA-ISU command must be reissued and the procedure allowed to run to completion for an upgrade to be created. The INIT-SYS-NEW command is denied subsequent to this command being executed.

Upon entry of the STP-ISU command, all scripts and processes associated with the STA-ISU command are terminated and an INIT-SYS::1 command is automatically invoked to reset the system.

If the STP-ISU command issued subsequent to a successful STA-ISU command, the request is successful and all generic/database indicators are reset to indicate that the previous generic is now the active generic.

An STP-ISU command is denied if:

- The command is issued after a failed STA-ISU.
- A STA-ISU command is not in progress and has not been previously issued.
- An INIT-SYS-NEW command is in progress.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

STP-ISU: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed

EXAMPLES

In the following example, the generic upgrade procedure is aborted.

```
STP-ISU;
```

RELATED COMMANDS

INIT-SYS-NEW

STA-ISU

COMMAND CODE: **SW-DX-EQPT**
COMMAND NAME: **SWITCH DUPLEX EQUIPMENT**

PURPOSE

The SW-DX-EQPT command performs a copy switch for the specified one-for-one redundant (duplex) ACM, CDB, CIM, CPU, DSB, ICM, IPU, MCB, OXB, SIO, or SPB equipment (the active copy becomes standby and the standby copy becomes active). Either copy of equipment can be specified; the command performs a copy switch regardless of which copy of equipment is specified.

If a ACM, CIM, CPU, ICM, SIO, or SPB entity is specified, executing a SW-DX-EQPT command sets a SST of STBYC on the previously active copy of equipment and clears the SST of STBYC on the previously standby copy of equipment (SST of STBYC is applied to the standby copy of equipment). If a DSB entity is specified, executing a SW-DX-EQPT command sets a SST of STBYH on the previously active copy of equipment and clears the SST of STBYH on the previously standby copy of equipment (SST of STBYH is applied to the standby copy of equipment).

A SW-DX-EQPT command is denied if MODE of NORM is entered and the active ICM or SIO specified is supporting CPORT. In this case, a MODE of FRCD is used and the standby ICM or SIO must be fully functional.

A SW-DX-EQPT command is denied if MODE of NORM or FRCD is entered and a ACM, CIM, CPU, ICM, SIO, or SPB equipment entity is specified, and the standby copy of equipment is not fully functional (does not have a PST of IS). A SW-DX-EQPT command is denied if MODE of NORM or FRCD is entered and a DSB equipment entity is specified, and the standby copy of equipment is not fully functional (does not have a PST, SST of IS, STBYH).

If MODE of FRCD is entered and an AID for a CDB, MCB, or OXB is specified, a copy switch is performed even if the standby copy of equipment is partially failed (has a PST of IS-ANR). (If a copy switch to a partially failed standby copy of equipment is performed and automatic copy switching is not disabled, via an INH-SW-EQPT command, the system will automatically revert back to the functional copy of equipment.) A SW-DX-EQPT command is denied if MODE of FRCD is entered, an AID for a CDB, MCB, or OXB is specified, and the standby copy of equipment is faulty (has a PST of OOS-AU).

A SW-DX-EQPT command is denied if:

- Both copies of the specified equipment entity have not previously been provisioned with the ENT-EQPT command.
- A MODE of NORM is entered, and the standby copy of equipment is not fully functional (does not have a PST of IS).
- A MODE of FRCD is entered, and an AID for a ACM, CIM, CPU, DSB, ICM, IPU, SIO, or SPB is specified, and the standby copy of equipment is Out-of-Service (does not have a PST of IS or IS-ANR).
- A MODE of FRCD is entered, an AID for a CDB, MCB, or OXB is specified, and the standby copy of equipment is faulty or Management-Out-of-Service (has a PST of OOS-AU, OOS-MA or OOS-AUMA).
- A MODE of NORM is entered with either copy of ICM or SIO specified, and the active ICM or SIO is supporting a CPORT.
- An invalid parameter value is entered.

INPUT FORMAT

SW-DX-EQPT: [TID] : AID: [CTAG] : : [MODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	EQUIPMENT_AID:
	{ACM-1-2-{3-7, 10-14}} {CDB-{5}-{1, 3}-{1, 2}} CDB-{2-43,104-111,112-135,136-141}-{1, 3}-{1, 2} {SI36: CDB-{6-9, 12-15, 18-21, 24-43}-{1, 3}-{1-2}, {SI48: CDB-{2-43,104-111,112-135,136-141}-{1, 3}-{1, 2}} {CIM-1-2-{3-7, 10-14}} {CPU-1-2-{1-2}} {DSB-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{1-2}} {ICM-1-2-{1, 2, 8, 9}} {IPU-{44-63}-{1-4}-{1-8}} {MCB-{2,3}-3-1} {MCB-{5}-{1, 3}-{1}} {OXB-{44-63}-{1-4}-{1-2}} {SIO-1-2-{1-2, 8-9}} {SPB-{2-43, 102-111, 112-135, 136-141}-{1, 3}-{1-2}} {SPB-{5}-{1, 3}-{1, 2}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment object entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MODE	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced, switch to the opposite copy of equipment even if it's faulty (has a PST of IS-ANR) or service affecting. NORM Normal, switch to the opposite copy of equipment only if it's functional (PST of IS) and non-service affecting.

SUCCESSFUL RESPONSE FORMAT

```

EXAMPLES

In the following example, a SPB copy switch is performed (the active copy becomes standby and the standby copy becomes active).

```
SW-DX-EQPT: :SPB-4-1-1;
```

RELATED COMMANDS

```

ALW-SW-EQPT
ENT-EQPT
INH-SW-EQPT
RTRV-EQPT
RTRV-STATE-EQPT

```

COMMAND CODE: **SW-TOPROTN-EQPT**
COMMAND NAME: **SWITCH TO PROTECTION EQUIPMENT**

PURPOSE

The SW-TOPROTN-EQPT command switches the specified (main) I/O circuit pack to the associated I/O protection circuit pack if (automatic and manual) I/O protection switching for the specified I/O circuit pack is not currently inhibited (via an INH-SWTOPROTN-EQPT command).

For SW-TOPROTN-EQPT to be successfully executed:

- Protection switching must be enabled,
- If a MODE of NORM is entered, I/O protection circuit pack must have a state of IS,STBYH.
- If a MODE of FRCD is entered, I/O protection circuit pack must have a state of IS,STBYH or IS-ANR,STBYH

In addition, if an EP3 circuit pack is specified, the “next card protection” I/O circuit pack (i.e., the I/O circuit pack that is not a protection circuit pack and is installed in the shelf to the left of the I/O circuit pack to be protected) must have a state of IS if MODE of NORM is entered or either IS or IS-ANR if MODE of FRCD is entered.

Executing a SW-TOPROTN-EQPT command sets a SST of STBYH on the specified (main) I/O circuit pack, if it has a PST of IS or IS-ANR, and clears the SST of STBYH on the I/O protection circuit pack.

Executing a SW-TOPROTN-EQPT command sets a MANWKSWPR condition type for the specified (main) I/O circuit pack.

A SW-TOPROTN-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned with the ENT-EQPT command.
- I/O protection switching is inhibited (via an INH-SWTOPROTN-EQPT command) for the specified I/O circuit pack.
- The specified I/O circuit pack is already switched to protection (has a SST of STBYH or a condition type of MANWKSWPR or WKSWPR).
- A MODE of NORM is entered and the associated I/O protection circuit pack is either not fully functional or is currently providing protection (does not have a state of IS,STBYH).
- A MODE of FRCD is entered and the associated I/O protection circuit pack is either out-of-service or is currently providing protection (does not have a state of IS,STBYH or IS-ANR,STBYH).
- A MODE of NORM is entered, and an EP3 circuit pack is specified, and the associated “next card protection” I/O circuit pack is not fully functional (does not have a PST of IS).
- A MODE of FRCD is entered, and an EP3 circuit pack is specified, and the associated “next card protection” I/O circuit pack is out-of-service (does not have a PST of IS or IS-ANR).
- The specified AID identifies a protection I/O circuit pack.
- The I/O circuit pack to be switched to is OOS-MA, or OOS,AUMA.
- An invalid parameter value is entered.

INPUT FORMAT

SSRE	Status, System Resources Exceeded /* The command was rejected. */ /* Unable to allocate USI response buffer. */

EXAMPLES

In the following example, EP3-8-1-4 is switched to the protection circuit pack (EP3-8-1-1).

```
SW-TOPROTN-EQPT : EP3-8-1-4;
```

RELATED COMMANDS

```
ALW-SWTOPTN-EQPT  
ALW-SWTOWKG-EQPT  
ENT-EQPT  
INH-SWTOPTN-EQPT  
INH-SWTOWKG-EQPT  
RTRV-EQPT  
RTRV-STATE-EQPT  
SW-TOWKG-EQPT
```

COMMAND CODE: **SW-TOWKG-EQPT**
COMMAND NAME: **SWITCH TO WORKING EQUIPMENT**

PURPOSE

The SW-TOWKG-EQPT command switches from the protection I/O circuit pack back to the specified main (working) I/O circuit pack if (automatic and manual) I/O switch to working for the specified I/O circuit pack is not currently inhibited (by an INH-SWTOWKG-EQPT command).

In order for a SW-TOWKG-EQPT command to execute, I/O switch to working must be enabled, and the specified (main) I/O circuit pack must have a state of IS,STBYH if MODE of NORM is entered or either IS,STBYH or IS-ANR,STBYH if MODE of FRCD is entered.

Executing a SW-TOWKG-EQPT command clears the SST of STBYH on the specified I/O circuit pack and sets a SST of STBYH on the I/O protection circuit pack.

Executing a SW-TOWKG-EQPT command clears the MANWKSWPR condition type for the specified I/O circuit pack.

A SW-TOWKG-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned with the ENT-EQPT command.
- I/O switch to working is inhibited (via an INH-SWTOWKG-EQPT command) for the specified I/O circuit pack.
- The specified I/O circuit pack is not currently switched to protection (does not have a SST of STBYH and a condition type of MANWKSWPR or WKSWPR).
- A MODE of NORM is entered, and the specified I/O circuit pack is not fully functional (does not have a state of IS,STBYH).
- A MODE of FRCD is entered, and the specified I/O circuit pack is out-of-service (does not have a state of IS,STBYH or IS-ANR,STBYH).
- The specified AID identifies a protection I/O circuit pack.
- An invalid parameter value is entered.

COMMAND CODE: **VRFY-COPY**
COMMAND NAME: **VERIFY COPY**

PURPOSE

The VRFY-COPY command is used during a matrix upgrade from a 672 port matrix to a 1344 port matrix or from a 1344 port matrix to a 2688 port matrix.

VRFY-COPY is used to automatically verify that the data of the copy specified in the command at each I/O circuit pack is good. On execution of this command the system performs the following operations:

- At each I/O Shelf/Quad, starting with the first I/O circuit pack within the protection group, the system verifies the copy selected by the COPY parameter.
- If the selected copy is good, the system proceeds to the next I/O circuit pack in the I/O Shelf/Quad until all of the I/O circuit packs in the Shelf/Quad are verified.
- If the selected copy for a circuit pack is not good, the verification for that circuit pack is terminated but the verification of the remaining I/O circuit packs within the Shelf/Quad and the verification of the remaining I/O Shelves/Quads is continued.
- After all the I/O Shelves/Quads are verified, the completion message identifies any circuit packs with invalid data.
- If a specific AID is entered, all connections on the specified circuit pack is checked for Connection ID Mismatch.

A VRFY-COPY command is denied if:

- A SELECT-COPY, VRFY-COPY, START-UPGRADE or START-ITMMODE command is currently in progress.
- An invalid parameter value is entered.

INPUT FORMAT

VRFY-COPY: [TID] : [AID] : [CTAG] : : COPY;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	EQUIPMENT_AID:
	{ALL} {DSI-{44-63}-{1-4}-{1-32}} {SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110, 136-141 }-{1, 3}-{1-18}, EP3-{9, 21, 35, 43, 107 }-3-{1-18}, EP3-{15, 27, 31, 39, 111 }-1-{1-18}} {SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}} {SI48: ES1-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110,136-141 }-{1, 3}-{1-18}, ES1-{9, 21, 35, 43, 107 }-3-{1-18}, ES1-{15, 27, 31, 39, 111 }-1-{1-18}} {SI36: ES1-{6-8, 12-14}-{1, 3}-{1-14}, ES1-9-3-{1-14}, ES1-15-1-{1-14}} {HMU-{44-53}-{1-4}-{1-8}} {LMU-{44-53}-{1-4}-{1-32}} {O1B-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141 }-{1, 3}-{2-9, 11-18}} {O4M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141 }-{1, 3}-{2-3, 11-12}} {S3M-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141 }-{1, 3}-{4-9, 13-18}} Default: {ALL} Addressing: None Description: Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics. Name-defined values are: ALL All I/O equipment entities.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.
COPY	{COPY0, COPY1} Default: Entry Required Addressing: None Description: Copy, specifies the copy to be verified. Values are: COPY0 Copy 0 is verified. COPY1 Copy 1 is verified.

SUCCESSFUL RESPONSE FORMAT

If all of the specified I/O circuit packs for the specified copy verified good, then the successful response format is:

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

If an AID value of ALL is entered and the verification failed for some I/O circuit packs for the specified copy, then the successful response format is:

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* <AID>: <Reason for the verification failure> */
    /* <AID>: <Reason for the verification failure> */]
....
    /* <AID>: <Reason for the verification failure> */]
    /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

If an AID value for a specific I/O circuit pack is entered and the verification failed for the specified copy, then the successful response format is:

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* <FROM>, <TO>, <FROMTYPE>, <TOTYPE>, <FROM_EQPT>, <TO_EQPT>,
<XID0>, <XID1> */]
    /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

```

To Equipment AID, identifies the I/O equipment detecting the Connection ID Mismatch (i.e., associated with the TO port).

XID0 {XID0, <NoVal>}

Connection ID Mismatch, Copy 0, indicates whether a Copy 0 Connection ID mismatch was detected. Values are:

XID0	Copy 0 Connection ID mismatch was detected.
<NoVal>	No Value, Copy 0 Connection ID mismatch was not detected.

XID1 {XID1, <NoVal>
Connection ID Mismatch, Copy 1, indicates whether a Copy 1 Connection ID mismatch was detected. Values are:
XID1 Copy 1 Connection ID mismatch was detected.
<NoVal> No Value, Copy 1 Connection ID mismatch was not detected.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID>. */
IIAC	Input, Invalid ACcess identifier /* Invalid parameters in the input command. */ /* Invalid AID for the EP3 card. */ /* Invalid or unassigned equipment identifier specified. */ /* Invalid command requested. */
SARB	Status, All Resources Busy /* VRFY COPY is in progress. */ /* SELECT COPY is in progress. */ /* SELECT COPY or START-UPGRADE is in progress. */ /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Manual or automatic action is in progress for <AID>. */ /* INIT-SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Error opening report file. */ /* Error accessing report file. */
SNVS	Status, Not in Valid State /* Inactive matrix copy unavailable because system is in ITM mode. */
SROF	Status, Requested Operation Failed /* Unable to allocate USI response buffer. */

EXAMPLES

In the following example, copy 1 is verified.

```
VRFY-COPY:::::COPY1;
```

RELATED COMMANDS

```
ED-PRMTR-NE
RTRV-MTX
SELECT-COPY
START-UPGRADE
STOP-UPGRADE
```

3. AUTONOMOUS MESSAGE DESCRIPTIONS

This section contains a description of the system generated autonomous messages. The autonomous message descriptions are presented in alphabetical order by message code.

For general information and input/output formats, refer to Section 1.

For information on commands and their associated responses, refer to Section 2.

For supplementary and reference information (e.g., condition types, state names and state diagrams, monitored parameters, etc.), refer to the appendices.

RESPONSE CODE: **KEEP^ALIVE**
RESPONSE NAME: **KEEP ALIVE MESSAGE**

PURPOSE

The KEEP^ALIVE^MESSAGE autonomous response is generated by the system to maintain communication link activity to any logged-in user provisioned with a KAMINTVL parameter value of {20–300} (refer to the ENT–USER or ED–PRVG–USER commands).

If a user is provisioned with a KAMINTVL parameter value of {20–300}, the system transmits an autonomous KEEP^ALIVE^MESSAGE to the user every n seconds, where n is {20–300}, until the user enters a TL1 command or receives any output response message (communication link activity occurs). When communication link activity occurs, the Keep Alive Message Interval Timer is reset and the system begins transmitting KEEP^ALIVE^MESSAGES again until new communication link activity occurs.

The system generates a new modulo KATAG value for every autonomous KEEP^ALIVE^MESSAGE.

RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
I  <KATAG> KEEP ALIVE MESSAGE  
;
```

OUTPUT PARAMETERS

KATAG	{KA0000–KA9999} Autonomous Keep–Alive Message Tag, the system assigned tag number used to correlate autonomous KEEP^ALIVE^MESSAGES. The format of KATAG is KAnnnn, where KA are the upper case alphabetic characters K and A, and n is a decimal integer from 0 through 9. A new modulo KATAG value is generated by the system for every KEEP^ALIVE^ MESSAGE.
-------	--

EXAMPLES

The following example provides a sample of the autonomous KEEP^ALIVE^MESSAGE messages generated by the system for two users, user1 with a KAMINTVL of 15 and user2 with a KAMINTVL of 25.

The autonomous responses, shown below, are assumed for **user1**. The response header would contain the provisioned Site ID of the system. The example assumes a date and time for each response.

```
<SID> 94-09-26 17:50:15  
I  KA9997 KEEP ALIVE MESSAGE  
;  
  
<SID> 94-09-26 17:50:30  
I  KA9999 KEEP ALIVE MESSAGE  
;  
  
<SID> 94-09-26 17:50:45  
I  KA0000 KEEP ALIVE MESSAGE  
;  
.....
```

The autonomous responses, shown below, are assumed for **user2**. The response header would contain the provisioned Site ID of the system. The example assumes a date and time for each response.

```
<SID> 94-09-26 17:50:25
I KA9998 KEEP ALIVE MESSAGE
;

<SID> 94-09-26 17:50:50
I KA0001 KEEP ALIVE MESSAGE
;

.....
```

RELATED COMMANDS

ACT-USER
CANC-USER
DLT-USER
ED-PRVG-USER
ENT-USER
RTRV-PRVG-USER
START-CID
STOP-CID

RESPONSE CODE: **REPT^ALM^COM**
RESPONSE NAME: **REPORT ALARM COMMON**

PURPOSE

The REPT^ALM^COM autonomous response is generated by the system to report the occurrence of an alarmed common (no specific entity) condition (an event occurred which caused a common condition with a notification code of major or minor to be set by the system), or to report the clearing of a previously reported alarmed common condition.

RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
<ALMCDE> <ATAG> REPT ALM COM
"COM:<NTFCNCDE>,<CONDTYPE>,<SRVEFF>,<OCRDAT>,<OCRTM>,<LOCN>,,,"
[:\"<CONDDDESCR>\",,,]"
;
```

OUTPUT PARAMETERS

ALMCDE	{**, ^, A^}	Alarm Code, identifies the nature of the autonomous response based on the priority of action. (Note. The ^ shown in the value set is used to represent a space. The ^ does not actually appear in the output response.) Values are:
	**	Major Alarm, indicates a major alarm is being reported.
	^	Minor Alarm, indicates a minor alarm is being reported.
	A^	Autonomous Message, indicates the clearing of an alarm is being reported.
ATAG	{0-99999}	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
NTFCNCDE	{CL, CR, MJ, MN}	Notification Code, indicates the notification code of the reported condition. Values are:
	CL	Cleared Alarm, a previously declared alarm has cleared.
	CR	Critical Alarm, a critical alarm has occurred.
	MJ	Major Alarm, a major alarm has occurred.
	MN	Minor Alarm, a minor alarm has occurred.

CONDTYPE {DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC3, GOS-OC12, GOS-ST1, GOS-ST3C, GOS-T1, GOS-T3, GOS-VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDATAOPY0, MANSELDATAOPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688}

Condition Type, identifies the condition type being reported. (Refer to Appendix C for a list of all condition types.) Values are:

DATAFLT	Data integrity Fault, CRC error detected during a database read.
EUA	Emergency User Access activated.
FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
GOS-ST1	Grade of Service-ST1, system-wide STS-1 GOS threshold reached.
GOS-ST3C	Grade of Service-ST3C, system-wide STS-3C GOS threshold reached.
GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
HLDVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
INIT	Initialization, system initialization in-process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
MANSELDATAOPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.

SRVEFF	{NSA, SA} Service Effect, identifies the service effect for the condition being reported. Values are: NSA Non-Service Affecting SA Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCR-DAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.
LOCN	{NEND} Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.
CONDDESCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").

EXAMPLES

The following example shows the autonomous message generated by the system to report an alarmed INHFL condition.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
** 2468 REPT ALM COM
"COM:MN, INHFL, NSA, 07-01, 07-05-10, NEND, , , , "

RELATED AUTONOMOUS RESPONSES

REPT^EVT^COM

RESPONSE CODE: **REPT^ALM^EC1**
RESPONSE NAME: **REPORT ALARM EC1**

PURPOSE

The REPT^ALM^EC1 autonomous response is generated by the system to report the occurrence of an alarmed standing condition (an event occurred which caused a condition with a notification code of major or minor to be set by the system) for the indicated EC1 port, or to report the clearing of a previously reported alarmed standing condition for the indicated EC1 port.

The autonomous response contains a line of parsable output data for each alarmed standing condition being reported. Only parsable data with the same NTFCNCDE is reported in an autonomous message if more than one alarmed standing condition is being reported (i.e., alarms with different notification codes are reported in different autonomous messages).

RESPONSE FORMAT

```

[:\"<CONDDDESCR>\",,,]"
;
```

OUTPUT PARAMETERS

ALMCDE	{*C, **, *^, A^}	Alarm Code, identifies the nature of the autonomous response based on the priority of action. (Note. The ^ shown in the value set is used to represent a space. The ^ does not actually appear in the output response.) Values are:
	*C	Critical Alarm, indicates a critical alarm is being reported.
	**	Major Alarm, indicates a major alarm is being reported.
	*^	Minor Alarm, indicates a minor alarm is being reported.
	A^	Autonomous Message, indicates the clearing of an alarm is being reported.
ATAG	{0-99999}	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
AID	EC1_AID: {EC1-{1-3840} }	(EC1-EC1/STS1#) EC1 AID, identifies the EC1 port.
NTFCNCDE	{CL, CR, MJ, MN}	Notification Code, indicates the notification code of the reported condition. Values are:
	CL	Cleared Alarm, a previously declared alarm has cleared.
	CR	Critical Alarm, a critical alarm has occurred.
	MJ	Major Alarm, a major alarm has occurred.
	MN	Minor Alarm, a minor alarm has occurred.

CONDTYPE	<p>NEAR-END_CONDTYPE:{ACTLPBK, AIS, INHPMREPT, LOF, LOS, MAN}, FAR-END_CONDTYPE:{RFI}</p> <p>Condition Type, identifies the condition type being reported. (Refer to Appendix C for a list of all condition types.) Values are:</p> <table> <tr> <td>ACTLPBK</td><td>Active Loopback, the EC1 port is in loop back.</td></tr> <tr> <td>AIS</td><td>Alarm Indication Signal, AIS detected.</td></tr> <tr> <td>INHPMREPT</td><td>Inhibit Performance Monitoring Report, PM report capability Inhibited.</td></tr> <tr> <td>LOF</td><td>Loss Of Frame detected.</td></tr> <tr> <td>LOS</td><td>Loss Of Signal detected.</td></tr> <tr> <td>MAN</td><td>Manual removal (logical removal was performed on the facility).</td></tr> <tr> <td>RFI</td><td>Remote Failure Indication detected.</td></tr> </table>	ACTLPBK	Active Loopback, the EC1 port is in loop back.	AIS	Alarm Indication Signal, AIS detected.	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.	LOF	Loss Of Frame detected.	LOS	Loss Of Signal detected.	MAN	Manual removal (logical removal was performed on the facility).	RFI	Remote Failure Indication detected.
ACTLPBK	Active Loopback, the EC1 port is in loop back.														
AIS	Alarm Indication Signal, AIS detected.														
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.														
LOF	Loss Of Frame detected.														
LOS	Loss Of Signal detected.														
MAN	Manual removal (logical removal was performed on the facility).														
RFI	Remote Failure Indication detected.														
SRVEFF	<p>{NSA, SA}</p> <p>Service Effect, identifies the service effect for the condition type and notification code being reported. Values are:</p> <table> <tr> <td>NSA</td><td>Non-Service Affecting</td></tr> <tr> <td>SA</td><td>Service Affecting</td></tr> </table>	NSA	Non-Service Affecting	SA	Service Affecting										
NSA	Non-Service Affecting														
SA	Service Affecting														
OCRDAT	<p>{MONTH-DAY:{01-12} - {01-31} }</p> <p>Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.</p>														
OCRTM	<p>{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} }</p> <p>Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.</p>														
LOCN	<p>{FEND, NEND}</p> <p>Location, identifies the location where the condition type is monitored. Values are:</p> <table> <tr> <td>FEND</td><td>Far-End, events occurring at a distant network element.</td></tr> <tr> <td>NEND</td><td>Near-End, events occurring at the system.</td></tr> </table>	FEND	Far-End, events occurring at a distant network element.	NEND	Near-End, events occurring at the system.										
FEND	Far-End, events occurring at a distant network element.														
NEND	Near-End, events occurring at the system.														
CONDESCR	<p>< 1-64 alpha-numeric characters ></p> <p>Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").</p>														

EXAMPLES

The following example shows the autonomous message generated by the system to report a LOS facility failure on EC1 port EC1-200.

The autonomous response, shown below, assumes a system generated ATAG value of 13579. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```

<SID> <YY-MM-DD> <HH:MM:SS>
** 13579 REPT ALM EC1
"EC1-200:MJ,LOS,SA,07-01,07-05-10,NEND,,,"

Condition Type, identifies the condition type being reported. (Refer to Appendix C for a list of all condition types.) Values are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected.
BKUPMEMP	Backup Memory—Primary, magnetic disk backup failure.
BKUPMEMS	Backup Memory—Secondary, optical disk/tape drive back-up failure.
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane.
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf.
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN.
CD	Control and Display interface audit error detected.
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0.
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1.
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB.
CONTBUS	Control Bus, shelf control bus interface failure.
CONTCOM	Control Communication equipment failure.
CONTR	Control processor equipment failure.
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure.
DATALCK0	Data Lock 0, I/O shelf/quad locked to databus 0.
DATALCK1	Data Lock 1, I/O shelf/quad locked to databus 1.
DBF	Database Backup Failure, OPD database backup failure detected (on second try).
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try.
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed.
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified.
DUPMACADDR	Duplicate MAC Address detected on the LAN.
DUPTARPENTRY	Duplicate TARP adjacency table.
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed.
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed.
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database.
GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
INHSWDX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.
INHSWPR	Inhibit Switch to Protection, automatic protection switching

	INHSSWWKG	of a main circuit pack to protection unit is inhibited. Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
	INIT	Initialization, shelf initialization in-process.
	INTERR	Internal Error, internal error suspected on equipment.
	LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
	LOTRI	Loss Of Offboard Timing Reference Input from mate Master Clock Board circuit pack.
	MAN	Manual removal (logical removal was performed on a circuit pack).
	MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
	MISC-1	Miscellaneous Class-1, slave MCB is not ready.
	OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs.
	PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning.
	PWR	Power, internal power failure detected.
	RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
	RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
	SWFTDWN	Software Download is in process on a circuit pack.
	SYNCEQPT	Synchronization Equipment failure detected.
	TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
	TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure.
	TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure.
	TERM-T1	Termination Equipment-T1, DSI circuit pack failure.
	TERM-T3	Termination Equipment-T3, HMU circuit pack failure.
	TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure.
	TSA	Test Session Active, maintenance test session active on the equipment.
	TSI	Time Slot Interchange equipment failure.
	WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
	XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect for the condition type being reported. Values are: NSA Non-Service Affecting SA Service Affecting	
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.	

LOCN	{NEND} Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.
CONDDSCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").

EXAMPLES

The following example shows the autonomous message generated by the system to report a circuit pack failure on EP3-7-1-3.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```

RESPONSE CODE: **REPT^ALM^F3**
RESPONSE NAME: **REPORT ALARM F3**

PURPOSE

The REPT^ALM^F3 autonomous response is generated by the system to report the occurrence of an alarmed standing condition (an event occurred which caused a condition with a notification code of major or minor to be set by the system) for the indicated F3 port, or to report the clearing of a previously reported alarmed standing condition for the indicated F3 port.

The autonomous response contains a line of parsable output data for each alarmed standing condition being reported. Only parsable data with the same NTFCNCDE is reported in an autonomous message if more than one alarmed standing condition is being reported (i.e., alarms with different notification codes are reported in different autonomous messages).

RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

OUTPUT PARAMETERS

ALMCDE	{*C, **, *^, A^} Alarm Code, identifies the nature of the autonomous response based on the priority of action. (Note. The ^ shown in the value set is used to represent a space. The ^ does not actually appear in the output response.) Values are: *C Critical Alarm, indicates a critical alarm is being reported. ** Major Alarm, indicates a major alarm is being reported. *^ Minor Alarm, indicates a minor alarm is being reported. A^ Autonomous Message, indicates the clearing of an alarm is being reported.
ATAG	{0-99999} Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) F3 AID, identifies the F3 port.
NTFCNCDE	{CL, CR, MJ, MN} Notification Code, indicates the notification code of the reported condition. Values are: CL Cleared Alarm, a previously declared alarm has cleared. CR Critical Alarm, a critical alarm has occurred. MJ Major Alarm, a major alarm has occurred. MN Minor Alarm, a minor alarm has occurred.
CONDTYPE	{INHPMREPT} Condition Type, identifies the condition type being reported. (Refer to Appendix C for a list of all condition types.) Values are: INHPMREPT Inhibit Performance Monitoring Report, PM report capability Inhibited.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect for the condition type and notification code being reported. Values are: NSA Non-Service Affecting SA Service Affecting

OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCR-DAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.
LOCN	{NEND} Location, identifies the location where the condition type is monitored. Values are: NEND Near-End, events occurring at the system.
CONDDDESCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").

EXAMPLES

The following example shows the autonomous message generated by the system to report a INHPMREPT facility failure on F3 port T3F3-200-1.

The autonomous response, shown below, assumes a system generated ATAG value of 13579. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

ALMCDE	{**, ^, A^}	
	Alarm Code, identifies the nature of the autonomous response based on the priority of action. (Note. The ^ shown in the value set is used to represent a space. The ^ does not actually appear in the output response.) Values are:	
	**	Major Alarm, indicates a major alarm is being reported.
	*^	Minor Alarm, indicates a minor alarm is being reported.
	A^	Autonomous Message, indicates the clearing of an alarm is being reported.
ATAG	{0–99999}	
	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.	
AID	STS1_AID:	
	{EC1STS1–{1–3840}}	(EC1STS1–EC1/STS1#)
	{OC3STS1–{1–2240}–{1–3}}	(OC3STS1–OC3#–STS1#)
	{OC12STS1–{1–560}–{1–4}–{1–3}}	(OC12STS1–OC12#–STM1#–STS1#)
	STS1 AID, identifies the STS1 port.	
NTFCNCDE	{CL, CR, MJ, MN}	
	Notification Code, indicates the notification code of the reported condition. Values are:	
	CL	Cleared Alarm, a previously declared alarm has cleared.
	CR	Critical Alarm, a critical alarm has occurred.
	MJ	Major Alarm, a major alarm has occurred.
	MN	Minor Alarm, a minor alarm has occurred.

CONDTYPE	<p>NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI}</p> <p>Condition Type, identifies the condition type being reported. RELATED AUTONOMOUS RESPONSES

REPT^EVT^STS1

RESPONSE CODE: **REPT^ALM^STS3C**
RESPONSE NAME: **REPORT ALARM STS3C**

PURPOSE

The REPT^ALM^STS3C autonomous response is generated by the system to report the occurrence of an alarmed standing condition (an event occurred which caused a condition with a notification code of major or minor to be set by the system) for the indicated STS3C port, or to report the clearing of a previously reported alarmed standing condition for the indicated STS3C port.

The autonomous response contains a line of parsable output data for each alarmed standing condition being reported. Only parsable data with the same NTFCNCDE is reported in an autonomous message if more than one alarmed standing condition is being reported (i.e., alarms with different notification codes are reported in different autonomous messages).

RESPONSE FORMAT

CONDDDESCR	<p>< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \ ").</p>																												

EXAMPLES

The following example shows the autonomous message generated by the system to report a LOS facility failure on DS3 port T3–1160.

The autonomous response, shown below, assumes a system generated ATAG value of 13579. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
** 13579 REPT ALM T3
   "T3-1160:MJ,LOS,SA,07-01,07-05-10,NEND,,,"

RELATED AUTONOMOUS RESPONSES

REPT^EVT^T3

RESPONSE CODE: **REPT^ALM^VT1**
RESPONSE NAME: **REPORT ALARM VT1**

PURPOSE

The REPT^ALM^VT1 autonomous response is generated by the system to report the occurrence of an alarmed standing condition (an event occurred which caused a condition with a notification code of major or minor to be set by the system) for the indicated VT1.5 port, or to report the clearing of a previously reported alarmed standing condition for the indicated VT1.5 port.

The autonomous response contains a line of parsable output data for each alarmed standing condition being reported. Only parsable data with the same NTFNCNDE is reported in an autonomous message if more than one alarmed standing condition is being reported (i.e., alarms with different notification codes are reported in different autonomous messages).

RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
<ALMCDE> <ATAG> REPT ALM VT1
  "<AID>:<NTFCNCDE>,<CONDTYPE>,<SRVEFF>,<OCRDAT>,<OCRTM>,<LOCN>,"
  [<DIRN>] , , , [ : \ "<CONDDDESCR>\ " , , , ] "
;
```

OUTPUT PARAMETERS

ALMCDE	{**, ^, A^}	Alarm Code, identifies the nature of the autonomous response based on the priority of action. (Note. The ^ shown in the value set is used to represent a space. The ^ does not actually appear in the output response.) Values are:
	**	Major Alarm, indicates a major alarm is being reported.
	^	Minor Alarm, indicates a minor alarm is being reported.
	A^	Autonomous Message, indicates the clearing of an alarm is being reported.
ATAG	{0-99999}	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	VT1 AID, identifies the VT1.5 port.	
NTFCNCDE	{CL, CR, MJ, MN}	Notification Code, indicates the notification code of the reported condition. Values are:
	CL	Cleared Alarm, a previously declared alarm has cleared.
	CR	Critical Alarm, a critical alarm has occurred.
	MJ	Major Alarm, a major alarm has occurred.
	MN	Minor Alarm, a minor alarm has occurred.

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Condition Type, identifies the condition type being reported. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the VT1.5 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	EBER	Excessive Bit Error Rate detected.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.
	LOP	Loss Of Pointer detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	RFI	Remote Failure Indication detected.
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
	SDBER	Signal Degrade Bit Error Rate detected.
	SLMF	Signal Label Match Failure detected.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect for the condition type and notification code being reported. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.	
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
CONDDDESCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (" ... ").	

EXAMPLES

The following example shows the autonomous message generated by the system to report a LOP facility failure on VT1.5 port EC1VT1-200-7-1.

The autonomous response, shown below, assumes a system generated ATAG value of 13579. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
** 13579 REPT ALM VT1
   "EC1VT1-200-7-1:MJ,LOP,SA,07-01,07-05-10,NEND,,,"

RELATED AUTONOMOUS RESPONSES

REPT^EVT^VT1

RESPONSE CODE: **REPT^DBCHG**
RESPONSE NAME: **REPORT Database change**

PURPOSE

The REPT^DBCHG autonomous response is generated by the system to report a database change to a user (OS – Operations System, or other user provisioned to receive REPT^DBCHG messages via ENT–USER or ED–PRVG–USER) caused by the execution of an entity provisioning command, an autonomous equipment insertion, extraction, failure, or failure recovery event, or an autonomous change in the entity's primary state (PST).

REPT^DBCHG messages are transmitted to all active users provisioned (via the user's OSL provisioning in the ENT–USER or ED–PRVG–USER commands) to receive REPT^DBCHG messages, except for the user originating an entity provisioning command.

A separate REPT^DBCHG message is generated for each AID specified in an entity provisioning command, regardless if a range of AIDs are entered in a command.

The REPT^DBCHG messages generated by the system are stored in the system's output disk buffer (the event log file). If the communication interface between the system and the user is interrupted and subsequently reestablished, or the user logs–off and subsequently logs–on the system, the system can automatically transmit the stored REPT^DBCHG messages that were generated while communication with the user was interrupted. The provisioning of each user's DSKBFIND parameter in the ENT–USER or ED–PRVG–USER commands controls whether the system transmits stored REPT^DBCHG messages to a user in this situation.

The input commands that cause a REPT^DBCHG autonomous message are:

- | | | | | |
|-----------------|---------------|-------------|-------------|-----------------|
| • ENT–EC1 | • ED–EC1 | • RMV–EC1 | • RST–EC1 | • DLT–EC1 |
| • ENT–EQPT | • ED–EQPT | • RMV–EQPT | • RST–EQPT | • DLT–EQPT |
| • ENT–F3 | • ED–F3 | | | • DLT–F3 |
| • ENT–OC12 | • ED–OC12 | • RMV–OC12 | • RST–OC12 | • DLT–OC12 |
| • ENT–OC3 | • ED–OC3 | • RMV–OC3 | • RST–OC3 | • DLT–OC3 |
| • ENT–STS1 | • ED–STS1 | • RMV–STS1 | • RST–STS1 | • DLT–STS1 |
| • ENT–STS3C | • ED–STS3C | • RMV–STS3C | • RST–STS3C | • DLT–STS3C |
| • ENT–T1 | • ED–T1 | • RMV–T1 | • RST–T1 | • DLT–T1 |
| • ENT–T3 | • ED–T3 | • RMV–T3 | • RST–T3 | • DLT–T3 |
| • ENT–VT1 | • ED–VT1 | • RMV–VT1 | • RST–VT1 | • DLT–VT1 |
| • ENT–CONF–T1 | | | | • DLT–CONF–T1 |
| • ENT–CONF–VT1 | | | | • DLT–CONF–VT1 |
| • ENT–CRS–STS1 | | | | • DLT–CRS–STS1 |
| • ENT–CRS–STS3C | | | | • DLT–CRS–STS3C |
| • ENT–CRS–T1 | | | | • DLT–CRS–T1 |
| • ENT–CRS–T3 | | | | • DLT–CRS–T3 |
| • ENT–CRS–VT1 | | | | • DLT–CRS–VT1 |

| • ENT–FFP–OC3 | | | | • DLT–FFP–OC3 |
| | • ED–FFP–STS1 | | | |
| | • ED–FFP–VT1 | | | |
| • ENT–RNG–OC12 | | | | • DLT–RNG–OC12 |
| • ENT–RNG–OC3 | | | | • DLT–RNG–OC3 |
| • ENT–ROLL–T1 | | | | • DLT–ROLL–T1 |
| • ENT–ROLL–VT1 | | | | • DLT–ROLL–VT1 |
| • SET–SID | | | | |

The autonomous events that cause a REPT^DBCHG autonomous message are:

- Installation (physical insertion) of an equipment entity.
- De-installation (physical extraction) of an equipment entity.
- Failure of an equipment entity.
- Failure recovery of an equipment entity.
- Change in primary state (PST) of an OC12, OC3, EC1, STS-1, STS-3C, VT1.5, DS3, DS1 or cross-connection entity.
- Change in secondary state (SST) of a VT1.5 or DS1 during the completion of ENT-ROLL-T1/VT1, and DLT-ROLL-T1/VT1 commands.

RESPONSE FORMAT

```

      <SID> <YY-MM-DD> <HH:MM:SS>
A  <ATAG> REPT DBCHG
    " [SOURCE=<CTAG> , ] DATE=<DATE> , TIME=<TIME> : <EVENT> : <AID>
[ : <POSITBLK> [ : <KYWDBLK> [ : <STATE> ] ] ] "
;

```

OUTPUT PARAMETERS

ATAG	{0-99999} Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
CTAG	{<CTAG of command causing the database change response>, <NOVAL>} Source CTAG, indicates the CTAG of the command that caused the REPT^DBCHG message. If the REPT^DBCHG message was not caused by an input command, the keyword SOURCE and CTAG value is not displayed.
DATE	{YY-MM-DD:{00-99} - {1-12} - {1-31} } Date, identifies the date the database change occurred. The format of DATE is <YEAR> - <MONTH> - <DAY>, where values for <YEAR> from 70 through 00 represent the year 1970 through the year 2000.
TIME	{HH-MM-SS:{00-23}-{00-59}-{00-59} } Time, identifies the time the database change occurred. The format of TIME is <HOUR> - <MINUTE> - <SECOND>.
EVENT	{CLEAR-AINS, CLEAR-FAULT-EQPT, DLT-CONF-T1, DLT-CONF-VT1, DLT-CRS-STs1, DLT-CRS-STs3C, DLT-CRS-T1, DLT-CRS-T3, DLT-CRS-VT1, DLT-EC1, DLT-EQPT, DLT-F3, DLT-FFP-OC3, DLT-OC3, DLT-RNG-OC12, DLT-RNG-OC3, DLT-ROLL-T1, DLT-ROLL-VT1, DLT-STs1, DLT-STs3C, DLT-T1, DLT-T3, DLT-VT1, DLT-RNG-OC12, DLT-RNG-OC3 ED-EC1, ED-EQPT, ED-F3, ED-FFP-STs1, ED-FFP-VT1, ED-OC3, ED-OC12, ED-STs1, ED-STs3C, ED-T1, ED-T3, ED-VT1, ENT-CONF-T1, ENT-CONF-VT1, ENT-CRS-STs1, ENT-CRS-STs3C, ENT-CRS-T1, ENT-CRS-T3, ENT-CRS-VT1, ENT-EC1, ENT-EQPT, ENT-F3, ENT-FFP-OC3, ENT-FFP-OC12, ENT-OC3, ENT-RNG-OC12, ENT-RNG-OC3, ENT-ROLL-T1, ENT-ROLL-VT1, ENT-STs1, ENT-STs3C, ENT-T1, ENT-T3, ENT-VT1, ENT-RNG-OC12, ENT-RNG-OC3, FAULT-EQPT, PLUGIN-EQPT} Triggering Event, identifies the executed command or autonomous event that caused the database change.

<NoVal>

No value provided if REPT^DBCHG is caused by a SET-SID.

Access IDentifier, identifies the equipment entity, OC12 port, OC3 port, EC1 port, STS-1 port, VT1.5 port, DS3 port, F3 port, or DS1 port associated with the database change. No value is provided in the AID field if the database change message was caused by a SET-SID command.

POSITBLK	{<Any data entered in the command's Positional Parameter Block>, <NoVal>} Command's Positional Block, identifies any data entered in a command's positional block if the database change message was caused by executing a command. Refer to the command descriptions (of each command that can cause a database change message) in section 2 for a description of each command's positional block. No value is provided in the POSITBLK field (the field is unpopulated) if the database change message was caused by an autonomous event.
KYWDBLK	{<Any data entered in the command's Keyword Parameter Block>, <NoVal>} Command's Keyword Block, identifies any data entered in a command's keyword block if the database change message was caused by executing a command. Refer to the command descriptions (of each command that can cause a database change message) in section 2 for a description of each command's keyword block. No value is provided in the KYWDBLK field (the field is unpopulated) if the database change message was caused by an autonomous event.
STATE	{<Any data entered in the command's State Parameter Block>, <Entities new PST[,SST] resulting from an autonomous state change>} State Change, identifies any data entered in a command's state block if the database change message was caused by executing a command. Refer to the command descriptions (of each command that can cause a database change message) in section 2 for a description of each command's keyword block. The STATE field indicates the entities new PST[,SST] state if the database change message was caused by an autonomous event.

EXAMPLES

The following example shows the autonomous REPT^DBCHG message generated by the system caused by the execution of a SET-SID command.

The autonomous response, shown below, assumes the system generated a CTAG value of Pad582 and an ATAG value of 2466. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2466 REPT DBCHG
"SOURCE=Pad582,DATE=94-08-21,TIME=09-35-13:SET-SID::THIS-IS-A-SITEID"
;
```

The following example shows the autonomous REPT^DBCHG message generated by the system caused by the execution of an ENT-T1 command on DS1 port 2-15-28.

The autonomous response, shown below, assumes the system generated a CTAG value of Pad567 and an ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT DBCHG
"SOURCE=Pad567,DATE=94-08-20,TIME=18-27-15:ENT-T1:2-15-28::FMT=ESF:IS"
;
```

The following example shows the autonomous REPT^DBCHG message generated by the system caused by the execution of an DLT-CRS-T1 command to delete the one-way cross-connection from DS1 port 3-9-15 to DS1 port 5-7-28.

The autonomous response, shown below, assumes the system generated a CTAG value of Pad572 and an ATAG value of 2471. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2471 REPT DBCHG
  "SOURCE=Pad572,DATE=94-08-20,TIME=18-43-22:DLT-CRS-T1:3-9-15,5-7-28:
  1WAY"
;
```

The following example shows the autonomous REPT^DBCHG message generated by the system caused by the execution of a DLT-T1 command using &&-ranging to delete DS1 ports 2-7-1 through 2-7-2.

The autonomous response, shown below, assumes the system generated a CTAG value of Pad575 and ATAG values of 2473 and 2474. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2473 REPT DBCHG
  "SOURCE=Pad575,DATE=94-08-20,TIME=18-55-07:DLT-T1:2-7-1:::OOS-MA,UAS"
;

<SID> <YY-MM-DD> <HH:MM:SS>
A 2474 REPT DBCHG
  "SOURCE=Pad575,DATE=94-08-20,TIME=18-55-07:DLT-T1:2-7-2:::OOS-MA,UAS"
;
```

The following example shows the autonomous REPT^DBCHG message generated by the system caused by the execution of an ENT-EQPT command of the EP3-10-3 circuit pack.

The autonomous response, shown below, assumes the system generated a CTAG value of Pad577 and an ATAG value of 2478. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2478 REPT DBCHG
  "SOURCE=Pad577,DATE=94-08-20,TIME=19-07-32:ENT-EQPT:EP3-10-3::
  LBO2=LONG,LBO3=LONG:OOS,MT"
;
```

The following example shows the autonomous REPT^DBCHG message generated by the system caused by the physical removal of an EP3-5-2 circuit pack that's was in an OOS-MA state.

The autonomous response, shown below, assumes a system generated ATAG value of 2480. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2480 REPT DBCHG
  "DATE=94-08-21,TIME=09-12-47:UNPLUG-EQPT:EP3-5-2:::OOS-AUMA,UEQ"
;
```

RESPONSE CODE: **REPT^EVT^COM**
RESPONSE NAME: **REPORT EVENT COMMON**

PURPOSE

The REPT^EVT^COM autonomous response is generated by the system

- to report the occurrence of a non–alarmed standing common (no specific entity) condition (an event occurred which caused a common condition with a notification code of not–alarmed to be set by the system),
- to report the clearing of a previously reported non–alarmed standing common condition,
- or to report a transient *non* threshold crossing alert (Non–TCA) common condition.

RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
A <ATAG> REPT EVT COM
  "COM:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCR TM>,<LOCN> , , ,
[ : \ "<CONDDDESCR>\ " , , , ] "
;
```

OUTPUT PARAMETERS

ATAG	{0–99999}	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
CONDTYPE	STANDING_CONDTYPE:{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS–EC1, GOS–OC3, GOS–OC12, GOS–STS1, GOS–STS3C, GOS–T1, GOS–T3, GOS–VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDATAACPY0, MANSELDATAACPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688} TRANSIENT_NON–TCA_CONDTYPE:{PMFILERDY}	Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing and transient Non–TCA condition types.) Values are:
	DATAFLT	Data integrity Fault, CRC error detected during a database read.
	EUA	Emergency User Access activated.
	FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
	FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
	GOS–EC1	Grade of Service–EC1, system–wide EC1 GOS threshold reached.
	GOS–OC3	Grade of Service–OC3, system–wide OC3 GOS threshold reached.
	GOS–OC12	Grade of Service–OC12, system–wide OC12 GOS threshold reached.
	GOS–STS1	Grade of Service–STS1, system–wide STS1 GOS threshold reached.
	GOS–STS3C	Grade of Service–STS3C, system–wide STS3C GOS threshold reached.
	GOS–T1	Grade of Service–T1, system–wide DS1 GOS threshold reached.
	GOS–T3	Grade of Service–T3, system–wide DS3 GOS threshold reached.

	GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
	HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
	INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
	INIT	Initialization, system initialization in-process.
	ITMIP	Installation Test and Maintenance (ITM) mode is set.
	MANSELDATACPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
	MANSELDATACPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
	MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
	MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
	MTXUPGRD	Matrix Upgrade in Progress.
	PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
	RCVRY	Recovery. The System level recovery has been executed.
	SWTOPRI	Automatic Switch To Primary Synchronization Reference.
	SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
	UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
	UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
	Values for TRANSIENT (Non Threshold Crossing Alert) CONDITION TYPES are:	
	PMFILERDY	15-Minute or 1-Day Binary PM Data is ready to be transferred.
CONDEFF	{CL, SC,TC}	Condition Effect, identifies the effect of the standing condition being reported. Values are:
	CL	Cleared, a previously declared non-alarmed standing condition has cleared.
	SC	Standing Condition, a non-alarmed standing condition has occurred.
	TC	Transient Condition, a non-alarmed transient condition has occurred.
OCRDAT	{MONTH-DAY:{01-12} - {01-31} }	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} }	Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.
LOCN	{NEND}	Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.
CONDDDESCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").	

EXAMPLES

The following example shows the autonomous message generated by the system to report a non-alarmed INHFL standing condition.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A 2468 REPT EVT COM  
  "COM:INHFL,SC,07-01,07-05-10,NEND,,,"  
;

RELATED AUTONOMOUS RESPONSES

REPT^ALM^COM

RESPONSE CODE: **REPT^EVT^EC1**
RESPONSE NAME: **REPORT EVENT EC1**

PURPOSE

The REPT^EVT^EC1 autonomous response is generated by the system

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated EC1 port(s),
- to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated EC1 port(s),
- or to report a transient threshold crossing alert (PM TCA) condition for the indicated EC1 port.

RESPONSE FORMAT

The following autonomous response format is provided when EC1 standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT EC1  
  "<AID>:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,,,,  
[:\"<CONDDDESCR>\" , , , ] "  
;
```

The following autonomous response format is provided when EC1 transient conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT EC1  
  "<AID>:<CONDTYPE> , , <OCRDAT>,<OCRTM>,<LOCN> , , <MONVAL> ,  
<THLEV>,<TMPPER> [ : \"<CONDDDESCR>\" , , , ] "  
;
```

OUTPUT PARAMETERS

ATAG	{0–99999} Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
AID	EC1_AID: {EC1–{1–3840} } EC1 AID, identifies the EC1 port. <div>(EC1–EC1/STS1#)</div>

CONDTYPE STANDING_NEAR-END_CONDTYPE:{ACTLPBK, AIS, INHPMREPT, LOF, LOS, MAN},
STANDING_FAR-END_CONDTYPE:{RFI},
TRANSIENT_NEAR-END_TCA_CONDTYPE:{T-LOSS, T-SEFS, T-CVL, T-ESA-L, T-ESB-L, T-ESL, T-SESL, T-UASL},
TRANSIENT_FAR-END_TCA_CONDTYPE:{T-AISS, T-ESL, T-FC-L, T-SESL, T-UASL}

Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing condition types and to Appendix F for a list of all monitored PM parameters for transient TCA condition types.) Values are:

Values for STANDING CONDITION TYPES are:

ACTLPBK	Active Loopback, the EC1 port is in loop back.
AIS	Alarm Indication Signal, AIS detected.
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.
LOF	Loss Of Frame detected.
LOS	Loss Of Signal detected.
MAN	Manual removal (logical removal was performed on the facility).
RFI	Remote Failure Indication detected.

Values for TRANSIENT (Threshold Crossing Alert) CONDITION TYPES are:

T-AISS	TCA-AIS Seconds, indicates an AISS threshold crossing was detected.
T-CVL	TCA-Coding Violations Line, indicates a CV-L threshold crossing was detected.
T-ESA-L	TCA-Errored Seconds type A – Line, indicates an ESA-L threshold crossing was detected.
T-ESB-L	TCA-Errored Seconds type B – Line, indicates an ESB-L threshold crossing was detected.
T-ESL	TCA-Errored Seconds Line, indicates an ES-L threshold crossing was detected.
T-FC-L	TCA-Failure Count – Line, indicates a FC-L threshold crossing was detected.
T-LOSS	TCA-Loss Of Signal Seconds – Section, indicates a LOSS-S threshold crossing was detected.
T-SEFS	TCA-Severely Errored Frame Seconds Section, indicates a SEFS-S threshold crossing was detected.
T-SESL	TCA-Severely Errored Seconds Line, indicates a SES-L threshold crossing was detected.
T-UASL	TCA-Unavailable Seconds Line, indicates an UAS-L threshold crossing was detected.

CONDEFF {CL, SC}
Condition Effect, identifies the effect of the standing condition being reported. A value for CONDEFF is only reported for a standing condition. Values are:

CL	Cleared, a previously declared non-alarmed standing condition has cleared.
SC	Standing Condition, a non-alarmed standing condition has occurred.

OCRDAT {MONTH-DAY:{01-12} – {01-31} }
Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.

OCRTM {HOUR-MINUTE-SECOND:{00-23} – {00-59} – {00-59} }
Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.

LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.
MONVAL	{0-4294967295} Monitored Parameter Value, indicates the measured value in the PM register corresponding to the threshold crossing alert being reported. A value for MONVAL is only reported for a transient condition (threshold crossing alert).
THLEV	{0-4294967295} Threshold Level, indicates the threshold level for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for THLEV is only reported for a transient condition (threshold crossing alert).
TMPER	{15-MIN, 1-DAY} Time Period, identifies the accumulation time period for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for TMPER is only reported for a transient condition (threshold crossing alert). Values are: 15-MIN 15-Minute PM collection period. 1-DAY 1-Day (24 hours) PM collection period.
CONDDDESCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").

EXAMPLES

The following example shows the autonomous message generated by the system to report a non-alarmed standing condition on EC1 port EC1-200.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT EC1
  "EC1-200:INHMPREPT,SC,07-01,07-05-10,NEND,,,"
;
```

The following example shows the autonomous message generated by the system to report a severely errored seconds, line transient condition (threshold crossing alert) on EC1 port EC1-252.

The autonomous response, shown below, assumes a system generated ATAG value of 2469. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2469 REPT EVT EC1
  "EC1-252:T-SESL,,07-01,07-25-38,FEND,,56,44,15-MIN"
;
```

 XIDMISM}

TRANSIENT_NON-TCA_CONDTYPE:{EXCOL}

Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing and transient Non-TCA condition types.) Values are:

Values for STANDING CONDITION TYPES are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected.
BKUPMEMP	Backup Memory—Primary, magnetic disk backup failure.
BKUPMEMS	Backup Memory—Secondary, optical disk/tape drive back-up failure.
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane.
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf.
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN.
CD	Control and Display interface audit error detected.
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0.
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1.
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB.
CONTBUS	Control Bus, shelf control bus interface failure.
CONTCOM	Control Communication equipment failure.
CONTR	Control processor equipment failure.
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure.
DATALCK0	Data Lock 0, I/O shelf/quad locked to databus 0.
DATALCK1	Data Lock 1, I/O shelf/quad locked to databus 1.
DBF	Database Backup Failure, OPD database backup failure detected (on second try).
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try.
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed.
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified.
DUPMACADDR	Duplicate MAC Address detected on the LAN.
DUPTARPENTRY	Duplicate TARP adjacency table.
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed.
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed.
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database.
GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited.
INHSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
INIT	Initialization, shelf initialization in-process.
INTERR	Internal Error, internal error suspected on equipment.

LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
LOTRI	Loss Of Offboard Timing Reference Input from mate Master Clock Board circuit pack.
MAN	Manual removal (logical removal was performed on a circuit pack).
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
MISC-1	Miscellaneous Class-1, slave MCB is not ready.
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs.
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning.
PWR	Power, internal power failure detected.
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
SWFTDWN	Software Download is in process on a circuit pack.
SYNCEQPT	Synchronization Equipment failure detected.
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure.
TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure.
TERM-T1	Termination Equipment-T1, DSI circuit pack failure.
TERM-T3	Termination Equipment-T3, HMU circuit pack failure.
TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure.
TSA	Test Session Active, maintenance test session active on the equipment.
TSI	Time Slot Interchange equipment failure.
WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.

Values for TRANSIENT (Non Threshold Crossing Alert) CONDITION TYPES are:

EXCOL	Excessive Collisions event occurred on the 802.3 LAN interface.				
CONDEFF	<p>{CL, SC}</p> <p>Condition Effect, identifies the effect of the standing condition being reported. Values are:</p> <table> <tr> <td>CL</td><td>Cleared, a previously declared non-alarmed standing condition has cleared.</td></tr> <tr> <td>SC</td><td>Standing Condition, a non-alarmed standing condition has occurred.</td></tr> </table>	CL	Cleared, a previously declared non-alarmed standing condition has cleared.	SC	Standing Condition, a non-alarmed standing condition has occurred.
CL	Cleared, a previously declared non-alarmed standing condition has cleared.				
SC	Standing Condition, a non-alarmed standing condition has occurred.				
OCRDAT	<p>{MONTH-DAY:{01-12} - {01-31} }</p> <p>Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.</p>				
OCRTM	<p>{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} }</p> <p>Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.</p>				

LOCN	{NEND} Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.
CONDDDESCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").

EXAMPLES

The following example shows the autonomous message generated by the system to report a non-alarmed standing condition on the EP3-7-1-3 circuit pack.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT EQPT
  "EP3-7-1-3: INHSWPR, SC, 07-01, 07-05-10, NEND, , , "
;

RELATED AUTONOMOUS RESPONSES

REPT^ALM^EQPT

RESPONSE CODE: **REPT^EVT^F3**
RESPONSE NAME: **REPORT EVENT F3**

PURPOSE

The REPT^EVT^F3 autonomous response is generated by the system

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated F3 port(s),
- or to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated F3 port(s).

RESPONSE FORMAT

The following autonomous response format is provided when F3 standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A <ATAG> REPT EVT F3
  "<AID>:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,,,"
  [:\"<CONDESCR>\",,,]"
;
```

OUTPUT PARAMETERS

ATAG	{0–99999} Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
AID	F3_AID: {T3F3–{1–4800}–{1–14}} F3 AID, identifies the F3 port. (T3F3–DS3#–Fractional_DS3#)
CONDTYPE	STANDING_CONDTYPE:{INHMPREPT} Condition Type, identifies the standing condition type being reported. (Refer to Appendix C for a list of all standing condition types.) Values are: Values for STANDING CONDITION TYPES are: INHMPREPT Inhibit Performance Monitoring Report, PM report capability Inhibited.
CONDEFF	{CL, SC} Condition Effect, identifies the effect of the standing condition being reported. A value for CONDEFF is only reported for a standing condition. Values are: CL Cleared, a previously declared non–alarmed standing condition has cleared. SC Standing Condition, a non–alarmed standing condition has occurred.
OCRDAT	{MONTH–DAY:{01–12} – {01–31}} Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
OCRTM	{HOUR–MINUTE–SECOND:{00–23} – {00–59} – {00–59}} Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.
LOCN	{NEND} Location, identifies the location where the condition type is monitored. Values are: NEND Near–End, events occurring at the system.

CONDDDESCR < 1–64 alpha–numeric characters >
Condition Description, an optional, non–parsable, text description of the condition, enclosed within escape–quotes (\“ ... \”).

EXAMPLES

The following example shows the autonomous message generated by the system to report a non–alarmed standing condition on F3 port T3F3–200–1.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A 2468 REPT EVT F3  
  "T3F3-200-1:INHPREREPT,SC,07-01,07-05-10,NEND,,,"

RELATED AUTONOMOUS RESPONSES

REPT^ALM^F3

RESPONSE CODE: **REPT^EVT^OC3**
RESPONSE NAME: **REPORT EVENT OC3**

PURPOSE

The REPT^EVT^OC3 autonomous response is generated by the system

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated OC3 port(s),
- to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated OC3 port(s),
- to report a transient *non* threshold crossing alert (Non–TCA) condition for the indicated OC3 port,
- or to report a transient threshold crossing alert (PM TCA) condition for the indicated OC3 port.

RESPONSE FORMAT

The following autonomous response format is provided when OC3 standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT OC3  
  "<AID>:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,,,,,  
[:\"<CONDDDESCR>\",,,,"  
;
```

The following autonomous response format is provided when OC3 transient conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT OC3  
  "<AID>:<CONDTYPE>,,,<OCRDAT>,<OCRTM>,<LOCN>,,,<MONVAL>,<THLEV>,<TMPER>[:\"<CONDDDESCR>\",,,,\"<OBSDBHVR>\",,\"<EXPTDBHVR>\"] "  
;
```

OUTPUT PARAMETERS

	OC3 AID, identifies the OC–3 port.	

CONDTYPE STANDING_NEAR-END_CONDTYPE:{ACTLPBK, AIS, DUPTARPENTRY, EBER, ESW, FRCDWKSWBK, FRCDWKSWPR, INHPMREPT, L2LCONFAIL, L2SCONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKSWBK, MANWKSWPR, SDBER, SDCCDLFL, WTR},
STANDING_FAR-END_CONDTYPE:{RFI},
TRANSIENT_NEAR-END_NON-TCA_CONDTYPE:{LDCCDM, LDCCFRMR, LDCCRESET, SDCCDM, SDCCFRMR, SDCCRESET, WKSWBK, WKSWPR}
TRANSIENT_NEAR-END_TCA_CONDTYPE:{T-CVS, T-ESA-S, T-ESB-S, T-ESS, T-LOSS, T-SEFS, T-SESS, T-AISS, T-CVL, T-ESA-L, T-ESB-L, T-ESL, T-FC-L, T-PSC-L, T-PSD-L, T-SESL, T-UASL},
TRANSIENT_FAR-END_TCA_CONDTYPE:{T-AISS, T-CVL, T-ESA-L, T-ESB-L, T-ESL, T-FC-L, T-SESL, T-UASL}

Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing and transient Non-TCA condition types and to Appendix F for a list of all monitored PM parameters for transient TCA condition types.)
Values are:

Values for STANDING CONDITION TYPES are:

ACTLPBK	Active Loopback, the OC3 port is in loop back.
DUPTARPENTRY	Duplicate TARP adjacency table.
AIS	Alarm Indication Signal, AIS detected.
EBER	Excessive Bit Error Rate detected.
ESW	Excessive Switching, lockout of automatic revertive (OC3) switching due to excessive switching.
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
L2LCONFAIL	Layer 2 Line DCC Connection Failure.
L2SCONFAIL	Layer 2 Section DCC Connection Failure.
LDCCDLFL	Line DCC Data Link Failure.
LOCKOUTOFPR	LockOut Of Protection facility.
LOF	Loss Of Frame detected.
LOS	Loss Of Signal detected.
MAN	Manual removal (logical removal was performed on the facility).
MANWKSWBK	Manual Working Switched Back, working facility was manually switched back to the main facility.
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
RFI	Remote Failure Indication detected.
SDBER	Signal Degrade Bit Error Rate detected.
SDCCDLFL	Section DCC Data Link Failure
WTR	Wait To Restore of protection facility.

Values for TRANSIENT (Non Threshold Crossing Alert) CONDITION TYPES are:

LDCCDM	Line DCC DM Frame Received.
LDCCFRMR	Line DCC Frame Error Frame.
LDCCRESET	Line DCC SABME Frame received unexpectedly.
SDCCDM	Section DCC DM Frame received.
SDCCFRMR	Section DCC Frame Error Frame.
SDCCRESET	Section DCC SABME Frame received unexpectedly.

WKSWBK	Working Switched Back, working facility automatically switched from protection to the main facility.						
WKSWPR	Working Switched to Protection, working facility automatically switched to the protection facility.						
Values for TRANSIENT (Threshold Crossing Alert) CONDITION TYPES are:							
T-AISS	TCA-AIS Seconds – Line, indicates an AISS–L threshold crossing was detected.						
T-CVL	TCA–Coding Violations Line, indicates a CV–L threshold crossing was detected.						
T-CVS	TCA–Coding Violations Section, indicates a CV–S threshold crossing was detected.						
T-ESA–L	TCA–Errored Seconds type A – Line, indicates an ESA–L threshold crossing was detected.						
T-ESA–S	TCA–Errored Seconds Type A – Section, indicates an ESA–S threshold crossing was detected.						
T-ESB–L	TCA–Errored Seconds type B – Line, indicates an ESB–L threshold crossing was detected.						
T-ESB–S	TCA–Errored Seconds Type B – Section, indicates an ESB–S threshold crossing was detected.						
T-ESL	TCA–Errored Seconds Line, indicates an ES–L threshold crossing was detected.						
T-ESS	TCA–Errored Seconds Section, indicates an ES–S threshold crossing was detected.						
T-FC–L	TCA–Failure Count – Line, indicates a FC–L threshold crossing was detected.						
T-LOSS	TCA–Loss Of Signal Seconds – Section, indicates a LOSS–S threshold crossing was detected.						
T-PSC–L	TCA–Protection Switch Counts–Line, indicates a PSC–L threshold crossing was detected.						
T-PSD–L	TCA–Protection Switch Duration – Line, indicates a PSD–L threshold crossing was detected.						
T-SEFS	TCA–Severely Errored Frame Seconds – Section, indicates a SEFS–S threshold crossing was detected.						
T-SESL	TCA–Severely Errored Seconds Line, indicates a SES–L threshold crossing was detected.						
T-SESS	TCA–Severely Errored Seconds Section, indicates a SES–S threshold crossing was detected.						
T-UASL	TCA–Unavailable Seconds Line, indicates an UAS–L threshold crossing was detected.						
CONDEFF	<p>{CL, SC, TC}</p> <p>Condition Effect, identifies the effect of the standing condition being reported. A value for CONDEFF is only reported for a non–TCA condition. Values are:</p> <table> <tr> <td>CL</td><td>Cleared, a previously declared non–alarmed standing condition has cleared.</td></tr> <tr> <td>SC</td><td>Standing Condition, a non–alarmed standing condition has occurred.</td></tr> <tr> <td>TC</td><td>Transient Non–TCA Condition, a non–alarmed transient non–TCA condition has occurred.</td></tr> </table>	CL	Cleared, a previously declared non–alarmed standing condition has cleared.	SC	Standing Condition, a non–alarmed standing condition has occurred.	TC	Transient Non–TCA Condition, a non–alarmed transient non–TCA condition has occurred.
CL	Cleared, a previously declared non–alarmed standing condition has cleared.						
SC	Standing Condition, a non–alarmed standing condition has occurred.						
TC	Transient Non–TCA Condition, a non–alarmed transient non–TCA condition has occurred.						
OCRDAT	<p>{MONTH–DAY:{01–12} – {01–31} }</p> <p>Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.</p>						
OCRTM	<p>{HOUR–MINUTE–SECOND:{00–23} – {00–59} – {00–59} }</p> <p>Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.</p>						

LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.
MONVAL	{0-4294967295} Monitored Parameter Value, indicates the measured value in the PM register corresponding to the threshold crossing alert being reported. A value for MONVAL is only reported for a transient condition (threshold crossing alert).
THLEV	{0-4294967295} Threshold Level, indicates the threshold level for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for THLEV is only reported for a transient condition (threshold crossing alert).
TMPER	{15-MIN, 1-DAY} Time Period, identifies the accumulation time period for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for TMPER is only reported for a transient condition (threshold crossing alert). Values are: 15-MIN 15-Minute PM collection period. 1-DAY 1-Day (24 hours) PM collection period.
CONDDESCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").
OBSDBHVR	<1-512 alpha-numeric characters> Observed Behaviour, indicates the new synchronization status message, and is only displayed if condition type is SSMC.
EXPTDBHVR	<1-512 alpha-numeric characters> Expected Behavior, indicates the old synchronization status message, and is only displayed if condition type is SSMC.

EXAMPLES

The following example shows the autonomous message generated by the system to report a non-alarmed standing condition on OC3 port OC3-113.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```

<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT OC3
  "OC3-113:INHMPREPT,SC,07-01,07-05-10,NEND,,,"
;

```

The following example shows the autonomous message generated by the system to report a severely errored seconds, line transient condition (threshold crossing alert) on OC3 port OC3-122.

The autonomous response, shown below, assumes a system generated ATAG value of 2469. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A 2469 REPT EVT OC3  
  "OC3-122:T-SESL,,07-01,07-25-38,NEND,,56,44,15-MIN"  
;
```

RELATED AUTONOMOUS RESPONSES

REPT^ALM^OC3

RESPONSE CODE: **REPT^EVT^OC12**
RESPONSE NAME: **REPORT EVENT OC-12**

PURPOSE

The REPT^EVT^OC12 autonomous response is generated by the system:

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated OC–12 port(s),
- to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated OC–12 port(s),
- to report a transient nonthreshold crossing alert (Non–TCA) condition for the indicated OC–12 port,
- or to report a transient threshold crossing alert (PM TCA) condition for the indicated OC–12 port.

RESPONSE FORMAT

The following autonomous response format is provided when OC–12 standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT OC12  
  "<AID>:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,,,,  
[:\"<CONDDDESCR>\" , , , "  
;
```

The following autonomous response format is provided when OC–12 transient conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT OC12  
  "<AID>:<CONDTYPE> , , <OCRDAT>,<OCRTM>,<LOCN> , , <MONVAL> ,  
<THLEV>,<TMPPER> [ : \"<CONDDDESCR>\" , , \"<OBSDBHVR>\" , \"<EXPTDBHVR>\" ] "  
;
```

OUTPUT PARAMETERS

ATAG	{0–99999} Autonomous Message Tag, the system–assigned tag number used to correlate autonomous messages.
AID	OC12_AID: {OC12–{1–560}} OC12 AID, identifies the OC–12 port. (OC12–OC12#)

CONDTYPE STANDING_NEAR-END_CONDTYPE:{ACTLPBK, AIS, DUPTARPENTRY, EBER, ESW, FRCDWKSWBK, FRCDWKSWPR, INHPMREPT, L2LCONFAIL, L2SCONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKSWBK, MANWKSWPR, SDBER, SDCCDLFL, WTR},
STANDING_FAR-END_CONDTYPE:{RFI},
TRANSIENT_NEAR-END_NON-TCA_CONDTYPE:{LDCCDM, LDCCFRMR, LDCCRESET, SDCCDM, SDCCFRMR, SDCCRESET, WKSWBK, WKSWPR}
TRANSIENT_NEAR-END_TCA_CONDTYPE:{T-CVS, T-ESA-S, T-ESB-S, T-ESS, T-LOSS, T-SEFS, T-SESS, T-AISS, T-CVL, T-ESA-L, T-ESB-L, T-ESL, T-FC-L, T-PSC-L, T-PSD-L, T-SESL, T-UASL},
TRANSIENT_FAR-END_TCA_CONDTYPE:{T-AISS, T-CVL, T-ESA-L, T-ESB-L, T-ESL, T-FC-L, T-SESL, T-UASL}

Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing and transient Non-TCA condition types and to Appendix F for a list of all monitored PM parameters for transient TCA condition types.)
Values are:

Values for STANDING CONDITION TYPES are:

ACTLPBK	Active Loopback, the OC-12 port is in loopback.
DUPTARPENTRY	Duplicate TARP adjacency table.
AIS	Alarm Indication Signal, AIS detected.
EBER	Excessive Bit Error Rate detected.
ESW	Excessive Switching, lockout of automatic revertive (OC12) switching due to excessive switching.
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
L2LCONFAIL	Layer 2 Line DCC Connection Failure.
L2SCONFAIL	Layer 2 Section DCC Connection Failure.
LDCCDLFL	Line DCC Data Link Failure.
LOCKOUTOFPR	LockOut Of Protection facility.
LOF	Loss Of Frame detected.
LOS	Loss Of Signal detected.
MAN	Manual removal (logical removal was performed on the facility).
MANWKSWBK	Manual Working Switched Back, working facility was manually switched back to the main facility.
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
RFI	Remote Failure Indication detected.
SDBER	Signal Degrade Bit Error Rate detected.
SDCCDLFL	Section DCC Data Link Failure
WTR	Wait To Restore of protection facility.

Values for TRANSIENT (Non Threshold Crossing Alert) CONDITION TYPES are:

LDCCDM	Line DCC DM Frame Received.
LDCCFRMR	Line DCC Frame Error Frame.
LDCCRESET	Line DCC SABME Frame received unexpectedly.
SDCCDM	Section DCC DM Frame received.
SDCCFRMR	Section DCC Frame Error Frame.
SDCCRESET	Section DCC SABME Frame received unexpectedly.

WKSWBK	Working Switched Back, working facility automatically switched from protection to the main facility.						
WKSWPR	Working Switched to Protection, working facility automatically switched to the protection facility.						
Values for TRANSIENT (Threshold Crossing Alert) CONDITION TYPES are:							
T-AISS	TCA-AIS Seconds – Line, indicates an AISS–L threshold crossing was detected.						
T-CVL	TCA–Coding Violations Line, indicates a CV–L threshold crossing was detected.						
T-CVS	TCA–Coding Violations Section, indicates a CV–S threshold crossing was detected.						
T-ESA–L	TCA–Errored Seconds type A – Line, indicates an ESA–L threshold crossing was detected.						
T-ESA–S	TCA–Errored Seconds Type A – Section, indicates an ESA–S threshold crossing was detected.						
T-ESB–L	TCA–Errored Seconds type B – Line, indicates an ESB–L threshold crossing was detected.						
T-ESB–S	TCA–Errored Seconds Type B – Section, indicates an ESB–S threshold crossing was detected.						
T-ESL	TCA–Errored Seconds Line, indicates an ES–L threshold crossing was detected.						
T-ESS	TCA–Errored Seconds Section, indicates an ES–S threshold crossing was detected.						
T-FC–L	TCA–Failure Count – Line, indicates a FC–L threshold crossing was detected.						
T-LOSS	TCA–Loss Of Signal Seconds – Section, indicates a LOSS–S threshold crossing was detected.						
T-PSC–L	TCA–Protection Switch Counts–Line, indicates a PSC–L threshold crossing was detected.						
T-PSD–L	TCA–Protection Switch Duration – Line, indicates a PSD–L threshold crossing was detected.						
T-SEFS	TCA–Severely Errored Frame Seconds – Section, indicates a SEFS–S threshold crossing was detected.						
T-SESL	TCA–Severely Errored Seconds Line, indicates a SES–L threshold crossing was detected.						
T-SESS	TCA–Severely Errored Seconds Section, indicates a SES–S threshold crossing was detected.						
T-UASL	TCA–Unavailable Seconds Line, indicates an UAS–L threshold crossing was detected.						
CONDEFF	<p>{CL, SC, TC}</p> <p>Condition Effect, identifies the effect of the standing condition being reported. A value for CONDEFF is only reported for a non–TCA condition. Values are:</p> <table> <tr> <td>CL</td><td>Cleared, a previously declared non–alarmed standing condition has cleared.</td></tr> <tr> <td>SC</td><td>Standing Condition, a non–alarmed standing condition has occurred.</td></tr> <tr> <td>TC</td><td>Transient Non–TCA Condition, a non–alarmed transient non–TCA condition has occurred.</td></tr> </table>	CL	Cleared, a previously declared non–alarmed standing condition has cleared.	SC	Standing Condition, a non–alarmed standing condition has occurred.	TC	Transient Non–TCA Condition, a non–alarmed transient non–TCA condition has occurred.
CL	Cleared, a previously declared non–alarmed standing condition has cleared.						
SC	Standing Condition, a non–alarmed standing condition has occurred.						
TC	Transient Non–TCA Condition, a non–alarmed transient non–TCA condition has occurred.						
OCRDAT	<p>{MONTH–DAY:{01–12} – {01–31} }</p> <p>Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.</p>						
OCRTM	<p>{HOUR–MINUTE–SECOND:{00–23} – {00–59} – {00–59} }</p> <p>Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.</p>						

LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.
MONVAL	{0-4294967295} Monitored Parameter Value, indicates the measured value in the PM register corresponding to the threshold crossing alert being reported. A value for MONVAL is only reported for a transient condition (threshold crossing alert).
THLEV	{0-4294967295} Threshold Level, indicates the threshold level for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for THLEV is only reported for a transient condition (threshold crossing alert).
TMPER	{15-MIN, 1-DAY} Time Period, identifies the accumulation time period for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for TMPER is only reported for a transient condition (threshold crossing alert). Values are: 15-MIN 15-Minute PM collection period. 1-DAY 1-Day (24 hours) PM collection period.
CONDDESCR	< 1-64 alpha-numeric characters > Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\ " ... \").
OBSDBHVR	<1-512 alpha-numeric characters> Observed Behavior, indicates the new synchronization status message, and is only displayed if condition type is SSMC.
EXPTDBHVR	<1-512 alpha-numeric characters> Expected Behavior, indicates the old synchronization status message, and is only displayed if condition type is SSMC.

EXAMPLES

The following example shows the autonomous message generated by the system to report a non-alarmed standing condition on OC-12 port OC12-113.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```

<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT OC12
  "OC12-113:INHMPREPT,SC,07-01,07-05-10,NEND,,,"
;
```

The following example shows the autonomous message generated by the system to report a severely errored seconds, line transient condition (threshold crossing alert) on OC-12 port OC12-122.

The autonomous response, shown below, assumes a system generated ATAG value of 2469. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2469 REPT EVT OC12
  "OC12-122:T-SESL,,07-01,07-25-38,NEND,,56,44,15-MIN"
;
```

RELATED AUTONOMOUS RESPONSES

REPT^ALM^OC12

RESPONSE CODE: **REPT^EVT^SESSION**
RESPONSE NAME: **REPORT EVENT SESSION**

PURPOSE

The REPT^EVT^SESSION autonomous response provides the provisioned user–logon warning message (refer to the SET–WARN–MSG command) to a user when the user logs–on to the system via an ACT–USER command.

The REPT^EVT^SESSION autonomous response is always sent to the user that executes the ACT–USER command. No mechanism is available to prevent the system from generating the response message.

The REPT^EVT^SESSION autonomous response is only returned to the user that executes the ACT–USER command. Other users do not receive the REPT^EVT^SESSION autonomous response, regardless of their OSL provisioning (e.g., regardless if they’re provisioned to receive the output responses sent to other users; refer to the ENT–USER and ED–PRVG–USER commands).

The REPT^EVT^SESSION autonomous response will contain an additional message that prompts the user to change the password identifier (PID) if the password has expired due to password aging (i.e. the PIDEXP parameter value is YES).

RESPONSE FORMAT

```
      <SID> <YY-MM-DD> <HH:MM:SS>
A  <ATAG> REPT EVT SESSION
    "<SID>:<PIDEXP>"
    [/* Password will be deactivated if not changed before logging-off */]
    /* <WARN> */
;
```

OUTPUT PARAMETERS

ATAG	{0–99999} Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.				
SID	< 1–20 Valid Site Identification Characters > Site Identifier. (Refer to the SET–SID command.)				
PIDEXP	{NO,YES} Password Identification (PID) Expiration, indicates whether a new user PID is required because of password aging. Values are: <table><tr><td>NO</td><td>The user password identifier does not require updating. (i.e. the PID has not expired)</td></tr><tr><td>YES</td><td>The system prompts the user to change the password identifier in the output response because the password has expired. The system will deactivate the user password identifier if it is not changed (via the ED–PID command) before the user exits the current session.</td></tr></table>	NO	The user password identifier does not require updating. (i.e. the PID has not expired)	YES	The system prompts the user to change the password identifier in the output response because the password has expired. The system will deactivate the user password identifier if it is not changed (via the ED–PID command) before the user exits the current session.
NO	The user password identifier does not require updating. (i.e. the PID has not expired)				
YES	The system prompts the user to change the password identifier in the output response because the password has expired. The system will deactivate the user password identifier if it is not changed (via the ED–PID command) before the user exits the current session.				
WARN	< 0–20 lines of up to 70 alpha–numeric characters per line > Warning Message, the provisioned user–logon warning message. A separate line of non–parsable text is provided for each line of the warning message provisioned by the SET–WARN–MSG command.				

EXAMPLES

The following example shows the successful response and the autonomous REPT^EVT^SESSION message generated by the system as a result of a user log–in via the ACT–USER command.

```
ACT-USER: :CUSTOMER1: :*****;
```

The output responses, shown below, assumes CID 3 was used to enter the command, a system generated CTAG value of P71049, and a system generated ATAG value of 2468. The response headers would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
/* ACT-USER CUSTOMER1 on CID 3 */
/* 1631SX,LMC-APS,R06.00.00 */
/* (c) Copyright 1995 Alcatel Network Systems */
"CUSTOMER1:95-06-22,15-14-24,0,1631SX,LMC-APS,R06.00.00"
/* ACT-USER::CUSTOMER1::***** [P71049] (2) */
;

<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT SESSION

```

RESPONSE CODE: **REPT^EVT^STS1**
RESPONSE NAME: **REPORT EVENT STS1**

PURPOSE

The REPT^EVT^STS1 autonomous response is generated by the system

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated STS–1 port(s),
- to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated STS–1 port(s),
- to report a transient *non* threshold crossing alert (Non–TCA) condition for the indicated STS–1 port,
- or to report a transient threshold crossing alert (PM TCA) condition for the indicated STS–1 port.

RESPONSE FORMAT

The following autonomous response format is provided when STS–1 standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT STS1  
  "<AID>:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,[<DIRN>],,,  
  [:\"<CONDDDESCR>\",,,]\"  
;
```

The following autonomous response format is provided when STS–1 transient conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT STS1  
  "<AID>:<CONDTYPE>,,<OCRDAT>,<OCRTM>,<LOCN>,,<MONVAL>,<THLEV>,<TMPPER>[:\"<CONDDDESCR>\",,,]\"  
;
```

OUTPUT PARAMETERS

ATAG	{0–99999}	
	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.	
AID	STS1_AID:	
	{EC1STS1–{1–3840}}	(EC1STS1–EC1/STS1#)
	{OC3STS1–{1–2240}–{1–3}}	(OC3STS1–OC3#–STS1#)
	{OC12STS1–{1–560}–{1–4}–{1–3}}	(OC12STS1–OC12#–STM1#–STS1#)
	STS1 AID, identifies the STS–1 port.	

CONDTYPE STANDING_NEAR-END_CONDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, PDI, SDBER, SLMF},
STANDING_FAR-END_CONDTYPE:{RFI},

TRANSIENT_NEAR-END_TCA_CONDTYPE:{T-ALS-P, T-CVP, T-ESA-P, T-ESB-P, T-ESP, T-FC-P, T-SESP, T-UASP},
TRANSIENT_FAR-END_TCA_CONDTYPE:{T-ALS-P, T-CVP, T-ESA-P, T-ESB-P, T-ESP, T-FC-P, T-SESP, T-UASP}

Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing and transient Non-TCA condition types and to Appendix F for a list of all monitored PM parameters for transient TCA condition types.)
Values are:

Values for STANDING CONDITION TYPES are:

ACTLPBK	Active Loopback, the STS-1 port is in loop back.
AIS	Alarm Indication Signal, AIS detected.
EBER	Excessive Bit Error Rate detected.
FLTESC	Facility Fault Escalation active.
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
IDLE	Idle, incoming idle detected.
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.
LOP	Loss Of Pointer detected.
MAN	Manual removal (logical removal was performed on the facility).
MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
PDI	Incoming PDI signal detected.
RFI	Remote Failure Indication detected.
SDBER	Signal Degrade Bit Error Rate detected.
SLMF	Signal Label Match Failure detected.

Values for TRANSIENT (Non Threshold Crossing Alert) CONDITION TYPES are:

WKSWBK	Working Switched Back, working facility automatically switched from protection to the main facility.
WKSWPR	Working Switched to Protection, working facility automatically switched to the protection facility.

Values for TRANSIENT (Threshold Crossing Alert) CONDITION TYPES are:

T-ALS-P	TCA-Alarm Indication Signal/Loss of Pointer Seconds-Path, indicates an ALS-P threshold crossing was detected.
T-CVP	TCA-Coding Violations Path, indicates a CV-P threshold crossing was detected.
T-ESA-P	TCA-Errored Seconds Type A - Path, indicates an ESA-P threshold crossing was detected.
T-ESB-P	TCA-Errored Seconds Type B - Path, indicates an ESB-P threshold crossing was detected.
T-ESP	TCA-Errored Seconds Path, indicates an ES-P threshold crossing was detected.

	T-FC-P	TCA-Failure Count – Path, indicates a FC-P threshold crossing was detected.
	T-SESP	TCA-Severely Errored Seconds Path, indicates a SES-P threshold crossing was detected.
	T-UASP	TCA-Unavailable Seconds Path, indicates an UAS-P threshold crossing was detected.
CONDEFF	{CL, SC}	Condition Effect, identifies the effect of the standing condition being reported. A value for CONDEFF is only reported for a standing condition. Values are: CL Cleared, a previously declared non-alarmed standing condition has cleared. SC Standing Condition, a non-alarmed standing condition has occurred.
OCRDAT	{MONTH-DAY:{01-12} – {01-31} }	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} – {00-59} – {00-59} }	Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.
LOCN	{FEND, NEND}	Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>}	Direction, identifies the direction of the condition type being monitored. Values are: TRMT Transmit Direction, value returned for CONDTYPE of FLTESC. <NoVal> No Value (null) returned for all conditions other than FLTESC.
MONVAL	{0-4294967295}	Monitored Parameter Value, indicates the measured value in the PM register corresponding to the threshold crossing alert being reported. A value for MONVAL is only reported for a transient condition (threshold crossing alert).
THLEV	{0-4294967295}	Threshold Level, indicates the threshold level for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for THLEV is only reported for a transient condition (threshold crossing alert).
TMPER	{15-MIN, 1-DAY}	Time Period, identifies the accumulation time period for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for TMPER is only reported for a transient condition (threshold crossing alert). Values are: 15-MIN 15-Minute PM collection period. 1-DAY 1-Day (24 hours) PM collection period.
CONDDESCR	< 1-64 alpha-numeric characters >	Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\“ ... \”).

EXAMPLES

The following example shows the autonomous message generated by the system to report a non-alarmed standing condition on STS-1 port EC1STS1-200.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT STS1
  "EC1STS1-200:INHMPREPT,SC,07-01,07-05-10,NEND,,,"
;
```

The following example shows the autonomous message generated by the system to report a severely errored seconds, path transient condition (threshold crossing alert) on STS-1 port EC1STS1-252.

The autonomous response, shown below, assumes a system generated ATAG value of 2469. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2469 REPT EVT STS1
  "EC1STS1-252:T-SESP,,07-01,07-25-38,NEND,,56,44,15-MIN"
;

RESPONSE CODE: **REPT^EVT^STS3C**
COMMAND NAME: **REPORT EVENT STS3C**

PURPOSE

The REPT^EVT^STS3C autonomous response is generated by the system

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated STS–3C port(s),
- to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated STS–3C port(s),
- or to report a transient threshold crossing alert (PM TCA) condition for the indicated STS–3C port.

RESPONSE FORMAT

The following autonomous response format is provided when STS–3C standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT STS3C  
  "<AID>:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,,,,  
[:\"<CONDDDESCR>\" , , , ] "  
;
```

The following autonomous response format is provided when STS–3C transient conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT STS3C  
  "<AID>:<CONDTYPE> , , <OCRDAT>,<OCRTM>,<LOCN> , , <MONVAL> ,  
<THLEV>,<TMPPER> [ : \"<CONDDDESCR>\" , , , ] "  
;
```

OUTPUT PARAMETERS

ATAG	{0–99999}	
	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.	
AID	STS3C_AID:	
	{OC3STS3C–{1–2240}}	(OC3STS3C–OC3#/STS3C#)
	{OC12STS3C–{1–560}–{1–4}}	(OC12STS3C–OC12#–STM1/STS3C#)
	STS3C AID, identifies the STS–3C port.

RELATED AUTONOMOUS RESPONSES

REPT^ALM^STS3C

RESPONSE CODE: **REPT^EVT^T1**
RESPONSE NAME: **REPORT EVENT T1**

PURPOSE

The REPT^EVT^T1 autonomous response is generated by the system

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated DS1 or Timing Reference (TMG) port(s),
- to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated DS1 or TMG port(s),
- to report a transient *non* threshold crossing alert (Non–TCA) condition for the indicated DS1 or TMG port,
- or to report a transient threshold crossing alert (PM TCA) condition for the indicated DS1 port.

RESPONSE FORMAT

The following autonomous response format is provided when DS1 or TMG standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A <ATAG> REPT EVT T1
  "<AID>:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,,,,
[:\"<CONDDDESCR>\",,,]"
;
```

The following autonomous response format is provided when DS1 transient conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A <ATAG> REPT EVT T1
  "<AID>:<CONDTYPE>,,<OCRDAT>,<OCRTM>,<LOCN>,,<MONVAL>,<THLEV>,<TMPER>[:\"<CONDDDESCR>\",,,\"<OBSDBHVR>\",\"<EXPTDBHVR>\"]"
;
```

OUTPUT PARAMETERS

ATAG	{0–99999}	
	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.	
AID	DS1_AID:	
	{T1–{1–59392}}	(T1–DS1#)
	{T3T1–{1–4800}–{1–28}}	(T3T1–DS3#–DS1#)

DS1_FAR-END_TRANSIENT_TCA_CONDTYPE:{T-CSS, T-CVP, T-ESA-P, T-ESB-P, T-ESL, T-ESP, T-FC-P, T-SEFS, T-SESP, T-UASP}

Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing and transient Non-TCA condition types and to Appendix F for a list of all monitored PM parameters for transient TCA condition types.) Values are:

Values for STANDING CONDITION TYPES are:

ACTLPBK	Active Loopback, the DS1 port is in loop back.
AIS	Alarm Indication Signal, AIS detected.
AIS-CI	Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near-End)
ALWCBLPBK	Allow C-bit Loopback.
DS1ISD	DS1 Idle Signal Detected, Incoming. (DS1 Near-End.)
EOC	Embedded Operations Channel, EOC failure detected.
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.
LOF	Loss Of Frame detected.
LOS	Loss Of Signal detected.
MAN	Manual removal (logical removal was performed on the facility).
RAI	Remote Alarm Indication detected.
RAI-CI	Remote Alarm Indication for Customer Installation detected. (DS1 Far-End)
RCVCLPBK	Receive (DS1) C-Bit Loopback.
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
SLTMSIG	Slipping Timing Reference Signal detected.
SYNCPRI	Primary Reference Synchronization failure.
SYNCSEC	Secondary Reference Synchronization failure.
SYNCSTATQUAL	Synchronization Status Quality.
XMTCLPBK	Transmit (DS1) C-Bit Loopback.

Values for TRANSIENT (Non Threshold Crossing Alert) CONDITION TYPES are:

SSMC	Synchronization Status Message Change.
------	--

Values for TRANSIENT (Threshold Crossing Alert) CONDITION TYPES are:

T-AISS	TCA-AIS Seconds, indicates an AISS threshold crossing was detected.
T-CSS	TCA-Controlled Slip Seconds, indicates a CSS threshold crossing was detected.
T-CVL	TCA-Coding Violations Line, indicates a CV-L threshold crossing was detected.
T-CVP	TCA-Coding Violations Path, indicates a CV-P threshold crossing was detected.
T-ESA-P	TCA-Errored Seconds Type A - Path, indicates an

	T-ESB-P	ESA-P threshold crossing was detected. TCA-Errored Seconds Type B – Path, indicates an ESB-P threshold crossing was detected.
	T-ESNP	TCA-Errored Seconds Network Path, indicates an ES-NP threshold crossing was detected.
	T-ESL	TCA-Errored Seconds Line, indicates an ES-L threshold crossing was detected.
	T-ESP	TCA-Errored Seconds Path, indicates an ES-P threshold crossing was detected.
	T-FC-P	TCA-Failure Count – Path, indicates a FC-P threshold crossing was detected.
	T-LOSS	TCA-Loss Of Signal Seconds – Line, indicates a LOSS-L threshold crossing was detected.
	T-QRSSS-P	TCA-QRSSS – Path, indicates a QRSSS-P threshold crossing was detected.
	T-SAS-P	TCA-Severely Errored Frame Seconds/AIS Seconds – Path, indicates a SAS-P threshold crossing was detected.
	T-SEFS	TCA-Severely Errored Frame Seconds, indicates a SEFS threshold crossing was detected.
	T-SESL	TCA-Severely Errored Seconds Line, indicates a SES-L threshold crossing was detected.
	T-SESNP	TCA-Severely Errored Seconds Network Path, indicates an ES-NP threshold crossing was detected.
	T-SESP	TCA-Severely Errored Seconds Path, indicates a SES-P threshold crossing was detected.
	T-UASNP	TCA-Unavailable Seconds Network Path, indicates an UAS-NP threshold crossing was detected.
	T-UASP	TCA-Unavailable Seconds Path, indicates an UAS-P threshold crossing was detected.
CONDEFF	{CL, SC} Condition Effect, identifies the effect of the standing condition being reported. A value for CONDEFF is only reported for a standing condition. Values are: CL Cleared, a previously declared non-alarmed standing condition has cleared. SC Standing Condition, a non-alarmed standing condition has occurred.	
OCRDAT	{MONTH-DAY:{01-12} – {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} – {00-59} – {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.	
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.	
MONVAL	{0-4294967295} Monitored Parameter Value, indicates the measured value in the PM register corresponding to the threshold crossing alert being reported. A value for MONVAL is only reported for a transient condition (threshold crossing alert).	

THLEV	{0–4294967295} Threshold Level, indicates the threshold level for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for THLEV is only reported for a transient condition (threshold crossing alert).
TMPER	{15–MIN, 1–DAY} Time Period, identifies the accumulation time period for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for TMPER is only reported for a transient condition (threshold crossing alert). Values are: 15–MIN 15–Minute PM collection period. 1–DAY 1–Day (24 hours) PM collection period.
CONDDDESCR	< 1–64 alpha–numeric characters > Condition Description, an optional, non–parsable, text description of the condition, enclosed within escape–quotes (\“ ... \”).
OBSDBHVR	<1–512 alpha–numeric characters> Observed Behaviour, indicates the new synchronization status message, and is only displayed if condition type is SSMC.
EXPTDBHVR	<1–512 alpha–numeric characters> Expected Behavior, indicates the old synchronization status message, and is only displayed if condition type is SSMC.

EXAMPLES

The following example shows the autonomous message generated by the system to report a non–alarmed standing condition on DS1 port T3T1–1160–22.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT T1
  "T3T1-1160-22:XMTCBLPBK,SC,07-01,07-05-10,NEND,,,"
;
```

The following example shows the autonomous message generated by the system to report a severely errored seconds transient condition (threshold crossing alert) on DS1 port T3T1–1212–28.

The autonomous response, shown below, assumes a system generated ATAG value of 2469. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2469 REPT EVT T1
  "T3T1-1212-28:T-SESP,,07-01,07-25-38,NEND,,56,44,15-MIN"
;

RELATED AUTONOMOUS RESPONSES

REPT^ALM^T1

RESPONSE CODE: **REPT^EVT^T3**
RESPONSE NAME: **REPORT EVENT T3**

PURPOSE

The REPT^EVT^T3 autonomous response is generated by the system

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated DS3 port(s),
- to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated DS3 port(s),
- or to report a transient threshold crossing alert (PM TCA) condition for the indicated DS3 port.

RESPONSE FORMAT

The following autonomous response format is provided when DS3 standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT T3  
  "<AID>:<CONDDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,[<DIRN>],,,

;
```

The following autonomous response format is provided when DS3 transient conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT T3  
  "<AID>:<CONDDTYPE>,,<OCRDAT>,<OCRTM>,<LOCN>,,<MONVAL>,<THLEV>,<TMPPER>[:\"<CONDDDESCR>\",,,]"  
;
```

OUTPUT PARAMETERS

ATAG	{0–99999} Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.
AID	DS3_AID: {T3–{1–4800}} (T3–DS3#) {EC1T3–{1–3840}} (EC1T3–EC1/STS1/DS3#) {OC3T3–{1–2240}–{1–3}} (OC3T3–OC3#–STS1/DS3#) {OC12T3–{1–560}–{1–4}–{1–3}} (OC12T3–OC12#–STM1#–STS1/DS3#) DS3 AID, identifies the DS3 port.
CONDDTYPE	STANDING_NEAR-END_CONDDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN}, STANDING_FAR-END_CONDDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI}, TRANSIENT_NEAR-END_TCA_CONDDTYPE:{T-AISS, T-CVCP–P, T-CVL, T-CVP, T-ESA–L, T-ESA–P, T-ESACP–P, T-ESB–L, T-ESB–P, T-ESBCP–P, T-ESCP–P, T-ESL, T-ESP, T-FC–P, T-LOSS, T-SAS–P, T-SESCP–P, T-SESL, T-SESP, T-UASCP–P, T-UASP}, TRANSIENT_FAR-END_TCA_CONDDTYPE:{T-CVCP–P, T-ESACP–P, T-ESBCP–P, T-ESCP–P, T-FCCP–P, T-SASCP–P, T-SESCP–P, T-UASCP–P} Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing condition types and to Appendix F for a list of all monitored PM parameters for transient TCA condition types.) Values are: Values for STANDING CONDITION TYPES are:

1TO6LOF	One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3.
7LOF	Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3.
ACTLPBK	Active Loopback, the DS3 port is in loop back.
AICMIS	Application Identification Channel Mismatch, AIC mismatch detected.
AIS	Alarm Indication Signal, AIS detected.
DS2YEL	DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3.
FEACEQPT	Far-End Alarm & Control (FEAC) Equipment detected.
FLTESC	Facility Fault Escalation active.
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.
ISD	Idle Signal Detected.
LOF	Loss Of Frame detected.
LOS	Loss Of Signal detected.
MAN	Manual removal (logical removal was performed on the facility).
RAI	Remote Alarm Indication detected.
Values for TRANSIENT (Threshold Crossing Alert) CONDITION TYPES are:	
T-AISS	TCA-AIS Seconds, indicates an AISS threshold crossing was detected.
T-CVCP-P	TCA-Coding Violations, CP-bit parity – Path, indicates a CVCP-P threshold crossing was detected.
T-CVL	TCA-Coding Violations Line, indicates a CV-L threshold crossing was detected.
T-CVP	TCA-Coding Violations Path, indicates a CV-P threshold crossing was detected.
T-ESA-L	TCA-Errored Seconds type A – Line, indicates an ESA-L threshold crossing was detected.
T-ESA-P	TCA-Errored Seconds Type A – Path, indicates an ESA-P threshold crossing was detected.
T-ESACP-P	TCA-Errored Seconds type A, CP-bit parity – Path, indicates an ESACP-P threshold crossing was detected.
T-ESB-L	TCA-Errored Seconds type B – Line, indicates an ESB-L threshold crossing was detected.
T-ESB-P	TCA-Errored Seconds Type B – Path, indicates an ESB-P threshold crossing was detected.
T-ESBCP-P	TCA-Errored Seconds type B, CP-bit parity – Path, indicates an ESBCP-P threshold crossing was detected.
T-ESCP-P	TCA-Errored Seconds, CP-bit parity – Path, indicates an ESCP-P threshold crossing was detected.
T-ESL	TCA-Errored Seconds Line, indicates an ES-L threshold crossing was detected.
T-ESP	TCA-Errored Seconds Path, indicates an ES-P threshold crossing was detected.
T-FC-P	TCA-Failure Count – Path, indicates a FC-P threshold crossing was detected.
T-FCCP-P	TCA-Failure Count, CP-bit parity – Path, indicates a FCCP-P threshold crossing was detected.
T-LOSS	TCA-Loss Of Signal Seconds – Line, indicates a LOSS-L threshold crossing was detected.
T-SAS-P	TCA-Severely Errored Frame Seconds/AIS Seconds –

	T-SASCP-P	Path, indicates a SAS-P threshold crossing was detected.
	T-SESCP-P	TCA-Severe AIS Seconds, CP-bit parity – Path, indicates a SASCP-P threshold crossing was detected.
	T-SESL	TCA-Severely Errored Seconds, CP-bit parity – Path, indicates a SESCO-P threshold crossing was detected.
	T-SESP	TCA-Severely Errored Seconds Line, indicates a SES-L threshold crossing was detected.
	T-UASCP-P	TCA-Severely Errored Seconds Path, indicates a SES-P threshold crossing was detected.
	T-UASP	TCA-Unavailable Seconds, CP-bit parity – Path, indicates an UASCP-P threshold crossing was detected.
		TCA-Unavailable Seconds Path, indicates an UAS-P threshold crossing was detected.
CONDEFF	{CL, SC}	Condition Effect, identifies the effect of the standing condition being reported. A value for CONDEFF is only reported for a standing condition. Values are:
	CL	Cleared, a previously declared non-alarmed standing condition has cleared.
	SC	Standing Condition, a non-alarmed standing condition has occurred.
OCRDAT	{MONTH-DAY:{01-12} – {01-31} }	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} – {00-59} – {00-59} }	Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.
LOCN	{FEND, NEND}	Location, identifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>}	Direction, identifies the direction of the condition type being monitored. Values are:
	TRMT	Transmit Direction, value returned for CONDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
MONVAL	{0-4294967295}	Monitored Parameter Value, indicates the measured value in the PM register corresponding to the threshold crossing alert being reported. A value for MONVAL is only reported for a transient condition (threshold crossing alert).
THLEV	{0-4294967295}	Threshold Level, indicates the threshold level for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for THLEV is only reported for a transient condition (threshold crossing alert).
TMPER	{15-MIN, 1-DAY}	Time Period, identifies the accumulation time period for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for TEMPER is only reported for a transient condition (threshold crossing alert). Values are:
	15-MIN	15-Minute PM collection period.
	1-DAY	1-Day (24 hours) PM collection period.
CONDDESCR	< 1-64 alpha-numeric characters >	Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (" ... ").

EXAMPLES

The following example shows the autonomous message generated by the system to report a non-alarmed standing condition on DS3 port T3-1160.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT T3
  "T3-1160:INHMPREPT,SC,07-01,07-05-10,NEND,,,"
;
```

The following example shows the autonomous message generated by the system to report a severely errored seconds, path transient condition (threshold crossing alert) on DS3 port T3-1212.

The autonomous response, shown below, assumes a system generated ATAG value of 2469. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2469 REPT EVT T3
  "T3-1212:T-SESP,,07-01,07-25-38,NEND,,56,44,15-MIN"
;
```

RELATED AUTONOMOUS RESPONSES

REPT^ALM^T3

RESPONSE CODE: **REPT^EVT^VT1**
RESPONSE NAME: **REPORT EVENT VT1**

PURPOSE

The REPT^EVT^VT1 autonomous response is generated by the system

- to report the occurrence of one or more non–alarmed standing condition(s) (an event occurred which caused a condition with a notification code of not–alarmed to be set by the system) for the indicated VT1.5 port(s),
- to report the clearing of one or more previously reported non–alarmed standing condition(s) for the indicated VT1.5 port(s),
- to report a transient *non* threshold crossing alert (Non–TCA) condition for the indicated VT1.5 port,
- or to report a transient threshold crossing alert (PM TCA) condition for the indicated VT1.5 port.

RESPONSE FORMAT

The following autonomous response format is provided when VT1.5 standing conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT VT1  
  "<AID>:<CONDTYPE>,<CONDEFF>,<OCRDAT>,<OCRTM>,<LOCN>,[<DIRN>],,,  
  [:\"<CONDDDESCR>\" , , , ] "  
;
```

The following autonomous response format is provided when VT1.5 transient conditions are reported.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT EVT VT1  
  "<AID>:<CONDTYPE>,,<OCRDAT>,<OCRTM>,<LOCN>,,<MONVAL>,  
<THLEV>,<TMPPER>[:\"<CONDDDESCR>\" , , , ] "  
;
```

OUTPUT PARAMETERS

ATAG	{0–99999}	
	Autonomous Message Tag, the system assigned tag number used to correlate autonomous messages.	
AID	VT1_AID: {EC1VT1–{1–3840}–{1–7}–{1–4}} {OC3VT1–{1–2240}–{1–3}–{1–7}–{1–4}} {OC12VT1–{1–560}–{1–4}–{1–3}–{1–7}–{1–4}} (OC12VT1–OC12#–STM1#–STS1#–VTGrp#–VT1.5#)	(EC1VT1–EC1/STS1#–VTGrp#–VT1.5#) (OC3VT1–OC3#–STS1#–VTGrp#–VT1.5#)
	VT1 AID, identifies the VT1.5 port.	

CONDTYPE STANDING_NEAR-END_CONDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF},
STANDING_FAR-END_CONDTYPE:{RFI},
TRANSIENT_NEAR-END_NON-TCA_CONDTYPE:{WKSWBK, WKSWPR},
TRANSIENT_NEAR-END_TCA_CONDTYPE:{T-ALS-V, T-CVV, T-ESA-V, T-ESB-V, T-ESV, T-FC-V, T-SESV, T-UASV},
TRANSIENT_FAR-END_TCA_CONDTYPE:{T-ALS-V, T-CVV, T-ESA-V, T-ESB-V, T-ESV, T-FC-V, T-SESV, T-UASV}

Condition Type, identifies the standing or transient condition type being reported. (Refer to Appendix C for a list of all standing and transient Non-TCA condition types and to Appendix F for a list of all monitored PM parameters for transient TCA condition types.)
Values are:

Values for STANDING CONDITION TYPES are:

ACTLPBK	Active Loopback, the VT1.5 port is in loop back.
AIS	Alarm Indication Signal, AIS detected.
EBER	Excessive Bit Error Rate detected.
FLTESC	Facility Fault Escalation active.
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
IDLE	Idle, incoming idle detected.
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.
LOP	Loss Of Pointer detected.
MAN	Manual removal (logical removal was performed on the facility).
MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
RFI	Remote Failure Indication detected.
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
SDBER	Signal Degrade Bit Error Rate detected.
SLMF	Signal Label Match Failure detected.

Values for TRANSIENT (Non Threshold Crossing Alert) CONDITION TYPES are:

WKSWBK	Working Switched Back, working facility automatically switched from protection to the main facility.
WKSWPR	Working Switched to Protection, working facility automatically switched to the protection facility.

Values for TRANSIENT (Threshold Crossing Alert) CONDITION TYPES are:

T-ALS-V	TCA-Alarm Indication Signal/Loss of Pointer Seconds – VT Path, indicates an ALS-V threshold crossing was detected.
T-CVV	TCA-Coding Violations VT Path, indicates a CV-V threshold crossing was detected.
T-ESA-V	TCA-Errored Seconds Type A – VT Path, indicates an ESA-V threshold crossing was detected.
T-ESB-V	TCA-Errored Seconds Type B – VT Path, indicates an ESB-V threshold crossing was detected.
T-ESV	TCA-Errored Seconds VT Path, indicates an ES-V

		threshold crossing was detected.
	T-FC-V	TCA-Failure Count – VT Path, indicates a FC-V threshold crossing was detected.
	T-SESV	TCA-Severely Errored Seconds VT Path, indicates a SES-V threshold crossing was detected.
	T-UASV	TCA-Unavailable Seconds VT Path, indicates an UAS-V threshold crossing was detected.
CONDEFF	{CL, SC}	Condition Effect, identifies the effect of the standing condition being reported. A value for CONDEFF is only reported for a standing condition. Values are:
	CL	Cleared, a previously declared non-alarmed standing condition has cleared.
	SC	Standing Condition, a non-alarmed standing condition has occurred.
OCRDAT	{MONTH-DAY:{01-12} – {01-31} }	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} – {00-59} – {00-59} }	Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.
LOCN	{FEND, NEND}	Location, identifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>}	Direction, identifies the direction of the condition type being monitored. Values are:
	TRMT	Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
MONVAL	{0-4294967295}	Monitored Parameter Value, indicates the measured value in the PM register corresponding to the threshold crossing alert being reported. A value for MONVAL is only reported for a transient condition (threshold crossing alert).
THLEV	{0-4294967295}	Threshold Level, indicates the threshold level for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for THLEV is only reported for a transient condition (threshold crossing alert).
TMPER	{15-MIN, 1-DAY}	Time Period, identifies the accumulation time period for the monitored PM parameter corresponding to the threshold crossing alert being reported. A value for TMPER is only reported for a transient condition (threshold crossing alert). Values are:
	15-MIN	15-Minute PM collection period.
	1-DAY	1-Day (24 hours) PM collection period.
CONDDESCR	< 1-64 alpha-numeric characters >	Condition Description, an optional, non-parsable, text description of the condition, enclosed within escape-quotes (\“ ... \”).

EXAMPLES

The following example shows the autonomous message generated by the system to report a non-alarmed standing condition on VT1.5 port EC1VT1-200-7-1.

The autonomous response, shown below, assumes a system generated ATAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2468 REPT EVT VT1
  "EC1VT1-200-7-1:INHMPREPT,SC,07-01,07-05-10,NEND,,,"
;
```

The following example shows the autonomous message generated by the system to report a severely errored seconds, VT path transient condition (threshold crossing alert) on VT1.5 port EC1VT1-252-4-1.

The autonomous response, shown below, assumes a system generated ATAG value of 2469. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
A 2469 REPT EVT VT1
  "EC1VT1-252-4-1:T-SESV,,07-01,07-25-38,NEND,,56,44,15-MIN"
;

RELATED AUTONOMOUS RESPONSES

REPT^ALM^VT1

RESPONSE CODE: **REPT^HWSW**
RESPONSE NAME: **REPORT HARDWARE SOFTWARE**
 (PROBLEM)

PURPOSE

The REPT^HWSW autonomous response is generated by the system to report unusual autonomous software errors or system anomalies, such as insufficient memory allocation for a task or an error in opening a database file.

RESPONSE FORMAT

```
      <SID> <YY-MM-DD> <HH:MM:SS>  
I  <ITAG> REPT HWSW  
    <ERROR CODE>  
    /* <CONDDESCR> */  
    /* SUBSYSTEM=<SUBSYS>, MODULE=<MODULE> */  
    /* PROCESSID=<PROCID>, SEVERITY=<SVL>, ACTION=<ACTION> */  
;
```

OUTPUT PARAMETERS

ITAG	{0–99999} Informational Message Tag, the system assigned tag number used to correlate autonomous informational messages.
ERROR CODE	<Valid 4 Character Error Code> Error Code. (Refer to Appendix D for a list of Error Codes.)
CONDDESCR	<1–10 lines of up to 64 alpha–numeric characters> Condition Description, an optional, non–parsable text description of the condition or problem being reported.
SUBSYS	<Software subsystem name> Software Subsystem, identifies the name of the software subsystem.
MODULE	<Software module name> Software Module, identifies the name of the software module.
PROCID	<Software process identifier> Process ID, identifies the software process ID.
SVL	{CRITICAL, MAJOR, MINOR} Severity Level, identifies the severity level of the problem. Values are: CRITICAL Critical, requires immediate attention. MAJOR Major, requires an action, but not immediately. MINOR Minor, a request cannot be completed although there are no deficiencies in either hardware or software.

ACT {CALL ALCATEL, CHECK CONFIGURATION, CHECK INPUT DATA, CHECK THE RECORDS, CHECK THE STATE, EXECUTE INIT-SYS:::1, EXECUTE INIT-SYS:::2, REENTER COMMAND, REENTER COMMAND LATER, REFER TO MANUALS}

Action, indicates a suggested action to resolve the problem. Values are:

- CALL ALCATEL
- CHECK CONFIGURATION
- CHECK INPUT DATA
- CHECK THE RECORDS
- CHECK THE STATE
- EXECUTE INIT-SYS:::1
- EXECUTE INIT-SYS:::2
- REENTER COMMAND
- REENTER COMMAND LATER
- REFER TO MANUALS

EXAMPLES

The following example shows the autonomous REPT^HWSW message generated because the system was unable to open a database file.

The autonomous response, shown below, assumes a system generated ITAG value of 2468. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

```
<SID> <YY-MM-DD> <HH:MM:SS>
I 2468 REPT HWSW
SDBE
/* DB ERROR: can not read system parameter file: lstat = -7 */
/* SUBSYSTEM=LIBCIDB,MODULE=neparm_open() */

RESPONSE CODE: **REPT^PM^RR**
RESPONSE NAME: **REPORT PERFORMANCE MONITORING
{EC1, F3, OC12, OC3, STS1, STS3C, T1, T3,
VT1}**

PURPOSE

The REPT^PM^rr autonomous responses are generated by the system as part of the scheduled daily PM reporting process. (Note the "rr" represents the facility type with values of {EC1, F3, OC12, OC3, STS1, STS3C, T1, T3, VT1}.)

The SCHED-PMREPT-ALL command enables or disables a daily PM report and sets the time-of-day the autonomous REPT^PM^rr messages containing the daily PM report is provided. Only monitored PM parameters that have PM reporting enabled (facility ports without an INHPMREPT condition type – refer to ALW-PM-REPT-rr) and that have event counts above or below the threshold level specified by MONLEV (in the SCHED-PMREPT-ALL command) are reported in a REPT^PM^rr message.

When a daily PM report is scheduled, the REPT^PM^rr autonomous responses provide the Recent 1-Day measured PM counts for each monitored near-end and far-end PM parameter being reported. Note that the 1-Day PM accumulation period is from midnight to midnight, so the previous day's PM measurements are actually reported in the scheduled PM report messages.

A scheduled daily PM report contains up to sixteen autonomous REPT^PM^rr responses. A separate autonomous response is provided for both near-end and far-end monitored PM parameters for each of the eight facility types (EC1, F3, OC12, OC3, STS1, STS3C, DS1, DS3, and VT1.5) supported by the system. An autonomous REPT^PM^rr message is only generated for a facility type if there is PM data to report for the facility type. Each autonomous REPT^PM^rr response message contains a line of parsable output data for each monitored PM parameter being reported within each facility port, in ascending order of (internal logical) facility AIDs.

RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
A <ATAG> REPT PM <FACTYPE>  
  "<AID> : <MONTYPE> , <MONVAL> , <VLDTY> , <LOCN> , <DIRN> , <TMPER> , <MONDAT> "  
;
```

Monitored Parameter Type, identifies the monitored PM parameter. Values are:

Values for EC1 Monitored PM Parameters are:

AISS	Alarm Indication Signal Seconds – Line, AISS register.
CVL	Coding Violations – Line, CV-L register.
ESL	Errored Seconds – Line, ES-L register.
ESA-L	Errored Seconds type A – Line, ESA-L register.
ESB-L	Errored Seconds type B – Line, ESB-L register.
FC-L	Failure Counts – Line, FC-L register.
LOSS	Loss Of Signal Seconds – Section, LOSS register.
SEFS	Severely Errored Frame Seconds – Section, SEFS-S register.
SESL	Severely Errored Seconds – Line, SES-L register.
UASL	Unavailable Seconds – Line, UAS-L register.

Values for F3 Monitored PM Parameters are:

CVN	Coding Violations – N, CV-N register contains a summary of CV-P counts for all DS1s assigned to the F3.
ESN	Errored Seconds – N, ES-N register contains a summary of ES-P counts for all DS1s assigned to the F3.
ESA-N	Errored Seconds type A – N, ESA-N register contains a summary of ESA-P counts for all DS1s assigned to the F3.
ESB-N	Errored Seconds type B – N, ESB-N register contains a summary of ESB-P counts for all DS1s assigned to the F3.
FC-N	Failure Count – N, FC-N register contains a summary of FC-P counts for all DS1s assigned to the F3.
SAS-N	Severe AIS Seconds – N, SAS-N register contains a summary of SAS-P counts for all DS1s assigned to the F3.
SESN	Severely Errored Seconds – N, SES-N register contains a summary of SES-P counts for all DS1s assigned to the F3.
UASN	Unavailable Seconds – N, UAS-N register contains a summary of UAS-P counts for all DS1s assigned to the F3.

Values for OC12 Monitored PM Parameters are:

AISS	Alarm Indication Signal Seconds – Line, AISS register.
CVL	Coding Violations – Line, CV-L register.
CVS	Coding Violations – Section, CV-S register.
ESL	Errored Seconds – Line, ES-L register.
ESS	Errored Seconds – Section, ES-S register.
ESA-L	Errored Seconds type A – Line, ESA-L register.
ESA-S	Errored Seconds type A – Section, ESA-S register.
ESB-L	Errored Seconds type B – Line, ESB-L register.
ESB-S	Errored Seconds type B – Section, ESB-S register.

FC-L	Failure Counts – Line, FC-L register.
LOSS	Loss Of Signal Seconds – Section, LOSS register.
PSC-L	Protection Switch Counts – Line, PSC-L register.
PSD-L	Protection Switch Duration – Line, PSD-L register.
SEFS	Severely Errored Frame Seconds – Section, SEFS-S register.
SESL	Severely Errored Seconds – Line, SES-L register.
SESS	Severely Errored Seconds – Section, SES-S register.
UASL	Unavailable Seconds – Line, UAS-L register.
Values for OC3 Monitored PM Parameters are:	
AISS	Alarm Indication Signal Seconds – Line, AISS register.
CVL	Coding Violations – Line, CV-L register.
CVS	Coding Violations – Section, CV-S register.
ESL	Errored Seconds – Line, ES-L register.
ESS	Errored Seconds – Section, ES-S register.
ESA-L	Errored Seconds type A – Line, ESA-L register.
ESA-S	Errored Seconds type A – Section, ESA-S register.
ESB-L	Errored Seconds type B – Line, ESB-L register.
ESB-S	Errored Seconds type B – Section, ESB-S register.
FC-L	Failure Counts – Line, FC-L register.
LOSS	Loss Of Signal Seconds – Section, LOSS register.
PSC-L	Protection Switch Counts – Line, PSC-L register.
PSD-L	Protection Switch Duration – Line, PSD-L register.
SEFS	Severely Errored Frame Seconds – Section, SEFS-S register.
SESL	Severely Errored Seconds – Line, SES-L register.
SESS	Severely Errored Seconds – Section, SES-S register.
UASL	Unavailable Seconds – Line, UAS-L register.
Values for STS-1 Monitored PM Parameters are:	
ALS-P	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.
CVP	Coding Violations – Path, CV-P register.
ESP	Errored Seconds – Path, ES-P register.
ESA-P	Errored Seconds type A – Path, ESA-P register.
ESB-P	Errored Seconds type B – Path, ESB-P register.
FC-P	Failure Counts – Path, FC-P register.
SESP	Severely Errored Seconds – Path, SES-P register.
UASP	Unavailable Seconds – Path, UAS-P register.
Values for STS-3C Monitored PM Parameters are:	
ALS-P	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.
CVP	Coding Violations – Path, CV-P register.
ESP	Errored Seconds – Path, ES-P register.
ESA-P	Errored Seconds type A – Path, ESA-P register.
ESB-P	Errored Seconds type B – Path, ESB-P register.
FC-P	Failure Counts – Path, FC-P register.
SESP	Severely Errored Seconds – Path, SES-P register.
UASP	Unavailable Seconds – Path, UAS-P register.
Values for DS1 Monitored PM Parameters are:	
AISS	AIS Seconds – Path, AISS register.
CSS	Controlled Slip Seconds – Path, CSS register.
CVL	Coding Violations – Line, CV-L register.
CVP	Coding Violations – Path, CV-P register.
ESA-P	Errored Seconds type A – Path, ESA-P register.
ESB-P	Errored Seconds type B – Path, ESB-P register.
ESL	Errored Seconds – Line, ES-L register.

ESP	Errored Seconds – Path, ES–P register.
FC–P	Failure Count – Path, FC–P register.
LOSS	Loss of Signal Seconds – Line, LOSS register.
QRSSS–P	QRSSS – Path, QRSSS–P register.
SAS–P	Severe AIS Seconds – Path, SAS–P register.
SEFS	Severely Errored Frame Seconds, SEFS register.
SESL	Severely Errored Seconds – Line, SES–L register.
SESP	Severely Errored Seconds – Path, SES–P register.
UASP	Unavailable Seconds – Path, UAS–P register.

Values for DS3 Monitored PM Parameters are:

AISS	AIS Seconds – Path, AISS register.
CVCP–P	Coding Violations, CP–bit parity – Path, CVCP–P register.
CVL	Coding Violations – Line, CV–L register.
CVP	Coding Violations – Path, CV–P register.
ESA–L	Errored Seconds type A – Line, ESA–L register.
ESA–P	Errored Seconds type A – Path, ESA–P register.
ESACP–P	Errored Seconds type A, CP–bit parity – Path, ESACP–P register.
ESB–L	Errored Seconds type B – Line, ESB–L register.
ESB–P	Errored Seconds type B – Path, ESB–P register.
ESBCP–P	Errored Seconds type B, CP–bit parity – Path, ESBCP–P register.
ESCP–P	Errored Seconds, CP–bit parity – Path, ESCP–P register.
ESL	Errored Seconds – Line, ES–L register.
ESP	Errored Seconds – Path, ES–P register.
FC–P	Failure Counts – Path, FC–P register.
FCCP–P	Failure Counts, CP–bit parity – Path, FC–P register.
LOSS	Loss Of Signal Seconds – Line, LOSS register.
SAS–P	Severe AIS Seconds – Path, SAS–P register.
SASCP–P	Severe AIS Seconds, CP–bit parity – Path, SASCP–P register.
SESCP–P	Severely Errored Seconds, CP–bit parity – Path, SESCP–P register.
SESL	Severely Errored Seconds – Line, SES–L register.
SESP	Severely Errored Seconds – Path, SES–P register.
UASCP–P	Unavailable Seconds, CP–bit parity – Path, UASCP–P register.
UASP	Unavailable Seconds – Path, UAS–P register.

Values for VT1.5 Monitored PM Parameters are:

ALS–V	Alarm Indication Signal/Loss of Pointer – VT Path, ALS–P register.
CVV	Coding Violations VT Path, CV–V register.
ESV	Errored Seconds VT Path, ES–V register.
ESA–V	Errored Seconds type A – VT Path, ESA–V register.
ESB–V	Errored Seconds type B – VT Path, ESB–V register.
FC–V	Failure Counts – VT Path, FC–V register.
SESV	Severely Errored Seconds VT Path, SES–V register.
UASV	Unavailable Seconds VT Path, UAS–V register.

MONVAL	{0–4294967295, NA} Monitored Parameter Value, indicates the measured value of the indicated MONTYPE being reported. Values are: 0–4294967295 Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}. NA Not Available, value reported if VLDTY is {NA}.
--------	--

VLDTY	{ADJ, COMPL, LONG, NA, OFF, PRTL}
	Validity, indicates whether the PM data being reported was accumulated over the entire time period or some portion thereof. Values are:
	ADJ Adjusted, the data was manually adjusted or initialized (via INIT-REG-rr).
	COMPL Complete, the data was accumulated over the entire time period.
	LONG Longer, the data was accumulated over a greater period of time than the indicated time period.
	NA Not Available, the data is not available.
	OFF Off, PM data collection for the entire time period was disabled (via SET-PMODE-rr).
	PRTL Partial, the data was accumulated over some portion of the time period, but not the entire time period.
LOCN	{FEND, NEND}
	Location, indicates whether a near-end or far-end monitored PM parameter is being reported. Values are:
	FEND Far-End
	NEND Near-End
DIRN	{NA, RCV}
	Direction, identifies the direction of the signal being monitored. Values are:
	NA Not Applicable, value reported for LOCN value of FEND.
	RCV Receive Side, value reported for LOCN value of NEND.
TMPER	{1-DAY}
	Time Period, identifies the accumulation time period for the indicated monitored PM parameter. Value is:
	1-DAY 1-Day (24 hour) PM collection period
MONDAT	{MONTH-DAY:{01-12} - {01-31} }
	Monitor Date, identifies the date when the PM collection period began. The format of MONDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.

EXAMPLES

The following example shows the autonomous REPT^PM^rr messages generated by the system as a result of a daily scheduled PM report with the MONLEV parameter (in the SCHED-PMREPT-ALL command) set to 1-UP (report measured PM parameter values greater-than or equal-to one). The example assumes there are no other monitored PM parameters to report other than those shown (e.g., other ports are not provisioned, PM reporting is inhibited for other ports, or other monitored parameters have a measured value below the MONLEV of 1-UP).

The autonomous responses, shown below, assumes a system generated ATAG value of 2469. The response header would contain the provisioned Site ID of the system, and the date and time the autonomous response was generated.

APPENDIX A. ACRONYMS AND ABBREVIATIONS

This appendix contains an alphabetized list of general terms, acronyms, mnemonics, and abbreviations used within this I/O manual and its related reference documents.

Appendix B, Access Identifiers (AIDs) provides an alphabetized list of all 1631 SX equipment names/mnemonics.

Appendix C, Condition Types provides a list of the equipment and facility standing (non-transient) condition types used in the 1631 SX.

Appendix D, Error Codes contains an alphabetized list of the Error Codes used in an unsuccessful response message by the 1631 SX.

Appendix F, Monitored PM Parameters provides a list of the facility performance monitoring parameters supported in the 1631 SX.

Appendix G, State Transitions provides a definition of the Primary and Secondary States (PST and SST) used in the 1631 SX.

A.1. Acronyms and Abbreviations

Shown below is an alphabetized list of general terms, acronyms, mnemonics, and abbreviations.

1631 SX	Alcatel 3/1 Digital Cross-Connect
1+1	A protection switching architecture where head end is permanently bridged
1:n	A protection switching architecture where any "n" head ends can be bridged to protection
%	No Automatic Login Parameter
AAID	Alternate Access Identifier
ACCMD	Access Mode
ACCTYPE	Access Type
ACO	Alarm Cutoff
ACOMODE	Alarm Cutoff Mode
ACT	Action
ACTUSERDM	ACT-USER Display Mode
ADDR	Address
ADDR1R	Address 1 Response
ADDR2R	Address 2 Response
ADDR1T	Address 1 Transmit
ADDR2T	Address 2 Transmit
ADRNGIPADR	Address Range Internet Protocol Address
ADRNGMASK	Address Range Mask
ADRNGNUM	Address Range Number
ADVFLAG	Advert Flag
AID	Access Identifier
AIDTYPE	Access Identifier Type
AISC	Alarm Indication Signal Insertion Criteria
AISF	Alarm Indication Signal Failure Substitution
AISPASS	Alarm Indication Signal Passed
AIST	Alarm Indication Signal Type
ALCATEL	Alcatel Maintenance Account
ALLDFLT	All Default
ALM	Alarm
ALTAID	Alternate Equipment Access Identifier
ALW	Allow
AMI	Alternate Mark Inversion

AMSGITMR	Autonomous Message Inactivity Timer
ANS	Alcatel Network Systems, Inc.
ANSAID	Alcatel Network Systems, Inc. Equipment Access Identifier
ANSI	American National Standards Institute
AOD	Automatic Offline Diagnostics
AP	Administration Processor
APPN	Application Name
APPV	Application Version
APS	Administration Processing System
APU	Administration Processing Unit
AREAID	Area Identifier
A,S,&C	Alarm, Surveillance, and Control
ASCII	American Standard Code for Information Interchange
ASIC	Application Specific Integrated Circuit
ASISPORT	Assist Port (Assisting Port)
ASN.1	Abstract Syntax Notation One
ASYNC	Asynchronous
ATAG	Autonomous Message Tag; an automatically generated tag for autonomous reports
ATM	Asynchronous Transfer Mode
ATTCNT	Attempt Count
ATTR	Attribute
ATTRS	Attributes
AUTCLK	Automatic Clock
AUTDAT	Automatic Data
AUTHKEY	Authentication Key
AUTHTYPE	Authentication Type
AUTOIN	Automatic login
AUTOVTRINGAIS	Automatic transmit VT path AIS
AVAILPOOL	Available Pool of VT1.5s
AXM	SX Administrative Cross-Connect Manager Subsystem
BAUD	Modem Baud Rate
BCC	Bell Client Company
BDCST	Broadcast
Bellcore	Bell Communications Research, Inc.
BER	Bit Error Rate
BERSLT	Bit Error Test Result
BHC	Bell Holding Company
BOC	Bell Operating Company
BPV	Bipolar Violations
BRDCSTADR	Broadcast Address
BUFLOC	Buffer Location
BYTERX	Number of Bytes Received
BYTETX	Number of Bytes Transmitted
CAL	Community Authorization Level
CANC	Cancel
CARDID	I/O Equipment Card Identifier
CBIT	C-Bit Loopback
CBLENGTH	Cable Length
CCAL	Command Code Authorization Level
CCITT	Consultative Committee for International Telegraph and Telephone
CCFC	Command Code Functional Category
CCM	Cross-Connect Map
CCN	Cross-Connect Network

CCT	Cross—Connect Type
CEPT	Conference of European Posts and Telegraphs
CFC	Community Functional Category
CFCI	Community Functional Category, Input
CFCO	Community Functional Category, Output
CHANL	Channel
CHG	Change
CIECRA	Customer Installation Equipment Circuit Record Address
CLEI	Common Language Equipment Identifier
CLKMDE	Clock Mode
CLKREF	Clock Reference
CLKSTAT	Clock Status
CLLI	Common Language Location Identifier
CMD	Command
CMDMDE	Command Mode
COND	Condition
CONDTYPE	Condition Type
CONF	Conference
<i>Configured Size</i>	The system configuration size as defined in the system database
CONN	Connect(ion)
CONTBUS	SPB Control Bus Interface Failure
CONTROLT	Control Field Transmit
CONTSTAT	Control Status
COUNT	Integer Count
CPD	Circuit Provisioning Data
CPE	Customer Premise Equipment
CPI	Card Presence Indicator
CPORT	Control Port
CRC	Cyclic Redundancy Code or Cyclic Redundancy Check
CRFLAG	Carrier/Response Flag
CRS	Cross—Connect
CRT	Cathode Ray Tube or Customer Response Team
CS	Center Stage
CS1TYPE	Center Stage #1 Type
CSDB	Command Security DataBase
CSU	Customer Service Unit
CTAG	Correlation Tag
CURPROT	Current Protection
DA	Delayed Activation
DAT	Date
DATABUS	Data Bus (Data Path) Error in Bay
DATCOPY	Data Copy
DATE	Date
DB	Data Base
DBCHG	Data Base Change
DBRID	Database Release Identification
DBSID	Database Site Identification
DCC	Data Communications Channel
DCCTYPE	Data Communications Channel Type
DCE	Data Circuit Termination Equipment or Data Communication Equipment

DCP	Data Collection Processor
DCS	Digital Cross-Connect System
DELD	Delayed
DESTTYPE	Destination Type
DETAID	Detecting Access Identifier
DFLT	Default
DFLTSIG	Default Signal
DGN	Diagnose
DIAG	Diagnostics
DID	Directory Identifier
DIG	Di-Group
DIO	Data Input/Output
DIRN	Direction
DISC	Disconnect
DISCRX	Number of Disconnect Frames Received
DISCTX	Number of Disconnect Frames Transmitted
DIST	Distance
DLT	Delete
DM	Display Mode
DMA	Direct Memory Access
DMX	Data Matrix
DOM	Day-of-Month
DOSCNT	Defect Oscillation Count
DOSCNTDUR	Defect Oscillation Duration Time
DOSHOLD	Defect Oscillation Hold Time
DQDB	Distributed Queue Duel Bus
DRAM	Dynamic Random Access Memory
DS	Data Suspect
DSx	Digital Signal of Unspecified Rate
DS0	Digital Signal Level 0 (56/64 Kilobits/second)
DS1	Digital Signal Level 1 (1.544 Megabits/second, contains 24 DS0s)
DS2	Digital Signal Level 2 Channel
DS3	Digital Signal Level 3 (44.736 Megabits/second, contains 28 DS1s)
DS3PTYEL	DS3 Yellow Behavior
DS4NA	Digital Signal Level 4 North America
DSKBFIND	Disk Buffer Find indicator
DSKPTN	Disk Partition
DSP	Digital Signal Parameter or Digital Signal Processing
DSU	Data Service Unit
DTAU	Digital Test Access Unit
DTE	Data Terminal Equipment
DUIO	Data Upstream Input/Output
DUMX	Data Upstream Matrix
DX	Duplex
DXC	Digital Cross-Connect Control
EBER	Excessive BER switching threshold
ED	Edit
EEPROM	Electrically Erasable Programmable Read Only Memory
EIA	Electronic Industries Association
ENAB	Enable Switch
ENRENUM	Enter Release Number
ENT	Enter
EPROM	Electrically Programmable Read Only Memory

EQPT	Equipment
<i>Equipped Size</i>	Total amount of equipment required to provide service to some maximum port capacity. The equipped size must be less than or equal to the configured size.
ERR1	Error in Leaf 1
ERR2	Error in Leaf 2
ERR3	Error in Leaf 3
ERR4	Error in Leaf 4
ES	End Stage Matrix Element or Errored Seconds
ES{1–4}TYPE	End Stage #1–4 Type
ES1AID	ES1 AID
ES1RSLT	ES1 Result
ESH	End System Hello
ESNUM	End Stage Number
EVT	Event
EXCOL	Number of Excessive Collisions detected
EXPTRC	Expected Path Trace
FACT	Facility Side of the TACC Connection, Port Number
FACTYPE	Facility Type
FAD	Facility Access Di-Group
FAILDET	Failure Detection
FDD	Feature Design Document
FDDI	Fiber Distributed Data Interface
FDL	Facility Data Link; an 8 Kilobit overhead channel in an ESF DS1 signal
FDLPM	Facility Data Link Performance Monitoring
FEAC	Far End Alarm and Control
FEMETHOD	Far-End PM Data Collection Method
FENDALM	Far End Alarm Condition
FENDNTE	Far-End NTE Performance Monitoring Terminal Type
FETPM	Far End TABs Performance Monitoring Mode
FI	Fault Isolation
FIC	Facility Identity Code or Frame Identification Code
FIO	Facility Input/Output
FIRMN	Firmware Name
FIRMV	Firmware Version
FL	Fault Locate
FLAG	Flag Value
FLTPRO	Fault Propagation
FLTYPE	Fault Retrieval Type
FMT	Framing Format
FMX	Facility Matrix
FRCD	Forced
FRDATM	From Date and Time
FRMRERR	Number of Frame Reject Errors
FRMRRX	Number of Frame Reject Frames Received
FRMRTX	Number of Frame Reject Frames Transmitted
FRMRX	Number of Frames Received
FRMTX	Number of Frames Transmitted
FS	Facility Suspect
FSD	Feature Scope Document
FTP	File Transfer Protocol
FTPPID	File Transfer Protocol Password Identifier

FTPUID	File Transfer Protocol User Identifier
FUIO	Facility Upstream Input/Output
FUMX	Facility Upstream Matrix
GATEWAYADR	Gateway Address
<i>Generic Upgrade</i>	The process of upgrading the system software from one release to the next generic software release
GOS	Grade of Service
GROUP1	Group 1 Security Code
GROUP2	Group 2 Security Code
GROUP3	Group 3 Security Code
<i>Growth</i>	Increasing the port capacity up to the maximum matrix capacity
GT2AID	GT2 AID
GT2RSLT	GT2 Result
GT3AID	GT3 AID
GT3RSLT	GT3 Result
GTAR	Global Trouble Activity Reporting System
HDLC	High-Level Data Link Control protocol
HDR	Header
HELLOINTVL	Hello Intervals
HIPVC	Highest PVC Number
HISVC	Highest Incoming SVC Number
HLD	High-Level Design
HOD	Hour-of-Day
HOSVC	Highest Outgoing SVC Number
HTSVC	Highest Two-way SVC Number
HW	Hardware
Hz	Hertz
ICDELAY	Inter-Command Delay
ICL	Interface Control Link
ID	Identification
IDL	Idle Condition
IDLE	Idle Signal Transmit Type
IDRSLT	Identification Result
IEEE	Institute of Electrical and Electronics Engineers
IFRX	Number of Information Frames Received
IFTX	Number of Information Frames Transmitted
IID	Image Identification
IMED	Immediate
INH	Inhibit
INHMODE	Inhibit Mode
INIT	Initialize
INITZN	Initialization
<i>In Service</i>	Ability to carry revenue-bearing payloads on provisioned and connected facilities
INTFTXDL	Interface Transmit Data Link
I/O	Input/Output
IP	In Progress or Internet Protocol
IPADDR	Internet Protocol Address
IPNEXT	Include Part Number Extension
ISGLP	In-Service Growth Loopback
ISID	Idle Signal Identifier
ISLEVEL	Intermediate System Level
ISO	International Standards Organization

ISTYPE	Intermediate System Type
ISUKEY	In-Service Upgrade Key
ITAG	Informational Message Tag
ITER	Iterations
ITM	Installation Test and Maintenance
ITS	Integrated Test System; a Bell OS

REPTINVL	Report Interval
REV	Revision
RFI	Radio Frequency Interference
RFROM	Roll From
RIP	Routing Information Protocol
RIPMODE	Routing Information Protocol Mode
RIPSTAT	Routing Information Protocol Status
RL	Repeat Later
RLS	Release
RMAS	Remote Memory Administration System
RMODE	Rolling Mode
RMV	Remove
rms	root mean square
RNR	Receiver Not Ready
RNRRX	Number of Receiver Not Ready Frames Received
RNRTX	Number of Receiver Not Ready Frames Transmitted
ROM	Read Only Memory
RPGM	Reprogram
RPLSHELF	Replacement Shelf
RPRIORITY	Router Priority
RPTIME	Report Time
RSML	Response Message Length
RSPLKSTAT	Remote Status Panel Lock Status
RST	Restore
RTO	Roll To
RTRV	Retrieve
RTRVTYPE	Retrieval Type
RTU	Remote Test Unit
RUSURE	Are You Sure Prompt
RVRTV	Revertive Mode
RXMTINTVL	Retransmission Interval
S148	SONET I/O 48 DS3/STS1 Shelf

S1TRANS	S1 byte to be transmitted
SABMERR	Number of Set Asynchronous Balanced Mode Frames In Error
SABMRX	Number of Set Asynchronous Balanced Mode Frames Received
SABMTX	Number of Set Asynchronous Balanced Mode Frames Transmitted
SARTS	Switched Access Remote Test System
SC	Switch Command
SCC	Serial Communication Controller
SCHED	Schedule
SCRIPTNAME	Privileged Command Script Name
SCSI	Small Computer System Interface
SDTHSW	Signal Degrade Threshold Switching
SID	System Identification
SIGSRC	Signal Source
SIGTO	Signal Timeout
SIZE	Size
SKIPTOEND	Skip to End of Saved Output
SNIDER	Asynchronous ASCII Echoplex Protocol
SNP	Sequence Numbers Protocol
SOM	Second-of-Minute
SONET	Synchronous Optical Network
SPBTYPE	SPB Equipment Type
SPE	Synchronous Payload Envelop
SRC	Idle Signal Source Port
SRVEFF	Service Effect
SST	Secondary State
STAT	Status
STATE	State
STATICRTNUM	Static Routing Number
STATICRTST	Static Routing Status
STATUS	Status
STBY	Standby
STS1	TL1 parameter value for Synchronous Transport System Level 1
STS-1	Synchronous Transport System Level 1
STS3C	TL1 parameter value for Synchronous Transport System Level 3C
STS3-C	Synchronous Transport System Level 3C
STSMAP	STS Payload Mapping
STSPTYEL	STS Path Yellow Behaviour
STUBDFLCOST	Stub Default Link Cost
STUBOPT	Stub Option
STWR	Software
STYPE	Shelf Type
SUSAID	Suspected Access Identifier
SVC	Switched Virtual Circuit
SW	Switch
SWITCHTO	Switch to Reference
SWTOPROTN	Switch to Protection
SWTOWKG	Switch to Working
SX	Identifier for Alcatel's Digital Cross-Connect Product Family
SXECRA	1631SX Equipment Circuit Record Address
SYNC	Synchronous
SYNCCNT	Synchronous Count
SYNCMODE	Synchronization Mode
SYNCMSG	Synchronization Message

SYNCTIME	Synchronous Time
SYS	System
SYSTMSG	Synchronization Status Message
T1	Transmission Carrier Level 1 or Login Retry (X.25) Timer
T3	Transmission Carrier Level 3
T4	No-Activity (X.25) Timer
TABS	Telemetry Asynchronous Block, Serial
TACC	Test Access
TAP	Test Access Path
TAPE CRC	Tape Cyclic Redundancy Check
TAPP	Test Access Port Pair
TAPPOOL	TAP Port Pool
TAR	Trouble Activity Report
TARP	Target Identification Address Resolution Protocol
TARPLDBFLSHTMR	Target Identification Address Resolution Protocol Loop Detection Buffer Flush Timer
TARPLDBENTTMR	Target Identification Address Resolution Protocol Loop Detection Buffer Entry Timer
TARPSEQ	Target Identification Address Resolution Protocol Sequence Number
TARPSYSID	Target Identification Address Resolution Protocol System Identification
TCA	Termination Crossing Alert
TCP	Transmission Control Protocol
TERMT	Termination Type
TESTDURN	Test Duration
TEXTLINE	Message Text Line
TESTTYPE	Test Type
TH	Threshold
THLEV	Threshold Level
TID	Target Identification
TIME	Time
TIMEGE	Trigger Time Greater Than or Equal to Keyword
TIMELE	Trigger Time Less Than or Equal to Keyword
TIO	Timing Input/Output
TL	Terminate and Leave
TL1	Transaction Language 1
TL1_CMD	Transaction Language 1 Command
TLS	Terminate and Leave Status
TLSA	Terminate and Leave Status of FADA in a TACC Connection
TLSB	Terminate and Leave Status of FADB in a TACC Connection
TM	Time
TMGREF	Timing Reference
TMN	Telecommunications Management Network
TMPER	Time Period
TMX	Timing Matrix
TOD	Time-of-Day
TODATM	To Date and Time
TOPROTN	To Protection
TOSCAP	Type of Service Capability
TOWKG	To Working
TP	Termination Point
TRC	Path Trace Message
TRM	Termination Module
TRYOTHER	Try Other Backup Device Option
TS	Timing Suspect

TSC	Test Session Controller
TSGRP	Test Signal Generator/Receiver Port
TSI	Timeslot Interchange (Function or Circuit-Pack)
TSID	Test Signal Identifier
TST	Test Access Ports
TTY	Teletype Terminal
TTYTYPE	Trigger Type
TUIO	Timing Upstream Input/Output
TUMX	Timing Upstream Matrix
TYPE	Type of Device
UART	Universal Asynchronous Receiver/Transmitter
UAS	Unavailable Seconds
UCAL	User Community Authorization Level
UCFC	User Community Functional Category
UCFCI	User Community Functional Category, Input
UCFCO	User Community Functional Category, Output
UHSTYPE	Upper-Half Shelf Type
UI	Unit Interval
UID	User Identifier
UIFRX	Number of Unnumbered Information Frames Received
UIFTX	Number of Unnumbered Information Frames Transmitted
UNAM	User Name
UNPROV	Unprovisioned
UPGRDTYP	Upgrade Type
USDB	User Security Database
USI	User System Interface
VA	Volt Ampere
VALIDATE	Validate Addresses
VC	Virtual Channel
VCNUM	Virtual Channel Number
VCTYPE	Virtual Channel Type
VDT	Video Display Terminal
VER	Verify or Version
VERSION	Version Number
VLDTY	Validity Indicator
VSN	Version
VT	Virtual Tributary
VT1	TL1 parameter value for Virtual Tributary Level 1.5
VT1.5	Virtual Tributary Level 1.5
VT2	Virtual Tributary Level 2
VTMAP	VT1.5 Payload Type
VTPTYEL	VT1.5 Path Yellow Behaviour
WAITTIME	Wait Time
WAN	Wide Area Network
WARN	Warning
WDCS	Wideband Digital Cross-Connect System
WTRTIME	Wait to Restore Time
WTSDEL	Wait to Switch Delay
X.25	CCITT Data Transmission Protocol defining Layers 1 through 3
X25COA	X.25 Call Out Address
XBITRCV	Receive X-Bit Translation
XIDRX	Number of Exchange ID Frames Received

XIDTX	Number of Exchange ID Frames Transmitted
XMIT	Transmit
XMT	Transmit (Function or Module)
XON	XON(/XOFF) Protocol
XPOL	Transmit X-bit Polarity
YEL	Yellow Signal

APPENDIX B. ACCESS IDENTIFIERS (AIDS)

This appendix provides:

- A description of the AID formats used in the system. Refer to section B.1.
- A diagram of the system's equipment (default) rack numbering and associated shelf numbering. Refer to section B.2.
- An alphabetized list of the equipment names/mnemonics and the associated (default) value set for each equipment Access Identifier (AID). Refer to Section B.3.
- A cross-reference between the (default) facility AIDs and (default) I/O equipment AIDs used in the system.

Section B.4. provides a cross-reference of (default) facility AIDs vs. (default) I/O Equipment AIDs for SI48 Racks.

Section NO TAG provides a cross-reference of (default) facility AIDs vs. (default) I/O Equipment AIDs for SI36 Racks.

Section NO TAG provides a cross-reference of (default) facility AIDs vs. (default) I/O Equipment AIDs for DS3 or DS1 Racks. This appendix shows AID value sets for both Alcatel (default) and Alternate AIDs. The AIDs value set to be used at a particular site are determined prior to system installation. Note that only the AID value sets are different; the format of AIDs are the same for both value sets. Refer to other customer documentation or contact the Alcatel Technical Assistance Center for additional information concerning the AID value sets.

B.1. AID Formats

An AID value directs an input command to its intended equipment, facility, or data entity. Both Alcatel (default) and Alternate AID value sets can be used. Refer to Section B.3. for AID value sets for equipment and to Sections B.4. through NO TAG for AID value sets for facilities. The AID formats supported in the system are:

- **Equipment** entities are referenced by a compound AID value consisting of a four- or five-part combined equipment name/physical location identifier. Two AID formats are used for equipment AIDs:
 - The **General Equipment AID** format is:
N-R-Sh-S where:
N = the assigned name for the equipment,
R = the number of the rack/bay where the equipment is located or installed,
Sh = the number of the shelf within the rack where the equipment is located,
S = the slot or location number of the equipment within the shelf.
 - The **GTI Cable Equipment AID** format is:
N-R-Sh-S-aa where:
N = the assigned name for the GTI cable,
R = the number of the rack/bay where the equipment is located or installed,
Sh = the number of the shelf within the circuit pack that terminates the GTI signal is located or installed,
S = the slot or location number of the circuit pack within the shelf, and
aa = the relative GTI cable number within the circuit pack slot.
- **OC-3** facilities are referenced by a compound AID value consisting of a two part combined facility name/logical identifier. The format for an OC3 AID value is:
OC3-aaaa where:
aaaa = the logical OC-3 port number within the system.

- **OC-12** facilities are referenced by a compound AID value consisting of a two part combined facility name/logical identifier. The format for an OC12 AID value is:
OC12-*aaa* where:
aaa = the logical OC-12 port number within the system.
- **EC1** facilities are referenced by a compound AID value consisting of a two part combined facility name/logical identifier. The AID format for an EC1 is
EC1-*aaaa* where:
aaaa = the logical EC1 port number within the system.
- **STS-1** facilities are referenced by a compound AID value consisting of a two or three part combined facility name/logical identifier. Three AID formats are used for STS-1 AIDs:
 - **Constituent STS-1 embedded within an OC3** AID format is:
OC3STS1-*aaaa-b* where:
aaaa = the logical OC-3 port number within the system, and
b = the relative STS-1 port number within the OC-3.
 - **Constituent STS-1 embedded within an OC12** AID format is:
OC12STS1-*aaa-b-c* where:
aaa = the logical OC-12 port number within the system, and
b = the relative STM1 within the OC-12 and
c = the relative STS-1 port number within the STM1.
 - **Constituent STS-1 embedded within an EC1** AID format is:
EC1STS1-*aaaa* where:
aaaa = the logical EC1/STS1 port number within the system.
- **STS-3C** facilities are referenced by a compound AID value consisting of a two part combined facility name/logical identifier. Two AID formats are used for STS-3C AIDs:
 - **Constituent STS-3C embedded within an OC3** AID format is:
OC3STS3C-*aaaa* where:
aaaa = the logical STS-3C/OC-3 port number within the system.
 - **Constituent STS-3C embedded within an OC12** AID format is:
OC12STS3C-*aaa-b* where:
aaa = the logical OC-12 port number within the system, and
b = the relative STM1/STS-3C within the OC-12
- **VT1.5** facilities are referenced by a compound AID value consisting of a four or five part combined facility name/logical identifier. Three AID formats are used for VT1.5 AIDs:
 - **Constituent VT1.5 embedded within an OC3** AID format is:
OC3VT1-*aaaa-b-c-d* where:
aaaa = the logical OC-3 port number within the system, and
b = the relative STS-1 port number within the OC-3, and
c = the relative VT Group number within the STS-1, and
d = the relative VT1.5 port number within the VT Group.
 - **Constituent VT1.5 embedded within an OC12** AID format is:
OC12VT1-*aaa-b-c-d-e* where:
aaa = the logical OC-12 port number within the system, and
b = the relative STM1 within the OC-12, and
c = the relative STS-1 port number within the STM1, and
d = the relative VT Group number within the STS-1, and
e = the relative VT1.5 port number within the VT Group.
 - **Constituent VT1.5 embedded within an EC1** AID format is:
EC1VT1-*aaaa-b-c* where:
aaaa = the logical EC1/STS1 port number within the system, and
b = the relative VT Group number within the STS-1, and
c = the relative VT1.5 port number within the VT Group.
- **DS3** facilities are referenced by a compound AID value consisting of a two or three part combined facility name/logical identifier. Four AID formats are used for DS3 AIDs:

- **Electrical DS3 AID format is:**
T3-aaaa where:
aaaa = the logical DS3 port number within the system.
- **Constituent DS3 embedded within an EC1 AID format is:**
EC1T3-aaaa where:
aaaa = the logical EC1 port number within the system.
- **Constituent DS3 embedded within an OC3 AID format is:**
OC3T3-aaaa-b where:
aaaa = the logical OC-3 port number within the system, and
b = the relative STS-1/DS3 port number within the OC-3.
- **Constituent DS3 embedded within an OC12 AID format is:**
OC12T3-aaa-b-c where:
aaa = the logical OC-12 port number within the system, and
b = the relative STM1 within the OC-12, and
c = the relative STS-1/DS3 port number within the STM1.
- **DS1 facilities are referenced by a compound AID value consisting of a two, three, four, or five part combined facility name/logical identifier. Six AID formats are used for DS1 AIDs:**
 - **Constituent DS1 embedded within a DS3 loaded OC3 AID format is:**
OC3T1-aaaa-b-cc where:
aaaa = the logical OC-3 port number within the system, and
b = the relative STS-1/DS3 port number within the OC-3, and
cc = the relative DS1 port number within the DS3.
 - **Constituent DS1 embedded within a DS3 loaded OC12 AID format is:**
OC12T1-aaa-b-c-dd where:
aaaa = the logical OC-12 port number within the system, and
b = the relative STM1 within the OC-12, and
c = the relative STS-1/DS3 port number within the STM1, and
dd = the relative DS1 port number within the DS3.
 - **Constituent DS1 embedded within a VT1.5 loaded OC3 AID format is:**
OC3T1-aaaa-b-c-d where:
aaaa = the logical OC-3 port number within the system, and
b = the relative STS-1 port number within the OC-3, and
c = the relative VT Group number within the STS-1, and
d = the relative VT1.5/DS1 port number within the VT Group.
 - **Constituent DS1 embedded within a VT1.5 loaded OC12 AID format is:**
OC12T1-aaa-b-c-d-e where:
aaa = the logical OC-12 port number within the system, and
b = the relative STM1 number within the OC-12, and
c = the relative STS-1 port number within the STM1, and
d = the relative VT Group number within the STS-1, and
e = the relative VT1.5/DS1 port number within the VT Group.
 - **Constituent DS1 embedded within a DS3 loaded EC1 AID format is:**
EC1T1-aaaa-bb where:
aaaa = the logical EC1/STS-1/DS3 port number within the system, and
bb = the relative DS1 port number within the DS3.
 - **Constituent DS1 embedded within a VT1.5 loaded EC1 AID format is:**
EC1T1-aaaa-b-c where:
aaaa = the logical EC1/STS-1 port number within the system, and
b = the relative VT Group number within the STS-1, and
c = the relative VT1.5/DS1 port number within the VT Group.
 - **Constituent DS1 embedded within an electrical DS3 AID format is:**
T3T1-aaaa-bb where:
aaaa = the logical DS3 port number within the system, and

bb = the relative DS1 port number within the DS3.

- **Electrical DS1** AID format is:

T1-*aaaaaa* where:

aaaaaa = the logical DS1 port number within the system.

- **F3 (Fractional T3)** entities are referenced by a compound AID value consisting of a three-part combined facility name/logical identifier. The AID format for a F3 AID is

T3F3-*aaaa-bb* where:

aaaa = the logical electrical DS3 port number within the system, and

bb = the relative F3 entity number within the electrical DS3.

- **Stratum Synchronization Timing Reference Source** entities are referenced by a compound AID value consisting of a two part combined name/logical identifier. The AID format for a Timing Reference Source is

TMG-*a* where:

a = the copy number (0 or 1) of the Timing Reference Source.

The value set for Alcatel and Alternate AIDs is:

{TMG-{0, 1}}

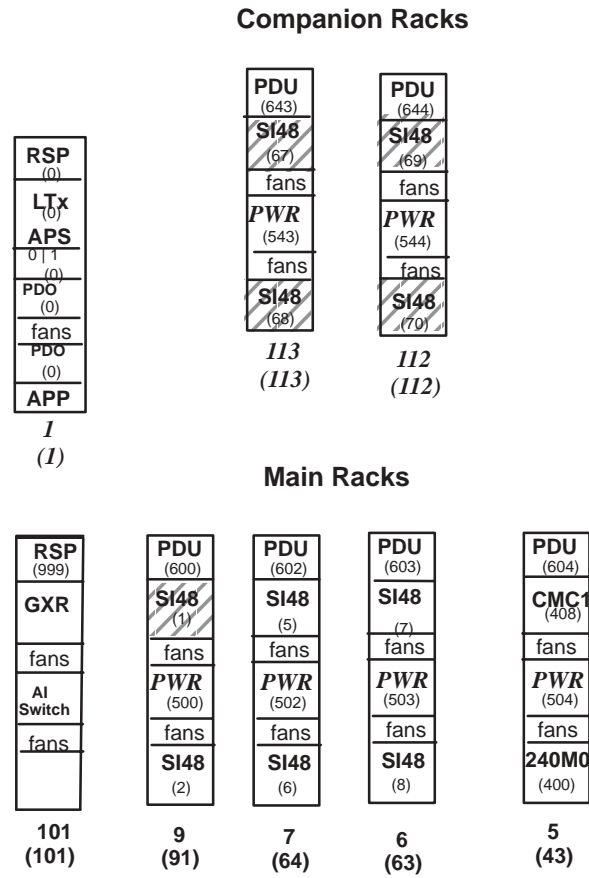

- **Control Port** entities are referenced by a one part numerical AID value, or two part compound numerical AID value. The AID format for a Control Port is

CPORT[,VCNUM] where:

CPORT = the number of the Control Port {1–12} in the system, and

VCNUM = the virtual channel number {1–8} if the CPORT is configured as an X.25 port.

B.2. (Default) Equipment Rack and Shelf Numbering

SI48 OCn Companion Shelf
FRONT VIEW of racks/bays are shown

This Diagram is not intended to show rack locations.
Rack #s not in Parentheses are default Alcatel rack numbers.
Rack #s in Parentheses are default Alternate rack numbers.
Shelf #s in Parentheses are Green Shelf numbers.

Figure B.1. 240 Port LMC Companion and Main Rack/Shelf Front View

Figure B.2. 1344 Port LMC Rack/Shelf Numbering

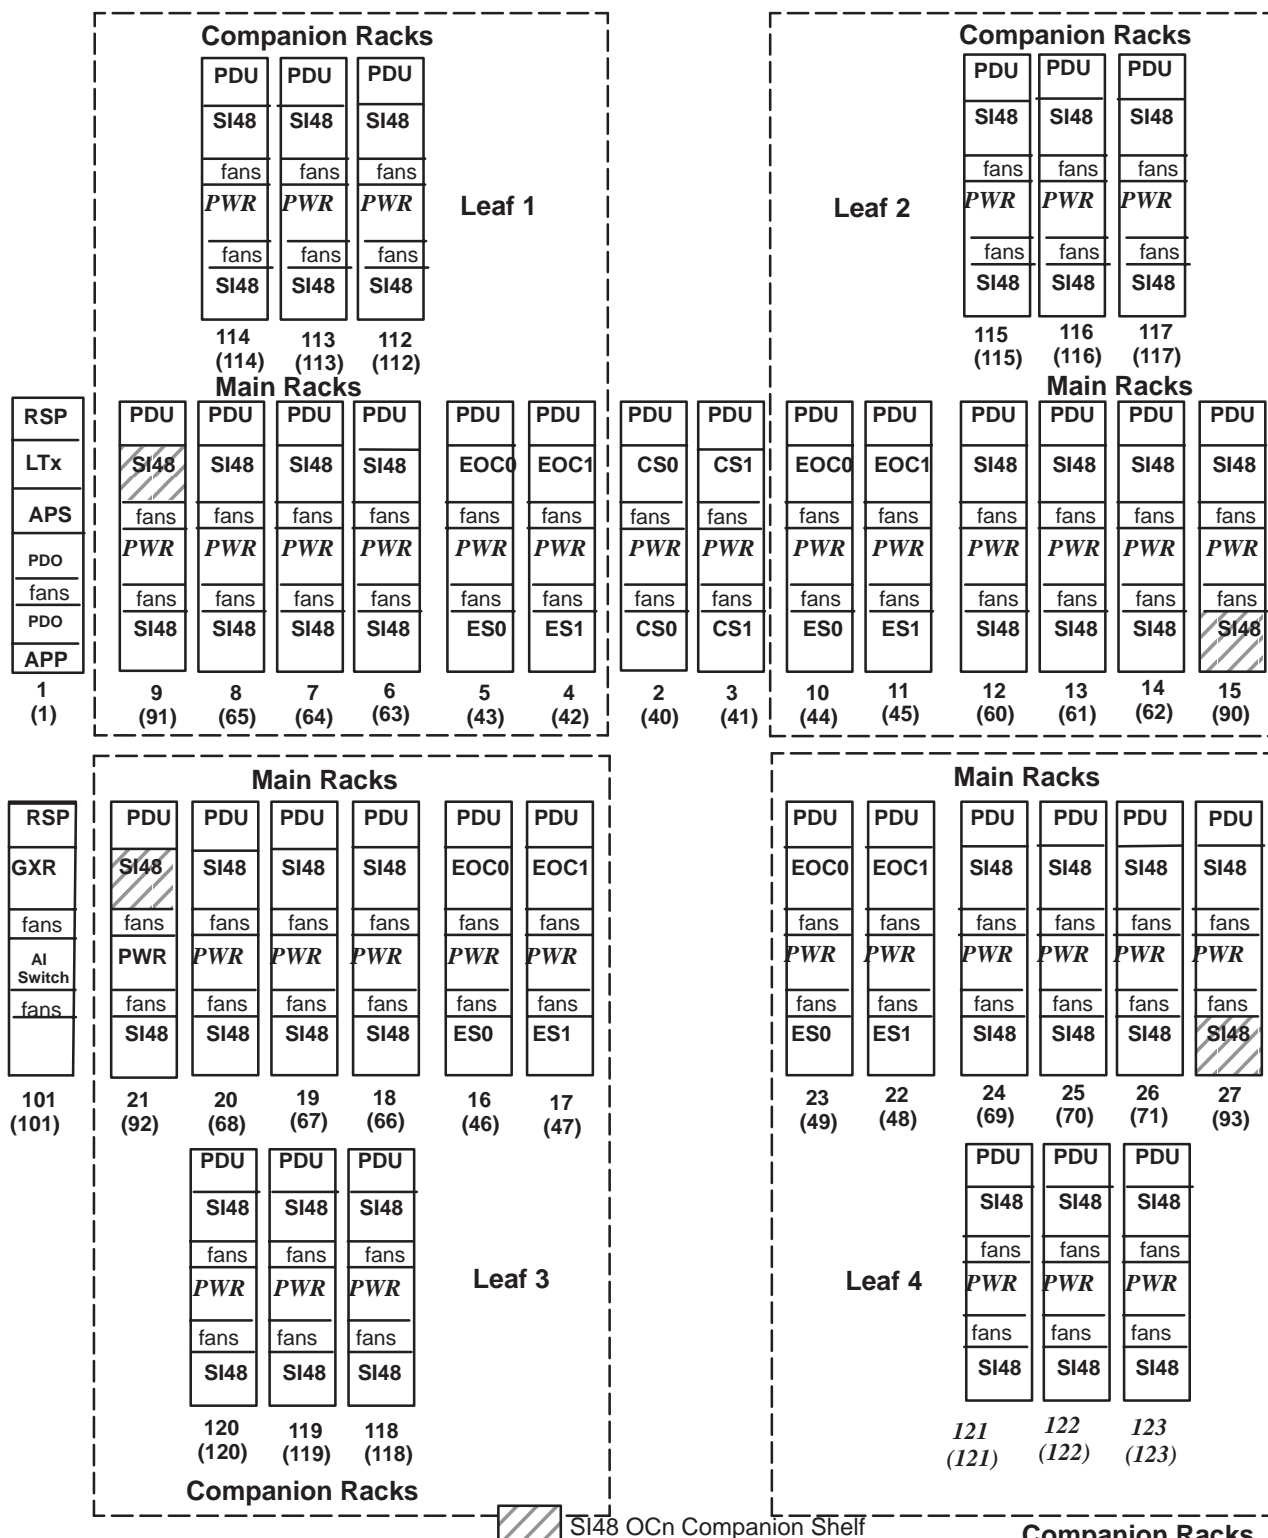

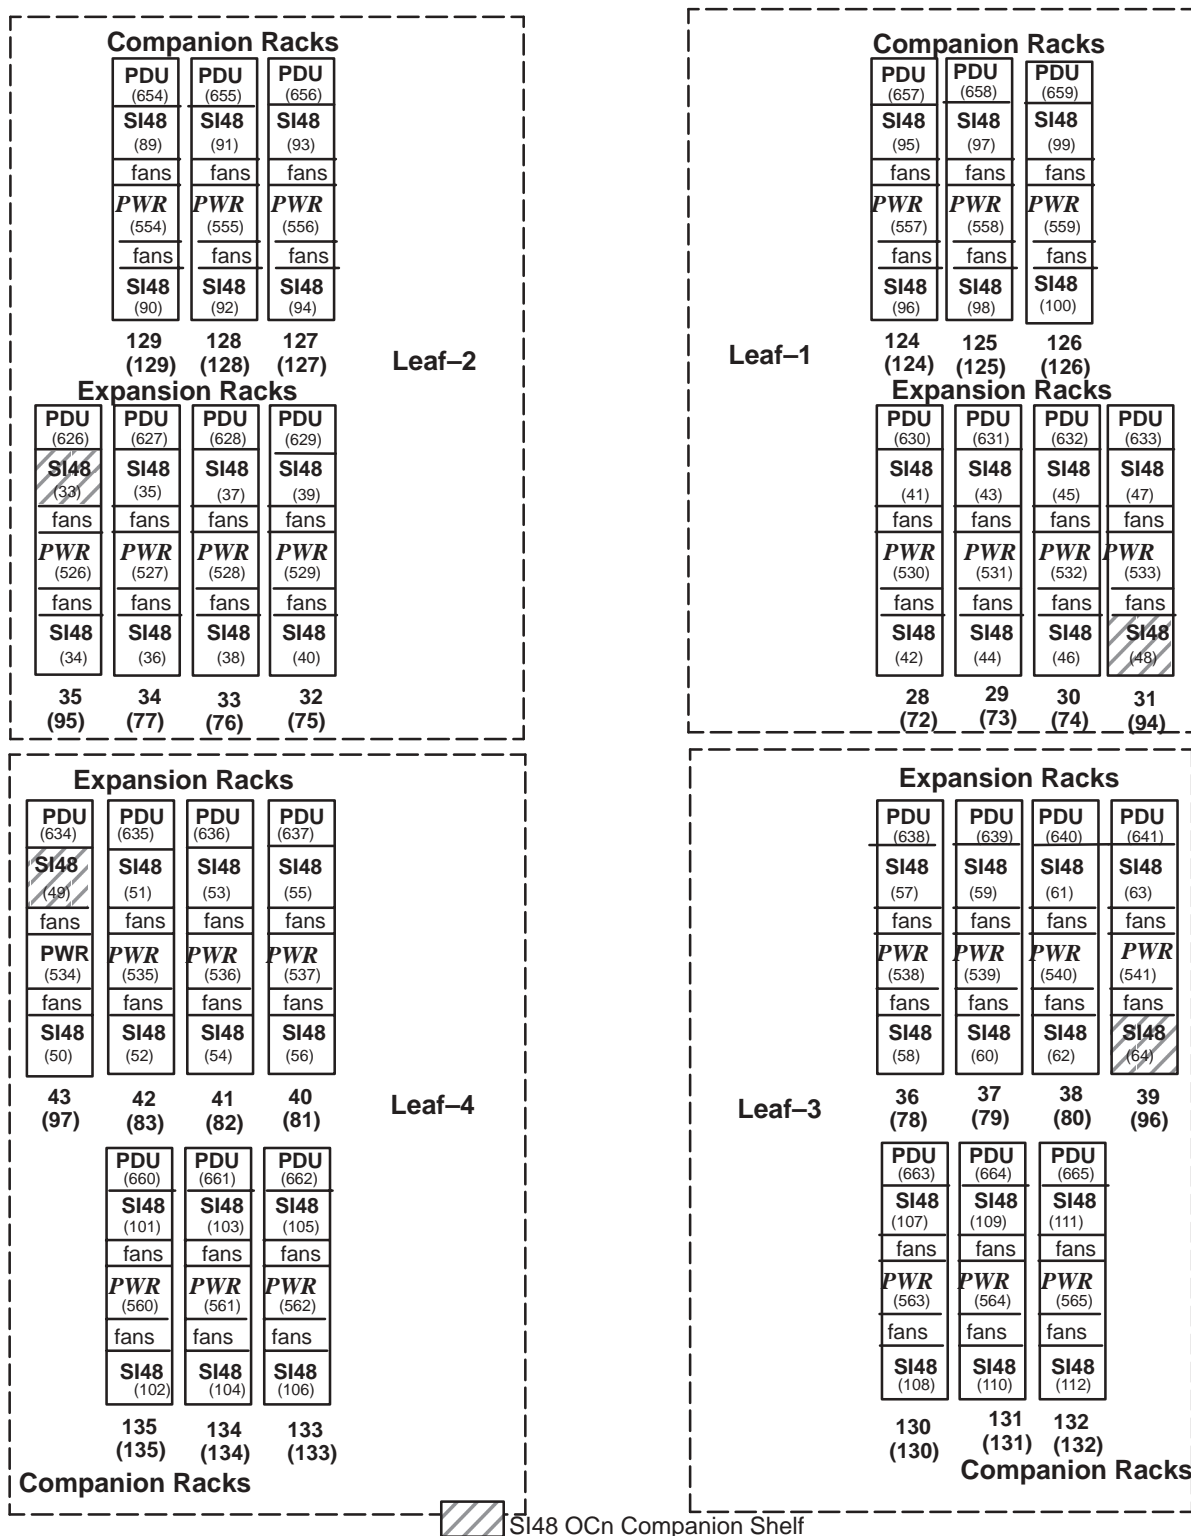

Figure B.3. Typical 1344 Port LMC Rack Line-Up

FRONT VIEW of racks/bays are shown.

This Diagram is not intended to show rack locations.
Rack #s not in Parentheses are default Alcatel rack numbers.
Rack #s in Parentheses are default Alternate rack numbers.
Shelf #s in Parentheses are Green Shelf numbers.

Figure B.4. 2688 Port LMC Rack/Shelf Numbering with SI48 I/O Shelves

FRONT VIEW of racks/bays are shown

This Diagram is not intended to show rack locations.
Rack #s not in Parentheses are default Alcatel rack numbers.
Rack #s in Parentheses are default Alternate rack numbers.
Shelf #s in Parentheses are Green Shelf numbers.

Figure B.5. 2688 Port LMC Expansio & Companion Rack/Shelf Front View

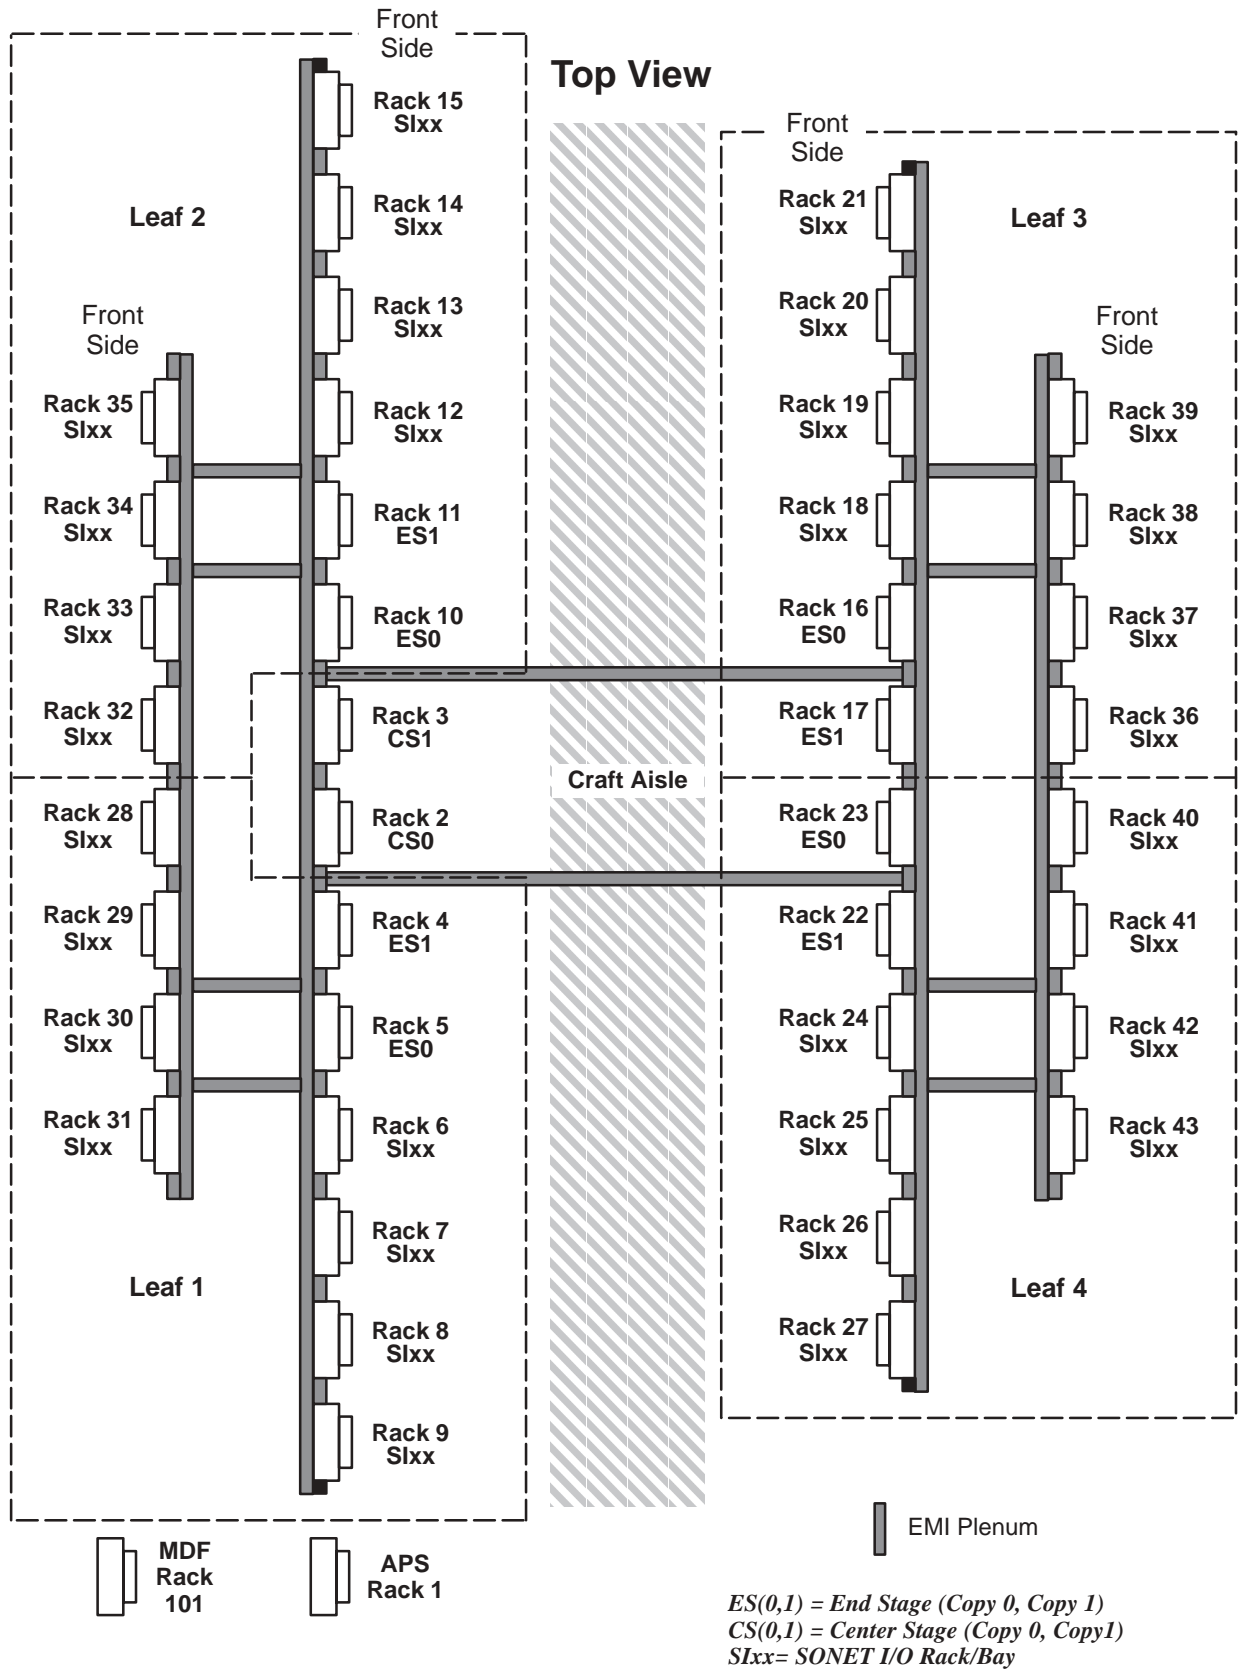

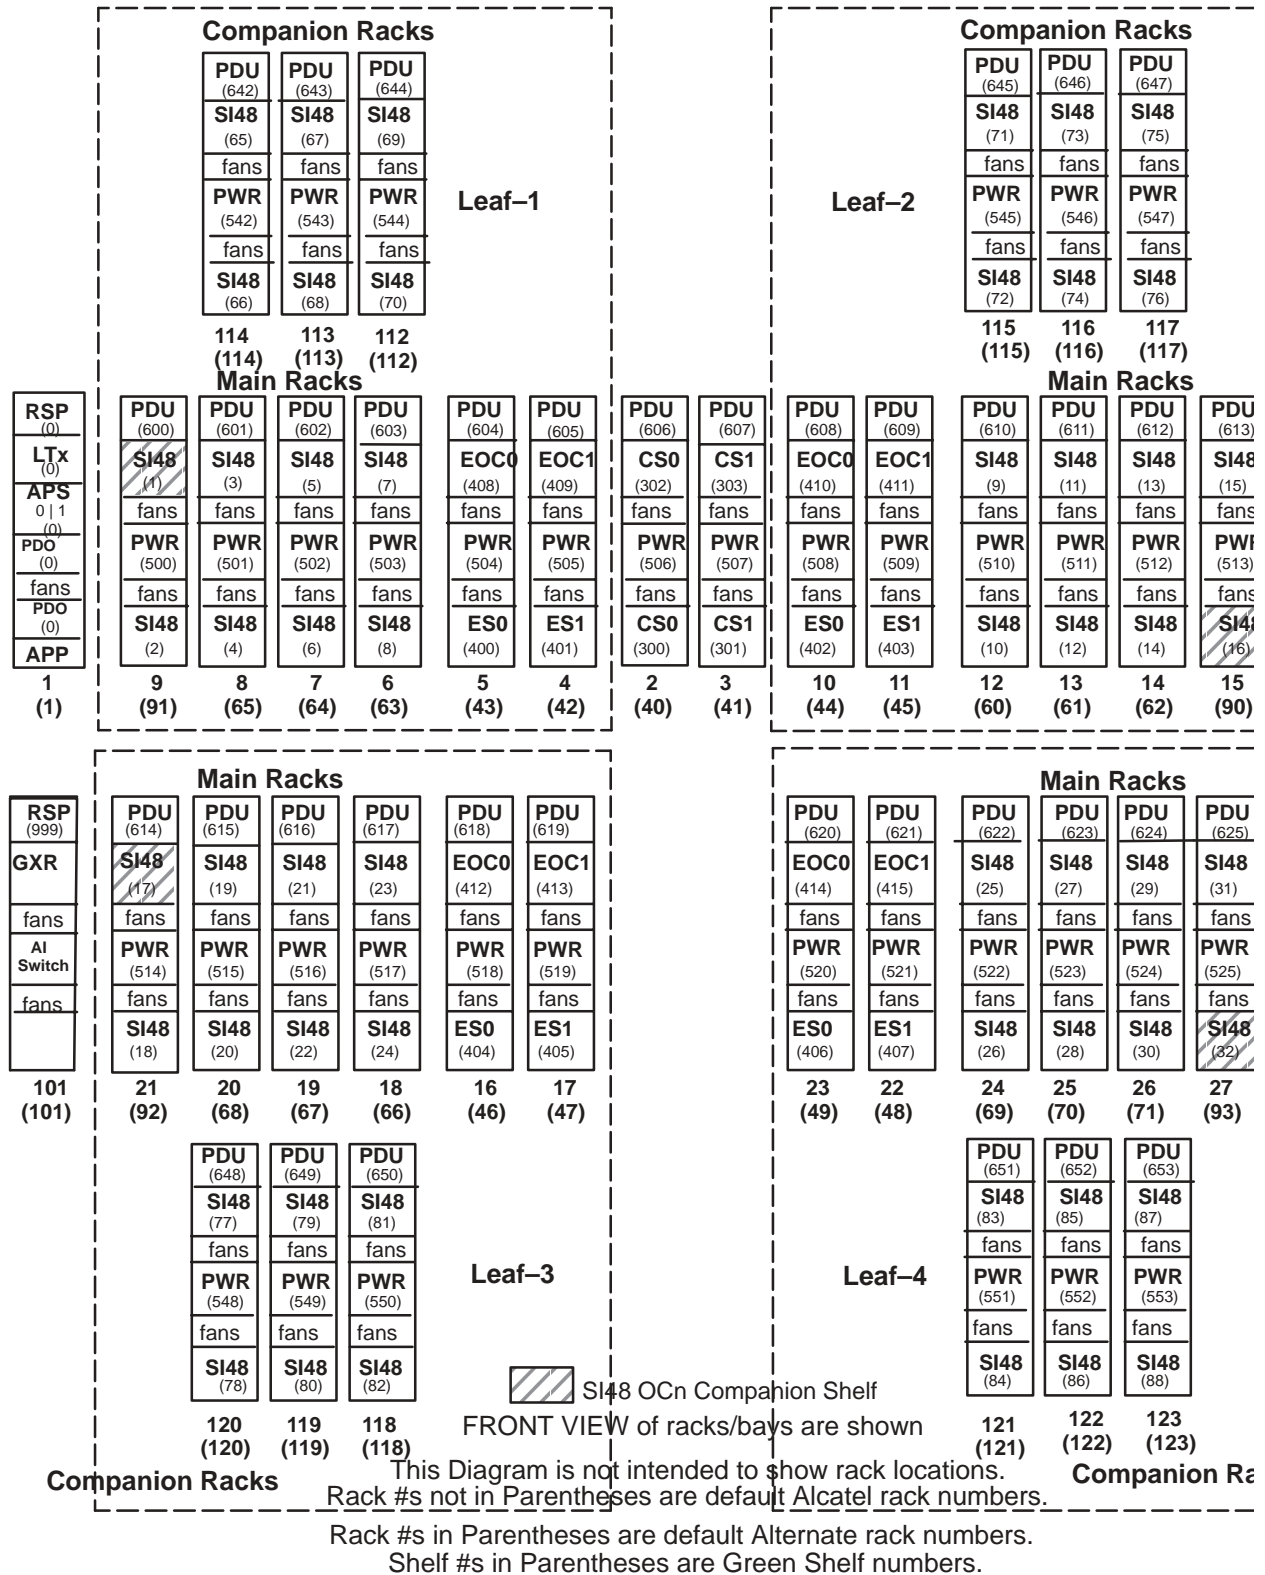

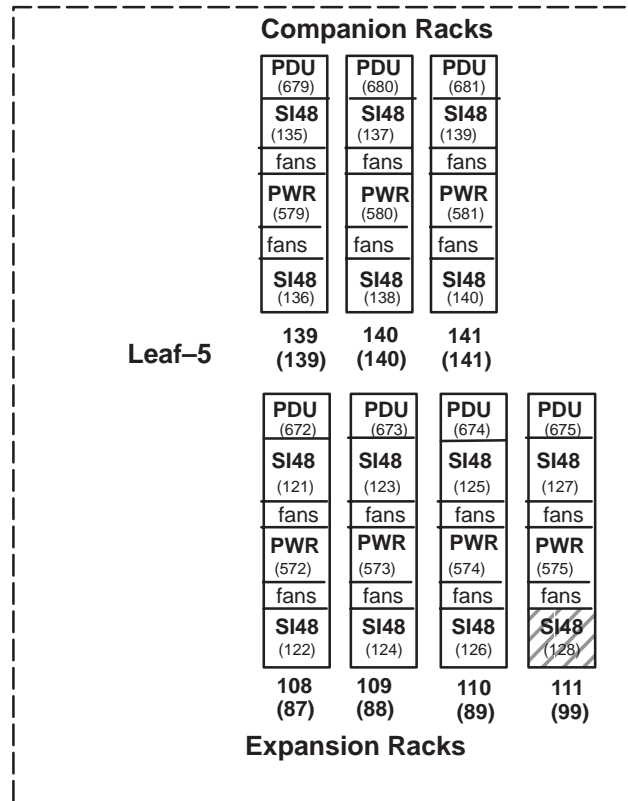

Figure B.6. Typical 2688 Port LMC Rack Line-Up

**Figure B.7. 3360 Ports LMC Main & Companion Rack/Shelf Front View
(Leaf 1 through Leaf 4)**

SI48 OCn Companion Shelf

FRONT VIEW of racks/bays are shown

This Diagram is not intended to show rack locations.
Rack #s not in Parentheses are default Alcatel rack numbers.
Rack #s in Parentheses are default Alternate rack numbers.
Shelf #s in Parentheses are Green Shelf numbers.

Figure B.8. 3360–Port LMC Main & Companion Rack/Shelf Front View (Leaf 5)

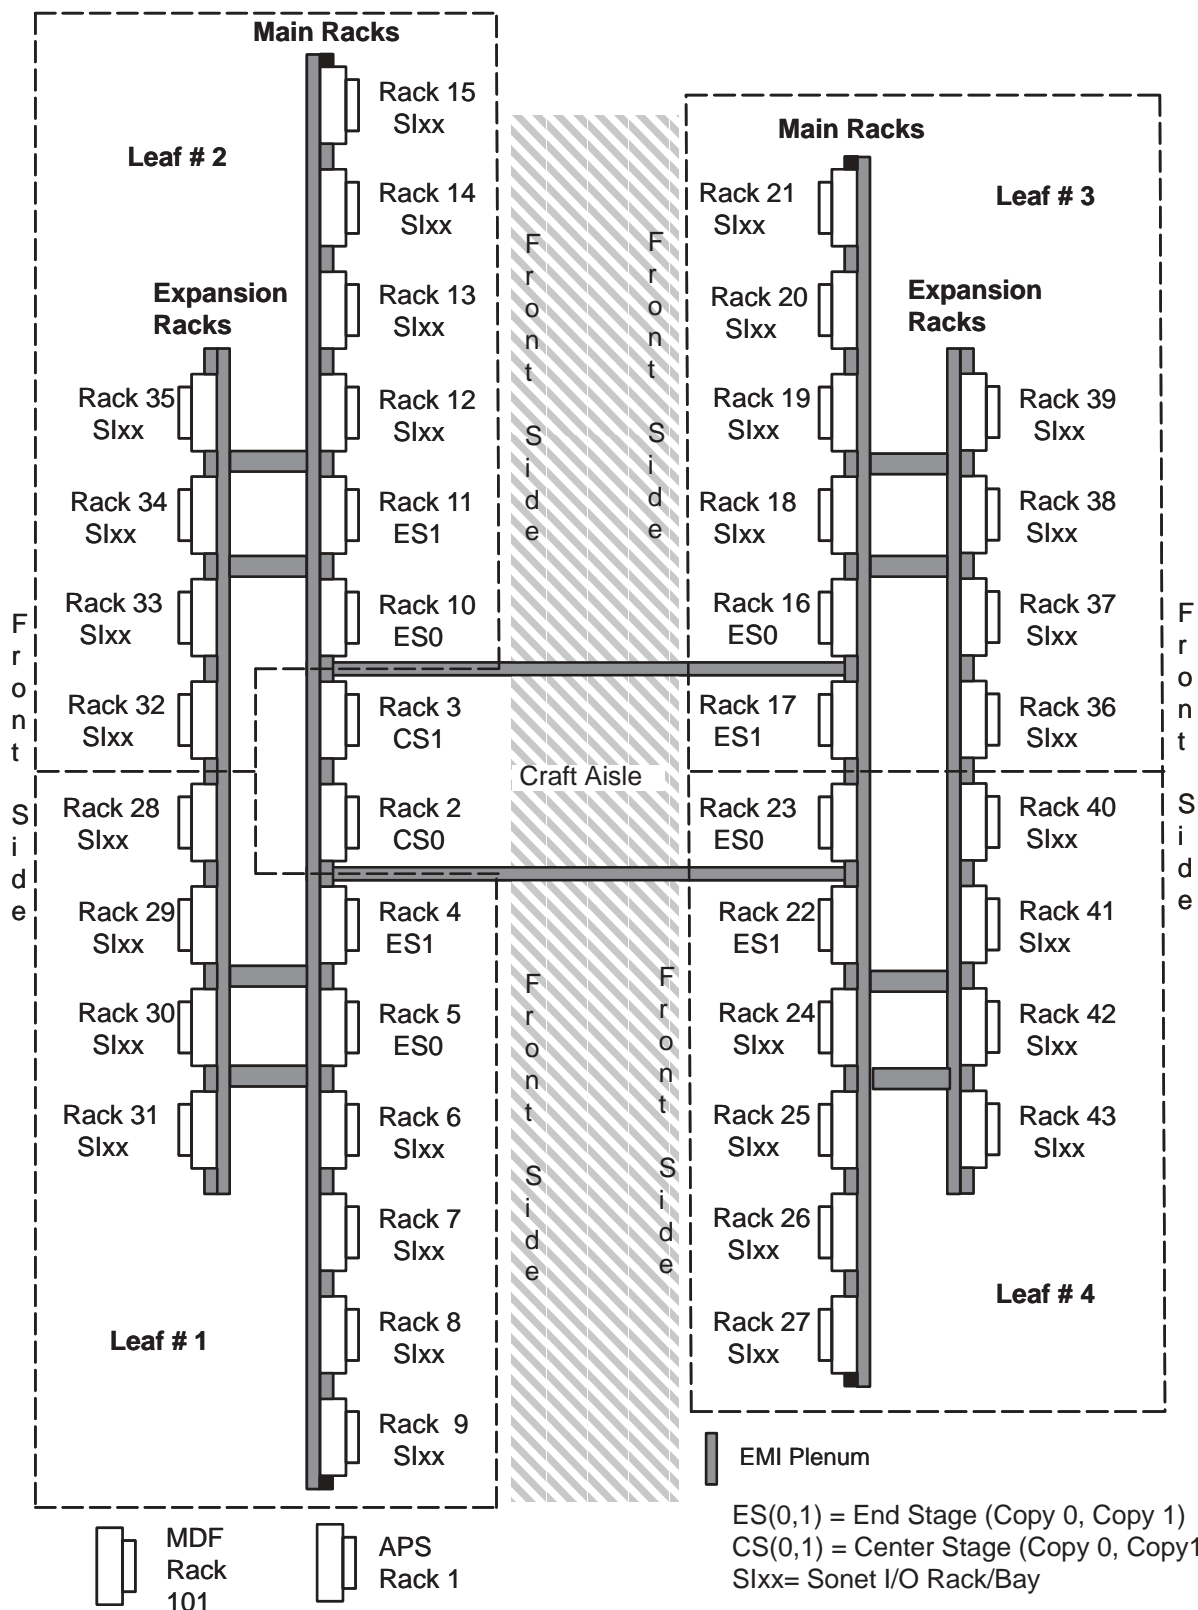

Figure B.9. I/O Main and Expansion Racks Floor Plan Top View
- Leaf 1 - 4

Note – End Stage racks in the 5th clover must be placed within 12 to 24 meters of the Center Stage Racks, in 3 meter increments. Of this, 6 meters is routed in the plenum, and the remaining cable is routed in the overhead trays.

I/O racks in the 5th clover are optically remoted, up to 500 meters maximum distance from their End Stage racks. Floorplan shown is for illustration purposes only and is only intended to show the relationship between the 5th clover end stages and the center stages.

FRONT VIEW of racks/bays are shown

This Diagram is not intended to show rack locations.

Rack #s not in Paranthesis are the default Alcatel rack numbers

Rack #s in Paranthesis and in bold letters are the default alternate map rack numbers

Shelf #s in Paranthesis and not in bold letters are Green Shelf numbers

DS1 Quad Shelves, upto a maximum of 20 bays allowed in this release. This gives 17,920 electrical DS1s.

Only racks 44 to 53 may contain DS3 quads.

Figure B.12. 3360–Port LMC Asynchronous Rack/Shelf Front View

B.3. Equipment Name/Mnemonic and Equipment AID Value Sets

The equipment names/mnemonics and the associated Alcatel (default) and Alternate value sets for each equipment entity in the system are shown in Table NO TAG

Table B.1. Alcatel and Alternate Equipment AIDs

Equipment Description	Alcatel AIDs	Alternate AIDs
G1ES1 (GTI cable terminating on an ES1)	G1ES1 – {6–8, 12–14, 18–20, 24–26, 28–30, 32–34, 36–38, 40–42, 104–106, 108–110 } – {1, 3} – {1–18} – {1, 2}, G1ES1 – {9, 21, 35, 43, 107 } – 3 – {1–18} – {1, 2}, G1ES1 – {15, 27, 31, 39, 111 } – 1 – {1–18} – {1, 2}	G1ES1 – {60–83, 84–89 } – {1, 3} – {1–18} – {1, 2}, G1ES1 – {91, 92, 95, 97, 98 } – 3 – {1–18} – {1, 2}, G1ES1 – {90, 93, 94, 96, 99 } – 1 – {1–18} – {1, 2}
G1IRPB (GTI cable terminating on the I/O side of an RPB)	G1IRPB – {6–9, 12–15, 18–21, 24–43, 104–111, 112–135, 136–141 } – {1, 3} – {1, 2} – {1–18}	G1IRPB – {60–83, 84–89, 90–97, 98, 99, 112–135, 136–141 } – {1, 3} – {1, 2} – {1–18}
G1MRPB (GTI cable terminating on the Matrix side of an RPB)	G1MRPB – {6–9, 12–15, 18–21, 24–43, 104–111, 112–135, 136–141 } – {1, 3} – {1, 2} – {1–16}	G1MRPB – {60–83, 84–89, 90–97, 98, 99, 112–135, 136–141 } – {1, 3} – {1, 2} – {1–16}
G1O1B (GTI cable terminating on an O1B)	G1O1B – {6–9, 12–15, 18–21, 24–43, 104–111, 112–135, 136–141 } – {1, 3} – {2–9, 11–18} – {1, 2}	G1O1B – {60–83, 84–89, 90–97, 98, 99, 112–135, 136–141 } – {1, 3} – {2–9, 11–18} – {1, 2}
G1O4M (GTI cable terminating on an O4M)	G1O4M – {6–9, 12–15, 18–21, 24–43, 104–111, 112–135, 136–141 } – {1, 3} – {2, 3, 11, 12} – {1, 2}	G1O4M – {60–83, 84–89, 90–97, 98, 99, 112–135, 136–141 } – {1, 3} – {2, 3, 11, 12} – {1, 2}
G1S3M (GTI cable terminating on an S3M)	G1S3M – {6–9, 12–15, 18–21, 24–43, 104–111, 112–135, 136–141 } – {1, 3} – {4–9, 13–18} – {1, 2}	G1S3M – {60–83, 84–89, 90–97, 98, 99, 112–135, 136–141 } – {1, 3} – {4–9, 13–18} – {1, 2}
G1TGR (GTI cable terminating on a TGR)	G1TGR – {6–8, 12–14, 18–20, 24–26, 28–30, 32–34, 36–38, 40–42, 104–106, 108–110 } – {1, 3} – {9, 18} – {1, 2}, G1TGR – {9, 21, 35, 43, 107 } – 3 – {9, 18} – {1, 2}, G1TGR – {15, 27, 31, 39, 111 } – 1 – {9, 18} – {1, 2}	G1TGR – {60–83, 84–89 } – {1, 3} – {9–18} – {1, 2}, G1TGR – {91, 92, 95, 97, 98 } – 3 – {9, 18} – {1, 2}, G1TGR – {90, 93, 94, 96, 99 } – 1 – {9, 18} – {1, 2}
G4EOB (GTI cable terminating on an EOB)	G4EOB – {6–9, 12–15, 18–21, 24–43, 104–111, 112–135, 136–141 } – {1, 3} – {1, 2} – {1–4}, G4EOB – {4, 5, 10, 11, 16, 17, 22, 23, 102, 103 } – 1 – {1–7, 9–15} – {1–4}	G4EOB – {60–83, 84–89, 90–97, 98, 99, 112–135, 136–141 } – {1, 3} – {1, 2} – {1–4}, G4EOB – {42–49, 50, 51 } – 1 – {1–7, 9–15} – {1–4}
G1IOB (GTI cable terminating on an IOB)	G1IOB – {6–8, 12–14} – {1, 3} – {1, 3, 5, 7} – {1–3, 5–7}, G1IOB – 9 – 3 – {1, 3, 5, 7} – {1–3, 5–7}, G1IOB – 15 – 1 – {1, 3, 5, 7} – {1–3, 5–7}	G1IOB – {60–65} – {1, 3} – {1, 3, 5, 7} – {1–3, 5–7}, G1IOB – 91 – 3 – {1, 3, 5, 7} – {1–3, 5–7}, G1IOB – 90 – 1 – {1, 3, 5, 7} – {1–3, 5–7}
G4IOB (GTI cable terminating on an IOB)	G4IOB – {6–8, 12–14} – {1, 3} – {1, 3, 5, 7} – {1, 2}, G4IOB – 9 – 3 – {1, 3, 5, 7} – {1, 2}, G4IOB – 15 – 1 – {1, 3, 5, 7} – {1, 2}	G4IOB – {60–65} – {1, 3} – {1, 3, 5, 7} – {1, 2}, G4IOB – 91 – 3 – {1, 3, 5, 7} – {1, 2}, G4IOB – 90 – 1 – {1, 3, 5, 7} – {1, 2}
G4OXB (GTI cable terminating on an OXB)	G4OXB – {44–63} – {1–4} – {1, 2} – 1	G4OXB – {3–6, 10–25} – {1–4} – {1, 2} – 1
HMU (High Speed Muldem Unit)	HMU – {44–53} – {1–4} – {1–8}	HMU – {3–6, 10–15} – {1–4} – {1–8}
ICM (Intelligent Communication Module)	ICM – 1 – 2 – {1, 2, 8, 9}	ICM – 1 – 2 – {1, 2, 8, 9}
IOB (Inter-rack Optical Board)	IOB – {6–8, 12–14} – {1, 3} – {1, 3, 5, 7}, IOB – 9 – 3 – {1, 3, 5, 7}, IOB – 15 – 1 – {1, 3, 5, 7}	IOB – {60–65} – {1, 3} – {1, 3, 5, 7}, IOB – 91 – 3 – {1, 3, 5, 7}, IOB – 90 – 1 – {1, 3, 5, 7}

Table B.1. Alcatel and Alternate Equipment AIDs		
Equipment Description	Alcatel AIDs	Alternate AIDs
IPB (Internal Protection Board)	IPB-{6-9, 12-15, 18-21,24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1, 2}	IPB-{60-83, 84-89 ,90-97, 98,99 ,112-135, 136-141 }-{1,3}-{1, 2}
IPU (Interface Processing Unit)	IPU-{44-63}-{1-4}-{1-8}	IPU-{3-6,10-25}-{1-4}-{1-8}
LMU (Low Speed Muldem Unit)	LMU-{44-53}-{1-4}-{1-32}	LMU-{3-6,10-15}-{1-4}-{1-32}
LT1 (Level 1 Translator)	LT1-1-1-{1-6}	LT1-1-1-{1-6}
LT2 (Level 2 Translator)	LT2-1-1-{1-6}	LT2-1-1-{1-6}
LT3 (Level 3 Translator)	LT3-1-1-{4-6}	LT3-1-1-{4-6}
LT4 (Level Translator 4)	LT4-1-1-{7-16}	LT4-1-1-{7-16}
LT5 (Level Translator 5)	LT5-1-1-{2-6}	LT5-1-1-{2-6}
LT8 (Level Translator 8)	LT8-1-1-{7-16}	LT8-1-1-{7-16}
M16 (Matrix End/Center Stage 16)	M16-{2-5,10,11,16,17,22,23}-3-{1-16}	M16-{40-49}-3-{1-16}
32 (Matrix End Stage 32)	M32-{4,5,10,11,16,17,22,23, 102,103 }-3-{1-16}	M32-{42-49, 50,51 }-3-{1-16}

B.4. Facility AIDs vs. Input/Output Equipment AIDs for SI48 Racks

Table B.2. provides a cross-reference of facility AIDs vs. I/O Equipment AIDs for SI48 Racks (shelf type = SI48). Alcatel AIDs and Alternate AIDs are shown.

Table B.2. does not include a cross-reference of I/O equipment AIDs to facility AIDs for constituents of an OC-3, OC-12, EC1, or DS3. These AIDs can be determined by extrapolating from an OC3 AID, an OC12 AID, an EC1 AID, or a T3 AID, respectively. For example:

An EC1VT1 AID has the format EC1VT1-EC1/STS1#-VTGrp#-VT1.5# with possible values of:
{EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)

APPENDIX C. CONDITION TYPES

This appendix provides a list of the equipment, facility, and common (no specific entity) standing and non-threshold-crossing transient condition types used in the 1631 SX, along with the factory default notification codes (Major, Minor, Not-Alarm, or Not-Reported) for each service effect setting (Service Affecting or Non-Service Affecting) standing condition type.

This appendix does not include a list of the transient facility performance monitoring threshold-crossing conditions supported by the system. Refer to Appendix F, Monitored PM Parameters for a list of performance monitoring parameters that could cause a transient condition and to REPT^EVT^rr autonomous responses (where rr can be EC1, OC3, STS1, STS3C, T1, T3, VT1) for a list of transient threshold-crossing condition types for each facility type.

The 1631 SX uses standing condition types to report non-transient (standing) abnormal or trouble conditions pertaining to an equipment entity, facility entity, or no specific entity (common). The notification code for each standing condition type is provisionable with the SET-ATTR-{COM, EQPT, rr} commands, where SET-ATTR-{COM, EQPT} support provisioning per entity type and SET-ATTR-rr support provisioning per facility. In addition, the system-wide default notification code for standing facility condition types is provisionable with the SET-DFLTATTR-rr commands.

Standing conditions with condition types provisioned as major or minor alarms are reported with a REPT^ALM^{COM, EQPT, rr} autonomous response message and are retrievable with the RTRV-ALM-{COM, EQPT, rr} commands. Standing conditions with condition types provisioned as non-alarmed are reported with a REPT^EVT^{COM, EQPT, rr} autonomous response message and are retrievable with the RTRV-COND-{COM, EQPT, rr} commands. Standing conditions with condition types provisioned as not-reported are not autonomously reported, but are retrievable with the RTRV-COND-{COM, EQPT, rr} commands.

Transient non-threshold-crossing conditions are reported with a REPT^EVT^rr autonomous response message.

This appendix provides a list of Standing and Transient Condition types for the Equipment, Facility and Common AIDs.

APPENDIX D. ERROR CODES

This appendix contains an alphabetized list of the Error Codes used in an unsuccessful response message by the 1631 SX and referenced in this I/O manual and its related reference documents.

Section D.2. contains a list of the Error Codes, and associated Informational_Error_Description_Text, used in an unsuccessful response message by the system when a command cannot be successfully parsed by the system's Command Parser.

Section D.3. provides a list of the Database Error Status Numbers that may be included within non-parsable text in an unsuccessful response message that has a SDBE (Status, internal Data Base Error) error code.

D.1. Error Code Mnemonics

Shown below is an alphabetized list of the Error Code mnemonics used in an unsuccessful response message by the 1631 SX.

EANS	Equipage, Access Not Supported
EATN	Equipage, Not valid for Access Type
ENEQ	Equipage, Not EQuipped
ENFE	Equipage, FEature Not provided
EFON	Equipage, Feature Option Not provided
ENPM	Equipage, Not equipped for Performance Monitoring
ENRE	Equipage, Not Recognized Equipage
ENRI	Equipage, Not equipped for Retrieving specified Information
ENSI	Equipage, Not equipped for Setting specified Information
ENTL	Equipage, Not Terminate and Leave
ESPG	Equipage, Software ProGram
IBEX	Input, Block EXtra
IBMS	Input, Block MiSsing
IBNC	Input, Block Not Consistent
ICNV	Input, Command Not Valid
IDMS	Input, Data MiSsing
IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IDRG	Input, Data RanGe
IEAE	Input, Entity Already Exists
INEE	Input, Entity does Not Exist
IIAC	Input, Invalid ACcess identifier
IICT	Input, Invalid Correlation Tag
IIDT	Input, Invalid DaTa parameter
IIFM	Input, Invalid data ForMat
IIPG	Input, Invalid Parameter Grouping
IISP	Input, Invalid Syntax or Punctuation
IITA	Input, Invalid TArget identifier
INUP	Input, Non-Null Unimplemented Parameter
IPEX	Input, Parameter EXtra
IPMS	Input, Parameter MiSsing
IPNC	Input, Parameter Not Consistent
IPNV	Input, Parameter Not Valid

ISCH	Input, invalid Syntax invalid CHaracter
ISPC	Input, Syntax PunCtuation
ITSN	Input, invalid/inactive Test Session Number
MERR	Multiple ERRor
PICC	Privilege, Invalid Command Code
PIMF	Privilege, Invalid Memory File
RABY	Resource, All taps BusY
RCBY	Resource, Circuit BusY
RCIN	Resource, requested Circuit Id does Not exist
RNBY	Resource, Ne is BusY
RTBY	Resource, requested Tap BusY
RTEN	Resource, requested Tap does Not Exist
RTUB	Resource, Test Unit Busy
SAAL	Status, Already ALlowed
SACS	Status, Access unit Can't Sync on facility signal
SADC	Status, Already DisConnected
SAIN	Status, Already INhibited
SAIS	Status, Already In Service
SAIU	Status, All In Use
SAMS	Status, Already in Maintenance State
SAOP	Status Already OPerated
SAOS	Status, Already Out of Service
SAPS	Status, Already in Protection State
SARB	Status, All Resources Busy
SARL	Status, Already ReLeased
SATF	Status, Automatic Test Failed
SAWS	Status, Already in Working State
SCAT	Status, Circuit Already connected to another Tap
SCSN	Status, invalid Command SequeNce
SDAS	Status, Diagnostics Already Started
SDBE	Status, internal Data Base Error
SDFA	Status, Duplex unit FAiled
SDNA	Status, Duplex unit Not Available
SDNC	Status, Data Not Consistent
SDNR	Status, Data Not Ready
SNCC	Status, Not Cross-Connected
SNIS	Status, Not In-Service
SNOS	Status, Not currently Out of Service
SNSR	Status, No Switch Request outstanding
SNVS	Status, Not in Valid State
SOSE	Status, Operating System Error
SPFA	Status, Protection unit FAiled
SRCI	Status, Requested Command Inhibited
SRCN	Status, Requested CoNdition already exists
SROF	Status, Requested Operation Failed

SRQN	Status, invalid ReQuest
SRT0	Status, Reply Timeout Occurred
SSRD	Status, Switch Request Denied
SSRE	Status, System Resources Exceeded
STTI	STatus, Tap Idle
SWFA	Status, Working unit FAiled

D.2. Command Parser Error Codes

Shown below is a list of the Error Codes, and associated Informational_Error_Description_Text, used in an unsuccessful response message by the system when a command cannot be successfully parsed by the system's Command Parser.

IBEX	Input, Block EXtra /* Too Many Blocks */
ICNV	Input, Command Not Valid
IDNV	Input, Data Not Valid /* Invalid Parameter Value */
IDRG	Input, Data RanGe /* Range not allowed for parameter */
IENE	Input, Entity does Not Exist /* The <shelf, quad> has not been provisioned */
IIAC	Input, Invalid ACcess identifier /* Invalid Parameter Value */ /* NULL Required parameter */
IICT	Input, Invalid Correlation Tag
IIDT	Input, Invalid DaTa parameter
IIFM	Input, Invalid data ForMat /* Identifier Too Long */
IISP	Input, Invalid Syntax or Punctuation
IITA	Input, Invalid TArget identifier /* Invalid TID */
INUP	Input, Non-Null Unimplemented Parameter
IPEX	Input, Parameter EXtra /* Too Many Parameters for the specified block */
IPMS	Input, Parameter MiSsing /* Keyword Required */ /* NULL Required parameter */
IPNV	Input, Parameter Not Valid /* Invalid Keyword */
ISPC	Input, Syntax PunCtuation /* Semantic error detected */
PICC	Privilege, Invalid Command Code /* Security Violation */
SSRE	Status, System Resources Exceeded

D.3. Database Error Code (SDBE) Error Status Numbers

Shown below is a list of the Database Error Status Numbers that may be included within non-parsable text in an unsuccessful response message that has a SDBE (Status, internal Data Base Error) error code.

-0	/* success */
-1	/* couldn't get/attach to header area */
-2	/* no match on file name in header area */
-3	/* couldn't close an open shm file */
-4	/* couldn't shmget on an shm file area */
-5	/* couldn't shmat to an shm file area */
-6	/* open with RD_WREXCL not allowed this area */
-7	/* this file not found on open list */
-8	/* record number given is past EOF for area */ (read)
-9	/* buffer addr passed points at NULL */
-10	/* flags passed inconsistent with open mode */
-11	/* read/lock permission denied, not excl_pid */
-12	/* read/lock permission denied, already locked */
-13	/* DBM can't read/lock this record */
-14	/* warning, data returned is transitional */
-15	/* record number given is past EOF for area */
-16	/* another process opened this area RD_WREXCL */
-17	/* PID is not the same as listed in area head */
-18	/* Must be locked in head before writing */
-19	/* Must be in lock list before writing */
-20	/* DBM can't write/unlock this record */
-21	/* the configuration file could not be read */
-22	/* length of a file could not be determined */
-23	/* error in initialization split routine */
-24	/* error return from smfainit() */
-25	/* error on DBM open_file() for a file */
-26	/* error on DBM read for a file */
-27	/* file already open */
-28	/* this open file has locks present */
-29	/* a malloc error has occurred */
-30	/* error on info for a disk only file */
-31	/* DBM could not read a record from disk */
-32	/* Record found from disk, file not in SHM */
-33	/* Invalid file type for smfind() and smgetptr() */
-34	/* Record match not found in smfind() */
-35	/* Some error has occurred in smfind()—read_indexed() */
-36	/* Read error, this record has been deleted */
-37	/* error from smcreat, file is in use */
-38	/* can't read multiple records yet */
-39	/* can't even open a file as DISK_ONLY */
-40	/* sequent files can not be locked/unlocked */
-41	/* dbm can't unlock record */

- 42 /* One of the above errors occurred, check for a report status to give exact one */
- 43 /* record size is > 2048, possible shm corruption */
- 44 /* key length > 2048, possible shm corruption */
- 45 /* MAXATTACHED has been reached */
- 46 /* key not found for shifting */
- 47 /* error has occurred while locking multiple records */
- 48 /* writing and updating at same time is not allowed */
- 49 /* writing new records with SMLOCK not allowed */

APPENDIX E. (COMMAND ENTRY) MENUS

This appendix describes the Command Input Menu and Forms Mode of operation (available with a VDT terminal) and the menu hierarchy (menu tree) from the main menu to each Command Input Form.

E.1. Menu Mode

The Command Input Menu Mode (Menu Mode) simplifies entering commands and parameter values by providing a fill-in-the-blank input form accessed through the menus. The Menu Mode is accessed by pressing the Mode function key (F7). The Mode function key toggles the VDT screen between the Direct Command Input Mode and the Menu Mode. A typical level 1 (Main) menu screen is shown in Figure E.1.

Alcatel 1631 SX ALCATEL		CID: 3		Mon Aug 2 09:10 1993	
Menu Mode: Menu		Output Waiting		Alarms — — —	
MAIN ACTIVITY MENU: LEVEL 1					
A. FAC/EQPT PROVISIONING		>		F. SYSTEM ADMINISTRATION	
B. CONNECTIONS		>		G. DELAYED ACTIVATION	
C. SYSTEM MAINTENANCE		>		H. REPORTS	
D. FACILITY TESTING		>		I. ALARMS/EVENT CONTROL	
E. PERFORMANCE MONITORING		>		J. LOGOUT (CANCEL USER)	
ENTER SELECTION:					
Command <					
Response:					
	F7 Mode	F8 Alarms	F9 Output	F10 Parent	F11 Abort

Figure E.1. Typical Level 1 Main Activity Menu Screen

A lower-level menu is selected from the displayed menu by entering the indicated letter for the desired menu selection (in this case, pressing the Enter key is not necessary), or by using the cursor up/down keys to highlight the desired menu selection and pressing the Enter key. Menu selections shown with a greater-than sign (>) produce a lower level menu display when selected. Menu selections shown without a greater-than sign (>) produce a Command Input Form when selected.

A typical level 2 menu is shown in Figure E.2.

ENTER SELECTION:					
Command <					
Response:					
	F7 Mode	F8 Alarms	F9 Output	F10 Parent	F11 Abort

Figure E.2. Typical Level 2 Main Activity Menu Screen

Command Input Forms provide the format and field size for entering command parameter values. The Input Form contains fields in which parameter data required to execute the command is entered. There is no need to remember or enter the special TL1 syntax characters (separators, etc.); the system enters them.

Note: Input Forms can also be accessed directly from the command input line in Direct Command Input Mode which allows bypassing the menu tree. In the Direct Input Mode, enter the command code (verb–modifier[–modifier]) on the command line and then press the Mode function key (F7).

Each Input Form displays the command code at the top center of the form. The form displays the command parameters in fields below the command name and are in plain text for readability. The underscored characters denote required fields and the square brackets [] denote optional fields.

When possible, the valid values for a particular command parameter are listed in parentheses. If the valid values are not listed or to find the default value of a particular command parameter, please refer to the I/O manual.

A typical Command Input Form screen is shown in Figure E.3.

E.1.1. Limited Command Entry Mode Menu Screen

When a STOP-OPS command is executed and F7 is pressed, the system is placed in the Limited Command Entry mode. (The Limited Command Execution mode limits commands that can be executed during a database restoral. Note that a database restoral can also be performed from the Normal Command Execution mode without executing a STOP-OPS command.)

The typical Limited Command Entry screen is shown in Figure E.4.

Figure E.4. Typical Limited Command Entry Mode Menu Screen

E.2. Menu Hierarchy

Shown below is the menu hierarchy (menu tree) and command code associated with each branch of the menu tree. Normal Command Entry mode commands are listed in Section E.2.1. Commands that may be entered in either Normal or Limited Command Entry mode are listed in in Section E.2.1. (Note that command text in parentheses does not appear on the actual menu screen but is included here for clarification.)

APPENDIX F. MONITORED PM PARAMETERS

This appendix provides a list of the facility performance monitoring parameters supported in the 1631 SX, along with the factory default threshold crossing alert level for each parameter.

The system collects facility performance monitoring (PM) data by continuously monitoring each provisioned facility and accumulating error counts in separate PM collection registers for both 15 minute and 1 day (midnight to midnight) accumulation intervals. Transient conditions of accumulated error counts exceeding the facility's provisioned threshold level (refer to SET-TH-{EC1, OC3, OC12, STS1, STS3C, T1, T3, VT1} commands) are reported via a corresponding REPT^EVT^{EC1, OC3, OC12, STS1, STS3C, T1, T3, VT1} autonomous response message.

The current or historical contents of each PM collection register can be retrieved with the RTRV-PM-{EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, VT1} commands. The current interval collection register can be initialized with the INIT-REG-{EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, VT1} commands.

Section F.1. lists the OC3/OC12 performance monitoring parameters.

Section F.2. lists the EC1 performance monitoring parameters.

Section F.3. lists the STS-1 performance monitoring parameters.

Section F.4. lists the STS-3C performance monitoring parameters.

Section F.5. lists the VT1.5 performance monitoring parameters.

Section F.6. lists the DS3 performance monitoring parameters.

Section F.7. lists the DS1 performance monitoring parameters.

Section F.8. lists the F3 (Fractional DS3) performance monitoring parameters.

F.1. OC3/OC12 Performance Monitoring Parameters

Tables F.1 through F.3 show OC3/OC12 performance monitoring parameters, the parameter's maximum value and maximum threshold level, and the parameter's factory default threshold setting.

Table F.1 OC3/OC12 Near-End Section PM Parameters					
MONTYPE Parameter	Definition	Threshold Level			
		15-Minute Register		1-Day Register	
		Maximum	Factory Default	Maximum	Factory Default
CV-S, CVS	Coding Violations	4294967295	4666	4294967295	44790
ES-S, ESS	Errored Seconds	900	9	65535	86
ESA-S, ESAS	Errored Seconds, Type A	900	9	65535	86
ESB-S, ESBS	Errored Seconds, Type B	900	9	65535	86
LOSS, LOSS-S	Loss of Signal Seconds	900	9	65535	86
SEFS, SEFS-S	Severely Errored Seconds	900	9	65535	86
SES-S, SESS	Severely Errored Seconds	900	9	65535	86

Table F.2 OC3/OC12 Near-End Line PM Parameters					
MONTYPE Parameter	Definition	Threshold Level			
		15-Minute Register		1-Day Register	
		Maximum	Factory Default	Maximum	Factory Default

F.8. F3 (Fractional DS3) Performance Monitoring Parameters

Table F.20 shows the F3 (Fractional DS3) performance monitoring parameters and the parameter's maximum value.

Table F.1. F3 (Fractional–T3) PM Parameters			
MONTYPE Parameter	Definition	Threshold Level	
		15–Minute Register	1–Day Register
		Maximum	Maximum
CV–N, CVN	Coding Violations	4294967295	4294967295
ES–N, ESN	Errored Seconds	900	65535
ESA–N, ESAN	Errored Seconds, Type A	900	65535
ESB–N, ESNB	Errored Seconds, Type B	900	65535
FC–N, FCN	Failure Counts	150	14400
SAS–N, SASN	Severe AIS Seconds	900	65535
SES–N, SESN	Severely Errored Seconds	900	65535
UAS–N, UASN	Unavailable Seconds	900	65535

Unlike all other monitored PM parameters, the calculations for Fractional-T3s (F3s) are not performed per an existing industry standard. Table F.21, below, provides a definition of the method of calculation for each of the Fractional-T3 PM parameters.

Table F.21 F3 PM Parameter Calculations		
MONTYPE Parameter	F3 PM Parameter Calculation Method	DS1 FMT
CV-N, CVN	Sum of CV-Ps for all (n) of the active DS1s in the F3.	SF/ESF
ES-N, ESN	One or more CV-N, or one or more SEF-P or AIS-P on any of the n DS1s in the F3.	SF/ESF
ESA-N, ESAN	Exactly one CV-N and no SEF-P or AIS-P on any of the n DS1s in the F3.	ESF
ESB-N, ESNB	$1 < CV-N < (0.3 * 333.33 * n)$ and $1 < CV-P < 320$ on any of the n DS1s and no $CV-P \geq 320$ on any of the n DS1s and no SEF-P or AIS-P on any of the n DS1s in the F3.	ESF
FC-N, FCN	Count of LOF-P or AIS-P failure events on any of the n DS1s when no failure conditions are currently declared (overlapping failures are not counted).	SF/ESF
SAS-N, SASN	One or more SEF-P or AIS-P on any one of the n DS1s in the F3.	SF/ESF
SES-N, SESN	CV-N $\geq (2/3 * X * n)$, or CV-P $\geq X$ on any of the n DS1s in the F3, or one or more SEF or AIS on any of the n DS1s in the F3, where $X = 8$ if both F_t and F_s bits measured or $X = 4$ if only F_t bits are measured.	SF
	CV-N $\geq (0.3 * 333 \frac{1}{3} * n)$, or CV-P ≥ 320 on any of the n DS1s in the F3, or one or more SEF or AIS on any of the n DS1s in the F3.	ESF
UAS-N, UASN	A second of unavailability begins at the onset of 10 contiguous SES-Ns and ends at the onset of 10 contiguous seconds with no SES-Ns.	SF/ESF
Note: The value of " n " in these calculations is based on the number of DS1s assigned to the F3 at the instant the calculation occurs.		

APPENDIX G. STATE TRANSITIONS

This appendix provides a definition of the Primary and Secondary States (PST and SST) used in the 1631 SX, and also provides state values and state transition diagrams associated with the system's equipment, OC12, OC3, EC1, STS1, STS3C, VT1.5, DS3, DS1, F3, or cross-connect entities. Refer to Section 2 for additional information on the commands referenced in this appendix.

G.1. State Names

The state of an entity represents the current condition of availability of the underlying resource or service in the system. The term "entity" represents the resource or service generally identified by the Access Identifier (AID) parameter. The system uses entity states to indicate the availability of an entity in providing its functions, and if an entity is not available, to indicate the cause of the unavailability and what kind of activity may be taken to make the entity available. An entity's state is described by two parameters, the Primary State (PST) and the Secondary State (SST).

The Primary State (PST) indicates the current overall service condition of an entity.

For an in-service equipment entity, the PST indicates whether the entity is totally or partially in-service (e.g., IS or IS-ANR). (Note. A PST of IS-ANR is only used with equipment entities.)

If an entity is out-of-service, the PST indicates whether the out-of-service condition is due to an external management command (from an OS or craft interface) or caused by the system because of an internal event (e.g., OOS-MA or OOS-AU).

When provisioning an entity and specifying a PST value in a command, the PST name is shortened to IS (In Service) or OOS (Out Of Service), but the full PST name (i.e., IS, IS-ANR, OOS-AU, OOS-AUMA, OOS-MA) is used when provided in output response messages.

The Secondary State (SST) provides additional information pertaining to the Primary State. Multiple Secondary State values may apply to an entity at a particular instant. If more than one SST value applies to an entity, the SST values are grouped with an ampersand (&) in the output response message (e.g., SGEO&FAF).

G.1.1. State Name Definitions

A definition of each of the Primary and Secondary States used in the system is provided below.

Primary States:

IS	In-Service: the entity is capable and allowed to provide its provisioned functions.
IS-ANR	In-Service-Abnormal: the (equipment) entity is available for providing only part (but not none) of its provisioned functions or is performing these functions at a degraded level.
OOS-AU	Out-Of-Service-Autonomous: the entity is not available for providing its provisioned functions but the entity is not intentionally suspended by external management command (from an OS or craft interface) from performing these functions. In general, the cause of the incapability is due to an unsolicited autonomous event detected in the system or in the associated network (e.g., DS3 LOS detected).
OOS-AUMA	Out-Of-Service-Autonomous and Management: the entity is not available for providing its provisioned functions because an OOS-AU state transition has occurred and the entity is intentionally suspended by external management command (from an OS or craft interface) from performing its provisioned functions.
OOS-MA	Out-Of-Service-Management: the entity is intentionally suspended by external management command (from an OS or craft interface) from performing its provisioned functions, but the entity may still be operationally capable of performing its provisioned functions.

Secondary States:

ACT	Active: the entity is currently in use and has spare operating capacity for further usage demand. When applied to a facility entity, this value means that the entity is cross-connected (the entity is a constituent leg of a cross-connect) and additional cross-connect capacity can be applied, e.g., a 1-way cross-connect, a 2-way cross-connect but not with a 1-way bridge, a 56-leg conference connection but not with a 1-way bridge.
AINS	Automatic In-Service: the entity is allowed to transition to the in-service state if it is operationally capable, e.g., a DS3 transitions from OOS-AU,AINS to IS when all DS3 alarm conditions have cleared.
ASI	Automatic Switch Inhibited: the redundant entity is inhibited from automatic switching to the associated redundant copy, i.e., automatic copy switching is inhibited. Refer to the INH-SW-EQPT command in Section 2.
BUSY	Busy: the entity is currently in use and has no spare operating capacity for further usage demand. When applied to a facility entity, this value means that the entity is cross-connected (the entity is a constituent leg of a cross-connect) and no additional capacity can be applied, e.g., a 2-Way cross-connect and a bridge connection or a Test Access port is connected to another entity for test access.
DSBLD	Disabled: the facility entity is prohibited from carrying traffic, e.g., the required supporting equipment is not provisioned.
FAF	Facility Failure: the associated facility entity has failed, e.g., a LOS, LOF, AIS, ISD, AICMIS, or 7LOF condition for DS3 entities; a AIS, LOF, or EOC condition for embedded DS1 entities.
LPBK	Loopback: loopback activity is currently being performed on the entity.
MEA	Mismatch of Equipment and Attributes: the entity is installed with improper equipment or circuit pack, or the correct equipment has improper attributes.
MT	Maintenance: the equipment entity or supporting equipment entity has been manually provisioned (by command from an OS or craft interface) for an in-service-growth maintenance activity. Refer to the OPR-ISGLP-T3 and OPR-ISGLP-T1 commands in Section 2.
PMI	Performance Monitoring Inhibited: the performance monitoring function performed by the entity has been temporarily suspended.
PRI	Protection Release Inhibited: the entity is inhibited from automatic release from protection (inhibited from automatic switching to working). Refer to INH-SWTOWKG in Section 2.
PSI	Protection Switching Inhibited: the protected (working) entity is inhibited from automatic switching to protection, i.e., it is locked out from automatic protection. Refer to the INH-SWTOPROTN and OPR-PROTNSW-OC12/OC3 commands in Section 2.
PWR	Power: the power supply entity is out of service because it has been turned off.
ROLL	Roll: the entity is currently under a roll operation. This state is a transitory state unless Manual rolling mode is being used.
SDEE	Supported Entity Exists: the entity is currently supporting other entities; deletion or state change of this entity will have impact on the service condition of the supported entities.
SGEO	Supporting Entity Outage: the associated supporting entity has failed or is out-of-service due to management action (OOS-MA or OOS-AUMA).
STBYC	Standby-Cold: the entity is to back-up another entity but is not synchronized with the backed-up entity. An entity with a cold standby status will not be immediately able to take over the role of the backed-up entity and will require some initialization activity.
STBYH	Standby-Hot: the entity is to back-up another entity and is synchronized with the backed-up entity. An entity with a hot standby status will be immediately able to take over the role of the backed-up entity without the need for initialization activity.
SWDL	Software Download: the software entity is currently being loaded with the necessary software or database data and code. This state is a transitory state only.
TERMB	Terminated-Both: when applied to a cross-connect entity, this value means that both the "From" channel and the "To" channel of the cross-connect have been terminated.

TERMF	Terminated-From: when applied to a cross-connect entity, this value means that the “From” channel of the cross-connect has been terminated.
TERMT	Terminated-To: when applied to a cross-connect entity, this value means that the “To” channel of the cross-connect has been terminated.
TRM	Terminated: the facility entity has been given termination parameters, i.e., a subordinate entity has a SST of ACT or BUSY.
TS	Test: a Test Access activity is currently being performed on or by the entity.
UAS	Unassigned: the entity has not been assigned with the necessary provisioning data. No service activity or maintenance activity (including monitoring, testing, or service recovery) is permitted in this state since the necessary data has not been assigned.
UEQ	Unequipped: the equipment entity has not been equipped with the necessary hardware, or the software entity has not been loaded with the necessary data or code.
WRK	Working: the redundant entity is currently providing service or carrying traffic.

G.2. State Transitions

A generic state model is provided in G.2.1. The generic state model is the basis for each of the equipment, OC12, OC3, EC1, STS1, STS3C, VT1.5, DS3, DS1, F3, and cross connect entity state models, although each entity state model is either a variation of the generic model or a subset of the generic model. However, the generic state model provides an introduction to the various entity state models and is provided for that purpose.

State model information for equipment, OC12, OC3, EC1, STS1, STS3C, VT1.5, DS3, DS1, F3, and cross connect entities in the system is provided in the subsequent subsections in this appendix.

For each type of entity, valid combinations and applicable state values are provided in a table using the following notation:

- Each row of the table represents a valid combination of PST, SST values. PST values are shown in the first column, SST values are shown in the second and third column. SST values in the second column indicate a possible cause for a transition to that PST state. SST values in the third column indicate possible additional state information that is provided if the SST applies to the entity.
- For each PST, SST combination, the PST values are always part of the entity's state, while the SST values are conditional, i.e., the SST value will be present only when it is applicable to the entity at that moment. The SST parameter may have zero or more values at any time.
- Conditional SST values are shown by using *square brackets*, (i.e., [...]). For simplicity, multiple independent conditional values are enclosed within a single square bracket. For example, [X, Y, Z] means that the values X, Y, and Z are independent and conditional, i.e., zero or more of them may be present.
- Mutually exclusive SST values are shown by using the *brace and pipe* (i.e., {...|...|...}). For example, {X | Y | Z} means that only one of the values X, Y, or Z will be present at any time.

For each type of entity, one or more state transition diagrams are provided following the state values table. Each state transition diagram shows the Primary State transitions for the entity, along with a description of the cause of the state transition.

Unless otherwise indicated in the state values table or state transition diagrams, any “possible additional” SST value (i.e., a SST value shown in the third column of the entity's state values table) that is applied to an entity will remain applied to the entity after a Primary State transition.

A simplified command format notation is used in the state diagrams to specify a command that causes a state transition. When execution of a command with a state value specified is shown in a state transition diagram, the command is shown without any of the preceding parameter blocks, parameters, or separating colons that may be necessary. For example: ENT-T3::AID:::IS,AINS is simply shown as ENT-T3:IS,AINS.

G.2.1. Generic State Model

The generic state model shown below is the basis for each of the equipment, OC12, OC3, EC1, STS1, STS3C, VT1.5, DS3, DS1, F3, and cross connect entity state transition models in the system. Although each entity state transition model has variations from the generic model, the generic model provides an introduction to entity state transitions in the system.

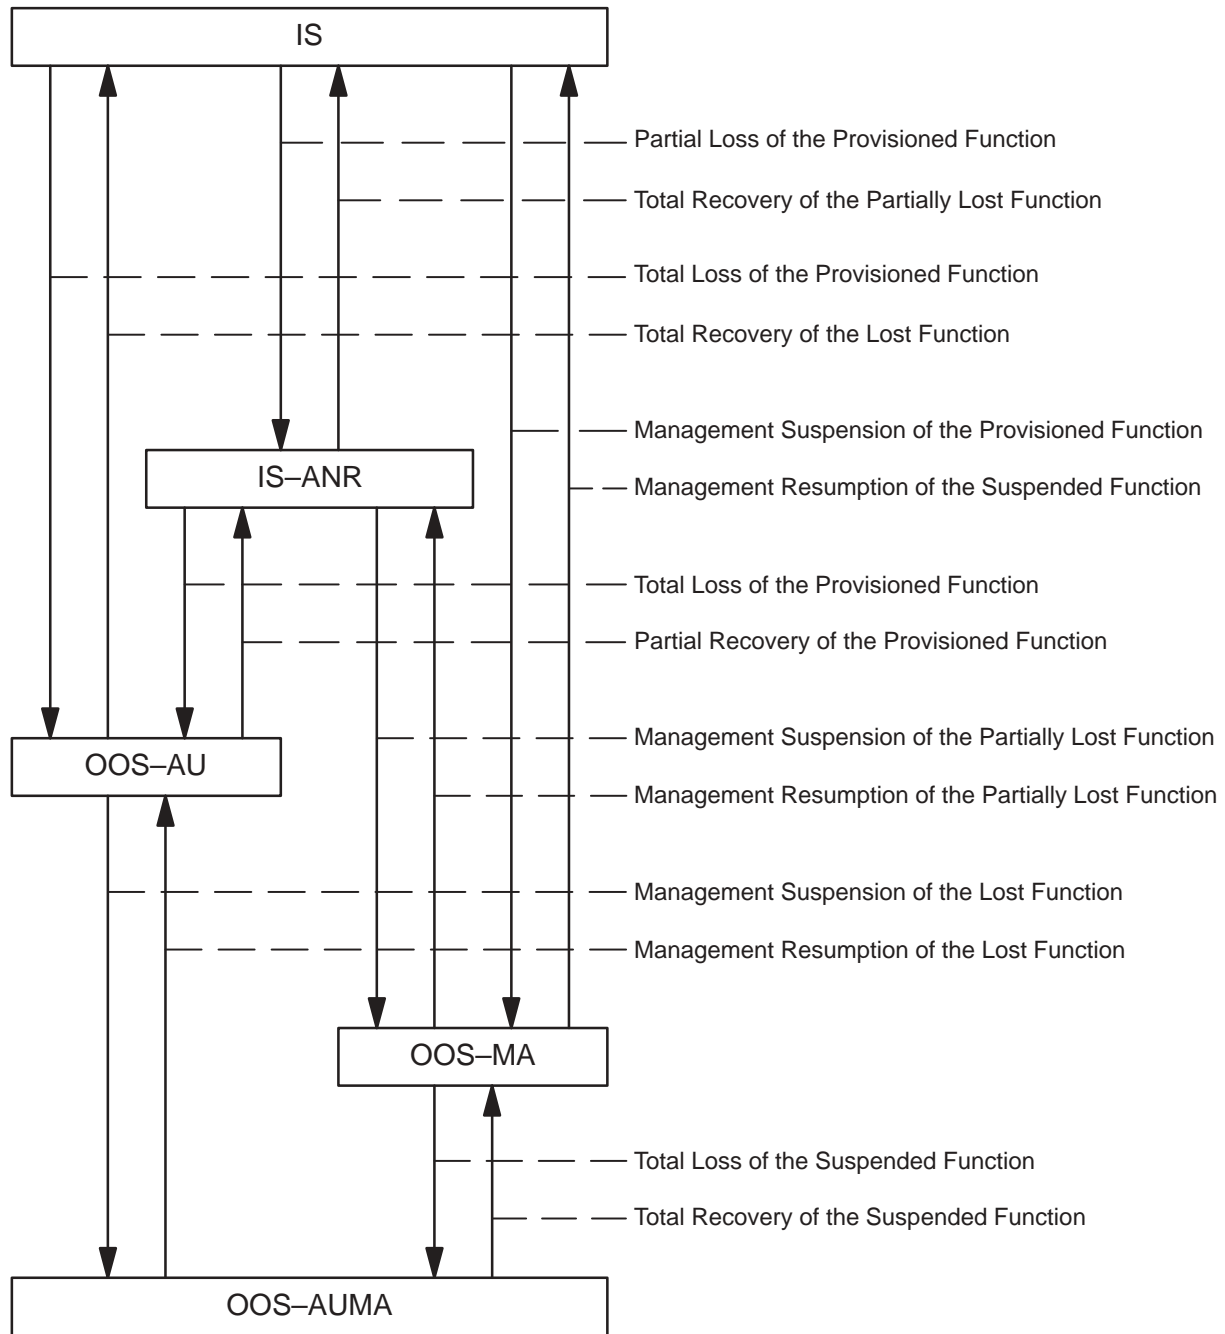

Figure G.1. Generic State Model

G.2.2. Equipment State Transitions

The valid PST,SST combinations and applicable state values for equipment entities is provided in Table G.1.

Table G.1. Equipment State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		{STBYC STBYH}, {ASI PRI PSI}, SDEE] ^{1, 3, 4, 9}
IS-ANR		{STBYH}, {ASI PRI PSI}, SDEE] ^{1, 4, 9}
OOS-AU	[UEQ] [UEQ&MEA] ⁶ [PWR] ⁷ [SWDL] ⁸	{ASI PRI PSI}, SDEE] ^{1, 4} {ASI PRI PSI}, SDEE] ^{1, 4} {ASI PRI PSI}, SDEE] ^{1, 4} {ASI PRI PSI}, SDEE] ^{1, 4}
OOS-AUMA	[UEQ] [UEQ&UAS] ⁵ [UEQ&MEA] ⁶ [UEQ&MT] ² [SWDL] ⁸	{ASI PRI PSI}, SDEE] ^{1, 4} {ASI PRI PSI}, SDEE] ^{1, 4} {ASI PRI PSI}, SDEE] ^{1, 4}
OOS-MA	[UAS] ⁵ [UAS&PWR] ⁷ [PWR] ⁷ [MT] ²	{ASI PRI PSI}, SDEE] ^{1, 4}
Notes: 1. {PRI, PSI, SDEE} only applies to a DSI,EP3,ES1,HMU,LMU,O1B,O4M,S3M circuit pack. 2. {MT} only applies to an DSI,EP3,ES1,HMU,LMU,M16,M32,O1B,O4M,S3M circuit pack. 3. {STBYC} only applies to a ACM,CIM,CPU,SIO,IPU, or SPB circuit pack. 4. {ASI} only applies to a CPU, IPU, or SPB circuit pack. 5. {UAS} does not apply to a MCB circuit pack. 6. {MEA} only applies to a CDA,CDB,DSI,EOB,EP3,ES1,HMU,IPB,LMU,M16,M32,M40,O1B,O4M,S3M,SPB,AXB,P39,P56, or RPB circuit pack. 7. {PWR} only applies to a PSF or PST circuit pack. 8. {SWDL} only applies to a ACM,CIM,EP3,ES1,IPU,M16,M32,M40,O1B,O4M,S3M,AXB, or SPB circuit pack. 9. {STBYH} only applies to a DSB,DSI,EP3,ES1,HMU,LMU,O1B,O4M,S3M circuit pack.		

Equipment entity state transition diagrams are provided in Figures G.2. through G.21. Each state transition diagram shows the Primary State transitions for the equipment entity, along with a description of the cause of the state transition.

A cross-reference of equipment types vs the corresponding state transition diagram is provided in Table G.2.

Table G.2. Cross-Reference of Equipment Types vs. State Diagrams					
Equipment Type	State Diagrams	Equipment Type	State Diagrams	Equipment Type	State Diagrams
ACL	Figure G.2.	ACM	Figure G.4.	CDA	Figure G.3.

SWI	Figure G.9.				

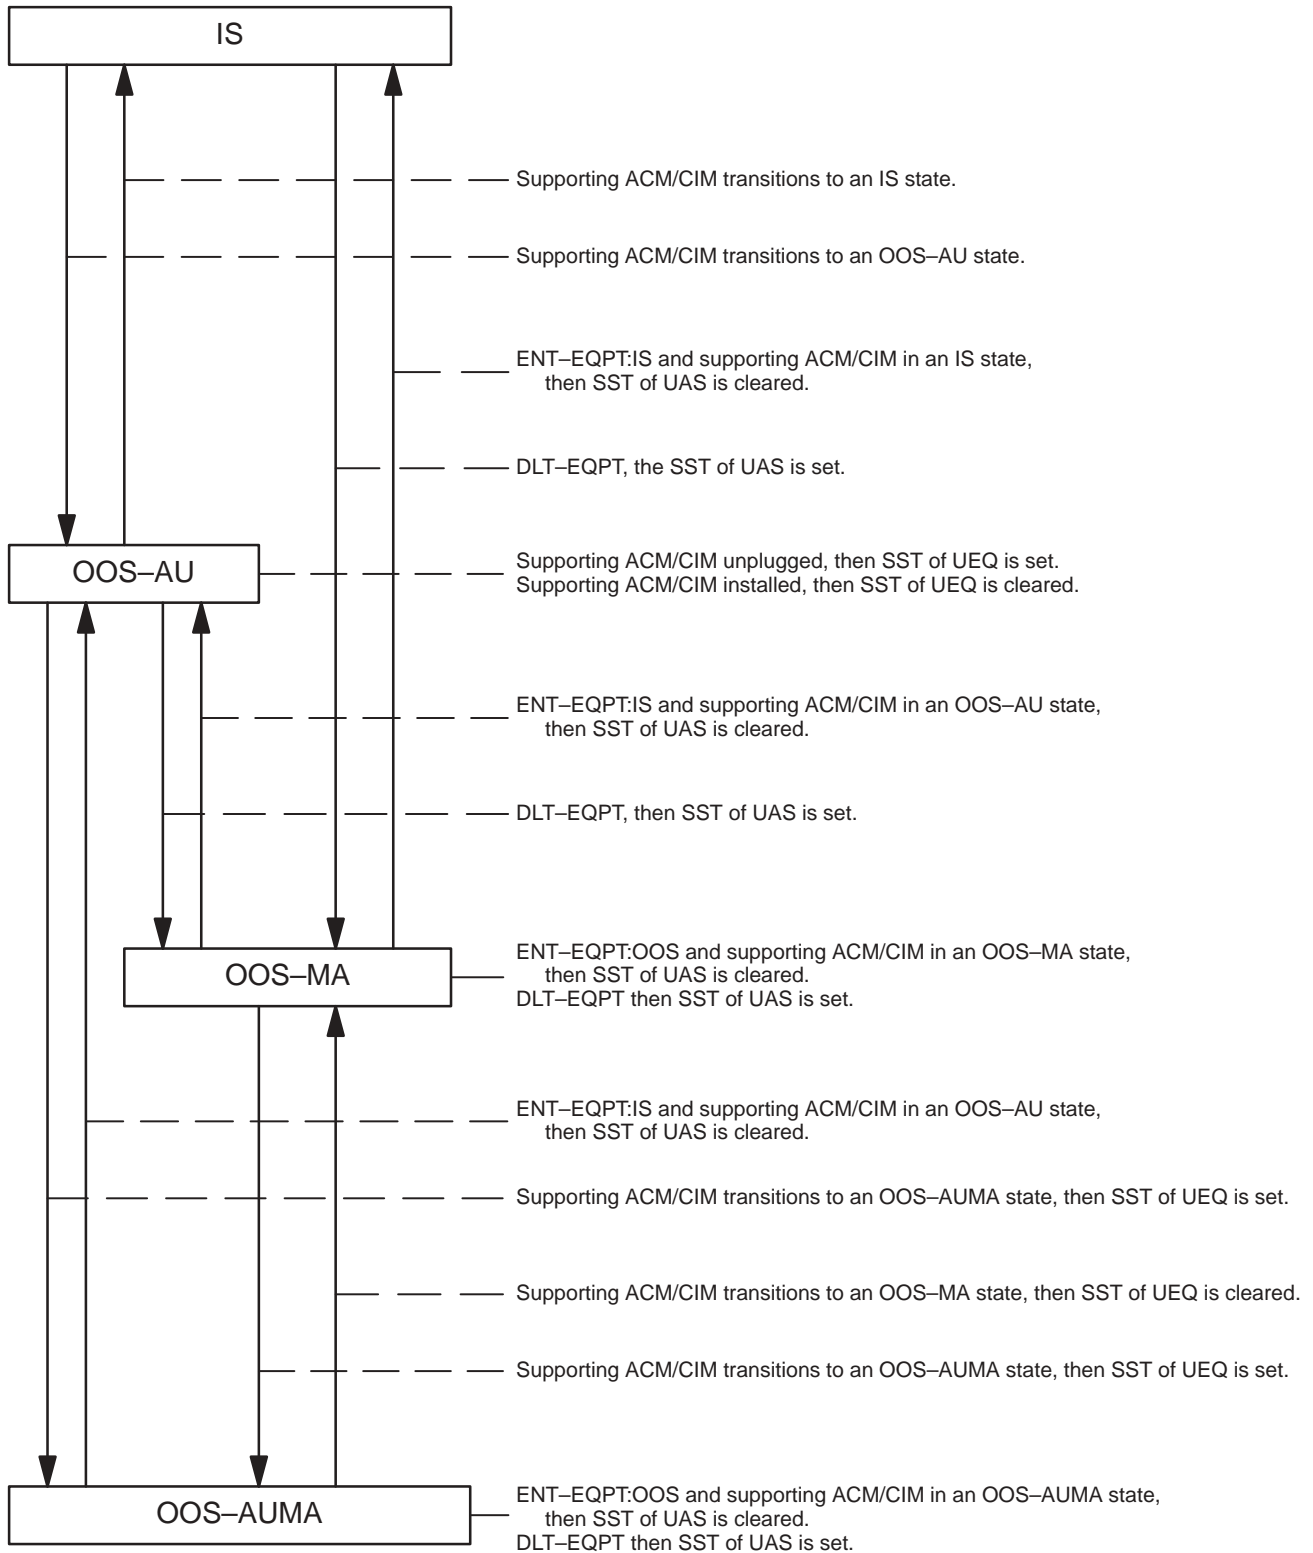

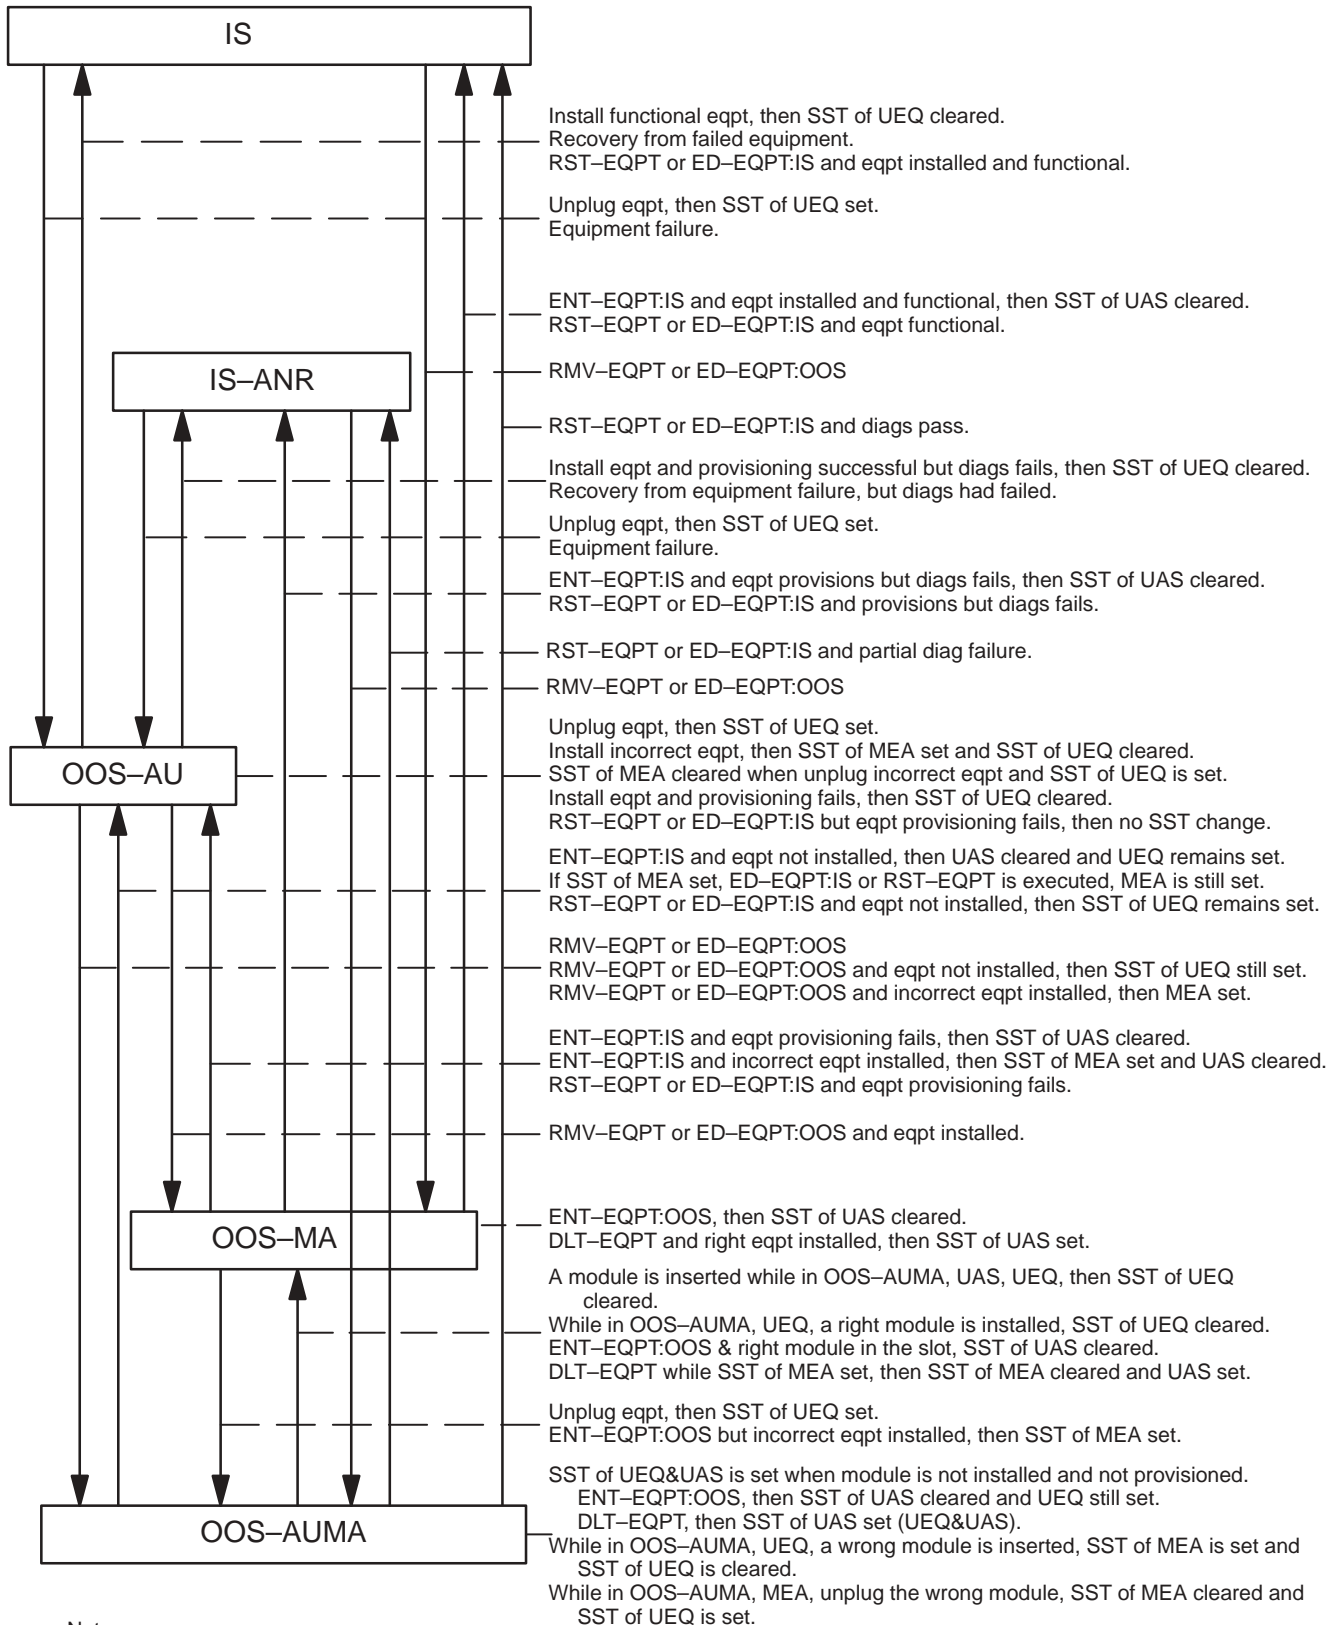

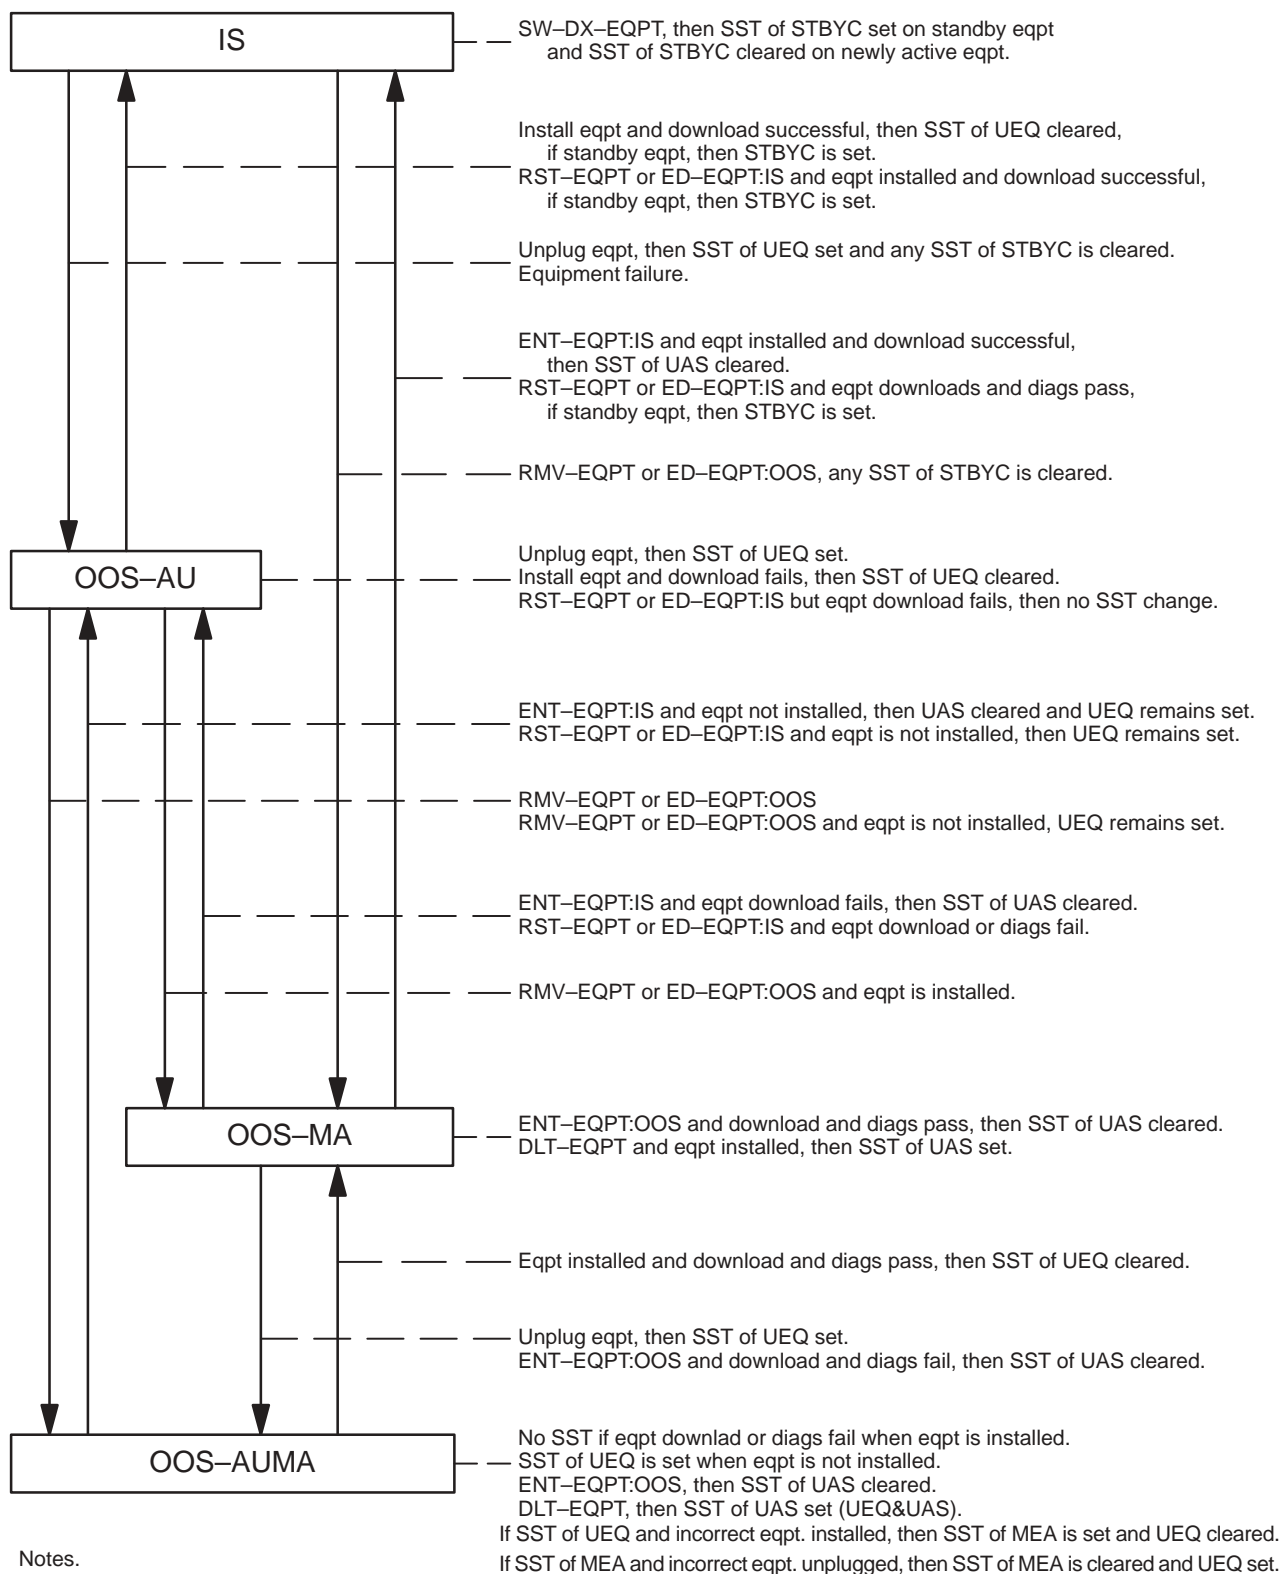

Figure G.2. ACL Equipment State Transitions

Notes.

1. The term "provisioning" refers to processor communication with the equipment and initializing hardware control registers.
2. For an OXB, a temporary transition to OOS-MA, SWDL or OOS-AUMA, SWDL occurs while a software download is in-process.

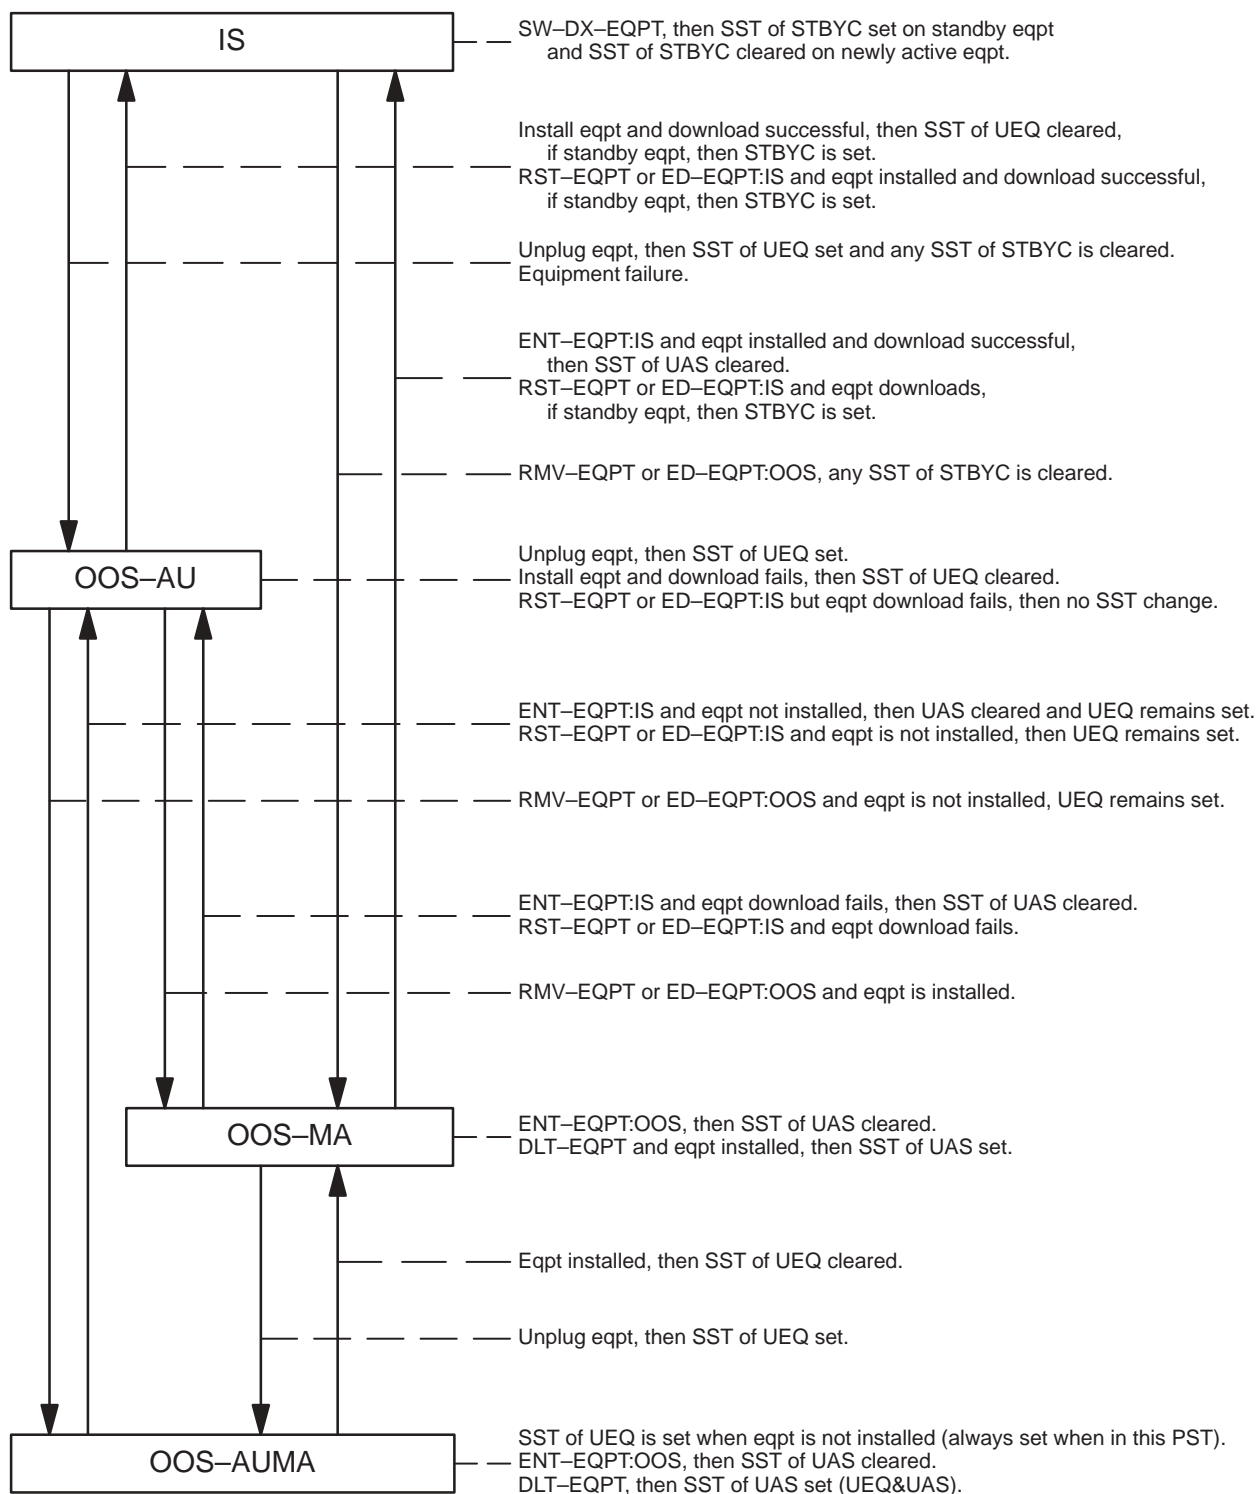

**Figure G.3. CDA, CDB, EOB, IOB, IPB, OXB, and RPB Equipment State
Transitions**

Notes.

- The following SST is applicable for any PST:
For an IPU or SPB, a SST of ASI is set if automatic copy switching is inhibited via INH-SW-EQPT, otherwise ASI is cleared.
- For a PST of IS: The standby ACM, CIM, IPU, or SPB has a SST of STBYC set, otherwise STBYC is cleared (the active ACM, CIM, IPU or SPB does not have a SST of STBYC).
- A temporary transition to OOS-MA, SWDL or OOS-AUMA, SWDL occurs while a software download is in-process.

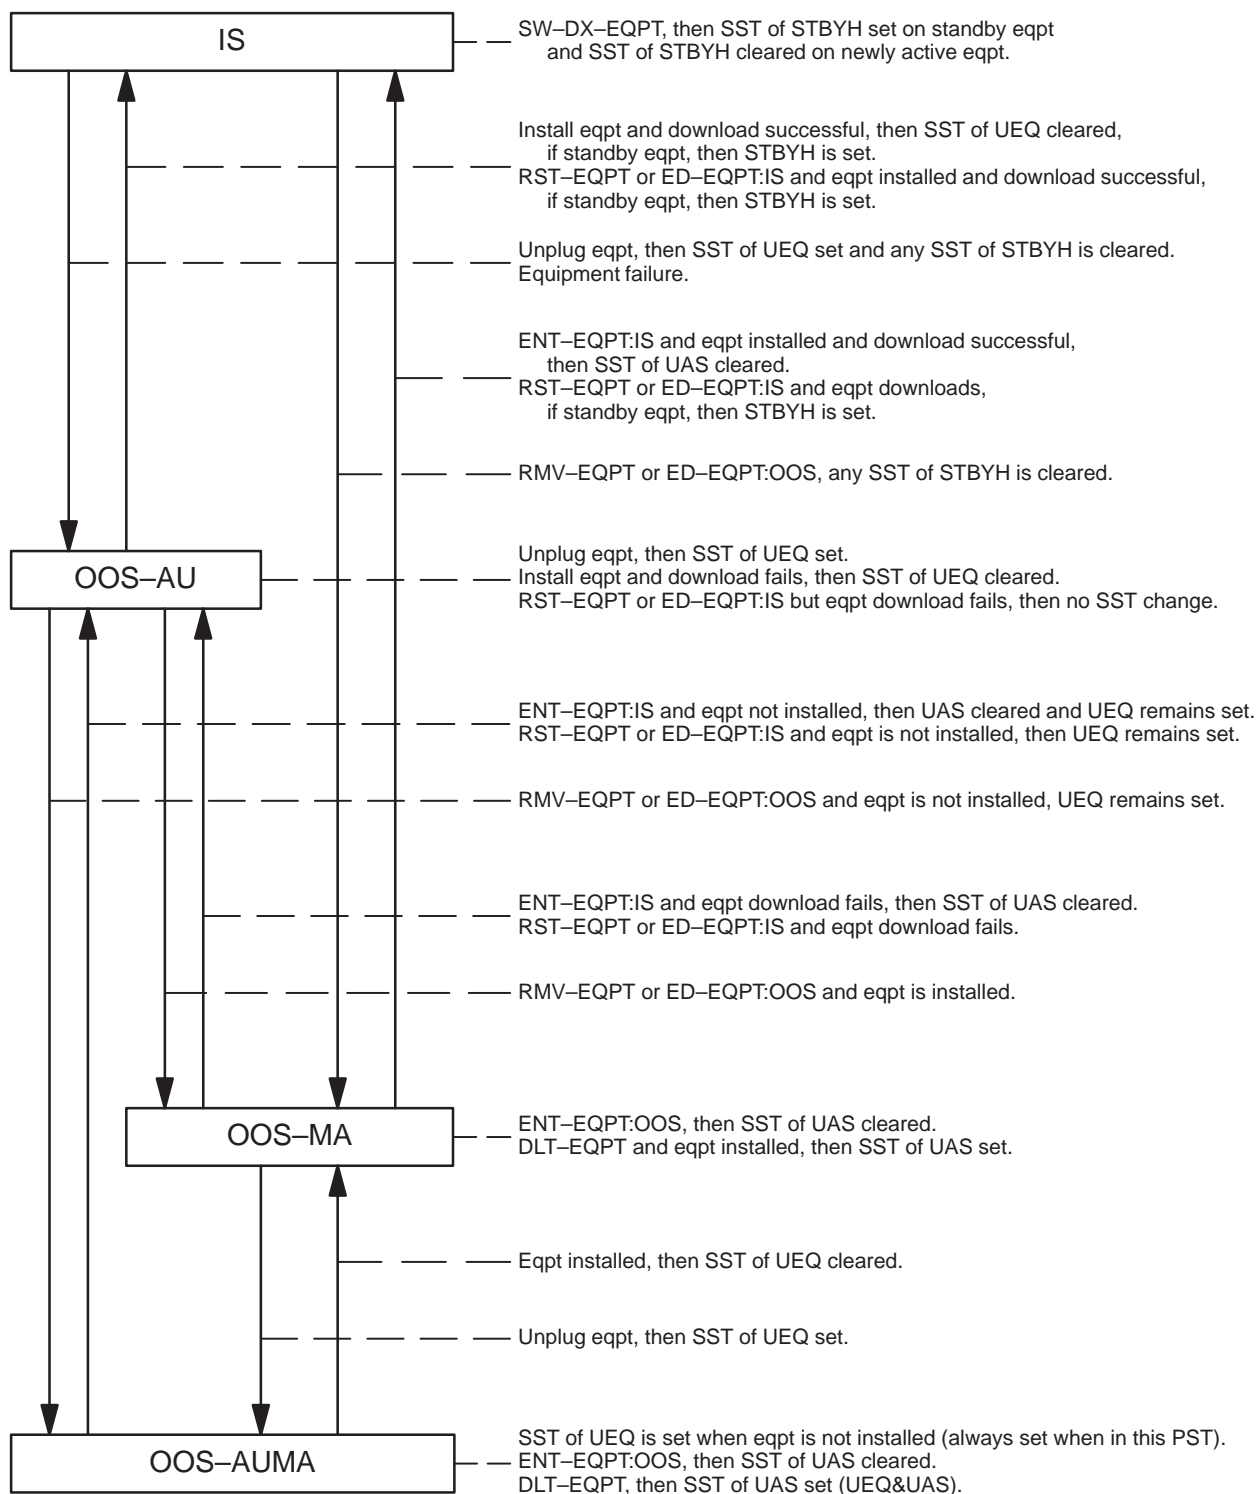

Figure G.4. ACM, CIM, IPU, and SPB Equipment State Transitions

Notes.

1. The following SST is applicable for any PST:
For a CPU, a SST of ASI is set if automatic copy switching is inhibited via INH-SW-EQPT, otherwise ASI is cleared.
2. For a PST of IS: The standby CPU has a SST of STBYC set, otherwise STBYC is cleared (the active CPU does not have a SST of STBYC).

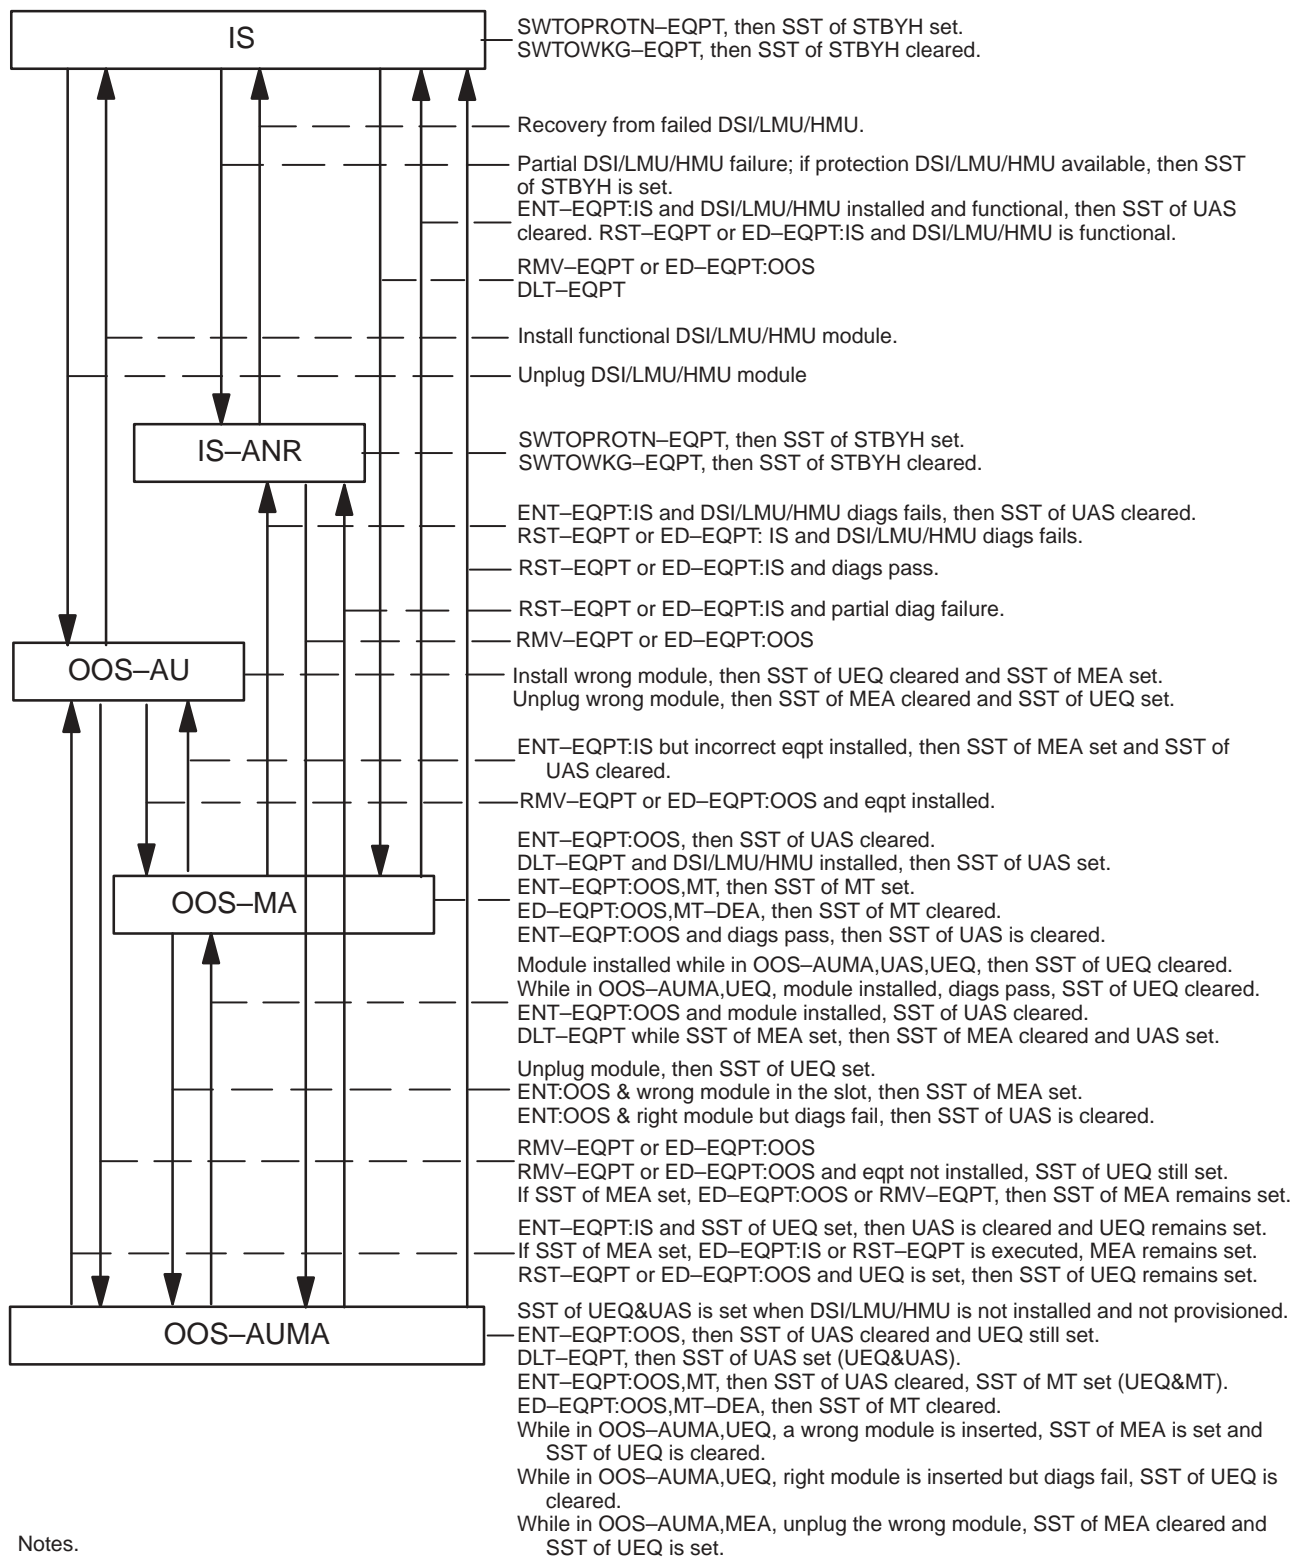

Figure G.5. CPU Equipment State Transitions

Notes.

1. The following SST is applicable for any PST:
For a DSB, a SST of ASI is not set since INH-SW-EQPT is not valid for the eqpt type.
2. For a PST of IS: The standby DSB has a SST of STBYH set, otherwise STBYH is cleared (the active DSB does not have a SST of STBYH).

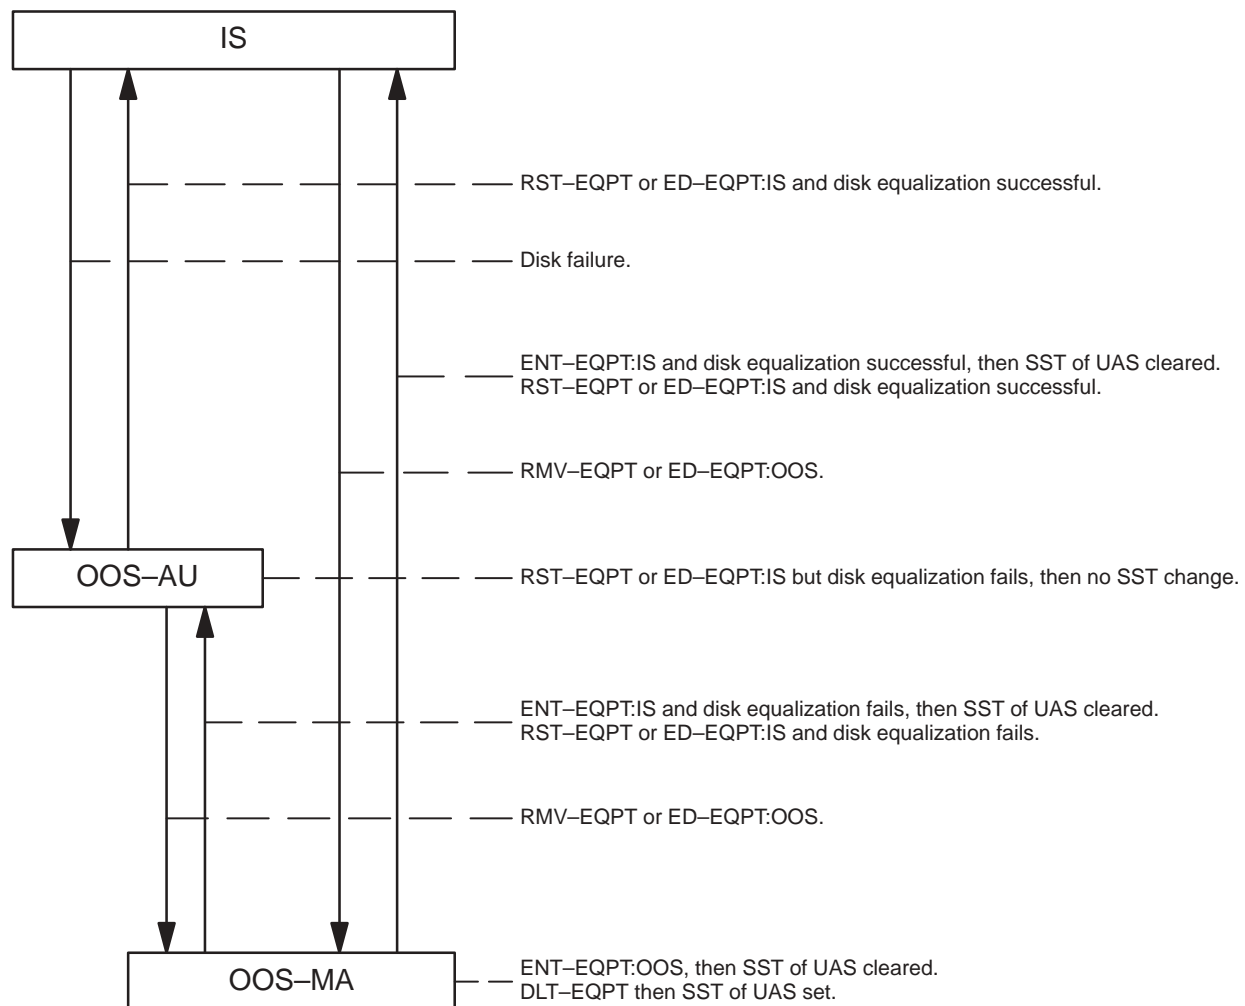

Figure G.6. DSB Equipment State Transitions

Notes.

- The following SSTs are applicable for any PST:
SST of SDEE is set if any supported DS3/DS1 is provisioned (via ENT-T1), otherwise SDEE is cleared.
SST of PSI is set if protection switching is inhibited via INH-SWTOPROTN-EQPT, otherwise PSI is cleared.
SST of PRI is set if release from protection is inhibited via INH-SWTOWKGEQPT, otherwise PRI is cleared.
- For PST of IS or IS-ANR: The Protect DSI/LMU/HMU has a SST of STBYH set if it is not providing protection; a Main DSI/LMU/ HMU has a SST of STBYH set if it is being protected.

Figure G.7. DSI, HMU, and LMU Equipment State Transitions

Notes.

1. The term "disk equalization" refers to synchronizing (equalizing) the contents of an out-of-synchronization disk drive with the contents of the active disk drive.

Figure G.8. DSK Equipment State Transitions

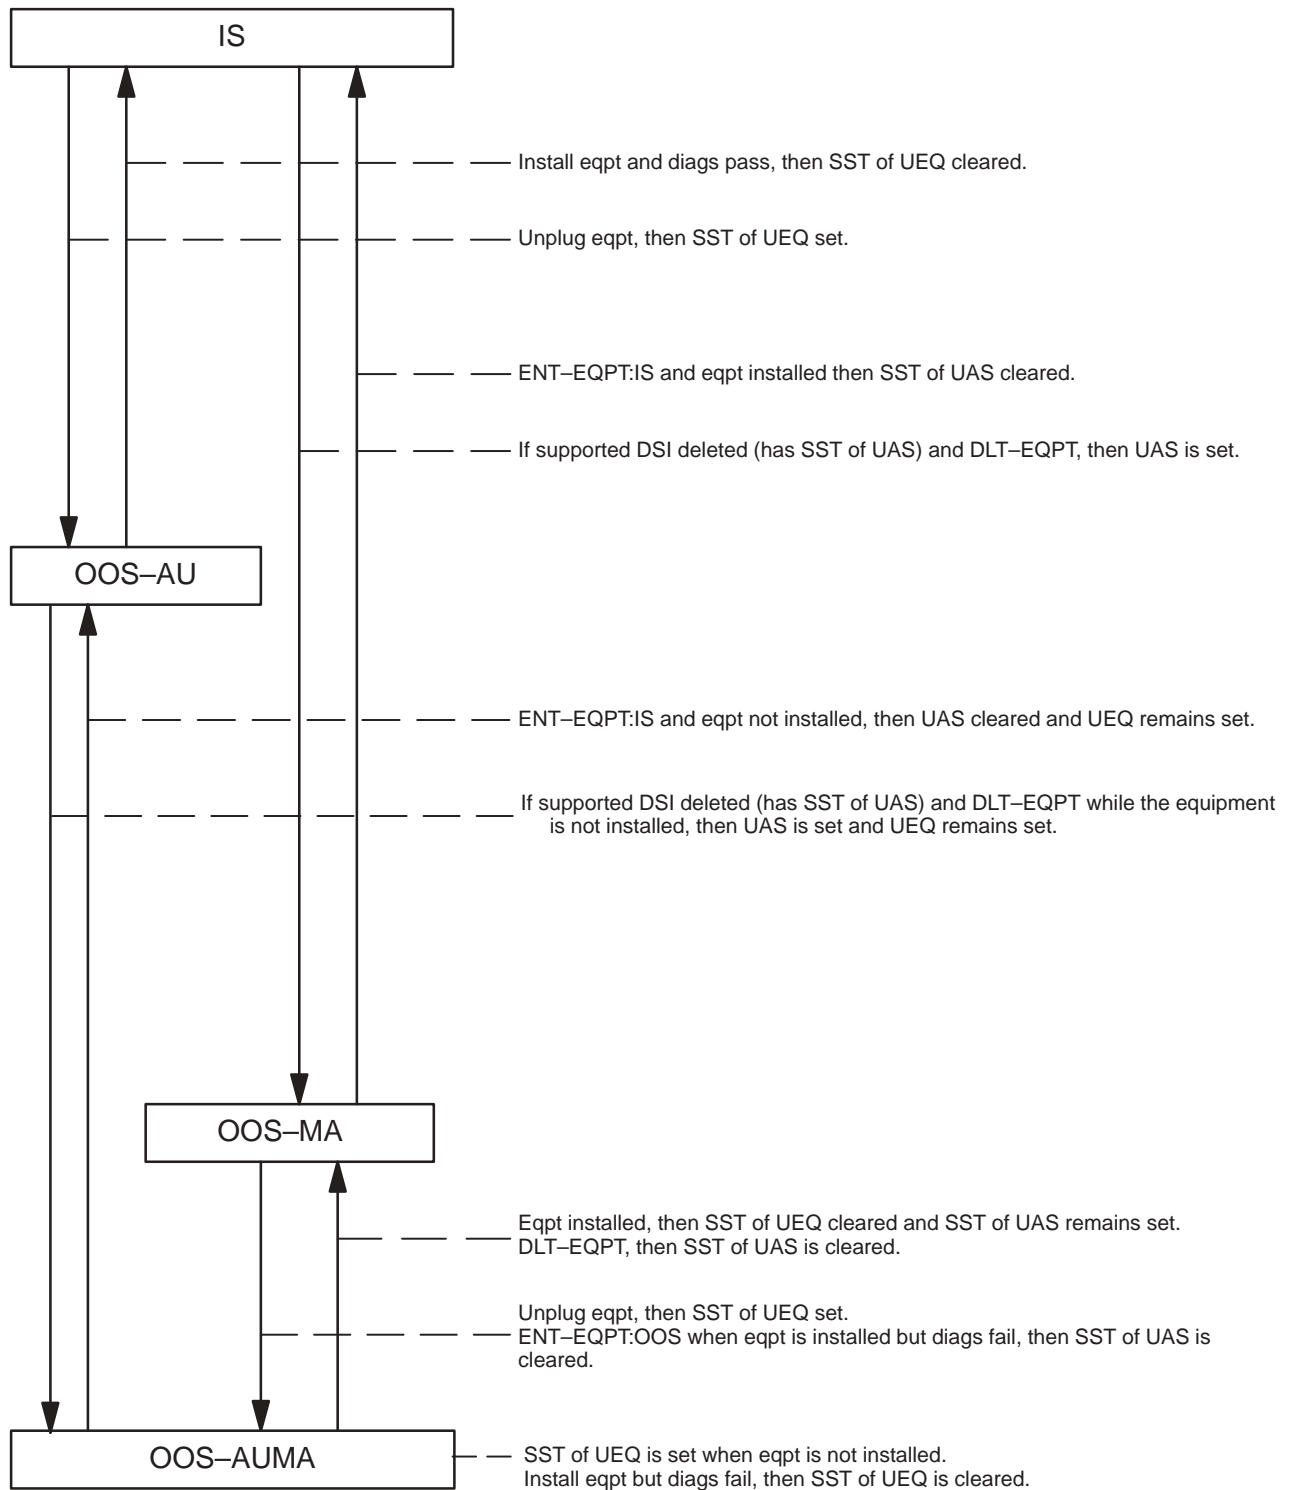

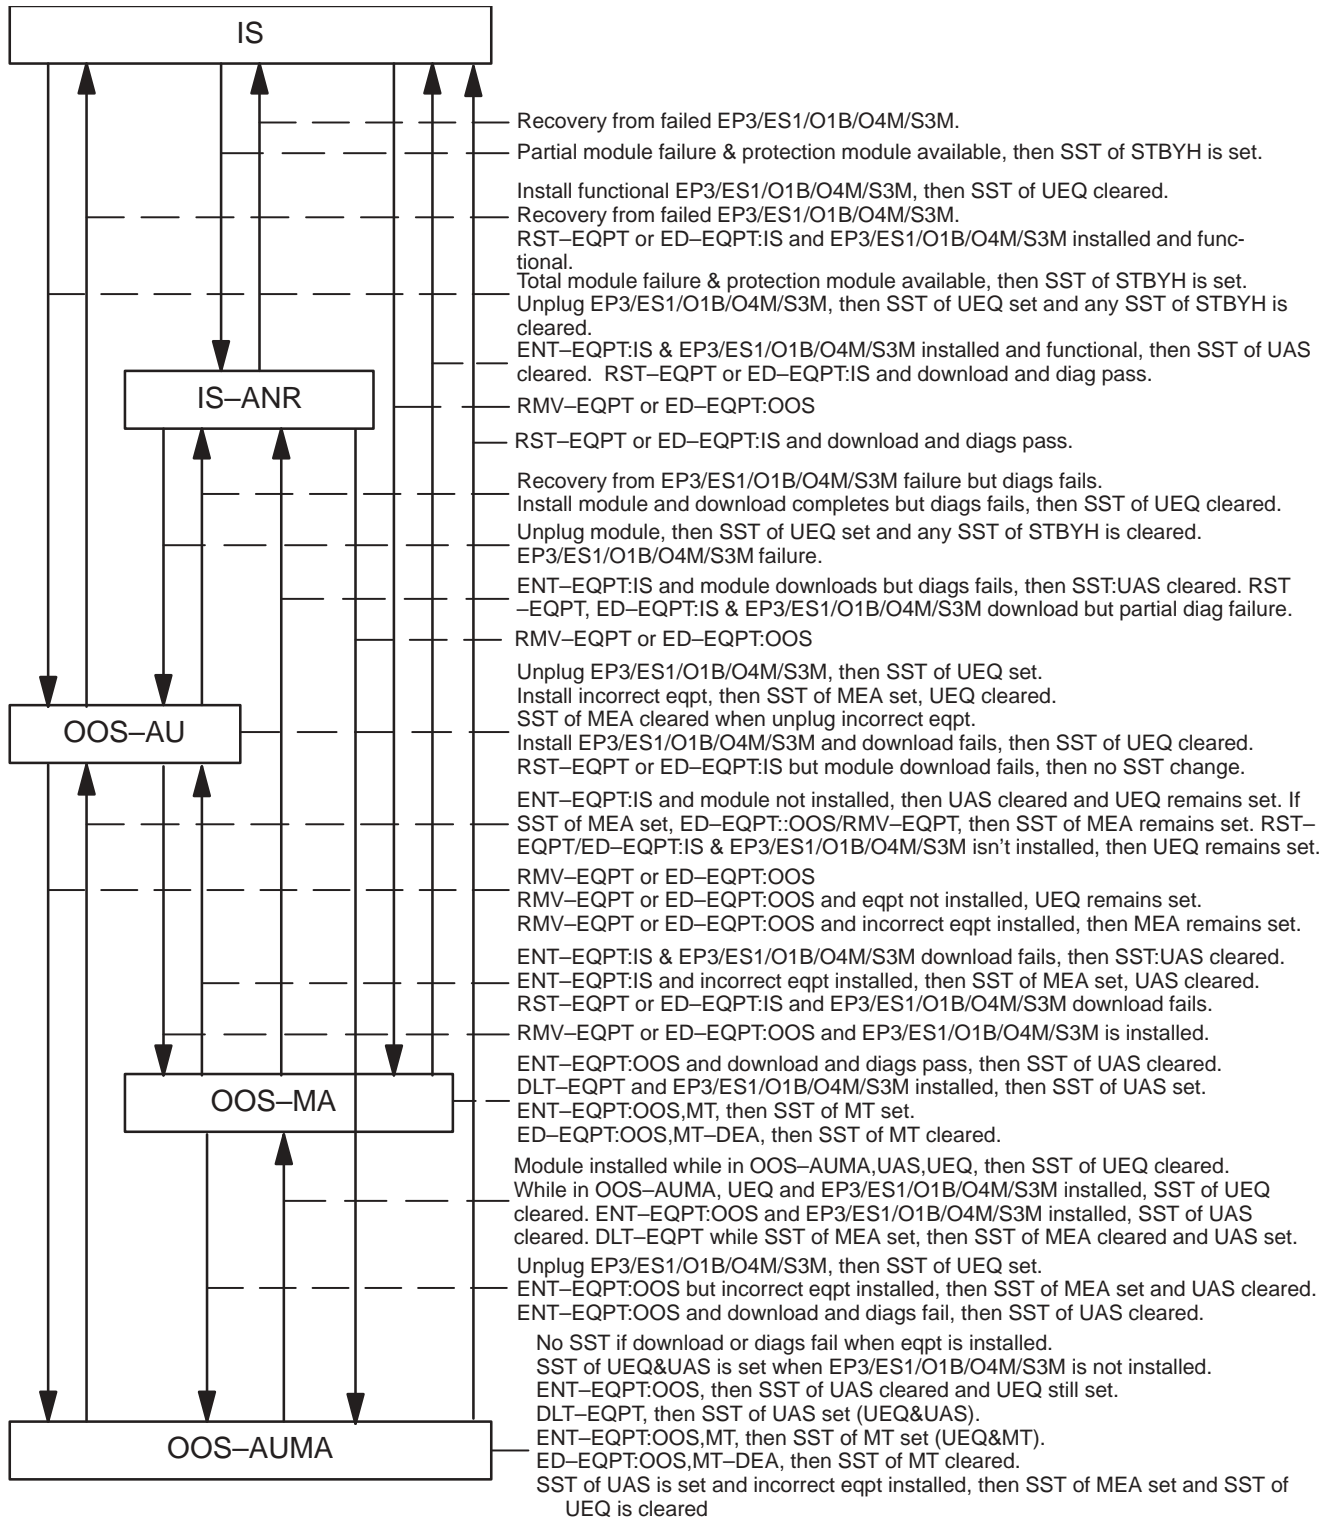

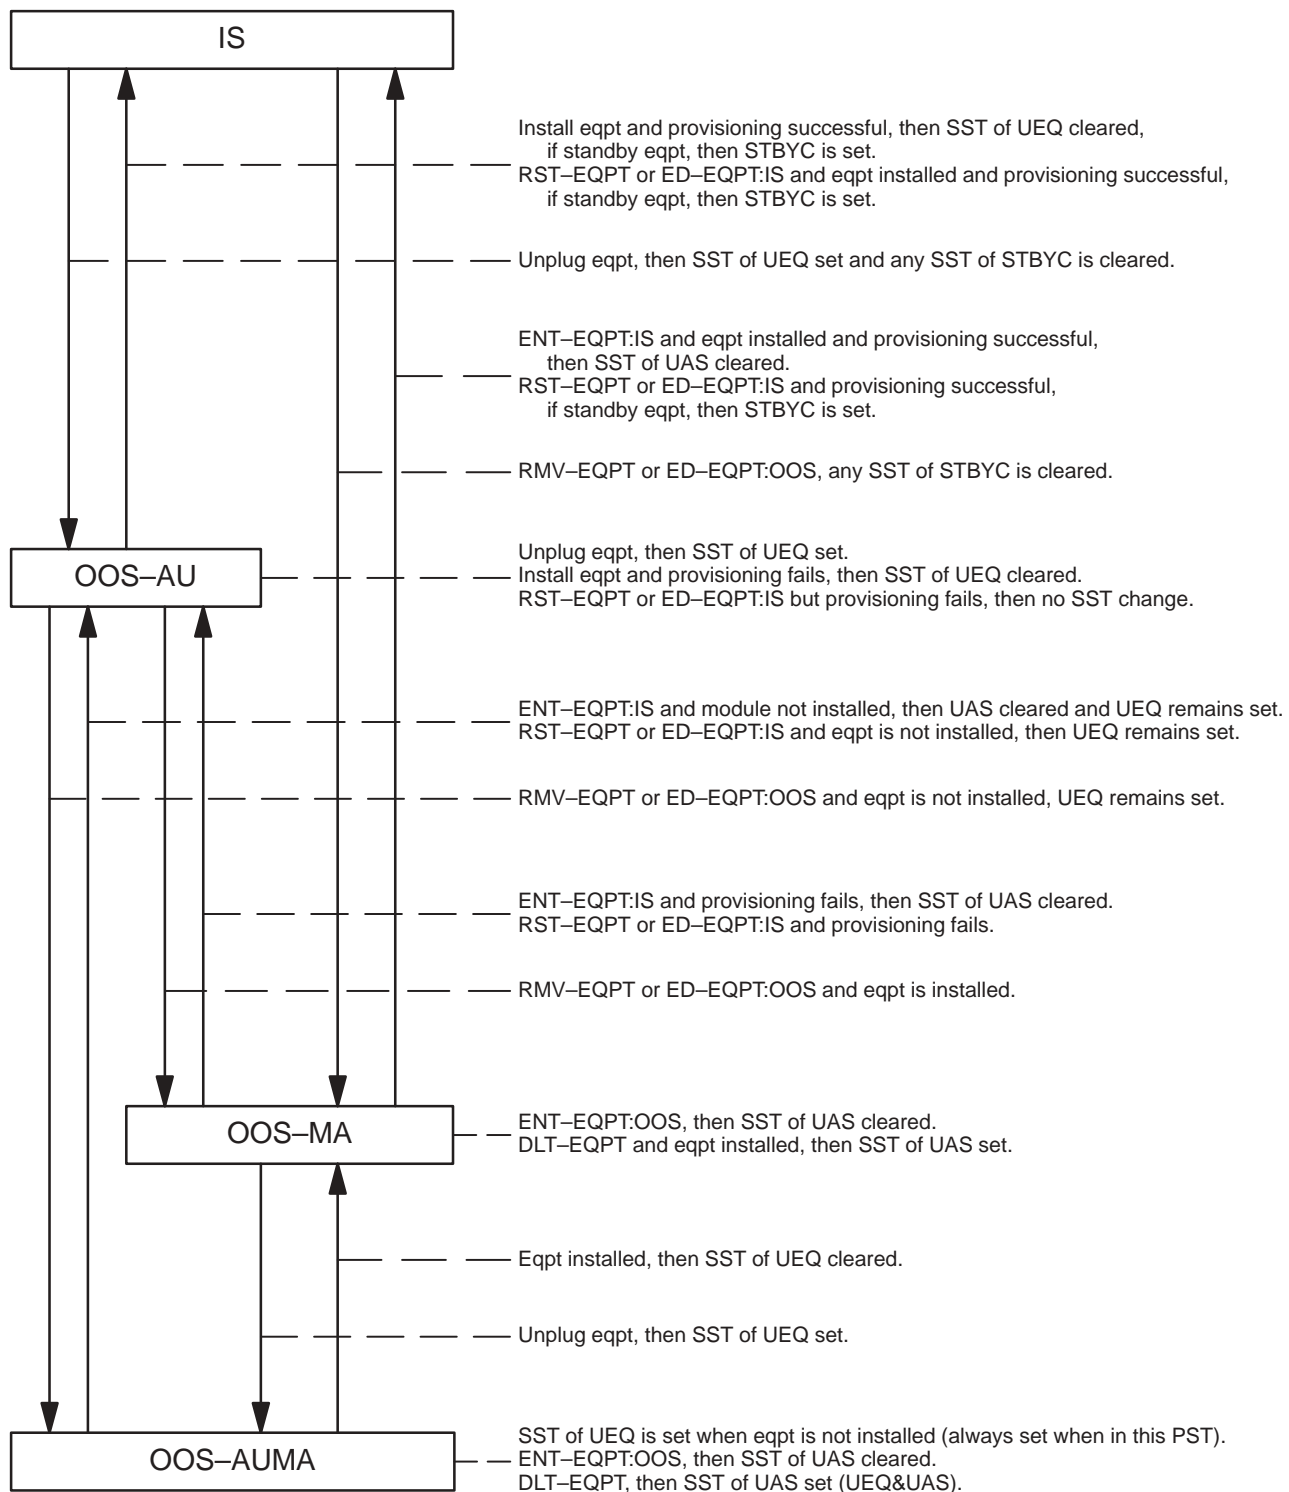

Figure G.9. ESA, PRT, and SWI Equipment State Transitions

Notes.

- The following SSTs are applicable for any PST:
SST of SDEE is set if any supported DS3/EC1/OC12/OC3 is provisioned (via ENT-T3/EC1/OC12/OC3), otherwise SDEE is cleared.
SST of PSI is set if protection switching is inhibited via INH-SWTOPROTN-EQPT on EP3/ES1 and OPR-PROTNSW-OC12/OC3 on O1B/O4M/S3M, otherwise PSI is cleared.
SST of PRI on EP3 is set if release from protection is inhibited via INH-SWTOWKG-EQPT, otherwise PRI is cleared.
- For PST of IS or IS-ANR: The Protect EP3/ES1/O1B/O4M/S3M has a SST of STBYH set if it is not providing protection; a Main EP3/ES1/O1B/O4M/S3M has a SST of STBYH set if it is being protected.
- A temporary transition to OOS-MA,SWDL or OOS-AUMA,SWDL occurs while a software download is in-process.

Figure G.10. EP3, ES1, O1B, O4M and S3M Equipment State Transitions

Notes.

1. For a PST of IS: The standby eqpt has a SST of STBYC set, otherwise STBYC is cleared (the active eqpt does not have a SST of STBYC).
2. The term "provisioning" refers to processor communication with the eqpt and initializing hardware control registers.

Figure G.11. ICM and SIO Equipment State Transitions

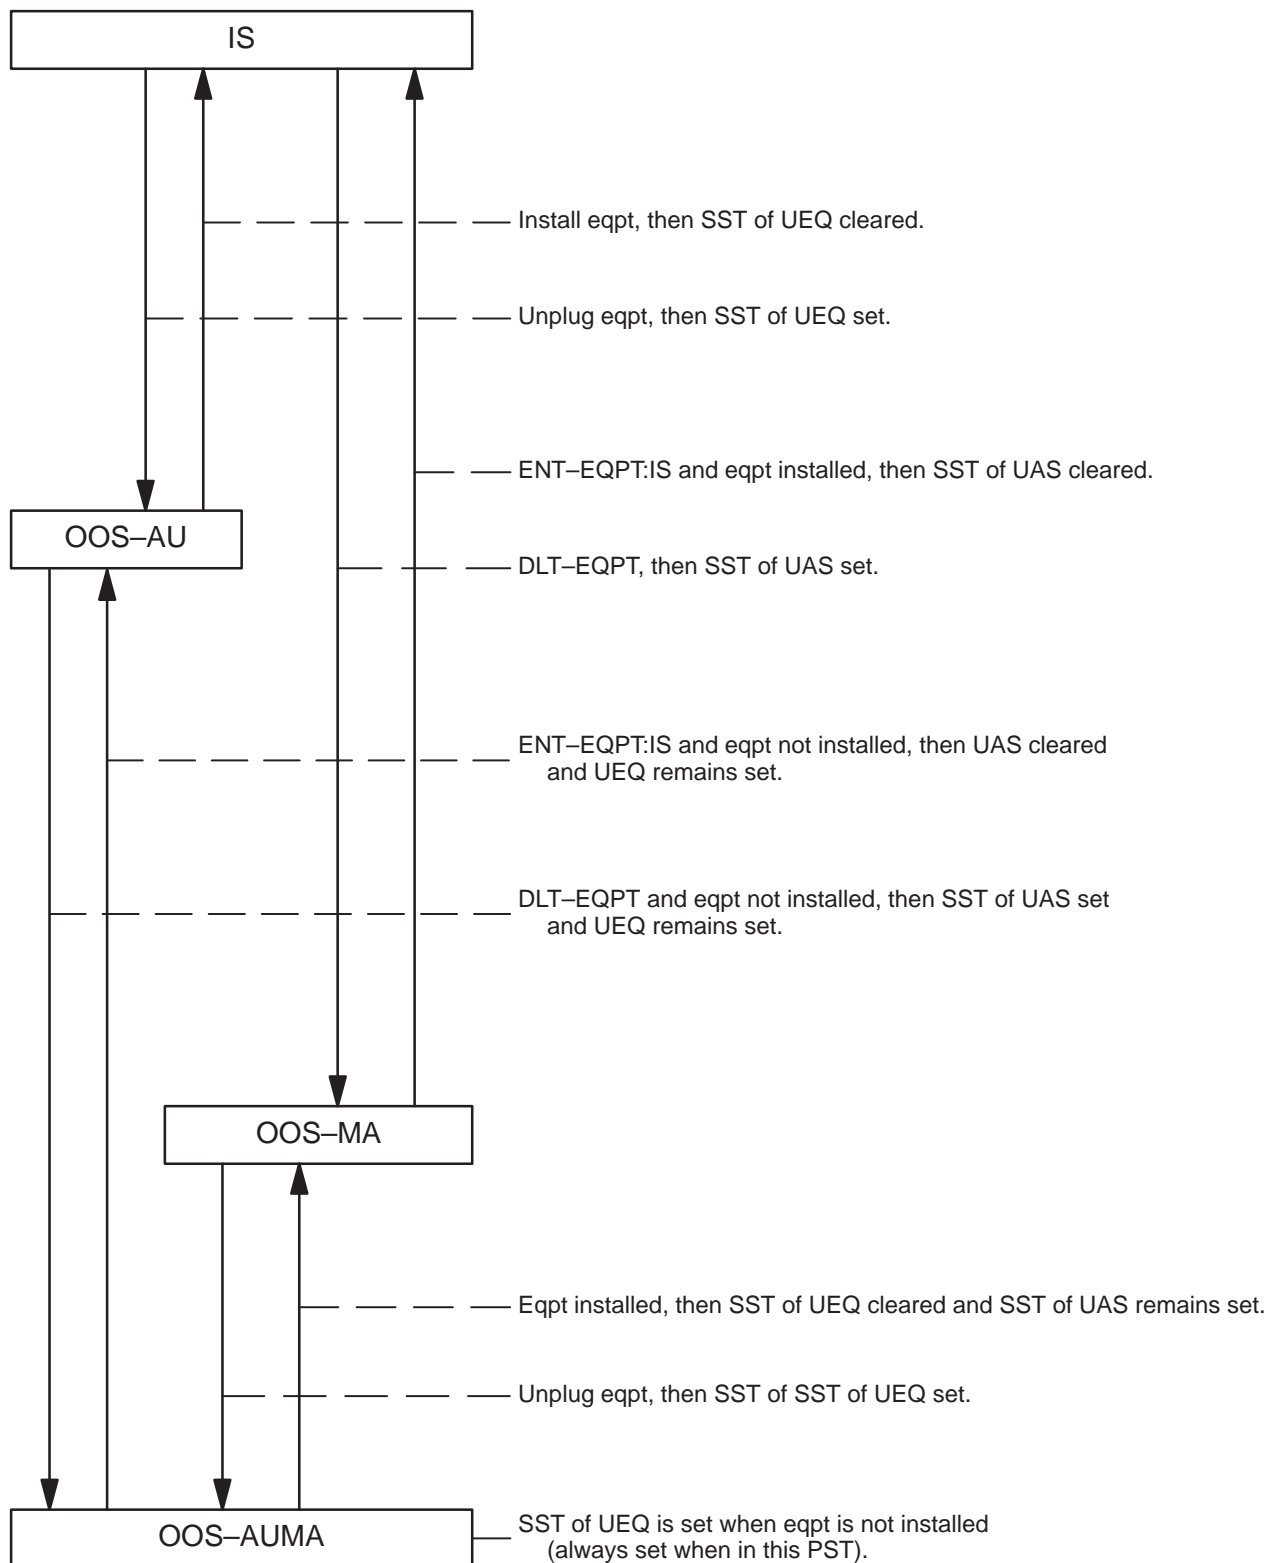

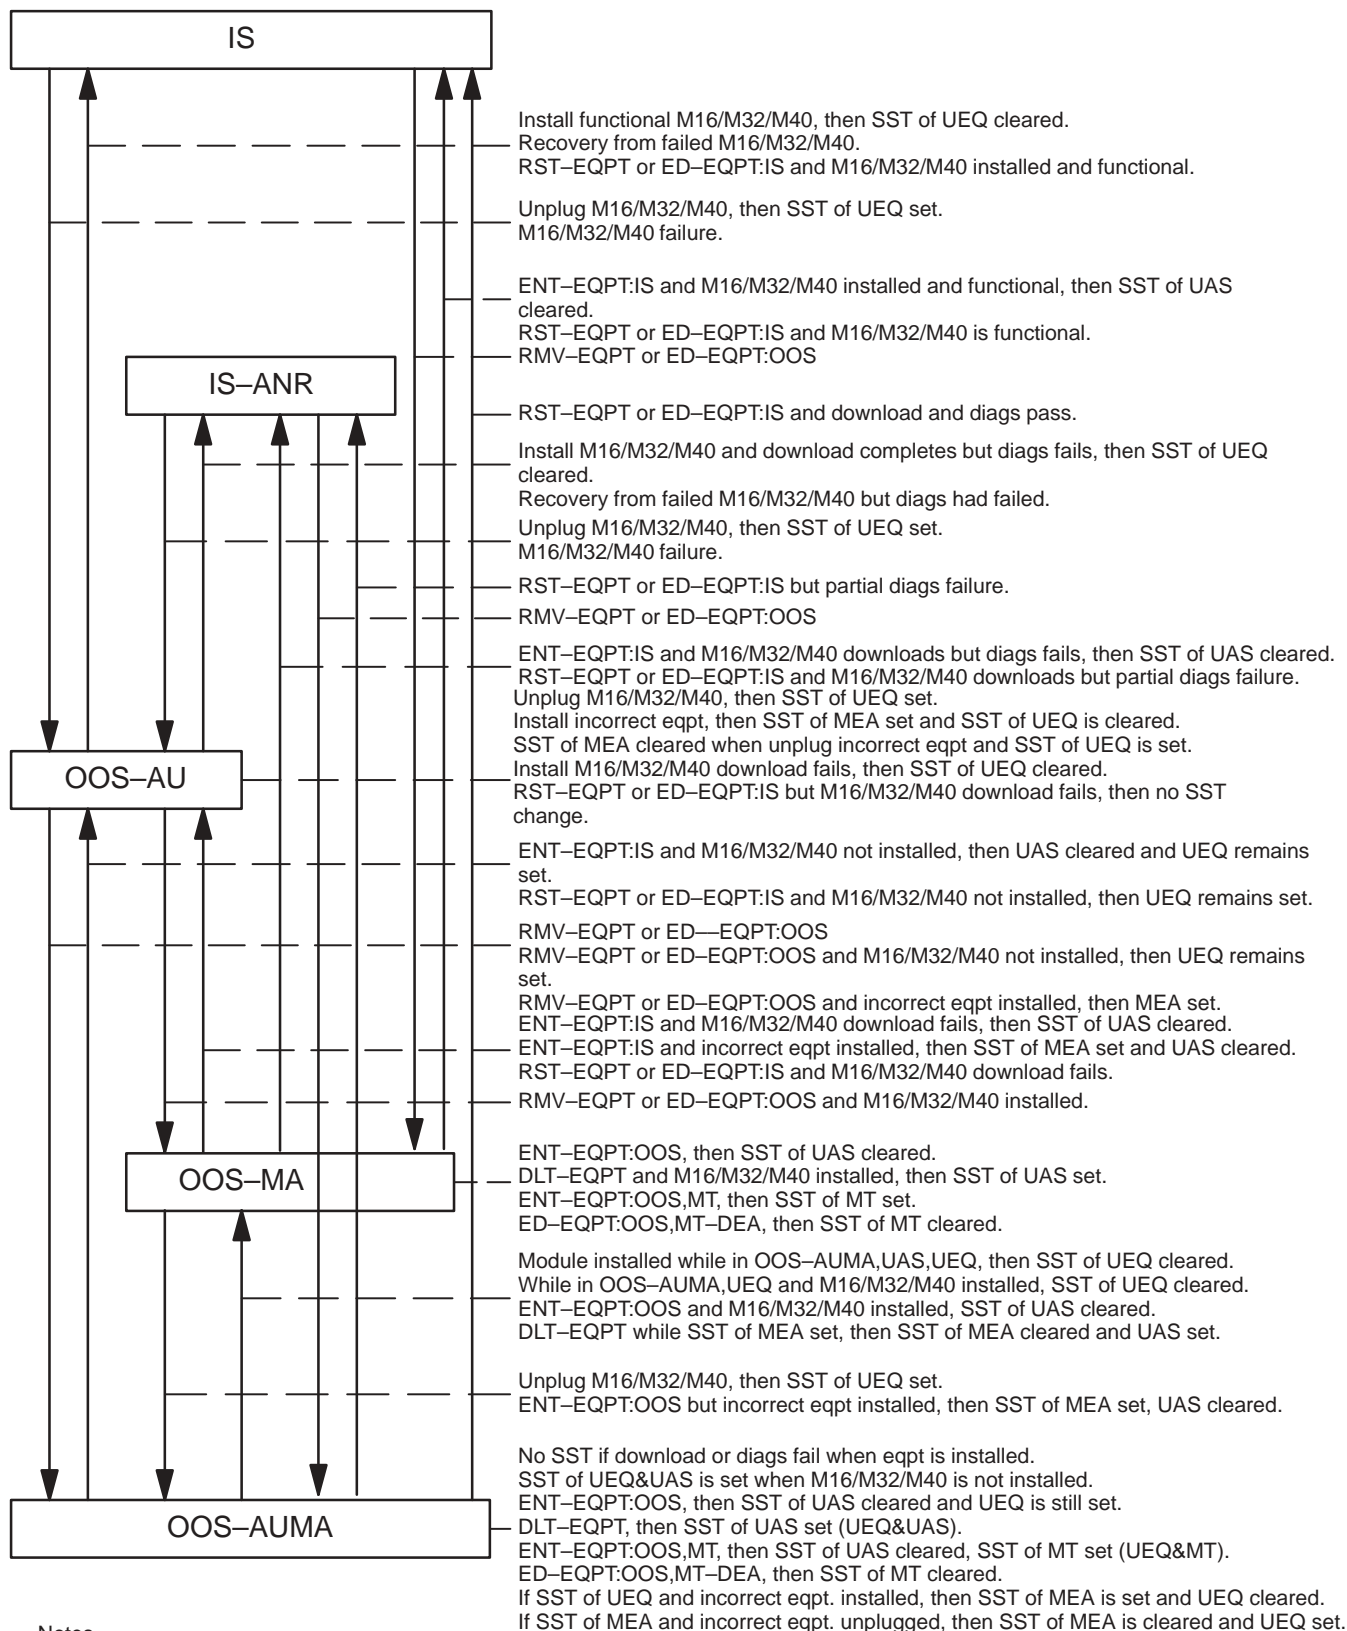

Figure G.12. LT1, LT2, LT4, LT5, LT8, PDU, and RDU Equipment State Transitions

Notes.

1. A temporary transition to OOS-MA,SWDL or OOS-AUMA,SWDL occurs while a software download is in-process.

Figure G.13. M16, M32, and M40 Equipment State Transitions

Notes.

1. The term "provisioning" refers to processor communication with the MCB and initializing hardware control registers.

Figure G.14. MCB Equipment State Transitions

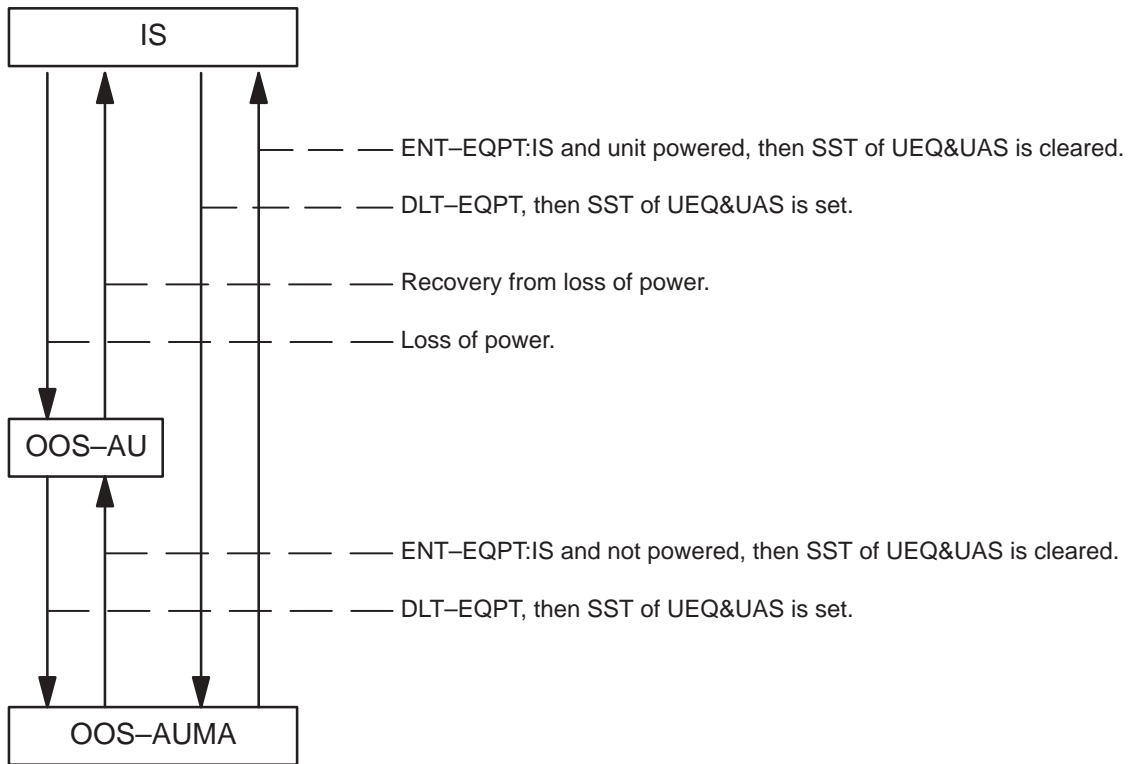

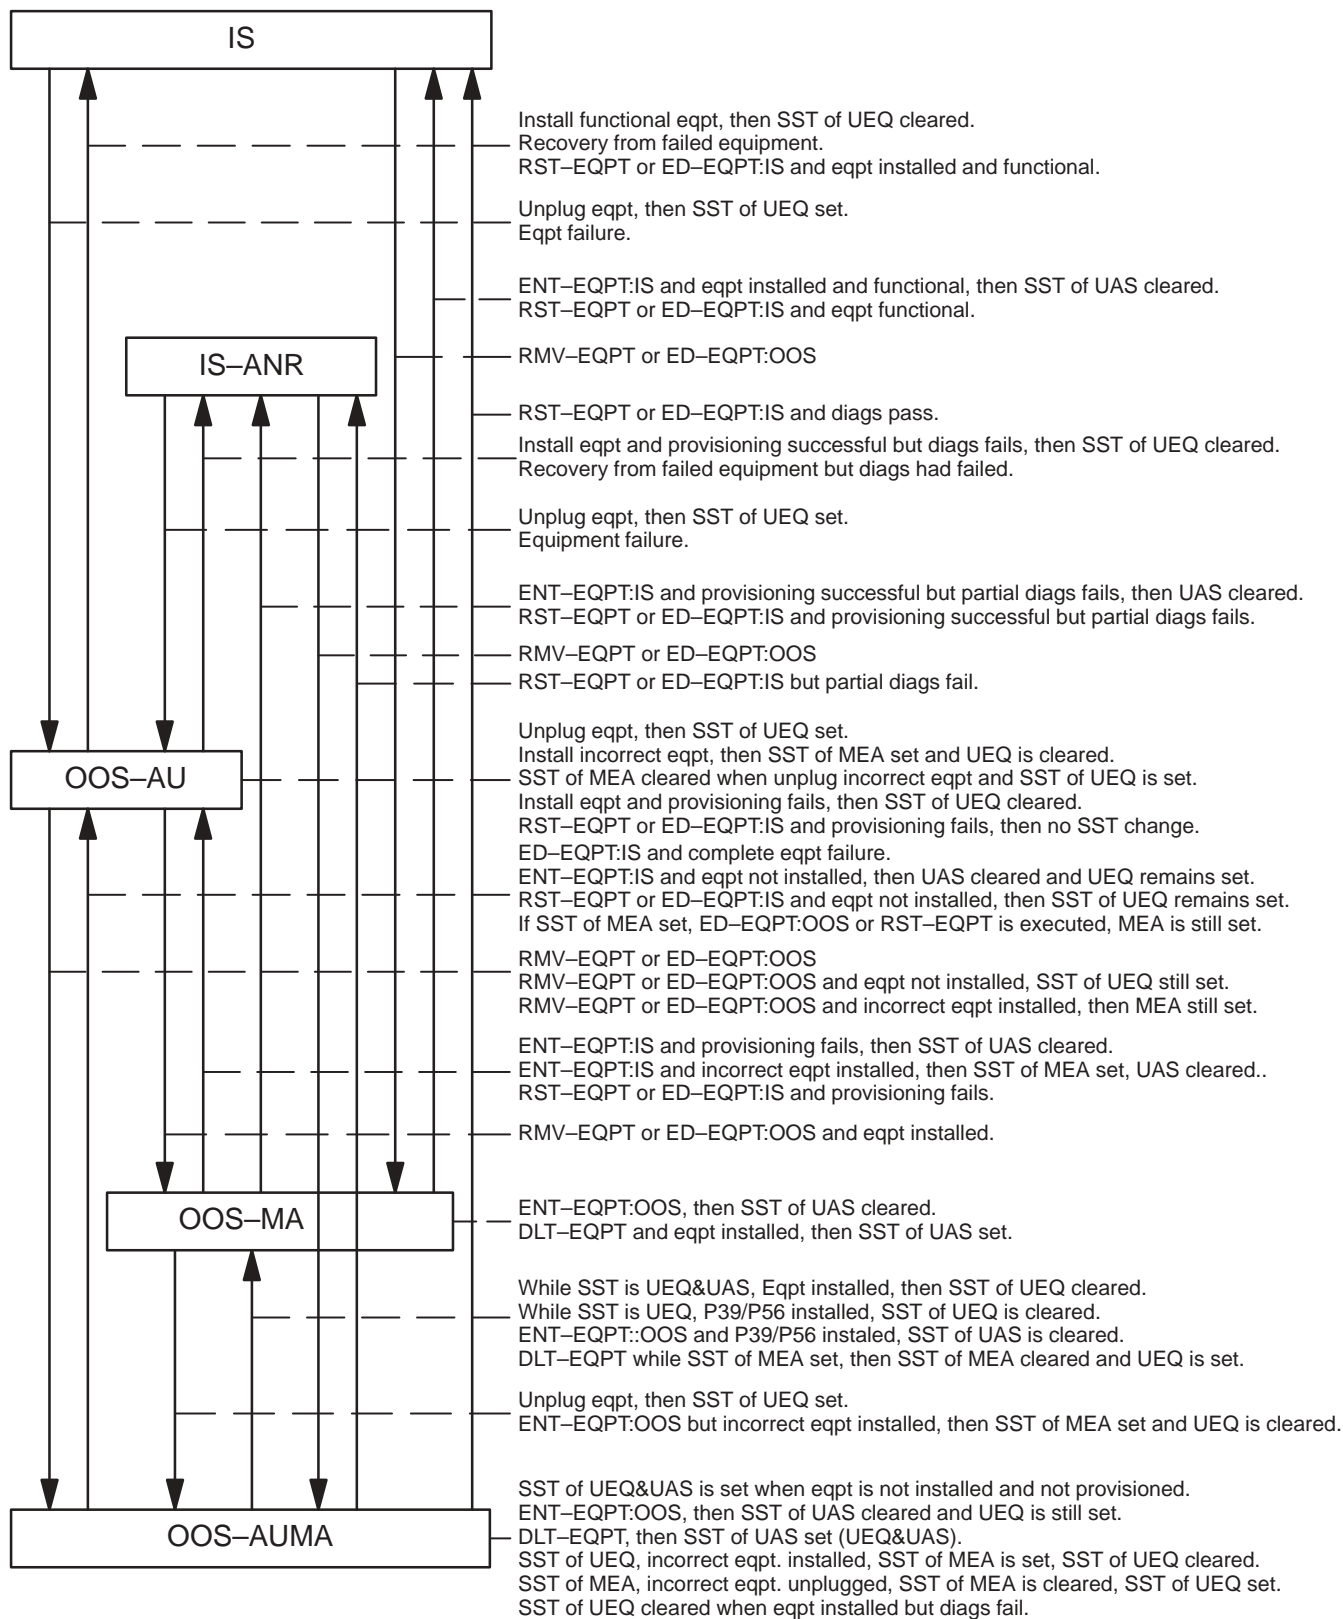

Figure G.15. OPD Equipment State Transitions

Notes.

1. The term "provisioning" refers to processor communication with the equipment.

Figure G.16. P39 and P56 Equipment State Transitions

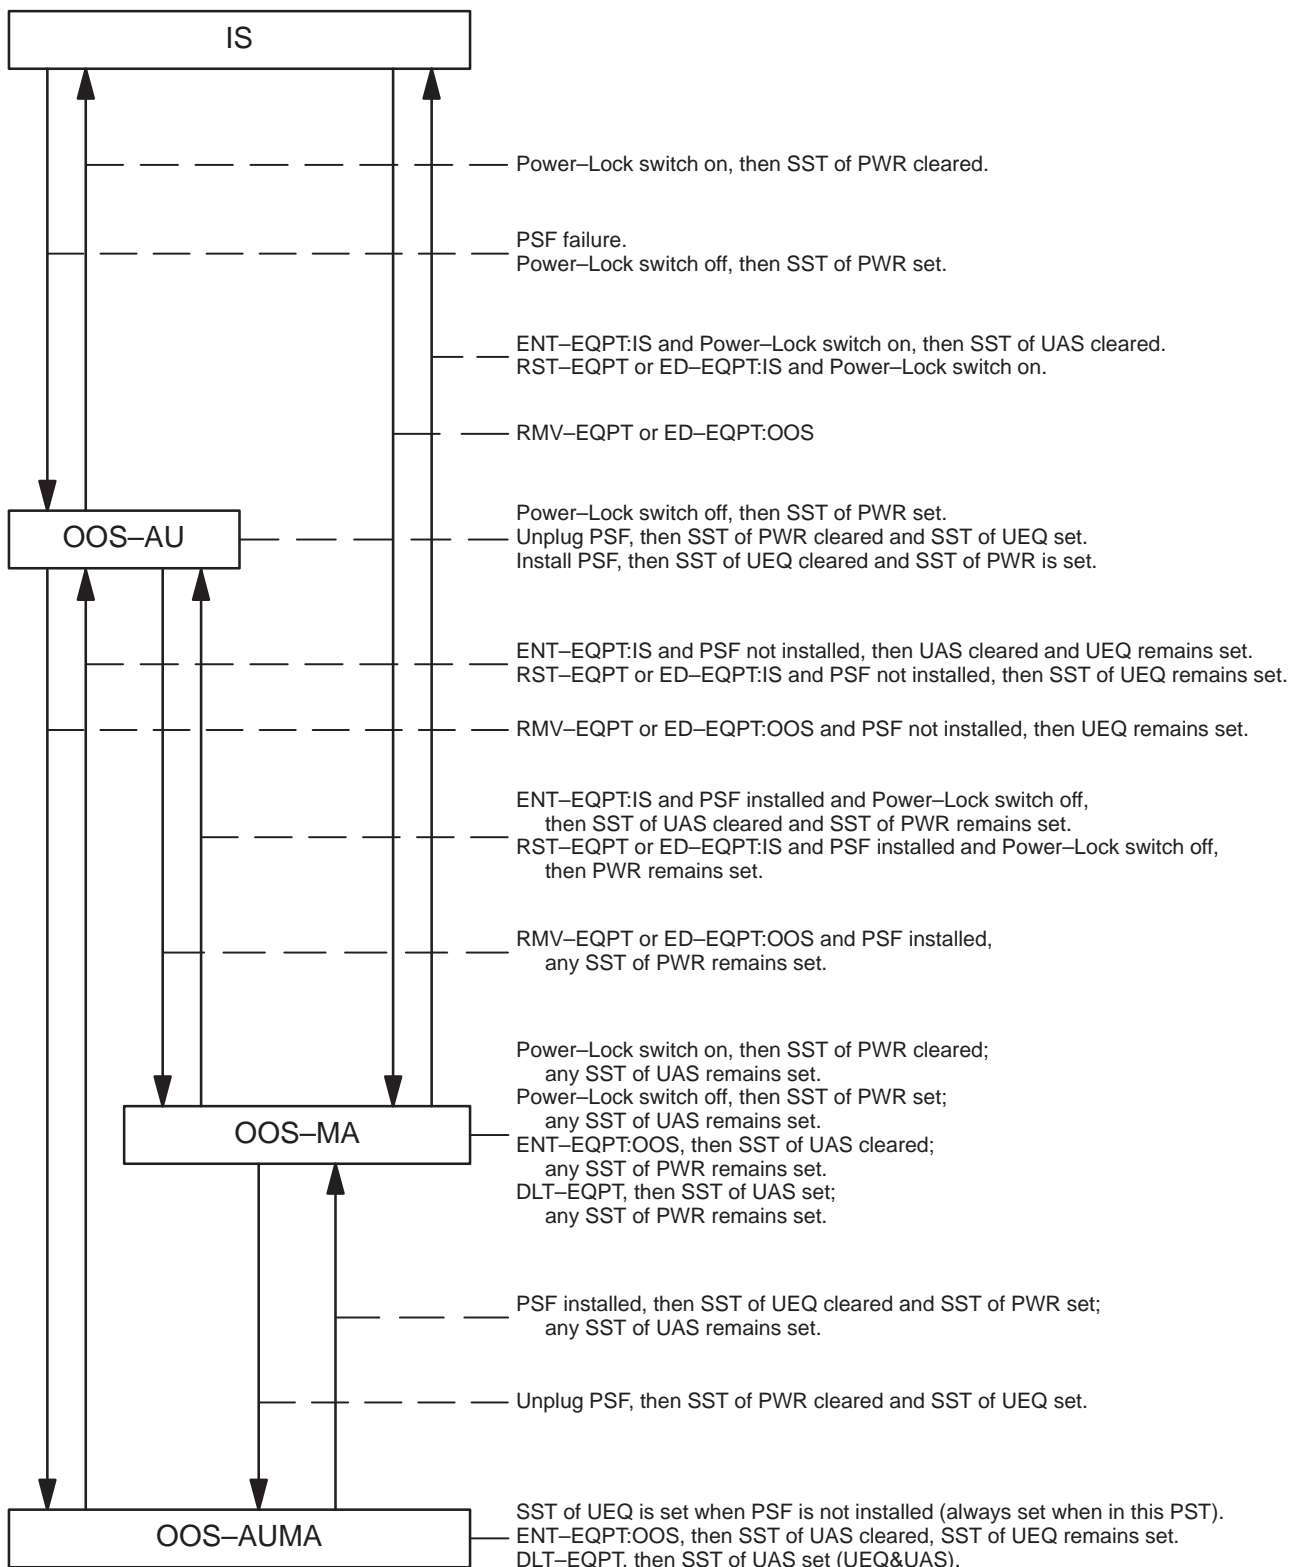

Figure G.17. PSF Equipment State Transitions

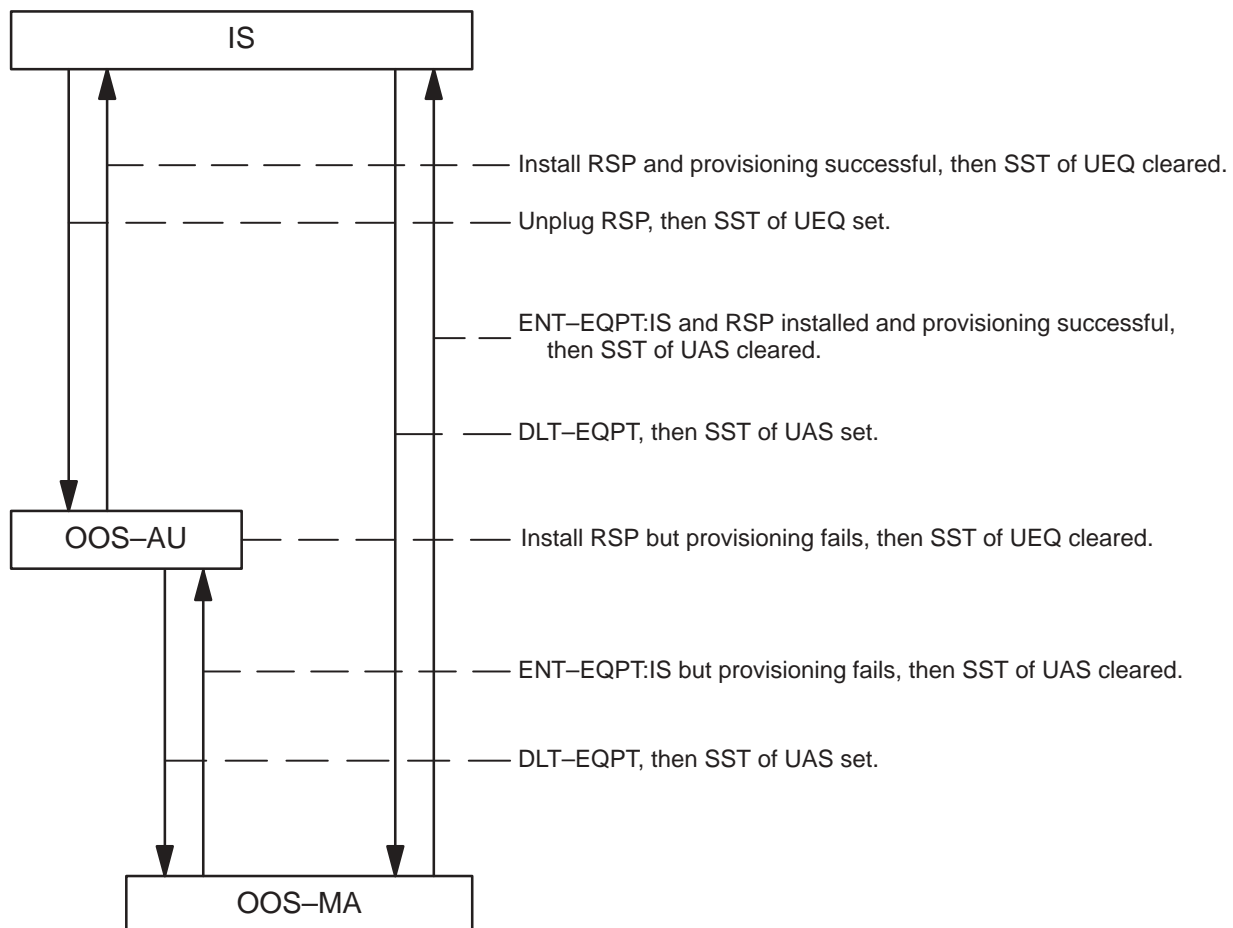

Figure G.18. PST Equipment State Transitions

Notes.

1. The term "provisioning" refers to processor communication with the RSP and initializing hardware control registers.

Figure G.19. RSP Equipment State Transitions

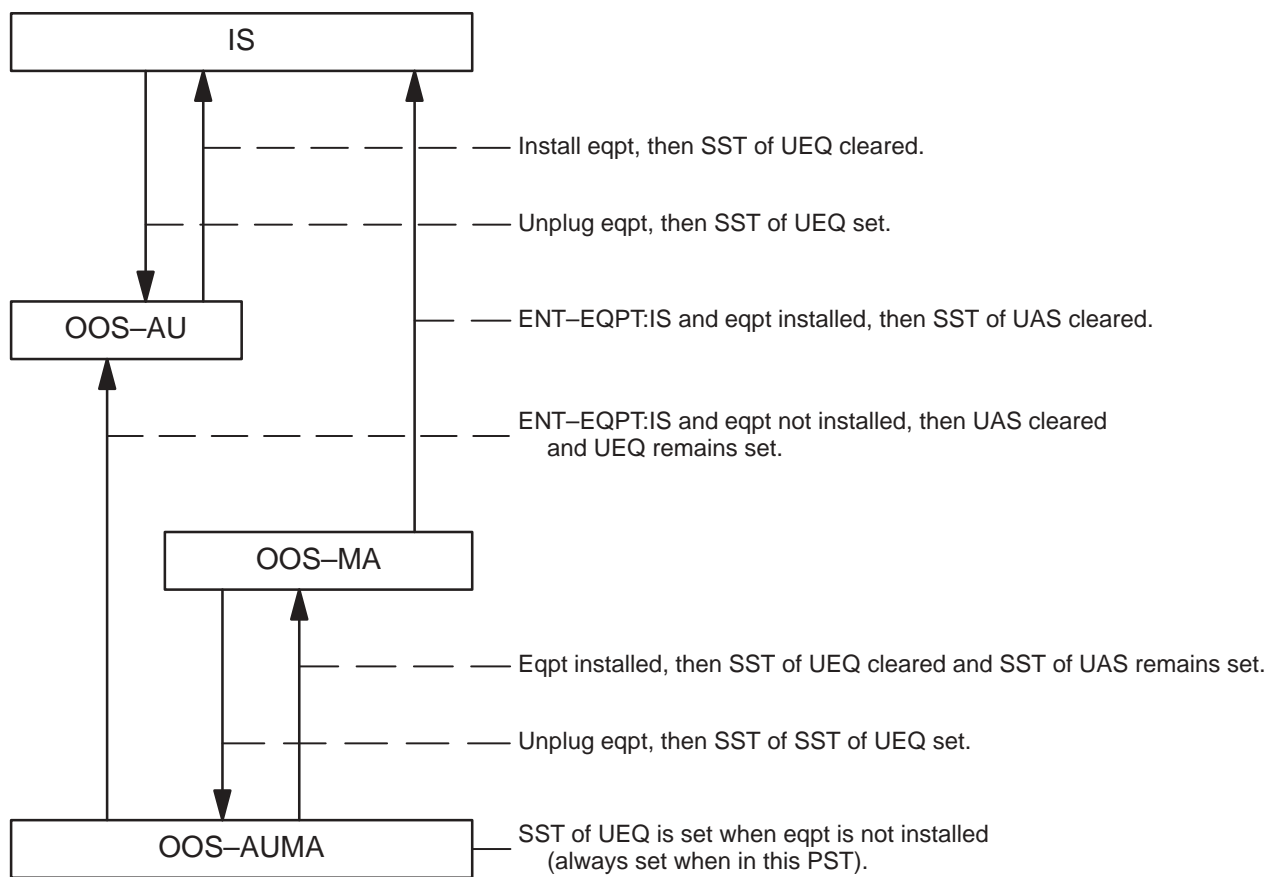

Figure G.20. SBT Equipment State Transitions

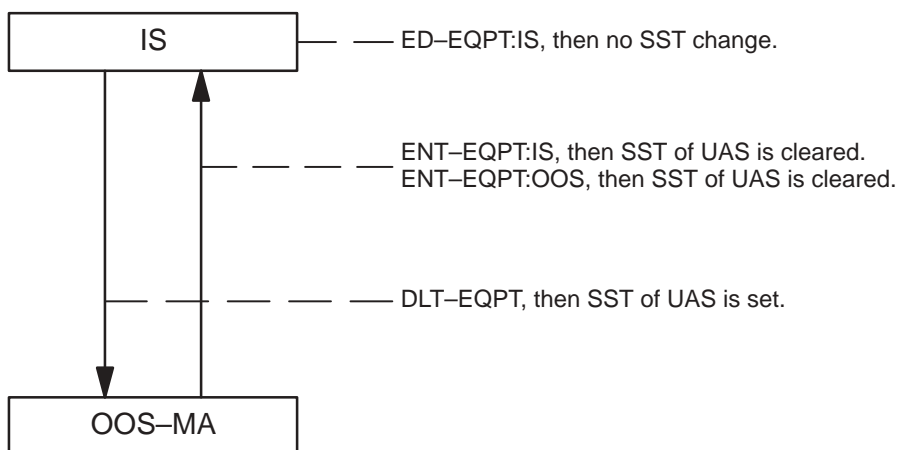

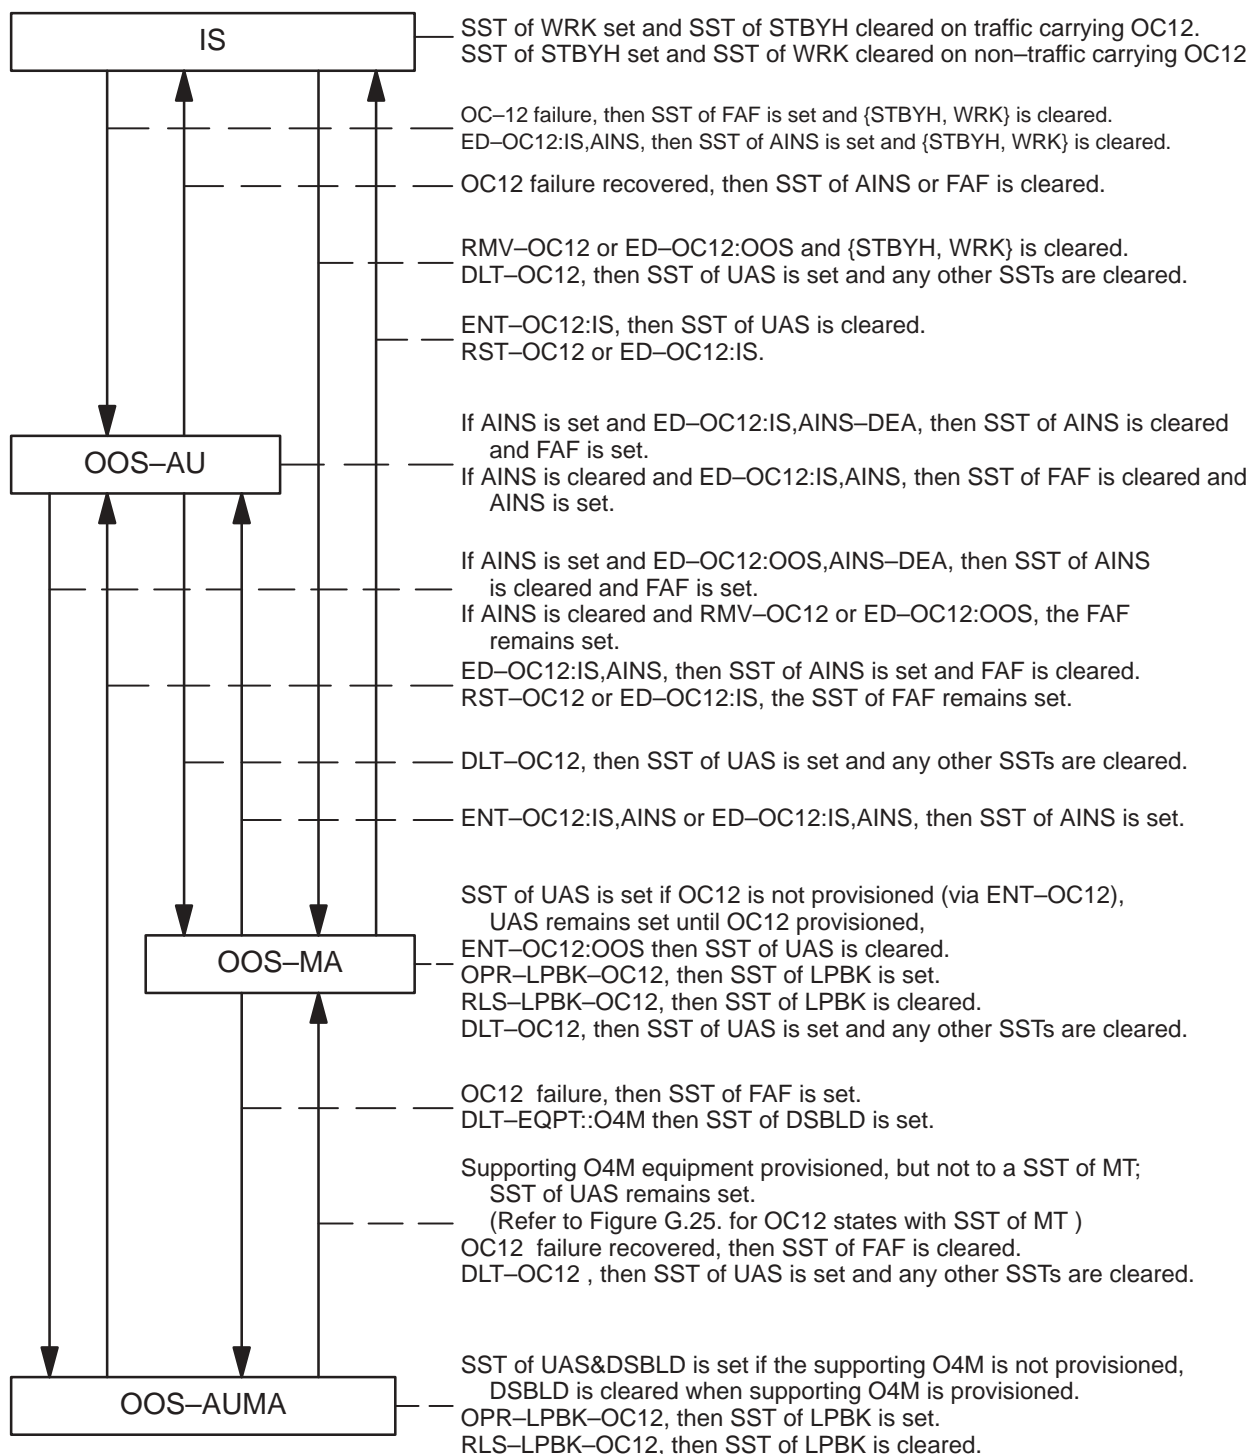

Figure G.21. QUAD and SHELF Equipment State Transitions

G.2.3. OC12 Entity State Transitions

The valid PST,SST combinations and applicable state values for OC12 entities is provided in Table G.4.

Table G.3. OC12 State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[{STBYH WRK}, PMI, PSI, SDEE]
OOS-AU	AINS FAF	[PMI, PSI, SDEE] [PMI, PSI, SDEE]
OOS-AUMA	[UAS] [UAS&DSBLD] [FAF]	[MT] [PMI, PSI, SDEE]
OOS-MA	[UAS]	[PMI, PSI, SDEE, LPBK]

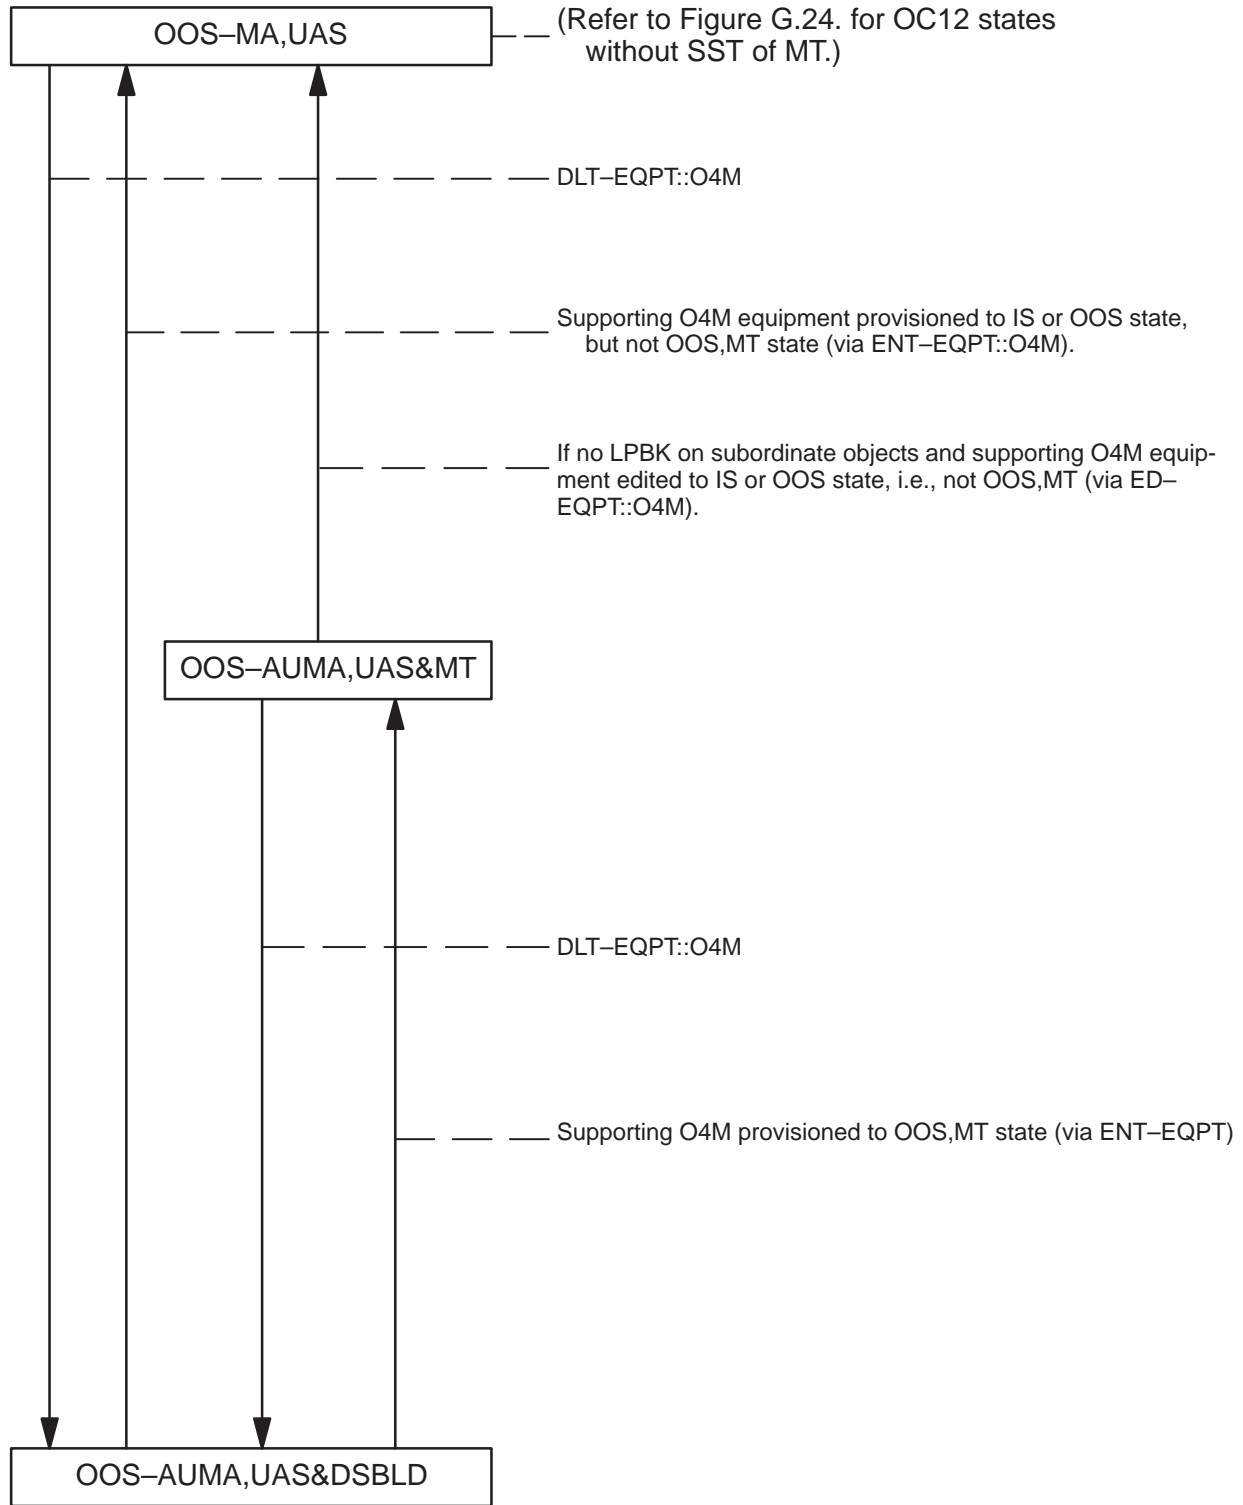

OC12 entity state transition diagrams are provided in Figures G.24. and G.25. Each state transition diagram shows the Primary State transitions for the OC12 entity, along with a description of the cause of the state transition. Figure G.24. shows OC12 entity state transitions when the OC12 entity does not have a SST of MT applied to it. Figure G.25. shows OC12 entity state transitions when the OC12 entity has a SST of MT applied to it, as when an in-service growth maintenance test is to be performed prior to provisioning of the OC12 entity.

Notes.

- When a SST of UAS is set, then any SST of {AINS, FAF, PMI, PSI, SDEE} is cleared.
- The following SSTs are set for any PST state, as follows:
SST of SDEE is set if any subordinate STS1 is provisioned (via ENT-STs1), otherwise SDEE is cleared.
SST of PMI is set if PM is inhibited via SET-PMODE-OC12, otherwise PMI is cleared if PM is enabled.
SST of PSI is set if protection switching is inhibited via OPR-PROTNSW-OC12, otherwise PSI is cleared.

**Figure G.22. OC-12 State Transitions
(OC-12 Without OC-12 SST of MT)**

Note. When SST of UAS is set, then any SST of {AINS, FAF, PMI, SDEE} is cleared.

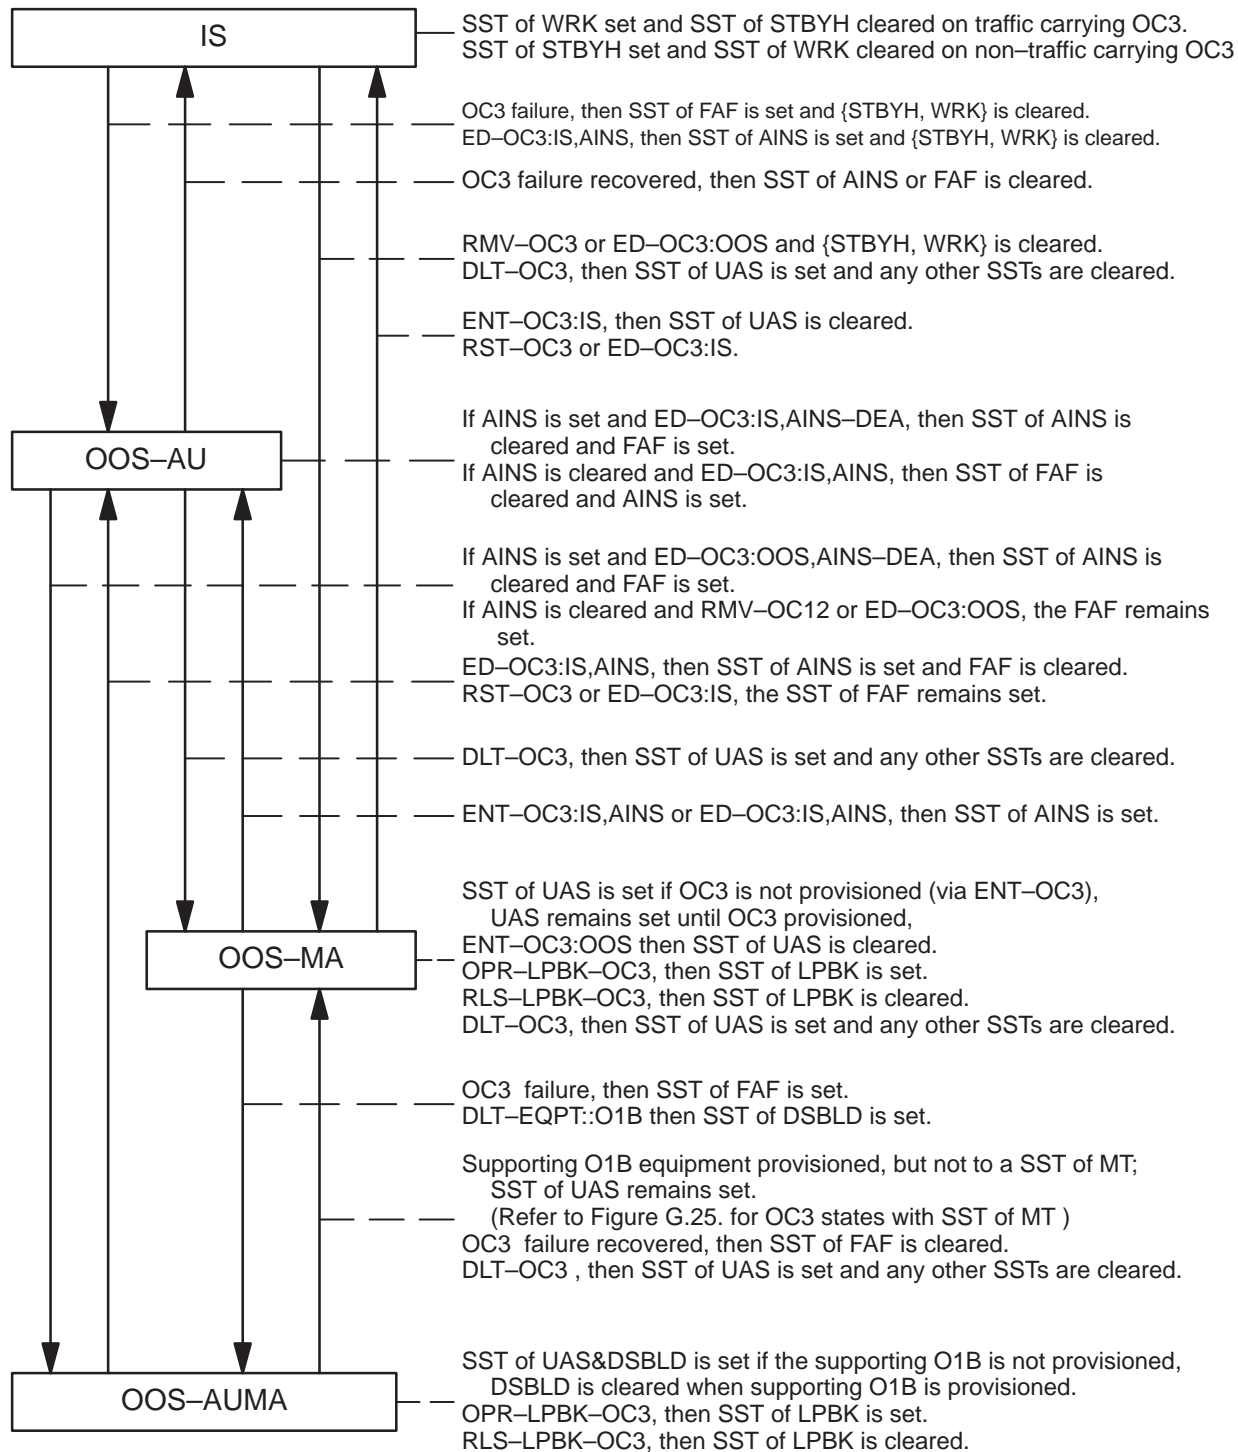

**Figure G.23. OC-12 State Transitions
(Showing Affect of OC-12 SST of MT)**

G.2.4. OC3 Entity State Transitions

The valid PST,SST combinations and applicable state values for OC3 entities is provided in Table G.4.

Table G.4. OC–3 State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[{STBYH WRK}, PMI, PSI, SDEE]
OOS–AU	AINS FAF	[PMI, PSI, SDEE] [PMI, PSI, SDEE]
OOS–AUMA	[UAS] [UAS&DSBLD] [FAF]	[MT] [PMI, PSI, SDEE]
OOS–MA	[UAS]	[PMI, PSI, SDEE, LPBK]

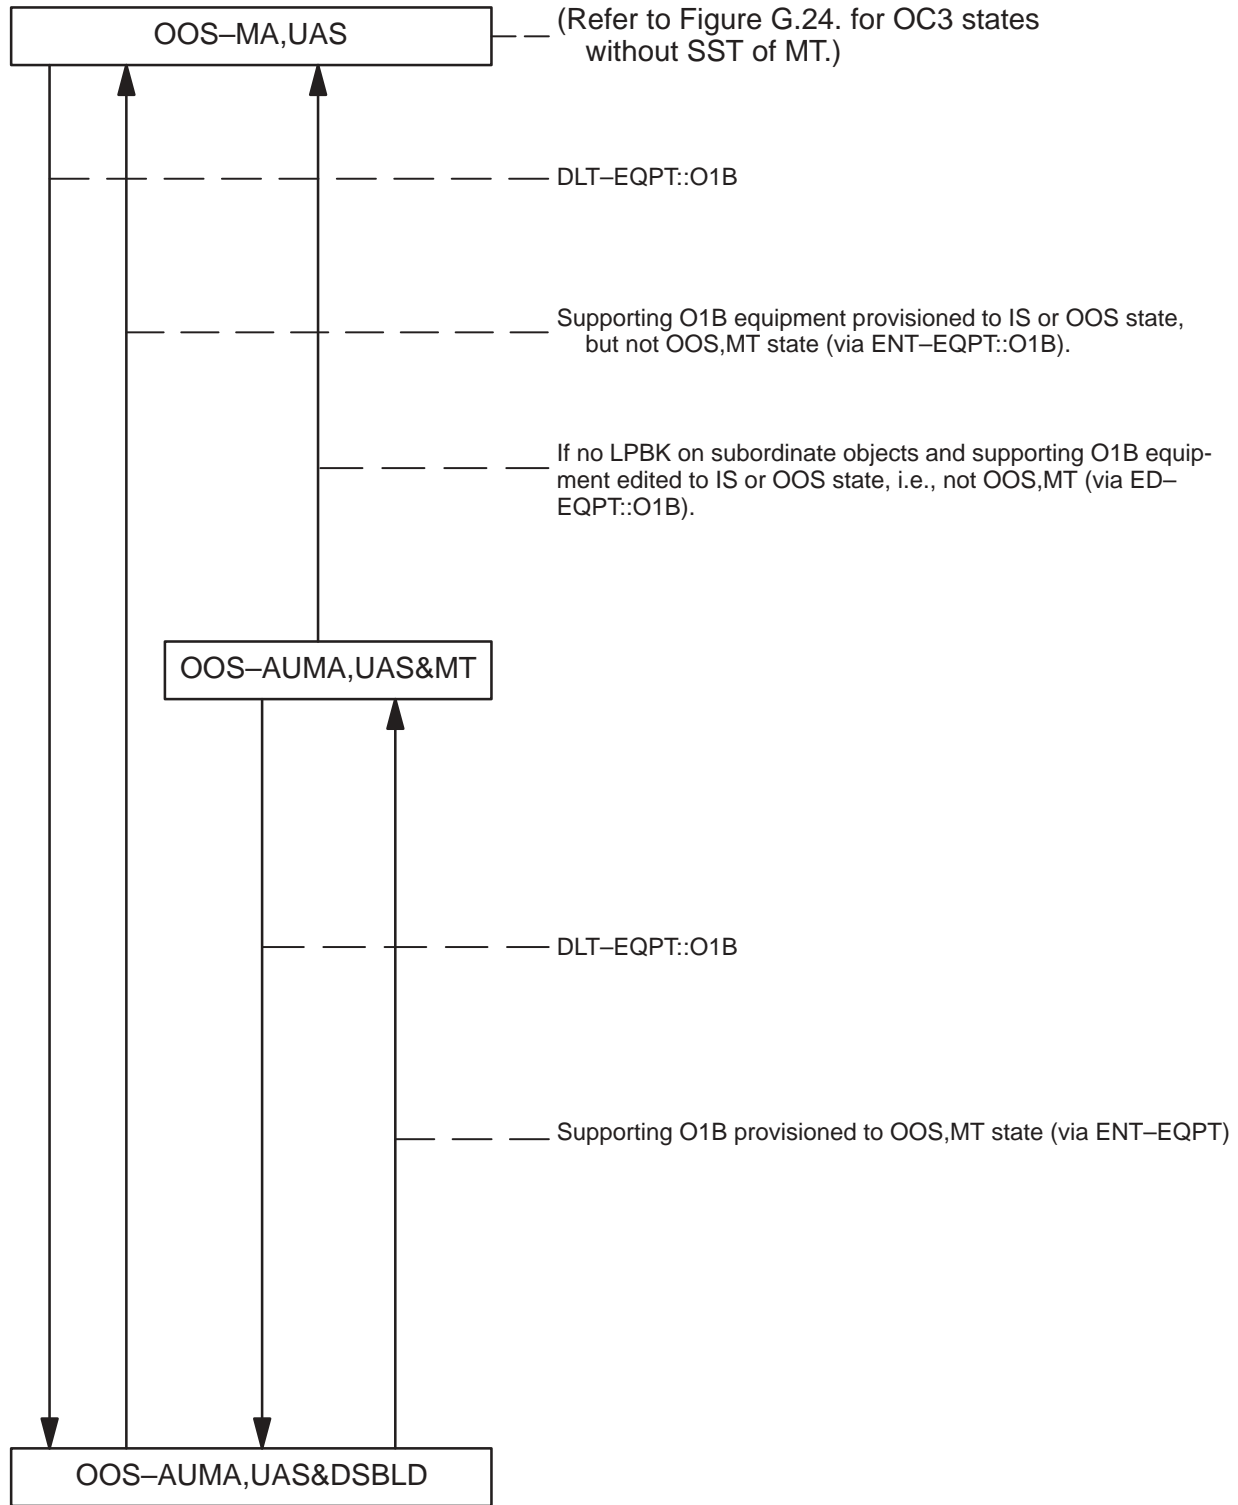

OC3 entity state transition diagrams are provided in Figures G.24. and G.25. Each state transition diagram shows the Primary State transitions for the OC3 entity, along with a description of the cause of the state transition. Figure G.24. shows OC3 entity state transitions when the OC3 entity does not have a SST of MT applied to it. Figure G.25. shows OC3 entity state transitions when the OC3 entity has a SST of MT applied to it, as when an in-service growth maintenance test is to be performed prior to provisioning of the OC3 entity.

Notes.

- When a SST of UAS is set, then any SST of {AINS, FAF, PMI, PSI, SDEE} is cleared.
- The following SSTs are set for any PST state, as follows:
SST of SDEE is set if any subordinate STS1 is provisioned (via ENT-STs1), otherwise SDEE is cleared.
SST of PMI is set if PM is inhibited via SET-PMODE-OC3, otherwise PMI is cleared if PM is enabled.
SST of PSI is set if protection switching is inhibited via OPR-PROTNSW-OC3, otherwise PSI is cleared.

**Figure G.24. OC3 State Transitions
(OC3 Without OC3 SST of MT)**

Note. When SST of UAS is set, then any SST of {AINS, FAF, PMI, SDEE} is cleared.

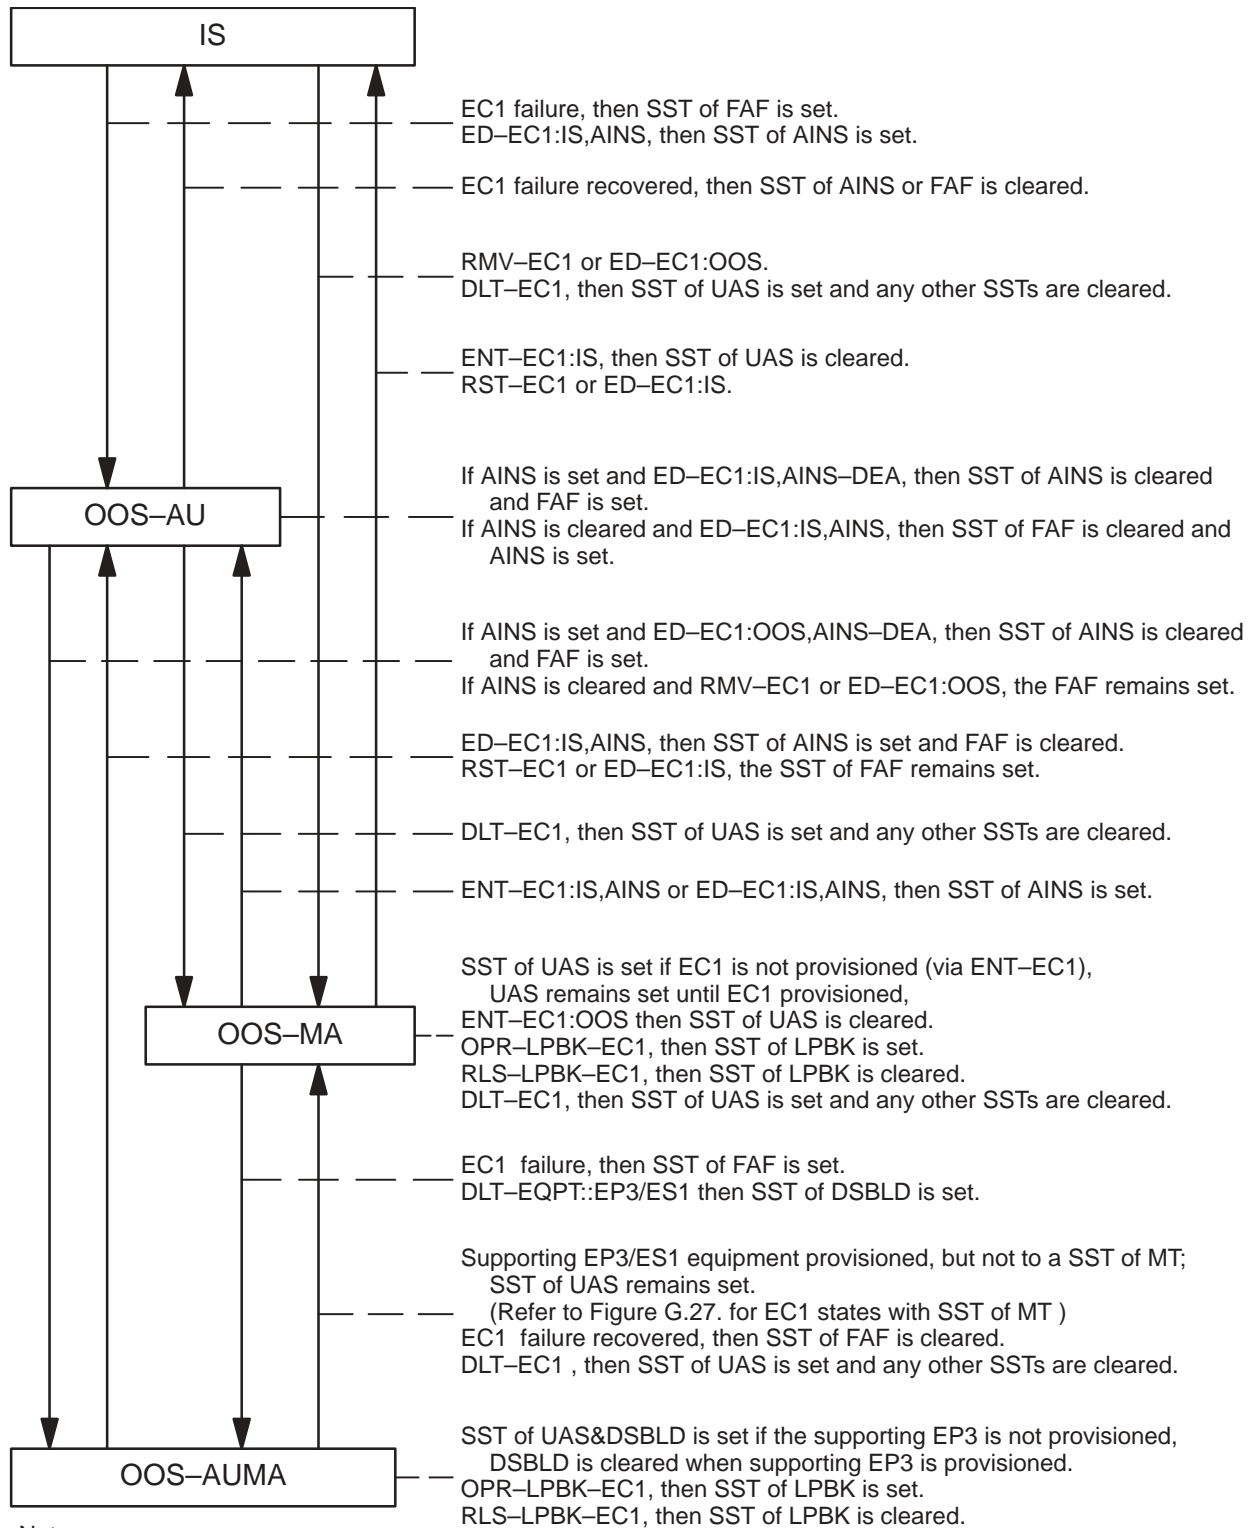

**Figure G.25. OC3 State Transitions
(Showing Affect of OC3 SST of MT)**

G.2.5. EC1 Entity State Transitions

The valid PST,SST combinations and applicable state values for EC1 entities is provided in Table G.5.

Table G.5. EC1 State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[PMI, SDEE, TRM] ¹
OOS-AU	AINS FAF	[PMI, SDEE, TRM] ¹ [PMI, SDEE, TRM] ¹
OOS-AUMA	[UAS] [UAS&DSBLD] [FAF]	[MT] [PMI, SDEE, TRM] ¹
OOS-MA	[UAS]	[PMI, SDEE, {LPBK TRM}] ¹
Notes: 1. TRM will only occur with SDEE (e.g., SDEE&TRM or SDEE&TRM&PMI).		

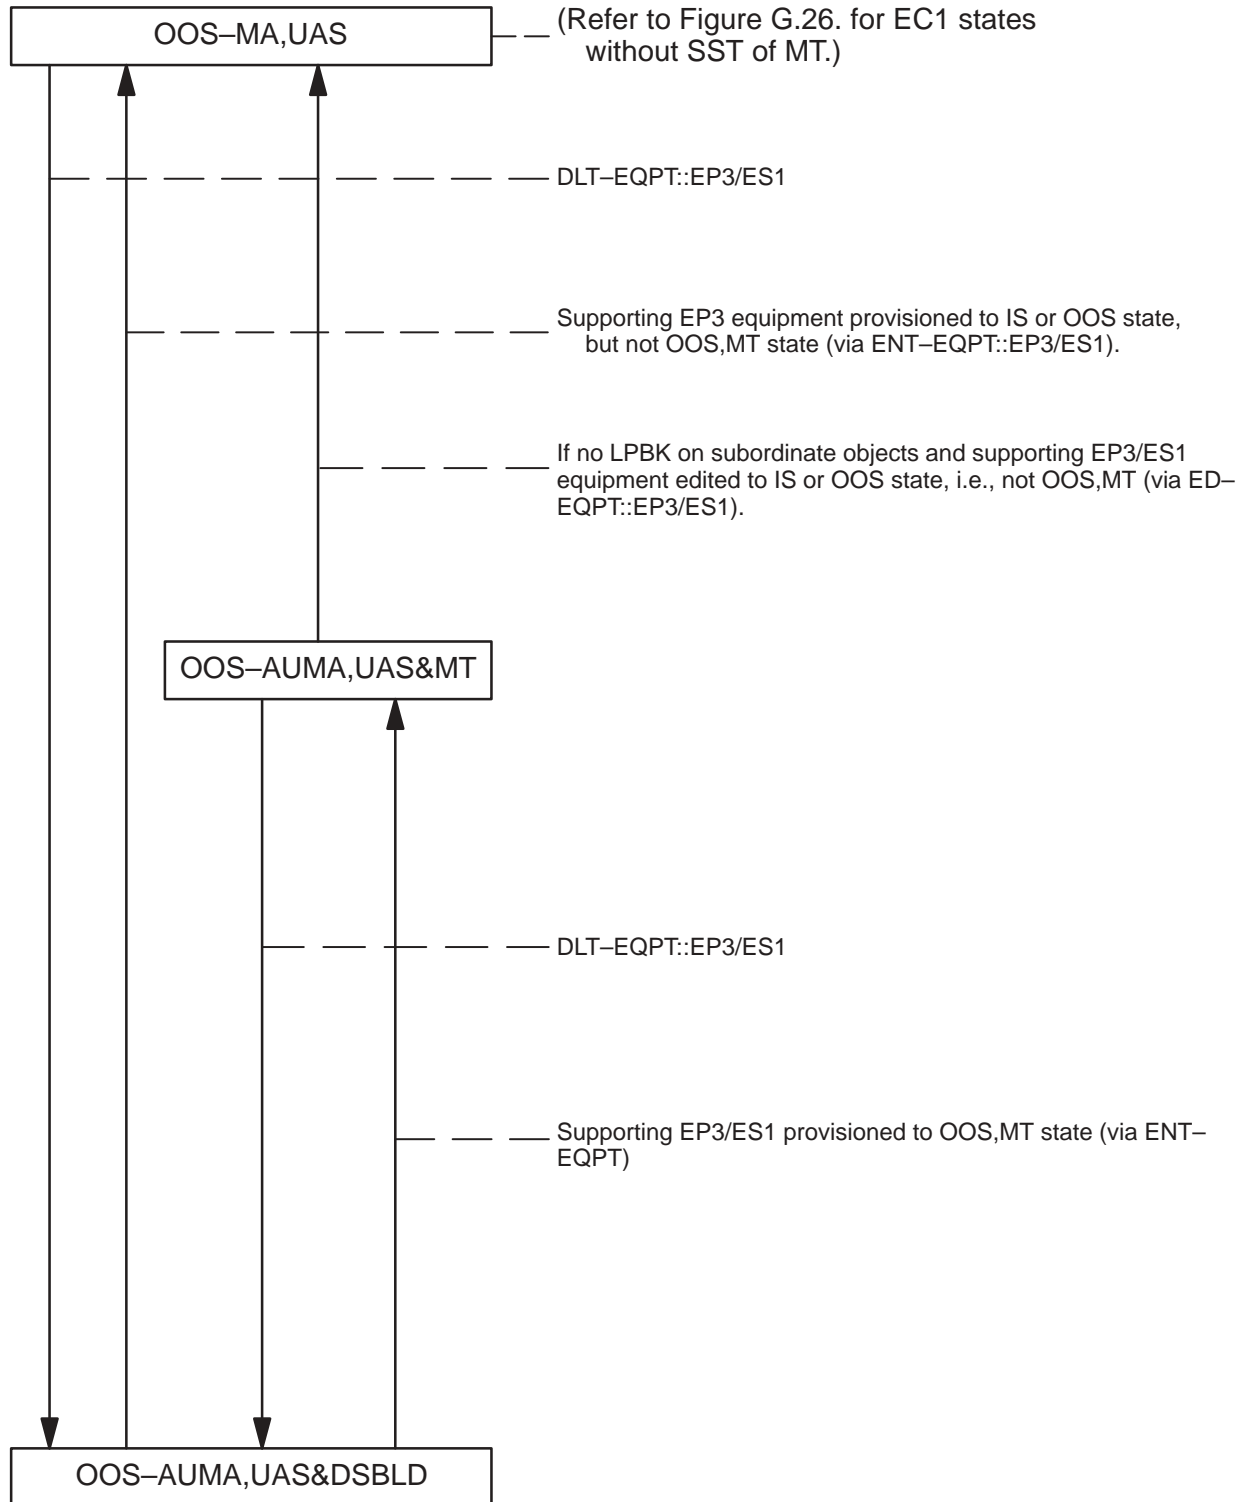

EC1 entity state transition diagrams are provided in Figures G.26. and G.27.G. Each state transition diagram shows the Primary State transitions for the EC1 entity, along with a description of the cause of the state transition. Figure G.26. shows EC1 entity state transitions when the EC1 entity does not have a SST of MT applied to it. Figure G.27. shows EC1 entity state transitions when the EC1 entity has a SST of MT applied to it, as when an in-service growth maintenance test is to be performed prior to provisioning of the EC1 entity.

Notes.

1. When a SST of UAS is set, then any SST of {AINS, FAF, PMI, SDEE, TRM} is cleared.
2. The following SSTs are set for any PST state, as follows:
SST of SDEE is set if any subordinate STS1 is provisioned (via ENT-STs1), otherwise SDEE is cleared.
SST of TRM is set If any subordinate STS1, or VT1.5 has SST of {ACT, BUSY}, otherwise TRM is cleared.
SST of PMI is set if PM is inhibited via SET-PMMODE-EC1, otherwise PMI is cleared if PM is enabled.

**Figure G.26. EC1 State Transitions
(EC1 Without EC1 SST of MT)**

Note. When SST of UAS is set, then any SST of {AINS, FAF, PMI, SDEE, TRM} is cleared.

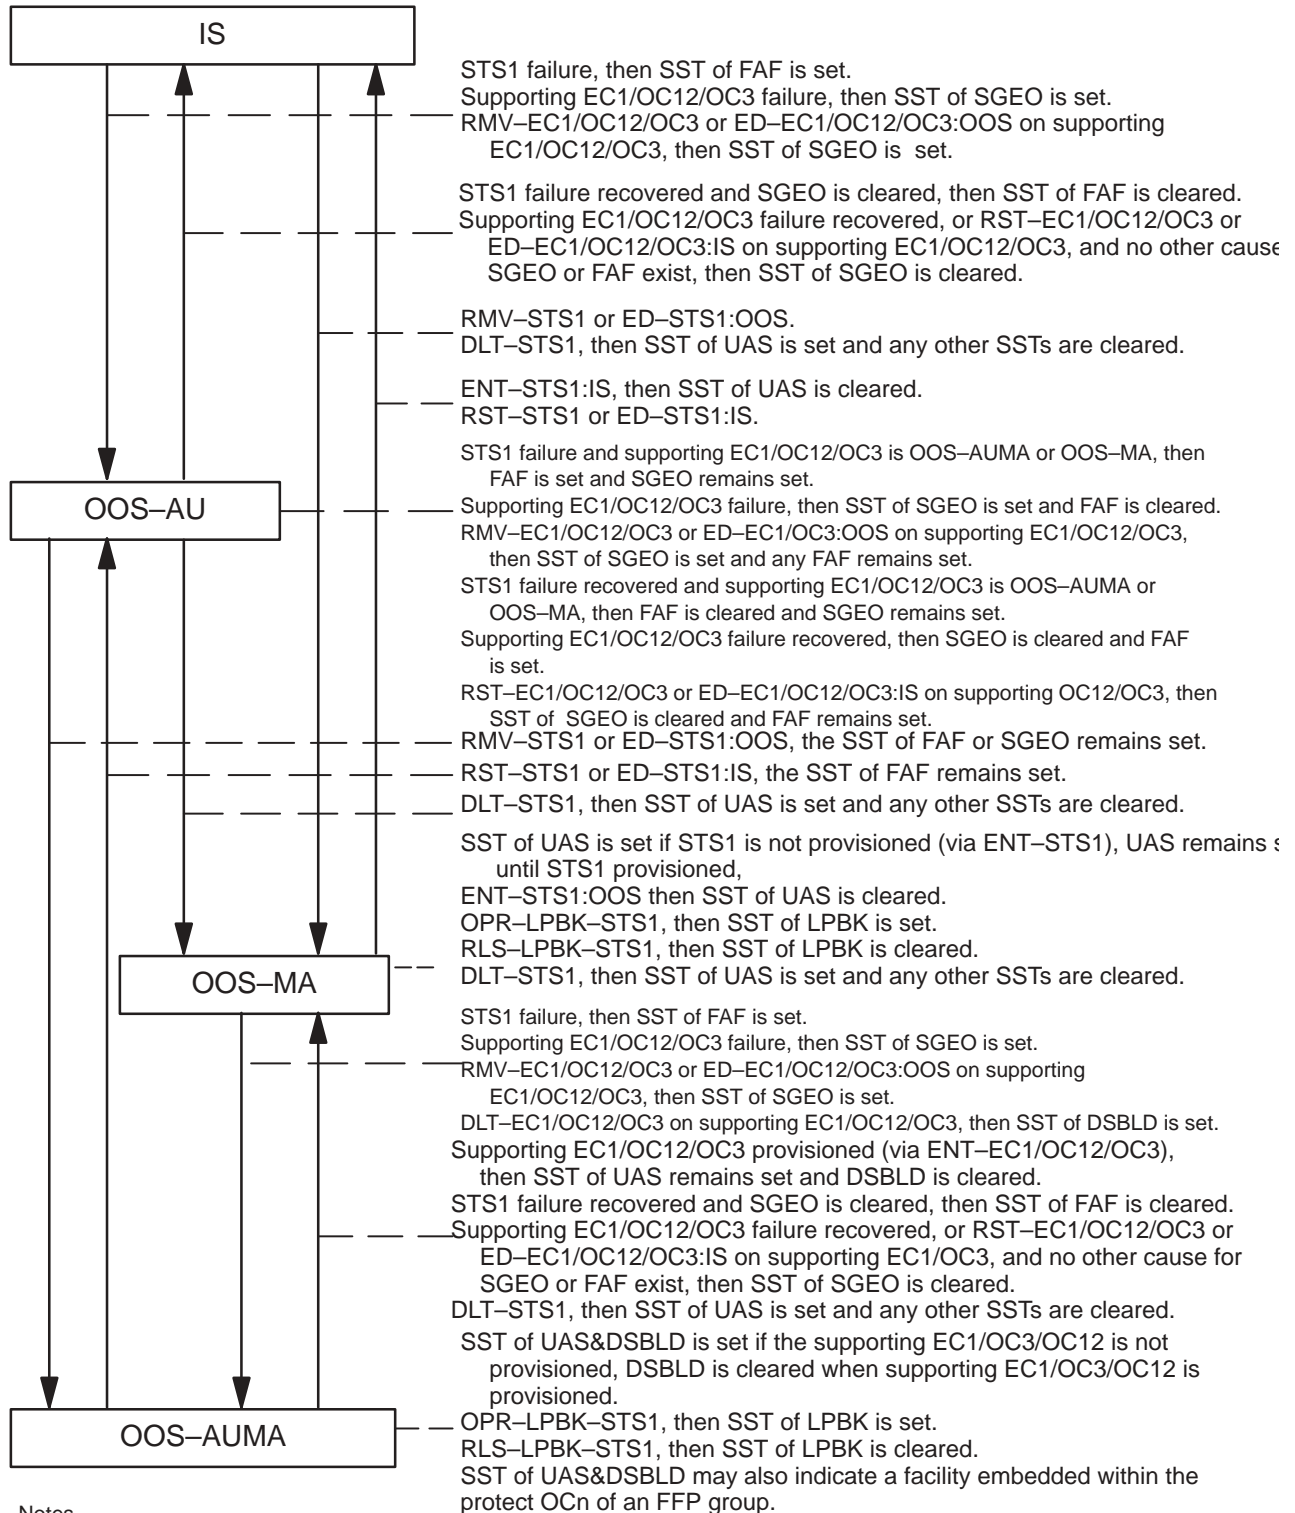

**Figure G.27. EC1 State Transitions
(Showing Affect of EC1 SST of MT)**

G.2.6. STS1 Entity State Transitions

The valid PST,SST combinations and applicable state values for STS1 entities is provided in Table G.6.

Table G.6. STS1 State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[{ACT BUSY}, PMI, SDEE, TRM]
OOS-AU	[FAF, SGEO]	[{ACT BUSY}, PMI, SDEE, TRM]
OOS-AUMA	[UAS] [UAS&DSBLD] [FAF, SGEO]	[MT {MT&LPBK}] [MT] [{ACT BUSY}, PMI, SDEE, {LPBK TRM}]
OOS-MA	[UAS]	[{ACT BUSY}, PMI, SDEE, {LPBK TRM}]

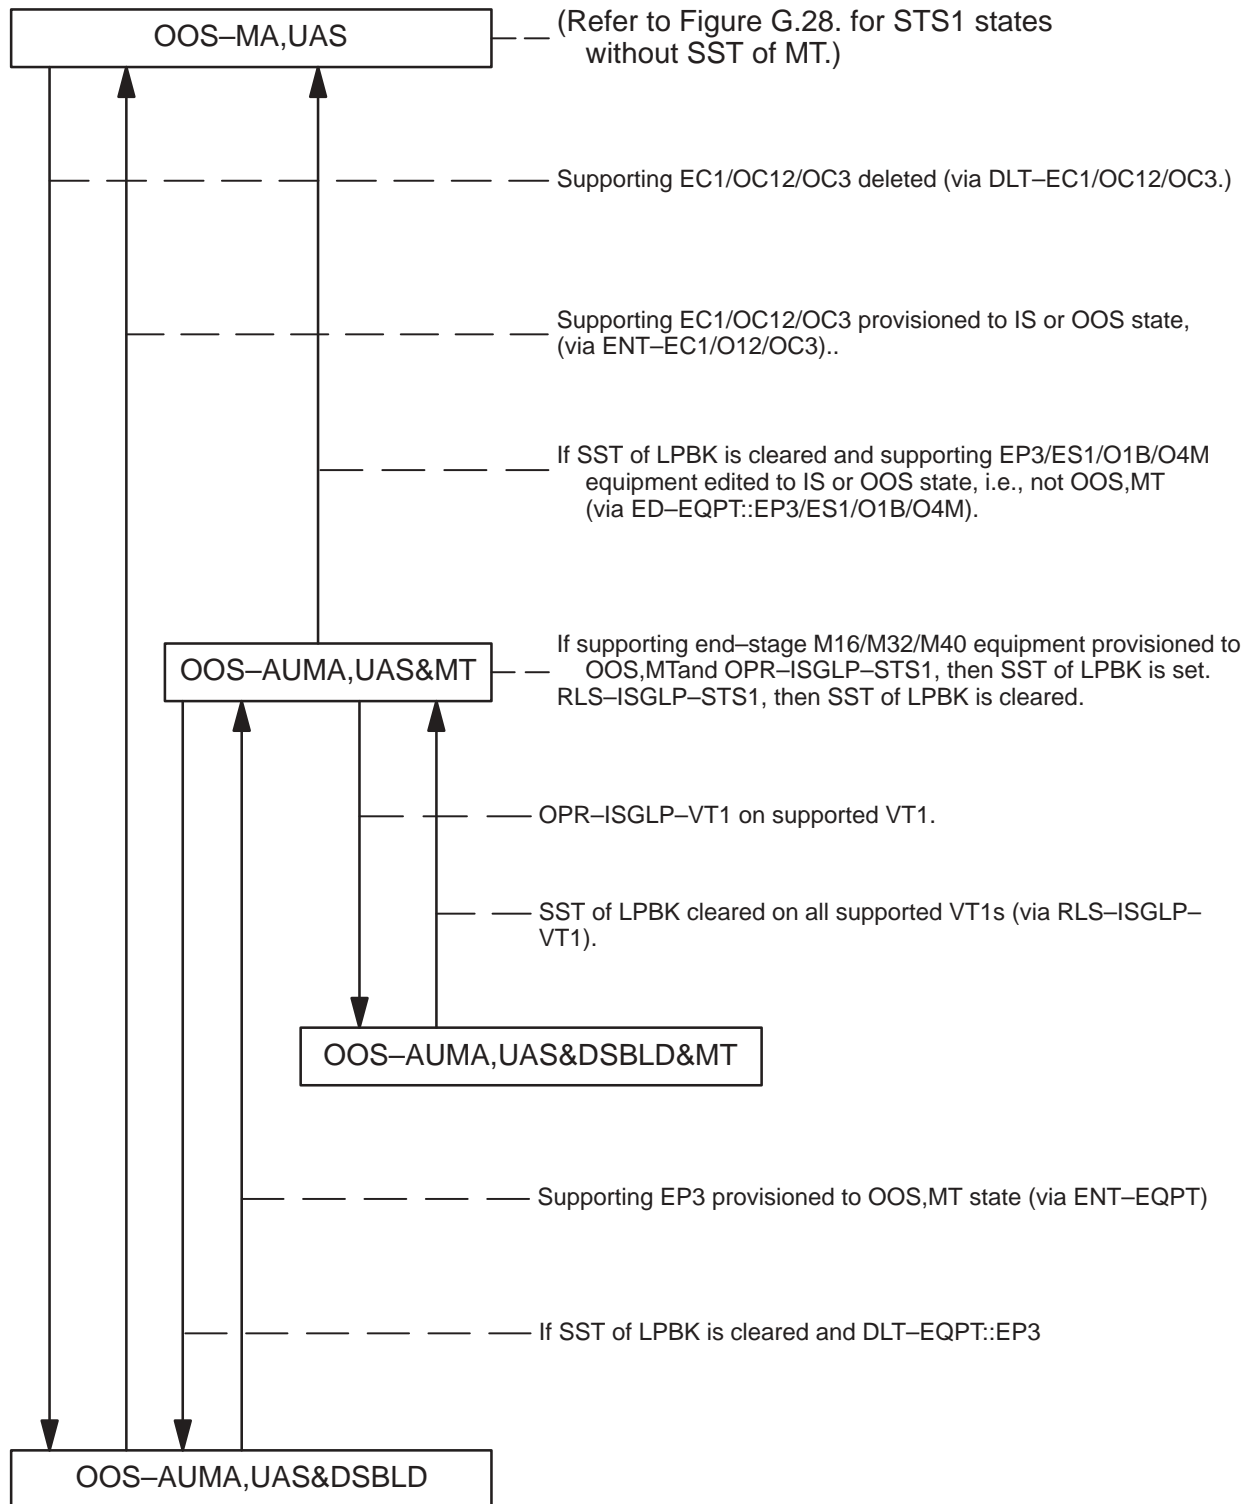

STS1 entity state transition diagrams are provided in Figures G.28. and G.29. Each state transition diagram shows the Primary State transitions for the STS1 entity, along with a description of the cause of the state transition. Figure G.28. shows STS1 entity state transitions when the STS1 entity does not have a SST of MT applied to it. Figure G.29. shows STS1 entity state transitions when the STS1 entity has a SST of MT applied to it, as when an in-service growth maintenance test is to be performed prior to provisioning of the STS1 entity.

Notes.

1. When a SST of UAS is set, then any SST of {FAF, PMI, SDEE, SGEO, TRM} is cleared.
2. The following SSTs are set for any PST state, as follows:
 - SST of SDEE is set if any subordinate VT1 is provisioned (via ENT-VT1), otherwise SDEE is cleared.
 - SST of TRM is set if any subordinate VT1 has SST of {ACT, BUSY}, otherwise TRM is cleared.
 - SST of PMI is set if PM is inhibited via SET-PMMODE-STS1, otherwise PMI is cleared if PM is enabled.
 - SST of ACT is set if the STS1 is connected but has additional bandwidth available, otherwise ACT is cleared.
 - SST of BUSY is set if the STS1 is connected but has not additional bandwidth available, otherwise BUSY is cleared.

**Figure G.28. STS1 State Transitions
(STS1 Without STS1 SST of MT)**

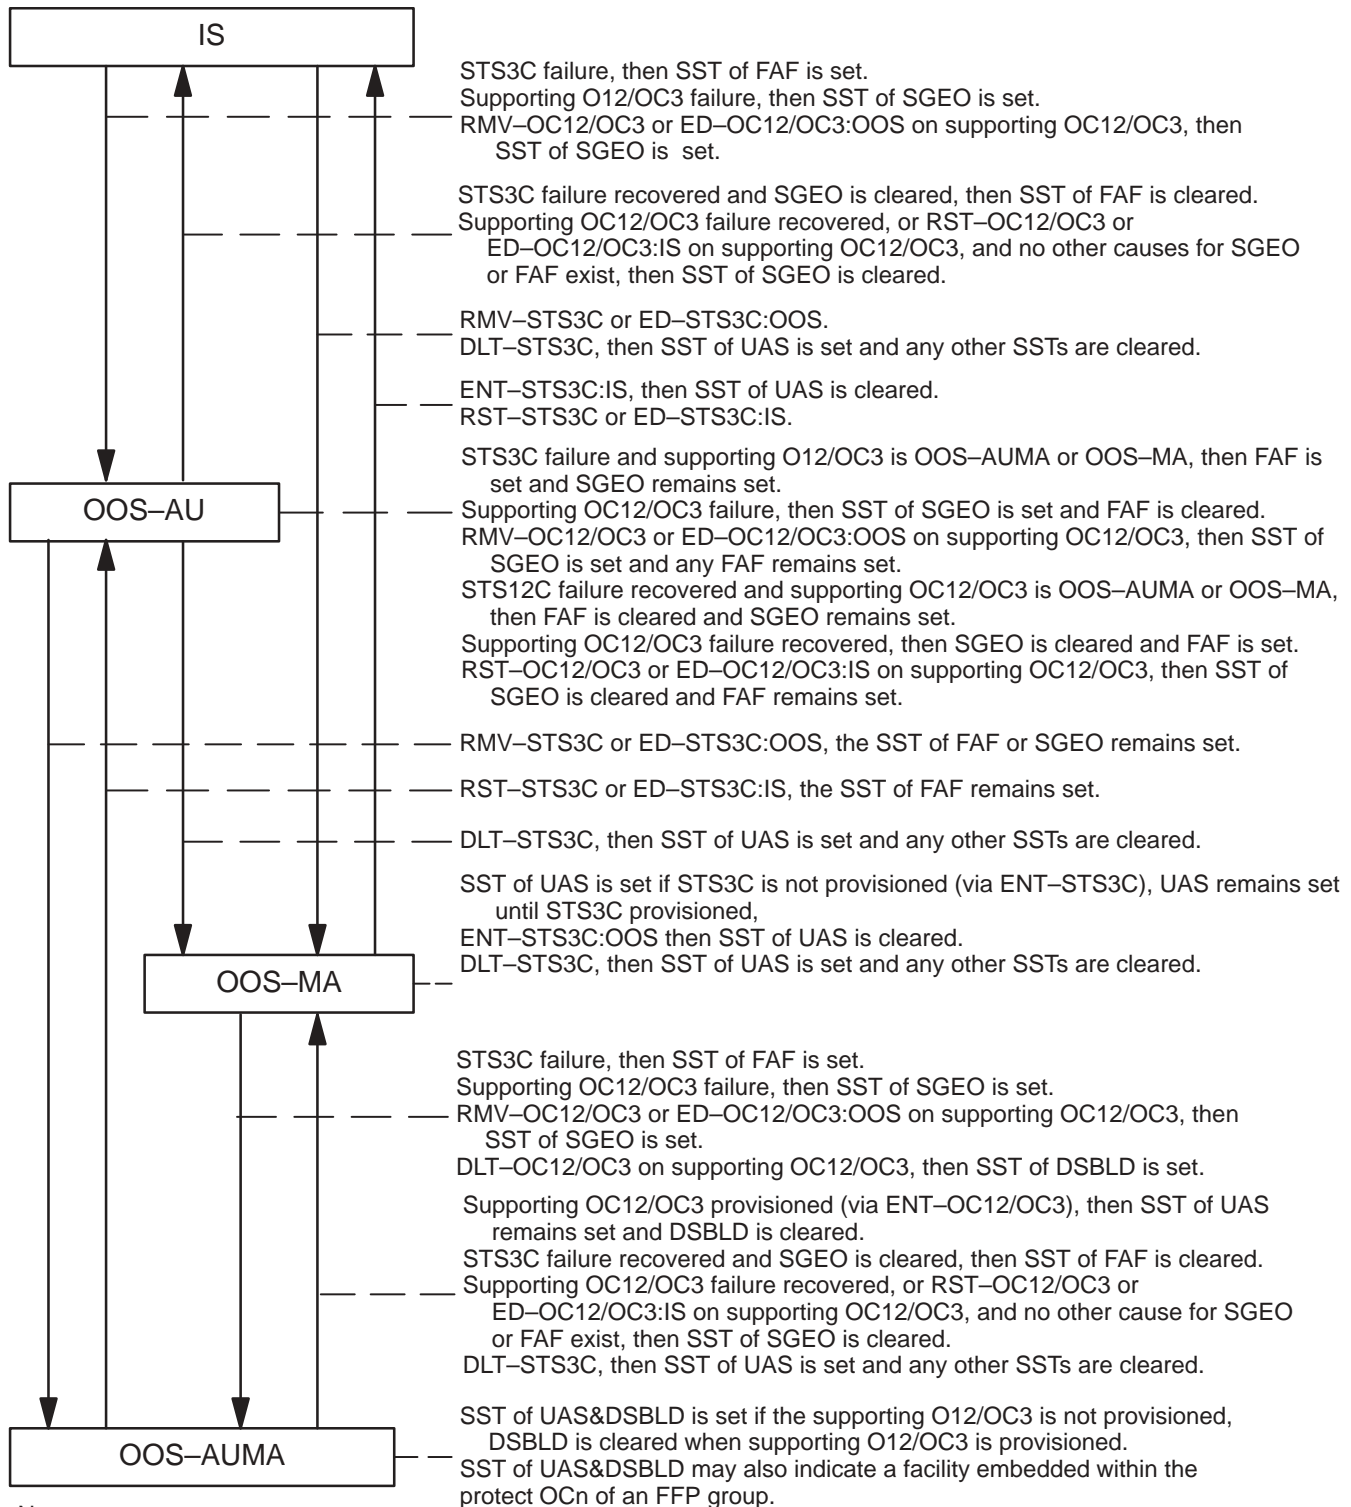

**Figure G.29. STS1 State Transitions
(Showing Affect of STS1 SST of MT)**

G.2.7. STS3C Entity State Transitions

The valid PST,SST combinations and applicable state values for STS3C entities is provided in Table G.7.

Table G.7. STS3C State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[{ACT BUSY}, PMI]
OOS-AU	[FAF, SGEO]	[{ACT BUSY}, PMI]
OOS-AUMA	[UAS] [UAS&DSBLD] [FAF, SGEO]	[{ACT BUSY}, PMI]
OOS-MA	[UAS]	[{ACT BUSY}, PMI]

STS3C entity state transition diagrams are provided in Figure G.30. Each state transition diagram shows the Primary State transitions for the STS3C entity, along with a description of the cause of the state transition.

Notes.

1. When a SST of UAS is set, then any SST of {FAF, PMI, SGEO} is cleared.
2. The following SSTs are set for any PST state, as follows:
SST of PMI is set if PM is inhibited via SET-PMMODE-STS3C, otherwise PMI is cleared if PM is enabled.

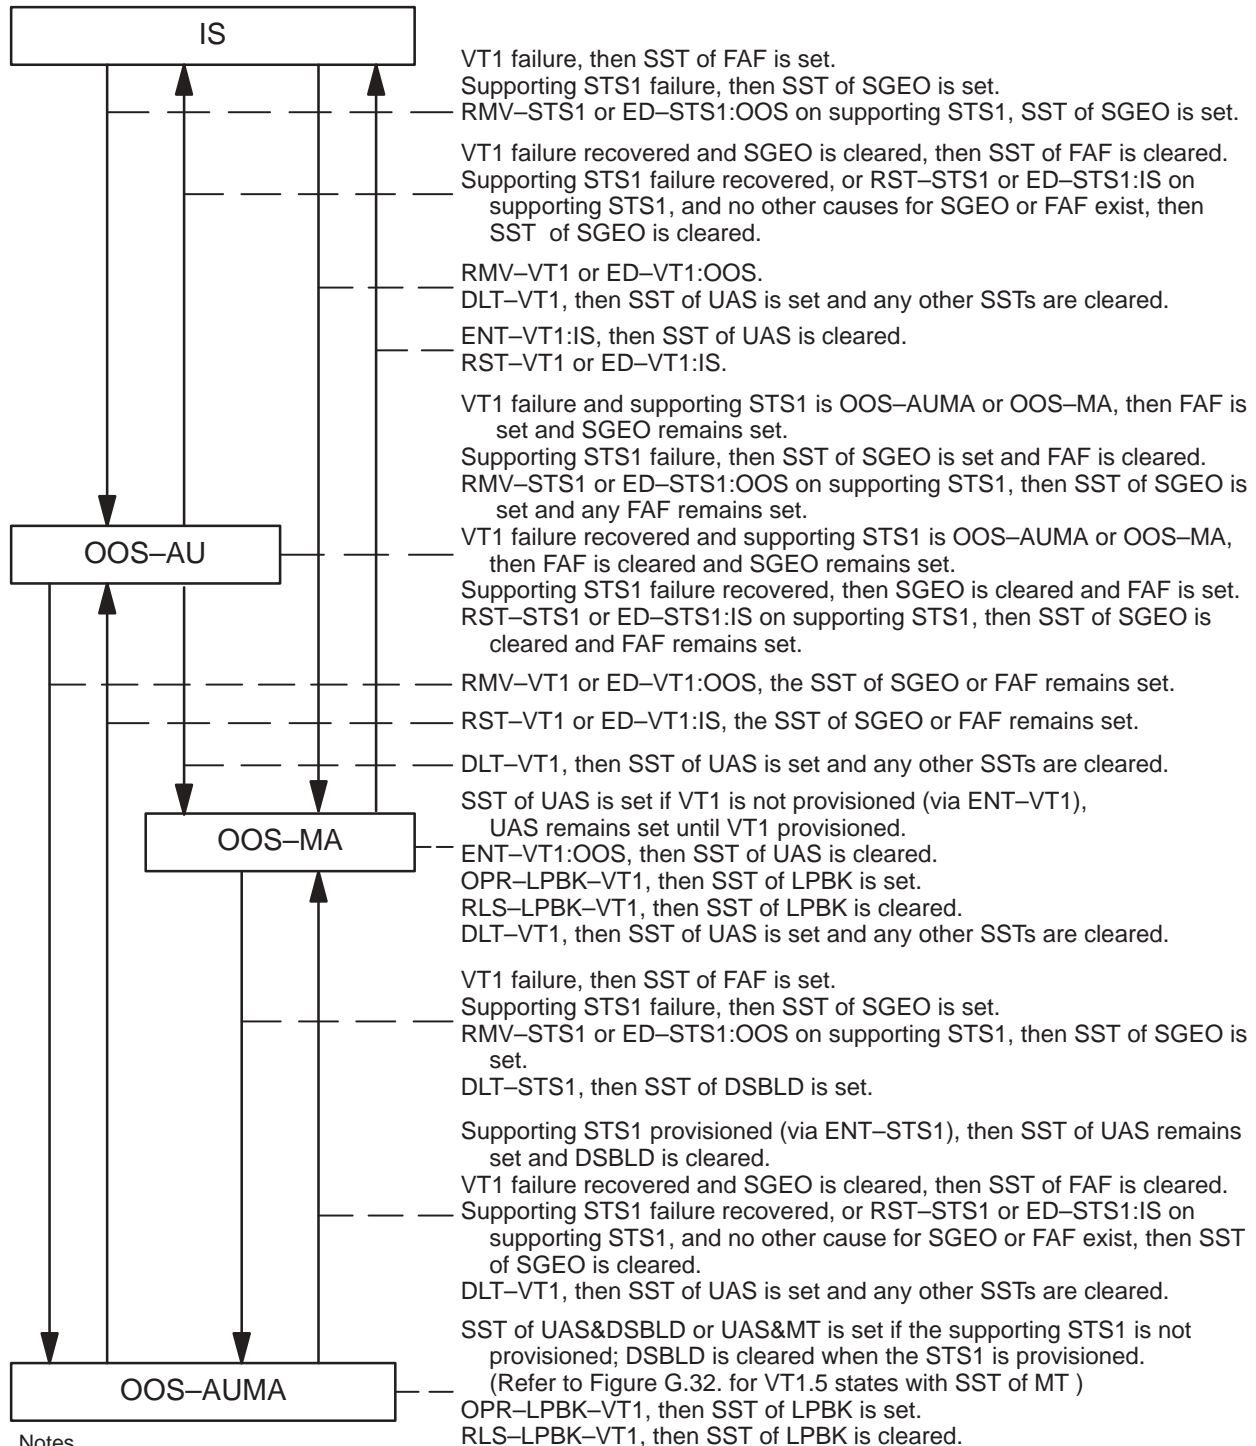

Figure G.30. STS3C State Transitions

G.2.8. VT1.5 Entity State Transitions

The valid PST,SST combinations and applicable state values for VT1.5 entities is provided in Table G.8.

Table G.8. VT1.5 State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[{ACT BUSY}, PMI, ROLL, SDEE, TRM, TS] ¹
OOS-AU	[FAF, SGEO]	[{ACT BUSY}, PMI, ROLL, SDEE, TRM, TS] ¹
OOS-AUMA	[UAS] [UAS&DSBLD] [FAF, SGEO]	[MT {MT&LPBK}] [ACT BUSY}, {LPBK TS}, PMI, ROLL, SDEE, TRM] ¹
OOS-MA	[UAS]	[ACT BUSY}, {LPBK TS}, PMI, ROLL] ¹
Notes: 1. ROLL is a transitory state unless MAN rolling mode is being used.		

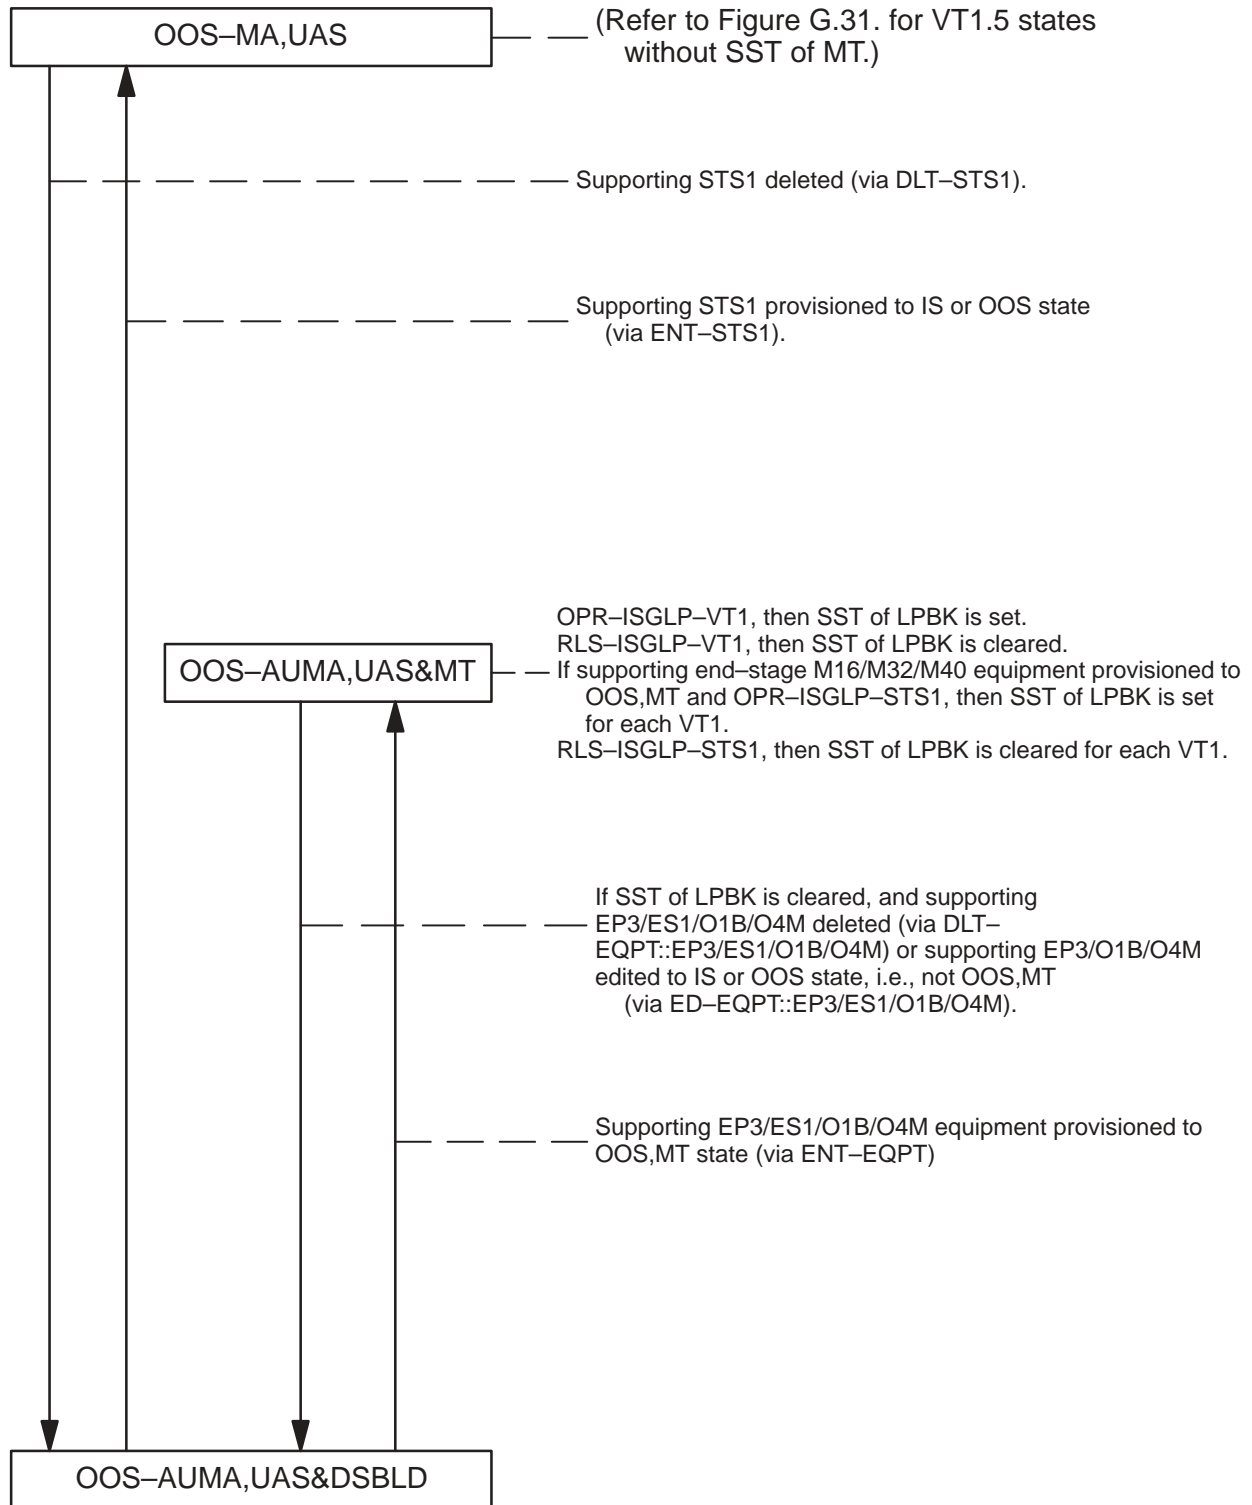

VT1.5 entity state transition diagrams are provided in Figures G.31. and G.32. Each state transition diagram shows possible Primary State transitions for the VT1.5 entity, along with a description of the cause of the state transition. Figure G.31. shows VT1.5 entity state transitions when the VT1.5 entity does not have a SST of MT applied to it. Figure G.32. shows VT1.5 entity state transitions when the VT1.5 entity has a SST of MT applied to it, as when an in-service growth maintenance test is to be performed prior to provisioning of the VT1.5 entity.

Notes.

1. When a SST of UAS is set, then any SST of {ACT, BUSY, FAF, PMI, SDEE, SGEO, TS} is cleared.
2. The following SSTs are set for any PST state, as follows:
SST of ACT is set if the VT1.5 is connected but has additional bandwidth available (e.g., 1-Way connected, or 2-Way connected but not with a bridge), otherwise ACT is cleared.
SST of BUSY is set If the VT1.5 is connected but has no additional bandwidth available (e.g., 2-Way connected with a bridge connection, a TAPP connected for test access), otherwise BUSY is cleared.
SST of PMI is set if PM is inhibited via SET-PMODE-VT1, otherwise PMI is cleared.
SST of TS is set if the VT1.5 are connected for a test access operation, otherwise TS is cleared.
SST of TRM is set if the VT1.5 is cross connected to a T1 in the VT1.5 to T1 direction, otherwise it is cleared.
SST of ROLL is temporarily set while the VT1.5 is under a roll operation.

**Figure G.31. VT1.5 State Transitions
(VT1.5 Without VT1.5 SST of MT)**

Note. When SST of UAS is set, then any SST of {ACT, BUSY, FAF, PMI, ROLL, SDEE, SGEO, TS} is cleared.

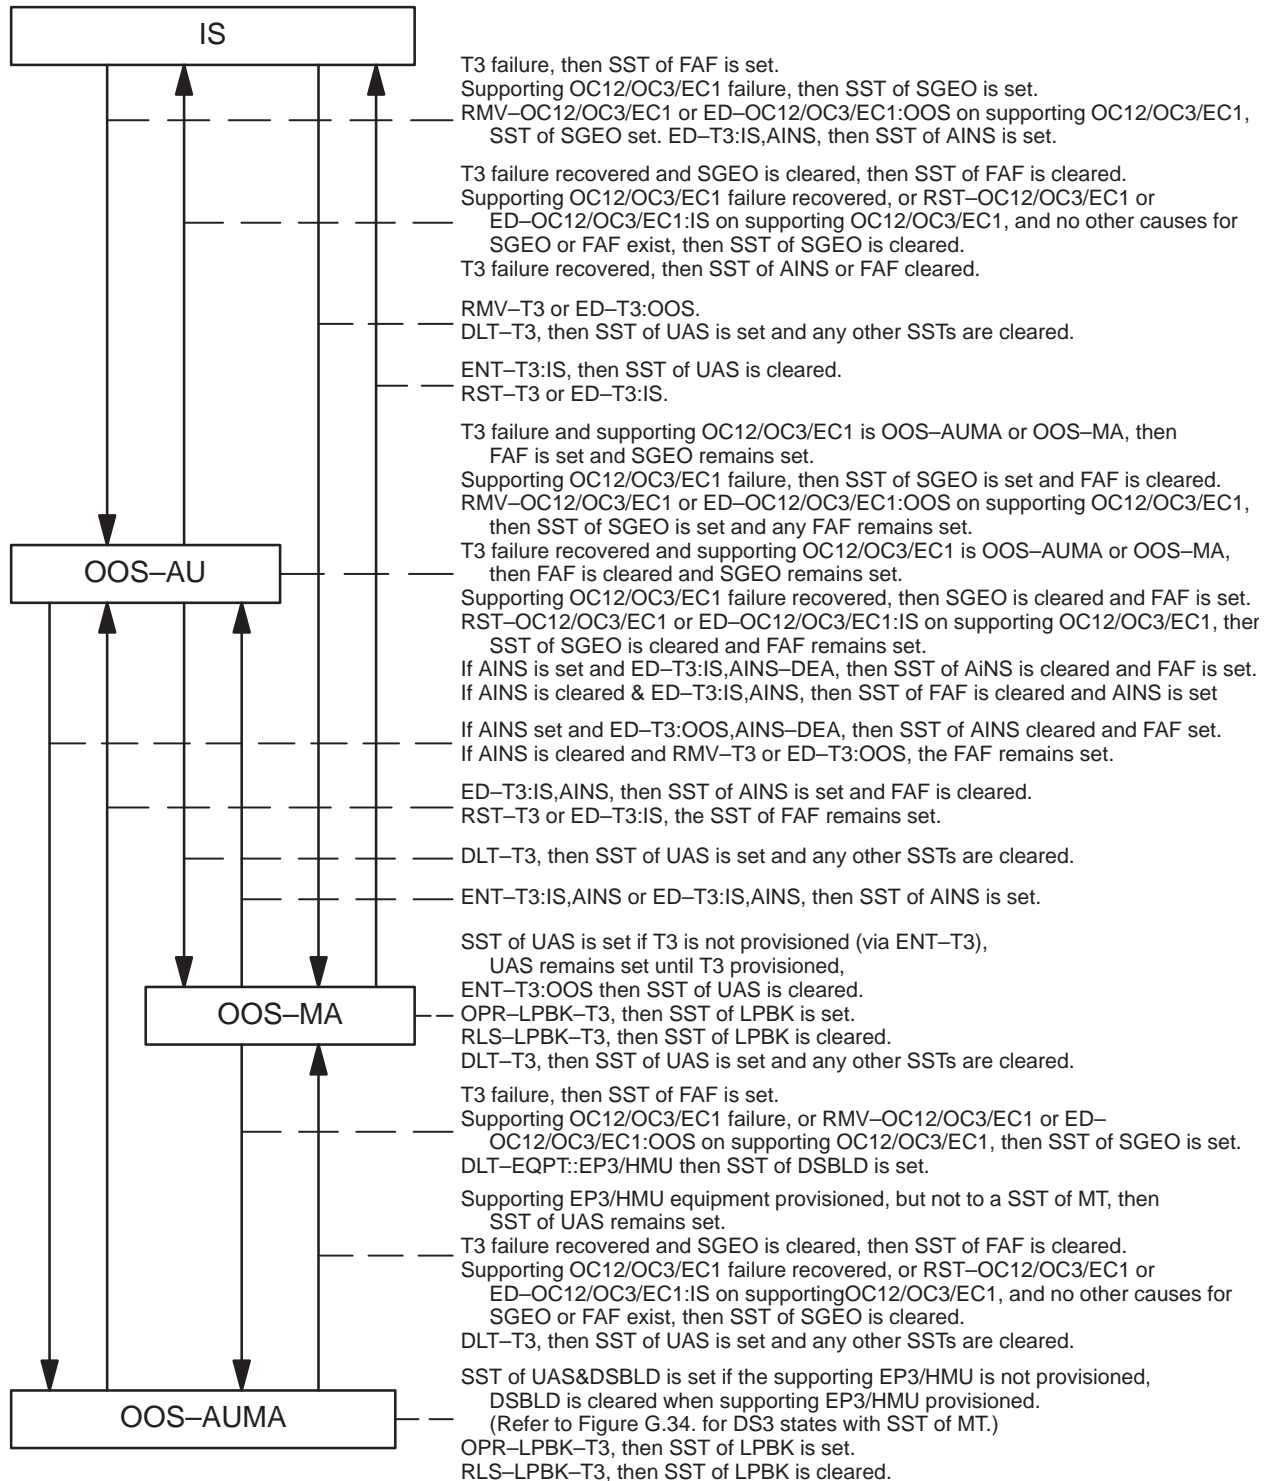

**Figure G.32. VT1.5 State Transitions
(Showing Affect of VT1.5 SST of MT)**

G.2.9. DS3 Entity State Transitions

The valid PST,SST combinations and applicable state values for DS3 entities is provided in Table G.9.

Table G.9. DS3 State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS ²		[{ACT BUSY}, PMI, SDEE, TRM, TS]
OOS–AU ²	AINS [FAF, SGEO]	[{ACT BUSY}, PMI, SDEE, TRM, TS] [{ACT BUSY}, PMI, SDEE, TRM, TS]
OOS–AUMA	[UAS] [UAS&DSBLD] [FAF, SGEO]	[MT {MT&LPBK}] ² [MT] ² [{ACT BUSY}, PMI, SDEE, {LPBK TRM TS}] ¹
OOS–MA	[UAS]	[{ACT BUSY}, PMI, SDEE, {LPBK TRM TS}] ¹
Notes: 1. A Test Access Port (FAD A or FAD B) cannot be provisioned to a PST of IS or OOS–AU, or have a SST of {ACT, DSBLD, LPBK, MT, UAS}.		

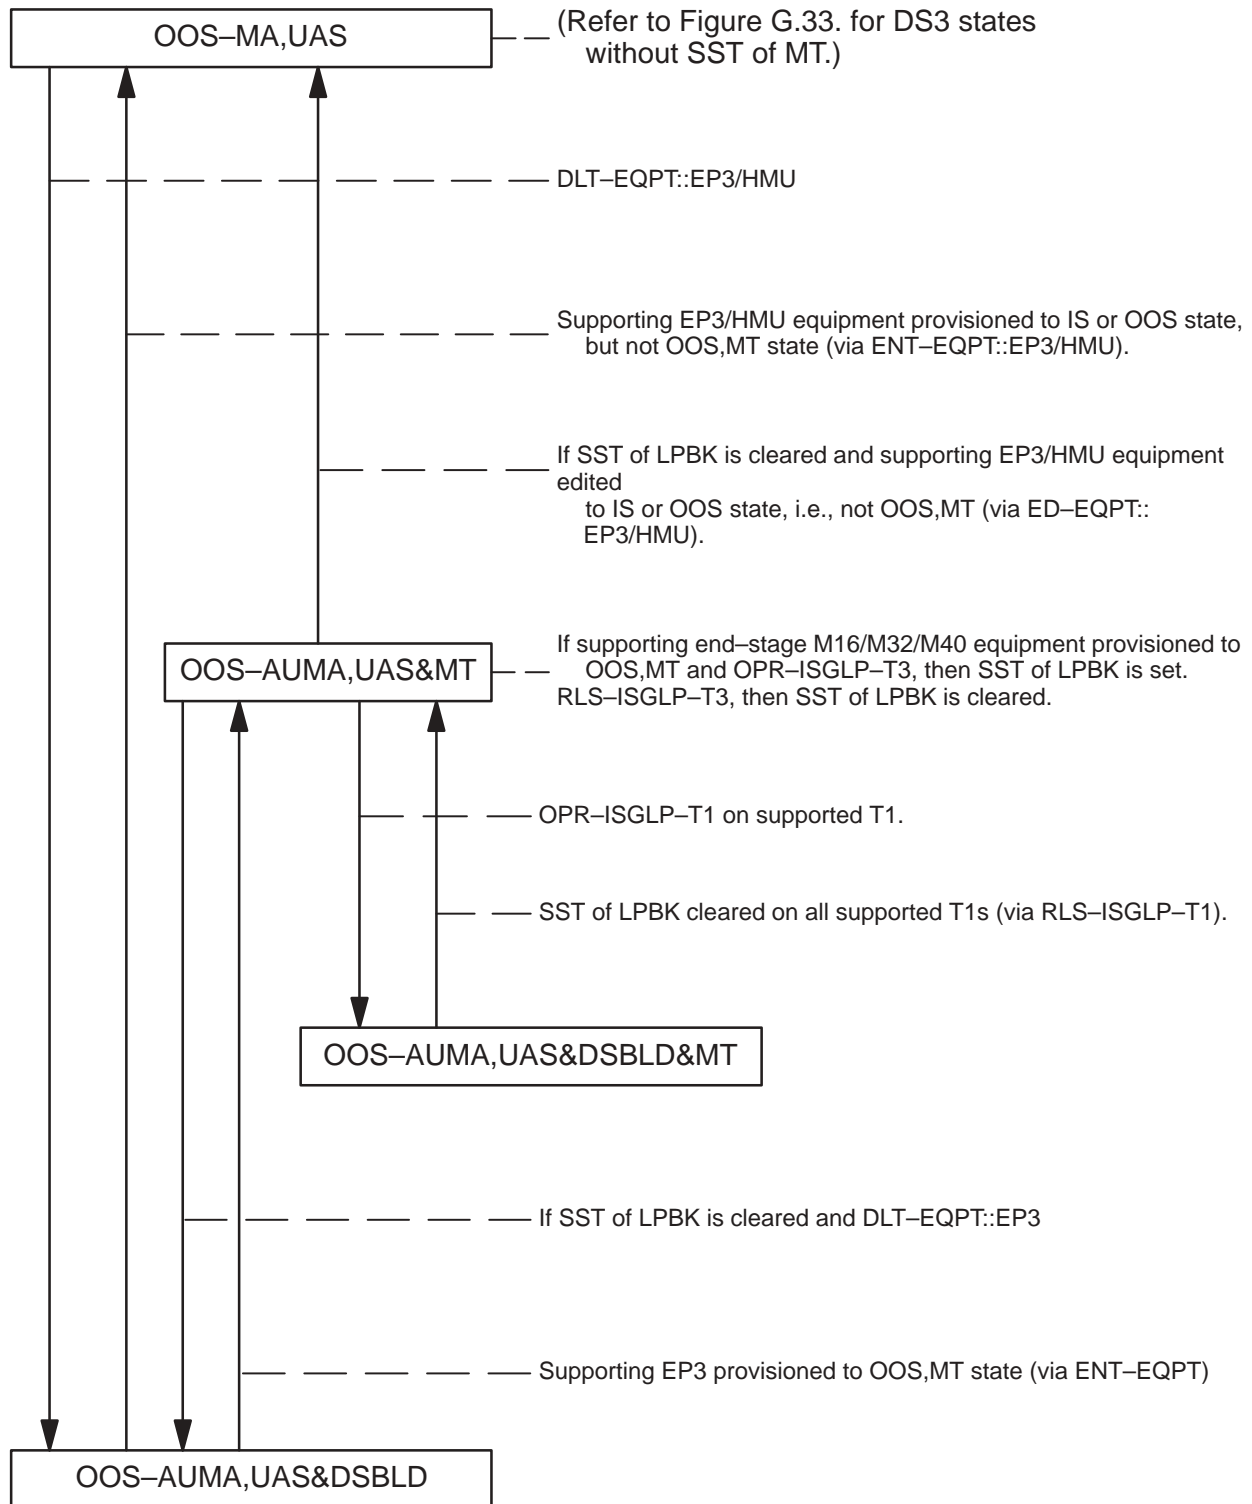

DS3 entity state transition diagrams are provided in Figures G.33. and G.34. Each state transition diagram shows the Primary State transitions for the DS3 entity, along with a description of the cause of the state transition. Figure G.33. shows DS3 entity state transitions when the DS3 entity does not have a SST of MT applied to it. Figure G.34. shows DS3 entity state transitions when the DS3 entity has a SST of MT applied to it, as when an in–service growth maintenance test is to be performed prior to provisioning of the DS3 entity.

Notes.

1. When a SST of UAS is set, then any SST of {ACT, AINS, BUSY, FAF, PMI, SDEE, SGEO, TRM, TS} is cleared.
2. The following SSTs are set for any PST state, as follows:
 - SST of ACT is set if the T3 is connected but has additional bandwidth available, otherwise ACT is cleared.
 - SST of BUSY is set if the T3 is connected but has no additional bandwidth available, otherwise BUSY is cleared.
 - SST of PMI is set if PM is inhibited via SET-PMMODE-T3, otherwise PMI is cleared if PM is enabled.
 - SST of SDEE is set if any subordinate T1 is provisioned (via ENT-T1), otherwise SDEE is cleared.
 - SST of TRM is set if any subordinate T1 has SST of {ACT, BUSY}, otherwise TRM is cleared.
 - SST of TS is set if the T3 or TAPP is connected for a test access operation, otherwise TS is cleared.

**Figure G.33. DS3 State Transitions
(DS3 Without DS3 SST of MT)**

Note. When SST of UAS is set, then any SST of {AINS, FAF, PMI, SDEE, TRM} is cleared.

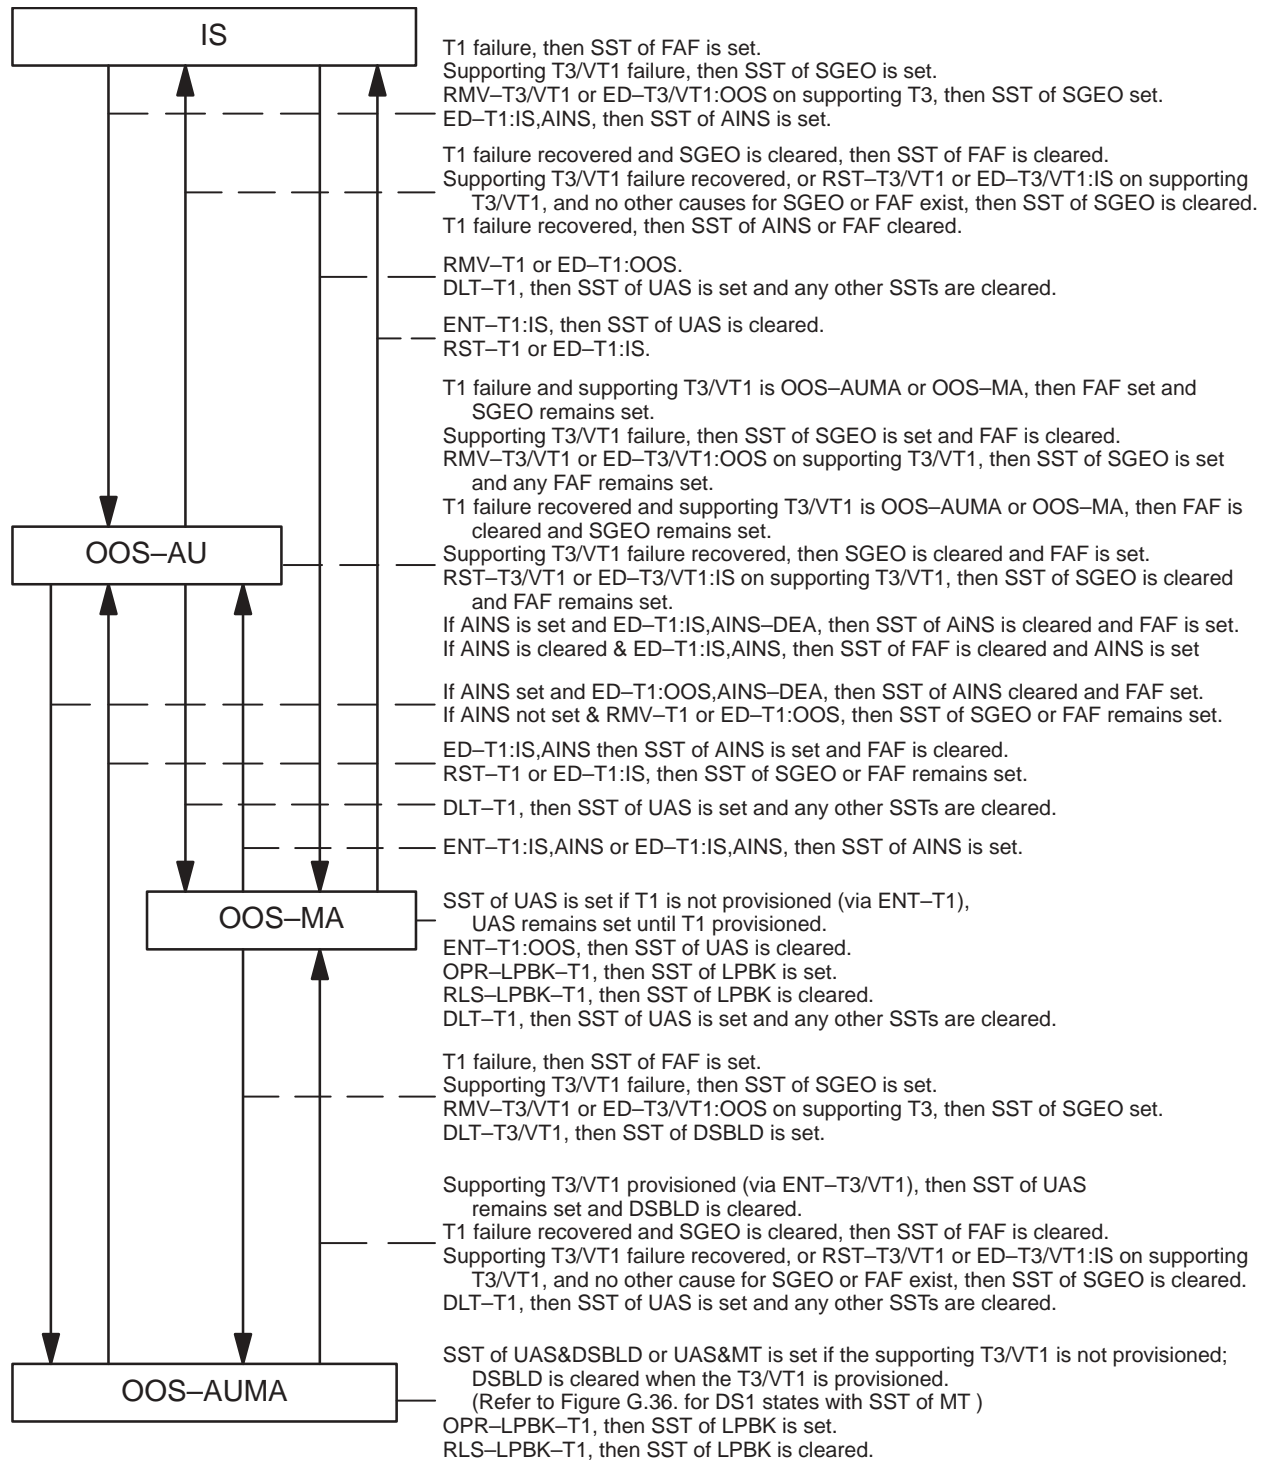

**Figure G.34. DS3 State Transitions
(Showing Affect of DS3 SST of MT)**

G.2.10. DS1 Entity State Transitions

The valid PST,SST combinations and applicable state values for DS1 entities is provided in Table G.10.

Table G.10. DS1 State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS ¹		[[ACT BUSY}, PMI, ROLL, TS] ^{2, 3}
OOS–AU ¹	AINS [FAF, SGEO]	[[ACT BUSY}, PMI, ROLL, TS] ^{2, 3} [[ACT BUSY}, PMI, TS] ²
OOS–AUMA	[UAS] ^{1, 2} [UAS&DSBLD] ^{1, 2} [FAF, SGEO]	[MT {MT&LPBK}] ^{1, 2} [[ACT BUSY}, {LPBK TS}, PMI, ROLL] ^{1, 2, 3}
OOS–MA	[UAS]	[[ACT BUSY}, {LPBK TS}, PMI, ROLL,] ^{1, 2, 3}
Notes: 1. A Test Access Port (FAD A or FAD B) cannot be provisioned to a PST of IS or OOS–AU, or have a SST of {ACT, DSBLD, LPBK, MT, ROLL, UAS}. 2. An Idle Signal Source port will not have a SST of {ACT, BUSY, DSBLD, MT, ROLL, UAS}. 3. ROLL is a transitory state unless MAN rolling mode is being used.		

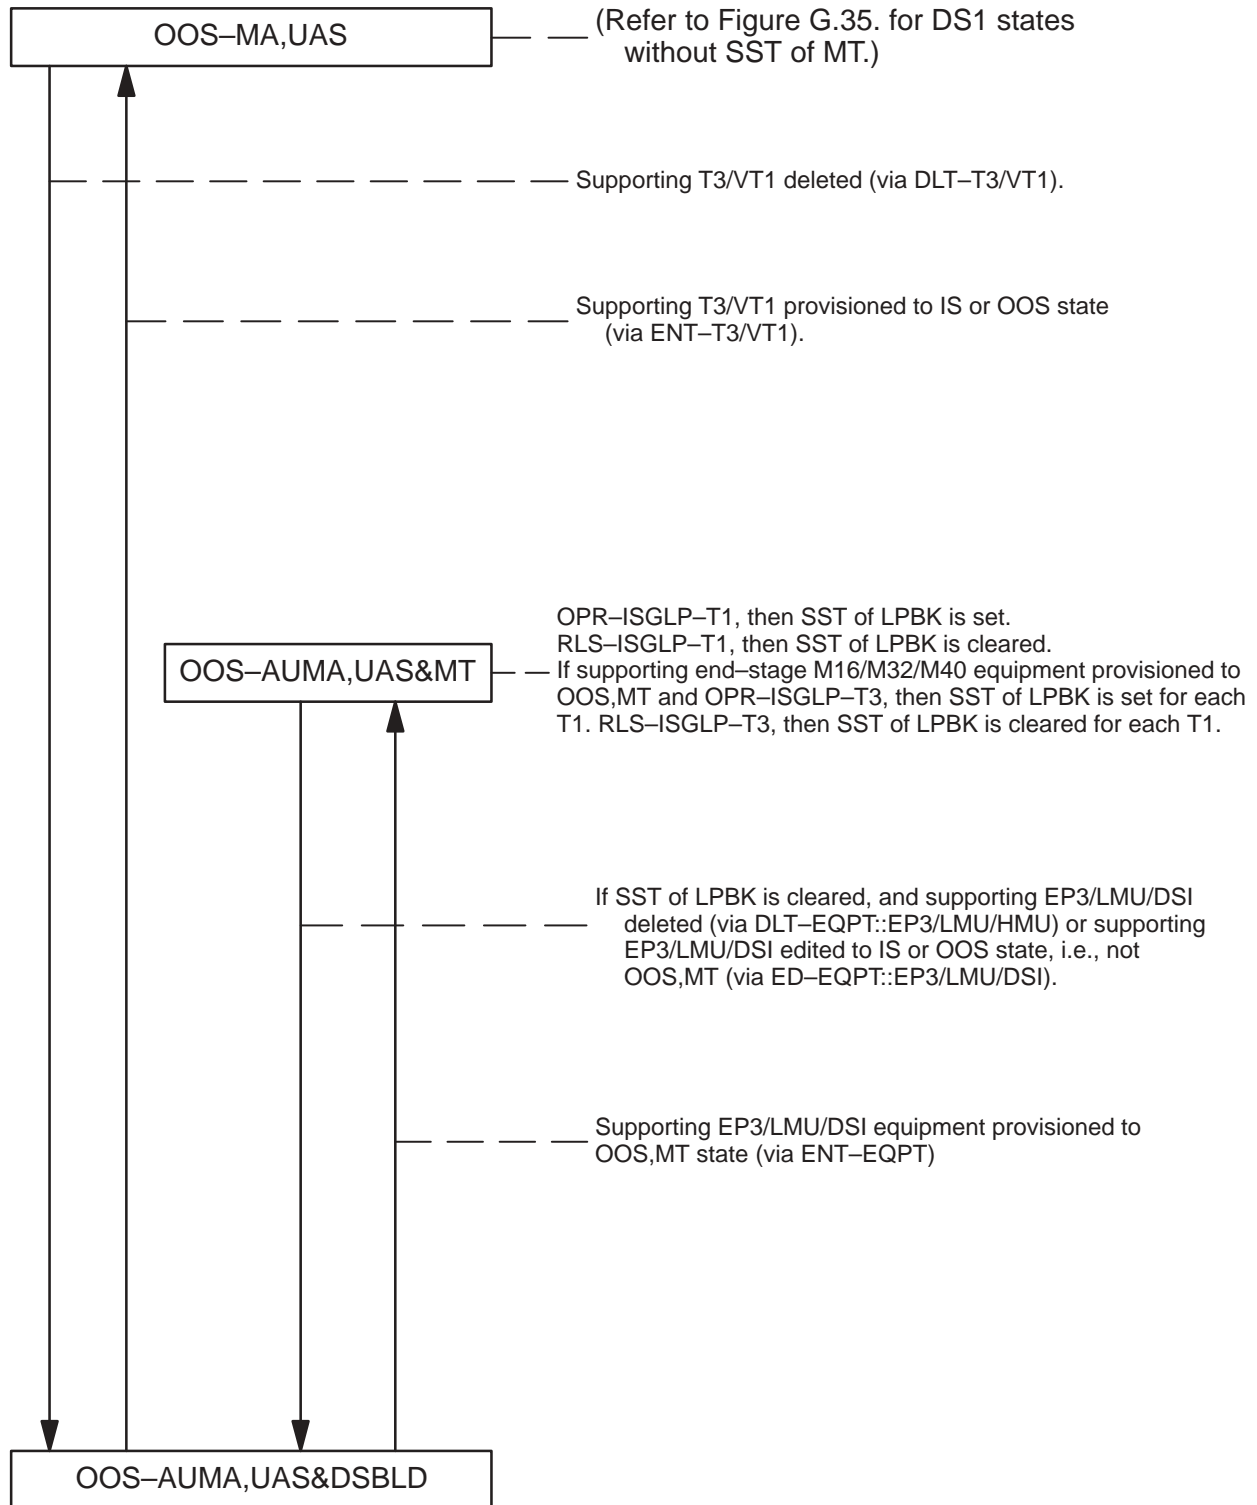

DS1 entity state transition diagrams are provided in Figures G.35. and G.36. Each state transition diagram shows possible Primary State transitions for the DS1 entity, along with a description of the cause of the state transition. Figure G.35. shows DS1 entity state transitions when the DS1 entity does not have a SST of MT applied to it. Figure G.36. shows DS1 entity state transitions when the DS1 entity has a SST of MT applied to it, as when an in–service growth maintenance test is to be performed prior to provisioning of the DS1 entity.

Notes.

1. When a SST of UAS is set, then any SST of {ACT, BUSY, FAF, PMI, SDEE, SGEO, TS} is cleared.
2. The following SSTs are set for any PST state, as follows:
 - SST of ACT is set if the T1 is connected but has additional bandwidth available (e.g., 1-Way connected, or 2-Way connected but not with a bridge), otherwise ACT is cleared.
 - SST of BUSY is set If the T1 is connected but has no additional bandwidth available (e.g., 2-Way connected with a bridge connection, a TAPP connected for test access), otherwise BUSY is cleared.
 - SST of PMI is set if PM is inhibited via SET-PMMODE-T1, otherwise PMI is cleared.
 - SST of TS is set if the T1 or TAPP are connected for a test access operation, otherwise TS is cleared.
 - SST of ROLL is temporarily set while the T1 is under a roll operation.

**Figure G.35. DS1 State Transitions
(DS1 Without DS1 SST of MT)**

Note. When SST of UAS is set, then any SST of {ACT, BUSY, FAF, PMI, ROLL, SDEE, SGEO, TS} is cleared.

**Figure G.36. DS1 State Transitions
(Showing Affect of DS1 SST of MT)**

G.2.11. F3 Entity State Transitions

The valid PST,SST combinations and applicable state values for F3 entities is provided in Table G.11.

Table G.11. F3 State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[PMI]
OOS-AU	SGEO	[PMI]
OOS-AUMA	UAS&DSBLD	
OOS-MA	UAS	

The F3 entity state transition diagram is provided in Figure G.37. The state transition diagram shows possible Primary State transitions for the F3 entity, along with a description of the cause of the state transition.

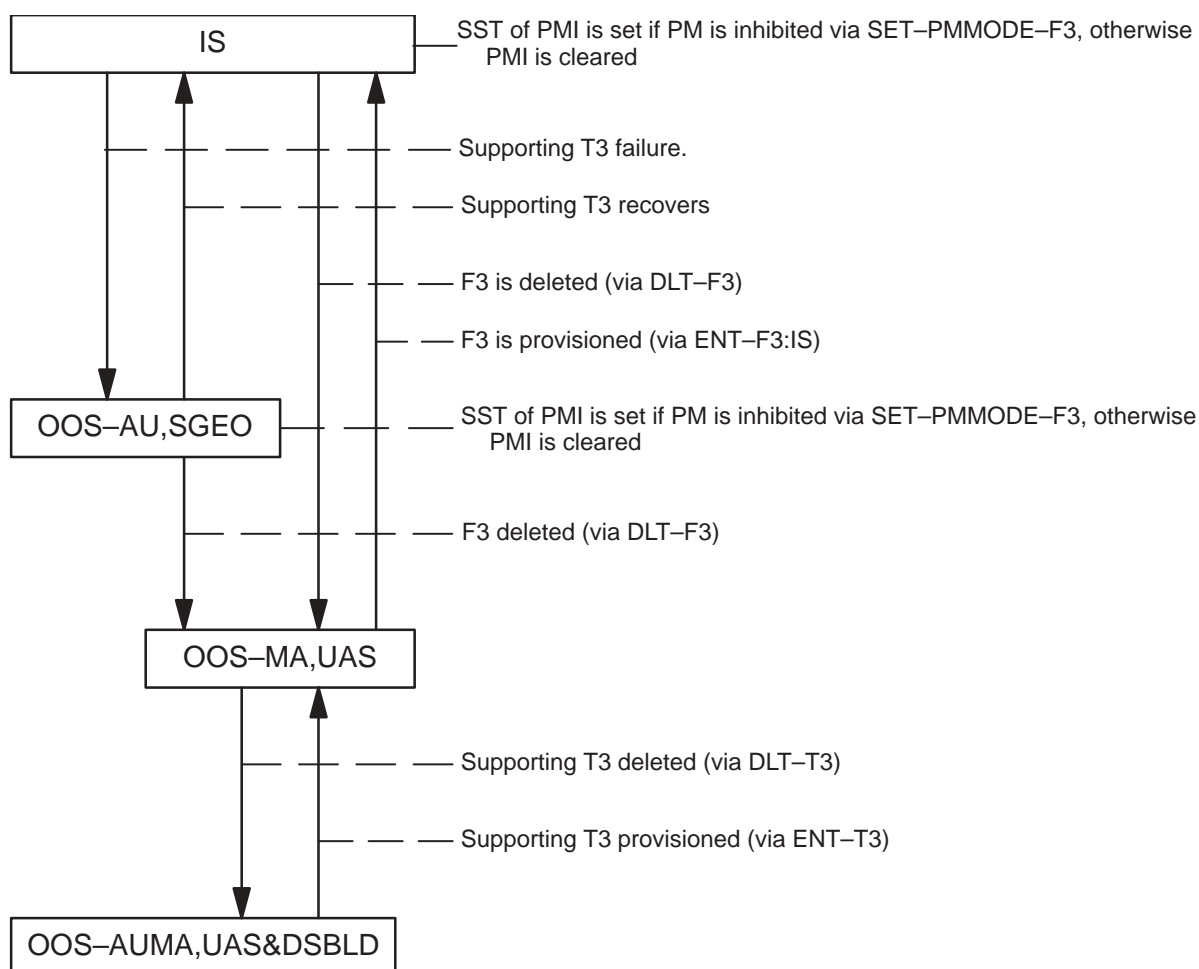

Figure G.37. F3 State Transitions

G.2.12. Timing Reference (TMG) State Transitions

The valid PST,SST combinations and applicable state values for Timing reference entities is provided in Table G.12.

Table G.12. Timing Reference (TMG) State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[BUSY]
OOS-AU	FAF	
OOS-MA	UAS	

The Timing reference entity state transition diagram is provided in Figure G.38. The state transition diagram shows the Primary State transitions for the Timing reference entity, along with a description of the cause of the state transition.

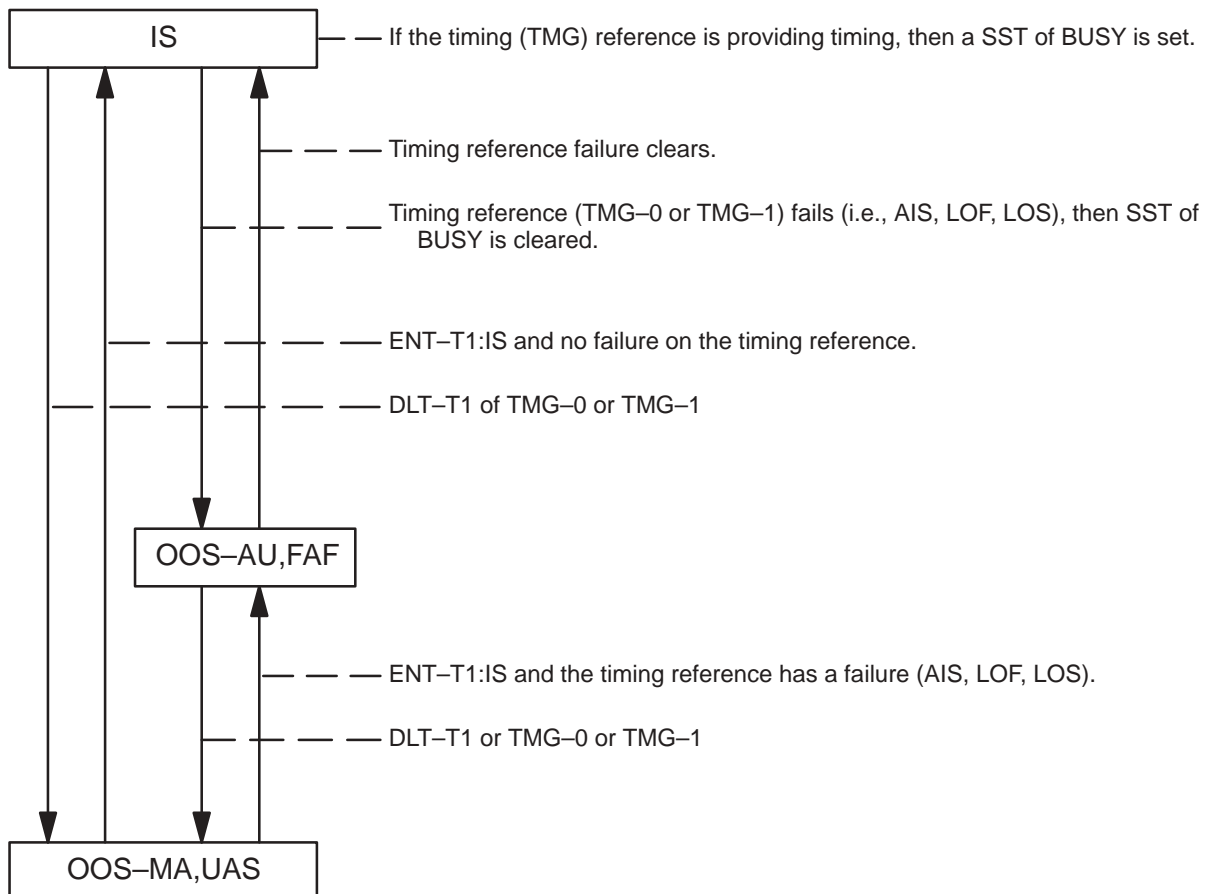

Figure G.38. Timing Reference (TMG-0 or TMG-1) State Transitions

G.2.13. Cross-Connect State Transitions

The valid PST,SST combinations and applicable state values for cross-connect entities is provided in Table G.13.

Table G.13. Cross-Connect State Values		
PST Value	SST Values	
	Possible Cause of PST Change	Possible Additional SST Information
IS		[{TERMB TERMF TERMT}, {TS ROLL}]
OOS-AU	SGEO	[{TERMB TERMF TERMT}, {TS ROLL}]

The cross-connect entity state transition diagram is provided in Figure G.39. The state transition diagram shows the Primary State transitions for the cross-connect entity, along with a description of the cause of the state transition.

Figure G.39. Cross-Connect State Transitions

APPENDIX H. USER COMMAND PRIVILEGE DEFAULTS (CCAL & CCFC)

H.1. General

This appendix provides a list of the TL1 commands available in the 1631 SX and the associated user command privilege default setting provided with the system for each command. User command privileges are controlled by the command's CCAL (Command Community Authorization Level) and CCFC (Command Community Functional Category).

In general, each command is included in one or more of the following CCFC default groups:

- | | |
|---------|---|
| Group A | USI/User/Site Provisioning/Maintenance and User/Command Security commands. |
| Group B | Facility Provisioning and Connection commands. |
| Group C | Equipment Provisioning and Maintenance commands. |
| Group D | Alarms/Condition Provisioning commands. |
| Group E | Diagnostics and Fault Isolation commands. |
| Group F | NMA (Network Maintenance and Alarms) commands (ALLOW, DIGNOSE, INHIBIT, INIT, OPERATE, RELEASE, REMOVE, RESTORE, RETRIEVE, SCHEDULE, SET, SWITCH). Please refer to GR-833-CORE for commands of this category. |
| Group H | OPS/INE commands (ACTIVATE, CANCEL, COPY, DELETE, EDIT, ENTER, RETRIEVE). Please refer to GR-199-CORE for the commands of this category. |
| Group M | DTMS (DACS Transport Maintenance System) Maintenance Commands. |
| Group Y | Default Set of User Facility Partitioning commands. |
| Group Z | All 1631 SX commands. |

Note. The RTRV-DB-LABEL, RESTORE-DB and START-OPS commands can be executed from the Limited Command Entry mode or the Normal Command Entry mode of operation.

H.2. User Privilege Defaults

The following is an alphabetized list of TL1 commands and the associated system defaults for each command's CCAL and CCFC.

Table H1 User Privilege Defaults												
General Market (GM) & Green Commands	Default CCAL	Default CCFC Groups										Applicable Release (Blank=GM and Green)
		A	B	C	D	E	F	H	M	Y	Z	
ACT-DA	15	A							M		Z

APPENDIX I. VDT FUNCTION KEYS

This appendix provides a description of the VDT function keys for each of the VDT input/output modes of operation.

The VDT input/output modes are

- Direct Command Input Mode (Direct Mode),
- Command Input Menu Mode (Menu Mode), and
- Command Input Forms Mode (Forms Mode).

The action performed by the VDT function keys varies depending on the VDT input/output mode.

I.1. Direct Command Input Mode Function Keys

The following VDT function keys are active when the VDT is in the Direct Command Input Mode:

- F7 Mode key: Transfers the VDT operation to the Menu Mode.
- F8 Alarms key: Displays the most recent system alarms and enables alarm scrolling in the VDT screen work area.
- F9 Output key: Displays the most recent system-generated output messages and enables message scrolling in the VDT screen work area.
- F11 Clr Fld key: Clears any keyboard entries on the command input line.
- F12 Abt Out key: Aborts the output message currently being displayed in the VDT screen work area (a TTY device does not have the Abort_Out capability).
- F19 Recall Fwd key: Displays the next command from the VDT recall buffer in the command input line. Successive key presses sequentially display up to 20 previously used commands. Recalled commands can be edited and executed from the command input line.
- F20 Recall Bkwd key: Displays the previous command from the recall buffer in the command input line. Successive key presses sequentially display up to 20 previously used commands. Recalled commands can be edited and executed from the command input line.

I.2. Command Input Menu Mode Function Keys

The following VDT function keys are active when the VDT is in the Menu Mode:

- F7 Mode key: Transfers the VDT operation to the Direct Command Input Mode.
- F8 Alarms key: Displays the most recent system alarms and enables alarm scrolling in the VDT screen work area.
- F9 Output key: Displays the most recent system-generated output messages and enables message scrolling in the VDT screen work area.
- F10 Parent key: Displays the previous-level menu screen from which the currently displayed menu or form screen was selected.
- F11 Abort key: Displays the first-level (main) menu screen.

I.3. Command Input Forms Mode Function Keys

The following VDT function keys are active when the VDT is in the Command Input Forms Mode:

F7 Mode key:	Transfers the VDT operation to the Direct Command Input Mode.
F8 Alarms key:	Displays the most recent system alarms and enables alarm scrolling in the VDT screen work area.
F9 Output key:	Displays the most recent system-generated output messages and enables message scrolling in the VDT screen work area.
F11 Abt In key:	Aborts the Input Form (no command is executed from the Form) and transfers the VDT operation to the Direct Command Input Mode.
F17 ClrFld key:	Clears the keyboard entry for the currently selected form input data field.
F19 Execute key:	Causes the command for the currently displayed input form to be executed with the parameter values populated from the form input data fields.
F20 Ex/Recycle key:	Executes the command shown in the command input line.

I.3.1. Command Input Forms Mode Editing Keys

Right Arrow	Moves the cursor one character to the right in a form input data field, skipping any blanks between fields.
Left Arrow	Moves the cursor one character to the left in a form input data field, skipping any blanks between fields.
Up Arrow	Moves the cursor to the beginning of the previous form input data field. If the cursor is in the top field of the form, the cursor skips to the bottom field.
Down Arrow	Moves the cursor to the beginning of the next form input data field. If the cursor is in the bottom field of the form, the cursor skips to the top field.
Tab	Operates the same as the down-arrow key.
Back space	Deletes the character to the left of the cursor.
Remove	Deletes the character at the cursor position.
