

1631 SX LMC

Commands and Messages

PN 3AL45392AJ 01
R10.01, Issue 01, February 2005

THIS PRODUCT COMPLIES WITH D.H.H.S. RADIATION PERFORMANCE STANDARDS 21 CFR, 1040.10, FOR A CLASS 1 LASER PRODUCT.

DANGER

Invisible laser radiation is present when the optic connector is open. AVOID DIRECT EXPOSURE TO BEAM.

WARNING

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case users will be required to correct the interference at their own expense.

NOTICE

This manual applies to 1631 SX LMC R10.01 software. Release notes describing revisions to this software may impact operations described in this manual.

This transfer of commodities, technology, or software, if from the United States, is an export in accordance with the U.S. Export Administration Regulations. Diversion contrary to U.S. law is prohibited. The export or re-export (further transfer) of such commodities, technology, software or products made from such technology is prohibited without proper authorization(s) from the U.S. Department of Commerce or other appropriate U.S. government agency(s).

All rights reserved. No part of this manual may be reproduced, translated, stored in a retrieval system, or transmitted or distributed by any means, electronic or mechanical, by photocopying, recording, or otherwise, without the written permission of Alcatel. Preparing derivative works or providing instruction based on the material is prohibited unless agreed to in writing by Alcatel.

The product specification and/or performance levels contained in this document are for information purposes only and are subject to change without notice. They do not represent any obligation on the part of Alcatel. Such obligations will only be committed to in a written sales agreement signed by Alcatel.

1. INTRODUCTION

1.1. General

This Manual describes the Transaction Language 1 (TL1) command and response messages available in release 10.01.00 of the 1631 SX Digital Cross-Connect system. These messages consist of input commands, command output response messages (successful and unsuccessful), acknowledgement output messages, and autonomous output messages.

This section of the manual provides the general description and syntax for these messages.

A description of each input command and its associated output responses (successful and unsuccessful) is presented in Section 2 in alphabetical order by command code.

A description of each autonomous output message is presented in Section 3 in alphabetical order by response code.

Supplementary information is included in the appendices which follow Section 3. A list of the appendices is provided at the end of this Introduction.

This manual is intended for use by personnel involved in system installation and acceptance, technical support, facility provisioning, plant maintenance, remote administration, and Operations Support Systems development.

1.2. Conventions

The following conventions, described below, are used in this manual.

1.2.1. TL1 Syntax Characters

The following symbols are TL1 command input and response output syntax characters. Some of these symbols are also used in this manual for notational purposes in describing command input format and response output format, but these characters are only used as literal characters in an actual command input or response output as described below.

- : A colon is used to separate parameter blocks in an input command or in a parsable text output message.
- , A comma is used to separate parameters within a parameter block of an input command or an output response message.
- ; A semi-colon is used as a terminator to indicate the completion, and to identify the end, of an input command, a successful or unsuccessful output message, or an autonomous message. A semi-colon does not appear within a parsable text string or within free form, non-parsable, informational text.
- > A greater-than sign is used as a continuation message terminator and indicates additional output associated with the response will follow. A greater-than sign does not appear within a parsable text string or within free form informational text.
- < A less-than sign is used as an acknowledgement message terminator and identifies the end of an acknowledgement output message. A less-than sign does not appear within a parsable text string or within free form informational text.
- A hyphen is used to separate a command verb and modifiers (the command code) and to separate arguments of a compound parameter.
- = An equal sign is used to separate a keyword parameter from the keyword parameter value.
- & An ampersand is used to group parameter values in an input command (a list of parameter values is generated), and to combine parameter values in an output message (for example, secondary states). For additional information on parameter addressing rules, refer to Section 1.9., AID (Access Identifier) Addressing (&&-Ranging and &-Grouping Rules).

&&	A double-ampersand is used to represent numeric ranging on the argument value of a (simple or compound) parameter in an input command (a sequential series of parameter values is generated beginning with the first term specified to the last term specified). For additional information on parameter addressing rules, refer to Section 1.9., AID Addressing (&&–Ranging and &–Grouping Rules).
.++.	A period – plus sign – plus sign – period is used to indicate that a numeric incrementing value, other than one, is being specified for a numeric &&–range. (Adding the notation .++.N after the argument value specified in a numeric &&–range results in a sequential series of values where the argument value of the parameter is incremented by N.) For additional information on parameter addressing rules, refer to Section 1.9., AID Addressing (&&–Ranging and &–Grouping Rules).
“ ... ”	Enclosing quotation marks are used to enclose parsable text strings in an output response message line or to enclose a literal string used for an input parameter value.
/ * ... */	Beginning slash–asterisk and ending asterisk–slash are used to enclose non–parsable free–form text strings in an output response message line.
\ “ ... \”	Enclosing back–slash–quotation marks are used to enclose non–parsable free–form text strings within a parsable text string in an output response message line.

1.2.2. Valid Character Set

The valid character set for command input is:

Upper and lower case alphabetical characters unless otherwise specified

Decimal numerals 0 through 9

Special characters:

- _ underscore
- + addition or plus sign
- % percent sign
- # number or pound sign

In addition, the following special characters are reserved for TL1 command input syntax and may not be used as part of a parameter’s value unless otherwise specified in a command’s description.

- : colon
- ; semi–colon
- , comma
- hyphen or dash
- = equal sign
- & ampersand
- ” quotation mark

All alphabetic characters entered by the user must be in upper case except:

Command code (verb–modifier–modifier), which may be entered in either upper or lower case, or a mixture of upper and lower case.

Values for CTAG (Correlation Tag), which may be entered in upper or lower case.

Values for PID (Password Identifier), UID (User Identifier), UNAM (User Name), and PNAM (Process File Name), which must be entered in the same case as when created.

Values for TID (Target Identifier), which are converted to upper case for comparison to the provisioned SID (Site Identifier) value.

Values for SID, which are converted to upper case for comparison to the entered TID value.

Values for OSL (Output Subscription Level), which must be entered using the case as shown in the ENT–USER and ED–PRVG–USER command descriptions.

Extra spaces (“white spaces”) are ignored by the system's command parser when entered in a command input message in the following cases:

Before or after a command verb or verb modifier in a command code

Before or after a command syntax punctuation or operator character,
(i.e., : , ; - = & && &- &&- .++ .)

Before or after a command parameter name or a parameter value.

The case of characters displayed by output messages is the same case as entered or as when created except:

Values for TID, which are always displayed in upper case.

Values for SID, which are always displayed in upper case.

Leading zeroes in parameter values can be entered in a command input, but may be truncated by the system, depending on the specific parameter. In general, leading zeroes in parameter values that are decimal numerals less than ten digits (nine digits or less) are truncated by the system. Leading zeroes in decimal numerals greater than or equal to ten digits are not truncated and are treated as a literal string by the system. Parameter values that are treated as a literal string (leading zeroes are not truncated), regardless of the value's length, are specifically identified as such in a command's description in Section 2.

Following definition is used for 'Printable ASCII characters' when they are retrieved :

All NULL characters (00 hex) are replaced with a period (.) character (2E hex).

All control characters (i.e., 01 hex to 1F hex and the value 7F hex) are replaced with a question mark (?) character (3F hex).

All double quote (") and back slash (\) characters (22 hex and 5C hex respectively) are replaced with a question mark (?) character(3F hex).

All 8 bit characters (i.e., 80 hex to FF hex) are replaced with a question mark (?) character (3F hex).

All other characters are left unchanged.

1.2.3. Parameter Value Set Notation

In most cases, an input parameter of a command has more than one possible value. A parameter's set of values, or domain, is defined in this manual by using the following notation:

- , A comma is used to separate parameter values when multiple values exist.
- A hyphen is used to indicate a range of values for the parameter, or a range of values within an argument of a compound parameter. For example, 1–12 indicates a value set of 12 discrete values from one through twelve. A hyphen may also be a literal character of a compound parameter's value.
- <...> Enclosing less-than and greater-than signs are used to enclose a description of the parameter's domain when this is more understandable than an exact definition of the domain. For example,

- < 1 – 6 VALID CTAG CHARACTERS >
describes the CTAG domain of 1–6 case sensitive alphanumeric characters.
- {...} Enclosing braces are used to enclose a set of values. Enclosing braces may be nested. For example:
Enclosing braces as used to enclose a set of values.
 {LOF, LOFLOS, LOS}
describes a value set consisting of the values LOF, LOFLOS, and LOS.
Enclosing braces as used to enclose an argument of a compound parameter when a range of values exist for the argument of the compound parameter.
 {ABC – {1–16} – {1–16} }
describes a value set of 256 discrete values from ABC–1–1 through ABC–16–16 (note that the hyphens outside of the braces are literal characters in the parameter's value).
Braces are used to enclose a value subset that has been named to provide additional clarity. A value subset may be named when the possible values of a parameter consist of more than one type of value (or when naming the value set provides additional clarity). When a value subset is named, the name of the value subset and the value subset are separated by a colon (:).
 {Date:{0–99} – {1–12} – {1–31},
 Day:{SUN,MON,TUE,WED,THU,FRI,SAT,ALL,ODD,EVEN} }
describes a value set that consists of two types of value subsets, one value subset named Date and the other value subset named Day.
- :
- A colon is used to separate the name of a value subset and the value subset when the value subset has been named for additional clarity. Refer to the example above.
- <NoVal> The notation <NoVal> is used to indicate a parameter value of “no value”. <NoVal> is used in describing input parameters when an unpopulated (not entered) parameter value has an explicit definition other than another specific parameter value or “previously existing value”. (Refer to RTRV–TACC for an example of the use of <NoVal>). <NoVal> is used in describing output parameters when no displayed output parameter value is part of the output parameter value set.

1.2.4. Command Input Format Notation

The following notation is used in this manual to describe a command's input format:

- [...] Enclosing brackets are used to enclose an optional command input parameter.
- <...> Enclosing less-than and greater-than signs are used to indicate a value substitution. The enclosing less-than and greater-than signs are not part of the actual input command. Generally, this notation is only used in this section to provide additional clarity in the syntax descriptions for an input command.

Also refer to Section 1.2.1., TL1 Syntax Characters, for a description of the TL1 command input syntax characters, and to Section 1.6., Command Input Format, for a description of each command input parameter block.

1.2.5. Output Response Format Notation

The following notation is used in this manual to describe a command's output response message or an autonomous output response message:

- ^ A caret is used to identify a space in a output response message. Generally, this notation is only used in this section to provide additional clarity in the syntax descriptions for output messages.
- cr “cr” (carriage return) is used to indicate a carriage return in an output response message. Generally, this notation is only used in this section to provide additional clarity in the syntax descriptions for output messages.
- lf “lf” (line feed) is used to indicate a line feed in an output response message. Generally, this notation is only used in this section to provide additional clarity in the syntax descriptions for output messages.

- (...) Enclosing parenthesis may be used to enclose a group of symbols in an output response, generally to provide additional notational clarity. Enclosing parenthesis are also used in the non-parsable command echo line (refer to Section 1.7., Command Response Messages) to enclose the Communications Interface device (CID) or Order Number (ON) pertaining to the output response message. The enclosing parenthesis are not part of the actual output message, except when used in the command echo line of an output response.
- [...] Enclosing brackets are used to enclose an optional item or group of items (for example, a parameter or output response message line) in an output response. Enclosing brackets are also used in the non-parsable command echo line (refer to Section 1.7., Command Response Messages) to enclose the CTAG value pertaining to the output response message. The enclosing brackets are not part of the actual output message, except when used in the command echo line of an output response.
- <...> Enclosing less-than and greater-than signs are used to indicate a value substitution. The enclosing less-than and greater-than signs are not part of the actual output message.
- {...} Enclosing braces are used to enclose a set of values. Generally, enclosing braces are used in the notation for the non-parsable command echo line and in describing an output parameter's value set. The enclosing braces are not part of the actual output message.
- ,
- A comma is used to separate parameters within an output response message, and is also used as part of a parameter's value set notation to separate parameter values. When used to separate parameter values within a value set, the separating comma is not part of the actual output message.
-
- A hyphen is used in describing an output parameter's value set to indicate a range of values for the parameter, or a range of values within an argument of a compound parameter. A hyphen may also be a literal character of a compound parameter's value.
- *
- An asterisk that is following enclosing brackets or parenthesis is used to indicate the enclosed item may appear in an output response message zero, one, or more times. The enclosing brackets or parenthesis and asterisk are not part of the actual output message. Generally, this notation is only used in this section to provide additional clarity in the syntax descriptions for output messages.
- +
- A plus sign that is following enclosing brackets or parenthesis is used to indicate the enclosed item may appear in an output response message one or more times. The enclosing brackets or parenthesis and plus sign are not part of the actual output message. Generally, this notation is only used in this section to provide additional clarity in the syntax descriptions for output messages.

1.3. Command Descriptions

Command descriptions for each command are located in Section 2 of this manual. Each command description consists of the following subsections:

- **Command Header**, located at the top of the first page of each command description, consists of the command code (verb and one or two modifiers) and the command name. For example:
COMMAND CODE: **ENT-T3**
COMMAND NAME: **ENTER T3**
- **Purpose** provides information on the use, effect, and function of the command.
- **Input Format** shows the command's TL1 input syntax. Refer to Section 1.6., Command Input Format, for a description of the format and notation for a TL1 command as used in this manual.
- **Input Parameters** describes the input parameters and parameter values that can be used with the command. Keyword-defined parameters are (generally) shown in alphabetical order, but may be entered in any order (the keyword defines the parameter value being entered). Refer to Section 1.3.1., Input Parameter Descriptions, for a description of the format used for this subsection of a command description.

- **Successful Response Format** shows the normal (successful) response format for the command. Keyword-defined parameters are (generally) shown in alphabetical order, but the system may generate an output response message with the keyword parameters in non-alphabetical order (the keyword in the output response defines the parameter value being reported). Refer to Section 1.7., Command Response Messages, for a description and syntax of command output response messages.
- **Acknowledgement Response Format** shows any unique acknowledgement response format for the command. An acknowledgement response format is only shown when a unique acknowledgement response is generated by the command (the standard In-Progress acknowledgement response format is not shown with each command description). Refer to Section 1.7.1., Acknowledgement Response Format, for a description and syntax of acknowledgement responses.
- **Output Parameters** describes the output parameters and parameter values shown in the output response message, if any, except for parameters in the response header. An Output Parameters subsection is not shown if the command does not provide output parameters. Refer to Section 1.3.2., Output Parameter Descriptions, for a description of the format used for this subsection of a command description.
- **Unsuccessful Response Format** shows the error (unsuccessful) response format for the command. Refer to Section 1.7., Command Response Messages, for a description and syntax of command output response messages.
- **Error Codes** lists the error codes associated with the command's unsuccessful response. The error code acronym, the expanded error code description, and any informational error description text that may be generated by the system for the Error Code, is provided for each Error Code listed. Error Codes common to all commands that are generated because of a Command Parser error are shown in Appendix D, Error Codes, and are not duplicated in this section. Only non-Parser generated Error Codes are shown in this subsection.
- **Examples** provides one or more illustrations on the use of the command.
- **Related Commands** provides a list of closely related or prerequisite (commands that must be executed before the described command can be executed) commands.
- **Related Autonomous Responses** provides a list of closely related autonomous response messages, if any. This subsection is not shown if there are no related autonomous responses.

1.3.1. Input Parameter Descriptions

The Input Parameters subsection of a command description describes all required and optional parameters listed in the Input Format subsection of a command description, and describes the possible values, default value, and any addressing or restrictions for each parameter. The general format of the Input Parameters subsection is:

```

PARM          {PARAMETER_VALUE_SET}
              Default:      {Default Value}
              Addressing:    Any parameter addressing or grouping rules
              Description:    Description of the parameter. Values are:
                              PARM_VALUE Description of the input parameter's values.
              Restrictions:    Any restrictions pertaining to the parameter or parameter's values.
```

where:

- **PARM**: the parameter identifier. A positional parameter is identified by PARM, a keyword parameter is identified by PARM=.
- **PARAMETER_VALUE_SET**: the parameter's set of values or domain.
- **Default**: the default value of the parameter if the parameter is omitted from the input command (the parameter value assumed by the system and/or obtained via an associated retrieve command if the parameter is not entered in the command).

- Addressing: any addressing rules that may apply to the parameter. In most cases, parameter addressing only applies to the AID parameter, in which case the type of AID addressing supported is specified. If no addressing is supported, "None" is specified. In a few cases, a description of any unique addressing supported for a specific parameter is provided.
- Description: the input parameter's name and a brief description of the parameter.
- PARM_VALUE: the parameter's value identifier and description for each of the parameter's values. PARM_VALUE is only shown when applicable, for example, it's not shown for the TID or CTAG parameters.
- Restrictions: any restrictions pertaining to the parameter or the parameter's values. Restrictions are only described when applicable.

1.3.2. Output Parameter Descriptions

The Output Parameters subsection of a command description describes all output parameters included in the command's successful response message, except those in the response header. If the command does not produce output parameters, this subsection does not appear. The format of the Output Parameters subsection is:

```
PARM          { PARAMETER VALUE SET }  
              Parameter Name. Description of the Output Parameter. Values are:  
                PARM_VALUE Value's Name. Description of the output parameter's value.
```

where:

- PARM: the output parameter's identifier.
- PARAMETER VALUE SET: the output parameter's set of values or domain.
- PARM_VALUE: the parameter's value identifier and description for each of the output parameter's values. PARM_VALUE is only shown when applicable.

1.4. Autonomous Response Descriptions

Autonomous response descriptions for each autonomous response are located in Section 3 of this manual. Refer to Section 1.8., Autonomous Response Messages, for a description and syntax of autonomous response messages. Each autonomous response description consists of the following subsections:

- **Response Header**, located at the top of the first page of each autonomous response description, consists of the autonomous response code (verb and one or two modifiers) and response name. For example:
RESPONSE CODE: REPT^EVT^T3
RESPONSE NAME: REPORT EVENT T3
- **Purpose** provides information on the function or cause of the autonomous response.
- **Response Format** shows the response format for the autonomous response.
- **Output Parameters** describes the parameters and parameter values shown in the autonomous response message, except for parameters in the response header. The description format for this subsection is the same as that used for describing a command's output parameter. (Refer to Section 1.3.2., Output Parameter Descriptions.)
- **Examples** provides one or more illustrations of the autonomous response message.
- **Related Commands** identifies closely related commands, if any.
- **Related Autonomous Responses** provides a list of closely related autonomous response messages, if any. This subsection is not shown if there are no related autonomous responses.

1.5. Command Entry

User access is provided through control ports (CPORTs) that connect to video display terminals (VDT – VT220 or compatible), Teletype (TTY) terminals, printers, or Operations Support Systems (OSSs).

Two command entry modes are available, Direct Input Command Entry mode (supported for VDT and TTY terminals) and Menu Entry mode (supported for VDT terminals only). In Direct Input Command Entry mode, commands are entered in their entirety by the user. In Menu Entry mode with VDT terminals, applicable parameters and values are presented in Form screens for each command.

1.5.1. Direct Input Command Entry Mode

In Direct Input Command Entry mode, commands are entered by typing the desired command on the command input line, ending with a ; (semi-colon). The system echoes keyboard entries in this area as they are typed.

1.5.2. Menu Entry Mode

In the VDT Menu Entry mode, a task-oriented hierarchy of menu and form screens are provided to simplify the task of entering commands. Commands are entered by making selections from the series of menus displayed in the on-screen work area. A menu is selected by typing the letter corresponding to the selection desired. The system then displays either a more detailed menu or a command input form. The input form contains fields in which parameter data required to execute the command are entered.

1.6. Command Input Format

A TL1 command is an input message which consists of a command code, blocks of parameters, and punctuation. The input message begins with the command verb and must end with a semicolon (;) terminator. The general command input format takes the form:

VERB-MODIFIER[-MODIFIER]:[TID]:[AID]:[CTAG]:[GENERAL]:[POSITIONAL]:[KEYWORD]:[STATE];

Some commands (for example, the CONN-TACC-T3 command) have an input format where all parameter blocks following the General Block are positional parameter blocks. In these cases, the command input format takes the form:

VERB-MODIFIER[-MODIFIER]:[TID]:[AID]:[CTAG]:[GENERAL]:[POSITIONAL]: . . . :[POSITIONAL];

A series of parameter blocks follow the command code. Parameter blocks contain zero, one, or more parameters. Parameter blocks are separated from the command code, and from each other, by a colon (:). Parameters within a parameter block are separated from each other by a comma (,). All parameter blocks are not required by all commands, nor are all parameters always required for each block.

Brackets [...] are used in the command input format to indicate optional parameters within a block. Absence of brackets indicate the parameter must be entered. The brackets are not entered as part of the actual command and are shown only for notational purposes. The syntax characters , (comma) or : (colon) can also be optional (as described below), but brackets are not necessarily used to indicate that they are optional.

If one or more parameter blocks are omitted from the end of a command (no parameters are entered in the last block(s) of a command), the trailing colons associated with them may be omitted. In addition, if one or more parameters are omitted from the end of a parameter block, the trailing commas associated with them may be omitted. However, if an optional parameter value in a positional parameter block is omitted with other positional parameter values following, all of the intervening place-holder commas must be provided to indicate no value is being entered for that positional parameter. No additional commas are needed if an optional keyword parameter is omitted from a keyword parameter block; only commas separating each keyword parameter are required in the keyword parameter block.

1.6.1. TID Parameter Block

The Target Identifier (TID) is optional and is the first block after the command code. The TID value is used to specify the target system for remotely issued commands. If unpopulated (not entered), the system assumes a TID value of the (upper-case) Site Identifier (SID) value. If a value is entered for TID, that value is converted to upper case and compared with the provisioned (upper-case) SID value. The command is denied if the converted upper-case TID value and the provisioned (upper-case) SID value don't match.

Valid values for TID are up to 20 alphanumeric characters, including up to four non-consecutive – (hyphen) characters. A TID value must begin with an alphabetic character and may not begin or end in a – (hyphen) character. No other special characters are allowed. If a TID value contains a – (hyphen), any leading zeroes are truncated unless the TID value is entered as a literal string by enclosing the value within quotes (" ... ").

1.6.2. AID Parameter Block

The Access Identifier (AID) may be optional and is the second parameter block after the command code. An AID value is generally a compound value and directs an input command to its intended equipment, facility, or data entity. Refer to Appendix B, Access Identifiers (AIDs), for a description of the AID formats used in the system for the following types of entities.

- **Equipment**
- **OC3**
- **OC12**
- **EC1**
- **STS-1**
- **STS-3C**
- **VT1.5**
- **DS3**
- **DS1**
- **F3 (Fractional T3)**
- **Stratum Synchronization Timing Reference Source**
- **Communication Port**

1.6.3. CTAG Parameter Block

The Correlation Tag (CTAG) is an optional block and is used to correlate an input command with its associated output message by copying the command's CTAG value into the appropriate field of the command's output response. A CTAG value is generated by the system for every command. If a user-specified CTAG value is entered in a command, the system-generated CTAG value is discarded and the user-specified CTAG value is used in the output response. However, the discarded system-generated CTAG value is not re-used for the next non-specified CTAG value since each system-generated CTAG value is assigned a sequential modulo value.

In the case where an invalid user-specified CTAG value is entered with a command, or the system is unable to parse the input command, the system provides a single decimal character zero (0) CTAG value in the output response for the command.

In the case where a control port (a non-X.25 CPORT or an X.25 virtual channel) is provisioned to automatically log-in a user (refer to ENT-CID, ENT-CID-VC, and ENT-OSADDR-SITE), the system generates an ACT-USER successful response message with a CTAG value of AUTOIN when the user identity (UID) auto-login is complete.

Valid values for a user-specified CTAG value are up to six case-sensitive alphanumeric characters, in any order. No special characters are allowed.

The format for the system-generated CTAG value is Pxxddd where P is the upper-case alphabetic character P, x is hexadecimal 0 – f, and d is decimal 0 – 9; a single decimal character zero; or the upper-case alphabetic characters AUTOIN.

(Refer to Section 1.8., Autonomous Response Messages, for a description of system-generated message TAGs for autonomous (ATAG), informational (ITAG), and keep-alive (KATAG) messages.)

1.6.4. General (Delayed Activation) Parameter Block

The general block is used for specifying delayed activation (DA) parameters. Delayed activation is only supported by those commands that include the general block in the command's input format. Brackets are used to indicate an optional parameter value. If one or more parameter values are omitted from the end of the block, the trailing commas associated with them may be omitted. However, if a parameter value is omitted with other positional parameter values following, all of the intervening place-holder commas must be provided to indicate no value is being entered for that parameter. The system assumes the default parameter value for omitted optional parameter values. Delayed activation is discussed in Section 1.10., Delayed Activation. The format of the general block is:

: [<ON>] , [<DATE>] , [<TIME>] , [<FLAG>]

For notational simplicity, the enclosing less-than and greater-than signs are not shown in a command description in Section 2 when describing a command's TL1 syntax. Only the parameter name and brackets to identify an optional parameter are shown in the parameter block (: [ON] , [DATE] etc.), but the appropriate parameter value must be entered for a parameter in an actual input command.

1.6.5. Positional Parameter Block

Parameters in the positional block are defined by their position or sequence in the block. Brackets are used to indicate optional parameter values. Absence of brackets indicate the parameter value must be entered. If one or more parameter values are omitted from the end of the block, the trailing commas associated with them may be omitted. However, if an optional parameter value is omitted with other positional parameter values following, all of the intervening place-holder commas must be provided to indicate no value is being entered for that parameter. The system assumes the default parameter value for omitted optional parameter values. Parameter value combinations are verified by the system whether the value is determined from a default value or explicitly entered in the command. The format for a positional parameter block is:

: [<PARM#1_Value>] , [<PARM#2_Value>] , [<PARM#3_Value>] , . . . , [<PARM_Value#n>]

For notational simplicity, the enclosing less-than and greater-than signs are not shown in a command description in Section 2 when describing a command's TL1 syntax. Only the parameter name, and any brackets to identify an optional parameter, are shown in the parameter block (: [PARAMETER#1], [PARAMETER#2] etc.), but the appropriate parameter value must be entered for a parameter in an actual input command.

1.6.6. Keyword Parameter Block

Parameters in the keyword block are defined by the use of a keyword parameter name. A value for a keyword parameter is specified by entering the parameter name followed by an = (equal) sign, followed by the parameter value. Keyword parameters may be entered in any order within the keyword block but must be separated by a comma. Only commas separating each keyword parameter are required in the keyword parameter block, but the keyword block may not begin or end with a comma. Brackets are used to indicate optional parameters and their associated comma separators. Absence of brackets indicate the parameter and any comma separator must be entered. The system assumes the default parameter value for omitted keyword parameters or omitted keyword parameter values. Parameter value combinations are verified by the system whether the value is determined from a default value or explicitly entered in the command. The format for a keyword parameter block is:

: [KEYWORD#1=VALUE#1] [, KEYWORD#2=VALUE#2] . . . [, KEYWORD#n=VALUE#n]

For notational simplicity, keyword parameters in a command description in Section 2 are (generally) shown in alphabetical order, but the keyword parameter value is not shown when describing a command's TL1 syntax. Only the keyword parameter name followed by an equal sign, and any brackets to identify an optional parameter, are shown in the parameter block (: [KEYWORD#1]=[, KEYWORD#2=] etc.), but the keyword parameter and keyword value must be entered in an actual input command.

1.6.7. State Parameter Block

The state parameter block is a positional block with parameters defined by their position or sequence in the block. The state block is only supported by those commands that include it in the command's input format. When supported, up to two parameters are possible for the state block, the PST (Primary State) parameter and SST (Secondary State) parameter. Brackets are used to indicate optional parameter values. Absence of brackets indicate the parameter value must be entered. If the SST parameter value is omitted from the end of the block, the trailing comma associated with it may be omitted. However, if an optional PST parameter value is omitted with an SST positional parameter value following, the intervening place-holder comma must be provided to indicate no value is being entered for the PST parameter. The system assumes the default parameter value for omitted optional parameter values. Parameter value combinations are verified by the system whether the value is determined from a default value or explicitly entered in the command. The format for a state parameter block is:

```
: [<PST>] , [<SST>]
```

For notational simplicity, the enclosing less-than and greater-than signs are not shown in a command description in Section 2 when describing a command's TL1 syntax. Only the parameter name, and any brackets to identify an optional parameter, are shown in the parameter block (:[PST],[SST]), but the appropriate parameter value must be entered for a parameter in an actual input command.

1.7. Command Response Messages – General

Command response messages provide information (data, status, etc.) as a result of entering a command. A successfully executed command results in a successful response. Commands which did not execute properly result in unsuccessful responses. If a successful or unsuccessful response cannot be sent within two seconds of receipt of an input command, one or more In-Progress acknowledgement response messages are sent to the user. If the user is provisioned appropriately (refer to the ENT-USER and ED-PRVG-USER commands), an additional In-Progress acknowledgement response message is sent to the user every MIPINTVL (Multiple In-Progress message Interval) until a successful or unsuccessful response is generated. The following general information applies to all response messages:

- All responses, except an Acknowledgement Response, begin with a header line:
cr If If
^^^<SID>^<YY-MM-DD>^<HH:MM:SS>
where:
 - SID is the upper-case Site Identifier as created using the SET-SID command.
 - YY-MM-DD is the year-month-day, where YY is the last two digits of the year, MM is the month, and DD is the day of the month. The range for MM is from 01 to 12 and the range for DD is from 01 to 31.
 - HH:MM:SS is the current time of day, where HH is the hour with a range from 00 to 23, MM is the minutes, SS is the seconds. The range for MM and SS is from 00 to 59.
- The last response line before the message terminator is a non-parsable "command echo" line. Presence of the command echo line in all types of output messages is controlled by the user's Output Subscription Level (OSL) O-flag set using the ENT-USER or ED-PRVG-USER command. If a user has the O-flag set, the user receives the command echo line as part of the output response, otherwise the user does not receive the command echo line. The format of a command echo line is:
^^^/*^<Command_Echo>^ [<CTAG>] ^ (<CID [-VCNUM] >) ^*/
or
^^^/*^<Command_Echo>^ [<CTAG>] ^ (CRON:<Order_Number>) ^*/
with a composite format representation of
^^^/*^<Command_Echo>^ [<CTAG>] ^ ({<CID [-VCNUM] >, CRON:<Order_Number>}) ^*/
where:
 - <Command_Echo> is an exact matching of the input command entered, except for commands that have password as an input parameter (ACT-USER, ENT-USER, ED-PID commands) do not display any parameter values after the CTAG as part of the command echo.

- <CTAG> is the associated CTAG value, displayed within brackets [...].
- <CID[-VCNUM]> is the control port number and virtual channel number, if any, used to enter the command, displayed within parenthesis (...).
- CRON:<Order_Number> is the delayed activation order number used to enter the command, displayed within parenthesis (...).

Two examples of a non-parsable command echo line are:

```
/* DLT-T3:APS672:8-22 [Paf285] (3-4) */
/* act-db-backup::OPD-1-3-1:: [P5d431] (CRON:246) */
```

- The maximum character length of any output response line is 256 characters. Output response lines that are longer than the terminal (VDT, TTY, or printer) display line automatically wrap to the first character position of the next line if the terminal is supporting an auto-wrap capability. The system does not insert a "cr lf" within a single output response line to prevent line "run-off" on terminals that do not have an auto-wrap capability.
- If the VDT abort output function key (F12) is pressed while the VDT is currently receiving output, that output is terminated, and the message /* Output aborted by user */ is displayed, followed by the message terminator (; , < , >) of the message that was aborted.

The system supports five command completion codes: **CANCLD** (Cancelled), **COMPLD** (Completed), **DELAY** (Delay Activated), **DENY** (Denied), and **PRTL** (Partial). The response format for the commands that can generate a CANCLD completion code is provided in the specific command description. Refer to Sections 1.7.2. through 1.7.8. for the general format of response messages that use the COMPLD, DENY, PRTL, or DELAY completion codes.

1.7.1. Acknowledgement Response Format

If the system is unable to complete a command within two seconds, a command acknowledgement response message (In-Progress message) is automatically generated. Additional In-Progress acknowledgement responses are generated if the user is provisioned to receive them (refer to the ENT-USER and ED-PRVG-USER commands). An acknowledgement response does not interrupt other output responses currently in progress.

The presence of the "cr lf" at the beginning of an acknowledgement message, any non-parsable (/ * ... */) lines containing informational text, and the non-parsable command echo line in an acknowledgement response is controlled by the user's Output Subscription Level (OSL) O-flag set using the ENT-USER or ED-PRVG-USER command.

IP (In-Progress) Acknowledgement Message: The IP (In-Progress) acknowledgement message indicates the command has been initiated and a completion message (CANCLD, COMPL, DELAY, DENY, PRTL) follows. An IP acknowledgement message is also used to provide error information when a Non-Administration, Retrieval command is issued using &&-ranging or &-grouping (for additional information, refer to Section 1.9., AID Addressing) and the command fails to execute for some of the AIDs within the range (refer to Section 1.7.5., Response Format – Non-Administration Retrieval Commands with &&-Ranging/&-Grouping). The general format of an IP acknowledgement message is:

```
[cr lf]
IP^<CTAG> cr lf
[^^^/*^<Free_Form_Informational_Text>^*/ cr lf] *
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ( {<CID [-VCNUM] >, CRON:<Order_Number> } ) ^*/ cr lf ]
<
```

OK (Good) Acknowledgement Message: The OK (Good) acknowledgement message indicates a REPT-INITZN or REPT-STAT command was received and the requested action was initiated and completed. This response is only returned for the REPT-INITZN or REPT-STAT commands and no additional successful or unsuccessful response is returned for these commands. The general format of an OK acknowledgement message is:

```
[cr lf lf]
OK^<CTAG> cr lf
[^^^/*^<Free_Form_Informational_Text>^*/ cr lf ]*
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ({<CID [-VCNUM] >, CRON:<Order_Number>}) ^*/ cr lf ]
<
```

The IP and OK acknowledgement responses are the only types of acknowledgement messages provided. The PF (Printout Follows), NA (No Acknowledgement), NG (No Good), and RL (Repeat Later) acknowledgement messages are not supported. The system generates an unsuccessful response message in lieu of any acknowledgement error response. Refer to Section 1.6.3., CTAG Parameter Block, for a description of CTAG values in output response messages.

1.7.2. Successful Response Format – Single AID

A single successful response message is generated if a command with a single AID specified is successfully executed. Information displayed in the response varies with each command and is specified in the command description. The general format of a successful response message is shown below.

The presence of the non-parsable command echo line in the successful response is controlled by the user's Output Subscription Level (OSL) O-flag set using the ENT-USER or ED-PRVG-USER command.

```
cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^COMPLD cr lf
[^^^"<Parsable_Output_Data>" cr lf ]*
[^^^/*^<Free_Form_Informational_Text>^*/ cr lf ]*
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ({<CID [-VCNUM] >, CRON:<Order_Number>}) ^*/ cr lf ]
;
```

1.7.3. Unsuccessful Response Format

A single unsuccessful response message is generated if:

- A command (other than to establish a log-in session) with a **single AID** specified fails to execute (**Single Error Denial Response** generated).
- A **Non-Administration** (Retrieval or Non-Retrieval) command (for additional information, refer to Section 1.7.4. through 1.7.6.) is issued using &&-ranging or &-grouping (refer to Section 1.9., AID Addressing) and the command **fails to execute for all** of the specified AIDs for a **single error code** (fails to execute for only one type of error – **Single Error Denial Response** generated).
- A **Non-Administration** command is issued using &&-ranging or &-grouping and the command **fails to execute for all** of the specified AIDs for **multiple error codes** (fails to execute for more than one type of error – **Multiple Error Denial Response** generated).
- An ACT-USER command to establish a log-in session fails to execute (**Session Attempt Denial Response** generated).

The information displayed in an unsuccessful response message varies for different commands and is specified in the command description. If a parsable line of output data is provided, the <Parameter_Block> field provides information about the location of any error(s) in the input command.

The presence of the non-parsable Expanded Error Code Description line, the non-parsable Optional Suggested Action Text line, and the non-parsable command echo line in an unsuccessful response is controlled by the user's Output Subscription Level (OSL) O-flag set using the ENT-USER or ED-PRVG-USER command.

Single Error Denial Response: The general format of an Single Error Denial Response is:

```

cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^DENY cr lf
^^^<Error_Code> cr lf
([^^^<AID>[,<AID>][(:<Parameter_Block>)*]" cr lf ]
[^^^/*<Informational_Error_Description_Text>^*/ cr lf ])*
[^^^/*<Expanded_Error_Code_Description>^*/ cr lf ]
[^^^/*<Optional_Suggested_Action_Text>^*/ cr lf ]
[^^^/*<Command_Echo>^ [<CTAG>] ^ ( {<CID [-VCNUM] >, CRON:<Order_Number>} ) ^*/ cr lf ]
;

```

Multiple Error Denial Response: The general format of an Multiple Error Denial Response is:

```

cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^DENY cr lf
^^^MERR cr lf
(^^^<AID>]:ERCDE=<Error_Code>[,<Parameter_Block>(:<Parameter_Block>)*]" cr lf ]
[^^^/*<Informational_Error_Description_Text>^*/ cr lf ]
[^^^/*<Expanded_Error_Code_Description>^*/ cr lf ])*
[^^^/*Multiple ERROR^*/ cr lf ]
[^^^/*<Command_Echo>^ [<CTAG>] ^ ( {<CID [-VCNUM] >, CRON:<Order_Number>} ) ^*/ cr lf ]
;

```

Session Attempt Denial Response: In the special case where a user attempts to log-in to the system (using the ACT-USER command) but enters an incorrect UID (User Identifier) or an incorrect PID (Password Identifier), the system generates the following unsuccessful response message. For security reasons, an Error Code is not provided with this response.

```

cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^DENY cr lf
^^^/*session not active^*/ cr lf
;

```

1.7.4. Response Format – Administration Commands with &&-Ranging/&-Grouping

If an Administration command (see list below) is issued using &&-ranging or &-grouping (for additional information, refer to Section 1.9., AID Addressing) and the command fails to execute for some of the AIDs within the range, a separate and complete successful (COMPLD) or unsuccessful (DENY) response is generated for each unique AID value in the range or list. A separate successful response output is provided for each successfully processed AID value and a separate unsuccessful response output is provided for each unsuccessfully processed AID value. However, each successful or unsuccessful response output associated with the entered command has an identical CTAG value (all responses are correlated to the same CTAG). Depending on the command entered, information lines are presented as either parsable output data or as non-parsable free form informational text.

The presence of any non-parsable Expanded Error Code Description lines, any non-parsable Optional Suggested Action Text line, and any non-parsable command echo line in each response is controlled by the user's Output Subscription Level (OSL) O-flag set using the ENT-USER or ED-PRVG-USER command.

The following are the **Administration commands that support &&-ranging and &-grouping:**

- | | | |
|---------------|--------------------|-------------------|
| • ACT-DA | • ED-PARTITN-OC3 | • RTRV-CID |
| • CANC-DA | • ED-PARTITN-OC12 | • RTRV-DA |
| • DLT-CID-VC | • ED-PARTITN-STS1 | • START-CID |
| • ED-CID-LCTN | • ED-PARTITN-STS3C | • START-MON-CPORT |
| • ED-CID-VC | • ED-PARTITN-T1 | • STOP-CID |

- ED-PARTITN-EC1
- ED-PARTITN-T3
- STOP-MON-CPORT
- ED-PARTITN-F3
- ED-PARTITN-VT1

Partially Successful Administration Command Response: The general format for the response messages to a partially successful Administration command using &&-ranging/&-grouping is shown below:

```
(cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^COMPLD cr lf
[^^^"<Parsable_Output_Data>" cr lf ] *
[^^^/*^<Free_Form_Informational_Text>^*/ cr lf ] *
[^^^/*^<Command_Echo>^[<CTAG>]^( {<CID [-VCNUM] >, CRON:<Order_Number> } ) ^*/ cr lf ]
; ) *
(cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^DENY cr lf
^^^<Error_Code> cr lf
[^^^/*^<Informational_Error_Description_Text>^*/ cr lf ] *
[^^^/*^<Expanded_Error_Code_Description>^*/ cr lf ]
[^^^/*^<Optional_Suggested_Action_Text>^*/ cr lf ] *
[^^^/*^<Command_Echo>^[<CTAG>]^( {<CID [-VCNUM] >, CRON:<Order_Number> } ) ^*/ cr lf ]
; ) *
```

1.7.5. Response Format – Non–Administration RETRIEVAL Commands with &&–Ranging/&–Grouping

A single successful or partially successful response message is generated for a Non–Administration (refer to Section 1.7.4.) Retrieval command (a command with a verb of RTRV) issued using &&–ranging or &–grouping (for additional information, refer to Section 1.9., AID Addressing) and the command:

- Successfully **completes for all** of the AIDs specified (**Successful Non–Administration RETRIEVAL Response** generated). In this case, all successful reports are grouped within a single successful (COMPLD) response message.
- Successfully **completes for some** of the AIDs specified (**Partially Successful Non–Administration RETRIEVAL Response** generated). In this case, all successful reports are grouped within a single successful (COMPLD) response message, and all unsuccessful reports are grouped within a single IP (In–Progress) acknowledgement message, with an identical CTAG value provided for both the successful (COMPLD) and acknowledgement (IP) messages. The IP acknowledgement message is transmitted before the successful response message. (A denial response message is generated, refer to Section 1.7.3., Unsuccessful Response Format, if the command fails to execute for all AIDs.)

The information displayed in the successful or partially successful response message varies for different commands and is specified in the command description. If a parsable line of output data is provided in a partially successful IP (In–Progress) response message, the <Parameter_Block> field provides information about the location of the error(s) in the input command.

The presence of the non–parsable Expanded Error Code Description line, the non–parsable Optional Suggested Action Text line, and the non–parsable command echo line in the response is controlled by the user's Output Subscription Level (OSL) O–flag set using the ENT–USER or ED–PRVG–USER command.

Successful Non–Administration RETRIEVAL Response: The general format of a Successful Non–Administration Retrieval Response is:

```
cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^COMPLD cr lf
[^^^"<AID>[,<AID>][:<Parsable_Output_Data>]" cr lf]*
[^^^/*^No match was found in the specified Range^*/ cr lf]
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ( { <CID [-VCNUM] >, CRON: <Order_Number> } ) ^*/ cr lf]
;
```

Partially Successful Non–Administration RETRIEVAL Response: The general format of a Partially Successful Non–Administration Retrieval Response is:

```
[cr lf lf]
IP^<CTAG> cr lf
(^^^/*^<AID>[,<AID>]:ERCDE=<Error_Code>[,<Parameter_Block>(:<Parameter_Block>)*]^*/ cr lf
[^^^/*^<Informational_Error_Description_Text>^*/ cr lf]
[^^^/*^<Expanded_Error_Code_Description>^*/ cr lf] )+
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ( { <CID [-VCNUM] >, CRON: <Order_Number> } ) ^*/ cr lf]
<
cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^COMPLD cr lf
[^^^"<AID>[,<AID>][:<Parsable_Output_Data>]" cr lf]*
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ( { <CID [-VCNUM] >, CRON: <Order_Number> } ) ^*/ cr lf]
;
```

1.7.6. Response Format – Non–Administration NON–RETRIEVAL Commands with &&–Ranging/&–Grouping

A single successful or partially successful response message is generated for a Non–Administration (refer to Section 1.7.4.) Non–Retrieval command (a command without a verb of RTRV) issued using &&–ranging or &–grouping (for additional information, refer to Section 1.9., AID Addressing) and the command:

- Successfully **completes for all** of the AIDs specified (**Successful Non–Administration NON–RETRIEVAL Response** generated). In this case, all successful reports are grouped within a single successful (COMPLD) response message.
- Successfully **completes for some** of the AIDs specified (**Partially Successful Non–Administration NON–RETRIEVAL Response** generated). In this case, all reports for unsuccessful AIDs are grouped within a single PRTL (Partial) completion message, and the successful AIDs are not reported (i.e., the command completes successfully for AIDs not reported in the PRTL completion message). (A denial response message is generated, refer to Section 1.7.3., Unsuccessful Response Format, if the command fails to execute for all AIDs.)

The information displayed in the successful or partially successful response message varies for different commands and is specified in the command description. If a parsable line of output data is provided in a partially successful IP (In–Progress) response message, the <Parameter_Block> field provides information about the location of the error(s) in the input command.

The presence of the non–parsable Expanded Error Code Description line and the non–parsable command echo line in the response is controlled by the user’s Output Subscription Level (OSL) O–flag set using the ENT–USER or ED–PRVG–USER command.

Successful Non–Administration NON–RETRIEVAL Response: The general format of a Successful Non–Administration Non–Retrieval Response is:

```
cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^COMPLD cr lf
[^^^"<Parsable_Output_Data>" cr lf ] *
[^^^/*<Free_Form_Informational_Text>^*/ cr lf ] *
[^^^/*<Command_Echo>^ [<CTAG>] ^ ( { <CID [-VCNUM] > , CRON: <Order_Number> } ) ^*/ cr lf ]
;
```

Partially Successful Non–Administration NON–RETRIEVAL Response: The general format of a Partially Successful Non–Administration Non–Retrieval Response is:

```
cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^PRTL cr lf
(^^^" [<AID> :ERCDE=<Error_Code> [ , <Parameter_Block> ( : <Parameter_Block> ) * ] " cr lf
[^^^/*<Informational_Error_Description_Text>^*/ cr lf ]
[^^^/*<Expanded_Error_Code_Description>^*/ cr lf ] ) +
[^^^/*<Command_Echo>^ [<CTAG>] ^ ( { <CID [-VCNUM] > , CRON: <Order_Number> } ) ^*/ cr lf ]
;
```

1.7.7. Continuation Message Format (Output Greater Than 4096 Bytes)

If a user is provisioned to receive output on a TTY terminal (TYPE=TTY, refer to ENT–USER and ED–PRVG–USER commands) and a response message contains more than 4096 bytes of data, the data block ends in a > (greater–than sign) terminator and subsequent data blocks containing the remainder of the data follow. The subsequent data blocks repeat the message header, the command echo line, and continue the data. The last data block ends with the normal ; (semi–colon) terminator.

The general format for continuation of a response message is:

```
( cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^<Completion_Code> cr lf
[^^^"<Parsable_Output_Data>" cr lf ] *
[^^^/*^<Free_Form_Informational_Text>^*/ cr lf ] *
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ( { <CID [-VCNUM] > , CRON : <Order_Number> } ) ^*/ cr lf ]
> ) +
cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^<Completion_Code> cr lf
[^^^"<Parsable_Output_Data>" cr lf ] *
[^^^/*^<Free_Form_Informational_Text>^*/ cr lf ] *
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ( { <CID [-VCNUM] > , CRON : <Order_Number> } ) ^*/ cr lf ]
;
```

1.7.8. Delayed Activation Response

A Delayed Activation response is returned upon successful queuing of any command submitted for delayed activation (refer to Section 1.10., Delayed Activation). The general format of a delayed activation response is:

```
cr lf lf
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr lf
M^^<CTAG>^DELAY cr lf
[^^^"<Parsable_Output_Data>" cr lf ] *
[^^^/*^<Free_Form_Informational_Text>^*/ cr lf ] *
[^^^/*^<Command_Echo>^ [<CTAG>] ^ ( CRON : <Order_Number> ) ^*/ cr lf ]
;
```

1.8. Autonomous Response Messages – General

Autonomous response messages are unsolicited and generated automatically because of an autonomous event detected by the system, as opposed to solicited response messages generated in response to a command entered by a user. There are three general categories of autonomous responses: autonomous system event messages (alarms, events, database changes, scheduled performance monitoring reports, and system initialization), autonomous informational messages, and autonomous keep–alive messages.

All autonomous response messages begin with a header line:

```
^^^<SID>^<YY-MM-DD>^<HH:MM:SS>
```

where

- SID is the upper–case Site Identifier as created by the SET–SID command.
- YY–MM–DD is the year–month–day, where YY is the last two digits of the year, MM is the month, and DD is the day of the month. The range for MM is from 01 to 12 and the range for DD is from 01 to 31.
- HH:MM:SS is the current time of day, where HH is the hour with a range from 00 to 23, MM is the minutes, SS is the seconds, and the range for MM and SS is from 00 to 59.

1.8.1. Autonomous REPT Message Format

The general format of an autonomous REPT message is:

```
cr If If
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr If
<CDE>^ { <ATAG>, <ITAG> } ^REPT^<MODIFIER> [ ^<MODIFIER> ] cr If
[ ^^^ "<Parsable_Output_Data>" cr If ] *
[ ^^^ /*<Free_Form_Informational_Text>*/ cr If ] *
;
```

where

- CDE identifies the type of autonomous REPT message. Values are:
 - *C autonomous critical alarm being reported
 - ** autonomous major alarm being reported
 - *^ autonomous minor alarm being reported
 - A^ autonomous non-alarm event being reported
 - I^ autonomous informational message being reported.
- ATAG is the autonomous message tag used to correlate autonomous messages. An ATAG value is sequentially generated by the system for every autonomous message (CDE has a value other than I^). The format for an ATAG is modulo nnnnn where n is decimal 0–9 with leading zeroes suppressed.
- ITAG is the informational message tag used to correlate informational messages. An ITAG value is sequentially generated by the system for every informational message (CDE has a value of I^). The format for an ITAG is modulo nnnnn where n is decimal 0–9 with leading zeroes suppressed.
- REPT^<MODIFIER> [^<MODIFIER>] is the autonomous response or informational response code name. Values are:
 - REPT^ALM { EC1, EQPT, F3, OC3, OC12, STS1, STS3C, T1, T3, VT1 }
 - REPT^DBCHG
 - REPT^EVT { EC1, EQPT, F3, OC3, OC12, STS1, STS3C, T1, T3, VT1, SESSION }
 - REPT^INITZN
 - REPT^PM { EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, VT1 }
 - REPT^DEBUG
 - REPT^HWSW
 - REPT^INFORMATION

where REPT^ALM, REPT^DBCHG, REPT^EVT, REPT^INITZN, and REPT^PM are used with autonomous response messages (have an ATAG), and REPT^DEBUG, REPT^HWSW, and REPT^INFORMATION are used with informational response messages (have an ITAG).

1.8.2. Autonomous KEEP^ALIVE Message Format

The KEEP ALIVE MESSAGE autonomous response is generated by the system to maintain communication link activity to any logged-in user provisioned with a KAMINTVL (keep alive message interval) parameter value of {20–300} (refer to the ENT–USER and ED–PRVG–USER commands).

The format of an autonomous KEEP^ALIVE message is:

```
cr If If
^^^<SID>^<YY-MM-DD>^<HH:MM:SS> cr If
I^^<KATAG>^KEEP^ALIVE^MESSAGE cr If
;
```

where

- KATAG is the autonomous keep-alive message tag used to correlate keep-alive messages. An KATAG value is sequentially generated by the system for every keep-alive message. The format for a KATAG is modulo KAnnnn, where KA is the upper-case alphabetic characters K and A, and n is a decimal integer from 0 through 9.

1.9. AID Addressing (&&–Ranging and &–Grouping Rules)

In some commands, AIDs can be addressed so a single occurrence of the command is applied to more than one entity. When AID addressing is supported, “&&–ranging and &–grouping” is explicitly stated in the command description of the AID parameter under Addressing to indicate a range of AID values, a list of AID values, or a combination of a range and list of AID values is supported.

AID parameter addressing within a command can be used to generate a range (sequential series) of AID values, a list of AID values, or a combination of both. The string && (double ampersand) is used to specify a range of AID values (&&–ranging), while the & (ampersand) character is used to specify a list of AID values (&–grouping). In addition, when &&–ranging is used, the string .++. can be used to specify a numeric incrementing value for the range (sequential series) of AID values. (e.g., .++.N specifies the range or sequential series of AIDs is generated with a numeric incrementing value of N. The system assumes a default numeric incrementing value of one unless an incrementing value is explicitly specified.)

&&–ranging rules: The following rules apply when &&–ranging is used to specify a range of AIDs:

- A sequential series (range) of AID values is defined by using a double & (&&) between AIDs.
- &&–ranging only supports numeric ranging on the argument of an AID parameter (the information unit in the AID).
- The first AID value in the &&–range must be fully defined.
- The first AID value of the &&–range is always included in the sequential series of AID values.
- If a compound AID parameter is used with &&–ranging, the ending numeric argument of the &&–range must include the preceding hyphen of the argument in the compound AID.
- If &&–ranging is specified with a numeric incrementing value (i.e., .++.N), the resulting sequential series of AID values is incremented by the incrementing value (N – with a default of N=1 if an incrementing value is not explicitly specified) from the first AID specified until the series of AID values is incremented through the ending argument of the range.
- If &&–ranging is specified with a numeric incrementing value of one, the AID value identified by the ending numeric argument of the range is always included in the resulting sequential series of AID values.
- AID formats for different entity types (e.g., a DS3 AID format and a DS1 AID format) cannot be mixed together when specifying &&–ranging.

Several examples of the use of &&–ranging are shown below:

- 1&&5 expands into the sequential series {1, 2, 3, 4, 5}.
- T3T1–2–1&&–6 expands into the sequential series {T3T1–2–1, T3T1–2–2, T3T1–2–3, T3T1–2–4, T3T1–2–5, T3T1–2–6}.
- T3–3&&–13.++.3 expands into the sequential series {T3–3, T3–6, T3–9, T3–12}.
- T3T1–2–1&&4 or T3T1–2–1&&–3–4 or T3T1–2–1&&T3T1–3–4 are syntactically incorrect.

&–grouping rules: The following rules apply when &–grouping is used to specify a range of AIDs:

- A group (list) of AID values is defined by using a single-ampersand (&) between AIDs.
- The first AID value for the &–group must be fully defined.
- The second AID value for the &–group must either be fully defined, or, if a compound AID parameter is used, can be specified by the argument of the AID with its preceding hyphen.
- A numeric incrementing value (.++.N) cannot be specified with/within the &–group.

Several examples of the use of &–grouping are shown below:

- 1&3&7&12 expands into the list {1, 3, 7, 12}.
- T3–1&T3–15&T3–20 expands into the list {T3–1, T3–15, T3–20}.
- T3T1–1–1&–7&–28 expands into the list {T3T1–1–1, T3T1–1–7, T3T1–1–28}.
- T3T1–1–1&4–15 or T3–1&–12.++.2 are syntactically incorrect.

Additional &&–ranging/&–grouping rules: The following additional rules apply when both &&–ranging and &–grouping are combined to specify a range and/or a list of AID values:

- &&–ranging and &–grouping can be used together to generate a combination of a range of AID values and a list of AID values.
- No more than 12 AID terms can be specified using &–grouping (i.e., no more than 11 & (ampersands) may be used to specify the list of AID values).
- The number of AID values (in the expanded set of AIDs) resulting from the use of &&–ranging/&–grouping must be 128 or less.
- When &&–ranging and/or &–grouping is supported by all fields within a AID parameter block with multiple AID fields (for example, FROM,TO in the ENT–CRS–T1 command), then &&–ranging and/or &–grouping must appear in all AID fields with the same number of AID values in each field (the expanded set of AIDs in one AID field must be able to correspond to an expanded set of AIDs in the other AID fields).
- A command is denied without processing any of the specified AID values if the entered AID violates any of the above &&–ranging, &–grouping, or combined application rules.

An example of the use of both &&–ranging and &–grouping is shown below:

- 4–1–1&&–3&5–2–7&&–10&6–4–16&&–18 expands into the sequential series {4–1–1, 4–1–2, 4–1–3, 5–2–7, 5–2–8, 5–2–9, 5–2–10, 6–4–16, 6–4–17, 6–4–18}.

One unsuccessful response output message (refer to Section 1.7.3., Unsuccessful Response Format) is generated if a command is executed with &&–ranging and/or &–grouping specified in the AID parameter block and the command syntax is incorrectly specified (the command cannot be successfully parsed or an AID grouping/ranging syntax error exists).

If a command is executed with &&–ranging and/or &–grouping specified in the AID parameter block and the command syntax is correctly specified, the command is executed as if a series of commands were executed consecutively with each command having a unique AID value from the specified range or list of AIDs. Once correctly parsed, the type of completion response message generated depends on the type of command entered.

- Refer to Sections 1.7.4. and 1.7.3. for the successful and unsuccessful response formats for an Administration command with &&–ranging/&–grouping specified.
- Refer to Sections 1.7.5. and 1.7.3. for the successful and unsuccessful response formats for a Non–Administration Retrieval command (a command with a verb of RTRV) with &&–ranging/&–grouping specified.
- Refer to Sections 1.7.6. and 1.7.3. for the successful and unsuccessful response formats for a Non–Administration Non–Retrieval command (a command without a verb of RTRV) with &&–ranging/&–grouping specified.

1.10. Delayed Activation

The commands ACT–DB–BACKUP, DLT–EQPT, ENT–EQPT, and INIT–SYS can be scheduled to execute at some specified future time, either once, or perpetually. This is known as Delayed Activation (DA). These commands are assigned for delayed activation by specifying their optional General Block parameters ON (Order Number), DATE, TIME, and FLAG. The system then enters the command line into the system's DA table when the command is issued. Upon occurrence of the specified date and/or time, the command is executed from the table.

Delayed activation is managed by three commands:

- RTRV–DA is used to retrieve delayed activation data (displays the delayed activation table).
- ACT–DA is used to manually execute commands in the delayed activation table.
- CANC–DA is used to remove commands from the delayed activation table.

1.11. User Security

The system controls individual user access by user identifier (UID), password identifier (PID), Command Code Authorization Level (CCAL), and Command Community Functional Category Input (CCFCI) assignments. A user's UID and PID control user access to the system and a user's CCAL and CCFCI control user access to TL1 command execution. User access to system response output is controlled through the use of Command Community Functional Category Output (CCFCO) and Output Subscription Level (OSL) assignments. Refer to the ENT-USER, ED-PID, ED-PRVG-CMD, and ED-PRVG-USER commands for information on provisioning these parameters and to Appendix H, User Command Privilege Defaults (CCAL & CCFC), for default settings pertaining to CCAL and CCFC.

Additional user access security is provided through PID aging (PAGE), PID deactivation on user inactivity (POUT), and UID deletion on user inactivity (UOUT). Refer to the SET-ATTR-SECUDFLT command for information on provisioning of these parameters.

The system supports 32 CCAL command security levels (1 through 32). Each TL1 command is assigned a CCAL level. The system also supports up to 26 CCFC command security groups (A through Z). Each of the CCFC groups contains one or more TL1 commands. The CANC-USER command is always contained in every CCFC group to ensure that a user can always log off the system. In addition, all commands are always contained in CCFC group Z and cannot be removed to ensure that every command always exists in at least one CCFC group.

User command access security is provided by assigning each user a CCAL level and one or more CCFC groups (CCFCI controls command input and CCFCO controls unsolicited command output). A user can execute any command with a CCAL level less than or equal to the user's assigned CCAL level and that is contained in the user's assigned CCFC group.

Functionally related commands can be placed in different CCFC groups (for example, system administration commands in group A, facility provisioning commands and connection commands in group B, equipment provisioning commands in group C, etc.). Users from various organizations can then be assigned the appropriate CCFC group, allowing the users from each organization to execute the necessary commands without interfering with each other.

Users can also be assigned a CCAL level according to user experience. Less experienced users with a lower CCAL level would *not* be able to execute commands with a higher CCAL assignment. For example, a less experienced user with CCFC group B access may be assigned a lower CCAL to restrict command access to only connection-related commands, while a more experienced user in the same CCFC group can have a higher CCAL to allow access to facility provisioning and connection commands.

1.11.1. Default User IDs (UIDs)

The initial system UID defaults include four pre-provisioned users:

- **Alcatel account user**, user TYPE of TTY.
- **System administrator**, user TYPE of VDT, two UIDs of "system" and "SYSTEM". By default, only these users and the Alcatel account user may execute commands that establish or modify user security parameters. (Refer to Section 1.11.2.)
- **System printer**, user type PRN, UID of "sysprint". This user is the system printer.

The system administrator may create up to 508 additional users (for a total of 512 users), making password, CCAL, CCFCI, CCFCO, and OSL assignments as required for each.

1.11.2. Capabilities Restricted to the System Administrator

The following capabilities are restricted to the System Administrator (UID of “system” or “SYSTEM”) or the Alcatel account user.

- **User Log-In/Log-Out Restricted Capabilities:**
 - Only the System Administrator (or Alcatel account user) can log-out another user. Refer to CANC-USER.
 - Only the System Administrator (or Alcatel account user) can edit another user’s disk output buffer location (pointer) to the end of the disk output buffer. Refer to ED-CID-LCTN.
- **User Provisioning Restricted Capabilities:**
 - Only the System Administrator (or Alcatel account user) can edit (change) another user’s database profile. Refer to ED-PRVG-USER.
 - Only the System Administrator (or Alcatel account user) can edit a user’s UCFCI, UCAL, or PARTNAM provisioning. Other user’s can only edit their own remaining user provisioning parameters. Refer to ED-PRVG-USER.
 - Only the System Administrator (or Alcatel account user) can add/delete a value of R or S to/from a user’s OSL. Refer to ENT-USER and ED-PRVG-USER.
 - Only the System Administrator (or Alcatel account user) can edit another user’s PID (Password Identifier). Refer to ED-PID.
 - Only the System Administrator (or Alcatel account user) can delete (remove from the system) another user’s database profile. The System Administrator (and Alcatel account user) database profile cannot be deleted/removed. Refer to DLT-USER.
 - Only the System Administrator (or Alcatel account user) can retrieve the database profile provisioning of another user. Refer to RTRV-PRVG-USER.
- **CPORT Monitoring Restricted Capabilities:**
 - Only the System Administrator (or Alcatel account user) can retrieve a list of CPORTs being monitored by another user. Refer to RTRV-MON-CPORT.

1.12. User Facility Partitioning

User facility partitioning allows any EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 facility to be partitioned into groups of EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 facilities, respectively, (facility partitions) with each partition associated with specific “partitioned” users. A partitioned user’s TL1 command access to the EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 ports in the specified facility partition can then be restricted to the facilities assigned to that partition. Restricted access is controlled by defining a user as a partitioned user and associating the user with a specific partition, by the user’s CCAL and CCFCI provisioning (restricts the commands the user can execute) and by the set of commands that operate on facility partitions (restricts the command operation to the facilities assigned to a partition).

A facility partition is created by specifying a unique partition name using the ENT-PARTITN command. EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 facilities are assigned to an EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 partition, respectively, using the ED-PARTITN-{EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, VT1.5} commands, respectively. A user is associated with a facility partition using the ENT-USER or ED-PRVG-USER command.

The EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 ports assigned to a facility partition need not be contiguous (physically or logically). A facility partition is only a logical mapping of EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 ports to the partition. Any EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 port can be added to an EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, or VT1.5 facility partition, respectively, regardless of whether the port is provisioned or the port exists in the system.

Any user, except the “sysprint”, “system” or “SYSTEM” (system administrator), and Alcatel account users, can be associated with a facility partition. The commands that a partitioned user can execute are determined by the user’s command privileges (the user’s CCAL and CCFC provisioning using ENT-USER or ED-PRVG-USER). However, execution of a command that supports facility partitions by a partitioned user only operates on the facilities in the facility partition associated with the partitioned user.

Special care should be exercised when provisioning command privileges for a partitioned user. Only those commands that support facility partitioning provide protection for facilities not in the partitioned user's facility partition. All other commands that do not support facility partitioning operate the same regardless if a partitioned user or non-partitioned user executes the command (e.g., DLT-EQPT, ENT-USER, INIT-SYS, RESTORE-DB, etc.). A set of commands recommended for use by partitioned users is contained in the default CCAL Group Y (refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC)).

The following input commands and autonomous responses support user facility partitioning.

Commands and Responses Supporting User Facility Partitioning					
Provisioning	Cross-Connect	Performance Monitoring	Alarms & Conditions	Test Access	Loopback
DLT-rr	DLT-CONF- {T1, VT1}	ALW-PMREPT-rr	RTRV-ALM-rr	CHG-ACCMD- {T1, T3}	ALW-CBIT-T1
ENT-rr	DLT-CRS- {STS1, STS3C, T1, T3, VT1}	INH-PMREPT-rr	RTRV-ATTR-rr	CHG-TL-DIG	INH-CBIT-T1
ED-rr	DLT-ROLL- {T1, VT1}	INIT-REG-rr	RTRV-COND-rr	CONN-TACC- {T1, T3}	OPR-ISGLP-rr
RMV-rr	ENT-CONF- {T1, VT1}	RTRV-PM-rr	SET-ATTR-rr	DISC-TACC	OPR-LPBK-rr
RST-rr	ENT-CRS- {STS1, STS3C, T1, T3, VT1}	RTRV-PMMODE-rr	REPT^ALM^rr	DISC-TACC-PRVG	RLS-ISGLP-rr
RTRV-rr	ENT-ROLL- {T1, VT1}	RTRV-TH-rr	REPT^EVT^rr	RST-TAP-DIG	RLS-LPBK-rr
RTRV-AAID-rr	RTRV-CONF- {T1, VT1}	SET-PMMODE-rr		RTRV-TACC	RTRV-ISGLP-ALL
	RTRV-CRS	SET-TH-rr		RTRV-TRID-T3	RTRV-LPBK-rr
	RTRV-CRS- {STS1, STS3C, T1, T3, VT1}	REPT^PM^rr		RTRV-TSID-T1	
	RTRV-ROLL- {T1, VT1}				

Note. Where the command code modifier "rr" is shown, "rr" can be {EC1, F3, OC3, OC12, STS1, STS3C, T1, T3, VT1}, provided the resulting command or response exists.

1.13. Appendices

The appendices contain supplementary information useful in using this manual. The following appendices are provided:

- **Appendix A, Acronyms and Abbreviations** contains an alphabetized list of general acronyms and abbreviations used within this manual.
 - Abbreviations for command names and autonomous response names can be found in the command and autonomous response descriptions in Sections 2 and 3 of this manual, respectively.
 - Abbreviations for condition types can be found in Appendix C.
 - Abbreviations for error codes can be found in Appendix D.
 - Abbreviations for monitored parameters can be found in Appendix F.
 - Abbreviations for equipment and facility state names can be found in Appendix G.
- **Appendix B Access Identifiers (AIDs)** contains a description of AID formats, a diagram of the equipment rack and shelf numbering, and an alphabetized list of equipment names.
- **Appendix C, Condition Types** contains a list of all equipment and facility condition types.
- **Appendix D, Error Codes** contains a list of all Error Codes that may be used in an unsuccessful response message, a list of Error Codes generated by the system's Command Parser, and a list of all Data Base Error Code Error Status Numbers that may be supplied as additional information with an Error Code of SDBE (Status, internal Data Base Error).
- **Appendix E, (Command Entry) Menus** explains the use of the command entry menus available with a VDT terminal and provides the menu structure (hierarchy) implemented in this release.
- **Appendix F, Monitored PM Parameters** provides a list of performance monitoring facility parameters along with the system threshold default value for each parameter.
- **Appendix G, State Transitions** defines the Primary and Secondary states for equipment, facilities, or cross-connect entities, and provides state transition diagrams for each entity.
- **Appendix H, User Command Privilege Defaults (CCAL & CCFC)** contains the system Command Code Authorization Level (CCAL) and Command Community Functional Category (CCFC) default values for each command.
- **Appendix I, VDT Function Keys** provides a description of each function key supported for a VDT terminal.

2. TL1 COMMAND

This section contains a description of each input command and its associated output (successful and unsuccessful) responses. The command descriptions are presented in alphabetical order by command code.

For general information and input/output formats, refer to Section 1 of this manual.

For information on autonomous messages, refer to Section 3 of this manual.

For supplementary and reference information (e.g., condition types, state names and state diagrams, monitored parameters, etc.), refer to the appendices.

COMMAND CODE: **ACT-DA**
COMMAND NAME: **ACTIVATE DELAYED ACTIVATION**

PURPOSE

The ACT-DA command manually activates a selected set of previously scheduled delay-activated commands.

The commands ACT-DB-BACKUP, DLT-EQPT, ENT-EQPT, or INIT-SYS may be scheduled to execute at some specified future time, either once, or perpetually. This is known as Delayed Activation (DA).

These commands are scheduled for delayed activation by specifying the optional parameters ON (Order Number), DATE, and TIME when the command is entered. When the command is entered with these parameters specified, the command line is entered into the delayed activation table. The command will subsequently execute automatically upon occurrence of the specified date and/or time, or manually by use of the ACT-DA command.

NOTE: Although the ON parameter value can be an integer from 0 to 999999, the user should limit the number of delayed activation commands at any given time to 500.

An ACT-DA command is denied if:

- The specified ON (Order Number) does not exist in the delayed activation table.
- An invalid parameter value is entered.

INPUT FORMAT

ACT-DA: [TID] :ON: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
ON	{ON_AID:{0 – 999999}, ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: Order Number AID, specifies the Order Number of the command to be delay activated. Values are: 0-999999 Order Number value previously assigned to the command. ALL All pending Order Numbers are to be activated. Restrictions: ACT-DA is denied if the specified Order Number does not exist in the delayed activation table.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```
IPNV      Input, Parameter Not Valid
          /* Order Number = <ON_AID> not found in crontab */
          /* Invalid Order Number = <ON_AID> */
```

EXAMPLES

In the following example, ACT-DA is used to activate the scheduled command which was assigned an Order Number (ON) of 1003.

```
ACT-DA::1003;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P28015. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P28015 COMPLD
/* ACT-DA::1003 [P28015] (1) */
;
```

In the next example, ACT-DA is used to activate all scheduled commands.

```
ACT-DA::ALL;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P28020. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P28020 COMPLD
/* ACT-DA::ALL [P28020] (2) */
;
```

RELATED COMMANDS

```
ACT-DB-BACKUP
CANC-DA
DLT-EQPT
ENT-EQPT
INIT-SYS
RTRV-DA
```

COMMAND CODE: **ACT-DB-BACKUP**
COMMAND NAME: **ACTIVATE DATABASE BACKUP**

PURPOSE

The ACT-DB-BACKUP command performs a database backup (writes the system database) to the specified optical disk. Normal system operation continues during the database backup process.

The database backup includes all provisioning, cross-connection, loopback, and test access database information, but does not include performance monitoring (PM) current or historical data or the contents of the Event Log File output disk buffer. The database backup does not produce a "bootable" optical disk media (the backup disk does not contain the system executable software code).

In addition to the database, the system also writes the System Type, software Release Stream, software Release Number, Site ID (SID), a backup date and time stamp, a media write count, and a 32-bit CRC (Cyclic Redundancy Code) to the optical disk media. The 32-bit CRC written to the media is verified against the CRC calculated by reading the backup data on the media (the data written to the media is validated) if VERIFY is specified for the VER parameter. If the CRCs do not match, the system "marks" the backed-up data on the optical disk media as "invalid" so that it cannot be used for a subsequent database restoral and returns an unsuccessful response (DENY) message for the ACT-DB-BACKUP command.

If TOD is specified for the TRYOTHER parameter and the database backup process to the specified optical disk drive fails, the system automatically attempts to perform the database backup on the opposite copy optical disk drive.

If the database backup process to the specified optical disk drive fails, a DBFFT Condition Type is set for the specified drive. If TOD is specified for the TRYOTHER parameter and the second database backup process to the opposite copy drive fails, a DBF Condition Type is set for the specified drive. (Note. A DBFFT or DBF condition is cleared via the CLR-ALM-EQPT command.)

An ACT-DB-BACKUP command can be scheduled for delayed activation (e.g., a database backup can be scheduled to occur at a specific date and time or every day at a specific time). However, command parsing and parameter validation is not performed until the command is executed (at the delay activated scheduled date and time).

NOTE: Although the ON parameter value can be an integer from 0 to 999999, the user should limit the number of delayed activation commands at any given time to 500.

Any database backup currently in-progress can be aborted (cancelled) by the CANC-DB-BACKUP command. If an in-progress database backup is cancelled, an unsuccessful response (CANCLD) message is generated for the ACT-DB-BACKUP command and the system "marks" the backed-up data on the optical disk media as "invalid" so that it cannot be inadvertently used for a subsequent database restoral.

NOTE: The 1631 SX LMC validates a new DB file (requiring 10 to 30 minutes) before verifying successful completion of DB file transfer. With a DB file uploaded using a PC client through FTP, a timeout may occur after the file transfer but before completion confirmation on the client. If a timeout occurs, the RTRV-DB-LABEL command or the FTP dir/lis commands may be used to verify that the file transfer was complete and that the new DB file was legitimate. Prior to completion of validation on the uploaded file, RTRV-DB-LABEL will return information about the previously backed up DB file, not the uploaded file.

An ACT-DB-BACKUP command is denied if:

- The write operation to the optical disk drive cannot be performed (e.g., the media is not inserted in the drive, the drive door is not closed, the drive is currently in use, etc.).
- VERIFY is specified for the VER parameter and the CRC validation fails.
- A database backup operation is currently in-progress.
- An in-service upgrade via the STA-ISU command is currently in progress
- The specified AID is not in an in-service (IS) state.
- If a database transfer to or from the client is in progress.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ACT-DB-BACKUP: [TID]:AID:[CTAG]:[ON],[DATE],[TIME],[FLAG]:[VER],[TRYOTHER];

INPUT PARAMETERS

TID	<p>< 1–20 VALID TID CHARACTERS ></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>
AID	<p>EQUIPMENT_AID:</p> <p>{DSK-1-3-1, DSK-1-4-2}</p> <p>{OPD-1-3-1, OPD-1-4-2}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: Equipment AID, specifies the equipment entity that is the target of the database backup. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.</p>
CTAG	<p>< 1–6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
ON	<p>{ON_AID:0–999999, <NoVal>}</p> <p>Default: <NoVal></p> <p>Addressing: None</p> <p>Description: Order Number, unique user–assigned integer number (up to six digits) used to identify scheduled (delay activated) commands. Values are:</p> <p>{0–999999} User–assigned Order Number. The command is scheduled to be executed as specified by DATE and TIME. If no value is entered for DATE or TIME, the command is scheduled for delayed manual activation (the command is entered in the delayed activation table and manually scheduled by using the ACT-DA command).</p> <p><NoVal> No Value, the command is executed immediately. (No value is entered for ON (Order Number), DATE, and TIME if ACT-DB-BACKUP is to be executed immediately – not delay activated.)</p> <p>Restrictions: ACT-DB-BACKUP is denied if no value is entered for ON (Order Number) and a value is entered for either DATE, TIME, or FLAG.</p>

DATE	{YY-MM-DD:{00-37,70-99} – {1-12, ALL} – {1-31, ALL}, {DAY:{SUN, MON, TUE, WED, THU, FRI, SAT, EVEN, ODD, ALL} }, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	<p>Date, specifies the date the command is scheduled to be executed. A specific date is specified by the value format <YY> – <MM> – <DD> where <YY> is the year, <MM> is the month, <DD> is the day. Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999. The values 00 through 37 are interpreted as the year 2000 through the year 2037. A specific day is specified by entering a keyword value. Values are:</p> <p><YY> – <MM> – <DD> Command is scheduled to be executed on the specified year, month, and day.</p> <p><YY> – <MM> – ALL Command is scheduled to be executed every day on the specified year and month.</p> <p><YY> –ALL– <DD> Command is scheduled to be executed every month on the specified year and day.</p> <p><YY> –ALL–ALL Command is scheduled to be executed every day of every month of the specified year.</p> <p>ALL– <MM> – <DD> Command is scheduled to be executed every year on the specified month and day.</p> <p>ALL– <MM> –ALL Command is scheduled to be executed every day of every year on the specified month.</p> <p>ALL–ALL– <DD> Command is scheduled to be executed every month of every year on the specified day.</p> <p>SUN Command is scheduled to be executed every Sunday.</p> <p>MON Command is scheduled to be executed every Monday.</p> <p>TUE Command is scheduled to be executed every Tuesday.</p> <p>WED Command is scheduled to be executed every Wednesday.</p> <p>THU Command is scheduled to be executed every Thursday.</p> <p>FRI Command is scheduled to be executed every Friday.</p> <p>SAT Command is scheduled to be executed every Saturday.</p> <p>EVEN Command is scheduled to be executed every even day (from January 1, 1970).</p> <p>ODD Command is scheduled to be executed every odd day (from January 1, 1970).</p> <p>ALL Command is scheduled to be executed every day.</p> <p><NoVal> No Value, the command is executed immediately if no value is entered for ON (Order Number), DATE, and TIME (not delay activated), or the command is scheduled to be executed at the next occurrence of the time specified by TIME.</p>
Restrictions:	ACT-DB-BACKUP is denied if a value is entered for DATE and no value is entered for ON (Order Number).

TIME	{HH-MM-SS:{0-23, ALL} – {0-59} – {0-59, HLF, QTR}, <NoVal>}
	Default: <NoVal>
	Addressing: None
	Description: Time, specifies the time the command is scheduled to be executed. A specific time is specified by the value format <HH> – <MM> – <SS> where <HH> is the hour, <MM> is the minute, and <SS> is the second. A value for <SS> must be entered, but the system uses a value of 0 when an integer value is entered. Values are:
	<HH> – <MM> – <SS> The command is scheduled to be executed at the specified hour and minute.
	ALL– <MM> – <SS> The command is scheduled to be executed every hour at the specified minute.
	<HH> – <MM> –HLF Two commands are scheduled to be executed, one command at the hour and minute specified by <HH> and <MM> and one command a half-hour (30 minutes) later. (<MM> must be less than 30.)
	<HH> – <MM> –QTR Four commands are scheduled to be executed, one command at the hour and minute specified by <HH> and <MM> and one command each quarter-hour (15 minutes) later. (<MM> must be less than 15.)
	ALL– <MM> –HLF Two commands are scheduled to be executed every hour, one command at the minute specified by <MM> and one command a half-hour (30 minutes) later. (<MM> must be less than 30.)
	ALL– <MM> –QTR Four commands are scheduled to be executed every hour, one command at the minute specified by <MM> and one command each quarter-hour (15 minutes) later. (<MM> must be less than 15.)
	<NoVal> No Value, the command is executed immediately if no value is entered for ON (Order Number), DATE, and TIME (not delay activated), or the command is scheduled to be executed at the current time on the date specified by DATE.
	Restrictions: ACT-DB-BACKUP is denied if a value is entered for TIME and no value is entered for ON (Order Number). ACT-DB-BACKUP is denied if <SS> of HLF or QTR is entered and <MM> is not less than 30 or 15, respectively.
FLAG	{0, <NoVal>}
	Default: <NoVal>
	Addressing: None
	Description: Flag. The value for FLAG is verified, but not processed by the system.
	Restrictions: ACT-DB-BACKUP is denied if a value is entered for FLAG and no value is entered for ON (Order Number).

VER	{NOVERIFY, VERIFY}
Default:	{NOVERIFY}
Addressing:	None
Description:	Verify, specifies whether a CRC (Cyclic Redundancy Code) verification of the data written to the optical disk is performed. Values are:
NOVERIFY	No CRC Verification, specifies that the data written to the optical disk is not verified.
VERIFY	CRC Verification, specifies that the data written to the optical disk is verified. After the data is written to the optical disk, the data on the optical disk is read and its re-calculated CRC compared to the overall CRC of the backed-up data. If the CRCs do not match, the system “marks” the backed-up data on the optical disk as “bad” so that it cannot be used for a database restoral.
TRYOTHER	{NOTOD, TOD}
Default:	{NOTOD}
Addressing:	None
Description:	Try Other Drive, specifies whether the database backup is to be attempted on the opposite copy optical disk drive if the database backup to the specified drive fails. Values are:
TOD	Try Other Drive, specifies that a database backup is automatically attempted on the opposite copy optical disk drive if the first database backup to the specified drive fails.
NOTOD	No Try Other Drive, specifies that a database backup is not automatically attempted on the opposite copy optical disk drive.
Restrictions:	ACT-DB-BACKUP shall be denied if either of the disk AIDs are specified with TRYOTHER parameter .

SUCCESSFUL RESPONSE FORMAT

The following successful response format is provided when the ACT-DB-BACKUP command is executed. If the command is executed as a scheduled (delay activated) command, the delay activation Order Number is provided in the command echo line.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>,<SID> */
/* Creation Date: <DATE> <TIME> */
/* Media Write Count: <WRCNT>, CRC: <CRC> */
[/* <Command Echo> [<CTAG>] ({<CID[-VCNUM]>,<CRON:<Order_Number>}) */]
;

```

The following output response format is provided if the ACT-DB-BACKUP command is scheduled for delayed activation (values for ON (Order Number), DATE, and TIME were entered in the command).

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DELAY
/* Command has been scheduled */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

SYSTYPE	{1631SX}
	System Type of the system software for the database being written to the backup media.
STREAM	{GRN-APS}
	Release Stream of the system software for the database being written to the backup media. Value is:
GRN-APS	Green-Administration Processing System.

RLSTYPE	<p>{F, P, R}</p> <p>Software Release Type of the system software for the database being written to the back-up media. Refer to the Software Support Agreement for applicable terms and conditions. Values are:</p> <table> <tr> <td>F</td><td>First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints.</td></tr> <tr> <td>P</td><td>Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions.</td></tr> <tr> <td>R</td><td>Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.</td></tr> </table>	F	First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints.	P	Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions.	R	Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.
F	First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints.						
P	Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions.						
R	Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.						
RLSNUM	<p>{06}</p> <p>Software Release Number of the system software for the database being written to the backup media.</p>						
IREV	<p>{00–99}</p> <p>Intermediate Release Revision of the system software for the database being written to the backup media. Refer to the Software Support Agreement.</p>						
MREV	<p>{00–99}</p> <p>Maintenance Release Revision of the system software for the database being written to the backup media. Refer to the Software Support Agreement.</p>						
SID	<p><1–20 CHARACTER SID></p> <p>Site Identification, identifies the SID provisioned via the SET–SID command.</p>						
DATE	<p>{YY–MM–DD:{00–37,70–99} – {1–12} – {1–31} }</p> <p>Database Backup Date, identifies the date of the database backup. The value format is <YY> – <MM> – <DD> where <YY> is the year, <MM> is the month, <DD> is the day. Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and 00 through 37 are interpreted as the year 2000 through the year 2037.</p>						
TIME	<p>{ {0–23}:{0–59}:{0–59} }</p> <p>Database Backup Time, identifies the time of the database backup. The format of TIME is <HH>:<MM>:<SS> where <HH> is the hour, <MM> is the minute, and <SS> is the second.</p>						
WRCNT	<p>{0–999}</p> <p>Optical Disk Write Count, indicates the number of times data has been written to the optical disk media.</p>						
CRC	<p><8 UPPER CASE HEXADECIMAL CRC CHARACTERS></p> <p>Database Backup Cyclic Redundancy Code, indicates the value of the 32-bit Cyclic Redundancy Code calculated over the backed-up data.</p>						

UNSUCCESSFUL RESPONSE FORMAT

The following unsuccessful response is generated if an incorrect or illegal command is entered or the database backup operation fails.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following unsuccessful response is generated if the ACT-DB-BACKUP command is cancelled by executing a CANCEL-DB-BACKUP command before the database backup operation is completed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> CANCLD
/* Media operation aborted */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier /* AID specified is AOOS */
IPNV	Input, Parameter Not Valid /* Order number required if date, time, and/or flag are entered */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, a database backup to OPD-1-3-1 is performed.

```
ACT-DB-BACKUP::OPD-1-3-1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P19003. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The first line of non-parsable data would also contain the provisioned Site ID of the system.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P19003 COMPLD
/* 1631SX,GRN-APS,R06.00.00,<SID> */
/* Creation Date: 94-09-03 14:05:01 */
/* Media Write Count: 5, CRC: 8A5CE31B */
/* ACT-DB-BACKUP::OPD-1-3-1 [P19003] (1) */
;
```

In the following example, a database backup to OPD-1-3-1 is scheduled to be performed with an Order Number of 152 on each day at 12:30 a.m. If the backup to OPD-1-3-1 fails, a backup attempt is performed on OPD-0-2.

```
ACT-DB-BACKUP::OPD-1-3-1::152,ALL,00-30-00:VERIFY,TOD;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P19015. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P19015 COMPLD
/* Command has been scheduled */
/* ACT-DB-BACKUP::OPD-1-3-1::152,ALL,00-30-00:VERIFY,TOD [P19015] (1)
*/
;
```

In the following example, the database backup to OPD-1-3-1 is cancelled by executing a CANC-DB-BACKUP command before the database backup operation is completed.

```
ACT-DB-BACKUP::OPD-1-3-1;
```

```
CANC-DB-BACKUP;
```

The output responses, shown below, assume CID 1 was used to enter the command and the system generated CTAG values of P19020 for the ACT-DB-BACKUP command and P19021 for the CANC-DB-BACKUP command. The response headers would contain the provisioned Site ID of the system, and the date and time the commands were executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P19020 COMPLD
/* Media operation aborted */
/* ACT-DB-BACKUP::OPD-1-3-1 [P19020] (1) */
;

<SID> <YY-MM-DD> <HH:MM:SS>
M P19021 COMPLD
/* CANC-DB-BACKUP [P19021] (1) */
;
```

RELATED COMMANDS

```

COMMAND CODE: **ACT-EUA**
COMMAND NAME: **ACTIVATE EMERGENCY USER ACCESS**

PURPOSE

The ACT-EUA command suspends the transfer of the following message types between the Level-1 processor and Level-2 processor and generates an EUA condition type. The messages already residing in the input buffers of the Level-1 and Level-2 processors are processed in the normal manner. Normal resumption of the message transfer between the Level-1 and Level-2 processor and clearing of the EUA condition type can be achieved when a CANC-EUA command is successfully executed.

Level-1 to Level-2 processor message types suspended are:

- Requests for Historical 15-minute and 1-day PM data
- Requests for PM Threshold Crossing alerts

Level-2 to Level-1 processor message types suspended are:

- Facility alarms
- PM Threshold Crossing alerts
- Historical 15-minute and 1-day PM data
- Historical XIDMISM data

An ACT-EUA command is denied if:

- The EUA condition type is already set.
- The system is unable to read or update the database.

INPUT FORMAT

ACT-EUA: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SDBE	Status, internal Data Base Error /* The ACT-EUA aborted due to system error. */ /* Error reading system configuration data base. */ /* Error updating system configuration data base. */
SNVS	Status, Not in Valid State /* The ACT-EUA was rejected. */ /* Emergency User Access already activated. */

EXAMPLES

In the following example, ACT-EUA is used to suspend the transfer of message types between the Level-1 processor and Level-2 processor and to generate an EUA condition type.

ACT-EUA;

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P28020. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P28020 COMPLD
/* ACT-EUA [P28020] (2) */
;
```

RELATED COMMANDS

CANC-EUA

COMMAND CODE: **ACT-USER**
COMMAND NAME: **ACTIVATE USER**

PURPOSE

The ACT-USER command establishes a session with the system and logs in the specified user.

The entered PID (Password Identifier) is not displayed on any screen and is not available to any user in any file. No in-progress message is output by the system in response to an ACT-USER command.

A user cannot log in to the system (via ACT-USER command) from a terminal that another user is already logged-in, unless the CID is provisioned for the SNIDER protocol (PROTOCOL of SNIDER in ENT-CID).

The ACT-USER command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An ACT-USER command is denied if:

- The specified user identifier (UID) has not been provisioned (does not exist in the system).
- Another user is already logged-in over the terminal being used, unless the CID is provisioned for the SNIDER protocol (PROTOCOL of SNIDER in ENT-CID).
- The specified UID is provisioned (via ENT-USER or ED-PRVG-USER) as an auto-login user.
- The specified password identifier (PID) has been deactivated by the system due to user account inactivity.
- An invalid parameter value is entered.

INPUT FORMAT

ACT-USER: [TID] :UID: [CTAG] : :PID, [SKIPTOEND] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
UID	<5-12 VALID UID CHARACTERS> Default: Entry Required Addressing: None Description: User Identifier, specifies the user issuing this command. (Refer to the UID parameter in ENT-USER for a description of valid UID values.) Restrictions: ACT-USER is denied if the specified UID is provisioned in the system as an auto-login (automatically logged-in) user. ACT-USER is denied if the system has removed the user's account (UID) due to inactivity. If the UID aging security option is enabled, the system will automatically remove the user's account when the user has not logged-in to the system for a period greater than the value specified in the UOUT parameter of the SET-ATTR-SECUDFLT command. This applies to all user accounts except for the system administrator and Alcatel user accounts.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

PID	<6–12 VALID PID CHARACTERS>
Default:	Entry Required
Addressing:	None
Description:	Password Identifier, specifies the user's login password. The password is not echoed to the screen or printed. (Refer to the PID parameter in ED–PID or ENT–USER for a description of valid PID values.)
Restrictions:	ACT–USER is denied if the system has deactivated the user's password identifier (PID) for security reasons. There are two conditions that cause the system to automatically deactivate the user's PID. The first condition, if enabled, occurs when the user has not logged–in to the system for a period greater than the value specified in the POUT parameter of the SET–ATTR–SECUDFLT command. The first condition applies to all user accounts except for the system administrator and Alcatel user accounts. The second condition, if enabled, occurs when the user has not changed the password identifier (PID) within the provisioned system password aging period and then does not change the PID during the first log–in session after that point in time. The second condition applies to all user accounts except the system administrator and the Alcatel user account. The system password aging period is provisionable through the PAGE parameter in the SET–ATTR–SECUDFLT command.
SKIPTOEND	{END}
Default:	<NoVal>
Addressing:	None
Description:	Skip To End, skip to end of saved output. If the user's DSKBFIND parameter (see ENT–USER or ED–PRVG–USER command) is set to ALWAYS, the system output is buffered while the user is logged–out. When the user logs–in, SKIPTOEND may be used to either receive all buffered output or to skip to the end of the output buffer and receive only new output. If the DSKBFIND parameter is set to NEVER, SKIPTOEND has no effect. Values are:
	END End, skip to the end of the output buffer and send only new output.
	<NoVal> No Value, receive buffered output at login if the user's DSKBFIND parameter (see ENT–USER or ED–PRVG–USER command) is set to ALWAYS.

SUCCESSFUL RESPONSE FORMAT

The user (executing an ACT-USER command) receives the following two output messages in response to a successful login via an ACT-USER command. The autonomous response message is only sent to the user that is logging-in to the system (the user executing the ACT-USER command). The autonomous REPT^EVT^SESSION response message is always transmitted to the user that is logging-in to the system and cannot be inhibited via a user's OSL provisioning with the ENT-USER or ED-PRVG-USER commands. The user is prompted to change the password identifier (PID) if the password has expired due to password aging (i.e. the PIDEVP parameter value is YES).

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* ACT-USER <UID> on CID <CPORT> [-<VCNUM>] */
    /* <SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV> */
    /* (c) Copyright <YEAR> Alcatel Network Systems*/
    "<UID>:<LSEDATE>,<LSESTIME>,<LOGATMPT>
[,<SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>]"
    [/* ACT-USER::<UID>:::***** [<CTAG>] (<CID [-VCNUM]>) */]
;

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <ATAG> REPT EVT SESSION
    "<SID>:<PIDEVP>"
[/* Password will be deactivated if not changed before logging-off */]
    /* <WARN> */
;

```

The following successful response message is transmitted to other logged-in users if they are provisioned appropriately (via the ENT-USER or ED-PRVG-USER commands).

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* ACT-USER <UID> on CID <CPORT> [-<VCNUM>] */
    [/* ACT-USER::<UID>:::***** [<CTAG>] (<CID [-VCNUM]>) */]
;

```

Note. If a CPORT or X.25 virtual channel is provisioned to automatically log-in a UID (refer to ENT-CID, ENT-CID-VC, and ENT-OSADDR-SITE), the above successful response messages are generated with a CTAG value of AUTOIN when the system automatically logs-in the provisioned auto-log-in UID.

OUTPUT PARAMETERS

UID	<5-12 VALID UID CHARACTERS> User Identifier, identifies the UID of the user that executed the command.
CPORT	{1-12} Control Port, identifies the physical control port connection to the system.
VCNUM	{1-8} Virtual Channel Number, identifies any X.25 virtual channel connection to the system. A value for VCNUM is only returned if the session is being established over an X.25 virtual channel.
SYSTYPE	{1631SX} System Type of the system the user is logging-on. A value for SYSTYPE is only returned in the parsable text line if ENRELNUM is Y (as set by ED-PRMTR-SITE).
STREAM	{LMC-APS} Release Stream of the system software for the indicated System Type. A value for STREAM is only returned in the parsable text line if ENRELNUM is Y (as set by ED-PRMTR-SITE). Value is: LMC-APS Large Matrix Configuration – Administration Processing System.

RLSTYPE	{F, P, R} Software Release Type of the system software. Refer to the Software Support Agreement for applicable terms and conditions. A value for RLSTYPE is only returned in the parsable text line if ENRELNUM is Y (as set by ED-PRMTR-SITE). Values are: F First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints. P Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions. R Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.
RLSNUM	{06} Software Release Number. A value for RLSNUM is only returned in the parsable text line if ENRELNUM is Y (as set by ED-PRMTR-SITE).
IREV	{00-99} Intermediate Release Revision. Refer to the Software Support Agreement. A value for IREV is only returned in the parsable text line if ENRELNUM is Y (as set by ED-PRMTR-SITE).
MREV	{00-99} Maintenance Release Revision. Refer to the Software Support Agreement. A value for MREV is only returned in the parsable text line if ENRELNUM is Y (as set by ED-PRMTR-SITE).
YEAR	{1970-2069} Copyright Year, identifies the year of the system software copyright.
LSESDATE	{YY-MM-DD:{00-99} - {1-12} - {1-31} } Last Session Date, identifies the date of the last session established by this UID. The format of LSESDATE is <YEAR> - <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
LSESTIME	{HH-MM-SS:{00-23} - {00-59} - {00-59} } Last Session Time, identifies the time of the last session established by this UID. The format of LSESTIME is <HOUR> - <MINUTES> - <SECONDS>.
LOGATMPT	{0-15} Unsuccessful Login Attempt Number, identifies the number of unsuccessful session attempts since last session.
SID	<1-20 VALID SID CHARACTERS> Site Identification, SID as established with the SET-SID command.
PIDEXP	{NO,YES} Password ID Expired, indicates whether the user is required to update the user's password identifier (PID) because of password aging. The user is prompted to change the password identifier in the REPT^EVT^SESSION autonomous message if the value of this parameter (PIDEXP) is YES.
WARN	<0-20 LINES OF INFORMATION> Warning, warning message field containing up to 20 lines as provisioned with the SET-WARN-MSG command.

UNSUCCESSFUL RESPONSE FORMAT

The following unsuccessful response message is generated if a user is not currently logged-in to the system over the CPORT[-VCNUM] (a session is not active) and an incorrect or illegal command is entered. No error code is generated (for security purposes) in this case.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> DENY
    [/* Session not active */]
;

```

The following unsuccessful response message is generated if a user is currently logged-in to the system over the CPORT[-VCNUM] (a session is active) and an ACT-USER command is entered.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> DENY
    <ERROR CODE>
    [/* <Informational Error Description Text> */]
    [/* <Expanded Error Code Description> */]
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

No error code is generated (for security purposes) when a user is not currently logged-in to the system over the CPORT[-VCNUM] and an ACT-USER command is unsuccessful.

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IPNV      Input, Parameter Not Valid
          /* Invalid login attempt on CID <CPORT[-VCNUM]>, UID: <UID> */

```

EXAMPLES

In the following example, ACT-USER is used to login a user named JOHN:

```

ACT-USER::JOHN::*****;

```

The output response, shown below, assumes CID 3 was used to enter the command, a system generated CTAG value of P2e002, and a system generated ATAG value of 3521. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  P2e002 COMPLD
    /* ACT-USER JOHN on CID 3 */
    /* 1631SX,LMC-APS,R06.00.00 */
    /* (c) Copyright 1995 Alcatel Network Systems */
    "JOHN:94-06-22,15-14-24,0,1631SX,LMC-APS,R06.00.00"
    /* ACT-USER::JOHN::***** [P2e002] (2) */
;

    <SID> <YY-MM-DD> <HH:MM:SS>
A  3521 REPT EVT SESSION
    "<SID>:NO"
    /* WARNING - This is a secured system */
    /* Unauthorized access will be prosecuted */
;

COMMAND CODE: **ALW-CBIT-T1**
COMMAND NAME: **ALLOW CBIT T1**

PURPOSE

The ALW-CBIT-T1 command enables a received C-bit loop back request in the supporting DS2 signal to cause a DS1 loop back of the specified embedded DS1.

The ALW-CBIT-T1 command is allowed on a DS1 port that is embedded within an unconnected/unterminated DS3 or on a DS1 port that is one-way or two-way cross-connected. If the C-bit loopback is executed on a DS1 that is one-way or two-way cross-connected (i.e., it has a SST of ACT or BUSY), DS1 AIS is transmitted in the outgoing direction if cross-connected to a DS1, or VT1.5 AIS is transmitted in the outgoing direction if cross-connected to a VT1.5, and the incoming DS1 signal is looped back.

Executing an ALW-CBIT-T1 causes an ALWCBLPBK condition type to be set for the specified DS1. (A RCVCBLPBK condition type is set for the specified DS1 if the DS1 is looped back as a result of a received C-bit loop back request in the supporting DS2 signal.)

An ALW-CBIT-T1 command is denied if:

- The specified DS1 port is not provisioned.
- The specified DS1 port is provisioned as an Idle Signal Source port.
- C-bit loop back is already enabled for the specified DS1 port (ALWCBLPBK condition type is set).
- The specified DS1 is connected to a Test Access port (a DS1 SST of TS), is a connected Test Access Port (a DS1 SST of TS), or is in a loop back (a DS1 SST of LPBK).
- The specified DS1 is embedded within VT1.5.
- The specified DS1 port is part of a redlined connection.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-CBIT-T1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)	
	Default:	Entry Required	
	Default:		
	Addressing:	&&-ranging and &-grouping	
	Description:	DS1 AID, identifies the DS1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SAAL	Status, Already ALlowed
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest /* Cbit not allowed when supporting entities are connected */

EXAMPLES

In the following example, ALW-CBIT-T1 enables an automatic loop back on DS1 port T3T1-1489-5 if a C-bit loop back request is received in the supporting DS2 signal.

```
ALW-CBIT-T1 : T3T1-1489-5 ;

```

COMMAND CODE: **ALW-FL-EQPT**
COMMAND NAME: **ALLOW FAULT LOCATION EQUIPMENT**

PURPOSE

The ALW-FL-EQPT command enables (allows) fault location (isolation) data collection and updating of the system's fault isolation database and enables the setting and clearing of equipment INTERR condition types (previously disabled by the INH-FL-EQPT command).

When ALW-FL-EQPT is executed, the system automatically updates (re-baselines) the fault isolation database with the current status of the equipment in the system. As a result, INTERR condition types that have not previously been declared are set and INTERR condition types that no longer exist are cleared.

Executing an ALW-FL-EQPT command also clears the INHFL condition type (previously set by executing an INH-FL-EQPT).

An ALW-FL-EQPT command is denied if:

- Fault location data collection is already enabled/allowed.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-FL-EQPT: [TID] : [AID] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {ALL} Default: {ALL} Addressing: None Description: Equipment AID. ALL is the only entry accepted by the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* The ALW-FL-EQPT completed. */
  /* Fault isolation allowed. */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENRE	Equipage, Not Recognized Equipage /* The command was rejected. */ /* Invalid or unassigned equipment identifier specified. */
ICNV	Input, Command Not Valid /* Invalid command requested on equipment. */
IPNV	Input, Parameter Not Valid /* The ALW-FL-EQPT was rejected. */ /* Invalid or unassigned equipment identifier specified. */
SAAL	Status, Already ALlowed /* The ALW-FL-EQPT was rejected. */ /* Fault isolation already allowed. */
SDBE	Status, internal Data Base Error /* The ALW-FL-EQPT aborted due to system error. */ /* Error reading system configuration data base. */ /* Error updating system configuration data base. */

EXAMPLES

In the following example, updating of the system's fault isolation data base and the setting and clearing of equipment INTERR condition types is enabled.

COMMAND CODE: **ALW-PMREPT-EC1**
COMMAND NAME: **ALLOW PERFORMANCE MONITORING
REPORT EC1**

PURPOSE

The ALW-PMREPT-EC1 command enables (allows) scheduled PM reporting (via the scheduled REPT^PM^EC1 message and binary PM reports via RS-232) for the specified EC1 port (previously disabled by the INH-PMREPT-EC1 command).

Executing an ALW-PMREPT-EC1 causes the INHPMREPT condition type to be cleared for the specified EC1.

An ALW-PMREPT-EC1 command is denied if:

- The specified EC1 port is not provisioned (via ENT-EC1).
- PM reporting is already enabled (an EC1 condition type of INHPMREPT is not set) for the specified EC1.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-PMREPT-EC1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

ALW-PMREPT-STS1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies the STS-1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV	Input, Command Not Valid /* Invalid command requested. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
SAAL	Status, Already ALlowed /* PM report already allowed. */
SDBE	Status, internal Data Base Error /* Error reading pm report database. */ /* Error updating pm report database. */ /* Failed to set pointer to FM STS1 record. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type. */

EXAMPLES

In the following example, the PM reporting for STS-1 port EC1STS1-197 is enabled.

COMMAND CODE: **ALW-PMREPT-STS3C**
COMMAND NAME: **ALLOW PERFORMANCE MONITORING
REPORT STS-3C**

PURPOSE

The ALW-PMREPT-STS3C command enables (allows) scheduled PM reporting (via the scheduled REPT^PM^STS3C message and binary PM reports via RS-232) for the specified STS-3C port (previously disabled by the INH-PMREPT-STS3C command).

Executing an ALW-PMREPT-STS3C causes the INHPMREPT condition type to be cleared for the specified STS-3C.

An ALW-PMREPT-STS3C command is denied if:

- The specified STS-3C port is not provisioned (via ENT-STS3C).
- PM reporting is already enabled (an STS-3C condition type of INHPMREPT is not set) for the specified STS-3C.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-PMREPT-STS3C: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID, identifies the STS-3C port.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **ALW-PMREPT-T1**
COMMAND NAME: **ALLOW PERFORMANCE MONITORING REPORT T1**

PURPOSE

The ALW-PMREPT-T1 command enables (allows) scheduled PM reporting (via the scheduled REPT^PM^T1 message and binary PM reports via RS-232) for the specified DS1 port (previously disabled by the INH-PMREPT-T1 command).

Executing an ALW-PMREPT-T1 causes the INHPMREPT condition type to be cleared for the specified DS1.

An ALW-PMREPT-T1 command is denied if:

- The specified DS1 port is not provisioned (via ENT-T1).
- The specified DS1 port is embedded within a protection OC-3 or protection OC-12.
- PM reporting is already enabled (a DS1 condition type of INHPMREPT is not set) for the specified DS1.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-PMREPT-T1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T1-{1-59392}}	(T1-DS1#)	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)

COMMAND CODE: **ALW-PMREPT-T3**
COMMAND NAME: **ALLOW PERFORMANCE MONITORING
REPORT T3**

PURPOSE

The ALW-PMREPT-T3 command enables (allows) scheduled PM reporting (via the scheduled REPT^PM^T3 message and binary PM reports via RS-232) for the specified DS3 port (previously disabled by the INH-PMREPT-T3 command).

Executing an ALW-PMREPT-T3 causes the INHPMREPT condition type to be cleared for the specified DS3.

An ALW-PMREPT-T3 command is denied if:

- The specified DS3 port is not provisioned (via ENT-T3).
- The specified DS3 port is embedded within a protection OC-3 or protection OC-12.
- PM reporting is already enabled (a DS3 condition type of INHPMREPT is not set) for the specified DS3.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-PMREPT-T3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) {EC1T3-{1-3840}} (EC1T3-EC1/STS1/DS3#) {OC3T3-{1-2240}-{1-3}} (OC3T3-OC3#-STS1/DS3#) {OC12T3-{1-560}-{1-4}-{1-3}} (OC12T3-OC12#-STM1#-STS1/DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS3 AID, identifies the DS3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **ALW-PMREPT-VT1**
COMMAND NAME: **ALLOW PERFORMANCE MONITORING
REPORT VT1**

PURPOSE

The ALW-PMREPT-VT1 command enables (allows) scheduled PM reporting (via the scheduled REPT^PM^VT1 message and binary PM reports via RS-232) for the specified VT1.5 port (previously disabled by the INH-PMREPT-VT1 command).

Executing an ALW-PMREPT-VT1 causes the INHPMREPT condition type to be cleared for the specified VT1.5.

An ALW-PMREPT-VT1 command is denied if:

- The specified VT1.5 port is not provisioned (via ENT-VT1).
- The specified VT1.5 port is embedded within a protection OC-3 or protection OC-12.
- PM reporting is already enabled (a VT1.5 condition type of INHPMREPT is not set) for the specified VT1.5.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-PMREPT-VT1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)

COMMAND CODE: **ALW-SW-EQPT**
COMMAND NAME: **ALLOW SWITCH EQUIPMENT**

PURPOSE

The ALW-SW-EQPT command enables (allows) automatic copy switching for the specified one-for-one redundant (duplex) CPU, IPU, or SPB equipment. Either copy of equipment can be specified; the command enables copy switching on both copies of equipment. (Note, if the system is locked to a faulty copy of equipment, it will automatically revert back to the functional copy when the ALW-SW-EQPT is executed.)

Executing an ALW-SW-EQPT command clears the SST of ASI (previously set by executing an INH-SW-EQPT command) for the specified equipment entity and the corresponding opposite copy equipment entity.

Executing an ALW-SW-EQPT command clears the INHSWDX condition type (previously set by executing an INH-SW-EQPT) for the specified equipment entity and the corresponding opposite copy equipment entity.

An ALW-SW-EQPT command is denied if:

- Both copies of the specified equipment entity have not previously been provisioned with the ENT-EQPT command.
- Copy switching for the specified equipment is already allowed/enabled (does not have a SST of ASI and a condition type of INHSWDX).
- An invalid parameter value is entered.

INPUT FORMAT

ALW-SW-EQPT: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {CPU-1-2-{1-2}} {IPU-{44-63}-{1-4}-{1-8}} {SPB-{2-43, 102-111 , 112-135, 136-141 }-{1, 3}-{1-2}} {SPB-{5}-{1, 3}-{1, 2}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment object entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* The ALW-SW-EQPT for <AID> was completed. */
  /* Automatic switching allowed for <AID>. */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

OUTPUT PARAMETERS

AID	EQUIPMENT_AID: {CPU-1-2-{1-2}} {IPU-{44-63}-{1-4}-{1-8}} {SPB-{2-43, 102-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Equipment AID, identifies the equipment entity.
-----	--

UNSUCCESSFUL RESPONSE FORMAT

      <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> DENY
      <ERROR CODE>
      [/* <Informational Error Description Text> */]
      [/* <Expanded Error Code Description> */]
      [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SAAL	Status, Already ALlowed /* Automatic switching already allowed for <AID>. */ /* Unexpected message response from <AID> – response expected from Slave. */
SDBE	Status, internal Data Base Error /* An invalid module type specified in request. */ /* Error accessing auxiliary EM data area. */

EXAMPLES

In the following example, manual and automatic copy switching is enabled for SPB-4-1-1 and its opposite copy SPB-4-1-2.

```
ALW-SW-EQPT::SPB-4-1-1;
```

RELATED COMMANDS

```

ENT-EQPT
INH-SW-EQPT
RTRV-EQPT
RTRV-STATE-EQPT
SW-DX-EQPT

```

COMMAND CODE: **ALW-SWTOPROTN-EQPT**
COMMAND NAME: **ALLOW SWITCH TO PROTECTION EQUIPMENT**

PURPOSE

The ALW-SWTOPROTN-EQPT command enables (allows) automatic and manual I/O protection switching of a main (working) I/O circuit pack to a protection I/O circuit pack for the specified equipment entity. If an AID for a protection circuit pack is entered, automatic and manual I/O protection switching is enabled for all I/O circuit packs in the protection group associated with the I/O protection circuit pack, except for any I/O circuit pack that has protection switching specifically inhibited due to an INH-SWTOPROTN-EQPT command. If an AID of ALL is entered, automatic and manual I/O protection switching is enabled for all I/O circuit packs in the system, regardless of whether I/O protection switching is specifically inhibited for any I/O circuit packs.

Executing an ALW-SWTOPROTN-EQPT command clears the SST of PSI (previously set by executing an INH-SWTOPROTN-EQPT) for the specified equipment entity.

Executing an ALW-SWTOPROTN-EQPT command clears the INHSWPR condition type (previously set by executing an INH-SWTOPROTN-EQPT) for the specified equipment entity.

An ALW-SWTOPROTN-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned with the ENT-EQPT command.
- Protection switching for the specified equipment is already allowed/enabled (does not have a SST of PSI and a condition type of INHSWPR), unless an AID of ALL is entered.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-SWTOPROTN-EQPT: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {ALL} {DSI-{44-63}-{1-4}-{1-32}} {SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110, 136-141}-{1, 3}-{1-18}, EP3-{9, 21, 35, 43, 107}-3-{1-18}, EP3-{15, 27, 31, 39, 111}-1-{1-18}} {SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}} {SI48: ES1-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110,136-141}-{1, 3}-{1-18}, ES1-{9, 21, 35, 43,107}-3-{1-18}, ES1-{15, 27, 31, 39,111}-1-{1-18}} {SI36: ES1-{6-8, 12-14}-{1, 3}-{1-14}, ES1-9-3-{1-14}, ES1-15-1-{1-14}} {HMU-{44-53}-{1-4}-{1-8}} {LMU-{44-53}-{1-4}-{1-32}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment object entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.

CTAG <1-6 VALID CTAG CHARACTERS>
Default: <System Assigned CTAG Value>
Addressing: None
Description: Correlation Tag, associates input command with its output responses.

 Equipment AID, identifies the EP3, ES1, HMU, LMU or DSI equipment entity.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC Input, Data Not Consistent
 /* Unable to read aux buffer for <AID>. */
IIAC Input, Invalid ACcess identifier
 /* Invalid or unassigned equipment identifier specified. */
 /* The command was rejected. */
 /* Invalid command for a TGR card. */
 /* Invalid AID for the given slot. */
 /* The ALW-SWTOPROTN-EQPT for <AID> was rejected. */

SAAL	Status, Already ALlowed /* The ALW-SWTOPROTN-EQPT for <AID> was rejected. */ /* Switching to protection already allowed. */
SARB	Status, All Resources Busy /* The command was rejected. */ /* Command already in progress on equipment. */ /* INIT-SYS command still active on shelf that equipment is on. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */
SDBE	Status, internal Data Base Error /* The command was aborted. */ /* Error accessing auxiliary EM data area. */ /* Data base access failure. */ /* The command was rejected. */ /* The ALW-SWTOPROTN-EQPT for <AID> was aborted. */ /* Auxiliary buffer access failure */ /* SPB Auxiliary buffer access failure */ /* IPU Auxiliary buffer access failure */ /* LMU/DSI data base access failure. */ /* HMU data base access failure. */
SSRE	Status, System Resources Exceeded /* The command was rejected. */ /* Unable to allocate USI response buffer. */

EXAMPLES

In the following example, automatic and manual I/O protection switching is enabled for EP3-8-1-4.

```
ALW-SWTOPROTN-EQPT: :EP3-8-1-4;  
  <SID> <YY-MM-DD> <HH:MM:SS>  
M P70003 COMPLD  
  /* The ALW-SWTOPROTN-EQPT for EP3-8-1-4 was completed. */  
  /* Switching to protection allowed. */  
  /* ALW-SWTOPROTN-EQPT::EP3-8-1-4 [P70003] (1) */
```

In the following example, automatic and manual I/O protection switching is enabled for all EP3 circuit packs (EP3-9-3-2 through EP3-9-3-9, except for those that have protection switching specifically disabled because of an INH-SWTOPROTN command) in the protection group associated with the protection circuit pack EP3-9-3-1.

```
ALW-SWTOPROTN-EQPT: :EP3-9-3-1;  
  <SID> <YY-MM-DD> <HH:MM:SS>  
M P70002 COMPLD  
  /* The ALW-SWTOPROTN-EQPT for EP3-9-3-1 was completed. */  
  /* Switching to protection allowed. */  
  /* ALW-SWTOPROTN-EQPT::EP3-9-3-1 [P70002] (1) */
```

In the following example, automatic and manual I/O protection switching is enabled for all DSI, EP3, ES1, HMU and LMU circuit packs in the system.

```
ALW-SWTOPROTN-EQPT: :ALL;  
  <SID> <YY-MM-DD> <HH:MM:SS>  
M P70003 COMPLD  
  /* The ALW-SWTOPROTN-EQPT for ALL was completed. */  
  /* ALW-SWTOPROTN-EQPT::ALL [P70003] (1) */
```

SW-TOWKG-EQPT

COMMAND CODE: **ALW-SWTOWKG-EQPT**
COMMAND NAME: **ALLOW SWITCH TO WORKING
EQUIPMENT**

PURPOSE

The ALW-SWTOWKG-EQPT command enables (allows) automatic and manual I/O protection switching from the protection I/O circuit pack to the main (working) I/O circuit pack for the specified equipment entity. If an AID for a protection circuit pack is entered, automatic and manual I/O protection switching from protection to working is enabled for all I/O circuit packs in the protection group associated with the I/O protection circuit pack, except for any I/O circuit pack that has protection switching to working specifically inhibited due to an INH-SWTOWKG-EQPT command. If an AID of ALL is entered, automatic and manual I/O protection switching from protection to working is enabled for all I/O circuit packs in the system, regardless of whether I/O protection switching to working is specifically inhibited for any I/O circuit packs.

Executing an ALW-SWTOWKG-EQPT command clears the SST of PRI (previously set by executing an INH-SWTOWKG-EQPT) for the specified equipment entity.

Executing an ALW-SWTOWKG-EQPT command clears the INH-SWTOWKG condition type (previously set by executing an INH-SWTOWKG-EQPT) for the specified equipment entity.

An ALW-SWTOWKG-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned with the ENT-EQPT command.
- Protection switching from protection to working (main) for the specified equipment is already allowed/enabled (does not have a SST of PRI and a condition type of INH-SWTOWKG), unless an AID of ALL is entered.
- An invalid parameter value is entered.

INPUT FORMAT

ALW-SWTOWKG-EQPT: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	EQUIPMENT_AID:
	{ALL} {DSI-{44-63}-{1-4}-{1-32}} {SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110, 136-141 }-{1, 3}-{1-18}, EP3-{9, 21, 35, 43, 107 }-3-{1-18}, EP3-{15, 27, 31, 39, 111 }-1-{1-18}} {SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}} {SI48: ES1-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110,136-141 }-{1, 3}-{1-18}, ES1-{9, 21, 35, 43, 107 }-3-{1-18}, ES1-{15, 27, 31, 39, 111 }-1-{1-18}} {SI36: ES1-{6-8, 12-14}-{1, 3}-{1-14}, ES1-9-3-{1-14}, ES1-15-1-{1-14}} {HMU-{44-53}-{1-4}-{1-8}} {LMU-{44-53}-{1-4}-{1-32}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment object entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.
CTAG	<1-6 VALID CTAG CHARACTERS>
	Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* The ALW-SWTOWKG-EQPT for <AID> was completed */]
  [/* Switching to working allowed. */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID>. */
IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified. */ /* The command was rejected. */ /* Invalid command for a TGR card. */ /* Invalid AID for the given slot. */ /* The ALW-SWTOWKG-EQPT for <AID> was rejected. */
SAAL	Status, Already ALlowed /* Switching to working already allowed. */ /* The ALW-SWTOWKG-EQPT for <AID> was rejected. */
SARB	Status, All Resources Busy /* The command was rejected. */ /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* INIT-SYS command still active on shelf that equipment is on. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */

SDBE Status, internal Data Base Error
 /* The command was aborted. */
 /* Error accessing auxiliary EM data area. */
 /* Data base access failure. */
 /* The command was rejected. */
 /* The ALW-SWTOWKG-EQPT for <AID> was aborted. */
 /* Auxiliary buffer access failure */
 /* SPB Auxiliary buffer access failure */
 /* IPU Auxiliary buffer access failure */
 /* LMU/DSI data base access failure. */
 /* HMU data base access failure. */
SSRE Status, System Resources Exceeded
 /* The command was rejected. */
 /* Unable to allocate USI response buffer. */

EXAMPLES

In the following example, automatic and manual I/O protection switching (from protection) back to working (main) is enabled for EP3-7-1-5.

```
ALW-SWTOWKG-EQPT: :EP3-7-1-5;  
  
<SID> <YY-MM-DD> <HH:MM:SS>  
M P70007 COMPLD  
/* The ALW-SWTOWKG-EQPT for EP3-7-1-5 was completed. */  
/* Switching to working allowed. */  
/* ALW-SWTOWKG-EQPT: :EP3-7-1-5 [P70007] (1) */
```

In the following example, automatic and manual I/O protection switching (from protection) back to working (main) is enabled for all EP3 circuit packs (EP3-9-3-2 through EP3-9-3-9, except for those that have protection switching to working specifically disabled because of an INH-SWTOWKG command) in the protection group associated with the protection circuit pack EP3-9-3-1.

```
ALW-SWTOWKG-EQPT: :EP3-9-3-1;  
  
<SID> <YY-MM-DD> <HH:MM:SS>  
M P70009 COMPLD  
/* The ALW-SWTOWKG-EQPT for EP3-9-3-1 was completed. */  
/* Switching to working allowed. */  
/* ALW-SWTOWKG-EQPT: :EP3-9-3-1 [P70009] (1) */
```

In the following example, automatic and manual I/O protection switching (from protection) back to working (main) is enabled for all EP3, ES1, DSI, HMU and LMU circuit packs in the system.

```
ALW-SWTOWKG-EQPT: :ALL;  
  
<SID> <YY-MM-DD> <HH:MM:SS>  
M P70011 COMPLD  
/* The ALW-SWTOWKG-EQPT for ALL was completed. */  
/* ALW-SWTOWKG-EQPT: :ALL [P70011] (1) */
```

SW-TOWKG-EQPT

COMMAND CODE: **CANC-DA**
COMMAND NAME: **CANCEL DELAYED ACTIVATION**

PURPOSE

The CANC-DA command cancels previously scheduled delay-activated commands (removes the command line entry from the delayed activation table).

The commands ACT-DB-BACKUP, DLT-EQPT, ENT-EQPT, or INIT-SYS may be scheduled to execute at some specified future time, either once, or perpetually. This is known as Delayed Activation (DA).

These commands are scheduled for delayed activation by specifying the optional parameters ON (Order Number), DATE, and TIME when the command is entered. When the command is entered with these parameters specified, the command line is entered into the delayed activation table. The command will subsequently execute automatically upon occurrence of the specified date and/or time, or manually by use of the ACT-DA command. The CANC-DA command removes the command line entry in the delayed activation table and cancels the scheduled delayed activation.

NOTE: Although the ON parameter value can be an integer from 0 to 999999, the user should limit the number of delayed activation commands at any given time to 500.

A CANC-DA command is denied if:

- The specified ON (Order Number) does not exist in the delayed activation table.
- An invalid parameter value is entered.

INPUT FORMAT

CANC-DA: [TID] :ON: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
ON	{ON_AID:{0 - 999999}, ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: Access Identifier, specifies the Order Number of the command to be cancelled (removed) from the delayed activation table. Values are: 0-999999 Order Number value previously assigned to the command. ALL All pending Order Numbers are to be cancelled. Restrictions: CANC-DA is denied if the specified Order Number does not exist in the delayed activation table.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Optional Suggested Action Text> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```
IPNV      Input, Parameter Not Valid
          /* Order Number = <ON_AID> not in crontab/not deleted */
          /* Invalid Order Number = <ON_AID> */
```

EXAMPLES

In the following example, the command scheduled for delayed activation with Order Number 1003 is cancelled.

```
CANC-DA::1003;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P28024. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P28024 COMPLD
  /* CANC-DA::1003: [P28024] (1) */
;
```

In the next example, the commands scheduled for delayed activation with Order Numbers 10 and 12 through 19 are cancelled.

```
CANC-DA::10&12&&19;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P28025. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P28025 COMPLD
  /* CANC-DA::10&12&&19: [P28025] (2) */
;
```

RELATED COMMANDS

ACT-DA
ACT-DB-BACKUP
DLT-EQPT
ENT-EQPT
INIT-SYS
RTRV-DA
```

COMMAND CODE: **CANC-DB-BACKUP**
COMMAND NAME: **CANCEL DATABASE BACKUP**

PURPOSE

The CANC-DB-BACKUP command aborts (cancels) any database backup currently in-progress (because of an ACT-DB-BACKUP command).

If an in-progress database backup is cancelled, an unsuccessful response (CANCLD) message is generated for the ACT-DB-BACKUP command (refer to the ACT-DB-BACKUP command) and the system "marks" the backed-up data on the optical disk media as "invalid" so that it cannot be inadvertently used for a subsequent database restoral.

A CANC-DB-BACKUP command is denied if:

- A database backup operation is not in-progress.
- The in-progress database backup operation has already been cancelled.
- An invalid parameter value is entered.

INPUT FORMAT

CANC-DB-BACKUP: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Optional Suggested Action Text> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV Input, Command Not Valid
 /* No Backup in progress */
 /* CANCEL-DB-BACKUP already in progress. */

EXAMPLES

In the following example, the in-progress database backup operation is cancelled.

```
CANCEL-DB-BACKUP ;
```

RELATED COMMANDS

ACT-DB-BACKUP
RESTORE-DB
RTRV-DB-LABEL
START-OPS
STOP-OPS

COMMAND CODE: **CANC-EUA**
COMMAND NAME: **CANCEL EMERGENCY USER ACCESS**

PURPOSE

The CANC-EUA command restores the transfer of message types between the Level-1 processor and Level-2 processor that were suspended via the ACT-EUA command and *resynchronizes the two processors*. It also clears the EUA condition type.

An CANC-EUA command is denied if:

- The EUA condition type is already set.
- The system is unable to read or update the database.

INPUT FORMAT

CANC-EUA: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SDBE	Status, internal Data Base Error
	/* The CANC-EUA aborted due to system error. */
	/* Error reading system configuration data base. */
	/* Error updating system configuration data base. */
SNVS	Status, Not in Valid State
	/* The CANC-EUA was rejected. */
	/* Emergency User Access already cancelled. */

EXAMPLES

In the following example, CANCEL-EUA is used to restore the transfer of message types between the Level-1 processor and Level-2 processor that were suspended via the ACT-EUA command and to resynchronize the two processors.

```
CANCEL-EUA;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P28020. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P28020 COMPLD  
/* CANCEL-EUA [P28020] (2) */  
;
```

RELATED COMMANDS

ACT-EUA

COMMAND CODE: **CANC-USER**
COMMAND NAME: **CANCEL USER**

PURPOSE

The CANC-USER command terminates a session with the system which was previously established by an ACT-USER command and logs-off the specified user.

Only the system administrator (UID of "system" or "SYSTEM") or the Alcatel account user can log-off any other user. Other users, besides the system administrator or Alcatel account, cannot log-off another user.

The CANC-USER command belongs to all Command Community Functional Category command privilege groups A through Z. The CANC-USER command cannot be removed from any command privilege group (refer to the ED-GROUP-CMD command and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)

The CANC-USER command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

A CANC-USER command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

CANC-USER: [TID] : [UID] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
UID	<5-12 VALID UID CHARACTERS> Default: <The UID of the user entering the command> Addressing: None Description: User Identifier, specifies the user to be logged-off. (Refer to the UID parameter in ENT-USER for a description of valid UID values.) Restrictions: CANC-USER is denied if a user other than "SYSTEM", "system", or the Alcatel account user, enters another user's UID.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The following successful response message is sent to the user whose session is being terminated (the user being logged-off). This message is not affected by a user's OSL provisioning (refer to ENT-USER or ED-PRVG-USER).

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* CANC-USER <UID> on CID <CPORT> [-<VCNUM>] */
"<UID> : <CPORT> [-<VCNUM>] "
;
```

The following successful response message is sent to any other user provisioned to receive messages generated in response to another user's commands (refer to ENT-USER or ED-PRVG-USER).

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * CANCEL-USER <UID> on CID <CPORT> [-<VCNUM>] */]
  [/ * <Command Echo> [<CTAG>] (<CID>[-<VCNUM>]) */]
;
```

OUTPUT PARAMETERS

UID	<5-12 VALID UID CHARACTERS> User Identifier, identifies the UID of the user that is logged-off the system.
CPORT	{ 1-12} Control Port, identifies the physical control port connection to the system.
VCNUM	{1-8} Virtual Channel Number, identifies any X.25 virtual channel connection to the system. A value for VCNUM is only returned if the session was over an X.25 virtual channel.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID>[-<VCNUM>]) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid /* A user is not currently logged onto this CID */ /* Invalid UID entered */ /* UID not found */ /* Privilege: Cannot process CANCEL-USER with specified UID */
SROF	Status, Requested Operation Failed /* Unable to read USDB record, status <STATUS> */ /* UID does not have an active session */ /* This CID is in an AOOS state */

EXAMPLES

In the following example, the session with the user “user4” on CID 2 is terminated (the user “user4” is logged-off).

```
CANC-USER;
```

The output responses, shown below, assume CID 2 was used to enter the command and a system generated CTAG value of P2b009. The response headers would contain the provisioned Site ID of the system, and the date and time the command was executed.

The following output response is sent to the user “user4” on CID 2.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M   P2b009 COMPLD
/*  CANC-USER user4 on CID 2 */
"user4:2"
/*  CANC-USER [P2b009] (2) */
;
```

The following output response is sent to any other user provisioned to receive the response messages generated from the execution of a command by another user.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M   P2b009 COMPLD
/*  CANC-USER user4 on CID 2 */
/*  CANC-USER [P2b009] (2) */
;
```

COMMAND NAME: **CHANGE ACCESS MODE STS1**

PURPOSE

The CHG-ACCMD-STS1 command changes the test access mode of a previously established test access session for a Test Access port connection from one mode to another. This command can only be executed after a CONN-TACC-STS1 command has been executed to establish a test access session.

The available test access modes for a Test Access port connection (the FAD A AID is specified for TAP) are LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, or SPLTF.

A CHG-ACCMD-STS1 command is denied if:

- An Idle Signal Source Port is not provisioned.
- The port specified for TAP is not the FAD A port of a TAPP owned by (provisioned by) the user and previously assigned for a test access session by a CONN-TACC-STS1 command.
- The specified MODE already exists.
- A value for MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist, or if {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
- A value for MODE of {LOOPE, LOOPF} is entered and the port to be tested is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMF, TERMT}).
- A value for MODE other than {MONE, MONEF, MONF} is entered and the facility-side port to be tested is the head of a bridge or conference connection.
- A value for MODE other than {MONE, MONEF, MONF} is entered and any connection involved in the existing TACC operation is redlined.
- An invalid parameter value or combination of parameter values is entered.

CHG-ACCMD-STS1 executed with a value for MODE of {MONE, MONEF, MONF} is not service affecting. CHG-ACCMD-STS1 executed with a value for MODE of {LOOPE, LOOPF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF} is service affecting and interrupts traffic. Care should be exercised when specifying one of these test access modes.

INPUT FORMAT

CHG-ACCMD-STS1 : [TID] : TAP : [CTAG] : : MODE ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
TAP	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	Test Access Port AID, identifies the FAD A AID of the Test Access Port Pair (TAPP) which is currently involved in the test access session.	
	Restrictions:	CHG-ACCMD-STS1 is denied if TAP specifies the 3rd STS1 within an OC3 or the {4-3}th STS1 within an OC12. Refer to Appendix B, Access Identifiers (AIDs).	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MODE	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF}
Default:	Entry Required
Addressing:	None
Description:	Test Access Mode, specifies the new test mode to be used. Values are:
LOOPE	Loop Equipment-side, specifies a test which loops the equipment-side incoming signal to its output and monitors the looped signal with FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, AIS-P is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
LOOPF	Loop Facility-side, specifies a test which loops the facility-side incoming signal to its output and monitors the looped signal with FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, AIS-P is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
MONE	Monitor Equipment-side, specifies a test which monitors the equipment-side port with FAD A.
MONEF	Monitor Equipment-side and Facility-side, specifies a test which monitors the equipment-side port with FAD A and the facility-side port with FAD B.
MONF	Monitor Facility-side, specifies a test which monitors the facility-side port with FAD A.
SPLTA	Split A-side, specifies a test which splits the A-side signal path and connects it both to and from FAD A.
SPLTB	Split B-side, specifies a test which splits the B-side signal path and connects it both to and from FAD A.
SPLTE	Split Equipment-side, specifies a test depending on the value entered for TAP. When a STS-1 AID is entered for TAP, the equipment-side port is connected both to and from FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, AIS-P is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
SPLTEF	Split Equipment-side and Facility-side, specifies a test which splits the A and B transmission paths (if existing) and connects the equipment-side port both to and from FAD A and the facility-side port both to and from FAD B.
SPLTF	Split Facility-side, specifies a test depending on the value entered for TAP. When a STS-1 AID is entered for TAP, the facility-side port is connected both to and from FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, AIS-P is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
Restrictions:	CHG-ACCMD-STs1 is denied if MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist. CHG-ACCMD-STs1 is denied if MODE of {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
ITSN	Input, invalid/inactive Test Session Number
RCIN	Resource, requested Circuit Id does Not exist /* Cannot use specified mode because there is no A-Side */ /* Cannot use specified mode because there is no B-Side */
RTEN	Resource, requested Tap does Not Exist /* TAPP specified does not exist */
SCSN	Status, invalid Command SequeNce /* LOOP mode not allowed on terminated ports */
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* <DATABASE TYPE> Database Error: <STATUS> */
SDNC	Status, Data Not Consistent /* Cannot use specified mode because there is no Facility */
SNVS	Status, Not in Valid State
SRCN	Status, Requested CoNdition already exists
SROF	Status, Requested Operation Failed /* No signal source is provisioned for UNCH QRS */
STTI	STatus, Tap Idle

EXAMPLES

COMMAND CODE: **CHG-ACCMD-T1**
COMMAND NAME: **CHANGE ACCESS MODE T1**

PURPOSE

The CHG-ACCMD-T1 command changes the test access mode of a previously established test access session for a Test Access port connection from one mode to another. This command can only be executed after a CONN-TACC-T1 command has been executed to establish a test access session.

The available test access modes for a Test Access port connection (the FAD A AID is specified for TAP) are LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, or SPLTF.

A CHG-ACCMD-T1 command is denied if:

- An Idle Signal Source Port for unframed QRS is not provisioned.
- The DS1 port specified for TAP is not the FAD A port of a TAPP owned by (provisioned by) the user and previously assigned for a test access session by a CONN-TACC-T1 command.
- The specified MODE already exists.
- A value for MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist, or if {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
- A value for MODE of {LOOPE, LOOPF} is entered and the DS1 port to be tested is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMB, TERMT}).
- A value for MODE other than {MONE, MONEF, MONF} is entered and the facility-side port to be tested is the head of a bridge or conference connection.
- A value for MODE other than {MONE, MONEF, MONF} is entered and any connection involved in the existing TACC operation is redlined.
- An invalid parameter value or combination of parameter values is entered.

CHG-ACCMD-T1 executed with a value for MODE of {MONE, MONEF, MONF} is not service affecting. CHG-ACCMD-T1 executed with a value for MODE of {LOOPE, LOOPF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF} is service affecting and interrupts traffic. Care should be exercised when specifying one of these test access modes.

INPUT FORMAT

CHG-ACCMD-T1 : [TID] : TAP : [CTAG] : : MODE ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
TAP	DS1_AID:		
	{T1-{1-59392}}	(T1-DS1#)	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	Test Access Port AID, identifies the FAD A AID of the Test Access Port Pair (TAPP) which is currently involved in the test session.	
	Restrictions:	CHG-ACCMD-T1 is denied if the TAP value specifies DS1 embedded within electrical DS3 and the 28th DS1 is not excluded.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MODE	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF}
Default:	Entry Required
Addressing:	None
Description:	Test Access Mode, specifies the new test mode to be used. Values are:
LOOPE	Loop Equipment-side, specifies a test which loops the equipment-side incoming signal to its output and monitors the looped signal with FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, unframed QRS is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
LOOPF	Loop Facility-side, specifies a test which loops the facility-side incoming signal to its output and monitors the looped signal with FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, unframed QRS is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
MONE	Monitor Equipment-side, specifies a test which monitors the equipment-side port with FAD A.
MONEF	Monitor Equipment-side and Facility-side, specifies a test which monitors the equipment-side port with FAD A and the facility-side port with FAD B.
MONF	Monitor Facility-side, specifies a test which monitors the facility-side port with FAD A.
SPLTA	Split A-side, specifies a test which splits the A-side signal path and connects it both to and from FAD A.
SPLTB	Split B-side, specifies a test which splits the B-side signal path and connects it both to and from FAD A.
SPLTE	Split Equipment-side, specifies a test depending on the value entered for TAP. If a DS1 AID is entered for TAP, the equipment-side port is connected both to and from FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, unframed QRS inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
SPLTEF	Split Equipment-side and Facility-side, specifies a test which splits the A and B transmission paths (if existing) and connects the equipment-side port both to and from FAD A and the facility-side port both to and from FAD B.
SPLTF	Split Facility-side, specifies a test depending on the value entered for TAP. If a DS1 AID is entered for TAP, the facility-side port is connected both to and from FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, unframed QRS inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
Restrictions:	CHG-ACCMD-T1 is denied if MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist. CHG-ACCMD-T1 is denied if MODE of {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.

COMMAND CODE: **CHG-ACCMD-T3**
COMMAND NAME: **CHANGE ACCESS MODE T3**

PURPOSE

The CHG-ACCMD-T3 command changes the test access mode of a previously established test access session for a Test Access port connection from one mode to another. This command can only be executed after a CONN-TACC-T3 command has been executed to establish a test access session.

The available test access modes for a Test Access port connection (the FAD A AID is specified for TAP) are LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, or SPLTF.

A CHG-ACCMD-T3 command is denied if:

- An IDLE Signal Source Port is not provisioned.
- The DS3 port specified for TAP is not the FAD A port of a TAPP in use by the user and previously assigned for a test access session by a CONN-TACC-T3 command.
- The specified MODE already exists.
- A value for MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist, or if {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
- A value for MODE of {LOOPE, LOOPF} is entered and the DS3 port to be tested is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMB, TERMT}).
- A value for MODE other than {MONE, MONEF, MONF} is entered and the facility-side port to be tested is the head of a bridge or conference connection.
- A value for MODE other than {MONE, MONEF, MONF} is entered and any connection involved in the existing TACC operation is redlined.
- An invalid parameter value or combination of parameter values is entered.

CHG-ACCMD-T3 executed with a value for MODE of {MONE, MONEF, MONF} is not service affecting. CHG-ACCMD-T3 executed with a value for MODE of {LOOPE, LOOPF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF} is service affecting and interrupts traffic. Care should be exercised when specifying one of these test access modes.

INPUT FORMAT

CHG-ACCMD-T3 : [TID] : TAP : [CTAG] : : MODE ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
TAP	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	Default:	Entry Required
	Addressing:	None
	Description:	Test Access Port AID, identifies the FAD A AID of the Test Access Port Pair (TAPP) which is currently involved in the test session.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

MODE	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF}
Default:	Entry Required
Addressing:	None
Description:	Test Access Mode, specifies the new test mode to be used. Values are:
LOOPE	Loop Equipment-side, specifies a test which loops the equipment-side incoming signal to its output and monitors the looped signal with FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, IDLE is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
LOOPF	Loop Facility-side, specifies a test which loops the facility-side incoming signal to its output and monitors the looped signal with FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, IDLE is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
MONE	Monitor Equipment-side, specifies a test which monitors the equipment-side port with FAD A.
MONEF	Monitor Equipment-side and Facility-side, specifies a test which monitors the equipment-side port with FAD A and the facility-side port with FAD B.
MONF	Monitor Facility-side, specifies a test which monitors the facility-side port with FAD A.
SPLTA	Split A-side, specifies a test which splits the A-side signal path and connects it both to and from FAD A.
SPLTB	Split B-side, specifies a test which splits the B-side signal path and connects it both to and from FAD A.
SPLTE	Split Equipment-side, specifies a test depending on the value entered for TAP. When a DS3 AID is entered for TAP, the equipment-side port is connected both to and from FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, IDLE inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
SPLTEF	Split Equipment-side and Facility-side, specifies a test which splits the A and B transmission paths (if existing) and connects the equipment-side port both to and from FAD A and the facility-side port both to and from FAD B.
SPLTF	Split Facility-side, specifies a test depending on the value entered for TAP. When a DS3 AID is entered for TAP, the facility-side port is connected both to and from FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, IDLE inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
Restrictions:	CHG-ACCMD-T3 is denied if MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist. CHG-ACCMD-T3 is denied if MODE of {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.

COMMAND CODE: **CHG-ACCMD-VT1**
COMMAND NAME: **CHANGE ACCESS MODE VT1**

PURPOSE

The CHG-ACCMD-VT1 command changes the test access mode of a previously established test access session for a Test Access port connection from one mode to another. This command can only be executed after a CONN-TACC-VT1 command has been executed to establish a test access session.

The available test access modes for a Test Access port connection (the FAD A AID is specified for TAP) are LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, or SPLTF.

A CHG-ACCMD-VT1 command is denied if:

- An Idle Signal Source Port is not provisioned.
- The port specified for TAP is not the FAD A port of a TAPP owned by (provisioned by) the user and previously assigned for a test access session by a CONN-TACC-VT1 command.
- The specified MODE already exists.
- A value for MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist, or if {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
- A value for MODE of {LOOPE, LOOPF} is entered and the port to be tested is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMF, TERMT}).
- A value for MODE other than {MONE, MONEF, MONF} is entered and the facility-side port to be tested is the head of a bridge or conference connection.
- A value for MODE other than {MONE, MONEF, MONF} is entered and any connection involved in the existing TACC operation is redlined.
- An invalid parameter value or combination of parameter values is entered.

CHG-ACCMD-VT1 executed with a value for MODE of {MONE, MONEF, MONF} is not service affecting. CHG-ACCMD-VT1 executed with a value for MODE of {LOOPE, LOOPF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF} is service affecting and interrupts traffic. Care should be exercised when specifying one of these test access modes.

INPUT FORMAT

CHG-ACCMD-VT1 : [TID] : TAP : [CTAG] : : MODE ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
TAP	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	None	
	Description:	Test Access Port AID, identifies the FAD A AID of the Test Access Port Pair (TAPP) which is currently involved in the test access session.	
	Restrictions:	CONN-TACC-VT1 is denied if TAP specifies the {7-4}th VT1 within an STS1. Refer to Appendix B, Access Identifiers (AIDs).	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MODE	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF}
Default:	Entry Required
Addressing:	None
Description:	Test Access Mode, specifies the new test mode to be used. Values are:
LOOPE	Loop Equipment-side, specifies a test which loops the equipment-side incoming signal to its output and monitors the looped signal with FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, AIS-V is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
LOOPF	Loop Facility-side, specifies a test which loops the facility-side incoming signal to its output and monitors the looped signal with FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, AIS-V is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
MONE	Monitor Equipment-side, specifies a test which monitors the equipment-side port with FAD A.
MONEF	Monitor Equipment-side and Facility-side, specifies a test which monitors the equipment-side port with FAD A and the facility-side port with FAD B.
MONF	Monitor Facility-side, specifies a test which monitors the facility-side port with FAD A.
SPLTA	Split A-side, specifies a test which splits the A-side signal path and connects it both to and from FAD A.
SPLTB	Split B-side, specifies a test which splits the B-side signal path and connects it both to and from FAD A.
SPLTE	Split Equipment-side, specifies a test depending on the value entered for TAP. When a STS-1 AID is entered for TAP, the equipment-side port is connected both to and from FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, AIS-V is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
SPLTEF	Split Equipment-side and Facility-side, specifies a test which splits the A and B transmission paths (if existing) and connects the equipment-side port both to and from FAD A and the facility-side port both to and from FAD B.
SPLTF	Split Facility-side, specifies a test depending on the value entered for TAP. When a STS-1 AID is entered for TAP, the facility-side port is connected both to and from FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, AIS-V is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
Restrictions:	CHG-ACCMD-VT1 is denied if MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist. CHG-ACCMD-VT1 is denied if MODE of {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
ITSN	Input, invalid/inactive Test Session Number
RCIN	Resource, requested Circuit Id does Not exist /* Cannot use specified mode because there is no A-Side */ /* Cannot use specified mode because there is no B-Side */
RTEN	Resource, requested Tap does Not Exist /* TAPP specified does not exist */
SCSN	Status, invalid Command SequeNce /* LOOP mode not allowed on terminated ports */
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* <DATABASE TYPE> Database Error: <STATUS> */
SDNC	Status, Data Not Consistent /* Cannot use specified mode because there is no Facility */
SNVS	Status, Not in Valid State
SRCN	Status, Requested CoNdition already exists
SROF	Status, Requested Operation Failed /* No signal source is provisioned for UNCH QRS */
STTI	SStatus, Tap Idle

EXAMPLES

The following example changes the existing test access mode for VT1 Test Access Port VT1-3-3-3-2 to MONF.

```
CHG-ACCMD-VT1::VT1-3-3-3-2:::MONF;
```

The following example changes the existing test access mode for VT1 Test Access Port VT1-3-3-3-2 to SPLTB.

```
CHG-ACCMD-VT1::VT1-3-3-3-2:::SPLTB;

DISC-TACC-PRVG

REPT-INITZN

REPT-STAT

RST-TAP-DIG

RTRV-TACC

COMMAND CODE: **CHG-TL-DIG**
COMMAND NAME: **CHANGE TERMINATE-AND-LEAVE
DIGITAL**

PURPOSE

The CHG-TL-DIG command is used to terminate-and-leave an existing cross-connection or to remove (release) an existing terminate-and-leave condition. This command can only be executed after a CONN-TACC-Tx command has been executed to establish a test access session. The cross-connection acted on by the CHG-TL-DIG command is determined by the ports involved in the test access session and the value of ACT.

If {TERMA, TERMB, TERMAB} is specified for ACT in the CHG-TL-DIG command, then the specified A-side path, B-side path, or both the A-side and B-side paths, are terminated at the receiving equipment-side port and/or facility-side port. Depending on the type of TACC being performed, the following is connected to the transmitting facility-side port and/or equipment-side port: DS1 unframed QRS, DS3 IDLE, VT1 AIS-V (VTMAP=ALL or VTBYTE), VT1 unframed QRS (VTMAP=ASYNCR) or STS1 AIS-P. The specified facility (and cross-connection entity) remains in the "terminated" condition while the test access session exists. The terminated condition is removed (released) if the test access session is discontinued before a DISC-TACC command is entered (e.g., the user logs-off or enters a RST-TAP-DIG command before entering a DISC-TACC command). Once the test access session is concluded by a DISC-TACC command, the specified facility remains in a terminated condition (i.e., the specified facility is in a terminate-and-leave condition), regardless if the TAPPs are user associated or the test session was link associated.

If {RLSA, RLSAB, RLSB} is specified for ACT in the CHG-TL-DIG command, the existing terminate-and-leave condition is removed (released) and the active type of the following is disconnected: DS1 unframed QRS, DS3 IDLE, VT1 AIS-V (VTMAP=ALL or VTBYTE), VT1 unframed QRS (VTMAP=ASYNCR) or STS1 AIS-P. The specified A-side path, B-side path, or both the A-side and B-side paths, are re-connected as the cross-connection existed prior to the terminate-and-leave condition.

Executing a CHG-TL-DIG command with {TERMA, TERMAB, TERMB} specified for ACT causes a cross-connection SST of {TERMB, TERMF, TERMT} to be applied to the cross-connection entity. Executing a CHG-TL-DIG command with {RLSA, RLSAB, RLSB} specified for ACT causes a cross-connection SST of {TERMB, TERMF, TERMT} to be removed from the cross-connection entity.

CHG-TL-DIG is denied if:

- A DS1 TAP is specified and an Unframed QRSS DS1 Idle Signal Source Port is not provisioned.
- The port specified for TAP is not the FAD A port of a TAPP owned by (provisioned by) the user and previously assigned for a test access session by a CONN-TACC-Tx command.
- ACT of {TERMA, TERMAB, TERMB} is entered and corresponding A-side or B-side connection does not exist.
- ACT of {TERMA, TERMAB, TERMB} is entered and the corresponding A-side or B-side connection is already terminated. However, the command is completed if ACT of TERMAB is entered and either the A-side or B-side connection, but not both, is terminated.
- ACT of {TERMA, TERMAB, TERMB} is entered and the test access operation has a test mode of {LOOPE, LOOPF}.
- ACT of {TERMA, TERMAB, TERMB} is entered and the equipment-side port or facility-side port is part of a conference or bridge.
- ACT of {RLSA, RLSAB, RLSB} is entered and the corresponding A-side or B-side connection is not terminated.
- Any connection involved in the existing TACC operation is redlined (in RDL=Y state).
- An invalid parameter value is entered.

Executing a CHG-TL-DIG command is traffic affecting. Received traffic is terminated and unframed QRS is injected in the outgoing direction. Care should be exercised when executing this command.

INPUT FORMAT

CHG-TL-DIG: [TID] : TAP : [CTAG] : : ACT;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
TAP	DS1_AID: {T1–{1–59392}} (T1–DS1#) {T3T1–{1–4800}–{1–28}} (T3T1–DS3#–DS1#) DS3_AID: {T3–{1–4800}} (T3–DS3#) STS1_AID: {EC1STS1–{1–3840}} (EC1STS1–EC1/STS1#) {OC3STS1–{1–2240}–{1–3}} (OC3STS1–OC3#–STS1#) {OC12STS1–{1–560}–{1–4}–{1–3}} (OC12STS1–OC12#–STM1#–STS1#) VT1_AID: {EC1VT1–{1–3840}–{1–7}–{1–4}} (EC1VT1–EC1/STS1#–VTGrp#–VT1.5#) {OC3VT1–{1–2240}–{1–3}–{1–7}–{1–4}} (OC3VT1–OC3#–STS1#–VTGrp#–VT1.5#) {OC12VT1–{1–560}–{1–4}–{1–3}–{1–7}–{1–4}} (OC12VT1–OC12#–STM1#–STS1#–VTGrp#–VT1.5#) Default: Entry Required Addressing: None Description: Test Access Port AID, identifies the FAD A AID of the Test Access Port Pair (TAPP) which is currently involved in the test session. Restrictions: CHG–TL–DIG is denied if the TAP value specifies DS1 embedded within electrical DS3 and the 28th DS1 is not excluded. The AID of an STS1 entity embedded in an OC12, OC3, or EC1, except the 3rd STS1 within an OC3 and the {4–3}th STS1 within an OC12. Refer to Appendix B, Access Identifiers (AIDs). The AIDs of VT1 entities embedded in an STS1 which can be embedded in an OC12, OC3, or EC1, except the {7–4}th VT1 within an STS1. Refer to Appendix B, Access Identifiers (AIDs).	
CTAG	< 1–6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

ACT	{RLSA, RLSAB, RLSB, TERMA, TERMAB, TERMB}
Default:	Entry Required
Addressing:	None
Description:	Action, specifies the terminate-and-leave action. Values are:
RLSA	Release A-side, specifies the release of the terminate-and-leave of the A-side connection. Unframed QRS, IDLE, AIS-V or AIS-P is disconnected from the facility-side port, and the equipment-side port is one-way cross-connected to the facility-side port.
RLSAB	Release A-side and B-side, specifies the release of the terminate-and-leave of the A-side and B-side connection. Unframed QRS, IDLE, AIS-V or AIS-P is disconnected from the equipment-side and facility-side ports, and the equipment-side port is two-way cross-connected to the facility-side port.
RLSB	Release B-side, specifies the release of the terminate-and-leave of the B-side connection. Unframed QRS, IDLE, AIS-V or AIS-P is disconnected from the equipment-side port, and the facility-side port is one-way cross-connected to the equipment-side port.
TERMA	Terminate A-side, specifies the one-way disconnection of the equipment-side to facility-side path, the termination of the received equipment-side signal, and the connection of unframed QRS, IDLE, AIS-V or AIS-P to the transmitted facility-side signal.
TERMAB	Terminate A-side and B-side, specifies the two-way disconnection of the equipment-side and facility-side ports, the termination of the received equipment-side and facility-side signals, and the connection of unframed QRS, IDLE, AIS-V or AIS-P to the transmitted equipment-side and facility-side signals.
TERMB	Terminate B-side, specifies the one-way disconnection of the facility-side to equipment-side path, the termination of the received facility-side signal, and the connection of unframed QRS, IDLE, AIS-V or AIS-P to the transmitted equipment-side signal.
Restrictions:	CHG-TL-DIG is denied if ACT of {RLSA, RLSAB, RLSB} is entered and the corresponding A-side or B-side connection is not terminated. CHG-TL-DIG is denied if ACT of {TERMA, TERMAB, TERMB} is entered and the corresponding A-side or B-side connection does not exist. However, the command is completed if ACT of TERMAB is entered and either the A-side or B-side connection, but not both, is terminated.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENTL	Equipage, Not Terminate and Leave
IIAC	Input, Invalid ACcess identifier
ITSN	Input, invalid/inactive Test Session Number
RCIN	Resource, requested Circuit Id does Not exist
RTEN	Resource, requested Tap does Not Exist /* TAPP specified does not exist */
SCSN	Status, invalid Command SequeNce
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* <DATABASE TYPE> Database Error: <STATUS> */
SNVS	Status, Not in Valid State
SRCN	Status, Requested CoNdition already exists
SROF	Status, Requested Operation Failed /* No signal source is provisioned for UNCH QRS */
SRQN	Status, invalid ReQuest /* Cannot terminate ports involved in ring pass-thru connections. */

EXAMPLES

In the following example, the CHG-TL-DIG causes a terminate-and-leave condition on the A-side one-way cross-connection from the equipment-side to facility-side ports currently under test access by the Test Access Port Pair identified by T1-24577. The one-way cross-connection is disconnected, the received equipment-side signal is terminated, and unframed QRS is connected to the transmitted facility-side signal.

```
CHG-TL-DIG::T1-24577:::TERMA;
```

In the following example, the previous A-side terminate-and-leave condition is released for the ports under test access by the Test Access Port Pair identified by T1-24577. Unframed QRS is disconnected from the transmitted facility-side signal and a one-way cross-connection is established from the equipment-side port to the facility-side port.

COMMAND CODE: **CLR-ALM-EQPT**
COMMAND NAME: **CLEAR ALARM EQUIPMENT**

PURPOSE

The CLR-ALM-EQPT command manually clears the standing equipment conditions (reported as either an alarm or a non-alarmed condition), specified by CONDTYPE, that cannot be automatically cleared by the system (CD, DBF, DBFFT, SWTOPRI, SWTOSEC). (The CLR-ALM-EQPT command is the only method available to clear these conditions.)

If the CLR-ALM-EQPT command is executed against a condition type that has already been cleared, a completed response is returned.

A CLR-ALM-EQPT command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

CLR-ALM-EQPT: [TID] :AID: [CTAG] : , [CONDTYPE] , [SRVEFF] ;

INPUT PARAMETERS

TID	<p>< 1-20 VALID TID CHARACTERS ></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>

COMMAND CODE: **CLR-DCC-STATS**
COMMAND NAME: **CLEAR DCC STATISTICS**

PURPOSE

The CLR-DCC-STATS command clears the Layer 2 (data link layer) statistic counters of the SONET Data Communication Channel (DCC) network. This command clears both the Line and Section DCC data link statistic counters of the specified OC-3 or OC-12.

A CLR-DCC-STATS command is denied if:

- The specified OC-3 or OC-12 that contains this DCC is in a UAS secondary state.
- The specified AID is a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

CLR-DCC-STATS: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3 or OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*TPidToGlobTPid(): <ERROR-STRING>*/
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the Line and Section DCC data link statistic counters of OC3-16 is cleared.

```
CLR-DCC-STATS::OC3-16;
```

RELATED COMMANDS

```
RTRV-DCC-STATS
```

COMMAND CODE: **CLR-LAN-STATS**
COMMAND NAME: **CLEAR LAN STATISTICS**

PURPOSE

The CLR-LAN-STATS command clears the data link statistic counters of the SONET Data Communication Channel (DCC) network. This command clears the data link statistic counters of the LAN residing on a DSB.

A CLR-LAN-STATS command is denied if:

- The specified DSB is not provisioned.
- An invalid parameter value is entered.

INPUT FORMAT

CLR-LAN-STATS: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	<1–20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB–{6–9, 12–15, 18–21, 24–43, 104–111 , 112–135, 136–141 }–{1, 3}–{1–2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB on which the LAN resides and whose data-link counters are being cleared.
CTAG	<1–6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */

RTRV-LAN-STATS
```

COMMAND CODE: **CONN-TACC-STs1**
COMMAND NAME: **CONNECT TEST ACCESS STs1**

PURPOSE

The CONN-TACC-STs1 command connects a user assigned (user owned) Test Access port or a system assigned (publicly owned) Test Access port to the specified STs-1 port in the specified test access mode. The assigned FAD A Test Access port AID is returned in the command's output response message.

A test access connection can be established on a disconnected STs-1 port, on one-way or two-way cross-connected ports.

The Test Access Port Pair (TAPP) specified in the command must belong either to the user's Private TAPP pool or the system's Public pool (pool assignment is done when the TAPP is provisioned). No user is allowed to use a TAPP that is in another user's private pool. If no value is specified for TAP in the CONN-TACC-STs1 command, the system assigns a TAPP from the available pool of TAPPs owned by the user (i.e., Private). If a TAPP from a user's private pool is not available, the system assigns a TAPP from the system common (i.e., Public) pool of TAPPs.

A TAPP connection can be link associated with the user and communication link associated with the CONN-TACC-STs1 command. If a CONN-TACC-STs1 is executed with link association specified, the test access connection (established by the user) is disconnected if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer is enabled and expires (refer to the LNKTMR parameter in ENT-USER and ED-PRVG-USER), or if the control system re-boots. (Note that a user's test access connections are disconnected if the user executes a DISC-TACC or RST-TAP-DIG command, regardless if the connection is link associated.)

The available test access modes for a Test Access port connection are LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, or SPLTF. Refer to the MODE parameter description.

Executing a CONN-TACC-STs1 command causes a STs-1 SST of BUSY to be applied to the assigned TAPP.

The CONN-TACC-STs1 command also allows testing of a pass through path of a single node ring.

A CONN-TACC-STs1 command is denied if:

- The specified TAP, equipment-side port, or facility-side port (identified by AID, TAP, or AID1) are not provisioned.
- The STs-1 port specified for TAP is not the FAD A port of a TAPP owned by (provisioned by) the user, or all of the TAPs owned by the user and that are in the public pool are in use.
- The specified TAP, equipment-side port or facility-side port are already involved in a test access operation (an STs1 or DS3 SST of TS).
- The specified TAP is busy.
- A facility side is specified and a cross-connection does not exist between the equipment side and the facility side specified.
- A value for MODE of {SPLTEF, SPLTA, SPLTB} is entered and the equipment side and facility side are connected by pass-through STs1 path in OC-3 or OC-12 provisioned as a ring node.
- The specified equipment-side or facility-side port has fault propagation active on it.
- Enough cross connection resources (i.e., expansion timeslots in the first-stage matrix) are NOT available to initially set up a TACC (via CONN-TACC-STs1).
- The equipment side or facility side is terminated (i.e., the embedded DS3s, VT1.5s, or DS1s are cross connected).
- The specified TAP, equipment-side port, or facility-side port are in a loopback (a DS3 or STs1 SST of LPBK).
- The specified equipment-side or facility-side port (identified by AID and any cross-connection) are provisioned as part of a TAPP.
- The STs1/DS3 port specified by AID is cross-connected to itself (the receive and transmit side of the same port are cross-connected).
- A value for MODE of {LOOPF, MONE, MONEF, MONF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist, or if {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.

- The specified STS-1 (and associated cross-connection) is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMF, TERMT}) and a MODE of {LOOPE, LOOPF} is specified.
- The specified port (port A) has an SST of LPBK, or port A is cross-connected to port B which has an SST LPBK, or port A is cross-connected to port B which itself is cross-connected to port C and port C has an SST of LPBK.
- Any value for MODE other than {LOOPE, LOOPF, MONE, MONF, SPLTE, SPLTF} is entered on a pass through path.
- Either of the ports under test is a T3 and the TAPP-STSMAP is not ASYNC.
- The specified equipment-side port or facility-side port is involved in a redlined connection (in an RDL=Y state) and the test access mode is SPLTE, SPLTF, SPLTEF, SPLTA, SPLTB, LOOPE, or LOOPF.
- An invalid parameter value or combination of parameter values is entered.

A CONN-TACC-STS1 executed with a value for MODE of {MONE, MONEF, MONF} is not service affecting. A CONN-TACC-STS1 executed with a value for MODE of {LOOPE, LOOPF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF} is service affecting and interrupts traffic. Care should be exercised when specifying one of these test access modes.

INPUT FORMAT

CONN-TACC-STS1 : [TID] : AID : [CTAG] : : [TAP] : MODE : [AID1] : [LA] ;

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: None Description: DS3 or STS1 AID, identifies the equipment-side DS3 or STS-1 port to be tested. Restrictions: CONN-TACC-STS1 is denied if the AID specifies an electrical DS3 which resides in a quad.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System assigned CTAG value> Addressing: None Description: Correlation Tag, associates input command with its output responses.
TAP	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: <System assigned Test Access port> Addressing: None Description: Test Access Port AID, identifies the FAD A AID (i.e., the STS1 AID) of the TAPP to be used in the test. Restrictions: CONN-TACC-STS1 is denied if TAP specifies the 3rd STS1 within an OC3 or the {4-3}th STS1 within an OC12. Refer to Appendix B, Access Identifiers (AIDs).

CONN-TACC-STs1 is denied if a T3 AID is specified, and the STS1 TAPP is provisioned as STSMAP={ALL, VTFLOAT}.

MODE	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF}
Default:	Entry required
Addressing:	None
Description:	Test Access Mode, specifies the new test mode to be used. Values are:
LOOPE	Loop Equipment-side, specifies a test which loops the equipment-side incoming signal to its output and monitors the looped signal with FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, AIS-P is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
LOOPF	Loop Facility-side, specifies a test which loops the facility-side incoming signal to its output and monitors the looped signal with FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, AIS-P is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
MONE	Monitor Equipment-side, specifies a test which monitors the equipment-side port with FAD A.
MONEF	Monitor Equipment-side and Facility-side, specifies a test which monitors the equipment-side port with FAD A and the facility-side port with FAD B.
MONF	Monitor Facility-side, specifies a test which monitors the facility-side port with FAD A.
SPLTA	Split A-side, specifies a test which splits the A-side signal path and connects it both to and from FAD A.
SPLTB	Split B-side, specifies a test which splits the B-side signal path and connects it both to and from FAD A.
SPLTE	Split Equipment-side, specifies a test depending on the value entered for TAP. When an STS-1 AID is entered for TAP, the equipment-side port is connected both to and from FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, AIS-P is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
SPLTEF	Split Equipment-side and Facility-side, specifies a test which splits the A and B transmission paths (if existing) and connects the equipment-side port both to and from FAD A and the facility-side port both to and from FAD B.
SPLTF	Split Facility-side, specifies a test depending on the value entered for TAP. When an STS-1 AID is entered for TAP, the facility-side port is connected both to and from FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, AIS-P is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
Restrictions:	CONN-TACC-STs1 is denied if MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist. CONN-TACC-STs1 is denied if MODE of {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.

AID1	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	< null >
	Addressing:	None
	Description:	DS3 or STS1 AID, identifies the DS3 or STS-1 facility-side port to be tested. If the AID specifies the drop side of a path switched ring and the AID1 is not specified, the DS3 or STS-1 within the preferred OC-3/OC-12 will be considered as the facility side.
	Restrictions:	CONN-TACC-STS1 is denied if the DS3 or STS1 port specified for AID1 is not connected to the equipment-side port (AID port). CONN-TACC-STS1 is denied if AID1 specifies an electrical DS3 which resides in a quad.
LA	{Y, N}	
	Default:	{Y}
	Addressing:	None
	Description:	Link Association, specifies whether the test access connection is to be associated with the communication link being used by the user. Values are:
	Y	Yes, specifies that the test access connection is to be disconnected if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer is enabled and expires, or if the APS control system re-boots.
	N	No, specifies that the test access connection is not disconnected regardless if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer expires, or if the APS control system re-boots.

SUCCESSFUL RESPONSE FORMAT

The following is the successful response format for the CONN-TACC-STS1 command.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<TAP>"
  "A, <TLS>"
  "B, <TLS>"
  "E, <STSMAP>"
  "F, <STSMAP>"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

TLS	{NORM, TERM, <NoVal>}
	Terminate and Leave Status, indicates whether the A side or B side STS-1 port being tested is in a terminate and leave status as a result of a previous CHG-TL-DIG command. Values are:
	NORM Normal, the A or B side port is not in a terminate and leave state.
	TERM Terminated, the A or B side port is in a terminate and leave state.
	<NoVal> No value is displayed, the A or B side connection does not exist.

STSMAP= {ALL, ASYNC, VTFLOAT, <NoVal>}
STS payload Mapping. Determines the expected STS–1 payload type and the value of the expected path signal label (C2). Used for comparison for the Signal Label Mismatch function. Values are:

ALL	Match ALL incoming signal labels, without creating a SLMF condition, and disallow mappings (i.e., terminating) at this STS–1. Only intact STS–1 connections are possible since ALL is intended for intermediate path monitoring only. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
ASYNC	Asynchronous mapping for DS3 (i.e., C2=04 hex). The system will accept only incoming signal labels of type ASYNC without creating a SLMF condition. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
VTFLOAT	Floating mode VTs (i.e., C2=02 hex).
<NoVal>	No value is displayed, the E side or F side is T3, or the F side does not exist.

UNSUCCESSFUL RESPONSE FORMAT

```

;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier /* AID cannot be provisioned as a FAD of a TAPP */
ITSN	Input, invalid/inactive Test Session Number /* TAPP belongs to another user */
RABY	Resource, All taps BusY /* No TAPP available for current user */
RCIN	Resource, requested Circuit Id does Not exist /* Cannot use specified mode because there is no A-Side */ /* Cannot use specified mode because there is no B-Side */
RTBY	Resource, requested Tap BusY
RTEN	Resource, requested Tap does Not Exist /* TAPP specified does not exist */
SCAT	Status, Circuit Already connected to another Tap
SCSN	Status, invalid Command SequeNce /* LOOP mode not allowed on terminated ports */
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* <DATABASE TYPE> Database Error: <STATUS> */ /* Error getting shelf info, status <STATUS> */
SDNC	Status, Data Not Consistent /* Cannot use specified mode because there is no Facility */

SNCC	Status, Not Cross-Connected
SNVS	Status, Not in Valid State
	/* Port <AID STRING> is in loopback */
	/* Port <AID STRING> has a supporting entity in loopback */
	/* Port <AID STRING> has a supported entity in loopback */
	/* TACC not allowed with ports under ROLL */
	/* Cannot use specified mode because there is a Red-Lined connection */
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest
	/* Cannot do TACC if fault propagation is active */
	/* Cannot connect TACC when a supporting TP under fault propagation */
	/* Cannot connect a port that has embedded SRC ports */
	/* Cannot do TACC on Alternate Ring Port */
	/* Port <AID STRING> under fault propagation */
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the CONN-TACC-STS1 establishes a monitor equipment-side test access connection, that will be disconnected if the user logs off, for STS-1 port OC3STS1-1-3 to the FAD A Test Access port OC3STS1-5-1.

```
CONN-TACC-STS1::OC3STS1-1-3::OC3STS1-5-1:MONE::Y;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pae956. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed, and the TAP port that has been assigned by the system.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pae956 COMPLD
"OC3STS1-5-1"
"A, NORM"
"B, NORM"
"E, ALL"
"F, ALL"
/* CONN-TACC-STS1::OC3STS1-1-3::OC3STS1-5-1:MONE::Y [Pae956] (2) */
;
```

COMMAND CODE: **CONN-TACC-T1**
COMMAND NAME: **CONNECT TEST ACCESS T1**

PURPOSE

The CONN-TACC-T1 command connects a user assigned (user owned) Test Access port or a system assigned (publicly owned) Test Access port to the specified DS1 port or VT1.5 port in the specified test access mode. In either case, the assigned FAD A Test Access port AID is returned in the command's output response message.

A test access connection can be established on a disconnected DS1 port or VT1.5 port, on one-way or two-way cross-connected ports, on the head or tail port of a one-way bridge connection, on the head (Master) port of a broadcast conference connection, or on a conference tail port connected back to the head of a conference head port. If a one-way bridge or conference connection exists and the test access mode affects the facility-side connection (MODE other than {MONE, MONEF, MONF}), then the head of the bridge or conference connection must be specified by AID and the facility-side port to be tested specified by AID1.

If a Test Access port AID is specified for TAP in the CONN-TACC-T1 command, the Test Access Port Pair (TAPP) must belong either to the user's Private TAPP pool or the system's Public pool (pool assignment is done when the TAPP is provisioned). No user is allowed to use a TAPP that is in another user's private pool. If no value is specified for TAP in the CONN-TACC-T1 command, the system assigns a TAPP from the available pool of TAPPs owned by the user (i.e., Private). Then, if those are all not available, the system assigns a TAPP from the system common (i.e., Public) pool of TAPPs.

A TAPP connection can be link associated with the user and communication link associated with the CONN-TACC-T1 command. If a CONN-TACC-T1 is executed with link association specified, the test access connection (established by the user) is disconnected if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer is enabled and expires (refer to the LNKTMR parameter in ENT-USER and ED-PRVG-USER), or if the control system re-boots. (Note that a user's test access connections are disconnected if the user executes a DISC-TACC or RST-TAP-DIG command, regardless if the connection is link associated.)

The available test access modes for a Test Access port connection are LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, or SPLTF. Refer to the MODE parameter description.

Executing a CONN-TACC-T1 command causes a DS1 SST of BUSY and TS to be applied to the assigned TAPP, and a DS1 SST of TS to be applied to any equipment-side and facility-side DS1 ports involved in the test access operation. If a cross-connection exists, a cross-connection SST of TS is applied to the cross-connection entity.

The CONN-TACC-T1 command also allows testing of a pass through path of a single node ring.

A CONN-TACC-T1 command is denied if:

- The specified TAPP, equipment-side port, or facility-side port (identified by AID, TAP, or AID1) are not provisioned.
- An Idle Signal Source Port for unframed QRS is not provisioned.
- The DS1 port specified for TAP is not the FAD A port of a TAPP owned by (provisioned by) the user, or all of the TAPPs owned by the user are in use.
- The port specified by AID is provisioned as an Idle Signal Source Port.
- The specified equipment-side or facility-side port (identified by AID and any cross-connection) are provisioned as part of a TAPP.
- The specified TAPP, equipment-side port, or facility-side port are already involved in a test access operation (a DS1 SST of TS).
- The specified TAPP, equipment-side port, or facility-side port are in a loopback (a DS1 or VT1.5 SST of LPBK) or have C-bit loopback enabled or established (a DS1 Condition Type of ALWCBLPBK or RCVCBLPBK).
- The specified TAPP, equipment-side port, or facility-side port is an embedded DS1/VT1.5 and the supporting facility is in a loopback (a SST of LPBK).
- The DS1 port specified by AID is cross-connected to itself (the receive and transmit side of the same port are cross-connected).

- Multiple cross-connections from the port specified by AID exist (a one-way bridge connection or a broadcast conference connection), the test access mode specified affects the facility-side connection (MODE other than {MONE, MONEF, MONF}) and the facility-side port to be tested is not specified by AID1.
- The specified facility-side or equipment-side port has fault propagation active on it.
- A value for MODE of {LOOPF, MONF, MONEF, MONF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist, or if {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
- The specified DS1 (and associated cross-connection) is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMB, TERMT}) and a MODE of {LOOPE, LOOPF} is specified.
- The specified port (port A) has a SST of LPBK, or port A is cross-connected to port B which has a SST LPBK, or port A is cross-connected to port B which itself is cross-connected to port C and port C has a SST of LPBK.
- The specified test access connection requires a first-stage matrix bridge connection and the first-stage matrix time slots reserved for broadcast connections are all in use (refer to RTRV-POOL).
- The specified TAP is busy, or the TAP is not specified and all TAP pairs in the Private Pool of the user and in the Public Pool are busy.
- Any value for MODE other than {LOOPE, LOOPF, MONE, MONF, SPLTE, SPLTF} is entered on a pass through path.
- Enough cross connection resources (i.e., expansion timeslots in the first-stage matrix) are NOT available to initially set up a TACC.
- The specified equipment-side port or facility-side port is involved in a redlined connection (in an RDL=Y state) and the test access mode is SPLTE, SPLTF, SPLTEF, SPLTA, SPLTB, LOOPE, or LOOPF.
- An invalid parameter value or combination of parameter values is entered.

A CONN-TACC-T1 executed with a value for MODE of {MONE, MONEF, MONF} is not service affecting. A CONN-TACC-T1 executed with a value for MODE of {LOOPE, LOOPF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF} is service affecting and interrupts traffic. Care should be exercised when specifying one of these test access modes.

INPUT FORMAT

CONN-TACC-T1 : [TID] : AID : [CTAG] : : [TAP] : MODE : [AID1] : [LA] ;

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS>		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T1-{1-59392}}	(T1-DS1#)	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)	
	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	DS1 or VT1 AID, identifies the equipment-side DS1 or VT1.5 port to be tested.	
	Restrictions:	CONN-TACC-T1 is denied if a VT1.5 type AID is specified and the VT1 is provisioned with VTMAP={ALL, VTBYTE}.	

CTAG	<1-6 VALID CTAG CHARACTERS>	
	Default:	<System Assigned CTAG Value>
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
TAP	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	Default:	< System assigned DS1 Test Access port >
	Addressing:	None
	Description:	Test Access Port AID, identifies the FAD A AID (i.e., the DS1 AID) to be used in the test. For DS1 embedded within electrical DS3, the 28th DS1 is excluded. Name defined values are:
MODE	<No Value>	Next DS1 Test Access port available in the user's PRIVATE pool (if any) is assigned. Otherwise the next port in the system's PUBLIC pool is assigned.
	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF}	
	Default:	Entry Required
	Addressing:	None
	Description:	Test Access Mode, specifies the test mode to be used. Values are:
	LOOPE	Loop Equipment-side, specifies a test which loops the equipment-side incoming signal to its output and monitors the looped signal with FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, unframed QRS is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
	LOOPF	Loop Facility-side, specifies a test which loops the facility-side incoming signal to its output and monitors the looped signal with FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, unframed QRS is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
	MONE	Monitor Equipment-side, specifies a test which monitors the equipment-side port with FAD A.
	MONEF	Monitor Equipment-side and Facility-side, specifies a test which monitors the equipment-side port with FAD A and the facility-side port with FAD B.
	MONF	Monitor Facility-side, specifies a test which monitors the facility-side port with FAD A.
	SPLTA	Split A-side, specifies a test which splits the A-side signal path and connects it both to and from FAD A.
	SPLTB	Split B-side, specifies a test which splits the B-side signal path and connects it both to and from FAD A.
	SPLTE	Split Equipment-side, specifies a test depending on the value entered for TAP. If a DS1 AID is entered for TAP, the equipment-side port is connected both to and from FAD A. In this case, if a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, unframed QRS inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated.
	SPLTEF	Split Equipment-side and Facility-side, specifies a test which splits the A and B transmission paths (if existing) and connects the equipment-side port both to and from FAD A and the facility-side port both to and from FAD B.

	SPLTF	Split Facility-side, specifies a test depending on the value entered for TAP. If a DS1 AID is entered for TAP, the facility-side port is connected both to and from FAD A. In this case, if an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, unframed QRS inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated.
	Restrictions:	CONN-TACC-T1 is denied if MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist. CONN-TACC-T1 is denied if MODE of {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
AID1	DS1_AID: {T1-{1-59392}} {T3T1-{1-4800}-{1-28}} {EC1T1-{1-3840}-{1-28}} {OC3T1-{1-2240}-{1-3}-{1-28}} {OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(T1-DS1#) (T3T1-DS3#-DS1#) (EC1T1-EC1/STS1/DS3#-DS1#) (OC3T1-OC3#-STS1/DS3#-DS1#) (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	Default:	< null >
	Addressing:	None
	Description:	DS1 or VT1 AID, identifies the DS1 or VT1.5 facility-side port of a broadcast (bridge or conference) connection to be tested. A value for AID1 is only entered if the test is to be performed on a leg of a bridge or conference connection. If the AID specifies the drop side of a path switched ring and the AID1 is not specified, the DS1 or VT1.5 within the odd-numbered VT1.5 will be considered as the facility side. The facility-side port to test is automatically defined in all other cases.
	Restrictions:	CONN-TACC-T1 is denied if the DS1 port specified for AID1 is not connected to the equipment-side port (AID port). CONN-TACC-T1 is denied if a VT1 type AID1 is specified and the VT1.5 is provisioned with VTMAP={ALL, VTBYTE}.
LA	{Y, N}	
	Default:	{Y}
	Addressing:	None
	Description:	Link Association, specifies whether the test access connection is to be associated with the communication link being used by the user. Values are:
	Y	Yes, specifies that the test access connection is to be disconnected if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer is enabled and expires, or if the APS control system re-boots.
	N	No, specifies that the test access connection is not disconnected regardless if the user logs off, the user enters a REPT-INITZN command, the communication link timer expires, or if the APS control system re-boots.

SUCCESSFUL RESPONSE FORMAT

The following successful response format is provided if TAP of DS1_AID is entered.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<TAP>"
  "A, <TLS>"
  "B, <TLS>"
  "E, <FMT>"
  "F, <FMT>"
  "E, <LINECDE>"
  "F, <LINECDE>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

TAP	DS1_AID: {T1-{1-59392}} (T1-DS1#) {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#) Test Access Port assigned, indicates the assigned DS1 TAPP FAD AID. For DS1 embedded within electrical DS3, the 28th DS1 is excluded.
TLS	{NORM, TERM, <NoVal>} Terminate and Leave Status, indicates whether the A side or B side DS1 port being tested is in a terminate and leave status as a result of a previous CHG-TL-DIG command. A value for TLS is only provided when a DS1 AID is entered for TAP in the input command. Values are: NORM Normal, the A or B side port is not in a terminate and leave state. TERM Terminated, the A or B side port is in a terminate and leave state. <NoVal> No value is displayed, the A or B side connection does not exist.
FMT	{E, S, U, X} Signal Format, indicates the signal format of the E (equipment) side or F (facility) side ports involved in the test access connection. A value for FMT is only provided when a DS1 AID is entered for TAP in the input command. Values are: E ESF (Extended Super Frame) format S SF (Super Frame) format U Unframed format X The format is not known
LINECDE	{A, B, U} Line Code, indicates the line code for terminated electrical E (equipment) side or F (facility) side ports involved in the test access connection. A value for LINECDE is only provided when a DS1 AID is entered for TAP in the input command. Values are: A Alternate Mark Inversion (AMI). B Bipolar with Eight Zero Substitution (B8ZS). U Unknown, the line code cannot be determined (as for an embedded DS1).

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENFE	Equipage, FEature Not provided
IIAC	Input, Invalid ACcess identifier /* AID cannot be provisioned as a FAD of a TAPP */ /* Both ports involved in 2WAYPR or 2WAYDC are Synchronous VTs */ /* TACC not allowed on Synchronous VTs */
IPNV	Input, Parameter Not Valid
ITSN	Input, invalid/inactive Test Session Number /* TAPP belongs to another user */
RABY	Resource, All taps BusY /* No TAPP available for current user */
RCIN	Resource, requested Circuit Id does Not exist /* Cannot use specified mode because there is no A-Side */ /* Cannot use specified mode because there is no B-Side */
RNAU	Resource, Requested NE access Address Unassigned
RTBY	Resource, requested Tap BusY
RTEN	Resource, requested Tap does Not Exist /* TAPP specified does not exist */
SCAT	Status, Circuit Already connected to another Tap
SCSN	Status, invalid Command SequeNce /* LOOP mode not allowed on terminated ports */
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* <DATABASE TYPE> Database Error: <STATUS> */
SDNC	Status, Data Not Consistent /* Cannot use specified mode because there is no Facility */
SNCC	Status, Not Cross-Connected
SNVS	Status, Not in Valid State /* Port <AID STRING> is in loopback */ /* Port <AID STRING> has a supporting entity in loopback */ /* Port <AID STRING> has a supported entity in loopback */ /* TACC not allowed on ports allowing CBIT */ /* TACC not allowed with ports in loopback */ /* TACC not allowed with ports under ROLL */ /* Cannot use specified mode because there is a Red-Lined connection */
SROF	Status, Requested Operation Failed /* No signal source is provisioned for UNCH QRS */
SRQN	Status, invalid ReQuest /* Cannot do TACC if fault propagation is active */ /* Cannot connect TACC when a supporting TP under fault propagation */ /* Cannot connect TACC when a supporting TP is connected */ /* Cannot do TACC on Alternate Ring Port */ /* Supporting port of <AID STRING> under fault propagation */ /* Port <AID STRING> under fault propagation */
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the CONN-TACC-T1 establishes a monitor equipment-side test access connection, that will be disconnected if the user logs off, for DS1 port T1-21505 to the FAD A Test Access port T1-24577.

```
CONN-TACC-T1::T1-21505:::T1-24577:MONE::Y;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pae956. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pae956 COMPLD
  "T1-24577"
  "A, NORM"
  "B, NORM"
  "E, E"
  "F, E"
  "E, U"
  "F, U"
/* CONN-TACC-T1::T1-21505:::T1-24577:MONE::Y [Pae956] (2) */
;

COMMAND CODE: **CONN-TACC-T3**
COMMAND NAME: **CONNECT TEST ACCESS T3**

PURPOSE

The CONN-TACC-T3 command connects a user assigned (user owned) Test Access port to the specified DS3 port in the specified test access mode and returns the assigned FAD A Test Access port AID in the command's output response message.

A test access connection can be established on a disconnected DS3 port, on one-way or two-way cross-connected ports.

The Test Access Port Pair (TAPP) specified in the command must belong either to the user's Private TAPP pool or the system's Public pool (pool assignment is done when the TAPP is provisioned). No user is allowed to use a TAPP that is in another user's private pool. If no value is specified for TAP in the CONN-TACC-T3 command, the system assigns a TAPP from the available pool of TAPPs owned by the user (i.e., Private). If a TAPP from a user's private pool is not available, the system assigns a TAPP from the system common (i.e., Public) pool of TAPPs.

A TAPP connection can be link associated with the user and communication link associated with the CONN-TACC-T3 command. If a CONN-TACC-T3 is executed with link association specified, the test access connection (established by the user) is disconnected if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer is enabled and expires (refer to the LNKTMR parameter in ENT-USER and ED-PRVG-USER), or if the control system re-boots. (Note that a user's test access connections are disconnected if the user executes a DISC-TACC or RST-TAP-DIG command, regardless if the connection is link associated.)

The available test access modes for a Test Access port connection are LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, or SPLTF. Refer to the MODE parameter description.

Executing a CONN-TACC-T3 command causes a DS3 SST of BUSY and TS to be applied to the assigned TAPP, and a DS3 SST of TS to be applied to any equipment-side and facility-side DS3 ports involved in the test access operation. If a cross-connection exists, a cross-connection SST of TS is applied to the cross-connection entity.

The CONN-TACC-T3 command also allows testing of a pass through path of a single node ring.

A CONN-TACC-T3 command is denied if:

- The specified TAPP, equipment-side port, or facility-side port (identified by AID, TAP, or AID1) are not provisioned.
- The DS3 port specified for TAP is not the FAD A port of a TAPP owned by (provisioned by) the user, or all of the TAPPs owned by the user and that in public pool are in use.
- The specified equipment-side or facility-side port (identified by AID and any cross-connection) are provisioned as part of a TAPP.
- The specified TAPP, equipment-side port, or facility-side port are already involved in a test access operation (a DS3 SST of TS).
- The specified TAPP, equipment-side port, or facility-side port are in a loopback (a DS3 SST of LPBK).
- The DS3 port specified by AID is cross-connected to itself (the receive and transmit side of the same port are cross-connected).
- A value for MODE of {LOOPF, MONF, MONEF, MONF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist, or if {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
- The specified DS3 (and associated cross-connection) is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMB, TERMT}) and a MODE of {LOOPE, LOOPF} is specified.
- The specified port (port A) has an SST of LPBK, or port A is cross-connected to port B which has an SST LPBK, or port A is cross-connected to port B which itself is cross-connected to port C and port C has an SST of LPBK.
- The specified test access connection requires a first-stage matrix bridge connection and the first-stage matrix time slots reserved for broadcast connections are all in use (refer to RTRV-POOL).

- The specified DS3 is an electrical (stand-alone) DS3 which resides in a quad or a Standard EP3 shelf.
- Any value for MODE other than {LOOPE, LOOPF, MONE, MONF, SPLTE, SPLTF} is entered on a pass through path.
- Enough cross connection resources (i.e., expansion timeslots in the first-stage matrix) are NOT available to initially set up a TACC.
- The specified equipment-side port or facility-side port is involved in a redlined connection (in an RDL=Y state) and the test access mode is SPLTE, SPLTF, SPLTEF, SPLTA, SPLTB, LOOPE, or LOOPF.
- An invalid parameter value or combination of parameter values is entered.

A CONN-TACC-T3 executed with a value for MODE of {MONE, MONEF, MONF} is not service affecting. A CONN-TACC-T3 executed with a value for MODE of {LOOPE, LOOPF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF} is service affecting and interrupts traffic. Care should be exercised when specifying one of these test access modes.

INPUT FORMAT

CONN-TACC-T3 : [TID] : AID : [CTAG] : : [TAP] : MODE : [AID1] : [LA] ;

INPUT PARAMETERS

TID	<p><1-20 VALID TID CHARACTERS></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>
AID	<p>DS3_AID: {T3-{1-4800}} (T3-DS3#)</p> <p>STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#)</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: DS3 or STS1 AID, identifies the equipment-side DS3 or STS-1 port to be tested.</p> <p>Restrictions: CONN-TACC-T3 is denied if an STS-1 AID is used when that STS-1 has STSMAP not set to ASYNC. CONN-TACC-T3 is denied if the AID specifies an electrical DS3 which resides in a quad.</p>
CTAG	<p><1-6 VALID CTAG CHARACTERS></p> <p>Default: <System Assigned CTAG Value></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
TAP	<p>DS3_AID: {T3-{1-4800}} (T3-DS3#)</p> <p>Default: < System assigned DS3 Test Access port ></p> <p>Addressing: None</p> <p>Description: Test Access Port AID, identifies the FAD A AID to be used in the test. Name defined values are: <No Value> Next DS3 Test Access port available in the user's PRIVATE pool (if any) is assigned. Otherwise the next port in the system's PUBLIC pool is assigned.</p> <p>Restrictions: CONN-TACC-T3 is denied if TAP specifies an electrical DS3 which resides in a quad.</p>

MODE	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF}
Default:	Entry Required
Addressing:	None
Description:	Test Access Mode, specifies the test mode to be used. Values are:
LOOPE	Loop Equipment–side, specifies a test which loops the equipment–side incoming signal to its output and monitors the looped signal with FAD A. If a facility–side port is connected to the equipment–side port, the A and B side transmission paths are split, IDLE is inserted into the outgoing facility–side signal, and the incoming facility–side signal is terminated.
LOOPF	Loop Facility–side, specifies a test which loops the facility–side incoming signal to its output and monitors the looped signal with FAD A. If an equipment–side port is connected to the facility–side port, the A and B side transmission paths are split, IDLE is inserted into the outgoing equipment–side signal, and the incoming equipment–side signal is terminated.
MONE	Monitor Equipment–side, specifies a test which monitors the equipment–side port with FAD A.
MONEF	Monitor Equipment–side and Facility–side, specifies a test which monitors the equipment–side port with FAD A and the facility–side port with FAD B.
MONF	Monitor Facility–side, specifies a test which monitors the facility–side port with FAD A.
SPLTA	Split A–side, specifies a test which splits the A–side signal path and connects it both to and from FAD A.
SPLTB	Split B–side, specifies a test which splits the B–side signal path and connects it both to and from FAD A.
SPLTE	Split Equipment–side, specifies a test depending on the value entered for TAP. If a DS3 AID is entered for TAP, the equipment–side port is connected both to and from FAD A. If a facility–side port is connected to the equipment–side port, the A and B side transmission paths are split, IDLE inserted into the outgoing facility–side signal, and the incoming facility–side signal is terminated.
SPLTEF	Split Equipment–side and Facility–side, specifies a test which splits the A and B transmission paths (if existing) and connects the equipment–side port both to and from FAD A and the facility–side port both to and from FAD B.
SPLTF	Split Facility–side, specifies a test depending on the value entered for TAP. If a DS3 AID is entered for TAP, the facility–side port is connected both to and from FAD A. If an equipment–side port is connected to the facility–side port, the A and B side transmission paths are split, IDLE inserted into the outgoing equipment–side signal, and the incoming equipment–side signal is terminated.
Restrictions:	CONN–TACC–T3 is denied if MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility–side connection does not exist. CONN–TACC–T3 is denied if MODE of {SPLTA, SPLTB} is entered and a corresponding A–side or B–side connection does not exist.

AID1	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	< null >
	Addressing:	None
	Description:	DS3 or STS1 AID, identifies the DS3 or STS-1 facility-side port to be tested. If the AID specifies the drop side of a path switched ring and the AID1 is not specified, the DS3 or STS-1 within the preferred OC-3/OC-12 will be considered as the facility side.
	Restrictions:	CONN-TACC-T3 is denied if the DS3 port specified for AID1 is not connected to the equipment-side port (AID port). CONN-TACC-T3 is denied if an STS-1 type AID is used when that STS-1's STSMAP is something other than ASYNC. CONN-TACC-T3 is denied if AID1 specifies an electrical DS3 which resides in a quad.
LA	{Y, N}	
	Default:	{Y}
	Addressing:	None
	Description:	Link Association, specifies whether the test access connection is to be associated with the communication link being used by the user. Values are:
	Y	Yes, specifies that the test access connection is to be disconnected if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer is enabled and expires, or if the APS control system re-boots.
	N	No, specifies that the test access connection is not disconnected regardless if the user logs off, the user enters a REPT-INITZN command, the communication link timer expires, or if the APS control system re-boots.

SUCCESSFUL RESPONSE FORMAT

The following is the successful response format for the CONN-TACC-T3 command

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<TAP>"
  "A, <TLS>"
  "B, <TLS>"
  "E, <FMT>"
  "F, <FMT>"
  "E, <LINECDE>"
  "F, <LINECDE>"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

TAP	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	Test Access Port assigned, indicates the assigned DS3 TAPP FAD AID. Electrical DS3s which reside in a quad are excluded.	

TLS	{NORM, TERM, <NoVal>}												
	Terminate and Leave Status, indicates whether the A side or B side DS3 port being tested is in a terminate and leave status as a result of a previous CHG–TL–DIG command. Values are:												
	<table> <tr> <td>NORM</td><td>Normal, the A or B side port is not in a terminate and leave state.</td></tr> <tr> <td>TERM</td><td>Terminated, the A or B side port is in a terminate and leave state.</td></tr> <tr> <td><NoVal></td><td>No value is displayed, the A or B side connection does not exist.</td></tr> </table>	NORM	Normal, the A or B side port is not in a terminate and leave state.	TERM	Terminated, the A or B side port is in a terminate and leave state.	<NoVal>	No value is displayed, the A or B side connection does not exist.						
NORM	Normal, the A or B side port is not in a terminate and leave state.												
TERM	Terminated, the A or B side port is in a terminate and leave state.												
<NoVal>	No value is displayed, the A or B side connection does not exist.												
FMT	{C, F, M, U, UC, X}												
	Signal Format, indicates the signal format of the E (equipment) side or F (facility) side ports involved in the test access connection. Values are:												
	<table> <tr> <td>C</td><td>C–bit Parity format</td></tr> <tr> <td>F</td><td>Framed Clear Channel</td></tr> <tr> <td>M</td><td>M23 format</td></tr> <tr> <td>U</td><td>Unframed format</td></tr> <tr> <td>UC</td><td>Unchannelized C–bit Parity format</td></tr> <tr> <td>X</td><td>The format is not known</td></tr> </table>	C	C–bit Parity format	F	Framed Clear Channel	M	M23 format	U	Unframed format	UC	Unchannelized C–bit Parity format	X	The format is not known
C	C–bit Parity format												
F	Framed Clear Channel												
M	M23 format												
U	Unframed format												
UC	Unchannelized C–bit Parity format												
X	The format is not known												
LINECODE	{A, B, U}												
	Line Code, indicates the line code for terminated electrical E (equipment) side or F (facility) side ports involved in the test access connection. Values are:												
	<table> <tr> <td>A</td><td>Alternate Mark Inversion (AMI).</td></tr> <tr> <td>B</td><td>Bipolar with Eight Zero Substitution (B8ZS).</td></tr> <tr> <td>U</td><td>Unknown, the line code can not be determined.</td></tr> </table>	A	Alternate Mark Inversion (AMI).	B	Bipolar with Eight Zero Substitution (B8ZS).	U	Unknown, the line code can not be determined.						
A	Alternate Mark Inversion (AMI).												
B	Bipolar with Eight Zero Substitution (B8ZS).												
U	Unknown, the line code can not be determined.												

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
	/* AID cannot be provisioned as a FAD of a TAPP */
	/* Both ports involved in 2WAYPR or 2WAYDC must be Asynchronous STSs */
	/* TACC not allowed on Synchronous STS1 */
ITSN	Input, invalid/inactive Test Session Number
	/* TAPP belongs to another user */
RABY	Resource, All taps BusY
	/* No TAPP available for current user */
RCIN	Resource, requested Circuit Id does Not exist
	/* Cannot use specified mode because there is no A–Side */
	/* Cannot use specified mode because there is no B–Side */
RTBY	Resource, requested Tap BusY
RTEN	Resource, requested Tap does Not Exist
	/* TAPP specified does not exist */
SCAT	Status, Circuit Already connected to another Tap
SCSN	Status, invalid Command SequenCe
	/* LOOP mode not allowed on terminated ports */

SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* <DATABASE TYPE> Database Error: <STATUS> */ /* Error getting shelf info, status <STATUS> */
SDNC	Status, Data Not Consistent /* Cannot use specified mode because there is no Facility */
SNCC	Status, Not Cross-Connected
SNVS	Status, Not in Valid State /* Port <AID STRING> is in loopback */ /* Port <AID STRING> has a supporting entity in loopback */ /* Port <AID STRING> has a supported entity in loopback */ /* TACC not allowed with ports under ROLL */ /* Cannot use specified mode because there is a Red-Lined connection */
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest /* Cannot do TACC if fault propagation is active */ /* Cannot connect TACC when a supporting TP under fault propagation */ /* Cannot connect a port that has embedded SRC ports */ /* Cannot do TACC on Alternate Ring Port */ /* Port <AID STRING> under fault propagation */
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the CONN-TACC-T3 establishes a monitor equipment-side test access connection, that will be disconnected if the user logs off, for DS3 port T3-1060 to the FAD A Test Access port T3-1104.

```
CONN-TACC-T3::T3-1060:::T3-1104:MONE::Y;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pae956. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed, and the TAP port that has been assigned by the system T3-1104.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pae956 COMPLD
  "T3-1104"
  "A, NORM"
  "B, NORM"
  "E, E"
  "F, E"
  "E, U"
  "F, U"
/* CONN-TACC-T3::T3-1060:::T3-1104:MONE::Y [Pae956] (2) */
;

COMMAND CODE: **CONN-TACC-VT1**
COMMAND NAME: **CONNECT TEST ACCESS VT1**

PURPOSE

The CONN-TACC-VT1 command connects a user assigned (user owned) Test Access port or a system assigned (publicly owned) Test Access port to the specified VT1 port in the specified test access mode. The assigned FAD A Test Access port AID is returned in the command's output response message.

A test access connection can be established on a disconnected VT1 and on one-way or two-way cross-connected ports.

The Test Access Port Pair (TAPP) specified in the command must belong either to the user's Private TAPP pool or the system's Public pool (pool assignment is done when the TAPP is provisioned). No user is allowed to use a TAPP that is in another user's private pool. If no value is specified for TAP in the CONN-TACC-VT1 command, the system assigns a TAPP from the available pool of TAPPs owned by the user (i.e., Private). If a TAPP from a user's private pool is not available, the system assigns a TAPP from the system common (i.e., Public) pool of TAPPs.

A TAPP connection can be link associated with the user and communication link associated with the CONN-TACC-VT1 command. If a CONN-TACC-VT1 is executed with link association specified, the test access connection (established by the user) is disconnected if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer is enabled and expires (refer to the LNKTMR parameter in ENT-USER and ED-PRVG-USER), or if the control system re-boots. (Note that a user's test access connections are disconnected if the user executes a DISC-TACC or RST-TAP-DIG command, regardless if the connection is link associated.)

The available test access modes for a Test Access port connection are LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, or SPLTF. Refer to the MODE parameter description.

Executing a CONN-TACC-VT1 command causes a VT1 SST of BUSY to be applied to the assigned TAPP.

The CONN-TACC-VT1 command also allows testing of a pass through path of a single node ring.

A CONN-TACC-VT1 command is denied if:

- The specified TAPP, equipment-side port, or facility-side port (identified by AID, TAP, or AID1) are not provisioned.
- An Idle Signal Source Port for unframed QRS is not provisioned.
- The VT1 port specified for TAP is not the FAD A port of a TAPP owned by (provisioned by) the user, or all of the TAPPs owned by the user and that are in the public pool are in use.
- The port specified by AID is provisioned as an Idle Signal Source Port.
- The specified equipment-side or facility-side port (identified by AID and any cross-connection) are provisioned as part of a TAPP.
- The specified TAPP, equipment-side port, or facility-side port are already involved in a test access operation (a VT1 SST of TS).
- The specified VT1 port is under roll operation (a SST of ROLL).
- The specified TAPP, equipment-side port, or facility-side port are in a loopback (a VT1 SST of LPBK) or have C-bit loopback enabled or established (a DS1 Condition Type of ALWCBLPBK or RCVCBLPBK).
- The specified TAPP, equipment-side port, or facility-side port is an embedded DS1/VT1.5 and the supporting facility is in a loopback (a SST of LPBK).
- The specified TAPP, equipment-side port, or facility-side port are in a loopback (a VT1 SST of LPBK).
- The VT1 port specified by AID is cross-connected to itself (the receive and transmit side of the same port are cross-connected).
- Multiple cross-connections from the port specified by AID exist (a one-way bridge connection or a broadcast conference connection), the test access mode specified affects the facility-side connection (MODE other than {MONE, MONEF, MONF}) and the facility-side port to be tested is not specified by AID1.
- The specified facility-side or equipment-side port has fault propagation active on it.

- A value for MODE of {LOOPF, MONF, MONEF, MONF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist, or if {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
- The specified VT1 (and associated cross-connection) is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMF, TERMT}) and a MODE of {LOOPE, LOOPF} is specified.
- The specified port (port A) has an SST of LPBK, or port A is cross-connected to port B which has an SST LPBK, or port A is cross-connected to port B which itself is cross-connected to port C and port C has an SST of LPBK.
- The specified test access connection requires a first-stage matrix bridge connection and the first-stage matrix time slots reserved for broadcast connections are all in use (refer to RTRV-POOL).
- The specified TAP is busy, or the TAP is not specified and all TAP pairs in the Private Pool of the user and in the Public Pool are busy.
- Any value for MODE other than {LOOPE, LOOPF, MONE, MONF, SPLTE, SPLTF} is entered on a pass through path.
- Either of the ports under test is a T1 and the TAPP-VTMAP is not ASYNC.
- Enough cross connection resources (i.e., expansion timeslots in the first-stage matrix) are NOT available to initially set up a TACC.
- The specified equipment-side port or facility-side port is involved in a redlined connection (in an RDL=Y state) and the test access mode is SPLTE, SPLTF, SPLTEF, SPLTA, SPLTB, LOOPE, or LOOPF.
- An invalid parameter value or combination of parameter values is entered.

A CONN-TACC-VT1 executed with a value for MODE of {MONE, MONEF, MONF} is not service affecting. A CONN-TACC-VT1 executed with a value for MODE of {LOOPE, LOOPF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF} is service affecting and interrupts traffic. Care should be exercised when specifying one of these test access modes.

INPUT FORMAT

CONN-TACC-VT1 : [TID] : AID : [CTAG] : : [TAP] : MODE : [AID1] : [LA] ;

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS>		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T1-{1-59392}}	(T1-DS1#)	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)	
	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	None	
	Description:	DS1 or VT1 AID, identifies the equipment-side DS1 or VT1.5 port to be tested.	
CTAG	<1-6 VALID CTAG CHARACTERS>		
	Default:	<System assigned CTAG value>	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

TAP	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	Default:	<System assigned Test Access port>
	Addressing:	None
	Description:	Test Access Port AID, identifies the FAD A AID (i.e., the VT1 AID) of the TAPP to be used in the test.
	Restrictions:	CONN-TACC-VT1 is denied if TAP specifies the {7-4}th VT1 within an STS1. Refer to Appendix B, Access Identifiers (AIDs). CONN-TACC-VT1 is denied if aT1 type AID or AID1 is specified, and the VT1.5 for the TAPP is provisioned with VTMAP={ALL, VTBYTE}.
MODE	{LOOPE, LOOPF, MONE, MONEF, MONF, SPLTA, SPLTB, SPLTE, SPLTEF, SPLTF}	
	Default:	Entry required
	Addressing:	None
	Description:	Test Access Mode, specifies the new test mode to be used. Values are:
	LOOPE	Loop Equipment-side, specifies a test which loops the equipment-side incoming signal to its output and monitors the looped signal with FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, a maintenance signal is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated. If VTMAP=ASNYC, the inserted maintenance signal is unframed QRS. If VTMAP is any non-ASNYC value or the VT port is in a pass-through connection, the maintenance signal is AIS-V.
	LOOPF	Loop Facility-side, specifies a test which loops the facility-side incoming signal to its output and monitors the looped signal with FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, a maintenance signal is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated. If VTMAP=ASNYC, the inserted maintenance signal is unframed QRS. If VTMAP is any non-ASNYC value or the VT port is in a pass-through connection, the maintenance signal is AIS-V.
	MONE	Monitor Equipment-side, specifies a test which monitors the equipment-side port with FAD A.
	MONEF	Monitor Equipment-side and Facility-side, specifies a test which monitors the equipment-side port with FAD A and the facility-side port with FAD B.
	MONF	Monitor Facility-side, specifies a test which monitors the facility-side port with FAD A.
	SPLTA	Split A-side, specifies a test which splits the A-side signal path and connects it both to and from FAD A.
	SPLTB	Split B-side, specifies a test which splits the B-side signal path and connects it both to and from FAD A.
	SPLTE	Split Equipment-side, specifies a test depending on the value entered for TAP. When an STS-1 AID is entered for TAP, the equipment-side port is connected both to and from FAD A. If a facility-side port is connected to the equipment-side port, the A and B side transmission paths are split, a maintenance signal is inserted into the outgoing facility-side signal, and the incoming facility-side signal is terminated. If VTMAP=ASNYC, the inserted maintenance signal is unframed QRS. If VTMAP is any non-ASNYC value or

	the VT port is in a pass-through connection, the maintenance signal is AIS-V.
SPLTEF	Split Equipment-side and Facility-side, specifies a test which splits the A and B transmission paths (if existing) and connects the equipment-side port both to and from FAD A and the facility-side port both to and from FAD B.
SPLTF	Split Facility-side, specifies a test depending on the value entered for TAP. When an STS-1 AID is entered for TAP, the facility-side port is connected both to and from FAD A. If an equipment-side port is connected to the facility-side port, the A and B side transmission paths are split, a maintenance signal is inserted into the outgoing equipment-side signal, and the incoming equipment-side signal is terminated. If VTMAP=ASNYC, the inserted maintenance signal is unframed QRS. If VTMAP is any non-ASNYC value or the VT port is in a pass-through connection, the maintenance signal is AIS-V.
Restrictions:	CONN-TACC-VT1 is denied if MODE of {LOOPF, MONF, MONEF, SPLTEF, SPLTF} is entered and a facility-side connection does not exist. CONN-TACC-VT1 is denied if MODE of {SPLTA, SPLTB} is entered and a corresponding A-side or B-side connection does not exist.
AID1	<p>DS1_AID:</p> <p>{T1-{1-59392}} (T1-DS1#)</p> <p>{T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)</p> <p>{EC1T1-{1-3840}-{1-28}} (EC1T1-EC1/STS1/DS3#-DS1#)</p> <p>{OC3T1-{1-2240}-{1-3}-{1-28}} (OC3T1-OC3#-STS1/DS3#-DS1#)</p> <p>{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}} (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)</p> <p>VT1_AID:</p> <p>{EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)</p> <p>{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)</p> <p>{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)</p> <p>Default: < null ></p> <p>Addressing: None</p> <p>Description: DS1 or VT1 AID, identifies the DS1 or VT1.5 facility-side port of a broadcast (bridge or conference) connection to be tested. A value for AID1 is only entered if the test is to be performed on a leg of a bridge or conference connection. If the AID specifies the drop side of a path switched ring and the AID1 is not specified, the DS1 or VT1.5 within the odd-numbered VT1.5 will be considered as the facility side. The facility-side port to test is automatically defined in all other cases.</p> <p>Restrictions: CONN-TACC-VT1 is denied if the DS1 or VT1.5 port specified for AID1 is not connected to the equipment-side port (AID port).</p>

LA	{Y, N}	
	Default:	{Y}
	Addressing:	None
	Description:	Link Association, specifies whether the test access connection is to be associated with the communication link being used by the user. Values are:
	Y	Yes, specifies that the test access connection is to be disconnected if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer is enabled and expires, or if the APS control system re-boots.
	N	No, specifies that the test access connection is not disconnected regardless if the user logs off, if the user enters a REPT-INITZN command, if the communication link timer expires, or if the APS control system re-boots.

SUCCESSFUL RESPONSE FORMAT

The following is the successful response format for the CONN-TACC-VT1 command.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<TAP>"
  "A, <TLS>"
  "B, <TLS>"
  "E, <VTMAP>"
  "F, <VTMAP>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

TLS	{NORM, TERM, <NoVal>}	
		Terminate and Leave Status, indicates whether the A side or B side VT1 port being tested is in a terminate and leave status as a result of a previous CHG-TL-DIG command. Values are:
	NORM	Normal, the A or B side port is not in a terminate and leave state.
	TERM	Terminated, the A or B side port is in a terminate and leave state.
	<NoVal>	No value is displayed, the A or B side connection does not exist.
VTMAP=	{ALL, ASYNC, VTBYTE, <NoVal>}	
		VT1.5 payload type. Determines the expected VT1.5 payload type and the value of the expected path signal label. Values are:
	ALL	Generic VT1.5 format. Contains payload of any mapping format. Since this value matches all signal label values, mismatch alarms can never be generated.
	ASYNC	VT Asynchronous mapping – VTFLOAT mode.
	VTBYTE	VT Byte synchronous mapping.
	<NoVal>	No value is displayed, the E side or F side is T1, or the F side does not exist.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier /* AID cannot be provisioned as a FAD of a TAPP */
ITSN	Input, invalid/inactive Test Session Number /* TAPP belongs to another user */
RABY	Resource, All taps BusY /* No TAPP available for current user */
RCIN	Resource, requested Circuit Id does Not exist /* Cannot use specified mode because there is no A-Side */ /* Cannot use specified mode because there is no B-Side */
RTBY	Resource, requested Tap BusY
RTEN	Resource, requested Tap does Not Exist /* TAPP specified does not exist */
SCAT	Status, Circuit Already connected to another Tap
SCSN	Status, invalid Command SequeNce /* LOOP mode not allowed on terminated ports */
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* <DATABASE TYPE> Database Error: <STATUS> */
SDNC	Status, Data Not Consistent /* Cannot use specified mode because there is no Facility */
SNCC	Status, Not Cross-Connected
SNVS	Status, Not in Valid State /* Port <AID STRING> is in loopback */ /* Port <AID STRING> has a supported entity in loopback */ /* TACC not allowed on ports allowing CBIT */ /* TACC not allowed with ports in loopback */ /* TACC not allowed with ports under ROLL */ /* Cannot use specified mode because there is a Red-Lined connection */
SROF	Status, Requested Operation Failed /* No signal source is provisioned for UNCH QRS */
SRQN	Status, invalid ReQuest /* Cannot connect TACC when a supporting TP is connected */ /* Cannot do TACC if fault propagation is active */ /* Cannot connect TACC when a supporting TP under fault propagation */ /* Supporting port of <AID STRING> under fault propagation */ /* Cannot do TACC on Alternate Ring Port */ /* Port <AID STRING> under fault propagation */
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the CONN-TACC-VT1 establishes a monitor equipment-side test access connection, that will be disconnected if the user logs off, for VT1 port OC3VT1-5-2-7-4 to the FAD A Test Access port OC3VT1-3-3-3-2.

```
CONN-TACC-VT1::OC3VT1-5-2-7-4::OC3VT1-3-3-3-2:MONE::Y;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pae956. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed, and the TAP port that has been assigned by the system.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pae956 COMPLD
  "OC3VT1-3-3-3-2"
  "A, NORM"
  "B, NORM"
  "E, ALL"
  "F, ALL"
  /* CONN-TACC-VT1::OC3VT1-5-2-7-4::OC3VT1-3-3-3-2:MONE::Y [Pae956] (2)
*/
;
```

```

COMMAND CODE: **CPY-MEM**
COMMAND NAME: **COPY MEMORY**

PURPOSE

The CPY-MEM command instructs the Network Element to copy data from a specific memory storage to another. The command will copy the LAN stack-related parameters from the entered DSB to its redundant DSB.

The proper sequence of using the CPY-MEM command is:

1. Logically remove the standby DSB using RMV-EQPT.
2. Change the upper layer common parameters using ED-ULCOMPMR.
3. Synchronize the changed parameters of the in-service DSB using CPY-MEM.
4. Restore the standby DSB to service using RST-EQPT.

The following areas are copied to the other DSB when the CPY-MEM command is used.

1. Manual Area Address
2. Lower Level LAN
3. Upper Level common parameters
4. Upper Level LAN
5. TARP Adjacency table

On successful completion of CPY-MEM, the system will copy the MEMCLASS type of memory on the module specified by the DSB to its redundant module.

A CPY-MEM command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

CPY-MEM: [TID] :AID: [CTAG] : : [MEMCLASS=] ;

INPUT PARAMETERS

TID	<p><1-20 VALID TID CHARACTERS></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>
AID	<p>EQUIPMENT_AID:</p> <p>{DSB-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{1-2}}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: DSB AID, identifies the DSB of the module whose memory is going to be copied.</p>
CTAG	<p><1-6 VALID CTAG CHARACTERS></p> <p>Default: <System Assigned CTAG Value></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
MEMCLASS=	<p>{STACK}</p> <p>Default: {STACK}</p> <p>Addressing: None</p> <p>Description: Memory Class, specifies the type of memory to be copied. Values are: STACK Stack parameters are to be copied.</p>

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID> */
IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified. */
SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */ /* INIT-SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Data base access failure. */ /* Unable to read the LANDCC database. */ /* Unable to read the mate DSB database. */ /* Unable to read the mate LANDCC database. */ /* Unable to update the mate LANDCC database. */

EXAMPLES

In the following example, the LAN stack-related parameters on the DSB is copied to its redundant DSB.

```
CPY-MEM::DSB-6-1-1:::MEMCLASS= STACK;

<SID> <YY-MM-DD> <HH:MM:SS>
M P73013 COMPLD
  /* The CPY-MEM for DSB-6-1-1 was completed. */
  /* CPY-MEM::DSB-6-1-1:::MEMCLASS= STACK [P73013] (1) */
```

RELATED COMMANDS

```
RMV-EQPT
ED-ULCOMPMR
RST-EQPT
```

COMMAND CODE: **DGN-EQPT**
COMMAND NAME: **DIAGNOSE EQUIPMENT**

PURPOSE

The DGN-EQPT command executes selected diagnostic tests (test phases) on the specified equipment entity. All test phases or a specific test phase, the number of test iterations, and whether the test terminates on the first detected error may be specified.

The successful response to a DGN-EQPT command contains a line of non-parsable output data which indicates the time of the last diagnostics, a line which indicates the overall testing pass/fail status of all executed test phases, a line for the pass/fail status of each test phase executed, and a line for each test phase that failed or had inconclusive test results.

In addition to being reported in the successful response message, the results of a DGN-EQPT command are stored on the system disk. Test results stored on the system disk can subsequently be retrieved by a RTRV-DGN-STATUS command.

A test phase that is potentially service affecting is not executed unless the specified equipment entity is installed (does not have a SST of UEQ) and in an out-of-service state (an equipment PST of OOS-AU (except for a SPB circuit pack) or OOS-MA).

If multiple iterations of an all-phases diagnostic test is specified, each test phase is executed for the specified number of iterations before testing continues to the next test phase. The response output indicates the results of the last test iteration for the test phases executed.

Results of DGN-EQPT are always inconclusive for any ACL link statistics test phase that is supported on a CIM. The results of any ACL link statistics test phase (e.g., number of link transmissions per unit interval) are reported as non-parsable free-format text in that particular test phase's <Result_Reason> output block.

A DGN-EQPT command is denied if:

- The specified equipment entity is not provisioned (via the ENT-EQPT command).
- The specified equipment entity is not installed (an equipment SST of UEQ).
- The specified equipment entity is a level 2 processor in a non-IS state (an equipment PST of OOS or SST of STBY)
- A diagnostic test is currently in-progress on the specified equipment entity.
- An invalid parameter value is entered.

INPUT FORMAT

DGN-EQPT: [TID] : AID: [CTAG] : : [PH] , [ITER] , [TERMT] ;

INPUT PARAMETERS

Default: Entry Required
Addressing: None
Description: Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.

CTAG <1–6 VALID CTAG CHARACTERS>
Default: <System Assigned CTAG Value>
Addressing: None
Description: Correlation Tag, associates input command with its output responses.

PH {1–16}
Default: <All test phases allowed for the present state of the equipment entity>
Addressing: None
Description: Test Phase, identifies the diagnostic test to be executed. A test phase that is potentially service affecting is not executed unless the specified equipment entity is installed and out-of-service (PST of OOS–AU or OOS–MA). Test phase values, the name of each test phase, and whether the test phase is service affecting, are shown below for each equipment entity:

PH	Service Affect	Test Phase Name
For an ACM (Administrative Communications Module circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	<i>Service Affecting</i>	ACM Main processor RAM Test
3	<i>Service Affecting</i>	ACM SBI Shared RAM Test
8	<i>Service Affecting</i>	ACM Com 0 68360 Device Test
11	<i>Service Affecting</i>	ACM Minnie Gate Array Test
12	<i>Service Affecting</i>	ACM Configurator Device Test
For a CDA (Clock Distribution A circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
For a CDB (Clock Distribution B circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	CDB Module Test
4	Non-Service Affecting	ICL Communications Test
5	Non-Service Affecting	Phase Locked Loop / Clock Test
6	<i>Service Affecting</i>	Clock Switch Forced/Auto Test
For a CIM (Communications Interface Module circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	CIM SBI Test
3	<i>Service Affecting</i>	Powerup Parity Test
4	<i>Service Affecting</i>	Powerup Write Protection Test
5	<i>Service Affecting</i>	Powerup Gate Array Interface Test
6	<i>Service Affecting</i>	Powerup PIC Test
7	<i>Service Affecting</i>	Powerup ICL Test
8	<i>Service Affecting</i>	Powerup DMA Test
9	<i>Service Affecting</i>	Powerup ACL Test
10	<i>Service Affecting</i>	Powerup RAM Test
11	<i>Service Affecting</i>	Powerup ROM Test
12	<i>Service Affecting</i>	Powerup Firmware Test
For a CPU (Central Processing Unit circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	<i>Service Affecting</i>	CPU Powerup RAM Test
3	<i>Service Affecting</i>	CPU Powerup ROM Test
4	<i>Service Affecting</i>	CPU Powerup Firmware Test
5	<i>Service Affecting</i>	CPU Powerup Interval Test

PH	Service Affect	Test Phase Name
6	<i>Service Affecting</i>	CPU Powerup RT Clock Test
7	<i>Service Affecting</i>	CPU Powerup SBI Test
8	<i>Service Affecting</i>	CPU Powerup ICL Test
For a DSB (DCC Server Board circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check
4	Non-Service Affecting	Processor Bus Test
5	Non-Service Affecting	DSB EEPROM Test
6	Non-Service Affecting	DSB LAPD Statistics Check
7	Non-Service Affecting	DSB Sub-board Control Logic Test
8	Non-Service Affecting	DSB LAPD Bank controller Test
9	<i>Service Affecting</i>	DSB Front-end Read/Write Test
10	Non-Service Affecting	DSB LAPD Monitor Test
11	Non-Service Affecting	DSB LAN Monitor Test
12	Non-Service Affecting	DSB MAC Address Test
13	<i>Service Affecting</i>	DSB LAN Self Test
For a DSI (DS1 I/O):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	SWI/PRT Card Presence Test
3	Non-Service Affecting	ICL Address Test
4	Non-Service Affecting	I/O In-Service Connect ID
5	Non-Service Affecting	In-Service Status
6	<i>Service Affecting</i>	I/O Out-of-Service Connect ID
7	<i>Service Affecting</i>	Out-of-Service Status
8	<i>Service Affecting</i>	Parity Error
9	<i>Service Affecting</i>	Positive and Negative Data Monitor
For a DSK (Disk Drive):		
1	Non-Service Affecting	DSK Presence Check
2	Non-Service Affecting	DSK Inquiry
3	Non-Service Affecting	DSK Unit Ready
4	Non-Service Affecting	DSK Self Diagnostic
5	Non-Service Affecting	DSK Read Capacity
6	Non-Service Affecting	DSK Media Installed
7	Non-Service Affecting	DSK Device Type Check
8	Non-Service Affecting	DSK Label Check

PH	Service Affect	Test Phase Name
9	Non-Service Affecting	DSK Partition Check

PH	Service Affect	Test Phase Name
For an EOB (Electrical Optical Board):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	ICL Communications Test
4	Non-Service Affecting	EOB Module Test
5	Non-Service Affecting	Clock and Frame Test
6	Non-Service Affecting	GTI Conversion Test
7	Non-Service Affecting	Serial/Parallel Converter Test
8	Non-Service Affecting	Optical Receive Test
9	Non-Service Affecting	Optical Transmit Test
For an EP3 (Electrical Plesiochronous DS3/STS1 circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check
4	Non-Service Affecting	Processor Bus Test
5	Non-Service Affecting	Memory Transfer Link Bus Test
6	Non-Service Affecting	EP3 Module Test
7	Non-Service Affecting	Clock and Frame Test
8	Non-Service Affecting	Duplex to Simplex Converter Test
9	Non-Service Affecting	STM Signal Process Test
10	Non-Service Affecting	Serial/Parallel Converter Test
11	Non-Service Affecting	Multiplexer / Demultiplexer Test
For an ES1 (Electrical Plesiochronous STS1 circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check
4	Non-Service Affecting	Processor Bus Test
5	Non-Service Affecting	Memory Transfer Link Bus Test
6	Non-Service Affecting	ES1 Module Test
7	Non-Service Affecting	Clock and Frame Test
8	Non-Service Affecting	Duplex to Simplex Converter Test
9	Non-Service Affecting	STM Signal Process Test
10	Non-Service Affecting	Serial/Parallel Converter Test
11	Non-Service Affecting	Multiplexer / Demultiplexer Test
For an ESA (External DS1 Signal Adapter circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test

PH	Service Affect	Test Phase Name
For a FAN (Fan/Blower assembly):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	FAN Failure Test
For an HMU (High Speed Muldem Unit (M23 multiplexing) circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	ICL Address Test
3	Non-Service Affecting	In Service Status
4	<i>Service Affecting</i>	Out of Service Status
5	<i>Service Affecting</i>	X-Bit Detect
6	<i>Service Affecting</i>	Match Error Detect
7	<i>Service Affecting</i>	Loss of Signal / Frame
For an ICM (Intelligent Communications Module circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	<i>Service Affecting</i>	ICM Main processor RAM Test
3	<i>Service Affecting</i>	ICM SBI Shared RAM Test
4	<i>Service Affecting</i>	ICM Com 1 Processor RAM Test
5	<i>Service Affecting</i>	ICM Com 2 Processor RAM Test
6	<i>Service Affecting</i>	ICM Com 1 Exchange RAM Test
7	<i>Service Affecting</i>	ICM Com 2 Exchange RAM Test
8	<i>Service Affecting</i>	ICM Com 0 68360 Device Test
11	<i>Service Affecting</i>	ICM Minnie Gate Array Test
12	<i>Service Affecting</i>	ICM Configurator Device Test
For an IOB (Inter-rack Optical Board):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	ICL Communications Test
4	Non-Service Affecting	IOB Module Test
5	Non-Service Affecting	Clock and Frame Test
6	Non-Service Affecting	Clock Delay Test
7	Non-Service Affecting	GTI Conversion Test
8	Non-Service Affecting	Serial/Parallel Converter Test
9	Non-Service Affecting	Optical Receive Test
10	Non-Service Affecting	Optical Transmit Test

PH	Service Affect	Test Phase Name
For an IPB (Internal Protection Board circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	ICL Communications Test
4	<i>Service Affecting</i>	IPB Module Test
5	Non-Service Affecting	Clock and Frame Test
6	Non-Service Affecting	Switch Matrix Test
For an IPU (Interface Processor Unit):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	ICL Communications Test
3	Non-Service Affecting	ACL Communications Test
For an LMU (Low Speed Muldem Unit (M12 multiplexing) circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	ICL Address Test
3	Non-Service Affecting	I/O In Service Connect ID
4	Non-Service Affecting	In Service Status
5	<i>Service Affecting</i>	I/O Out of Service Connect ID
6	<i>Service Affecting</i>	Out of Service Status
7	<i>Service Affecting</i>	Parity Error
8	<i>Service Affecting</i>	X-Bit Detect
9	<i>Service Affecting</i>	Match Error Detect
For an LT1 (Level 1 Translator (RS-232) circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test *
For an LT2 (Level 2 Translator (RS-449/422) circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test *
For an LT4 (Level 4 Translator (ACL) circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test *
For an LT5 (Level 5 Translator (RS-449/LAN) circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test *
For an LT8 (Level 8 Translator (ACL) circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test *
2	TBD...	
* Note: LT card test phases are dependant on the parent SBI card. For example, a provisioned LT4 card in slot 16 cannot have diagnostics run if there is not an In-Service CIM in either slot 7 or 14.		

PH	Service Affect	Test Phase Name
For an M16 (Matrix 16 circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check
4	Non-Service Affecting	Processor Bus Test
5	<i>Service Affecting</i>	M16 Module Test
6	Non-Service Affecting	Clock and Frame Test
7	Non-Service Affecting	Basic Switching Test
8	Non-Service Affecting	Serial/Parallel Converter Test
For an M32 (Matrix 32 circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check
4	Non-Service Affecting	Processor Bus Test
5	Non-Service Affecting	M32 Module Test
6	Non-Service Affecting	Clock and Frame Test
7	Non-Service Affecting	Basic Switching Test
8	Non-Service Affecting	Serial/Parallel Converter Test
For an M40 (Matrix 40 circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check
4	Non-Service Affecting	Processor Bus Test
5	Non-Service Affecting	M40 Module Test
6	Non-Service Affecting	Clock and Frame Test
7	Non-Service Affecting	Framer Test
8	Non-Service Affecting	Space Switching Test
For an MCB (Master Clock Board circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	ICL Communications Test
4	Non-Service Affecting	MCB Crystal Oscillator Oven Test
5	Non-Service Affecting	MCB Module Test
6	Non-Service Affecting	DS1 Interface Test
7	Non-Service Affecting	Clock Recovery / Generation Test
8	Non-Service Affecting	Application Firmware ID Check

PH	Service Affect	Test Phase Name
9	<i>Service Affecting</i>	External Partner Timing Ref Test *
10	<i>Service Affecting</i>	Ext SF Timing Reference 0 Test *
11	<i>Service Affecting</i>	Ext ESF Timing Reference 0 Test *
12	<i>Service Affecting</i>	Ext SF Timing Reference 1 Test *
13	<i>Service Affecting</i>	Ext ESF Timing Reference 1 Test *
* Note: MCB test phases 9 through 13 are only executed when explicitly requested by entering a PH value of {9–13}, respectively.		
For an O1B (Optical Interface Level 1 (OC–3) Board circuit pack):		
1	Non–Service Affecting	Card Presence and Card ID Test
2	Non–Service Affecting	Fuse Test
3	Non–Service Affecting	Load Check
4	Non–Service Affecting	Processor Bus Test
5	Non–Service Affecting	Memory Transfer Link Bus Test
6	Non–Service Affecting	O1B Module Test
7	Non–Service Affecting	Clock and Frame Test
8	Non–Service Affecting	Duplex to Simplex Converter Test
9	Non–Service Affecting	STM Signal Process Test
10	Non–Service Affecting	Serial / Parallel Converter Test
11	Non–Service Affecting	Multiplexer / Demultiplexer Test
12	Non–Service Affecting	Optical Transmit Test
13	Non–Service Affecting	Optical Receive Test
For an O4M (OC–12 Muldem circuit pack):		
1	Non–Service Affecting	Card Presence and Card ID Test
2	Non–Service Affecting	Fuse Test
3	Non–Service Affecting	Load Check
4	Non–Service Affecting	Processor Bus Test
5	Non–Service Affecting	Memory Transfer Link Bus Test
6	Non–Service Affecting	O4M Module Test
7	Non–Service Affecting	Clock and Frame Test
8	Non–Service Affecting	Duplex to Simplex Converter Test
9	Non–Service Affecting	STM Signal Process Test
10	Non–Service Affecting	Serial / Parallel Converter Test
11	Non–Service Affecting	Multiplexer / Demultiplexer Test
12	Non–Service Affecting	Optical Transmit Test
13	Non–Service Affecting	Optical Receive Test
For an OPD (Optical Disk Drive):		

PH	Service Affect	Test Phase Name
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	SCSI Test
For an OXB (Optical Transceiver Board circuit pack):		
1	Non-Service Affecting	Card Presence Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check
4	Non-Service Affecting	OXB Module Test
5	Non-Service Affecting	ICL Communications Test
6	Non-Service Affecting	ICL Address Test
7	Non-Service Affecting	GTI Conversion Test
8	Non-Service Affecting	TSI Translator Test
9	Non-Service Affecting	GTI to SFF Mapping Test
10	Non-Service Affecting	Clock Recover / Generation Test
For a P39 (Power Supply, 3.9V circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
For a P56 (Power Supply, 5.6V circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
For a PDU (Power Distribution Unit):		
1	Non-Service Affecting	Card Presence and Card ID Test
For a PRT (DSI Protection Circuit pack):		
1	Non-Service Affecting	Card Presence Test
For a PSF (Power Supply, 5V circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	PSF Alarm Bit Test
For a PST (Power Supply, 12V circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	PST Alarm Bit Test
For an RDU (Rack Distribution Unit):		
1	Non-Service Affecting	Card Presence Test
For an RPB (Ring Protection Board circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check

PH	Service Affect	Test Phase Name
4	Non-Service Affecting	Memory Transfer Link Bus Test
5	Non-Service Affecting	RPB Module Test
6	Non-Service Affecting	Clock and Frame Test
7	Non-Service Affecting	IO Serial/Parallel Converter Test

12	Non-Service Affecting	MTX to IO Serial Test
13	Non-Service Affecting	MTX to IO Continue Test
For an RSP (Rack Status Panel):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Alarm Bit Test
For an S3M (STS3 Module):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Fuse Test
3	Non-Service Affecting	Load Check
4	Non-Service Affecting	Processor Bus Test
5	Non-Service Affecting	Memory Transfer Link Bus Test
6	Non-Service Affecting	S3M Module Test
7	Non-Service Affecting	Clock and Frame Test
8	Non-Service Affecting	Duplex to Simplex Converter Test
9	Non-Service Affecting	STM Signal Process Test
10	Non-Service Affecting	Serial / Parallel Converter Test
11	Non-Service Affecting	Multiplexer / Demultiplexer Test
12	Non-Service Affecting	Optical Transmit Test
13	Non-Service Affecting	Optical Receive Test
For an SBT (System Bus Termination circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
For a SHELF (CS, EOC, ES, I/O Shelf Equipment Entity):		
1	Non-Service Affecting	Backplane Terminator Test
For an SIO (Serial Input/Output circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	System Bus Interface Test
3	Service Affecting	SIO RAM Test

PH	Service Affect	Test Phase Name
For an SPB (Satellite Processor Board circuit pack):		
1	Non-Service Affecting	Card Presence and Card ID Test
2	Non-Service Affecting	Shelf P-Bus Test
3	Non-Service Affecting	Shelf ICL Bus Test
4	Non-Service Affecting	Shelf MTL Bus Test
5	Non-Service Affecting	Shelf RI Bus Test
6	Non-Service Affecting	ACL Communications Test
For an SWI (DSI Switch Circuit pack):		
1	Non-Service Affecting	Card Presence Test

Restrictions: DGN-EQPT is denied if a value for PH is entered that is not supported for the specified AID.

ITER	{1-20}	
	Default:	{1}
	Addressing:	None
	Description:	Test Iterations, specifies how many times the diagnostic tests are executed. Each test phase is executed for the specified number of iterations before executing another test phase (if multiple iterations of a multiple phase diagnostic test is specified).
TERMT	{IMED, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Terminate Test, specifies whether the diagnostic test is terminated on detection of the first error or executed to completion with the possibility of detecting multiple errors. Values are:
	IMED	Immediate, terminate the tests on the first detected error.
	NORM	Normal, execute all tests to completion and report the results of the last test iteration for the test phases executed.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* Time of Last Diag: <Diag_Dat_Tm> */
/* Card <Test_Result> */
/* <Phase_Number> <Phase_Name> : <Phase_Result> */
[/* <Phase_Number> Reason: <Result_Reason> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

Note: The line of text containing the <Result_Reason> is provided for each test phase with a <Test_Result> of either "Failed" or "Inconclusive".

OUTPUT PARAMETERS

Diag_Dat_Tm {YY-MM-DD HH:MM:SS{ {00-99}-{1-12}-{1-31} {00-23}:{00-59}:{00-59} } }

Diagnostic Date and Time, identifies the date and time when the last diagnostic was executed. The format for DIAG_DAT_TM is <YEAR> - <MONTH> - <DAY>^<HOUR>:<MINUTE>:<SECOND> (where ^ indicates a space).

Test_Result	{Failed, Passed}	Test Result, indicates the overall testing pass/fail status of all executed test phases.
	Failed	Failed, some or all of the executed test phases failed.
	Passed	Passed, all of the executed test phases passes.
Phase_Number	{1–16}	Test Phase, identifies the diagnostic test phase that was executed. Refer to the PH input parameter values for the test phases that can be executed for each circuit pack.
Phase_Name	<Name of the test phase that was executed>	Phase Name, identifies the name of the test phase that was executed. Refer to the PH input parameter values for the test phases that can be executed for each circuit pack.
Phase_Result	{Failed, Inconclusive, Invalid State for Test, Passed}	Test Result, indicates the result of each phase of the diagnostic test. Values are:
	Failed	Failed, the equipment entity failed this test phase.
	Inconclusive	Inconclusive, the results of this test phase are inconclusive for the reason described by <Result_Reason>.
	Invalid State for Test	This test phase was not executed because the equipment entity is in an invalid state for this test.
	Passed	Passed, the equipment entity passed the last iteration of this test phase.
Result_Reason	<Reason for a Failed or Inconclusive Test Result>	Failed/Inconclusive Result Reason, indicates the reason the Test_Result was either “Failed” or “Inconclusive”. Note, this information is useful to Alcatel repair personnel and may or may not be useful to a craft person.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENRE	Equipment, Not Recognized Equipment
	/* Invalid or unassigned equipment identifier specified. */
ICNV	Input, Command Not Valid
	/* Invalid command requested on equipment. */
	/* DGN-EQPT cannot be performed on a CIM. */
IPNV	Input, Parameter Not Valid
	/* Invalid phase request. */
	/* Destructive test is not allowed on card in service. */
	/* In-service test will not run properly on card out of service. */
	/* Invalid iteration request. */
	/* Invalid termination request. */
SARB	Status, All Resources Busy
	/* IPU unable to perform diagnostic, try again later. */
SDAS	Status, Diagnostics Already Started
	/* Diagnostic currently in progress on specified module. */

SDBE Status, internal Data Base Error
 /* Error reading <type-bay-shelf-slot> data base */
SNVS Status, Not in Valid State
 /* Card is in incorrect state for diagnostic request. */
SROF Status, Requested Operation Failed
 /* ACL Message Rejection Error */
 /* Level 2 Processor Not Responding */
 /* Manual diagnostic request time out. */

EXAMPLES

In the following example, 15 iterations of test phase # 2 are executed on EP3-7-3-1 with testing terminated on the first test phase that encounters a failure.

```
DGN-EQPT::EP3-7-3-1:::2,15,IMED;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The "Card Passed" result in the output response indicates only the analysis of the single test phase.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
/* Time of Last Diag: <96-07-12> <15:04:59> */
/* Card Passed. */
/* 2 Fuse Test : Passed */
/* DGN-EQPT::EP3-7-3-1:::2,15,IMED [Pad567] (2) */
;
```

In the following example, a single iteration of all allowable diagnostic test phases are executed on EP3-7-3-1 with testing terminated after all test phases have executed.

```
DGN-EQPT::EP3-7-3-1;
```

The output response, shown below, assumes CID 4 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad569 COMPLD
/* Time of Last Diag: <96-07-12> <15:20:13> */
/* Card Passed */
/* 1 Card Presence and Card ID Test : Passed */
/* 2 Fuse Test : Passed */
/* 3 Load Check : Passed */
/* 4 Processor Bus Test : Passed */
/* 5 Memory Transfer Link Bus Test : Passed */
/* 6 EP3 Module Test : Passed */
/* 7 Clock and Frame Test : Passed */
/* 8 Duplex to Simplex Converter Test : Passed */
/* 9 STM Signal Process Test : Passed */
/* 10 Serial/Parallel Converter Test : Passed */
/* 11 Multiplexer / Demultiplexer Test : Passed */
/* DGN-EQPT::EP3-7-3-1 [Pad569] (4) */
;
```

COMMAND CODE: **DISC-TACC**
COMMAND NAME: **DISCONNECT TEST ACCESS**

PURPOSE

The DISC-TACC command disconnects an existing Test Access port connection established by the user from the ports being tested. After DISC-TACC is executed, the disconnected Test Access Port Pairs (TAPPs) are available for other test access operations.

For this command, the Test Access Port Pair (TAPP) identified as the TAP must be in use by the user. No user is allowed to disconnect a TAPP assigned from the Public or Private pool that is in use by another user with this command, unless they are the system administrator or the same executor of the corresponding CONN-TACC-T1/T3/STS1/VT1 command (see DISC-TACC-PRVG command).

If a Test Access port AID is specified for TAP in the DISC-TACC command, the terminate-and-leave status of any A-side and B-side cross-connection is returned in the successful response message.

Executing a DISC-TACC command removes the SST values of BUSY and TS from the assigned TAPP and the SST value of TS from any equipment-side and facility-side ports involved in the test access operation. If a cross-connection exists, the cross-connection SST of TS is removed from the cross-connection entity.

A DISC-TACC command is denied if:

- The specified TAPP is not involved in a test access operation.
- The port specified for TAP is not the FAD A port of a TAPP in use by the user.
- An invalid parameter value is entered.

INPUT FORMAT

DISC-TACC: [TID] :TAP: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

TAP	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	{OC3T3-{1-2240}-{1-3}}	(OC3T3-OC3#-STS1/DS3#)
	{OC12T3-{1-560}-{1-4}-{1-3}}	(OC12T3-OC12#-STM1#-STS1/DS3#)
	STS1_AID:

	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
Default:		Entry Required
Addressing:		None
Description:		Test Access Port AID, identifies the AID of the FAD A to be disconnected.
Restrictions:		The TAP value given must be that of a TAPP's FAD A currently in use by the user issuing the command (unless that user is the system administrator). DISC-TACC is denied if the TAP value specifies DS1 embedded within electrical DS3 and the 28th DS1 is not excluded. The AID of an STS1 entity embedded in an OC12, OC3, or EC1, except the 3rd STS1 within an OC3 and the {4-3}th STS1 within an OC12. Refer to Appendix B, Access Identifiers (AIDs). The AIDs of VT1 entities embedded in an STS1 which can be embedded in an OC12, OC3, or EC1, except the {7-4}th VT1 within an STS1. Refer to Appendix B, Access Identifiers (AIDs).
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["A <TLS>"]
  ["B <TLS>"]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

TLS	{NORM, TERM, <NoVal>}
	Terminate and Leave Status, indicates whether the A-side or B-side port being tested is in a terminate and leave status as a result of a previous CHG-TL-DIG command. A parsable line of output data is only provided when a TAPP's FAD A AID is entered for TAP in the input command. Values are:
	NORM Normal, the A or B side port is not in a terminate and leave state.
	TERM Terminated, the A or B side port is in a terminate and leave state.
	<NoVal> No value is displayed, the A or B side connection does not exist.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENFE	Equipage, FEature Not provided
IIAC	Input, Invalid ACcess identifier
ITSN	Input, invalid/inactive Test Session Number
RTEN	Resource, requested Tap does Not Exist /* TAPP specified does not exist. */
SADC	Status, Already DisConnected
SARB	Status, All Resources Busy
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* <DATABASE TYPE> Database Error: <STATUS> */
SNVS	Status, Not in Valid State

EXAMPLES

In the following example, the DISC-TACC disconnects the TAPP identified by the FAD A AID of T1-21505.

```
DISC-TACC::T1-21505;
```

COMMAND CODE: **DISC-TACC-PRVG**
COMMAND NAME: **DISCONNECT TEST ACCESS
PRIVILEGED**

PURPOSE

The DISC-TACC-PRVG command disconnects an existing Test Access port connection established by any user from the ports being tested. After DISC-TACC-PRVG is executed, the disconnected Test Access Port Pairs (TAPPs) are available for other test access operations.

When a Test Access port AID is specified for TAP in the DISC-TACC-PRVG command, that Test Access Port Pair (TAPP) is disconnected regardless of its user ownership and whether the TAP parameter is allocated from the Public pool or Private pool.

If a Test Access port AID is specified for TAP in the DISC-TACC-PRVG command, the terminate-and-leave status of any A-side and B-side cross-connection is returned in the successful response message.

Executing a DISC-TACC-PRVG command removes the SST values of BUSY and TS from the assigned TAPP and the SST value of TS from any equipment-side and facility-side ports involved in the test access operation. If a cross-connection exists, the cross-connection SST of TS is removed from the cross-connection entity.

A DISC-TACC-PRVG command is denied if:

- The specified TAPP is not involved in a test access operation.
- The port specified for TAP is not the FAD A port of a TAPP.
- An invalid parameter value is entered.

INPUT FORMAT

DISC-TACC-PRVG: [TID] :TAP: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.

COMMAND CODE: DLT-CID
COMMAND NAME: DELETE COMMUNICATIONS
INTERFACE DEVICE

PURPOSE

The DLT-CID command deletes the entry for the specified CPORT from the system's CID (Communication Interface Device) configuration database.

The CPORT must be logically removed (using RMV-CID) before it can be deleted. If the CPORT is configured as an X.25 port (PROTOCOL of X25 set using ENT-CID or ED-CID), all virtual channels within the CPORT must be deleted (using the DLT-CID-VC command) before the CPORT can be deleted.

A DLT-CID command is denied if:

- The specified CPORT has not previously been provisioned (using ENT-CID).
- The specified CPORT has not been logically removed (using RMV-CID).
- The specified CPORT is configured as an X.25 port (PROTOCOL of X25 set using the ENT-CID or ED-CID commands) and all of its virtual channels are not deleted (using DLT-CID-VC).
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CID: [TID] : CPORT: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{1-12} Default: Entry Required Addressing: None Description: Control Port, specifies the physical communication port number on the APS control system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* CID <CPORT> deleted */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

CPORT	{1-12} Control Port, identifies the physical control port number.
-------	--

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid /* Invalid CID <CPORT> entered */ /* CID <CPORT> does not exist */ /* X25 vc <VCNUM> does not exist */
SDBE	Status, internal Data Base Error /* Unable to read OSDB – status = <status number> */ /* Unable to delete CID <CPORT> from OSDB – status = <status number> */
SROF	Status, Requested Operation Failed /* <CPORT>:<VCNUM>, Virtual Channel must be deleted */ /* CID must first be removed */ /* This CID is pending removal */ /* This CID <CPORT> is an X.25 vc */

EXAMPLES

In the following example, CPORT 5 is deleted from the CID configuration database.

```
DLT-CID::5;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P06042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P06042 COMPLD
/* CID 5 deleted */
/* DLT-CID::5 [P06042] (3) */
;

COMMAND CODE: **DLT-CID-VC**
COMMAND NAME: **DELETE COMMUNICATIONS
INTERFACE DEVICE VIRTUAL
CHANNEL**

PURPOSE

The DLT-CID-VC command deletes a virtual channel entry for the specified X.25 CPORT (Control Port) and VCNUM (Virtual Channel Number) from the system's CID (Communication Interface Device) configuration database.

The specified virtual channel (specified by CPORT and VCNUM) must be logically removed (using the RMV-CID command) before it can be deleted.

A DLT-CID-VC command is denied if:

- The specified virtual channel (specified by CPORT and VCNUM) is not previously logically removed (using the RMV-CID command).
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CID-VC: [TID] : CPORT, VCNUM: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{2-5, 7-12} Default: Entry Required Addressing: None Description: Control Port, specifies the physical communication port number on the APS control system.
VCNUM	{1-8} Default: Entry Required Addressing: &&-ranging and &-grouping Description: Virtual Channel Number, specifies the X.25 virtual channel within the specified CPORT.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
/* <CPORT>,<VCNUM> Virtual Channel deleted */  
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

OUTPUT PARAMETERS

CPORT	{2-5, 7-12} Control Port, identifies the physical control port number.
-------	---

VCNUM {1–8}
Virtual Channel Number, identifies the X.25 virtual channel within the specified X.25 CPORT.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Optional Suggested Action Text> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid /* Invalid CID <CPORT> entered */ /* CID <CPORT> does not exist */ /* X25 vc <VCNUM> does not exist */
SDBE	Status, internal Data Base Error /* Cannot delete Virtual Channel <CPORT>:<VCNUM> from OSDB – status – <status number> */ /* Unable to read OSDB – status = <status number> */
SROF	Status, Requested Operation Failed /* CID must be removed before deletion (use: RMV-CID) */ /* This CID is pending removal */ /* This CID <CPORT> is not an X.25 vc */

EXAMPLES

In the following example, virtual channel 1 on CPORT 2 is deleted.

```
DLT-CID-VC::2,1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P17032. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P17032 COMPLD
  /* 2,1 Virtual Channel deleted */
  /* DLT-CID-VC::2,1 [P17032] (1) */

COMMAND CODE: **DLT-CONF-T1**
COMMAND NAME: **DELETE CONFERENCE T1**

PURPOSE

The DLT-CONF-T1 command disconnects (deletes) the specified one-way cross-connection from the conference head (MASTER) that is either a DS1 or VT1.5, to the conference tail (TO) that is either DS1 or VT1.5. However if both the conference head and the tail are both VT1.5s, the command will be denied (See DLT-CONF-VT1). Upon completion of a DLT-CONF-T1, the specified cross-connection is placed in a “non-existent” state. The conference connection ceases to exist when all associated conference tails have been disconnected.

If a conference tail is one-way cross-connected back to the conference head (MASTER), the back connection must first be disconnected (via DLT-CRS-T1) before the one-way conference connection from the conference head to the conference tail can be disconnected (using DLT-CONF-T1).

Executing an DLT-CONF-T1 command causes a state transition for the specified one-way conference cross-connection from

- IS to Non-Existent
- OOS-AU to Non-Existent

When the DLT-CONF-T1 is completed successfully, the port specified by the TO parameter will have its ACT/BUSY secondary state cleared. Also if the tail was a T1 and the head was VT1.5 and this is the last tail that got deleted, then the head shall have ACT and TRM secondary states cleared.

When a DLT-CONF-T1 is completed, all condition types associated with the specified one-way conference cross-connection are cleared.

A DLT-CONF-T1 command is denied if:

- The specified conference cross-connection does not exist.
- A one-way cross-connection from the specified conference tail (TO) to the conference head (MASTER) exists.
- Either of the specified MASTER or TO DS1 ports are in a test access operation (a DS1 or cross-connection SST of TS), or have been terminated (via a CHG-TL-DIG, a cross-connection SST of TERMB, TERMF, TERMT).
- The specified cross-connection is connected to a Test Access port (it has an SST of TS).
- If the conference head and the conference tail are both VT1.5.
- The specified MASTER and/or TO DS1/VT1.5 port is embedded within a protection OC-3 or OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CONF-T1 : [TID] : MASTER, TO : [CTAG] : : : [RDLMODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

MASTER	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SADC	Status, Already DisConnected
SARB	Status, All Resources Busy
SDBE	Status, internal Data Base Error
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, the one-way DS1 conference cross-connection from the conference head (MASTER) port T3T1-1-15 to the conference tail port T3T1-16-4 is disconnected. This cross-connection was previously redlined (flagged to help prevent inadvertent disconnection).

```
DLT-CONF-T1::T3T1-1-15,T3T1-16-4:::INCL;
```

In the following example, the one-way DS1 conference cross-connections from the conference head (MASTER) port T3T1-1-15 to the conference tail port EC1VT1-16-4-1 which is a VT1.5 embedded within an electrical STS-1 is disconnected.

```
DLT-CONF-T1::T3T1-1-15,EC1VT1-16-4-1;
```

In the following example, the one-way DS1 conference cross-connections from the conference head (MASTER) port T3T1-1-15 to the conference tail ports T3T1-12-8, T3T1-12-9, T3T1-12-10, and T3T1-5-28 are disconnected.

```
DLT-CONF-T1::T3T1-1-15,T3T1-12-8&&-10&T3T1-5-28;
```

COMMAND CODE: **DLT-CONF-VT1**
COMMAND NAME: **DELETE CONFERENCE VT1**

PURPOSE

The DLT-CONF-VT1 command disconnects (deletes) the specified one-way cross-connection from the conference head (MASTER) that is a VT1.5, to the conference tail (TO) that is a VT1.5. If both the conference head and the tail are not VT1.5s, the command will be denied (see DLT-CONF-T1). Upon completion of a DLT-CONF-VT1, the specified cross-connection is placed in a "non-existent" state. The conference connection ceases to exist when all associated conference tails have been disconnected.

If a conference tail is one-way cross-connected back to the conference head (MASTER), the back connection must first be disconnected (via DLT-CRS-VT1) before the one-way conference connection from the conference head to the conference tail can be disconnected (via DLT-CONF-VT1).

Executing a DLT-CONF-VT1 command causes a state transition for the specified one-way conference cross-connection from

- IS to Non-Existent
- OOS-AU to Non-Existent

When the DLT-CONF-VT1 is completed successfully, the port specified by the tail will have its ACT/BUSY secondary state deleted. If this is the last tail that is deleted, then the head will have ACT secondary state cleared.

When a DLT-CONF-VT1 is completed, all condition types associated with the specified one-way conference cross-connection are cleared.

A DLT-CONF-VT1 command is denied if:

- The specified conference cross-connection does not exist.
- A one-way cross-connection from the specified conference tail (TO) to the conference head (MASTER) exists.
- Either of the specified MASTER or TO VT1.5 ports are in a test access operation (a VT1.5 or cross-connection SST of TS), or have been terminated (via a CHG-TL-DIG, a cross-connection SST of TERMB, TERMF, TERMT).
- The specified cross-connection is connected to a Test Access port (it has an SST of TS).
- If the conference head and the conference tail both are not VT1.5.
- The specified MASTER and/or TO DS1/VT1.5 port is embedded within a protection OC-3/OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CONF-VT1 : [TID] : MASTER, TO : [CTAG] : : : [RDLMODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
MASTER	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	None	
	Description:	VT1 AID. Identifies the head (receive side from the network) of a broadcast conference connection.	

TO	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	VT1 AID. Identifies the tail (transmit side to the network) of a broadcast conference connection.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
RDLMODE	{INCL, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Redline Mode. Values are:
	INCL	INCLusive. Both normal and redlined connections will be deleted
	NORM	NORMal. Only normal (non-redlined) connections will be deleted
	Restrictions:	DLT-CONF-VT1 is denied if INCL is not specified for a redlined connection.

SUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SADC	Status, Already DisConnected
SARB	Status, All Resources Busy
SDBE	Status, internal Data Base Error
	/* Failed to get supporting entity records */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, the one-way VT1.5 conference cross-connections from the conference head (MASTER) port EC1VT1-1-6-2 to the conference tail port EC1VT1-16-4-3 is disconnected. This cross-connection had been previously redlined (flagged to help prevent inadvertent disconnection).

```
DLT-CONF-VT1::EC1VT1-1-6-2,EC1VT1-16-4-3:::INCL;
```

In the following example, the one-way VT1.5 conference cross-connections from the conference head (MASTER) port EC1VT1-1-6-2 to the conference tail port OC3VT1-7-2-7-1 which is a VT1.5 embedded within an STS-1 that is itself embedded within an OC-3 is disconnected.

```
DLT-CONF-VT1::EC1VT1-1-6-2,OC3VT1-7-2-7-1;
```

In the following example, the one-way VT1.5 conference cross-connections from the conference head (MASTER) port EC1VT1-1-6-2 to the conference tail ports EC1VT1-12-6-1, EC1VT1-12-6-2, EC1VT1-12-6-3, and EC1VT1-5-7-4 are disconnected.

```
DLT-CONF-VT1::EC1VT1-1-6-2,EC1VT1-12-6-1&&-3&EC1VT1-5-7-4;

COMMAND CODE: **DLT-CRS-STS1**
COMMAND NAME: **DELETE CROSS-CONNECT STS1**

PURPOSE

The DLT-CRS-STS1 command disconnects (deletes) the specified cross-connection identified by the FROM and TO STS1 AIDs. Upon completion of a DLT-CRS-STS1 command, the specified cross-connection is placed in a "non-existent" state. Both the FROM and TO AID must be the AID of an STS1 embedded within an EC1, OC3, or OC12. (Use DLT-CRS-T3 if either the FROM or TO AIDs are not for an STS1.)

If CCT of 1WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified one-way connection is disconnected and the cross-connect entity becomes a one-way cross-connection. If CCT of 2WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified two-way connection is disconnected. If CCT of 2WAYPR is entered for a cross-connection established as a two-way path ring connection (refer to ENT-CRS-STS1 and ENT-RNG-OC3), the specified two-way path ring connection is disconnected.

Executing an DLT-CRS-STS1 command causes a state transition for the specified cross-connection from

- IS to Non-Existent
- OOS-AU to Non-Existent

When the DLT-CRS-STS1 command is successfully completed in normal linear mode, if either FROM or TO had BUSY secondary state, it will be cleared and the object will enter ACT secondary state. If this command deletes all the cross connects that exist on the port, then the ACT/BUSY secondary state will be cleared.

When the DLT-CRS-STS1 command is successfully completed in ring mode, the STBYH/WRK secondary state on the FROM and TO ports within the ring OC3/OC12 will be cleared and the STS1 FFP will be deleted.

When a DLT-CRS-STS1 is completed, all condition types associated with the specified cross-connection are cleared.

A DLT-CRS-STS1 command is denied if:

- The specified cross-connection does not exist.
- CCT of 2WAYPR is entered and the specified two-way path ring cross-connection does not exist.
- CCT of 2WAYDC is entered and the specified two-way drop and continue ring cross-connection does not exist.
- CCT of 2WAY is entered and the specified cross-connection is a one-way connection.
- Either of the specified FROM or TO STS1 ports are in a test access operation (an STS1 or cross-connection SST of TS), or have been terminated (using CHG-TL-DIG, a cross-connection SST of TERMB, TERMF, TERMT).
- If both FROM and TO parameters do not refer to STS1.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CRS-STS1 : [TID] : **FROM, TO** : [CTAG] : : [CCT] : [RDLMODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

FROM	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	STS1 AID. If CCT=1WAY, FROM identifies the receive side (from the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY then either AID of the cross-connection may be used as the FROM AID.
TO	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	STS1 AID. If CCT=1WAY, TO identifies the transmit side (to the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY then either AID of the cross-connection may be used as the TO AID.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
CCT	{1WAY, 2WAY, 2WAYPR, 2WAYDC}	
	Default:	{2WAY}
	Addressing:	None
	Description:	Cross-Connect Type. Values are:
	Value(s)	
	1WAY	One-Way. Delete a one-way cross-connection or bridge between the FROM and TO STS1 ports.
	2WAY	Two-Way. Delete a two-way cross-connection between the FROM and TO STS1 ports.
	2WAYPR	Two-Way Path Ring. Delete a two-way path ring cross-connection between the FROM and TO STS1 ports.
	2WAYDC	Two-Way Drop and Continue. Delete a two-way Drop and Continue connection between the FROM and TO STS1 ports.
RDLMODE	{INCL, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Redline Mode. Values are:
	INCL	INCLusive. Both normal and redlined connections will be deleted
	NORM	NORMal. Only normal (non-redlined) connections will be deleted
	Restrictions:	DLT-CRS-STS1 is denied if INCL is not specified for a redlined connection.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IIAC	Input, Invalid ACcess identifier
SADC	Status, Already DisConnected
SARB	Status, All Resources Busy
	/*A switch is in progress for this protection group*/
	/*Please try the command again later*/
SDBE	Status, internal Data Base Error
	/*CONN Database Error: <ERROR-STRING> for <AID>*/
	/*Failed to Update Sptg Tps: Status=<ERROR-CODE>*/
	/*Failed to put B2 TP database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*Failed to put CONN database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*Failed to put TP database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*RPP Database Error: <ERROR-STRING> for <AID>*/
	/*TP Database Error: <ERROR-STRING> for <AID>*/
SDNC	Status, Data Not Consistent
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a one-way STS1 cross-connection is disconnected between ports OC3STS1-1-3 (FROM), which is an STS1 embedded within an OC3 and EC1STS1-48 (TO) which is an STS1 embedded within an EC1. The specified one-way cross-connection is disconnected whether the existing connection is a one-way or a two-way cross-connection. This cross-connection was previously designated as redlined to help prevent inadvertent disconnection.

```
DLT-CRS-STs1::OC3STS1-1-3,EC1STS1-48::1WAY:INCL;
```

In the following example, a two-way STS1 cross-connection is disconnected between ports OC3STS1-5-2, which is an STS1 embedded within an OC3 and EC1STS1-13 which is an STS1 embedded within an EC1. Either port may be specified as the FROM or TO AID. The two-way cross-connection is disconnected whether the connection was established as a single two-way connection or as two one-way connections.

```
DLT-CRS-STs1::OC3STS1-5-2,EC1STS1-13;
```

COMMAND CODE: **DLT-CRS-STS3C**
COMMAND NAME: **DELETE CROSS-CONNECT STS-3C**

PURPOSE

The DLT-CRS-STS3C disconnects (deletes) the specified cross-connection identified by the FROM and TO STS-3C AIDs. Upon completion of a DLT-CRS-STS3C command, the specified cross-connection is placed in a "non-existent" state. Both the FROM and TO AID must be the AID of an STS-3C embedded within an OC-3 or OC-12.

If CCT of 1WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified one-way connection is disconnected and the cross-connect entity becomes a one-way cross-connection. If CCT of 2WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified two-way connection is disconnected.

Executing an DLT-CRS-STS3C command causes a state transition for the specified cross-connection from

- IS to Non-Existent
- OOS-AU to Non-Existent

When a DLT-CRS-STS3C is completed, all condition types associated with the specified cross-connection are cleared.

When the DLT-CRS-STS3C command is successfully completed, if either FROM or TO had BUSY secondary state, it will be cleared and the object will enter ACT secondary state. If this command deletes all the cross connects that exist on the port, then the ACT/BUSY secondary state will be cleared.

A DLT-CRS-STS3C command is denied if:

- The specified cross-connection does not exist.
- CCT of 2WAY is entered (or is not specified) and the specified cross-connection is a one-way connection.
- If both FROM and TO parameters do not refer to STS-3C.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CRS-STS3C: [TID] : FROM, TO: [CTAG] : : [CCT] : [RDLMODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
FROM	STS3C_AID:		
	{OC3STS3C-{1-2240}}	(OC3STS3C-OC3#/STS3C#)	
	{OC12STS3C-{1-560}-{1-4}}	(OC12STS3C-OC12#-STM1/STS3C#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS3C AID. If CCT=1WAY, FROM identifies the receive side (from the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY then either AID of the cross-connection may be used as the FROM AID.	
TO	STS3C_AID:		
	{OC3STS3C-{1-2240}}	(OC3STS3C-OC3#/STS3C#)	
	{OC12STS3C-{1-560}-{1-4}}	(OC12STS3C-OC12#-STM1/STS3C#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS3C AID. If CCT=1WAY, TO identifies the transmit side (to the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY then either AID of the cross-connection may be used as the TO AID.	

CTAG	< 1–6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
CCT	{1WAY, 2WAY}	
	Default:	{2WAY}
	Addressing:	None
	Description:	Cross–Connect Type. Values are:
	Value(s)	
	1WAY	One–Way. Delete a one–way cross–connection or bridge between the FROM and TO ports.
RDLMODE	{INCL, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Redline Mode. Values are:
	INCL	INCLusive. Both normal and redlined connections will be deleted
	NORM	NORMal. Only normal (non–redlined) connections will be deleted
	Restrictions:	DLT–CRS–STS3C is denied if INCL is not specified for a redlined connection.

EXAMPLES

In the following example, a one-way STS-3C cross-connection is disconnected between ports OC3STS3C-1 (FROM), which is an STS-3C embedded within an OC-3 and OC3STS3C-3 (TO) which is also an STS-3C embedded within an OC-3. The specified one-way cross-connection is disconnected whether the existing connection is a one-way or a two-way cross-connection. This cross-connection was previously designated as redlined to help prevent inadvertent disconnection.

```
DLT-CRS-ST3C: :OC3STS3C-1, OC3STS3C-3 : : 1WAY: INCL;
```

In the following example, a two-way STS-3C cross-connection is disconnected between ports OC3STS3C-5, which is an STS-3C embedded within an OC-3 and OC3STS3C-11 which is also an STS-3C embedded within an OC-3. Either port may be specified as the FROM or TO AID. The two-way cross-connection is disconnected whether the connection was established as a single two-way connection or as two one-way connections.

```
DLT-CRS-ST3C: :OC3STS3C-5, OC3STS3C-11;
```

RELATED COMMANDS

RTRV-CRS-ST3C  
RTRV-RDL-ALL  
RTRV-ST3C
```

COMMAND CODE: **DLT-CRS-T1**
COMMAND NAME: **DELETE CROSS-CONNECT T1**

PURPOSE

The DLT-CRS-T1 command disconnects (deletes) the specified cross-connection identified by the FROM and TO AIDs. Upon completion of a DLT-CRS-T1 command, the specified cross-connection is placed in a “non-existent” state. Either FROM or TO AIDs, but not both, can be the AID of a VT1.5 embedded within an EC1, OC-3, or OC-12. (Use DLT-CRS-VT1 if both the FROM or TO AIDs are for a VT1.5.)

If CCT of 1WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified one-way connection is disconnected and the cross-connect entity becomes a one-way cross-connection. If CCT of 2WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified two-way connection is disconnected. If CCT of 2WAYPR is entered for a cross-connection established as a two-way path ring connection (refer to ENT-CRS-T1, ENT-RNG-OC3, and ENT-RNG-OC12), the specified two-way path ring connection is disconnected. If CCT of 2WAYDC is entered for a cross-connection established as a two-way drop and continue connection (refer to ENT-CRS-T1, ENT-RNG-OC3, and ENT-RNG-OC12), the specified two-way path ring connection is disconnected.

Executing an DLT-CRS-T1 command causes a state transition for the specified cross-connection from

- IS to Non-Existent
- OOS-AU to Non-Existent

When the DLT-CRS-T1 command is successfully completed in normal linear mode, if either FROM or TO had BUSY secondary state, it will be cleared and the object will enter ACT secondary state. If this command deletes all the cross connects that exits on the port, then the ACT secondary state will be cleared. If this command deletes a cross connection from a VT1.5 to a T1, then the VT1.5 port will have TRM secondary state cleared.

When the DLT-CRS-T1 command is successfully completed in ring mode, the STBYH/WRK secondary state on the FROM and TO VT1.5 ports within the ring OC-3/OC-12 will be cleared and the VT1 FFP will be deleted.

When a DLT-CRS-T1 is completed, all condition types associated with the specified cross-connection are cleared.

A DLT-CRS-T1 command is denied if:

- The specified cross-connection does not exist.
- CCT of 2WAYPR is entered and the specified VT1.5/T1 two-way path ring cross-connection does not exist.
- CCT of 2WAYDC is entered and the specified VT1.5/T1 two-way drop and continue ring cross-connection does not exist.
- CCT of 2WAY is entered and the specified cross-connection is a one-way connection.
- The specified cross-connection is part of a broadcast conference connection.
- Either of the specified FROM or TO DS1 ports are in a test access operation (a DS1 or cross-connection SST of TS), have been terminated (via a CHG-TL-DIG, a cross-connection SST of TERMB, TERMF, TERMT), or in under Roll operation (the entity has ROLL secondary state).
- If both FROM and TO parameters refer to VT1.5.
- The command addresses a DS1/VT1.5 embedded within protection OC-3 or OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CRS-T1 : [TID] : FROM, TO : [CTAG] : : [CCT]] : [RDLMODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

FROM	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)

SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a one-way DS1 cross-connection is disconnected between ports T3T1-1-15 (FROM) and T3T1-6-4 (TO). The specified one-way cross-connection is disconnected whether the existing connection is a one-way or a two-way cross-connection. This cross-connection was previously designated as redlined to help prevent inadvertent disconnection.

```
DLT-CRS-T1::T3T1-1-15,T3T1-6-4:::1WAY:INCL;
```

In the following example, a two-way DS1 cross-connection is disconnected between ports T3T1-1-10 and T3T1-13-8. Either port may be specified as the FROM or TO AID. The two-way cross-connection is disconnected whether the connection was established as a single two-way connection or as two one-way connections.

```
DLT-CRS-T1::T3T1-1-10,T3T1-13-8;
```

RTRV-T1

COMMAND CODE: **DLT-CRS-T3**
COMMAND NAME: **DELETE CROSS-CONNECT T3**

PURPOSE

The DLT-CRS-T3 command disconnects (deletes) the specified cross-connection identified by the FROM and TO AIDs. Upon completion of a DLT-CRS-T3 command, the specified cross-connection is placed in a "non-existent" state. Either FROM or TO parameters, but not both, can be the AID of an STS-1 embedded within an EC1, OC-3, or OC-12. (Use DLT-CRS-ST51 if both the FROM or TO AIDs are for an STS-1.)

If CCT of 1WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified one-way connection is disconnected and the cross-connect entity becomes a one-way cross-connection. If CCT of 2WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified two-way connection is disconnected. If CCT of 2WAYPR is entered for a cross-connection established as a two-way path ring connection (refer to ENT-CRS-T3, ENT-RNG-OC3, and ENT-RNG-OC12), the specified two-way path ring connection is disconnected. If CCT of 2WAYDC is entered for a cross-connection established as a two-way drop and continue connection (refer to ENT-CRS-T3, ENT-RNG-OC3, and ENT-RNG-OC12), the specified two-way drop and continue connection is disconnected.

Executing an DLT-CRS-T3 command causes a state transition for the specified cross-connection from

- IS to Non-Existent
- OOS-AU to Non-Existent

When the DLT-CRS-T3 is successfully completed in normal linear mode, if either FROM or TO had BUSY secondary state, it will be cleared and the object will enter ACT secondary state. If this command deletes all the cross connects that exists on the port, then the ACT secondary state will be cleared. If this command deletes a cross connection from an STS-1 to a T3 then the STS-1 port will have TRM secondary state cleared.

When the DLT-CRS-T3 is successfully completed in ring mode, the STBYH/WRK secondary state on the FROM or TO STS-1 ports within the ring OC-3/OC-12 will be cleared and the STS-1 FFP will be deleted.

When a DLT-CRS-T3 is completed, all condition types associated with the specified cross-connection are cleared.

A DLT-CRS-T3 command is denied if:

- The specified cross-connection does not exist.
- CCT of 2WAYPR is entered and the specified T3/STS-1 two-way path ring cross-connection does not exist.
- CCT of 2WAYDC is entered and the specified T3/STS-1 two-way drop and continue ring cross-connection does not exist.
- CCT of 2WAY is entered and the specified cross-connection is a one-way connection.
- Either of the specified FROM or TO DS3/STS-1 ports are in a test access operation (a DS3 or cross-connection SST of TS), or have been terminated (using CHG-TL-DIG, a cross-connection SST of TERMB, TERMF, TERMT).
- If both FROM and TO parameters refer to STS-1.
- The command addresses a DS3/STS-1 within protection OC-3/OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CRS-T3 : [TID] : FROM, TO : [CTAG] : : [CCT] : [RDLMODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

FROM	DS3_AID,:	
	{T3-{1-4800}}	(T3-DS3#)
	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS3 or STS1 AID. If CCT=1WAY, FROM identifies the receive side (from the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY then either AID of the cross-connection may be used as the FROM AID.
TO	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS3 or STS1 AID. If CCT=1WAY, TO identifies the transmit side (to the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY then either AID of the cross-connection may be used as the TO AID.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
CCT	{1WAY, 2WAY, 2WAYPR, 2WAYDC}	
	Default:	{2WAY}
	Addressing:	None
	Description:	Cross-Connect Type. Values are:
	Value(s)	
	1WAY	One-Way. Delete a one-way cross-connection or bridge between the FROM and TO ports.
	2WAY	Two-Way. Delete a two-way cross-connection between the FROM and TO ports.
	2WAYPR	Two-Way Path Ring. Delete a two-way path ring cross-connection between the FROM and TO ports. This value is only valid for STS-1 to T3 ring cross-connections.
	2WAYDC	Two-Way Drop and Continue. Delete a two-way drop and continue cross-connection between the FROM and TO ports. This value is only valid for STS-1 to T3 ring cross-connections.
RDLMODE	{INCL, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Redline Mode. Values are:
	INCL	INCLusive. Both normal and redlined connections will be deleted
	NORM	NORMal. Only normal (non-redlined) connections will be deleted
	Restrictions:	DLT-CRS-T3 is denied if INCL is not specified for a redlined connection.

EXAMPLES

In the following example, a one-way DS3/STS-1 cross-connection is disconnected between ports T3-1 (FROM), which is an electrical DS3 and OC3STS1-5-3 (TO), which is an STS-1 embedded within an OC-3. The specified one-way cross-connection is disconnected whether the existing connection is a one-way or a two-way cross-connection. This cross-connection was previously designated as redlined to help prevent inadvertent disconnection.

```
DLT-CRS-T3::T3-1,OC3STS1-5-3:::1WAY:INCL;
```

In the following example, a two-way DS3 cross-connection is disconnected between ports T3-1 and T3-13. Either port may be specified as the FROM or TO AID. The two-way cross-connection is disconnected whether the connection was established as a single two-way connection or as two one-way connections.

```
DLT-CRS-T3::T3-1,T3-13;

RTRV-T3
```

COMMAND CODE: **DLT-CRS-VT1**
COMMAND NAME: **DELETE CROSS-CONNECT VT1**

PURPOSE

The DLT-CRS-VT1 command disconnects (deletes) the specified cross-connection identified by the FROM and TO AIDs. Upon completion of a DLT-CRS-VT1 command, the specified cross-connection is placed in a "non-existent" state. Both the FROM and TO AID must be the AID of a VT1.5 embedded within an EC1, OC-3, or OC-12. (Use DLT-CRS-T1 if either the FROM or TO AIDs are not for a VT1.5.)

If CCT of 1WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified one-way connection is disconnected and the cross-connect entity becomes a one-way cross-connection. If CCT of 2WAY is entered for a cross-connection established as two one-way connections or as a two-way connection, the specified two-way connection is disconnected. If CCT of 2WAYPR is entered for a cross-connection established as a two-way path ring connection (refer to ENT-CRS-VT1, ENT-RNG-OC3, and ENT-RNG-OC12), the specified two-way path ring connection is disconnected. If CCT of 2WAYDC is entered for a cross-connection established as a two-way drop and continue connection (refer to ENT-CRS-VT1, ENT-RNG-OC3, and ENT-RNG-OC12), the specified two-way drop and continue connection is disconnected.

Executing an DLT-CRS-VT1 command causes a state transition for the specified cross-connection from

- IS to Non-Existent
- OOS-AU to Non-Existent

When the DLT-CRS-VT1 command is successfully completed in normal linear mode, if either FROM or TO had BUSY secondary state, it will be cleared and the object will enter ACT secondary state. If this command deletes all the cross connects that exits on the port, then the ACT secondary state shall be cleared.

When the DLT-CRS-VT1 command is successfully completed in ring mode, the STBYH/WRK secondary state on the FROM and TO VT1.5 ports within the ring OC-3/OC-12 will be cleared and the VT1 FFP will be deleted.

When a DLT-CRS-VT1 is completed, all condition types associated with the specified cross-connection are cleared.

A DLT-CRS-VT1 command is denied if:

- The specified cross-connection does not exist.
- CCT of 2WAYPR is entered and the specified VT1.5/VT1.5 two-way path ring cross-connection does not exist.
- CCT of 2WAYDC is entered and the specified VT1.5/VT1.5 two-way drop and continue ring cross-connection does not exist.
- CCT of 2WAY is entered and the specified cross-connection is a one-way connection.
- The specified cross-connection is part of a broadcast conference connection.
- Either of the specified FROM or TO VT1.5 ports are in a test access operation (a VT1.5 or cross-connection SST of TS), have been terminated (using CHG-TL-DIG, a cross-connection SST of TERMB, TERMF, TERMT), or are under roll operation (the entity has ROLL secondary state).
- If both FROM and TO parameters do not refer to VT1.5.
- The command addresses a VT1.5 embedded within protection OC-3 or a protection OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-CRS-VT1 : [TID] : FROM, TO : [CTAG] : : [CCT] : [RDLMODE] ;

COMMAND NAME: **DELETE EC1**

PURPOSE

The DLT-EC1 command deletes (unassigns and deprovisions) the specified EC1 object entity (AID). Upon completion of a DLT-EC1 command, the specified EC1 is placed in the deprovisioned state of OOS-MA,UAS.

Executing a DLT-EC1 command causes a state transition for the specified EC1 from:

- IS to OOS-MA,UAS
- OOS-AU to OOS-MA,UAS
- OOS-AU,AINS to OOS-MA,UAS
- OOS-AUMA to OOS-MA,UAS
- OOS-MA to OOS-MA,UAS

When a DLT-EC1 is completed, all condition types associated with the specified EC1 are cleared.

A DLT-EC1 command is denied if:

- The specified EC1 is not provisioned (with the ENT-EC1 command).
- Any embedded STS-1s within the specified EC1 are provisioned (the EC1 has an SST of SDEE).
- The specified EC1 has an SST of LPBK.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-EC1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* EC1 Shelf info error, Error=<ERROR-STRING> */ /* Error enabling corresponding T3s, Error=<ERROR-STRING> */ /* Error disabling supported STS1, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, EC1 port EC1-16 is deprovisioned:

```
DLT-EC1::EC1-16;
```

In the following example, EC1 ports EC1-1 through EC1-5 and EC1-7 are deprovisioned:

```
DLT-EC1::EC1-1&&-5&-7;
```

RELATED COMMANDS

```
ED-EC1  
ENT-EC1  
RMV-EC1  
RST-EC1  
RTRV-EC1
```

COMMAND CODE: **DLT-EQPT**
COMMAND NAME: **DELETE EQUIPMENT**

PURPOSE

The DLT-EQPT command deletes (unassigns and deprovisions) the specified equipment entity (AID).

If the specified equipment entity is a CDA, CDB, CIM, CPU, DSB, DSI, DSK, EOB, ES1, EP3, HMU, ICM, IOB, IPB, IPU, LMU, M16, M40, O1B, O4M, OXB, P39, P56, PSF, RPB, S3M, SIO, or SPB, the specified entity must be in an OOS-MA or OOS-AUMA state (refer to ED-EQPT and RMV-EQPT) in order for the DLT-EQPT command to execute. Executing a DLT-EQPT command with one of these equipment types specified causes a state transition for the specified equipment entity from

- OOS-MA to OOS-MA,UAS
- OOS-MA,MT to OOS-MA,UAS
- OOS-AUMA,UEQ to OOS-AUMA,UEQ&UAS
- OOS-AUMA,UEQ&MT to OOS-AUMA,UEQ&UAS

If the specified equipment entity is an ACL, LT1, LT2, LT4, LT5, LT8, OPD, PDU, PST, QUAD, RDU, RSP, SHELF, or SWI, the specified entity can only be deleted from an IS or OOS-AU state. Executing a DLT-EQPT command with one of these equipment types specified causes a state transition for the specified equipment entity from

- IS to OOS-MA,UAS
- OOS-AU,UEQ to OOS-AUMA,UEQ&UAS

When a DLT-EQPT is completed, any existing SST (Secondary State) of MEA (Mismatch Equipment and Attributes) and any existing BPMISM condition associated with the specified SHELF is cleared.

If the specified entity is a DSB, the OSIPARMISM condition is cleared if set, on the addressed DSB or its mate.

When a DLT-EQPT is completed, all condition types associated with the specified equipment entity are cleared.

The deprovisioning of supported equipment must be performed prior to the deprovisioning of some types of equipment entities. The supported equipment deprovisioning dependencies are:

- For EP3 equipment: all supported DS3 or EC1 ports and embedded DS1, STS-1, DS3, or VT1.5 ports must be deprovisioned first. If the EP3 is a protection circuit pack, it cannot be performing a protection function.
- For O1B equipment: all supported OC-3 ports and embedded DS1, DS3, STS-1, or VT1.5 ports must be deprovisioned first.
- For O4M equipment: all supported OC-12 ports and embedded DS1, DS3, STS-1, STS-3C, or VT1.5 ports must be deprovisioned first.
- For S3M equipment: associated O4M equipment must be deprovisioned first.
- For S3M equipment: all supported STS-3C ports and embedded DS1, STS-1, DS3, or VT1.5 ports must be deprovisioned first.
- For EP3 equipment other than the EP3 located in the right-most card slot of an SI48 half-shelf: the EP3 equipment entity physically located to the right of the specified EP3 must be deprovisioned first.
- For ES1 equipment: all supported STS-1 ports and VT1.5 ports must be deprovisioned first. If the ES1 is a protection circuit pack, it cannot be performing a protection function.
- For ES1 equipment other than the ES1 located in the right-most card slot of an SI48 half-shelf: the ES1 equipment entity physically located to the right of the specified ES1 must be deprovisioned first.
- For DSI equipment: all supported DS1 ports must be deprovisioned first. If the DSI is a protection circuit pack, it cannot be performing a protection function.
- For LMU or HMU equipment: all supported DS3 ports and embedded DS1 ports must be deprovisioned first. If the LMU is a protection circuit pack, it cannot be performing a protection function. If an HMU is specified, it cannot be performing a protection function.
- For SHELF equipment entity: all provisioned equipment in the I/O shelf must be deprovisioned first.
- For QUAD equipment entity: all provisioned equipment in the I/O shelf must be deprovisioned first.
- For ACL equipment: all supported SPB or IPU equipment must be deprovisioned first.
- For LT4 and LT8 equipment: all supported ACL equipment must be deprovisioned first.

- For LT1, LT2, and LT5 equipment: all supported communication ports must be removed (RMV–CID) or deprovisioned (DLT–CID) first.
- For PST equipment: all supported DSK and OPD equipment must be deprovisioned first.

NOTE: Although the ON parameter value can be an integer from 0 to 999999, the user should limit the number of delayed activation commands at any given time to 500.

A DLT–EQPT command can be scheduled for delayed activation. However, command parsing and parameter validation is not performed until the command is executed (at the delay activated scheduled date and time).

A DLT–EQPT command is denied if:

- The specified equipment entity is an ACM, CDA, CDB, CIM, CPU, DSB, DSI, DSK, EOB, EP3, ES1, HMU, ICM, IPB, IPU, LMU, M16, M32, M40, O1B, O4M, OXB, P39, P56, PSF, RPB, S3M, or SPB and the entity is not in an OOS–MA or OOS–AUMA state.
- The specified equipment entity is already unassigned/deprovisioned (an SST of UAS).
- The specified AID addresses a End Stage or EOC shelf and all the modules in the shelf are not in UAS secondary state (i.e., all the modules in the shelf are not deprovisioned).
- An O1B equipment entity is specified and all supported OC–3 ports are not deprovisioned prior to deprovisioning the specified O1B.
- An O4M equipment entity is specified and all supported OC–12 ports are not deprovisioned prior to deprovisioning the specified O4M.
- An S3M equipment entity is specified and its associated O4M module are not deprovisioned prior to deprovisioning the specified S3M.
- An EP3 equipment entity is specified and all supported DS3 or STS–1 ports are not deprovisioned prior to deprovisioning the specified EP3.
- An ES1 equipment entity is specified and all supported VT1.5 or STS–1 ports are not deprovisioned prior to deprovisioning the specified ES1.
- A DSI equipment entity is specified and all supported DS1 ports are not deprovisioned prior to deprovisioning the specified DSI.
- An LMU or HMU equipment entity is specified and all supported DS3 ports and embedded DS1 ports are not deprovisioned prior to deprovisioning the specified LMU or HMU.
- An SIO/ICM is being deleted and the specified entity is the last ICM in the system.
- A supported equipment entity is not deprovisioned prior to deprovisioning the specified entity. (Refer to the paragraph, above, on supported equipment deprovisioning dependencies.)
- A DSB is being deleted and the OC–3 or OC–12 feeding the DSB has DCC enabled.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

DLT–EQPT: [TID] :AID: [CTAG] : [ON] [, DATE] [, TIME] [, FLAG] :: [CMDMDE=] ;

INPUT PARAMETERS

 {SWI-{44-63}-{1-4}-{1-7, 9-15, 17-23, 25-31}}

Default: Entry Required

Addressing: None

Description: Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.

Restrictions: DLT-EQPT with AID of {SHELF-9-3-1, SHELF-15-1-1, SHELF-21-3-1, or SHELF-27-1-1} is denied if its companion {SHELF-9-1-1, SHELF-15-3-1, SHELF-21-1-1, SHELF-27-3-1}, is still provisioned (i.e., it is not in OOS-AUMA, UAS state.)

CTAG <1-6 VALID CTAG CHARACTERS>

Default: <System Assigned CTAG Value>

Addressing: None

Description: Correlation Tag, associates input command with its output responses.

ON {ON_AID:0-999999, <NoVal>}

Default: <NoVal>

Addressing: None

Description: Order Number, unique user-assigned integer number (up to six digits) used to identify scheduled (delay activated) commands. Values are:

{0-999999} User-assigned Order Number. The command is scheduled to be executed as specified by DATE and TIME. If no value is entered for DATE or TIME, the command is scheduled for delayed manual activation (the command is entered in the delayed activation table and manually scheduled by using the ACT-DA command).

<NoVal> No Value, the command is executed immediately. (No value is entered for ON (Order Number), DATE, and TIME if DLT-EQPT is to be executed immediately – not delay activated.)

Restrictions: DLT-EQPT is denied if no value is entered for ON (Order Number) and a value is entered for either DATE, TIME, or FLAG.

DATE	{YY-MM-DD:{00-37,70-99} – {1-12, ALL} – {1-31, ALL}, {DAY:{SUN, MON, TUE, WED, THU, FRI, SAT, EVEN, ODD, ALL}, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	<p>Date, specifies the date the command is scheduled to be executed. A specific date is specified by the value format <YY> – <MM> – <DD> where <YY> is the year, <MM> is the month, <DD> is the day. Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and 00 through 37 are interpreted as the year 2000 through the year 2037. Values are:</p> <p><YY> – <MM> – <DD> Command is scheduled to be executed on the specified year, month, and day.</p> <p><YY> – <MM> – ALL Command is scheduled to be executed every day on the specified year and month.</p> <p><YY> –ALL– <DD> Command is scheduled to be executed every month on the specified year and day.</p> <p><YY> –ALL–ALL Command is scheduled to be executed every day of every month of the specified year.</p> <p>ALL– <MM> – <DD> Command is scheduled to be executed every year on the specified month and day.</p> <p>ALL– <MM> –ALL Command is scheduled to be executed every day of every year on the specified month.</p> <p>ALL–ALL– <DD> Command is scheduled to be executed every month of every year on the specified day.</p> <p>SUN Command is scheduled to be executed every Sunday.</p> <p>MON Command is scheduled to be executed every Monday.</p> <p>TUE Command is scheduled to be executed every Tuesday.</p> <p>WED Command is scheduled to be executed every Wednesday.</p> <p>THU Command is scheduled to be executed every Thursday.</p> <p>FRI Command is scheduled to be executed every Friday.</p> <p>SAT Command is scheduled to be executed every Saturday.</p> <p>EVEN Command is scheduled to be executed every even day (from January 1, 1970).</p> <p>ODD Command is scheduled to be executed every odd day (from January 1, 1970).</p> <p>ALL Command is scheduled to be executed every day.</p> <p><NoVal> No Value, the command is executed immediately if no value is entered for ON (Order Number), DATE, and TIME (not delay activated), or the command is scheduled to be executed at the next occurrence of the time specified by TIME.</p>
Restrictions:	DLT–EQPT is denied if a value is entered for DATE and no value is entered for ON (Order Number).

TIME	{HH-MM-SS:{0-23, ALL} – {0-59} – {0-59, HLF, QTR}, <NoVal> Default: <NoVal> Addressing: None Description: Time, specifies the time the command is scheduled to be executed. A specific time is specified by the value format <HH> – <MM> – <SS> where <HH> is the hour, <MM> is the minute, and <SS> is the second. A value for <SS> must be entered, but the system uses a value of 0 when any integer value is entered. Values are: <HH> – <MM> – <SS> The command is scheduled to be executed at the specified hour and minute. ALL– <MM> – <SS> The command is scheduled to be executed every hour at the specified minute. <HH> – <MM> –HLF Two commands are scheduled to be executed, one command at the hour and minute specified by <HH> and <MM> and one command a half-hour (30 minutes) later. (<MM> must be less than 30.) <HH> – <MM> –QTR Four commands are scheduled to be executed, one command at the hour and minute specified by <HH> and <MM> and one command each quarter-hour (15 minutes) later. (<MM> must be less than 15.) ALL– <MM> –HLF Two commands are scheduled to be executed every hour, one command at the minute specified by <MM> and one command a half-hour (30 minutes) later. (<MM> must be less than 30.) ALL– <MM> –QTR Four commands are scheduled to be executed every hour, one command at the minute specified by <MM> and one command each quarter-hour (15 minutes) later. (<MM> must be less than 15.) <NoVal> No Value, the command is executed immediately if no value is entered for ON (Order Number), DATE, and TIME (not delay activated), or the command is scheduled to be executed at the current time on the date specified by DATE. Restrictions: DLT–EQPT is denied if a value is entered for TIME and no value is entered for ON (Order Number). DLT–EQPT is denied if <SS> of HLF or QTR is entered and <MM> is not less than 30 or 15, respectively.
FLAG	{0, <NoVal>} Default: <NoVal> Addressing: None Description: Flag. The value for FLAG is verified, but not processed by the system. Restrictions: DLT–EQPT is denied if a value is entered for FLAG and no value is entered for ON (Order Number).
CMDMDE=	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Value is: FRCD Forced. The command is completed even if the result of its execution is service-affecting. NORM Normal. The command is denied if the result of its execution is service-affecting.

SUCCESSFUL RESPONSE FORMAT

The following successful response format is provided when the DLT-EQPT command is executed. If the command is executed as a scheduled (delay activated) command, the delay activation Order Number is provided in the command echo line.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* The DLT-EQPT for <AID> was completed. */
  /* <Command Echo> [<CTAG>] ({<CID[-VCNUM]>,<CRON:<Order_Number>}) */
;
```

The following output response format is provided if the DLT-EQPT command is scheduled for delayed activation (values for ON (Order Number), DATE, and TIME were entered).

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DELAY
  /* Command has been scheduled */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

COMMAND CODE: **DLT-F3**
COMMAND NAME: **DELETE F3**

PURPOSE

The DLT-F3 command deletes (unassigns and deprovisions) the specified F3 (Fractional DS3) object entity (AID). Upon completion of a DLT-F3 command, the specified F3 is placed in the deprovisioned state of OOS-MA,UAS.

When an F3 is deleted via the DLT-F3 command, any DS1s that were assigned to it are automatically unassigned and thereafter can be reassigned to other F3s (using ENT-F3 or ED-F3).

A DLT-F3 command is denied if:

- The specified F3 is not provisioned (using ENT-F3).
- An invalid parameter value is entered.

INPUT FORMAT

DLT-F3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies a fractional DS3 group of DS1s.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error updating supporting entity, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, F3 #2 in DS3 T3-6 is deprovisioned:

```
DLT-F3::T3F3-6-2;
```

In the following example, F3s T3F3-4-3 through T3F3-4-5 are deprovisioned:

```
DLT-F3::T3F3-4-3&&-5;
```

COMMAND CODE: **DLT-FFP-OC12**
COMMAND NAME: **DELETE FAST FACILITY PROTECTION
OC-12**

PURPOSE

The DLT-FFP-OC12 command deletes (unassigns) a facility protection group for OC-12. It disassociates a protecting (alternate) OC-12 from a protected (main/preferred) OC-12.

If the protecting OC-12 that is specified in B2 does not have any protection relationship with any other OC-12, executing DLT-FFP-OC12 clears the SST of STBYH on that specified OC-12.

An DLT-FFP-OC12 command is denied if:

- The OC-12 specified in B1 and B2 parameters do not refer to working and protection OC-12 respectively.
- The OC-12 specified in B1 and/or B2 is not provisioned (i.e., it is in UAS secondary state).
- The specified OC-12 is the protection line that is carrying service.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

DLT-FFP-OC12 : [TID] : B1 , B2 : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
B1	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the protected (working) OC-12 port. Restrictions: The command is denied if the OC-12 specified is not an odd-numbered OC-12.
B2	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the protecting (protection) OC-12 port. Restrictions: The command is denied if the OC-12 specified is not an even-numbered OC-12. The command is denied if B2 is not adjacent to B1 (is not equal to B1+1).
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **DLT-FTP-USER**
COMMAND NAME: **DELETE FTP USER**

PURPOSE

The DLT-FTP-USER command deletes the user profile entry from the FTP (File Transfer Protocol) User Security Database for the specified FTPUID.

A DLT-FTP-USER command is denied if:

- There is no entry corresponding to the specified FTPUID in the FTP User Security Database.
- A system administrator and Alcatel user profile is specified.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-FTP-USER: [TID] : : [CTAG] : : FTPUID;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
FTPUID	<5–12 VALID FTPUID CHARACTERS> Default: Entry Required Addressing: None Description: FTP User Identifier, specifies the user ID of the FTP whose user security database entry is to be deleted. (Refer to the FTPUID parameter in ENT-FTP-USER for a description of valid FTPUID values.) Restrictions: DLT-FTP-USER command is denied if an FTPUID of {system, SYSTEM, sysprint, or alcatel} is entered.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <FTPUID> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

FTPUID	<5–12 VALID FTPUID CHARACTERS> FTP User Identifier, identifies the FTPUID profile deleted from the database.
--------	---

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC Input, Data Not Consistent

EXAMPLES

In the following example, user11's user profile is deleted (the FTPUID of user11 is removed from the system).

```
DLT-FTP-USER:::::user11;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P09056. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P09056 COMPLD
/* user11 */
/* DLT-FTP-USER:::::user11 [P09056] (1) */
;
```

RELATED COMMANDS

COMMAND CODE: **DLT-IP-FILTER**
COMMAND NAME: **DELETE IP PACKET FILTER TABLE ENTRY**

PURPOSE

The DLT-IP-FILTER command deletes an entry or all entries from the packet filter table used by the Internet Protocol (IP) router of the stack running on the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command deletes entries from the network layer (Layer 3) parameters pertaining to the packet filter table.

If NETMASK is specified, an entry that matches the IPADDR and NETMASK parameters will be deleted from the IP packet filter table. If NETMASK is not specified, all entries corresponding to the IPADDR parameter and any NETMASK will be deleted.

If DLT-IP-FILTER is issued with IPADDR=ALL and NETMASK is not specified, the entire IP packet filter table for the specified CPORT will be deleted.

The DLT-IP-FILTER command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

A DLT-IP-FILTER command is denied if:

- The specified CID is not configured as the LAN on the ICM.
- The specified CID is not configured with the IP packet filter table entry being deleted.
- An entry corresponding to the IP address specified in the IPADDR and NETMASK parameters does not exist in the IP packet filter table.
- NETMASK is specified while IPADDR=ALL.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-IP-FILTER: [TID] : CPORT : [CTAG] : : IPADDR= [, NETMASK=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
IPADDR=	{{(0-255)-(0-255)-(0-255)-(0-255)}, ALL} Default: <Previously Existing Value> Addressing: None Description: Internet Protocol Address, specifies the IP Address of the NE to which the packet filter table entry is deleted. Name-defined values are: ALL All the packet filter table entries are deleted.
NETMASK=	{{(0-255)-(0-255)-(0-255)-(0-255)}, ALL} Default: ALL Addressing: None Description: Subnet Mask, specifies the subnet mask of the network to which the NE with IPADDR is connected to. Name-defined values are:

ENT-IP-FILTER
RTRV-IP-FILTER
```

COMMAND CODE: **DLT-IP-PRMTR**
COMMAND NAME: **DELETE IP PARAMETERS**

PURPOSE

The DLT-IP-PRMTR command deletes parameters from the Internet Protocol (IP) Layer of the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM).

The DLT-IP-PRMTR command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

A DLT-IP-PRMTR command is denied if:

- The specified CID is not configured as a LAN port on the ICM.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-IP-PRMTR : [TID] : CPORT : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
IDNV	Input, Data Not Valid

EXAMPLES

In the following example, the IP layer parameters pertaining to the LAN for CPORT 11 are being deleted.

```
DLT-IP-PRMTR::11;
```

RELATED COMMANDS

```
ED-IP-PRMTR  
ENT-IP-PRMTR  
RTRV-IP-PRMTR
```

COMMAND CODE: **DLT-IP-STATICRT**
COMMAND NAME: **DELETE IP STATIC ROUTER TABLE ENTRY**

PURPOSE

The DLT-IP-STATICRT command deletes an entry or all entries in the static routing table used by the Internet Protocol (IP) router running on the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command deletes an entry in the network layer (Layer 3) parameters pertaining to the static routing table.

If NETMASK is specified, an entry that matches the IPADDR and NETMASK parameters will be deleted from the static routing table. If NETMASK is not specified, all entries corresponding to the IPADDR parameter and any NETMASK will be deleted.

IF DLT-IP-STATICRT is issued with IPADDR=ALL and NETMASK is not specified, the entire static routing table for the specified CPORT will be deleted.

The DLT-IP-STATICRT command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

A DLT-IP-STATICRT command is denied if:

- The specified CID is not configured as the LAN on the ICM.
- An entry corresponding to the IP address specified in the IPADDR and NETMASK parameters does not exist in the static routing table.
- NETMASK is specified while IPADDR=ALL.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-IP-STATICRT: [TID] : CPORT: [CTAG] : : IPADDR= [, NETMASK=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
IPADDR=	{{(0-223)-(0-255)-(0-255)-(0-255)}, ALL} Default: <Previously Existing Value> Addressing: None Description: Internet Protocol Address, specifies the IP Address of the NE to which the static route entry is deleted. Name-defined values are: ALL All the static router table entries are deleted.
NETMASK=	{{(0-255)-(0-255)-(0-255)-(0-255)}, ALL} Default: ALL Addressing: None Description: Subnet Mask, specifies the subnet mask of the network to which the NE with IPADDR is connected to.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
IDNV	Input, Data Not Valid

EXAMPLES

In the following example, all the entries in the static routing table for CPORT 3 are being deleted with IPADDR set to ALL.

```
DLT-IP-STATICRT::3:::IPADDR=ALL;
```

RELATED COMMANDS

```
ED-IP-STATICRT

```

COMMAND CODE: **DLT-MAADDR**
COMMAND NAME: **DELETE MANUAL AREA ADDRESS**

PURPOSE

The DLT-MAADDR command allows deleting of the Manual Area Address of Layer 3 (network layer) of the SONET Data Communication Channel (DCC) network.

Changes to the name-defined parameters are stored in the database and take effect when the OSI stack is (re)initialized. This is accomplished by performing a RST-EQPT of the DSB or by editing the DSB into an IS state from an OOS state via ED-EQPT command. All of the name-defined parameters survive a database backup and restore.

A DLT-MAADDR command is denied if:

- The specified DSB is not provisioned, i.e. the DSB is in a UAS secondary state.
- The specified DSB is not in an OOS-MA or OOS-AUMA state.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-MAADDR: [TID] :AID: [CTAG] : : [MANADNRNUM=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.								
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB on which the manual area addresses are being deleted.								
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.								
MANADNRNUM={1, 2, 3, ALL}	Default: {1} Addressing: None Description: Manual Area Address Number, determines which of the three manual area addresses is to be deleted. Name-defined values are: <table><tr><td>1</td><td>Specifies level 1 manual area addresses is to be deleted.</td></tr><tr><td>2</td><td>Specifies level 2 manual area addresses is to be deleted.</td></tr><tr><td>3</td><td>Specifies level 3 manual area addresses is to be deleted.</td></tr><tr><td>ALL</td><td>Specifies all three of the manual area addresses are to be deleted.</td></tr></table>	1	Specifies level 1 manual area addresses is to be deleted.	2	Specifies level 2 manual area addresses is to be deleted.	3	Specifies level 3 manual area addresses is to be deleted.	ALL	Specifies all three of the manual area addresses are to be deleted.
1	Specifies level 1 manual area addresses is to be deleted.								
2	Specifies level 2 manual area addresses is to be deleted.								
3	Specifies level 3 manual area addresses is to be deleted.								
ALL	Specifies all three of the manual area addresses are to be deleted.								

SUCCESSFUL RESPONSE FORMAT

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID> */
IDNV	Input, Data Not Valid /* Invalid parameter in the input command */
IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified */
SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */ /* INIT-SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Data base access failure. */ /* Unable to read the LANDCC database. */ /* Unable to update the LANDCC database. */
SNVS	Status, Not in Valid State /* DSB is not in a Maintenance state. */

EXAMPLES

In the following example, all three of the manual area addresses for DSB-6-1-1 are deleted:

```
DLT-MAADDR::DSB-6-1-1:::MANADNRNUM= ALL;

<SID> <YY-MM-DD> <HH:MM:SS>
M P72005 COMPLD
/* The DLT-MAADDR for DSB-6-1-1 was completed. */
/* DLT-MAADDR::DSB-6-1-1:::MANADNRNUM= ALL [P72005] (1) */
```

RELATED COMMANDS

```
ED-MAADDR
ENT-MAADDR
RTRV-MAADDR
```

COMMAND CODE: **DLT-OC12**
COMMAND NAME: **DELETE OC-12**

PURPOSE

The DLT-OC12 command deletes (unassigns and deprovisions) the specified OC-12 object entity (AID). Upon completion of a DLT-OC12 command, the specified OC-12 is placed in the deprovisioned state of OOS-MA,UAS.

Executing an DLT-OC12 command causes a state transition for the specified OC-12 from

- IS to OOS-MA,UAS
- OOS-AU to OOS-MA,UAS
- OOS-AU,AINS to OOS-MA,UAS
- OOS-AUMA to OOS-MA,UAS
- OOS-MA to OOS-MA,UAS

When a DLT-OC12 is completed, all condition types associated with the specified OC-12 are cleared.

A DLT-OC12 command is denied if:

- The specified OC-12 is not provisioned (with the ENT-OC12 command).
- Any embedded STS-1s within the specified OC-12 are provisioned (the OC-12 has an SST of SDEE).
- The specified OC-12 has an SST of LPBK.
- A FFP protection relationship exists for the specified OC-12 (refer to DLT-FFP-OC12).
- The specified OC-12 is being used as a source for a Derived DS1.
- The specified OC-12 is associated with a mate OC-12 in a ring protection relationship (using ENT-RNG-OC12).
- An invalid parameter value is entered.

INPUT FORMAT

DLT-OC12: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* ConvertTPNum(TP_OC12, <RECORD-NUMBER>, TP_OC3): <ERROR-STRING>*/
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error disabling supported STS1s, Error=<ERROR-STRING> */
	/* Error disabling supported DCC, Error=<ERROR-STRING> */
	/*TPidToTarpD(<TP-TYPE>, <RECORD-NUMBER>): <ERROR-STRING>*/
	/*TPidToGlobTPid(<TP-TYPE>, <RECORD-NUMBER>): <ERROR-STRING>*/
	/*TARP_DCC Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC-12 port OC12-16 is deprovisioned:

```
DLT-OC12::OC12-16;
```

In the following example, EC1 ports OC12-1 through OC12-5 and OC12-7 are deprovisioned:

```
DLT-OC12::OC12-1&&-5&-7;
```

RELATED COMMANDS

```
ED-OC12
ENT-OC12
RMV-OC12
RST-OC12
RTRV-OC12
```

COMMAND CODE: **DLT-OC3**
COMMAND NAME: **DELETE OC3**

PURPOSE

The DLT-OC3 command deletes (unassigns and deprovisions) the specified OC-3 object entity (AID). Upon completion of a DLT-OC3 command, the specified OC-3 is placed in the deprovisioned state of OOS-MA,UAS.

Executing an DLT-OC3 command causes a state transition for the specified OC-3 from

- IS to OOS-MA,UAS
- OOS-AU to OOS-MA,UAS
- OOS-AU,AINS to OOS-MA,UAS
- OOS-AUMA to OOS-MA,UAS
- OOS-MA to OOS-MA,UAS

When a DLT-OC3 is completed, all condition types associated with the specified OC-3 are cleared.

A DLT-OC3 command is denied if:

- The specified OC-3 is not provisioned (with the ENT-OC3 command).
- Any embedded STS-1s within the specified OC-3 are provisioned (the OC-3 has an SST of SDEE).
- The specified OC-3 has an SST of LPBK.
- A FFP protection relationship exists for the specified OC-3 (refer to DLT-FFP-OC3).
- The specified OC-3 is being used as a source for a Derived DS1.
- The specified OC-3 is associated with a mate OC-3 in a ring protection relationship (using ENT-RNG-OC3).
- An invalid parameter value is entered.

INPUT FORMAT

DLT-OC3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error disabling supported STS1s, Error=<ERROR-STRING> */
	/* Error disabling supported DCC, Error=<ERROR-STRING> */
	/*TPidToTarpD(<TP-TYPE>, <RECORD-NUMBER>): <ERROR-STRING>*/
	/*TPidToGlobTPid(<TP-TYPE>, <RECORD-NUMBER>): <ERROR-STRING>*/
	/*TARP_DCC Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC-3 port OC3-16 is deprovisioned:

```
DLT-OC3::OC3-16;
```

In the following example, EC1 ports OC3-1 through OC3-5 and OC3-7 are deprovisioned:

```
DLT-OC3::OC3-1&&-5&-7;
```

RELATED COMMANDS

```
ED-OC3
ENT-OC3
RMV-OC3
RST-OC3
RTRV-OC3
```

COMMAND CODE: **DLT-OSADDR-SITE**
COMMAND NAME: **DELETE OPERATIONS SYSTEM
ADDRESS SITE**

PURPOSE

The DLT-OSADDR-SITE command deletes an existing X.25 incoming SVC calling address entry from the system's X.25 Incoming SVC Calling Address database. Changes to the database take effect on the next incoming X.25 SVC call request received by the system.

A DLT-OSADDR-SITE command is denied if:

- The specified ADDR value is not an entry in the system's X.25 Incoming SVC Calling Address database.
- An invalid parameter value is entered.

The DLT-OSADDR-SITE command only deletes an X.25 incoming SVC calling address entry from the system's X.25 Incoming SVC Calling Address database. The ENT-OSADDR-SITE command adds an X.25 incoming SVC calling address entry to the database. The ED-OSADDR-SITE command changes the AUTOIN parameter value associated with an incoming SVC calling address database entry. The RTRV-OSADDR-SITE command retrieves the contents of the system's X.25 Incoming SVC Calling Address database.

INPUT FORMAT

DLT-OSADDR-SITE: [TID] :: [CTAG] :: ADDR;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ADDR	<1-15 INTEGER X.25_CALLING_ADDRESS> Default: Entry Required Addressing: None Description: X.25 Incoming SVC Calling Address, specifies the X.25 Incoming SVC Calling Address in the X.25 Incoming SVC Calling Address database.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* OSADDR <ADDR> deleted */
[/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

ADDR	<1-15 INTEGER X.25_CALLING_ADDRESS> X.25 Incoming SVC Calling Address, indicates the X.25 Incoming SVC Calling Address that was deleted from the X.25 Incoming SVC Calling Address database.
------	---

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Unable to find requested OSADDR */
IIFM	Input, Invalid data ForMat /* Illegal Input: ADDR length */
SDBE	Status, internal Data Base Error /* Unable to read OSADDR – status = <status number> */ /* Unable to delete <ADDR> from OSADDR – status = <status number> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the incoming SVC calling address 14045551212 is deleted from the system's X.25 Incoming SVC Calling Address database.

```
DLT-OSADDR-SITE:::::14045551212;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P1e012. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P1e012 COMPLD
/* OSADDR 14045551212 deleted. */
/* DLT-OSADDR-SITE:::::14045551212 [P1e012] (1) */
;

COMMAND CODE: **DLT-PARTITN**
COMMAND NAME: **DELETE PARTITION**

PURPOSE

The DLT-PARTITN command removes (deletes) the existing user facility partition specified by PARTNAM.

Prior to executing a DLT-PARTITN command, all User IDs (UIDs) associated with the specified partition must be deleted (via a DLT-USER command).

After the execution of a DLT-PARTITN command, any OC12, OC3, EC1, STS1, VT1, T3, T1, or F3 ports assigned to the deleted partition are available for assignment to another partition.

If the user executing the DLT-PARTITN command is provisioned with RUSURE of YES (refer to ENT-USER or ED-PRVG-USER), the following text message is transmitted to the user.

```
Delete this User Partition <PARTNAM>? [YES/NO]
Confirm <CTAG>:
```

If the user does not enter "YES" within 120 seconds after the "RUSURE" prompt, the DLT-PARTITN command is cancelled (a CANCLD response message is transmitted to the user).

A DLT-PARTITN command is denied if:

- All User IDs (UIDs) associated with the specified user facility partition have not been deleted (via a DLT-USER command).
- The "User Partitioning" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-PARTITN: [TID] :: [CTAG] :: PARTNAM;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.
PARTNAM	<1-20 CHARACTER VALID PARTITION NAME>
Default:	Entry Required
Addressing:	None
Description:	Partition Name, specifies the name of the user facility partition.
Restrictions:	DLT-PARTITN is denied if a PARTNAM of "ALL" is entered.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* Partition <PARTNAM> has been deleted */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

The following unsuccessful response is generated if an incorrect or invalid command is entered.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following unsuccessful response is generated if the command is cancelled after an "RUSURE" prompt.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> CANCLD
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENFE	Equipage, FEature Not provided
IDNV	Input, Data Not Valid /* Invalid Partition Name */
IIAC	Input, Invalid ACcess identifier /* ALL cannot be used as a partition name */
IIFM	Input, Invalid data ForMat /* PARTNAM length */
IPNV	Input, Parameter Not Valid /* PARTNAM */
SDBE	Status, internal Data Base Error /* Error accessing the PARTITION DB – status = <status number> */ /* All USI users for this partition must be deleted. */

EXAMPLES

In the following example, the user facility partition PARTITION1 is deleted.

```
DLT-PARTITN::::PARTITION1;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P26023. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes the command is issued by a user provisioned with the RUSURE parameter (in ENT-USER) enabled.

```
Delete this User Partition PARTITION1? [YES/NO]
Confirm [P26023]:YES;
<SID> <YY-MM-DD> <HH:MM:SS>
M P26023 COMPLD
/* Partition PARTITION1 has been deleted. */
/* DLT-PARTITN::::PARTITION1 [P26023] (3) */
;
```

COMMAND CODE: **DLT-RNG-OC12**
COMMAND NAME: **DELETE RING OC-12**

PURPOSE

The DLT-RNG-OC12 command deletes (unassigns) ring protection group pairs for OC-12 facilities. It deletes the preferred (protected) OC-12 and its associated alternate (protecting) OC-12.

Upon successful completion of the DLT-RNG-OC12 command for ring protection group pairs of OC-12 facilities, the OC-12 ports return to their normal linear mode of operation, in which the terminology “working (i.e., protected)” and “protection (i.e., protecting)” applies once again.

Executing a DLT-RNG-OC12 command causes all of the VT1.5s within the ring that are two-way cross-connected to carry an SST of ACT.

A DLT-RNG-OC12 command is denied if:

- The OC-12s specified in B1 and B2 parameters do not refer to preferred and alternate OC-12, respectively, of the same ring.
- Any of the supported objects within the B1 is involved in 2WAYPR or pass through ring cross-connections.
- Any of the supported objects within the B1 is involved in a loopback (an SST of LPBK) or in a test access operation (an SST of TS).
- All the supported objects within B2 are not deleted (i.e., B2 OC-12 has an SST of SDEE).
- An invalid parameter value.

INPUT FORMAT

DLT-RNG-OC12 : [TID] : B1 , B2 : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
B1	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the preferred (protected) OC-12 port. Restrictions: DLT-RNG-OC12 is denied if the OC-12 specified is not an odd-numbered OC-12.
B2	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the alternate (protecting) OC-12 port. Restrictions: DLT-RNG-OC12 is denied if the OC-12 specified is not an even-numbered OC-12. DLT-RNG-OC12 is denied if B2 is not equal to B1+1 (i.e., B1 has not been defined as part of the same ring as B2).
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

    <SID> <YY-MM-DD> <HH:MM:SS>

    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/*TP Database Error: <ERROR-STRING> for <AID-STRING>*/
	/*Error updating OC ring supported entities, Error=<ERROR-STRING>*/
	/*RNG Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/
	/*CONN Database Error: <ERROR-STRING> for <AID-STRING>*/
	/*RPP Database Error: <ERROR-STRING> for <AID-STRING>*/
	/*TPidToTbss(<TP-TYPE>, <RECORD-NUMBER>) Error: <ERROR-STRING>*/
SNVS	Status, Not in Valid State

EXAMPLES

In the following example, the ring protection relationship is deleted for OC-12 ports OC12-14 (alternate line) and OC12-13 (preferred line).

```
DLT-RNG-OC12::OC12-13,OC12-14;
```

RELATED COMMANDS

```

ED-RNG-OC12
ENT-RNG-OC12
RTRV-RNG-OC12

```

COMMAND CODE: **DLT-RNG-OC3**
COMMAND NAME: **DELETE RING OC-3**

PURPOSE

The DLT-RNG-OC3 command deletes (unassigns) ring protection group pairs for OC-3 facilities. It deletes the preferred (protected) OC-3 and its associated alternate (protecting) OC-3.

Upon successful completion of the DLT-RNG-OC3 command for ring protection group pairs of OC-3 facilities, the OC-3 ports return to their normal linear mode of operation, in which the terminology “working (i.e., protected)” and “protection (i.e., protecting)” applies once again.

Executing a DLT-RNG-OC3 command causes all of the VT1.5s within the ring that are two-way cross-connected to carry an SST of ACT.

A DLT-RNG-OC3 command is denied if:

- The OC-3s specified in B1 and B2 parameters do not refer to preferred and alternate OC-3, respectively, of the same ring.
- Any of the supported objects within the B1 is involved in 2WAYPR or pass through ring cross-connections.
- Any of the supported objects within the B1 is involved in a loopback (an SST of LPBK) or in a test access operation (an SST of TS).
- All the supported objects within B2 are not deleted (i.e., B2 OC-3 has an SST of SDEE).
- An invalid parameter value.

INPUT FORMAT

DLT-RNG-OC3 : [TID] : B1 , B2 : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
B1	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: None Description: OC3 AID, identifies the preferred (protected) OC-3 port. Restrictions: DLT-RNG-OC3 is denied if the OC-3 specified is not an odd-numbered OC-3.
B2	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: None Description: OC3 AID, identifies the alternate (protecting) OC-3 port. Restrictions: DLT-RNG-OC3 is denied if the OC-3 specified is not an even-numbered OC-3. DLT-RNG-OC3 is denied if B2 is not equal to B1+1 (i.e., B1 has not been defined as part of the same ring as B2).
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

ED-RNG-OC3
ENT-RNG-OC3
RTRV-RNG-OC3
```

COMMAND CODE: **DLT-ROLL-T1**
COMMAND NAME: **DELETE ROLL T1**

PURPOSE

The DLT-ROLL-T1 command aborts an attempted roll of a facility or drops the residual tail for a successful roll. The FROM and TO parameters can be specified as DS1 or VT1.5, but not both parameters as VT1.5. DLT-ROLL-T1 is generally used to abort the roll when the REPT^EVT autonomous message, indicating the clearing of the ROLLMON condition type which signals a valid signal detection on the RTO port of the roll, has not been received within a reasonable amount of time. DLT-ROLL-T1 is generally used to drop a broadcast tail when it is left from an old connection after the roll is completed.

Rolling may not include any DS1 ports that are being used for QRS, TACC or Broadcast. Once rolling operation has begun, all the three ports involved in the roll will be in the ROLL secondary state and this is the only state in which a DLT-ROLL-T1 command will be considered valid.

If the corresponding ENT-ROLL-T1 command was issued with RMODE=MAN, then DLT-ROLL-T1 must be executed to complete the roll.

Executing a DLT-ROLL-T1 causes a state transition for the disconnected cross-connect entity from

- IS to Non-Existent
- OOS-AU to Non-Existent

On successful completion of this command, the ports involved in the roll operation will have their ROLL secondary states cleared.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

DLT-ROLL-T1 is denied if:

- Either of the specified FROM or TO DS1/VT1.5 ports are not provisioned (via ENT-T1/VT1.5).
- The cross-connection specified by FROM, TO does not exist.
- The specified FROM and TO values are identical (the same DS1 port).
- Both FROM and TO specify a VT1.5 port.
- Both FROM and TO do not have a ROLL secondary state, i.e., they are not under roll operation.
- DLT-ROLL-T1 command has been issued with WHY as STOP on a pair of ports that are involved in manual roll operation (RMODE of MAN in a corresponding ENT-ROLL-T1 command) after the port specified in RTO parameter in the ENT-ROLL-T1 command has received a valid signal (i.e., ROLLMON condition has been cleared).
- DLT-ROLL-T1 command has been issued with WHY as STOP on a pair of ports that are involved in fully manual roll operation (RMODE of FMAN1 in a corresponding ENT-ROLL-T1 command) after the ENT-ROLL-T1 command with mode as FMAN2 has been executed on the pair of ports.
- DLT-ROLL-T1 command is issued with a WHY as END on a pair of ports that are involved in an automatic roll (RMODE of AUTO in corresponding ENT-ROLL-T1 command).
- DLT-ROLL-T1 command is issued with a WHY as END on a pair of ports that are involved in a manual roll (RMODE of MAN in corresponding ENT-ROLL-T1 command) before the port specified in RTO parameter in the ENT-ROLL-T1 command has received a valid signal (i.e., the ROLLMON condition is still set).
- DLT-ROLL-T1 command is issued with a WHY as END on a pair of ports that are involved in fully manual duplex roll (RMODE of FMAN1 in corresponding ENT-ROLL-T1 command) before an ENT-ROLL-T1 command with RMODE set to FMAN2 has been issued.
- DLT-ROLL-T1 command is issued with a WHY as END on a pair of ports that are involved in a fully manual simplex receive side roll (RMODE of FMAN1 in corresponding ENT-ROLL-T1 command).
- The specified FROM and/or TO VT1.5/DS1 is embedded within a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

COMMAND CODE: **DLT-ROLL-VT1**
COMMAND NAME: **DELETE ROLL VT1**

PURPOSE

The DLT-ROLL-VT1 command aborts an attempted roll of a facility or drops the residual tail from a successful roll. Both the FROM and TO parameters must be VT1.5. DLT-ROLL-VT1 is generally used to abort the roll when the REPT^EVT autonomous message, indicating the clearing of the ROLLMON condition type which signals a valid signal detection on the RTO port of the roll, has not been received within a reasonable amount of time. DLT-ROLL-VT1 is generally used to drop a broadcast tail when it is left from an old connection after the roll is completed.

Rolling may not include any VT1.5 ports that are being used in a Broadcast. Once rolling operation has begun, all the three ports involved in the roll will be in the ROLL secondary state and this is the only state in which a DLT-ROLL-VT1 command will be considered valid.

If the corresponding ENT-ROLL-VT1 command was issued with RMODE=MAN, then DLT-ROLL-VT1 must be executed to complete the roll.

Executing a DLT-ROLL-VT1 causes a state transition for the disconnected cross-connect entity from:

- IS to Non-Existent
- OOS-AU to Non-Existent

On successful completion of this command, the ports involved in the roll operation will have their ROLL secondary states cleared.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

DLT-ROLL-VT1 is denied if:

- Either of the specified FROM or TO VT1.5 ports are not provisioned (using ENT-VT1.5).
- The cross-connection specified by FROM, TO does not exist.
- The specified FROM and TO values are identical (the same VT1.5 port).
- Both FROM and TO do not specify a VT1.5 port.
- Both FROM and TO do not have a ROLL secondary state, i.e., they are not under roll operation.
- DLT-ROLL-VT1 command has been issued with WHY as STOP on a pair of ports that are involved in manual roll operation (RMODE of MAN in a corresponding ENT-ROLL-VT1 command) after the port specified in RTO parameter in the ENT-ROLL-VT1 command has received a valid signal (i.e., ROLLMON condition has been cleared).
- DLT-ROLL-VT1 command has been issued with WHY as STOP on a pair of ports that are involved in fully manual roll operation (RMODE of FMAN1 in a corresponding ENT-ROLL-VT1 command) after the ENT-ROLL-VT1 command with mode as FMAN2 has been executed on the pair of ports.
- DLT-ROLL-VT1 command is issued with a WHY as END on a pair of ports that are involved in an automatic roll (RMODE of AUTO in corresponding ENT-ROLL-VT1 command).
- DLT-ROLL-VT1 command is issued with a WHY as END on a pair of ports that are involved in a manual roll (RMODE of MAN in corresponding ENT-ROLL-VT1 command) before the port specified in RTO parameter in the ENT-ROLL-VT1 command has received a valid signal (i.e., the ROLLMON condition is still set)
- DLT-ROLL-VT1 command is issued with a WHY as END on a pair of ports that are involved in fully manual duplex roll (RMODE of FMAN1 in corresponding ENT-ROLL-VT1 command) before an ENT-ROLL-VT1 command with RMODE set to FMAN2 has been issued.
- DLT-ROLL-VT1 command is issued with a WHY as END on a pair of ports that are involved in a fully manual simplex receive side roll (RMODE of FMAN1 in corresponding ENT-ROLL-VT1 command).
- The specified FROM and/or TO VT1.5 is embedded within a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SCSN	Status, invalid Command SequeNce
SDBE	Status, internal Data Base Error
	/* Failed to get OTHER supporting entity records */
	/* Failed to get RTO supporting entity records */
	/* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */
	/* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, a VT1.5 roll connection between EC1VT1-2-2-2 and EC1VT1-3-3-3 is being aborted.

```
DLT-ROLL-VT1::EC1VT1-2-2-2,EC1VT1-3-3-3:::WHY=STOP;
```

RELATED COMMANDS

```
ENT-ROLL-VT1

RTRV-ROLL-VT1
```

COMMAND CODE: **DLT-STS1**
COMMAND NAME: **DELETE STS-1**

PURPOSE

The DLT-STS1 command deletes (unassigns and deprovisions) the specified STS-1 object entity (AID). Upon completion of a DLT-STS1 command, the specified STS-1 is placed in the deprovisioned state of OOS-MA,UAS.

Executing a DLT-STS1 command causes a state transition for the specified STS-1 from

- IS to OOS-MA,UAS
- OOS-AU to OOS-MA,UAS
- OOS-AU,AINS to OOS-MA,UAS
- OOS-AUMA to OOS-MA,UAS
- OOS-MA to OOS-MA,UAS

When a DLT-STS1 is completed, all condition types associated with the specified STS-1 are cleared.

If this is the last STS-1 embedded within an EC1, OC-3, or OC-12, then the EC1/OC-3/OC-12 will have its SDEE secondary state cleared when the STS-1 is deleted.

A DLT-STS1 command is denied if:

- The specified STS-1 is not provisioned (using ENT-STS1).
- Any VT1.5s or DS3s embedded within the specified STS-1 are provisioned (the STS-1 has an SST of SDEE).
- The specified STS-1 has an SST of ACT, BUSY, or LPBK.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-STS1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS1 AID, identifies the STS-1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
PICC	Privilege, Invalid Command Code
	/* TAPP belongs to another user */
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error updating supporting entity, Error=<ERROR-STRING> */
	/* Error disabling supported VT1s, Error=<ERROR-STRING> */
	/* STS1 Shelf info error, Error=<ERROR-STRING> */
	/* Error disabling supported T3, Error=<ERROR-STRING> */
	/* Error updating FAD B's supporting entity, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, STS-1 port EC1STS1-16 is deprovisioned:

```
DLT-STS1::EC1STS1-16;
```

In the following example, STS-1 ports EC1STS1-1 through EC1STS1-5 and OC3STS1-7-3 are deprovisioned:

```
DLT-STS1::EC1STS1-1&&-5&OC3STS1-7-3;
```

RELATED COMMANDS

```
ED-STS1
ENT-STS1
RMV-STS1
RST-STS1
RTRV-STS1
```

COMMAND CODE: **DLT-STS3C**
COMMAND NAME: **DELETE STS-3C**

PURPOSE

The DLT-STS3C command deletes (unassigns and deprovisions) the specified STS-3C object entity (AID). Upon completion of a DLT-STS3C command, the specified STS-3C is placed in the deprovisioned state of OOS-MA,UAS.

Executing an DLT-STS3C command causes a state transition for the specified STS-3C from

- IS to OOS-MA,UAS
- OOS-AU to OOS-MA,UAS
- OOS-AU,AINS to OOS-MA,UAS
- OOS-AUMA to OOS-MA,UAS
- OOS-MA to OOS-MA,UAS

When a DLT-STS3C is successfully completed, all condition types associated with the specified STS-3C are cleared.

When a DLT-STS3C is successfully completed, the DSBLD secondary states, which are present on all of the STS1 objects corresponding to the specified STS-3C, are cleared. This means that both STS1 and STS-3C object entities are enabled to be provisioned.

A DLT-STS3C command is denied if:

- The specified STS-3C has not previously been provisioned with the ENT-STS3C command (an SST of UAS).
- The specified STS-3C is cross-connected (has a SST of ACT, BUSY).
- An invalid parameter value is entered.

INPUT FORMAT

DLT-STS3C: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS3C_AID:		
	{OC3STS3C–{1–2240}}		(OC3STS3C–OC3#/STS3C#)
	{OC12STS3C–{1–560}–{1–4}}		(OC12STS3C–OC12#–STM1/STS3C#)
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	STS3C AID, identifies the STS–3C port.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error updating supporting entity, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, STS-3C port OC3STS3C-6 is deprovisioned:

```
DLT-STS3C::OC3STS3C-6;
```

In the following example, STS-3C ports OC3STS3C-1 and OC3STS3C-3 are deprovisioned:

```
DLT-STS3C::OC3STS3C-1&-3;
```

ENT-STS3C
RMV-STS3C
RST-STS3C
RTRV-STS3C
```

COMMAND CODE: **DLT-T1**
COMMAND NAME: **DELETE T1**

PURPOSE

The DLT-T1 command deletes (unassigns and deprovisions) the specified DS1/TMG object entity (AID). Upon completion of a DLT-T1 command, the specified DS1 or TMG is placed in the deprovisioned state of OOS-MA,UAS.

If the DS1 specified is the first port of a TAPP, both DS1s associated with the TAPP are deleted (deprovisioned).

If the DS1 has been assigned to an F3 (Fractional T3) using ENT-F3 or ED-F3, deleting the DS1 automatically removes its assignment from the F3.

If this is the last DS1 embedded within an EC1, VT1.5, OC-3, or OC-12, then the EC1/VT1.5/OC-3/OC-12 will have its SDEE secondary state cleared when the DS1 is deleted.

Executing an DLT-T1 command causes a state transition for the specified DS1/TMG entity from:

- IS to OOS-MA,UAS
- OOS-AU to OOS-MA,UAS
- OOS-AUMA to OOS-MA,UAS
- OOS-MA to OOS-MA,UAS

When a DLT-T1 is completed, all condition types associated with the specified DS1/TMG entity are cleared.

A DLT-T1 command is denied if:

- The specified DS1 is not provisioned (using ENT-T1).
- The specified DS1 has an SST of ACT, BUSY, LPBK, or TS.
- The specified DS1 has C-bit loopback allowed (it has a condition type of ALWCBLPBK).
- The specified DS1 is transmitting a C-bit loopback (it has a condition type of XMTCLPBK).
- The specified DS1 is an Idle Signal Source port supplying an Idle signal to another DS1 port.
- The specified DS1 is a Test Access Port currently in use for a test access operation, or the AID identifies the FAD B port of a TAPP, or the TAPP is owned by another user and the user entering the command does not have a CCAL of 31 or 32.
- The specified timing reference has an SST of BUSY.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-T1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{EC1T1-{1-3840}-{1-7}-{1-4}}	(EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)
	TMG_AID:	
	{TMG-{0, 1}}	
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS1 AID identifies the DS1 port and TMG AID identifies external timing reference source.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV	Input, Command Not Valid
	/* Signal source port is in use by port <AID-STRING>. */
IIAC	Input, Invalid ACcess identifier
PICC	Privilege, Invalid Command Code
	/* TAPP belongs to another user */
SARB	Status, All Resources Busy
	/* The command was rejected. */

SDBE Status, internal Data Base Error
 /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
 /* TAPP Database Error: <ERROR-STRING> for record number <RECORD-NUM-
 BER> */
 /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
 /* Error updating FAD B's supporting entity, Error=<ERROR-STRING> */
 /* Error updating supporting entity, Error=<ERROR-STRING> */
 /*GetSptgTps(T1, <RECORD-NUMBER>): <ERROR-STRING>*/
 /*PutSptgTpBank(): <ERROR-STRING>*/

SNVS Status, Not in Valid State
 /* Cannot delete a port that has cbit loopback ALLOWED. */

SROF Status, Requested Operation Failed
 /* Error accessing MCB database. */
 /* Error accessing auxiliary EM data area for Master MCB. */

EXAMPLES

In the following example, DS1 port T3T1-25-5 is deprovisioned.

```
DLT-T1::T3T1-25-5;
```

In the following example, DS1 TAPPs T3T1-6-5 and T3T1-6-6 are deprovisioned. Since TAPPs are always assigned as sequential port pairs, the command deprovisions both ports T3T1-6-5 and T3T1-6-6. (The command is denied if port T3T1-6-6 is referenced as the AID.)

```
DLT-T1::T3T1-6-5;
```

RELATED COMMANDS

ED-T1
ENT-F3
ENT-T1
RMV-T1
RST-T1
RTRV-T1

COMMAND CODE: **DLT-T3**
COMMAND NAME: **DELETE T3**

PURPOSE

The DLT-T3 command deletes (unassigns and deprovisions) the specified DS3 object entity (AID). Upon completion of a DLT-T3 command, the specified DS3 is placed in the deprovisioned state of OOS-MA,UAS.

Executing a DLT-T3 command causes a state transition for the specified DS3 from:

- IS to OOS-MA,UAS
- OOS-AU to OOS-MA,UAS
- OOS-AU,AINS to OOS-MA,UAS
- OOS-AUMA to OOS-MA,UAS
- OOS-MA to OOS-MA,UAS

When a DLT-T3 is completed, all condition types associated with the specified DS3 are cleared.

If this is the last DS3 embedded within an OC-3 or OC-12, then the OC-3/OC-12 will have its SDEE secondary state cleared when the DS3 is deleted. If this is the last DS3 embedded within an EC1, then the EC1 will have its SDEE secondary state cleared when the DS3 is deleted.

When a DLT-T3 is completed and the deleted T3 port is a DS3 TAP, its mate DS3 TAP (identified by AID+1 or AID-1) will also be deleted.

A DLT-T3 command is denied if:

- The specified DS3 is not provisioned (using ENT-T3).
- Any DS1s embedded within the specified DS3 are provisioned (the DS3 has an SST of SDEE).
- Any F3s embedded within the specified DS3 are provisioned (the DS3 has an SST of SDEE).
- The specified DS3 has an SST of ACT, BUSY, LPBK, or TS.
- The specified DS3 is a Test Access Port currently in use for a test access operation, or the AID identifies the FAD B port of a TAPP, or the TAPP is owned by another user and the user entering the command does not have a CCAL of 31 or 32.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-T3 : [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)

```

COMMAND CODE: **DLT-TARPADJ-DCC**
COMMAND NAME: **DELETE TARP ADJACENCY TABLE**
ENTRY OF DCC

PURPOSE

The DLT-TARPADJ-DCC command allows deleting of a manually provisioned Network Service Access Point (NSAP) entry in the TID Address Resolution Protocol (TARP) adjacency table entries on the Data Communication Channel (DCC).

The TARP Protocol Data Units (PDUs) are carried by Layer 3 (network layer) of the SONET DCC network.

If the deleted NSAP causes a condition of DUPTARPEENTRY to be set on the addressed OC-3/OC-12 and the command completes successfully, the condition will be cleared.

A DLT-TARPADJ-DCC command is denied if:

- A value entered for the NSAP is not in the adjacency table of the specified OC-3/OC-12 .
- The specified NSAP is less than 40 ASCII characters.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-TARPADJ-DCC: [TID] :AID: [CTAG] : : : [DCCTYPE=] [, NSAP=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3/OC-12 whose DCC adjacency table entries are being deleted.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DCCTYPE=	{BOTH, LDCC, SDCC} Default: {SDCC} Addressing: None Description: DCC Type, specifies which DCC type is deleted in the adjacency table. BOTH Both, specifies both the SDCC and LDCC types are deleted in the adjacency table. LDCC Line DCC, specifies the LDCC type is deleted in the adjacency table. SDCC Section DCC, specifies the SDCC type is deleted in the adjacency table.

NSAP=	<40 ASCII HEXADECEIMAL VALUES>
Default:	None
Addressing:	None
Description:	Network Service Access Point, specifies the Network Service Access Point (NSAP) address of the neighboring NE to be deleted from the adjacency table. Values are 20 octets long encoded as 40 ASCII hexadecimals. The user enters the values in either upper case or lower case (i.e. case sensitive). If NSAP is not specified, all NSAPs configured for the specified OC-3/OC-12 for the DCCTYPE is deleted.
Restrictions:	DLT-TARPADJ-DCC is denied if the specified NSAP is less than 40 ASCII characters.

SUCCESSFUL RESPONSE FORMAT

```

M  <SID> <YY-MM-DD> <HH:MM:SS>
    <CTAG> COMPLD

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/*TP Database Error: <ERROR-STRING> for <AID-STRING>*/
	/*TPidToTarpD(<TP-TYPE>, <RECORD-NUMBER>): <ERROR-STRING>*/
	/*TPidToGlobTPid(<TP-TYPE>, <RECORD-NUMBER>): <ERROR-STRING>*/
	/*TARP_DCC Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the specified NSAP for the OC-3 is deprovisioned.

```
DLT-TARPAJ-DCC::OC3-2:::DCCTYPE=SDCC,  
NSAP=39840F800000000000000000000000000000;

COMMAND CODE: **DLT-TARPADJ-LAN**
COMMAND NAME: **DELETE TARP ADJACENCY TABLE
ENTRY OF LAN**

PURPOSE

The DLT-TARPADJ-LAN command allows deleting of a manually provisioned Network Service Access Point (NSAP) entry in the TID Address Resolution Protocol (TARP) adjacency table entries on the DSB.

The TARP Protocol Data Units (PDUs) are carried by Layer 3 (network layer) of the SONET Local Area Network (LAN).

If the deleted NSAP causes a condition of DUPTARPEENTRY to be set on the addressed DSB and the command completes successfully, the condition will be cleared.

An DLT-TARPADJ-LAN command is denied if:

- A value entered for the NSAP/ISLEVEL already exists in the adjacency table of the specified DSB.
- The specified NSAP is less than 40 ASCII characters.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-TARPADJ-LAN: [TID] :AID: [CTAG] : : [NSAP=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB whose adjacency table entries are being deleted.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NSAP=	<40 ASCII HEXADECIMAL VALUES> Default: None Addressing: None Description: Network Service Access Point, specifies the Network Service Access Point (NSAP) address of the neighboring NE to be deleted from the adjacency table. Values are 20 octets long encoded as 40 ASCII hexadecimal. The user enters the values in either upper case or lower case (i.e. case sensitive). If NSAP is not specified, all the NSAPs configured for the specified DSB is deleted. Restrictions: DLT-TARPADJ-LAN is denied if the specified NSAP is less than 40 ASCII characters.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID> */
IDNV	Input, Data Not Valid /* Invalid parameter in the input command. */ /* Error reading input for NSAP. */ /* NSAP address must be 40 characters long. */ /* Unable to find the requested NSAP entry. */
IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified. */
SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */ /* INIT-SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Data base access failure. */ /* Unable to read the LANDCC database. */ /* Unable to update the LANDCC database. */

EXAMPLES

In the following example, the specified NSAP is deleted from DSB-6-1-1's TARP table.

```
DLT-TARPADJ-LAN::DSB-6-1-1:::NSAP= 398406a0000000000
000000000000000000000000;

<SID> <YY-MM-DD> <HH:MM:SS>
M P72014 COMPLD
  /* The DLT-TARPADJ-LAN for DSB-6-1-1 was completed. */
  /* DLT-TARPADJ-LAN::DSB-6-1-1:::NSAP= 398406a0000000000
000000000000000000000000 [P72014] (1) */
```

COMMAND CODE: **DLT-TARPLDB**
COMMAND NAME: **DELETE TARP LOOP DETECTION
BUFFER**

PURPOSE

The DLT-TARPLDB command allows clearing of all the entries in the TID Address Resolution Protocol (TARP) Loop Detection Buffer (LDB) on the DSB.

The TARP Protocol Data Units (PDUs) are carried by Layer 3 (network layer) of the SONET Data Communication Channel (DCC) network.

A DLT-TARPLDB command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

DLT-TARPLDB: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: Access Identifier, identifies the high level stack on the DSB whose loop detection buffer is being deleted.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID> */
IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified. */
SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */ /* INIT–SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Data base access failure. */ /* Unable to read the LANDCC database. */

EXAMPLES

In the following example, the TARP loop detection buffer entries of the network layer are deleted for DSB–9–1–1.

```
DLT-TARPLDB::DSB-9-1-1;
```

RELATED COMMANDS

```
RTRV-TARPLDB
```

COMMAND CODE: **DLT-USER**
COMMAND NAME: **DELETE USER**

PURPOSE

The DLT-USER command deletes the user profile entry in the User Security Database for the specified UID.

When a DLT-USER command is executed, any TAPPs (Test Access Port Pairs) assigned to the deleted user are automatically deprovisioned (a DS1 SST of UAS). Any cross-connections that were connected to one of the deleted user's TAPPs (the cross-connection has a SST of TS and the cross-connected DS1 ports have a SST of TS) are returned to its pre-test access cross-connect (the equivalent of executing a DISC-TACC for all TAPPs assigned to the deleted user).

Only the system administrator (UID of "system" or "SYSTEM") or the Alcatel account user can delete a user profile entry in the User Security Database (i.e., execute a DLT-USER command). In addition, the system administrator and Alcatel user profiles cannot be deleted.

A DLT-USER command is denied if:

- A user other than "SYSTEM", "system", or Alcatel account user, enters the command.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-USER: [TID] : : [CTAG] : : UID;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
UID	<5-12 VALID UID CHARACTERS> Default: Entry Required Addressing: None Description: User Identifier, specifies the user ID whose user security database entry is to be deleted. (Refer to the UID parameter in ENT-USER for a description of valid UID values.) Restrictions: DLT-USER command is denied if a UID of {system, SYSTEM, sysprint} is entered.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
/* <UID> */  
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

OUTPUT PARAMETERS

UID	<5-12 VALID UID CHARACTERS> User Identifier, identifies the UID profile deleted from the database.
-----	---

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Optional Suggested Action Text> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Privilege: Unauthorized UID deletion attempt */ /* Privilege: Cannot delete current UID */ /* Privilege: Unauthorized Deletion Attempt */
IPEX	Input, Parameter EXtra
IPNV	Input, Parameter Not Valid /* UID not found */ /* Illegal Input: UID length */ /* Illegal Input: UID */ /* User requesting change not found in USDB */ /* Cannot delete UID from USDB – status = <status number> */
SDBE	Status, internal Data Base Error /* Unable to read USDB – status = <status number> */

EXAMPLES

In the following example, user11's user profile is deleted (the UID of user11 is removed from the system).

```
DLT-USER:::::user11;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P09056. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P09056 COMPLD
  /* user11 */
  /* DLT-USER:::::user11 [P09056] (1) */
;
```

```

COMMAND CODE: **DLT-VT1**
COMMAND NAME: **DELETE VT1**

PURPOSE

The DLT-VT1 command deletes (unassigns and deprovisions) the specified VT1.5 object entity (AID). Upon completion of a DLT-VT1 command, the specified VT1.5 is placed in the deprovisioned state of OOS-MA,UAS.

Executing a DLT-VT1 command causes a state transition for the specified VT1.5 from

- IS to OOS-MA,UAS
- OOS-AU to OOS-MA,UAS
- OOS-AU,AINS to OOS-MA,UAS
- OOS-AUMA to OOS-MA,UAS
- OOS-MA to OOS-MA,UAS

When a DLT-VT1 is completed, all condition types associated with the specified VT1.5 are cleared.

If this is the last VT1.5 embedded within an STS-1, then the STS-1 will have its SDEE secondary state cleared when the VT1.5 is deleted.

A DLT-VT1 command is denied if:

- The specified VT1.5 is not provisioned (using ENT-VT1).
- Any DS1s embedded within the specified VT1.5 are provisioned (the VT1.5 has an SST of SDEE).
- The specified VT1.5 has an SST of ACT, BUSY, LPBK, or TS.
- An invalid parameter value is entered.

INPUT FORMAT

DLT-VT1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	VT1 AID, identifies the VT1.5 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
PICC	Privilege, Invalid Command Code /* TAPP belongs to another user */
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating supporting entity, Error=<ERROR-STRING> */ /* VT1 Shelf info error, Error=<ERROR-STRING> */ /* Error disabling supported T1, Error=<ERROR-STRING> */ /* Error updating FAD B's supporting entity, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, VT1.5 port EC1VT1-6-7-4 (VT1.5 embedded within an EC1) is deprovisioned:

```
DLT-VT1::EC1VT1-6-7-4;
```

In the following example, VT1.5 ports EC1VT1-3-5-1 through EC1VT1-3-5-5 and OC3VT1-7-3-7-2 (VT1.5 embedded within an OC-3) are deprovisioned:

```
DLT-VT1::EC1VT1-3-5-1&&-5&OC3VT1-7-3-7-2;
```

RST-VT1
RTRV-VT1
```

COMMAND CODE: **ED-CID**
COMMAND NAME: **EDIT COMMUNICATIONS INTERFACE
DEVICE**

PURPOSE

The ED-CID command modifies the provisioned parameter values, previously provisioned using ENT-CID, in the system's CID (Communication Interface Device) configuration database for the specified CPORT.

The provisioned changes to the CPORT's configuration are applied to the CPORT after it is logically removed and logically restored (using the RMV-CID and RST-CID commands), except that changes to the AUTOIN parameter value also take effect when the next user logs in to the system (using an ACT-USER command).

A CPORT must be logically removed (using RMV-CID) to edit the PROTOCOL parameter to or from a value of X25 or TCP.

An ED-CID command is denied if:

- The specified CPORT has not previously been provisioned (using ENT-CID).
- The PROTOCOL parameter is being edited to or from a value of X25 or TCP and the CPORT has not been logically removed (using the RMV-CID command).
- A UID specified for AUTOIN has not previously been provisioned (using the ENT-USER command).
- An invalid parameter value or combination of parameter values is entered.

When the system is in the Limited Command Entry Mode of operation (refer to the STOP-OPS command), the system administrator (UID of "system") is automatically logged-in on CPORT 1 and the system printer (UID of "sysprint") is automatically logged-in on CPORT 6.

CPORT 1 is not allowed to be configured for automatic UID login. Therefore, a normal login sequence (using ACT-USER) is required from CPORT 1 when the system is in the normal command entry mode (Direct Input Command Entry or Menu Mode).

When the CPU is reset, the baud rate is set to 9600 and the protocol type is set to XON for CPORT 1.

If a CPORT is configured as an X.25 communication port, then:

- The ED-CID-OSPORT command is used to configure the common X.25 protocol parameters (such as packet size, range of PVC and SVC channel numbers, and the X.25 called address) for the CPORT. These parameters are applicable to all PVCs or SVCs within the CPORT.
- The ENT-CID-VC command is used to configure the CPORT for up to eight X.25 PVC or SVC channels, or combination of both. The command is also used to configure the Logical Channel Number for a PVC, and any associated automatic UID login for a PVC or outgoing SVC.
- The ENT-OSADDR-SITE and ED-OSADDR-SITE commands are used to create a database of allowable X.25 calling addresses, and any associated automatic UID login for each calling address for incoming SVCs.

If a CPORT is configured as a TCP communication port, then:

- The ED-IP-PRMTR command is used to provision the IP Layer parameters of the LAN interface on the ICM.

User login security is removed by provisioning a CPORT, or an X.25 PVC or SVC, with automatic UID login since anyone with access to the communication interface has the same command privileges as the UID provisioned in AUTOIN parameter.

A CPORT connected to a printer terminal (refer to the TYPE parameter in the ENT-USER command) should be configured for automatic UID login. If the CPORT is configured for a normal login sequence (AUTOIN of %), the system waits for an ACT-USER command (indefinitely if an output-only printer terminal is connected).

INPUT FORMAT

ED-CID: [TID] : CPORT: [CTAG] : : [PROTOCOL] , [BAUD] , [AUTOIN] , [ACTUSERDM] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{1–12} Default: Entry Required Addressing: None Description: Control Port, specifies the physical communication port number on the APS control system. Restrictions: ED–CID is denied if an invalid combination of values for PROTOCOL and CPORT is entered. Valid value combinations are shown below:

Valid Value Combinations for:	
PROTOCOL	CPORT
SNIDER	{2–12} (Up to 11 CPORTs)
TCP	{3,5,7,9,11} (Up to 3 CPORTs)
X25	{2–5, 7–12} (Up to 4 CPORTs)
XON	{1–12} (Up to 12 CPORTs)

ED–CID is denied if CPORT of {1} and AUTOIN of {<UID>} is entered.

CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.								
PROTOCOL	{SNIDER, TCP, X25, XON} Default: <Previously Existing Value> Addressing: None Description: Protocol, specifies the communication protocol used for the control port. Values are: <table> <tr> <td>SNIDER</td><td>AT&T's SNIDER protocol.</td></tr> <tr> <td>TCP</td><td>TCP/IP protocol, implies the selected CPORT is running the TCP/IP over the Local Area Network (LAN).</td></tr> <tr> <td>X25</td><td>X.25 protocol. The X.25 port parameters are applied to all PVCs and SVCs within the CPORT. (Refer to the ED–CID–OSPORT and ENT–CID–VC commands.)</td></tr> <tr> <td>XON</td><td>XON/XOFF protocol, specifies the asynchronous XON/XOFF (flow control) protocol.</td></tr> </table> Restrictions: ED–CID is denied if an invalid combination of values of PROTOCOL with CPORT, BAUD, AUTOIN, and ACTUSERDM is entered.	SNIDER	AT&T's SNIDER protocol.	TCP	TCP/IP protocol, implies the selected CPORT is running the TCP/IP over the Local Area Network (LAN).	X25	X.25 protocol. The X.25 port parameters are applied to all PVCs and SVCs within the CPORT. (Refer to the ED–CID–OSPORT and ENT–CID–VC commands.)	XON	XON/XOFF protocol, specifies the asynchronous XON/XOFF (flow control) protocol.
SNIDER	AT&T's SNIDER protocol.								
TCP	TCP/IP protocol, implies the selected CPORT is running the TCP/IP over the Local Area Network (LAN).								
X25	X.25 protocol. The X.25 port parameters are applied to all PVCs and SVCs within the CPORT. (Refer to the ED–CID–OSPORT and ENT–CID–VC commands.)								
XON	XON/XOFF protocol, specifies the asynchronous XON/XOFF (flow control) protocol.								

BAUD {1200, 2400, 4800, 9600, 19200, 38400, 10}
Default: <Previously Existing Value>
Addressing: None
Description: Baud Rate, specifies the baud rate of the control port. For CPORTs with PROTOCOL set to X25, any entered BAUD parameter value is ignored and the system automatically selects the external timing reference provided by the DCE (Data Communication Equipment). For CPORTs with PROTOCOL set to TCP, the BAUD parameter value is 10 megabit/second.
Restrictions: ED-CID is denied if an invalid combination of values for PROTOCOL and BAUD is entered. Valid value combinations are shown below:

Valid Value Combinations for:	
PROTOCOL	BAUD
SNIDER	{1200, 2400, 4800, 9600, 19200}
TCP	{10}
X25	{1200, 2400, 4800, 9600, 19200}
XON	{1200, 2400, 4800, 9600, 19200}

AUTOIN {%, <UID>}
Default: <Previously Existing Value>
Addressing: None
Description: Automatic Login, specifies whether a User ID is automatically logged-in on the control port. Values are:
 % No Automatic Login, a normal log-on sequence (using ACT-USER) is required to access the system, or UID Auto Login for X.25 virtual channels is specified by ENT-CID-VC for PVCs and outgoing SVCs or by ENT-OSADDR-SITE for incoming SVCs.
 <UID> UID Automatically Logged-on, the entered User ID (UID) is automatically logged-on whenever the CPORT is in service.
Restrictions: ED-CID is denied if an invalid combination of values for PROTOCOL and AUTOIN is entered. Valid value combinations are shown below:

Valid Value Combinations for:	
PROTOCOL	AUTOIN
SNIDER	{%, <UID>}
TCP	{%}
X25	{%}
XON	{%, <UID>}

ED-CID is denied if AUTOIN of {<UID>} and CPORT of {1} is entered.
 ED-CID is denied if AUTOIN of {SYSTEM, system} is entered.

ACTUSERDM {AUECHO, AUNOECHO, <NoVal>
Default: <Previously Existing Value>
Addressing: None
Description: ACT–USER Display Mode, specifies whether the input characters (key-strokes) for an ACT–USER command entered over the specified CPORT, or entered over any provisioned X.25 PVCs or incoming SVCs within the CPORT, are echoed by the system. Values are:
 AUECHO Character Echo, ACT–USER input characters are echoed.
 AUNOECHO Character Not Echo, ACT–USER input characters are not echoed.
Restrictions: ED–CID is denied if an invalid combination of values for PROTOCOL and ACTUSERDM is entered. Valid value combinations are shown below:

Valid Value Combinations for:	
PROTOCOL	ACTUSERDM
SNIDER	{AUECHO, AUNOECHO, <NoVal>}
TCP	{AUNOECHO, <NoVal>}
X25	{AUECHO, AUNOECHO, <NoVal>}
XON	{AUECHO, AUNOECHO, <NoVal>}

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <CPORT>, <PROTOCOL>, <BAUD>, <AUTOIN>, <ACTUSERDM> */
[/* <MODEM>, <SIZE>, <L3WIN>, <KWIN>, <HIPVC>, <LISVC>, <HISVC>,
<LTSVC>, <HTSVC>, <LOSVC>, <HOSVC>, <ADDR> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

CPORT {1–12}
Control Port, identifies the physical control port number.

PROTOCOL {SNIDER, TCP, X25, XON}
Protocol, identifies the communication protocol used with the control port. Values are:
 SNIDER SNIDER protocol.
 TCP TPC/IP protocol, implies the selected CPORT is running the IP over the Local Area Network (LAN).
 X25 X.25 protocol.
 XON XON/XOFF protocol, indicates the asynchronous XON/XOFF (flow control) protocol.

BAUD {1200, 2400, 4800, 9600, 19200, 38400, 10}
Baud Rate, identifies the baud rate of the control port. (Note. The system automatically selects the external timing reference provided by the DCE (Data Communication Equipment) if PROTOCOL is X25, regardless of the value returned for BAUD.) For CPORTs with PROTOCOL set to TCP, the BAUD parameter value is 10 megabit/second.

AUTOIN	<p>{%, <UID>}</p> <p>Automatic Login, indicates whether a User ID is automatically logged-in on the control port. Values are:</p> <table> <tr> <td>%</td><td>No Automatic Login, a normal log-on sequence (using ACT-USER) is required to access the system, or UID Auto Login for X.25 virtual channels is specified by ENT-CID-VC for PVCs and outgoing SVCs or by ENT-OSADDR-SITE for incoming SVCs.</td></tr> <tr> <td><UID></td><td>UID Automatically Logged-on, the entered User ID (UID) is automatically logged-on whenever the CPORT is in service.</td></tr> </table>	%	No Automatic Login, a normal log-on sequence (using ACT-USER) is required to access the system, or UID Auto Login for X.25 virtual channels is specified by ENT-CID-VC for PVCs and outgoing SVCs or by ENT-OSADDR-SITE for incoming SVCs.	<UID>	UID Automatically Logged-on, the entered User ID (UID) is automatically logged-on whenever the CPORT is in service.
%	No Automatic Login, a normal log-on sequence (using ACT-USER) is required to access the system, or UID Auto Login for X.25 virtual channels is specified by ENT-CID-VC for PVCs and outgoing SVCs or by ENT-OSADDR-SITE for incoming SVCs.				
<UID>	UID Automatically Logged-on, the entered User ID (UID) is automatically logged-on whenever the CPORT is in service.				
ACTUSERDM	<p>{AUECHO, AUNOECHO}</p> <p>ACT-USER Display Mode, indicates whether the input characters (keystrokes) for an ACT-USER command entered over the indicated CPORT, or entered over any provisioned X.25 PVCs or incoming SVCs within the CPORT, are echoed by the system.. Values are:</p> <table> <tr> <td>AUECHO</td><td>Character Echo, ACT-USER input characters are echoed.</td></tr> <tr> <td>AUNOECHO</td><td>Character Not Echo, ACT-USER input characters are not echoed.</td></tr> </table>	AUECHO	Character Echo, ACT-USER input characters are echoed.	AUNOECHO	Character Not Echo, ACT-USER input characters are not echoed.
AUECHO	Character Echo, ACT-USER input characters are echoed.				
AUNOECHO	Character Not Echo, ACT-USER input characters are not echoed.				
MODEM	<p>{NO, YES}</p> <p>Modem Controls, indicates whether the X.25 control port is provisioned (using ED-CID-OSPORT) to use RTS (Request To Send) and CTS (Clear To Send) modem control signals. The output line for MODEM is returned only if PROTOCOL is X25.</p>				
SIZE	<p>{128, 256}</p> <p>Packet Size, indicates the provisioned value (using ED-CID-OSPORT) for the X.25 maximum packet size. The output line for SIZE is returned only if PROTOCOL is X25.</p>				
L3WIN	<p>{1-7}</p> <p>Level 3 Window Size, indicates the provisioned value (using ED-CID-OSPORT) for the X.25 level 3 window size. The output line for L3WIN is returned only if PROTOCOL is X25.</p>				
KWIN	<p>{1-7}</p> <p>Level 2 Window Size, indicates the provisioned value (using ED-CID-OSPORT) for the X.25 level 2 window size (in number of frames). The output line for KWIN is returned only if PROTOCOL is X25.</p>				
HIPVC	<p>{0-8}</p> <p>Highest Incoming PVC Channel Number, indicates the provisioned value (using ED-CID-OSPORT) for the X.25 HIPVC number. The output line for HIPVC is returned only if PROTOCOL is X25.</p>				
LISVC	<p>{0-4095}</p> <p>Lowest Incoming SVC Channel Number, indicates the provisioned value (using ED-CID-OSPORT) for the X.25 LISVC number. The output line for LISVC is returned only if PROTOCOL is X25.</p>				
HISVC	<p>{0-4095}</p> <p>Highest Incoming SVC Channel Number, indicates the provisioned value (using ED-CID-OSPORT) for the X.25 HISVC number. The output line for HISVC is returned only if PROTOCOL is X25.</p>				
LTSVC	<p>{0-4095}</p> <p>Lowest Two-way (Incoming or Outgoing) SVC Channel Number, indicates the provisioned value (using ED-CID-OSPORT) for the X.25 LTSVC number. The output line for LTSVC is returned only if PROTOCOL is X25.</p>				
HTSVC	<p>{0-4095}</p> <p>Highest Two-way (Incoming or Outgoing) SVC Channel Number, indicates the provisioned value (using ED-CID-OSPORT) for the X.25 HTSVC number. The output line for HTSVC is returned only if PROTOCOL is X25.</p>				

LOSVC	{0–4095} Lowest Outgoing SVC Channel Number, indicates the provisioned value (using ED–CID–OSPORT) for the X.25 LOSVC number. The output line for LOSVC is returned only if PROTOCOL is X25.
HOSVC	{0–4095} Highest Outgoing SVC Channel Number, indicates the provisioned value (using ED–CID–OSPORT) for the X.25 HOSVC number. The output line for HOSVC is returned only if PROTOCOL is X25.
ADDR	< 1–15 INTEGER X.25_CALLED_ADDRESS > X.25 Called Address, indicates the provisioned value (using ED–CID–OSPORT) for the X.25 Called Address (the X.25 address for the system). The output line for ADDR is returned only if PROTOCOL is X25.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IDNV      Input, Data Not Valid
          /* Delete vc's before changing this port to be non-x25 */
          /* Illegal Input: OS error */
          /* Illegal Input: AUTOIN */
          /* X.25 not allowed on CID <cid> */
          /* SNIDER not allowed on CID <cid> */
          /* Maximum of <cid> CID ports already configured for X.25 */
          /* AUTO LOGIN (Illegal AUTOIN) */
          /* AUTO LOGIN illegal on CID 1 */
          /* AUTO LOGIN invalid with X25 port */
          /* AUTO LOGIN (Duplicate AUTOIN in OSADDR) */
          /* AUTO LOGIN (Duplicate AUTOIN in OSDB) */
          /* AUTO LOGIN (Non-existent AUTOIN) */
          /* Invalid CID (CPORT) entered */
          /* CID (CPORT) already exists */

SDBE      Status, internal Data Base Error
          /* Unable to read OSDB – status = <status number> */
          /* Unable to write to OSDB – status = <status number> */
          /* Unable to update OSDB – status = <status number> */

```

EXAMPLES

In the following example, the provisioning for CPORT 2 is changed to the X.25 protocol.

```
ED-CID::2:::X25;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P05003. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P05003 COMPLD
/* 2,X25,9600,%,AUECHO */
/* YES,128,2,7,0,0,0,0,0,0,0,0 */
/* Change(s) will take effect on next RST-CID */
/* ED-CID::2::X25 [P05003] (1) */
;
```

In the following example, the provisioning for CPORT 3 is changed to the XON protocol and a baud rate of 9600.

```
ED-CID::3::XON,9600;
```

The output response, shown below, assumes CID 5 was used to enter the command and a system generated CTAG value of P05048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P05048 COMPLD
/* 3,XON,9600,%,AUECHO */
/* Change(s) will take effect on next RST-CID */
/* ED-CID::3::XON,, [P05048] (5) */
;
```

COMMAND CODE: **ED-CID-LCTN**
COMMAND NAME: **EDIT COMMUNICATIONS INTERFACE
DEVICE (OUTPUT BUFFER) LOCATION**

PURPOSE

The ED-CID-LCTN command adjusts the specified CPORT's or X.25 virtual channel's or TCP session's output message buffer location to the end of the output message disk buffer so that the next output message transmitted on the CPORT or virtual channel is the output message for the next message event from the system (i.e., the end of the output message disk buffer).

A user, other than the system administrator (UID of "system" or "SYSTEM") or the Alcatel account user, cannot change the output message buffer location of a CPORT or X.25 virtual channel or TCP session being used by another user.

When a user logs in to the system (using ACT-USER), the user may receive all output messages generated by the system while the user was logged off the system, depending on the provisioning of the DSKBFIND parameter (using ENT-USER or ED-PRVG-USER) for the user. Executing an ED-CID-LCTN command causes these buffered output messages to be skipped (the output message process jumps to the end of the output message buffer). After executing this command, the user receives output messages caused by current events in the system.

An ED-CID-LCTN command is denied if:

- A user is not currently logged in on the specified CPORT or X.25 virtual channel or TCP session.
- A user, other than system, SYSTEM, or the Alcatel account user, specifies a CPORT,[VCNUM] other than the communication port the user is currently using (logged in on).
- A VCNUM value of {1-8} is *not* entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is set to X25.
- A VCNUM value of {1-8} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is *not* set to X25.
- A VCNUM value of {1-32} is *not* entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is set to TCP.
- A VCNUM of {1-32} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is *not* set to TCP.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ED-CID-LCTN: [TID] : CPORT , [VCNUM] : [CTAG] : : [BUFLOC] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
CPORT	{1-12}	
	Default:	Entry Required
	Addressing:	None
	Description:	Control Port, specifies the physical control port number on the APS control system.

VCNUM	{1–32}	
	Default:	Entry required for an X.25 or TCP CPORT (the CPORT's PROTOCOL parameter is set to X25 or TCP). No entry allowed for a non-X.25 or non-TCP CPORT (the CPORT's PROTOCOL parameter is not set to X25 or TCP).
	Addressing:	&&–ranging and &–grouping
	Description:	Virtual Channel Number, specifies the X.25 virtual channel within the specified CPORT or the TCP session number within a TCP CPORT (i.e., the CPORT refers to a LAN on the ICM). Values are:
	{1–8}	Identifies the specific virtual channel number within the X.25 configured CPORT specified by the CPORT parameter.
	{1–32}	Identifies the specific TCP session number within a TCP CPORT.
	Restrictions:	ED–CID–LCTN is denied if VCNUM of {1–8} is <i>not</i> entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is set to X25. ED–CID–LCTN is denied if VCNUM of {1–8} is entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is <i>not</i> set to X25. ED–CID–LCTN is denied if VCNUM of {1–32} is <i>not</i> entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is set to TCP. ED–CID–LCTN is denied if VCNUM of {1–32} is entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is <i>not</i> set to TCP.
CTAG	< 1–6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
BUFLOC	{END}	
	Default:	{END}
	Addressing:	None
	Description:	Event Log File Buffer Location, specifies the location in the Event Log File disk buffer for the next output message for the specified CPORT or X.25 virtual channel or TCP session. Values are:
	END	Skip to End of Buffer, specifies all message output from the disk buffer is to be skipped so that the next output message transmitted on the CPORT or virtual channel is the output message for the next message event from the system.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* CID <CPORT>[:<VCNUM>] has been adjusted to display current output */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

CPORT	{1–12}	Control Port, identifies the physical control port number.
VCNUM	{1–32}	Virtual Channel Number, identifies the X.25 virtual channel within the specified X.25 CPORT or the TCP session number within a TCP CPORT. A value for VCNUM is returned only if the PROTOCOL parameter in the ENT–CID or ED–CID command is set to X25 or TCP.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IPMS	Input, Parameter MiSsing
IPNV	Input, Parameter Not Valid
	/* Illegal Input: CID is an X25 CPORT; specify a VCNUM */
	/* session <SESSION> does not exist */
	/* CID <CPORT> does not have an active buffer */
	/* CID <CPORT>:<VCNUM> does not have an active buffer */
	/* Invalid CID <CPORT> entered */
	/* X25 vc <VCNUM> does not exist */
	/* A user is not currently logged onto this CID */
	/* The user on this CID is in the process of logging out */
SDBE	Status, internal Data Base Error
	/* Unable to read OSDB – status = <status number> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the Event Log File output message buffer location for CPORT 3, virtual channel 5 is adjusted to the end of any disk buffered output.

```

ED-CID-LCTN: :3,5;

The output response, shown below, assumes CID 3, X.25 virtual channel 5 was used to enter the com-
mand and a system generated CTAG value of P71062. The response header would contain the
provisioned Site ID of the system, and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>
M P71062 COMPLD
/* CID 3:5 has been adjusted to display current output */
/* ED-CID-LCTN::3,5 [P71062] (3-5) */
;

COMMAND CODE: ED-CID-OSPORT
COMMAND NAME: EDIT COMMUNICATIONS INTERFACE
DEVICE OPERATIONS SYSTEM PORT

PURPOSE

The ED-CID-OSPORT command modifies the common X.25 protocol parameters (CTS/RTS modem signaling, packet size, level 2 and 3 window sizes, PVC and SVC logical channel number ranges, and the X.25 called address) for the specified CPORT. These parameters are applicable to all PVCs or SVCs within the CPORT.

The provisioned changes to the CPORT's X.25 configuration are applied to the CPORT after it and its provisioned virtual channels are logically removed and logically restored (via the RMV-CID and RST-CID commands), provided any changes to the PVC/SVC logical channel number ranges does not conflict with the existing provisioned virtual channel configuration. If a virtual channel provisioning conflict would result in executing the ED-CID-OSPORT command, the X.25 CPORT must be logically removed (via RMV-CID) and each conflicting virtual channel must be deleted (via DLT-CID-VC) and re-provisioned (via ENT-CID-VC).

Factory default values are assigned for each of the common X.25 protocol parameters when a CPORT database entry is created using the ENT-CID command with the PROTOCOL parameter set to X25.

An X.25 connection cannot be established on a CPORT that does not have a unique provisioned X.25 called address (ADDR parameter) per CPORT.

An ED-CID-OSPORT command is denied if:

- The specified CPORT has not been provisioned as an X.25 CPORT (via ENT-CID with PROTOCOL of X25).
- The specified PVC/SVC ranges of logical channel numbers conflict with the existing provisioned virtual channel configuration (e.g., changing the HIPVC when the X.25 CPORT is provisioned with a PVC).
- The specified ADDR value (X.25 called address) is not unique, other than zero, per CPORT.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
ED-CID-OSPORT: [TID] :CPORT: [CTAG] ::: [MODEM=] [, SIZE=] [, L3WIN=] [, KWIN=]  
[ , HIPVC=] [, LISVC=] [, HISVC=] [, LTSVC=] [, HTSVC=] [, LOSVC=] [, HOSVC=]  
[ , ADDR=] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{2-5, 7-12} Default: Entry Required Addressing: None Description: Control Port, specifies the physical communication port number on the APS control system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MODEM=	{NO, YES} Default: Previously existing value, or {YES} (Factory Default) Addressing: None Description: Modem Controls, specifies whether RTS (Request To Send) and CTS (Clear To Send) modem control signals are used.

SIZE=	{128, 256}	
	Default:	Previously existing value, or {128} (Factory Default)
	Addressing:	None
	Description:	Packet Size, specifies the maximum X.25 packet size in bytes.
L3WIN=	{1-7}	
	Default:	Previously existing value, or {2} (Factory Default)
	Addressing:	None
	Description:	Level 3 Window Size, specifies the X.25 level 3 window size.
KWIN=	{1-7}	
	Default:	Previously existing value, or {7} (Factory Default)
	Addressing:	None
	Description:	Level 2 K Window Size, specifies the X.25 Level 2 K window size (in number of frames).
HIPVC=	{0-8}	
	Default:	Previously existing value, or {0} (Factory Default)
	Addressing:	None
	Description:	Highest Incoming PVC Channel Number, specifies the highest allowable PVC channel number. A value of 0 specifies that no PVCs are allowed. The CPORTs provisioned value for LCN (in the ENT-CID-VC command) must be less-than or equal-to the value for HIPVC which must be less-than the value for LISVC.
	Restrictions:	ED-CID-OSPORT is denied if the LCN parameter (in ENT-CID-VC) value is not less-than or equal-to the HIPVC parameter value. ED-CID-OSPORT is denied if the HIPVC parameter value is not less-than or equal-to the LISVC parameter value.
LISVC=	{0-4095}	
	Default:	Previously existing value, or {0} (Factory Default)
	Addressing:	None
	Description:	Lowest Incoming SVC Channel Number, specifies the lowest allowable incoming SVC channel number.
	Restrictions:	ED-CID-OSPORT is denied if the HIPVC parameter value is not less-than or equal-to the LISVC parameter value. ED-CID-OSPORT is denied if the LISVC parameter value is not less-than or equal-to the HISVC parameter value.
HISVC=	{0-4095}	
	Default:	Previously existing value, or {0} (Factory Default)
	Addressing:	None
	Description:	Highest Incoming SVC Channel Number, specifies the highest allowable incoming SVC channel number.
	Restrictions:	ED-CID-OSPORT is denied if the LISVC parameter value is not less-than or equal-to the HISVC parameter value. ED-CID-OSPORT is denied if the HISVC parameter value is not less-than or equal-to the LTSVC parameter value.
LTSVC=	{0-4095}	
	Default:	Previously existing value, or {0} (Factory Default)
	Addressing:	None
	Description:	Lowest Two-way (Incoming or Outgoing) SVC Channel Number, specifies the lowest allowable two-way SVC channel number.
	Restrictions:	ED-CID-OSPORT is denied if the HISVC parameter value is not less-than or equal-to the LTSVC parameter value.

		ED-CID-OSPORT is denied if the LTSVC parameter value is not less-than or equal-to the HTSVC parameter value.
HTSVC=	{0-4095}	
	Default:	Previously existing value, or {0} (Factory Default)
	Addressing:	None
	Description:	Highest Two-way (Incoming or Outgoing) SVC Channel Number, specifies the highest allowable two-way SVC channel number.
	Restrictions:	ED-CID-OSPORT is denied if the LTSVC parameter value is not less-than or equal-to the HTSVC parameter value. ED-CID-OSPORT is denied if the HTSVC parameter value is not less-than or equal-to the LOSVC parameter value.
LOSVC=	{0-4095}	
	Default:	Previously existing value, or {0} (Factory Default)
	Addressing:	None
	Description:	Lowest Outgoing SVC Channel Number, specifies the lowest allowable outgoing SVC channel number.
	Restrictions:	ED-CID-OSPORT is denied if the HTSVC parameter value is not less-than or equal-to the LOSVC parameter value. ED-CID-OSPORT is denied if the LOSVC parameter value is not less-than or equal-to the HOSVC parameter value.
HOSVC=	{0-4095}	
	Default:	Previously existing value, or {0} (Factory Default)
	Addressing:	None
	Description:	Highest Outgoing SVC Channel Number, specifies the highest allowable outgoing SVC channel number.
	Restrictions:	ED-CID-OSPORT is denied if the LOSVC parameter value is not less-than or equal-to the HOSVC parameter value.
ADDR=	<1-15 INTEGER X.25_CALLED_ADDRESS>	
	Default:	Previously existing value, or {0} (Factory Default)
	Addressing:	None
	Description:	X.25 Called Address, specifies the X.25 Called Address (the X.25 address for the system) which is compared to the Called Address field in the X.25 call request packet. An X.25 connection cannot be established on a CPORT that does not have a unique Called Address per CPORT. Leading zeros are not truncated.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <CPORT>,<BAUD>,<AUTOIN> */
/* <MODEM>,<SIZE>,<L3WIN>,<KWIN>,<HIPVC>,<LISVC>,<HISVC>,<LTSVC>,<HTSVC>,<LOSVC>,<HOSVC>,<ADDR> */
/* Warning: REMOVE and RESTORE (RMV-CID/RST-CID) to use OS parameters */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

CPORT	{2-5, 7-12}	Control Port, identifies the physical control port number.
BAUD	{1200, 2400, 4800, 9600, 19200}	Baud Rate, identifies the baud rate of the control port. (Note. The system automatically selects the external timing reference provided by the DCE (Data Communication Equipment) if PROTOCOL is X25, regardless of the value returned for BAUD.)

AUTOIN	{%} Automatic Login, a value of {%} is always returned. Auto-login for PVCs is provisioned via ENT-CID-VC and auto-login for SVCs is provisioned via ENT-OSADDR-SITE.
MODEM	{NO, YES} Modem Controls, indicates whether the X.25 control port uses RTS (Request To Send) and CTS (Clear To Send) modem control signals.
SIZE	{128, 256} Packet Size, indicates the X.25 maximum packet size.
L3WIN	{1-7} Level 3 Window Size, indicates the X.25 Level 3 window size.
KWIN	{1-7} Level 2 K Window Size, indicates the X.25 Level 2 window size (in number of frames).
HIPVC	{0-8} Highest Incoming PVC Channel Number, indicates the X.25 HIPVC channel number.
LISVC	{0-4095} Lowest Incoming SVC Channel Number, indicates the X.25 LISVC channel number.
HISVC	{0-4095} Highest Incoming SVC Channel Number, indicates the X.25 HISVC channel number.
LTSVC	{0-4095} Lowest Two-way (Incoming or Outgoing) SVC Channel Number, indicates the X.25 LTSVC channel number.
HTSVC	{0-4095} Highest Two-way (Incoming or Outgoing) SVC Channel Number, indicates the X.25 HTSVC channel number.
LOSVC	{0-4095} Lowest Outgoing SVC Channel Number, indicates the X.25 LOSVC channel number.
HOSVC	{0-4095} Highest Outgoing SVC Channel Number, indicates the X.25 HOSVC channel number.
ADDR	<1-15 INTEGER X.25_CALLED_ADDRESS> X.25 Called Address, indicates the X.25 Called Address (the X.25 address for the system).

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Optional Suggested Action Text> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid /* HIPVC cannot be less than an existing PVC's LCN */ /* HIPVC cannot be larger than LISVC */ /* PVC and Incoming SVC ranges overlap */ /* LISVC cannot be larger than HISVC */ /* HISVC cannot be larger than LTSVC */ /* Incoming and Two-Way SVC ranges overlap */ /* LTSVC cannot be larger than HTSVC */ /* HTSVC cannot be larger than LOSVC */ /* Two-Way and Outgoing SVC ranges overlap */ /* LOSVC cannot be larger than HOSVC */ /* Too many vc's defined in CID <CPORT> */ /* Existing number of svc's exceed number being defined */ /*Invalid CID <CPORT> entered */ /* CID <CPORT> does not exist */ /* X25 vc <VCNUM> does not exist */ /* This CID <CPORT> is not configured for X.25 */
SDBE	Status, internal Data Base Error /* Unable to read OSDB – status = <status number> */ /* Unable to update OSDB – status = <status number> */
SDNC	Status, Data Not Consistent /* Duplicate DTE ADDR */
SROF	Status, Requested Operation Failed /*This CID is pending removal */ /* This CID <CPORT> is an X.25 vc */

EXAMPLES

In the following example, the allowable PVC and SVC channel numbers and the X.25 called address for CPORT 2 are edited.

```
ED-CID-OSPORT::2:::HIPVC=4,LISVC=5,HISVC=16,LTSVC=17,HTSVC=32,  
  LOSVC=32,HOSVC=32,ADDR=12145551212;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P18021. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P18021 COMPLD  
/* 2,9600,% */  
/* YES,128,2,7,4,5,16,17,32,32,32,12145551212 */  
/* Warning: REMOVE and RESTORE (RMV-CID/RST-CID) to use OS parameters  
*/  
/* ED-CID-OSPORT::2:::HIPVC=4,LISVC=5,HISVC=16,LTSVC=17,HTSVC=32,  
  LOSVC=32,HOSVC=32 [P18021] (1) */  
;

COMMAND CODE: **ED-CID-VC**
COMMAND NAME: **EDIT COMMUNICATIONS INTERFACE
DEVICE VIRTUAL CHANNEL**

PURPOSE

The ED-CID-VC command edits the provisioned virtual channel entry for the specified X.25 CPORT (Control Port) and VCNUM (Virtual Channel Number) in the system's CID (Communication Interface Device) configuration database. The command edits the virtual channel number to a SVC (Switched Virtual Circuit, Incoming or Outgoing) or a PVC (Permanent Virtual Circuit). For PVC channels, the command also edits the PVC's assigned LCN (Logical Channel Number) along with any UID automatic login for the PVC. For outgoing SVC channels, the command also edits the X.25 Call Out Address and Autonomous Message Inactivity Timer along with the UID automatic login for the outgoing SVC. The virtual channel is configured with the specified provisioning changes by executing a RST-CID command for the specified CPORT.

An ED-CID-VC command is denied if:

- The specified virtual channel (specified by CPORT and VCNUM) is not previously provisioned (via the ENT-CID-VC command).
- A VCTYPE of PVC is entered and the specified LCN value is greater than the HIPVC value in ED-CID-OSPORT.
- An invalid parameter value or combination of parameter values is entered.

User login security is removed by provisioning an X.25 PVC with automatic UID login since anyone with access to the communication interface has the same command privileges as the UID provisioned in the AUTOIN parameter.

A virtual channel connected to a printer terminal (refer to the TYPE parameter in the ENT-USER command) should be configured for automatic UID login. If the virtual channel is configured for a normal login sequence (AUTOIN of %), the system waits for an ACT-USER command (indefinitely if an output-only printer terminal is connected).

INPUT FORMAT

ED-CID-VC: [TID] : CPORT, VCNUM: [CTAG] : : [VCTYPE] , [LCN] , [AUTOIN] , [X25COA] ,
[AMSGITMR] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{2-5, 7-12} Default: Entry Required Addressing: None Description: Control Port, specifies the physical communication port number on the APS control system.
VCNUM	{1-8} Default: Entry Required Addressing: None Description: Virtual Channel Number, specifies the X.25 virtual channel within the specified CPORT.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

VCTYPE	{PVC, SVC}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Virtual Circuit Type, specifies the type of virtual circuit for the indicated X.25 virtual channel. Values are:
	PVC	Permanent Virtual Circuit
	SVC	Switched Virtual Circuit (incoming SVC if AUTOIN of %, outgoing SVC if AUTOIN of <UID>).
	Restrictions:	ED-CID-VC is denied if VCTYPE of PVC is entered and an X25COA value or AMSGITMR value is entered. ED-CID-VC is denied if VCTYPE of SVC and an LCN value is entered. ED-CID-VC is denied if VCTYPE of SVC and AUTOIN of <UID> is entered and the TYPE parameter in ENT-USER is <i>not</i> PRN for the specified <UID>. ED-CID-VC is denied if VCTYPE of SVC and AUTOIN of % is entered and an X25COA value or AMSGITMR value is entered.
LCN	{1-8, <NoVal>}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Logical Channel Number, specifies the logical channel number for an X.25 PVC. Values are:
	1-8	Logical Channel Number 1 through 8 for PVC.
	<NoVal>	No Value, LCN must be unpopulated if VCTYPE of SVC is entered.
	Restrictions:	ED-CID-VC is denied if an LCN value greater-than the HIPVC value in ED-CID-OSPORT is entered. ED-CID-VC is denied if an LCN value and VCTYPE of SVC is entered.
AUTOIN	{%, <UID>}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Automatic Login, specifies whether a User ID is automatically logged-in on the specified PVC or outgoing SVC channel. Values are:
	%	No Automatic Login, a normal log-on sequence (via ACT-USER) is required to access the system, or UID Auto Login for X.25 incoming SVCs is specified by ENT-OSADDR-SITE.
	<UID>	UID Automatically Logged-on, the entered User ID (UID) is automatically logged-on when the outgoing SVC or PVC channel is in service.
	Restrictions:	ED-CID-VC is denied if AUTOIN of <UID> and VCTYPE of SVC is entered and the TYPE parameter in ENT-USER is <i>not</i> PRN for the specified <UID>. ED-CID-VC is denied if AUTOIN of % and VCTYPE of SVC is entered and an X25COA value or AMSGITMR value is entered.

X25COA	{<1–15 INTEGER X.25_CALL_OUT_ADDRESS>, <NoVal>}
Default:	<Previously existing value> (for VCTYPE of SVC and AUTOIN of <UID>) <NoVal> (for VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of %)
Addressing:	None
Description:	X.25 Call Out Address, specifies the X.25 Call Out Address of the called DTE for outgoing SVCs. Leading zeros are not truncated. Values are: <CALL_OUT_ADDRESS> 1–15 Integer X.25 Call Out Address. <NoVal> No Value, X25COA is unpopulated for VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of %.
Restrictions:	ED–CID–VC is denied if an X25COA value is entered and VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of % is entered.
AMSGITMR	{15–3600, <NoVal>}
Default:	<Previously existing value> (for VCTYPE of SVC and AUTOIN of <UID>) <NoVal> (for VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of %)
Addressing:	None
Description:	Autonomous (X.25 Call Out) Message Inactivity Timer, specifies the number of seconds the system waits for another autonomous message before terminating the X.25 outgoing SVC session. Expiration of the AMSGITMR indicates that no autonomous messages in the output message queue remain to be transmitted. Values are: 15–3600 15 to 3600 seconds. <NoVal> No Value, AMSGITMR is unpopulated for VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of %.
Restrictions:	ED–CID–VC is denied if an AMSGITMR value is entered and VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of % is entered.

SUCCESSFUL RESPONSE FORMAT

```

M <CTAG> COMPLD
/* <CPORT>, <VCNUM>, <VCTYPE>, [<LCN>], <AUTOIN>[, <X25COA>, <AMSGITMR>] */
/* Warning: REMOVE and RESTORE (RMV-CID/RST-CID) to use OS parameters */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

CPORT	{2–5, 7–12} Control Port, identifies the physical control port number.
VCNUM	{1–8} Virtual Channel Number, identifies the X.25 virtual channel within the specified X.25 CPORT.
VCTYPE	{PVC, SVC} Virtual Circuit Type, identifies the type of virtual circuit for the indicated X.25 virtual channel. Values are: PVC Permanent Virtual Circuit. SVC Switched Virtual Circuit (incoming SVC if AUTOIN of %, outgoing SVC if AUTOIN of <UID>).
LCN	{1–8, <NoVal>} Logical Channel Number, identifies the logical channel number for the X.25 PVC. A value for LCN is only returned if VCTYPE is PVC.

AUTOIN	<p>{%, <UID>}</p> <p>Automatic Login, indicates whether a User ID is automatically logged-in on the PVC or outgoing SVC virtual channel. Values are:</p> <p>% No Automatic Login, a normal log-on sequence (via ACT-USER) is required to access the system, or UID Auto Login for X.25 incoming SVCs is specified by ENT-OSADDR-SITE.</p> <p><UID> UID Automatically Logged-in, the entered User ID (UID) is automatically logged-in whenever the PVC or outgoing SVC is in service.</p>
X25COA	<p>{<1-15 INTEGER X.25_CALL_OUT_ADDRESS>, <NoVal>}</p> <p>X.25 Call Out Address, indicates the X.25 Call Out Address of the called DTE for outgoing SVCs. A value for X25COA is only returned if VCTYPE is SVC and AUTOIN is <UID>.</p>
AMSGITMR	<p>{15-3600, <NoVal>}</p> <p>Autonomous (X.25 Call Out) Message Inactivity Timer, indicates the number of seconds the system waits for another autonomous message before terminating the X.25 outgoing SVC session. Expiration of the AMSGITMR indicates that no autonomous messages in the output message queue remain to be transmitted. A value for AMSGITMR is only returned if VCTYPE is SVC and AUTOIN is <UID>.</p>

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid /* Illegal Input: Unable to find requested vc */ /* Illegal Input: OS Port must be defined before adding a vc */ /* Illegal Input: PROTOCOL */ /* Illegal Input: LCN */ /* LCN matches an existing PVC's LCN */ /* LCN cannot be larger than HIPVC */ /* Auto Login cannot be assigned to SVCs with this command */ /* AUTO LOGIN (Illegal AUTOIN) */ /* AUTO LOGIN (Duplicate AUTOIN in OSADDR) */ /* AUTO LOGIN (Duplicate AUTOIN in OSDB) */ /* AUTO LOGIN (Non-existent AUTOIN) */ /* Illegal Input: AUTOIN */ /* Invalid CID <CPORT> entered */ /* CID <CPORT> does not exist */ /* X25 vc <VCNUM> does not exist */ /* This CID is pending removal */ /* This CID <CPORT> is not an X.25 vc */ /* The user on this CID is in the process of logging out */ /* X25 vc <VCNUM> already exists */ /* This CID <CPORT> is not configured for X.25 */
SDBE	Status, internal Data Base Error /* Illegal Input: Unable to read OSDB – status = <status number> */ /* Unable to update OSDB – status = <status number> */

EXAMPLES

The following example, the provisioning for CPORT 2, VCNUM 1 is changed to a PVC channel on logical channel 3 with no UID auto-login.

```
ED-CID-VC::2,1::PVC,3,%;
```

The output response shown below assumes CID 1 was used to enter the command and a system generated CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
/* 2,1,PVC,3,% */
/* Warning:REMOVE and RESTORE (RMV-CID/RST-CID) to use OS parameters */
/* ED-CID-VC::2,1::PVC,3,% [P71061] (1) */

COMMAND CODE: **ED-CONF-T1**
COMMAND NAME: **EDIT CONFERENCE T1**

PURPOSE

ED-CONF-T1 enables the user to modify the circuit identification (CKTID) or the redline (RDL) status associated with a T1 conference connection. It does not enable changes to existing cross-connections.

If ampersand ranging (&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

ENT-CONF-T1 is denied if:

- Either the MASTER or TO AIDs are invalid or null.
- The RDL parameter is specified together with any other parameter.
- The specified MASTER and/or TO do not refer to a T1 or VT1.

INPUT FORMAT

ED-CONF-T1 : [TID] : MASTER, TO : [CTAG] : : [CKTID=] [, RDL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
MASTER	DS1_AID:		
	{T1-{1-59392}}		(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}		(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}		(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}		(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}		(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}		(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}		(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	None	
	Description:	DS1 or VT1 AID. Identifies the head (receive side from the network) of the T1/VT1 conference connection.	
TO	DS1_AID:		
	{T1-{1-59392}}		(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}		(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}		(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}		(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}		(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}		(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}		(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	DS1 or VT1 AID. Identifies the tail (transmit side to the network) of a broadcast conference connection.	

CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CKTID=	< 0–45 VALID CKTID CHARACTERS > Default: < Previously existing value > Addressing: None Description: MASTER and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string. Restrictions: CKTID can not be changed in same command execution used to change redline status of the connection
RDL=	{N, Y} Default: < Previously existing value > Addressing: None Description: N = connection is not redlined, Y = connection is redlined. Restrictions: Redline status cannot be changed in same command execution used to change CKTID.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
IDNC	Input, Data Not Consistent
SDBE	Status, internal Data Base Error
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, an existing one-way broadcast conference connection between port T3T1-1-25 (MASTER) and each of the ports T3T1-12-8, T3T1-12-9, T3T1-12-10, and T3T1-15-28 is assigned a circuit ID of TESTCKT.

```
ED-CONF-T1::T3T1-1-25,T3T1-12-8&&-10&T3T1-15-28:::CKTID="TESTCKT";
```

COMMAND CODE: **ED-CONF-VT1**
COMMAND NAME: **EDIT CONFERENCE VT1**

PURPOSE

ED-CONF-VT1 enables the user to modify the circuit identification (CKTID) or the redline (RDL) status associated with a VT1 conference connection. It does not enable changes to existing cross-connections.

If ampersand ranging (&&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

ED-CONF-VT1 is denied if:

- Either the MASTER or TO AIDs are invalid or null.
- The RDL parameter is specified together with any other parameter.
- The specified MASTER and TO do not refer to VT1.5.

INPUT FORMAT

ED-CONF-VT1 : [TID] : MASTER, TO : [CTAG] : : : [CKTID=] [, RDL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
MASTER	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID. Identifies the head (receive side from the network) of a broadcast conference connection. A one-way cross-connection is established from the conference head to the conference tail.
TO	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID. Identifies the tail (transmit side to the network) of a broadcast conference connection.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

CKTID= < 0–45 VALID CKTID CHARACTERS >
Default: < Previously existing value >
Addressing: None
Description: MASTER and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.
Restrictions: CKTID can not be changed in same command execution used to change redline status of the connection.

RDL= {N, Y}
Default: < Previously existing value >
Addressing: None
Description: N = connection is not redlined, Y = connection is redlined.
Restrictions: Redline status cannot be changed in same command execution used to change CKTID.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
IDNC	Input, Data Not Consistent
SDBE	Status, internal Data Base Error
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a one-way broadcast conference connection is established between port EC1VT1-1-7-4 (MASTER) and each of the ports EC1VT1-12-3-1, EC1VT1-12-3-3, and EC1VT1-15-1-2. The connection is assigned a circuit ID of TESTCKT.

```
ED-CONF-VT1::EC1VT1-1-7-4,EC1VT1-12-3-1&&-3&EC1VT1-15-1-2:::
  CKTID="TESTCKT" ;
```

In the following example, the one-way broadcast conference connections are redlined.

```
ED-CONF-VT1::EC1VT1-1-7-4,EC1VT1-12-3-1&&-3&EC1VT1-15-1-2:::RDL=Y;
```

COMMAND CODE: **ED-CRS-STs1**
COMMAND NAME: **EDIT CROSS-CONNECT STs1**

PURPOSE

The ED-CRS-STs1 command provides for editing an STs-1 level cross-connection that has been previously established via ENT-CRS-STs1. Permitted conversions are among 2WAY, 2WAYPR, and 2WAYDC connections.

When the ED-CRS-STs1 command is successfully completed with CCT of 2WAYPR or 2WAYDC, an STs-1 FFP will be created using the default values defined in ED-FFP-STs1 (e.g., the STs-1 within the working or protect ring will be selected, and the STs1 within the other (protect or working) ring will be standby).

When the ED-CRS-STs1 command is successfully completed with CCT of 2WAY, the STs1 FFP will be deleted and the STBYH/WRK secondary state on the FROM and TO STs1 ports within the ring OC3 or OC12 will be cleared.

If ampersand ranging (&&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

ED-CRS-STs1 is denied if:

- The specified FROM and TO ports are not cross-connected, i.e., they do not have SST of ACT or BUSY.
- Either of the specified FROM or TO ports is in a loopback (an SST of LPBK) or a test access operation (an SST of TS).
- The specified FROM and TO values are identical (the same STs1 port).
- The ED-CRS-STs1 command is used to change a 1WAY connection to a 2WAY, 2WAYPR, or a 2WAYDC connection.
- The specified STs1 is in a 2WAY ring pass through connection.
- The requested cross-connect type is explicitly specified in the command (not system default), and it is the same as the existing value.
- An invalid parameter value or combination of parameter values is entered.
- The FROM and TO ports are not connected in a 2WAY, 2WAYPR, or 2WAYDC connection.
- When changing from a ring type connection (2WAYPR or 2WAYDC) to an unprotected 2WAY connection, the even side OCx is specified.
- The FROM or TO port is involved in a ring connection, and a ring protection switch is in progress.
- The mate STs1 of the specified FROM or TO STs1 port within the ring OC3/OC12 is not provisioned and CCT of 2WAYPR or 2WAYDC is specified.
- The mate VT1 of the specified FROM or TO STs1 port within the ring OC3/OC12 has a different STSMAP and CCT of 2WAYPR or 2WAYDC is specified.
- CCT=2WAYPR, the odd STs1 of the ring OCn is in a matrix loopback, and the odd+1 is not OOS-MA or OOS-AUMA.
- CCT is specified and the existing connection is a pass through connection.
- A CCT value is specified that is identical to the CCT value of the existing connection.

INPUT FORMAT

ED-CRS-STs1 : [TID] : **FROM, TO** : [CTAG] : : [CCT] : [**CKTID=**][**,CKTIDTF=**][**,RDL=**];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

FROM	<p>STS1_AID:</p> <p>{EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#)</p> <p>{OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#)</p> <p>{OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#)</p> <p>Default: Entry Required</p> <p>Addressing: &&-ranging and &-grouping</p> <p>Description: STS1 AID. Either the FROM or TO AID may be used to identify an STS1 within a ring OC3 or OC12.</p>

CCT	<p>{2WAY, 2WAYPR, 2WAYDC}</p> <p>Default: <Previously Existing Value></p> <p>Note: If no CCT value is specified, the system will default to the previously existing CCT value and the command will be executed without change to the cross-connect type. In the case of 2WAYPR and 2WAYDC, the command will be executed without change to Preferred/Alternate Ports regardless of which AIDs in the ring pair(s) are specified.</p> <p>Addressing: None</p> <p>Description: Cross-Connect Type. Values are:</p> <table> <tr> <td>2WAY</td><td>Two-Way drop (through matrix) connection</td></tr> <tr> <td>2WAYPR</td><td>Two-Way Path Protected Ring connection</td></tr> <tr> <td>2WAYDC</td><td>Two-Way Drop and Continue connection</td></tr> </table>	2WAY	Two-Way drop (through matrix) connection	2WAYPR	Two-Way Path Protected Ring connection	2WAYDC	Two-Way Drop and Continue connection
2WAY	Two-Way drop (through matrix) connection						
2WAYPR	Two-Way Path Protected Ring connection						
2WAYDC	Two-Way Drop and Continue connection						
CKTID=	<p>< 0-45 VALID CKTID CHARACTERS ></p> <p>Default: < Previously existing value ></p> <p>Addressing: None</p> <p>Description: FROM and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.</p>						
CKTIDTF=	<p>< 0-45 VALID CKTIDTF CHARACTERS ></p> <p>Default: < Previously existing value ></p> <p>Addressing: None</p> <p>Description: To and FROM Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.</p> <p>Restrictions: ED-CRS-STs1 is denied if CKTIDTF and CCT=1WAY are specified.</p>						

RDL= {N, Y}
Default: < Previously existing value >
Addressing: None
Description: N = connection is not redlined, Y = connection is redlined.
Restrictions: ED-CRS-STs1 is denied if RDL=Y or RDL=N is specified together with any other parameter.
ED-CRS-STs1 is denied if RDL=Y is specified and the connection is already designated as a 2WAYDC continue path ring connection.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Cannot use B2 side AID to edit to 2WAY*/
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SARB	Status, All Resources Busy /*A switch is in progress for this protection group*/ /*Please try the command again later*/
SDBE	Status, internal Data Base Error /*CONN Database Error: <ERROR-STRING> for <AID>*/ /*RPP Database Error: <ERROR-STRING> for <AID>*/ /*TP Database Error: <ERROR-STRING> for <AID>*/
SNVS	Status, Not in Valid State /*B2 Cannot Be Working*/
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a two-way STS1 linear cross-connection between ports OC3STS1-7-1 (FROM), which is an STS1 embedded within an OC3 and OC3STS1-12-3 (TO) which is an STS1 embedded within a ring OC3, is converted to a two-way path ring cross-connection. In addition, the cross-connection is assigned a circuit ID of TESTCKTID4.

```
ED-CRS-STs1::OC3STS1-7-1,OC3STS1-12-3:::2WAYPR:CKTID="TESTCKTID4";
```

In the following example, the cross-connection is changed to redlined.

```
ED-CRS-STs1::OC3STS1-7-1,OC3STS1-12-3:::RDL=Y";

COMMAND CODE: **ED-CRS-STS3C**
COMMAND NAME: **EDIT CROSS-CONNECTION STS-3C**

PURPOSE

This command enables editing of circuit IDs and redline states for STS-3C level cross-connections previously established via ENT-CRS-STS3C.

If ampersand ranging (&&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

ED-CRS-STS1 is denied if:

- The ports specified by FROM and TO AIDs are not cross connected, i.e. they are not already in ACT or BUSY secondary state from having been provisioned (using ENT-STS3C).
- The specified state for the cross-connection already exists.
- An invalid parameter value or combination of parameter values is entered.
- Any of the AIDs specified are involved in a loopback or test access.

INPUT FORMAT

ED-CRS-STS3C : : [TID] :FROM, TO: [CTAG] : : : [CKTID=] [, CKTIDTF=] [, RDL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
FROM	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID. In a one-way cross-connect, FROM identifies the receive side (from the network) of the cross-connection specified by the FROM,TO AID pair. In a two-way cross-connect, either AID of the cross-connection may be used as the FROM AID. Restrictions: Entries are limited to those previously selected using ENT-STS3C.
TO	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID. In a one-way cross-connect, TO identifies the transmit side (to the network) of the cross-connection specified by the FROM,TO AID pair. In a two-way cross-connect, either AID of the cross-connection may be used as the TO AID. Restrictions: Entries are limited to those previously selected using ENT-STS3C.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

CKTID=	< 0–45 VALID CKTID CHARACTERS >	
	Default:	< Previously existing value >
	Addressing:	None
	Description:	FROM and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.
CKTIDTF=	< 0–45 VALID CKTIDTF CHARACTERS >	
	Default:	< Previously existing value >
	Addressing:	None
	Description:	To and FROM Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.
RDL=	{N, Y}	
	Default:	< Previously existing value >
	Addressing:	None
	Description:	N = connection is not redlined, Y = connection is redlined.
	Restrictions:	ED–CRS–STS3C is denied if CKTIDTF and CCT=1WAY are specified.
	Restrictions:	ED–CRS–STS3C is denied if RDL=Y or RDL=N is specified together with any other parameter.

SUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SARB	Status, All Resources Busy
SDBE	Status, internal Data Base Error
SDNC	Status, Data Not Consistent
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a circuit ID of TESTCKT is assigned to a one-way STS-3C cross-connection previously established between ports OC3STS3C-3, an STS-3C embedded within an OC-3 (FROM) and OC3STS3C-7, an STS-3C embedded within an OC-3 (TO).

```
ED-CRS-ST3C:::OC3STS3C-3,OC3STS3C-7:::CKTID="TESTCKT";
```

In the following example, the cross-connection is redlined

```
ED-CRS-ST3C:::OC3STS3C-3,OC3STS3C-7:::RDL=Y;
```

COMMAND CODE: **ED-CRS-T1**
COMMAND NAME: **EDIT CROSS-CONNECT T1**

PURPOSE

The ED-CRS-T1 command provides for editing a T1 level cross-connection that has been previously established via ENT-CRS-T1. Permitted conversions are among 2WAY, 2WAYPR, and 2WAYDC connections.

When the ED-CRS-T1 command is successfully completed with CCT of 2WAYPR or 2WAYDC, a VT1.5 FFP will be created using the default values defined in ED-FFP-VT1 (e.g., the VT1.5 within the working or protect ring will be selected, and the VT1.5 within the other (protect or working) ring will be standby).

When the ED-CRS-T1 command is successfully completed with CCT of 2WAY, the VT1.5 FFP will be deleted and the STBYH/WRK secondary state on the FROM and TO VT1.5 ports within the ring OC-3 or OC12 will be cleared.

If ampersand ranging (&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

ED-CRS-T1 is denied if:

- The specified FROM and TO ports are not cross-connected, i.e., they do not have SST of ACT or BUSY.
- Either of the specified FROM or TO port is in a loopback (a SST of LPBK), is in a test access operation (a SST of TS), or is in a rolling operation (an SST of ROLL).
- The specified FROM and TO values are identical.
- An invalid parameter value or combination of parameter values is entered.
- The ED-CRS-T1 command is used to change a 1WAY connection to a 2WAY, 2WAYPR, or a 2WAYDC connection.
- The requested cross-connect type is explicitly specified in the command (not system default), and it is the same as the existing value.
- The FROM and TO ports are not connected in a 2WAY, 2WAYPR, or 2WAYDC connection.
- When changing from a ring type connection (2WAYPR or 2WAYDC) to an unprotected 2WAY connection, the even side OCx is specified.
- The FROM or TO port is involved in a ring connection, and a ring protection switch is in progress.
- The mate STS1 of the specified FROM or TO STS1 port within the ring OC3/OC12 is not provisioned and CCT of 2WAYPR or 2WAYDC is specified.
- The mate VT1 of the specified FROM or TO VT1 port within the ring OC3/OC12 has a different VTMAP, and CCT of 2WAYPR or 2WAYDC is specified.
- CCT=2WAYPR, the odd VT1 of the ring OCn is in a matrix loopback, and the odd+1 is not OOS-MA or OOS-AUMA.
- CCT is specified and the existing connection is a pass through connection.
- A CCT value is specified that is identical to the CCT value of the existing connection.

INPUT FORMAT

ED-CRS-T1 : [TID] : FROM, TO : [CTAG] : : [CCT] : [CKTID=] [, CKTIDTF=] [, RDL=] ;

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Cannot use B2 side AID to edit to 2WAY*/
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SARB	Status, All Resources Busy /*A switch is in progress for this protection group*/ /*Please try the command again later*/
SDBE	Status, internal Data Base Error /*CONN Database Error: <ERROR-STRING> for <AID>*/ /*RPP Database Error: <ERROR-STRING> for <AID>*/ /*TP Database Error: <ERROR-STRING> for <AID>*/
SNVS	Status, Not in Valid State /*B2 Cannot Be Working*/
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a two-way DS1 to VT1.5 linear cross-connection between ports OC3T1-15-3-1 (FROM) which is embedded within a linear OC3, and OC3VT1-27-3-1-1 (TO) which is a VT1.5 embedded within a ring OC-3, is converted to a two-way path ring cross-connection. In addition, this cross-connection is assigned a circuit ID of TESTCKT3.

```
ED-CRS-T1::OC3T1-15-3-1,OC3VT1-27-3-1-1:::2WAYPR:CKTID="TESTCKT3";
```

In the following example the cross-connection is redlined.

```
ED-CRS-T1::OC3T1-15-3-1,OC3VT1-27-3-1-1:::RDL=Y;
```

COMMAND CODE: **ED-CRS-T3**
COMMAND NAME: **EDIT CROSS-CONNECT T3**

PURPOSE

The ED-CRS-T3 command provides for editing an T3 level cross-connection that has been previously established via ENT-CRS-T3. Permitted conversions are among 2WAY, 2WAYPR, and 2WAYDC connections.

When the ED-CRS-T3 command is successfully completed with CCT of 2WAYPR or 2WAYDC, an STS-1 FFP will be created using the default values defined in ED-FFP-ST51 (e.g., the STS-1 within the working or protect ring will be selected, and the STS-1 within the other (protect or working) ring will be standby).

When the ED-CRS-T3 command is successfully completed with CCT of 2WAY, the STS-1 FFP will be deleted and the STBYH/WRK secondary state on the FROM and TO STS-1 ports within the ring OC3 or OC12 will be cleared.

If ampersand ranging (&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

ED-CRS-T3 is denied if:

- The specified FROM and TO ports are not cross-connected, i.e., they do not have SST of ACT or BUSY.
- Either of the specified FROM or TO port is in a loopback (an SST of LPBK) or is in a test access operation (an SST of TS).
- The specified FROM and TO values are identical.
- An invalid parameter value or combination of parameter values is entered.
- The ED-CRS-T3 command is used to change a 1WAY connection to a 2WAY, 2WAYPR, or a 2WAYDC connection.
- The requested cross-connect type is explicitly specified in the command (not system default), and it is the same as the existing value.
- The FROM and TO ports are not connected in a 2WAY, 2WAYPR, or 2WAYDC connection.
- When changing from a ring type connection (2WAYPR or 2WAYDC) to an unprotected 2WAY connection, the even side OCx is specified.
- The FROM or TO port is involved in a ring connection, and a ring protection switch is in progress.
- The mate STS1 of the specified FROM or TO STS1 port within the ring OC3/OC12 is not provisioned and CCT of 2WAYPR or 2WAYDC is specified.
- The mate STS1 of the specified FROM or TO STS1 port within the ring OC3/OC12 has a different STSMAP and CCT of 2WAYPR or 2WAYDC is specified.
- CCT=2WAYPR, the odd STS1 of the ring OCn is in a matrix loopback, and the odd+1 is not OOS-MA or OOS-AUMA.
- CCT is specified and the existing connection is a pass through connection.
- A CCT value is specified that is identical to the CCT value of the existing connection.

INPUT FORMAT

ED-CRS-T3 : [TID] : **FROM, TO** : [CTAG] : : [CCT] : [CKTID=] [, CKTIDTF=] [, RDL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

FROM	DS3_AID: {T3-{1-4800}}	(T3-DS3#)
	STS1_AID: {EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS3 or STS1 AID. Either the FROM or TO AIDs may be used to identify an STS-1 within a ring OC-3 or OC-12.
TO	DS3_AID: {T3-{1-4800}}	(T3-DS3#)
	STS1_AID: {EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)

COMMAND CODE: **ED-CRS-VT1**
COMMAND NAME: **EDIT CROSS-CONNECT VT1**

PURPOSE

The ED-CRS-VT1 command provides for editing a VT1 level cross-connection that has been previously established via ENT-CRS-VT1. Permitted conversions are among 2WAY, 2WAYPR, and 2WAYDC connections.

When the ED-CRS-VT1 command is successfully completed with CCT of 2WAYPR or 2WAYDC, a VT1.5 FFP will be created using the default values defined in ED-FFP-VT1 (e.g., the VT1.5 within the working or protect ring will be selected, and the VT1.5 within the other (protect or working) ring will be standby).

When the ED-CRS-VT1 command is successfully completed with CCT of 2WAY, the VT1.5 FFP will be deleted and the STBYH/WRK secondary state on the FROM and TO VT1.5 ports within the ring OC-3 or OC-12 will be cleared.

If ampersand ranging (&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

ED-CRS-VT1 is denied if:

- The specified FROM and TO ports are not cross-connected, i.e., they do not have SST of ACT or BUSY.
- Either of the specified FROM or TO ports is in a loopback (an SST of LPBK), is in a test access operation (an SST of TS), or is in a rolling operation (an SST of ROLL).
- The specified FROM and TO values are identical (the same VT1.5 port).
- The ED-CRS-VT1 command is used to change a 1WAY connection to a 2WAY, 2WAYPR or 2WAYDC connection.
- The specified VT1.5 is in a 2WAY ring pass-through connection.
- The requested cross-connect type is explicitly specified in the command (not system default), and it is the same as the existing value.
- The FROM and TO ports are not connected in a 2WAY, 2WAYPR, or 2WAYDC connection.
- When changing from a ring type connection (2WAYPR or 2WAYDC) to an unprotected 2WAY connection, the even side OCx is specified, or the odd side OCx is specified while in protection.
- The FROM or TO port is involved in a ring connection, and a ring protection switch is in progress.
- The mate STS1 of the specified FROM or TO STS1 port within the ring OC3/OC12 is not provisioned and CCT of 2WAYPR or 2WAYDC is specified.
- The mate VT1 of the specified FROM or TO VT1 port within the ring OC3/OC12 has a different VTMAP and CCT of 2WAYPR or 2WAYDC is specified.
- CCT=2WAYPR, the odd VT1 of the ring OCn is in a matrix loopback, and the odd+1 is not OOS-MA or OOS-AUMA.
- An invalid parameter value or combination of parameter values is entered.
- CCT is specified and the existing connection is a pass through connection.
- A CCT value is specified that is identical to the CCT value of the existing connection.

Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

FROM	<p>VT1_AID; {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)</p> <p>Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID. Either the FROM or TO AIDs may be used to identify a VT1.5 within a ring OC-3 or OC-12.</p>
TO	<p>VT1_AID; {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)</p> <p>Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID. Either the FROM or TO AIDs may be used to identify a VT1.5 within a ring OC-3 or OC-12.</p>
CTAG	<p>< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.</p>
CCT	<p>{2WAY, 2WAYPR, 2WAYDC} Default: {Previously Existing Value} Note: If no CCT value is specified, the system will default to the previously existing CCT value and the command will be executed without change to the cross-connect type. In the case of 2WAYPR and 2WAYDC, the command will be executed without change to Preferred/Alternate Ports regardless of which AIDs in the ring pair(s) are specified. Addressing: None Description: Cross-Connect Type. Values are: 2WAY Two-Way drop (through matrix) connection 2WAYPR Two-Way Path Protected Ring connection 2WAYDC Two-Way Drop and Continue connection</p>
CKTID=	<p>< 0-45 VALID CKTID CHARACTERS > Default: < Previously existing value > Addressing: None Description: FROM and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.</p>
CKTIDTF=	<p>< 0-45 VALID CKTIDTF CHARACTERS > Default: < Previously existing value > Addressing: None Description: To and FROM Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string. Restrictions: ED-CRS-VT1 is denied if CKTIDTF and CCT=1WAY are specified.</p>

RDL= {N, Y}
Default: < Previously existing value >
Addressing: None
Description: N = connection is not redlined, Y = connection is redlined.
Restrictions: ED-CRS-VT1 is denied if RDL=Y or RDL=N is specified together with any other parameter.
ED-CRS-VT1 is denied if RDL=Y is specified and the connection is already designated as a 2WAYDC continue path ring connection.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]

;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Cannot use B2 side AID to edit to 2WAY*/
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SARB	Status, All Resources Busy /*A switch is in progress for this protection group*/ /*Please try the command again later*/
SDBE	Status, internal Data Base Error /*CONN Database Error: <ERROR-STRING> for <AID>*/ /*RPP Database Error: <ERROR-STRING> for <AID>*/ /*TP Database Error: <ERROR-STRING> for <AID>*/
SNVS	Status, Not in Valid State /*B2 Cannot Be Working*/
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a two-way VT1.5 to VT1.5 linear cross-connection between ports OC3VT1-15-3-7-1 (FROM) which is embedded within a linear OC-3, and OC3VT1-27-3-1-1 (TO) which is a VT1.5 embedded within a ring OC-3, is converted to a two-way path ring cross-connection. This cross-connection is assigned a circuit ID of TESTCKT6.

```
ED-CRS-T1::OC3VT1-15-3-7-1,OC3VT1-27-3-1-1:::2WAYPR:CKTID="TESTCKT6";
```

In the following example the cross-connection is redlined.

```
ED-CRS-T1::OC3VT1-15-3-7-1,OC3VT1-27-3-1-1:::RDL=Y;
```

COMMAND CODE: **ED-DAT**
COMMAND NAME: **EDIT DATE**

PURPOSE

The ED-DAT command sets the system date and time.

An ED-DAT command is denied if:

- An invalid parameter value entered.

Before changing the date and time of the system consider the following:

- Check all pending delayed activation commands to ensure that no conflicts, or dropped/duplicate actions result from the time change.
- Moving the system time forward by one hour within 15 minutes before a daily scheduled PM (performance monitoring) report is scheduled to occur results in cancelling that day's daily PM report.
- Changing the system time forward or backward could result in partial or incomplete 15-Minute and 1-Day PM data.

INPUT FORMAT

ED-DAT: [TID] : : [CTAG] : : DAT, TM;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DAT	{ YY-MM-DD:{00–37, 70–99} – {1–12} – {1–31} } Default: Entry Required Addressing: None Description: Date, specifies the new system date. A specific date is specified by the value format <YY> – <MM> – <DD> where <YY> is the year, <MM> is the month, <DD> is the day, and values for <YY> from 70 through 99 are interpreted as the years 1970 through 1999 and values for <YY> from 00 through 37 are interpreted as the years 2000 through 2037.
TM	{HH-MM-SS:{0–23} – {0–59} – {0–59} } Default: Entry Required Addressing: None Description: Time, specifies the new system time. A specific time is specified by the value format <HH> – <MM> – <SS> where <HH> is the hour, <MM> is the minute, and <SS> is the second.

```

COMMAND CODE: **ED-EC1**
COMMAND NAME: **EDIT EC1**

PURPOSE

The ED-EC1 command modifies the specified EC1 port parameter values previously provisioned using ENT-EC1.

Executing an ED-EC1 command causes the following primary state transitions for the specified EC1. Secondary states associated with the EC1 after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Current PST State is:				
	IS	OOS-AU	OOS-AU,AINS	OOS-AUMA	OOS-MA
IS,<NoVal>	Denied	Denied	Denied	OOS-AU	IS
OOS,<NoVal>	OOS-MA	OOS-AUMA	Denied	Denied	Denied
IS,AINS	OOS-AU,AINS	OOS-AU,AINS	Denied	OOS-AU,AINS	OOS-AU,AINS
IS,AINS-DEA	Denied	Denied	OOS-AU	Denied	Denied
OOS,AINS-DEA	Denied	Denied	OOS-AUMA	Denied	Denied

Note: 1. <NoVal> means no value is entered for the SST parameter.
2. No state change occurs if no value is entered for PST and SST.
3. ED-EC1 is denied if SST of AINS-DEA is entered and the current DS3 state is not OOS-AU,AINS (an SST state of AINS).

When an EC1 is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set for the specified EC1. The MAN condition type is cleared when the EC1 is provisioned to an OOS-AU or IS state.

When an EC1 is in an OOS-MA, OOS-AUMA, or OOS-AU,AINS state, no EC1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the EC1, but EC1 alarm conditions are monitored (retrievable with the RTRV-EC1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-EC1 command) for the EC1. An EC1 in an OOS-AU,AINS state transitions to an IS state when all EC1 near-end alarm conditions for that EC1 have cleared.

An ED-EC1 command is denied if:

- The specified EC1 has not previously been provisioned with the ENT-EC1 command.
- The specified EC1 is being edited from an IS or OOS-AU state to an IS state.
- The specified EC1 is being edited from an OOS-MA or OOS-AUMA state to an OOS,<Null> state.
- The specified EC1 is being edited from an OOS-MA or OOS-AUMA state to an IS or OOS-AU,AINS state and the specified EC1 is in a loopback (the EC1 has an SST of LPBK).
- The specified EC1 is being edited in an IS or OOS-AU state and any of the embedded VT1.5s or STS1s are cross-connected (the EC1 has an SST of TRM), unless CMDMDE=FRCD is used.
- An invalid parameter value or combination of parameter values is entered.

I/O protection switching is disabled if all three EC1 ports supported by the EP3 I/O circuit pack are provisioned to an OOS-MA or OOS-AUMA state. I/O protection switching only occurs if at least one of the supporting EC1s on the supporting EP3 I/O circuit pack is provisioned to an IS or an OOS-AU state.

INPUT FORMAT

ED-EC1 : [TID] : AID : [CTAG] : : : [AINSTH=] [, CMDMDE=] : [PST] [, SST] ;

INPUT PARAMETERS

TID < 1-20 VALID TID CHARACTERS >
Default: <SID>
Addressing: None
Description: Target Identifier, specifies the network node TID for the command.

AID	EC1_AID:	
	{EC1-{1-3840} }	(EC1-EC1/STS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	EC1 AID, identifies the EC1 port or range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
AINSTH=	{HH-MM:{00-48} - {00-59} }	
	Default:	Previously existing value.
	Addressing:	None
	Description:	Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is:
	HH-MM	Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively.
	Restrictions:	If 48 is specified in the HH, then MM has to be 00.
CMDMDE=	{FRCD, NORM}	
	Default:	{Previously Existing Value}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	FRCD	Forced. The command is accepted and parameter values are modified even if a constituent VT1.5/STS1/DS1 is cross-connected (the EC1 has an SST of TRM).
	NORM	Normal. The command is denied if the EC1 is in an IS or OOS-AU state and any constituent VT1.5/STS1/DS1 are cross-connected (the EC1 has an SST of TRM).
PST	{IS, OOS}	
	Default:	<PST VALUE DETERMINED BY THE CURRENT EC1 STATE> (A PST value of IS if the current state is IS or OOS-AU) (A PST value of OOS if the current state is OOS-AUMA or OOS-MA)
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the EC1. Values are:
	IS	In-Service, the EC1 is provisioned to an IS or OOS-AU state.
	OOS	Out-Of-Service, the EC1 is provisioned to an OOS-AUMA or OOS-MA state.
	Restrictions:	ED-EC1 is denied if PST of OOS and SST of AINS is entered.

SST	{AINS, AINS-DEA}
Default:	<Null> (Unpopulated)
Addressing:	None
Description:	Secondary State, specifies the secondary state to provision the EC1. Values are:
AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the EC1 is provisioned to an OOS-AU,AINS state.
AINS-DEA	Automatic In-Service-Deactivate, the EC1 is not provisioned to an OOS-AU,AINS state. The EC1's SST value is entered as <Null> (unpopulated) and the SST state is determined by its provisioned PST value and system detected events.
Restrictions:	ED-EC1 is denied if SST of AINS and PST of OOS is entered. ED-EC1 is denied if SST of AINS-DEA is entered and the current EC1 state is not OOS-AU,AINS (an SST state of AINS).

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Free Form Informational Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SAOS	Status, Already Out of Service
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error updating supported STS1 */
SNVS	Status, Not in Valid State
	/* To edit a non-idle in-service port, set CMDMDE=FRCD */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, EC1 port EC1-24 provisioning is changed to the OOS-AU,AINS state. All other parameter values are unchanged.

```
ED-EC1::EC1-24:::::IS,AINS;
```

In the following example, EC1 port EC1-24 and EC1-26 have previously been provisioned, but EC1-25 has not been provisioned, with the ENT-EC1 command. An ED-EC1 command is entered to change the provisioning of EC1 ports EC1-24 through EC1-26, using &&-ranging, to the OOS-MA state. All other parameter values are unchanged.

```
ED-EC1::EC1-24&&-26::::OOS;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 PRTL
  "EC1-25:ERRCDE=SNVS"
/* Status, Not in Valid State */
/* The port is not provisioned */
/* ED-EC1::EC1-24&&-26::::OOS [Pfc518] (1) */
;
```

RMV-EC1
RST-EC1
RTRV-EC1
```

COMMAND CODE: **ED-EQPT**
COMMAND NAME: **EDIT EQUIPMENT**

PURPOSE

The ED-EQPT command modifies the specified equipment entity state and parameter values previously provisioned using an ENT-EQPT command.

If the specified equipment is being edited to the IS state, an off-line diagnostic test is executed and any applicable firmware (except for an MCB), software, and provisioning data are downloaded before the equipment is placed in-service. If CMDMDE=NORM is entered and the download fails, the ED-EQPT command is denied. If CMDMDE of FRCD is entered and the diagnostic test fails, the ED-EQPT command is completed, the equipment entity transitions to the appropriate state, and an equipment-specific failure condition type is set. If an ACM, CIM, CPU, DSK, ICM, SIO, or SPB equipment entity is specified and a CMDMDE of FRCD is entered and any download fails, the ED-EQPT command is denied (CMDMDE of FRCD is treated the same as a CMDMDE of NORM for an ACM, CIM, CPU, DSK, ICM, SIO, or SPB equipment entity). If CMDMDE of FRCD is entered and an equipment entity other than an ACM, CIM, CPU, DSK, ICM, SIO, or SPB is specified and the download fails, the command is completed and an equipment-specific condition type is set for the failed equipment entity.

Executing an ED-EQPT command on a DSI, EP3, ES1, HMU, or LMU equipment entity to edit it to an OOS state does not cause a protection switch to the entity's redundant equipment unit. If ED-EQPT is executed on a DSI, EP3, ES1, HMU, or LMU with CMDMDE of FRCD (to edit it to an OOS state), the command completes successfully regardless of whether the equipment unit is switched to protection.

If a one-plus-one redundant equipment entity (i.e., a DSB, IOB, or SI48 EOB) is specified to edit the entity to an OOS state with CMDMDE of NORM and the redundant equipment is in an IS state, ED-EQPT completes successfully if and only if all functions supported are transferred (switched) to the redundant equipment. Upon successful completion, an NSA MAN condition is set. If CMDMDE of FRCD is entered instead, ED-EQPT completes successfully regardless of the state of the redundant copy. If all functions supported are switched to the redundant equipment, an NSA MAN condition is set, otherwise an SA MAN condition is set.

The ED-EQPT command accepts LT4 and LT8 AIDs. The **GRTHTYPE** and **CMDMDE** parameters are the only parameters that can legally be used with these AIDs. If an attempt is made to upgrade an LT4 AID to an LT8 and the command is syntactically correct, a check is made to see if one or both of the supporting interface modules for that LT4 is a CIM. If an LT4 or LT8 AID is provided (with an appropriate **GRTHTYPE**) and the command is successfully executed, the LT4 (or LT8) will then be viewed as though it were an LT8 (or LT4) all of the time.

Executing an ED-EQPT command causes the following primary state transitions for the specified equipment entity. Secondary states associated with the equipment entity before and after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions for each type of equipment entity.

Current PST	Next PST State if ED-EQPT Completed with PST,SST Value of:			
	IS,<NoVal>	IS,MT-DEA	OOS,<NoVal>	OOS,MT-DEA
For EP3, ES1, M16, M32, M40, O1B, O4M, and S3M Equipment Entities:				
IS	Denied	Denied	OOS-MA	Denied
IS-ANR	Denied	Denied	OOS-MA	Denied
OOS-AU	IS (if eqpt functional) IS-ANR (diags fail) OOS-AU (download fails)	Denied	OOS-MA (if eqpd) OOS-AUMA,UEQ	Denied
OOS-AUMA	OOS-AU	Denied	Denied	Denied
OOS-AUMA,MT (Not valid for M40)	Denied	OOS-AU	Denied	OOS-AUMA

Current PST	Next PST State if ED-EQPT Completed with PST,SST Value of:			
	IS,<NoVal>	IS,MT-DEA	OOS,<NoVal>	OOS,MT-DEA
OOS-MA	IS (if eqpt functional) IS-ANR (diags fail) OOS-AU (download fails)	Denied	Denied	Denied
OOS-MA,MT (Not valid for M40)	Denied	IS (if eqpt functional) IS-ANR (diags fail) OOS-AU (download fails)	Denied	OOS-MA
For CDA, CDB, EOB, IOB, IPB, MCB, P39, P56, OXB, and RPB Equipment Entities:				
IS	Denied	Denied	OOS-MA	Denied
IS-ANR	Denied	Denied	OOS-MA	Denied
OOS-AU	IS (if eqpt functional) IS-ANR (diags fail) OOS-AU (provisioning fails)	Denied	OOS-MA (if eqpd) OOS-AUMA,UEQ	Denied
OOS-AUMA	OOS-AU	Denied	Denied	Denied
OOS-MA	IS (if eqpt functional) IS-ANR (diags fail) OOS-AU (provisioning fails)	Denied	Denied	Denied
For DSI, LMU, and HMU Equipment Entities:				
IS	Denied	Denied	OOS-MA	Denied
IS-ANR	Denied	Denied	OOS-MA	Denied
OOS-AU	IS (if eqpt functional) IS-ANR (diags fail) OOS-AU (provisioning fails)	Denied	OOS-MA (if eqpd) OOS-AUMA,UEQ	Denied
OOS-AUMA	OOS-AU	Denied	Denied	Denied
OOS-AUMA,MT	Denied	OOS-AU	Denied	OOS-AUMA
OOS-MA	IS (if eqpt functional) IS-ANR (diags fail)	Denied	Denied	Denied
OOS-MA,MT	Denied	IS (if eqpt functional) IS-ANR (diags fail)	Denied	OOS-MA
For ACM, CIM, CPU, DSB, ICM, IPU, SIO, and SPB Equipment Entities:				
IS	Denied	Denied	OOS-MA	Denied
OOS-AU	IS (if eqpt functional) OOS-AU (provisioning fails)	Denied	OOS-MA (if eqpd) OOS-AUMA,UEQ	Denied
OOS-AUMA	OOS-AU	Denied	Denied	Denied
OOS-MA	IS (if eqpt functional) OOS-AU (provisioning fails)	Denied	Denied	Denied
For PSF Equipment Entities:				
IS	Denied	Denied	OOS-MA	Denied

Current PST	Next PST State if ED-EQPT Completed with PST,SST Value of:			
	IS,<NoVal>	IS,MT-DEA	OOS,<NoVal>	OOS,MT-DEA
OOS-AU	Denied	Denied	OOS-MA (if eqpd) OOS-AUMA,UEQ	Denied
OOS-AUMA	OOS-AU	Denied	Denied	Denied
OOS-MA	IS (if eqpt functional) OOS-AU (Pwr-Lock Off)	Denied	Denied	Denied
For DSK Equipment Entities:				
IS	Denied	Denied	OOS-MA	Denied
OOS-AU	IS (if disk equalizes) OOS-AU (equalization fails)	Denied	OOS-MA	Denied
OOS-MA	IS (if disk equalizes) OOS-AU (equalization fails)	Denied	Denied	Denied
For QUAD and SHELF Equipment Entities:				
IS	IS	Denied	Denied	Denied

If the specified equipment entity is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set and any equipment-specific condition types that may exist are cleared for the specified entity.

If the specified equipment entity is edited to an IS, IS-ANR, or OOS-AU state, a MAN condition type is cleared. An IMPROPRMVL condition type is set for the specified equipment entity if the specified equipment is not installed in the system. If the specified equipment is installed in the system but is partially or totally failed, an equipment specific condition type is set for the specified equipment entity.

When a DSB is successfully edited to a PST of IS, all of the upper-layer parameters and specific lower-layer parameters are initialized. When the DSB is successfully edited to a PST of OOS, the OSIPARMISM condition is cleared if set, on the addressed DSB or its mate.

When an O1B is successfully edited to an OOS state with CMDMDE of NORM, the Section and/or Line DCC on the contained OC3 (if enabled) is disabled and the DUPTARPEENTRY is cleared if set on the addressed DSB/OC3.

When an O4M is successfully edited to an OOS state with CMDMDE of NORM, the Section and/or Line DCC on the contained OC12 (if enabled) is disabled and the DUPTARPEENTRY is cleared if set on the addressed DSB/OC12.

If a DSI, EP3, ES1, O1B, O4M, S3M, HMU, LMU, M16, or M32 circuit pack is edited to deactivate an SST of MT (ED-EQPT with SST of MT-DEA entered), a TSA condition type is cleared for the specified DSI, EP3, ES1, O1B, O4M, S3M, HMU, LMU, M16, or M32.

Refer to Appendix C, Condition Types for a list and definition of condition types.

If AID is set to SHELF, the LHSTYPE and/or UHSTYPE parameter can be changed to one of the values within the following groups :

- Group-1 : EP3F36, EP3E36, EP3S36, ES136
- Group-2 : EP3T48, EP3F48, EP3E48, EP3S48, ES148
- Group-3 : O1BFH48, O1BSH48
- Group-4 : O4MFH48, O4MSH48

Tables EDEQPT-1, EDEQPT-2, EDEQPT-3, and EDEQPT-4 illustrate the effects of changing the LHSTYPE/ UHSTYPE parameter values when AID is set to SHELF.

Table EDEQPT–1: Editing of LHSTYPE or UHSTYPE within Group–1

From Current LHSTYPE or UH- STYPE	To New LHSTYPE or UHSTYPE			
	EP3F36	EP3E36	EP3S36	ES136
EP3F36	Successful ¹	Successful/Denied ²		
EP3E36	Successful ¹	Successful ¹	Successful/Denied ²	
EP3S36	Successful ¹		Successful ¹	Successful/Denied ²
ES136	Successful ¹	Successful/Denied ²		Successful ¹

Table EDEQPT–2: Editing of LHSTYPE or UHSTYPE within Group–2

From Current LHSTYPE or UH- STYPE	To New LHSTYPE or UHSTYPE			
	EP3F48	EP3E48	EP3S48	ES148
EP3F48	Successful ¹	Successful/Denied ²		
EP3E48	Successful ¹	Successful ¹	Successful/Denied ²	
EP3S48	Successful ¹		Successful ¹	Successful/Denied ²
ES148	Successful ¹	Successful/Denied ²		Successful ¹

Table EDEQPT–3: Editing of LHSTYPE or UHSTYPE within Group–3

From Current LHSTYPE or UH- STYPE	To New LHSTYPE or UHSTYPE	
	O1BFH48	O1BSH48
O1BFH48	Successful ¹	Successful/Denied ²
O1BSH48	Successful ¹	Successful ¹

Table EDEQPT–4: Editing of LHSTYPE or UHSTYPE within Group–4

From Current LHSTYPE or UH- STYPE	To New LHSTYPE or UHSTYPE	
	O4MFH48	O4MSH48
O4MFH48	Successful ¹	Successful/Denied ²
O4MSH48	Successful ¹	Successful ¹

Note :

- The command is Successful regardless of provisioning status.
If provisioned, the command is successful regardless if the module is carrying traffic.
 - The command is Successful only if none of the modules within the half shelf are provisioned.
Or else, the command is Denied and an error code SNVS is sent.
- An ED–EQPT command is denied if:
- The specified equipment entity has not previously been provisioned with the ENT–EQPT command.
 - A PST of IS is entered and the specified equipment entity is already in–service (a PST of IS, IS–ANR).

- A PST of IS is entered and the specified equipment entity is in a state other than OOS–AUMA or OOS–MA.
- A PST of IS and a CMDMDE of NORM is entered and the specified equipment entity is not functional.
- A PST of IS and a CMDMDE of FRCD is entered and a ACM, CIM, CPU, DSK, ICM, SIO, or SPB equipment entity is specified and the equipment entity is not functional.
- A PST of OOS is entered and the specified equipment entity is already in an OOS–MA or OOS–AUMA state.
- A PST of OOS and a DSI, EP3, ES1, HMU, or LMU circuit pack is specified and the equipment has a PST of IS or IS–ANR without an SST of STBYH, unless CMDMDE of FRCD is entered.
- A PST of OOS and CMDMDE of NORM is entered on an EP3, ES1, O1B, O4M, or S3M module, and the module is not switched to protection (regardless of whether the module has a PST of IS, IS–ANR, or OOS–AU when the command is entered).
- A PST of OOS is entered on an O1B module, the CMDMDE is either not specified or specified as NORM, the OC–3 on the O1B is defined as part of a ring (via ENT–RNG–OC3), and the Section and/or Line DCC is enabled.
- A PST of OOS is entered on an O4M module, the CMDMDE is either not specified or specified as NORM, the OC–12 on the O4M is defined as part of a ring (via ENT–RNG–OC12), and the Section and/or Line DCC is enabled.
- An EP3, O1B, O4M, or S3M circuit pack is edited to deactivate an SST of MT (ED–EQPT with SST of MT–DEA entered) and any of the supported DS3/STS1/STS3C ports or embedded DS1/VT1.5 ports are in a loopback (an STS1, STS3C, VT1.5, DS3, or DS1 state of OOS–AUMA,UAS&MT&LPBK).
- A protection O4M or any S3M circuit pack is edited to deactivate an SST of MT (ED–EQPT with SST of MT–DEA entered).
- An ES1 circuit pack is edited to deactivate an SST of MT (ED–EQPT with SST of MT–DEA entered) and any of the supported STS–1 ports or VT1.5 (embedded or stand alone) ports are in a loopback (an STS1 or VT1 state of OOS–AUMA,UAS&MT&LPBK).
- A LMU or HMU circuit pack is edited to deactivate an SST of MT (ED–EQPT with SST of MT–DEA entered) and any of the supported DS3 ports or embedded DS1 ports are in a loopback (a DS3 or DS1 state of OOS–AUMA,UAS&MT&LPBK).
- A DSI circuit pack is edited to deactivate an SST of MT (ED–EQPT with SST of MT–DEA entered) and any of the supported DS1 ports are in a loopback (a DS1 state of OOS–AUMA,UAS&MT&LPBK).
- A PST of OOS and a one–for–one redundant equipment entity, other than a CPU, or the last ICM or last SIO in the system, is specified and the corresponding redundant equipment is not available but required for service (e.g., the “master” is to be removed and the “slave” unit does not have a PST of IS or automatic copy switching is inhibited), unless CMDMDE of FRCD is entered.
- A PST of OOS is entered, a one–plus–one protected circuit pack (i.e., a DSB, IOB, or SI48 EOB) AID is specified, CMDMDE of NORM is entered, and the redundant equipment is in an OOS state or IS–ANR state (not fully functional or already removed).
- A CPU circuit pack and PST of OOS is specified and its corresponding opposite copy CPU is not available for service (regardless if CMDMDE of NORM or FRCD is entered).
- An ICM or SIO circuit pack, PST of OOS, and CMDMDE of NORM is specified and its corresponding opposite copy ICM or SIO is not available for service, or PST of OOS and CMDMDE of FRCD is specified and all of the ICM’s or SIO’s supported LTx circuit packs have not been deleted.
- A value for LHSTYPE or UHSTYPE is entered and all of the equipped EP3 or ES1 circuit packs do not support the specified LHSTYPE/UHSTYPE functionality, or greater functionality.
- A value for QTYPE is entered and all of the supported DSI, LMU, or HMU equipment entities have not previously been deleted (do not have an SST of UAS).
- A CS matrix AID is specified, ESTYPE of M16 or M32 is entered, and clover leaf 3, 4 or 5 ES is provisioned to a PST of IS.
- A value for CBLENGTH is entered and any of the EOBs, IOBs, or OXBs in the shelf are not in a OOS–MA or OOS–AUMA state.
- A PST of OOS is entered and an O1B, O4M, or S3M is specified which has STS–3Cs, STS–1s, or VT1.5s involved in path switching and are in WRK secondary states, unless CMDMDE of FRCD is entered.
- A P56 circuit pack and MODE of NORM or FRCD is specified with PST of OOS and the P56 provides power to an MCB that is simultaneously involved in a copy switch with another MCB.

- A PST of OOS is entered with CMDMDE of NORM, and an I/O or matrix P39 or P56 is specified that would cause a copy lock to a copy residing on a shelf with GTI alarms.
- A PST of OOS is entered with CMDMDE of NORM, a SI36 CDB or SI48 CDB is specified, and the opposite copy of IOB/EOB in the shelf has GTI alarms.
- A PST of OOS is entered with CMDMDE of NORM, an end-stage or center-stage matrix module is specified and its opposite copy has GTI alarms.
- A PST of OOS is entered with CMDMDE of NORM, an IPB or RPB is specified and its opposite copy has GTI alarms on the matrix modules (i.e., EOB, IPB, M16, M32, M40, OXB, RPB).
- An attempt to upgrade an LT4 AID to an LT8 and one or both of the supporting interface modules for the LT4 is a CIM.
- An attempt to downgrade an LT8 AID to an LT4 and any of the extended ACLs for the LT8 is provisioned.
- An end stage SHELF and CSTYPE of M40 is entered and the specified end stage is not a high density backplane.
- An invalid parameter value or combination of parameter values is entered.
- The user tries to edit center stage shelf 1 of rack 2 or rack 3 from M40 to M16.
- An SST of MT-DEA is entered and the AID specifies a working O4M module and any of the associated S3M modules is in SST=MT state.
- The command is entered on a 240-port system, and a value for CSTYPE or ESTYPE is specified.
- The command is entered on a 240-port system, and CTYPE=DS3 or LHSTYPE/UHSTYPE=EP3F36, EP3E36, EP3S36 or ES136.
- The command is entered on a 240-port system, and an LT8 AID is specified along with GRTHTYPE=LT4.

Executing an ED-EQPT command with PST of OOS (editing the equipment entity to an OOS-MA or OOS-AUMA state) and CMDMDE of FRCD is service-affecting in the following situations:

- A DSI, ES1, EP3, HMU, LMU, O1B, O4M, or S3M circuit pack is specified and the circuit pack is not switched to its associated protection circuit pack.
- A DSB, IOB or SI48 EOB circuit pack is specified and not all functions supported by the specified equipment have been switched to the corresponding protection circuit pack.
- A CDA, CDB, IPB, M16, M32, MCB, RPB, or SIO circuit pack/entity is specified and the corresponding redundant equipment is not in an IS state, or the opposite copy of the cross-connect matrix has lost signal transmission.
- An ACM, CIM, CPU, DSK, EOB, ICM, IPU, OXB, SIO, or SPB circuit pack/entity is specified and the corresponding redundant equipment is not in an IS state.
- A P39, P56, or PSF circuit pack in an I/O bay/rack or APS bay/rack is specified and all of the power supplies within the specified power supply's power group are not in an IS state (one or more of power supplies in the power group have a fault or have been removed).
- A P39, P56, or PSF circuit pack in an end-stage or matrix bay/rack is specified and one or more of the power supplies within the specified power supply's power group are not in an IS state and the redundant matrix power supply group is similarly limited in power capacity, or the associated I/O shelves are not able to switch to the opposite copy of the matrix.

Default: Entry Required

Addressing: None

Description: Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.

Restrictions: ED-EQPT is denied if the specified AID does not identify an EP3 circuit pack and an LBO1, LBO2, or LBO3 value is entered.
ED-EQPT is denied if the specified AID does not identify an EP3 circuit pack with an LHSTYPE or UHSTYPE of EP3F48 and a value for DFLTSIG is entered.
ED-EQPT is denied if the specified AID does not identify a SHELF equipment entity and an LHSTYPE or UHSTYPE value is entered.
ED-EQPT is denied if the specified AID does not identify an DSI, EP3, ES1, LMU, HMU, M16, M32, O1B, O4M, or S3M circuit pack and an SST value of MT-DEA is entered.
ED-EQPT is denied if a value for DIST is entered and the specified AID does not identify a DS1 circuit pack.
ED-EQPT is denied if RVRTV of {N,Y} is entered and the specified AID does not identify an MCB circuit pack.
ED-EQPT is denied if the specified AID does not identify a SHELF/QUAD/RACK and the DESC value is entered.
ED-EQPT is denied if the specified AID identifies a RACK and any parameter value other than for the DESC parameter is entered.
ED-EQPT is denied if the specified AID identifies an EOC SHELF equipment entity {SHELF-{4, 5, 11, 16, 17, 22, 23}-1-1} and any parameter value other than for DESC is entered.
ED-EQPT is denied if the specified AID identifies an EP3 circuit pack and the corresponding Shelf LHSTYPE or UHSTYPE is not provisioned with EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48.
ED-EQPT is denied if the specified AID identifies an ES1 circuit pack and the corresponding shelf parameter LHSTYPE or UHSTYPE is not {ES136, ES148}.

ED-EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in a mixture of SI36 and SI48 half-shelves or shelves specified within the same rack.

ED-EQPT is denied if the specified AID of SI48 SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in a mixture of O1B and O4M modules specified within the same shelf.

ED-EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in changing an SI36 half-shelf to an SI48 half-shelf or vice-versa.

ED-EQPT is denied if the specified AID does not identify a SHELF or QUAD and a CBLENGTH value is entered.

ED-EQPT is denied if AID=SHELF or AID=QUAD and CBLENGTH greater than 500 is entered.

ED-EQPT is denied if AID of a SI36 SHELF and CBLENGTH greater than 350 are specified.

ED-EQPT is denied if the specified AID of LT4 or LT8 is entered and a value for any parameter other than GRTHTYPE and CMDMDE is entered.

ED-EQPT is denied if the specified AID of LT4 or LT8 is entered and a value for CMDMDE is either not specified or specified as NORM.

ED-EQPT is denied if the specified AID of LT4 or LT8 is entered and a value for GRTHTYPE is not specified.

ED-EQPT is denied if the specified AID of LT4 is entered and GRTHTYPE=LT4.

ED-EQPT is denied if the specified AID of LT8 is entered and GRTHTYPE=LT8.

CTAG	<1-6 VALID CTAG CHARACTERS>
	Default: <System Assigned CTAG Value>
	Addressing: None
	Description: Correlation Tag, associates input command with its output responses.
CBLENGTH=	{<Integers in 5 meter increments from 5 through 500 meters>, <NoVal>}
	Default: <Previously Existing Value>
	Addressing: None
	Description: Optical Cable Length, specifies the cable length (in meters) of the optical cable between a DS3/DS1 Quad shelf or SI36/SI48 shelves and the EOC shelf. The system downloads and configures the appropriate delay values corresponding to the specified CBLENGTH value. Non-numeric values are:
	<NoVal> CBLENGTH is not applicable if AID does not identify a QUAD or SHELF.
	Restrictions: ED-EQPT is denied if a value for CBLENGTH is entered and the specified AID does not identify a QUAD or SHELF. ED-EQPT is denied if a value for CBLENGTH is entered and all the EOBs, IOBs, or OXBs in the shelf are not in an OOS-MA or OOS-AUMA state. ED-EQPT is denied if a value for CBLENGTH is not an increment of 5. ED-EQPT is denied if CBLENGTH is greater than 350 meters, and the supporting ES shelf has been grown as M16.

CMDMDE=	{FRCD, NORM}
	Default: {Previously Existing Value} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced. The command is completed even if the result of its execution is service-affecting. NORM Normal. The command is denied if the result of its execution is service-affecting.
DESC=	<0–62 ASCII CHARACTERS excluding the enclosing double quotes>
	Default: <Previously Existing Value> Addressing: None Description: Description Text, specifies any desired text description (e.g., physical location) associated with a specified SHELF/QUAD/RACK AID. Enclosing quotes are required to enter a value for DESC parameter. A null character is entered as "". Restrictions: ED–EQPT is denied if a value for DESC is entered and the specified AID does not identify a SHELF/QUAD/RACK equipment entity. ED–EQPT is denied if DESC and PST/SST are both being edited.
DFLTSIG=	{ASYNC, CBIT, STS1, <NoVal>}
	Default: <Previously Existing Value> Addressing: None Description: Default Signal, specifies the type of (default) signal transmitted by an EP3 circuit pack (in a FlexPoint Half–Shelf), after the EP3 has powered–on and data–base down–loaded, for each of the supported un–provisioned facilities (the signal transmitted for provisioned facilities is based on the facility provisioning). Values are: ASYNC Asynchronous DS3, the default transmitted signal for un–provisioned ports on the specified EP3 (in a FlexPoint Half–Shelf) is M13 formatted DS3 with DS1 AIS on all embedded DS1s. CBIT C–Bit DS3, the default transmitted signal for un–provisioned ports on the specified EP3 (in a FlexPoint Half–Shelf) is C–Bit formatted DS3 with DS1 AIS on all embedded DS1s. STS1 Unequipped STS–1, the default transmitted signal for un–provisioned ports on the specified EP3 (in a FlexPoint Half–Shelf) is Unequipped STS–1. <NoVal> DFLTSIG is not applicable if AID does not identify an EP3 circuit pack. Restrictions: ED–EQPT is denied if a value for DFLTSIG is entered and the specified AID does not identify an EP3 circuit pack and the corresponding LHSTYPE/UHSTYPE value is not provisioned as EP3F36 or EP3F48.
DIST=	{LONG, MAX, MED, SHORT}
	Default: <Previously Existing Value> Addressing: None Description: Distance, specifies the cable length of the DS1 cable connected to DSI equipment identified by AID. Values are: LONG DIST configured for 440–550 feet of cable. MAX DIST configured for 550 feet or longer of cable. MED DIST configured for 220–440 feet of cable. SHORT DIST configured for 0–220 feet of cable. <NoVal> DIST is not applicable if AID does not identify an DSI circuit pack. Restrictions: ED–EQPT is denied if a value for DIST is entered and the specified AID does not identify an DS1 circuit pack.

GRTHTYPE=	{LT4, LT8}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Growth Process Type, specifies the type of growth process for a provisioned LT4 or LT8.
	LT4 Downgrades the provisioned LT8 AID to a provisioned LT4 module.
	LT8 Upgrades the provisioned LT4 AID to a provisioned LT8 module.
Restrictions:	ED-EQPT is denied if a value for GRTHTYPE is entered and the specified AID does not identify an LT4 or LT8 equipment entity.
LBO1=	{LONG, SHORT}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Line Build Out 1, specifies the line build out for the lowest numbered DS3 on the EP3 or ES1 circuit pack identified by AID. Values are:
	LONG LBO configured for 226–450 feet of cable.
	SHORT LBO configured for 0–225 feet of cable.
Restrictions:	ED-EQPT is denied if a value for LBO1 is entered and the specified AID does not identify an EP3 or ES1 circuit pack.
LBO2=	{LONG, SHORT}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Line Build Out 2, specifies the line build out for the middle numbered DS3 on the EP3 or ES1 circuit pack identified by AID. Values are:
	LONG LBO configured for 226–450 feet of cable.
	SHORT LBO configured for 0–225 feet of cable.
Restrictions:	ED-EQPT is denied if a value for LBO2 is entered and the specified AID does not identify an EP3 or ES1 circuit pack.
LBO3=	{LONG, SHORT}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Line Build Out 3, specifies the line build out for the highest numbered DS3 on the EP3 or ES1 circuit pack identified by AID. Values are:
	LONG LBO configured for 226–450 feet of cable.
	SHORT LBO configured for 0–225 feet of cable.
Restrictions:	ED-EQPT is denied if a value for LBO3 is entered and the specified AID does not identify an EP3 or ES1 circuit pack.

LHSTYPE=	{EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48, ES136, ES148, O1BFH48, O1BSH48, O4MSH48, O4MFH48}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Lower Half Shelf Type, specifies the type of I/O shelf if a SHELF AID is specified. Values are:
EP3E36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Enhanced capability.
EP3E48	High Density DS3/STS Shelf with 48 DS3s per shelf containing EP3s that have Enhanced capability.
EP3F36	High Density DS3/STS Shelf with 36 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3F48	High Density DS3/STS Shelf with 48 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3S36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Standard capability.
EP3S48	High Density DS3/STS Shelf with 48 DS3s per shelf containing EP3s that have Standard capability.
ES136	High Density STS Shelf with 36 STSs per shelf containing ES1 circuit packs.
ES148	High Density DS3/STS Shelf with 48 STSs per shelf containing ES1 circuit packs.
O1BFH48	O1B (OC-3) Shelf with 48 DS3/STS1s per shelf, with FlexPoint capability, and Half-bandwidth to the matrix.
O1BSH48	O1B (OC-3) Shelf with 48 STS1s per shelf, with SONET capability, and Half-bandwidth to the matrix.
O4MSH48	O4M (OC-12) Standard module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.
O4MFH48	O4M (OC-12) FlexPoint module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.
Restrictions:	<p>ED-EQPT is denied if a value for LHSTYPE is entered and the specified AID does not identify a SHELF equipment entity.</p> <p>ED-EQPT is denied if either LHSTYPE or UHSTYPE are provisioned as {O1BFH48, O1BSH48} and both LHSTYPE or UHSTYPE are not provisioned as {O1BFH48, O1BSH48}.</p> <p>ED-EQPT is denied if either LHSTYPE or UHSTYPE are provisioned as {O4MFH48, O4MSH48} and both LHSTYPE or UHSTYPE are not provisioned as {O4MFH48, O4MSH48}.</p> <p>ED-EQPT is denied if the specified AID identifies an EP3 circuit pack and the corresponding LHSTYPE/UHSTYPE value is not provisioned as EP3F36 or EP3F48 and a value for DFLTSIG is entered.</p> <p>ED-EQPT is denied if the specified AID identifies an EP3 circuit pack and the corresponding shelf parameter LHSTYPE or UHSTYPE is not {EP3E36, EP3F36, EP3S36, EP3E48, EP3F48, EP3S48}.</p> <p>ED-EQPT is denied if the specified AID identifies an ES1 circuit pack and the corresponding shelf parameter LHSTYPE or UHSTYPE is not {ES136, ES148}.</p> <p>ED-EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in a mixture of SI36 and SI48 half-shelves or shelves specified within the same rack.</p> <p>ED-EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in changing a SI36 half-shelf to a SI48 half-shelf or vice-versa.</p>

ED-EQPT is denied if the specified AID of {SHELF-9-1-1, SHELF-15-3-1, SHELF-21-1-1, or SHELF-27-3-1} is entered and the LHSTYPE or UHSTYPE does not specify {O1BFH48, O1BSH48} or {O4MFH48, O4MSH48}.

ED-EQPT is denied if the specified AID of {SHELF-9-1-1, SHELF-15-3-1, SHELF-21-1-1, or SHELF-27-3-1} is entered and the other shelf in the SI48 rack (e.g., {SHELF-9-3-1, SHELF-15-1-1, SHELF-21-3-1, SHELF-27-1-1}, respectively) is not provisioned, or is provisioned but *not* as an OC3 or OC12 shelf with half bandwidth (i.e., LHSTYPE and UHSTYPE of {O1BFH48, O1BSH48} or {O4MFH48, O4MSH48}).

ED-EQPT is denied if both LHSTYPE or UHSTYPE are not specified for O1B Standard, O1B FlexPoint, O4M Standard or O4M FlexPoint respectively.

CSTYPE=	{M16, M40}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Matrix shelf type, specifies the type of matrix circuit packs used in the center shelf. Values are:
	M16	M16, specifies that the center stage shelf consists of all M16 modules.
	M40	M40, specifies that the center stage shelf consists of all M40 modules.
	Restrictions:	ED-EQPT is denied if a value for CSTYPE is entered and the specified AID does not identify a matrix SHELF equipment entity.
ESTYPE=	{M16, M32}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Matrix shelf type, specifies the type of matrix circuit packs used in the end stage shelf. Values are:
	M16	M16, specifies that the Standard Density end stage shelf consists of all M16 modules or that the High Density end stage shelf consists of any mix of M16 and/or M32 modules with each M32 functioning at half the capacity.
	M32	M32, specifies that the High Density end stage shelf consists of all M32 modules each functioning at full capacity.
	Restrictions:	ED-EQPT is denied if a value for end stage shelf type is entered and the specified AID does not identify a matrix shelf equipment entity. ED-EQPT is denied if the system size is 2688 or 3360 and ESTYPE=16 is specified.
QTYPE=	{DS1, DS3}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	QUAD Type, specifies the quadrant type for the DS1 I/O QUAD identified by AID. Values are:
	DS1	QTYPE configured for DS1 Quad.
	DS3	QTYPE configured for DS3 QUAD.
	<NoVal>	QTYPE is not applicable if AID does not identify an DS1 Quad.
	Restrictions:	ED-EQPT is denied if a value for QTYPE is entered and the specified AID does not identify a QUAD equipment entity.

RVRTV=	{N, Y}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Revertive Mode, specifies the revertive mode of operation of the TMG reference signal for the pair of MCBs identified by AID. Values are:
	N	TMG operation configured for non-revertive mode of operation. With this option there is no preferred timing source.
	Y	TMG operation configured for revertive mode of operation.
	Restrictions:	ED-EQPT is denied if a value for RVRTV is entered and the specified AID does not identify an MCB circuit pack.
TMG=	{EXT1544, INT}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Timing Reference Source, specifies the operational mode of the MCB (Master Clock Board) identified by AID. Values are:
	EXT1544	TMG configured for an external 1544 KHz timing reference source.
	INT	TMG configured for an internal timing reference source. With this option, the Primary reference is always the preferred timing source.
	Restrictions:	ED-EQPT is denied if a value for TMG is entered and the specified AID does not identify an MCB circuit pack.
UHSTYPE=	{EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48, ES136, ES148, O1BFH48, O1BSH48, O4MSH48, O4MFH48}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Upper Half Shelf Type, specifies the type of I/O shelf if a SHELF AID is specified. Values are:

EP3E36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Enhanced capability.
EP3E48	High Density DS3/STS Shelf with 48 DS3s per shelf containing EP3s that have Enhanced capability.
EP3F36	High Density DS3/STS Shelf with 36 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3F48	High Density DS3/STS Shelf with 48 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3S36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Standard capability.
EP3S48	High Density DS3/STS Shelf with 48 DS3s per shelf containing EP3s that have Standard capability.
ES136	High Density STS Shelf with 36 STSs per shelf containing ES1 circuit packs.
ES148	High Density DS3/STS Shelf with 48 STSs per shelf containing ES1 circuit pas.
O1BFH48	O1B (OC-3) Shelf with 48 DS3/STS1s per shelf, with FlexPoint capability, and Half-bandwidth to the matrix.
O1BSH48	O1B (OC-3) Shelf with 48 STS1s per shelf, with SONET capability, and Half-bandwidth to the matrix.
O4MSH48	O4M (OC-12) Standard module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.
O4MFH48	O4M (OC-12) FlexPoint module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.
Restrictions:	<p>ED-EQPT is denied if a value for UHSTYPE is entered and the specified AID does not identify a SHELF equipment entity.</p> <p>ED-EQPT is denied if either LHSTYPE or UHSTYPE are provisioned as {O1BFH48, O1BSH48} and both LHSTYPE and UHSTYPE are not provisioned as {O1BFH48, O1BSH48}.</p> <p>ED-EQPT is denied if either LHSTYPE or UHSTYPE are provisioned as {O4MFH48, O4MSH48} and both LHSTYPE and UHSTYPE are not provisioned as {O4MFH48, O4MSH48}.</p> <p>ED-EQPT is denied if the specified AID identifies an EP3 circuit pack and the corresponding LHSTYPE/UHSTYPE value is not provisioned as EP3F36 or EP3F48 and a value for DFLTSIG is entered.</p> <p>ED-EQPT is denied if the specified AID identifies an EP3 circuit pack and the corresponding shelf parameter LHSTYPE or UHSTYPE is not {EP3E36, EP3F36, EP3S36, EP3E48, EP3F48, EP3S48}.</p> <p>ED-EQPT is denied if the specified AID identifies an ES1 circuit pack and the corresponding shelf parameter LHSTYPE or UHSTYPE is not {ES136, ES148}.</p> <p>ED-EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in a mixture of SI36 and SI48 half-shelves or shelves specified within the same rack.</p> <p>ED-EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in changing an SI36 half-shelf to an SI48 half-shelf or vice-versa.</p> <p>ED-EQPT is denied if the specified AID of {SHELF-9-1-1, SHELF-15-3-1, SHELF-21-1-1, or SHELF-27-3-1} is entered and the LHSTYPE or UHSTYPE does not specify {O1BFH48, O1BSH48} or {O4MFH48, O4MSH48}.</p>

ED-EQPT is denied if the specified AID of {SHELF-9-1-1, SHELF-15-3-1, SHELF-21-1-1, or SHELF-27-3-1} is entered and the other shelf in the SI48 rack (e.g., {SHELF-9-3-1, SHELF-15-1-1, SHELF-21-3-1, SHELF-27-1-1}, respectively) is not provisioned, or is provisioned but *not* as an OC3 or OC12 shelf with half bandwidth (i.e., LHSTYPE and UHSTYPE of {O1BFH48, O1BSH48} or {O4MFH48, O4MSH48}).

ED-EQPT is denied if both LHSTYPE or UHSTYPE are not specified for O1B Standard, O1B FlexPoint, O4M Standard or O4M FlexPoint respectively.

PST	{IS, OOS}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the specified equipment entity. Values are:
	IS	In-Service
	OOS	Out-Of-Service
SST	{MT-DEA}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the specified equipment entity. Values are:
	MT-DEA	Maintenance-Deactivate
	Restrictions:	ED-EQPT is denied if SST of MT-DEA is entered and the specified AID does not identify an DSI, EP3, M16, M32, O1B, O4M, S3M circuit pack or the specified DSI, EP3, M16, M32, O1B, O4M, S3M does not currently have an SST of MT.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENEQ	Equipage, Not EQuipped /* Not all modules are of their corresponding half shelf type */ /* <AID> must be in-service first. */
IDNC	Input, Data Not Consistent /*Editing CBLENGTH is only allowed in first Quad.*/ /*Cable length parameter only valid with optical interface.*/ /*Can not edit ES to M16 for current system size.*/ /*ESTYPE of M16 is not valid during a MTX_UPGRADE_2688.*/ /*CSTYPE of M16 is not valid when the opposite copy CS is not M16 */ /*CSTYPE of M16 is only valid during a MTX_UPGRADE_1344.*/ /*Unable to edit ES to M32 with a CS of M16 type.*/ /*Companion shelf must be a half-bandwidth OCn shelf.*/ /*This specific quad can not be edited to a DS3 type.*/ /*Invalid field specified.*/ /*Quads cannot be edited to DS3 in a 240 port system.*/ /*Unable to read aux buffer for <AID>*/
IDNV	Input, Data Not Valid /*Invalid parameter or option specified in command.*/ /*Both half shelf types must be of same half-band-width for OCn.*/ /*Both half shelf types must be of same full-bandwidth for OCn.*/ /*Cannot edit to requested subrack type from current subrack type.*/ /*Invalid ENTYP_QTYPE parameter specified in command.*/ /*Invalid CBLENGTH parameter entered.*/ /*Invalid UHSTYPE parameter specified in command.*/ /*Invalid LHSTYPE parameter specified in command.*/ /*Requested matrix shelf type is not consistent with given matrix shelf.*/ /*Companion shelf is still provisioned.*/ /*Editing to full-bandwidth not allowed.*/ /*Invalid ESTYPE parameter specified in command.*/ /*Invalid CSTYPE parameter specified in command.*/ /*Error retrieving ESTYPE parameter.*/

IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified. */ /* An invalid module type specified in request. */ /*SHELF has been provisioned the PBTYPE as <CARD_TYPE>.*/ /* Invalid AID for the given slot. */ /*Invalid AID specified.*/*
IIFM	Input, Invalid data ForMat /* Parameter value too long */ /* Description must be enclosed in quotes.*/ /* Invalid description specified in command.*/*
IPEX	Input, Parameter EXtra /* Protection card LBOs cannot be edited. */ /* Protection card DIST value cannot be edited. */ /* Protection card LBOs and DFLTSIG cannot be edited. */ /* Editing DFLTSIG is not valid for standard or enhanced subbracks */ /* Can't edit PST and other parameters at the same time. */
IPNC	Input, Parameter Not Consistent /* Input, Parameter Not Consistent*/ /* Invalid field specified.*/* /*Editing CBLENGTH is only valid for IO shelves and quads*/
IPNV	Input, Parameter Not Valid /*Error retrieving CBLENGTH parameter/* /*Error retrieving LHSTYPE parameter/* /* Error retrieving ESTYPE parameter.*/* /* Error retrieving CSTYPE parameter.*/* /*Invalid CBLENGTH parameter entered.*/*
SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* INIT–SYS command still active on shelf that equipment is on.*/ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */
SATF	Status, Automatic Test Failed /* The module failed software loading */ /* The module failed due to a firmware mismatch */ /* The module failed diagnostic testing */ /* Unexpected diag response message for <AID> */
SCSN	Status, invalid Command SequeNce /*In service growth Loopbacks on supported facilities must first be released.*/*

SDBE	<p>Status, internal Data Base Error</p> <p>/* Invalid or unassigned equipment identifier specified */</p> <p>/* <CARD_TYPE> data base access failure */</p> <p>/* Error accessing auxiliary EM data area */</p> <p>/* <AID> database update error */</p> <p>/* Error reading database for card <AID> */</p> <p>/* Error accessing auxiliary buffer for card <AID> */</p> <p>/* Error updating database for card <AID> */</p> <p>/* Error in get_rec_ptr accessing record of the Mate <AID> */</p> <p>/* IO QUAD data base access failure */</p> <p>/* Unable to read database for <AID> */</p> <p>/* Unable to read system configuration file */</p> <p>/* Error reading reference table for <AID> */</p> <p>/* Error updating reference table for <AID> */</p> <p>/* Unable to read shelf database <AID> */</p> <p>/* Error obtaining auxiliary buffer for <AID> */</p> <p>/* Invalid subrack type <#> encountered */</p> <p>/* Error reading ES1 to CS cable database for cable <#> */</p> <p>/* Error reading CS to ES3 cable database for cable <#> */</p> <p>/* <AID> Data base access failure */</p> <p>/* L2P database read error for STD ID <AID> */</p> <p>/* Error retrieving L2P TBSS for STD ID <AID> */</p> <p>/* Auxiliary buffer access failure */</p> <p>/* LMU/DSI data base access failure */</p> <p>/* Error reading database for <AID> */</p> <p>/* Unable to read quad database <AID> */</p> <p>/* Error updating database for <AID> */</p> <p>/* Invalid table id <#> in reference table */</p> <p>/* Error updating shduse table.*/</p>

COMMAND CODE: **ED-F3**
COMMAND NAME: **EDIT F3**

PURPOSE

The ED-F3 command modifies the previously provisioned parameter values of an F3 (Fractional DS3) entity. An F3 (Fractional DS3) entity consists of a set of up to 7 DS1 entities, all of which reside within a given electrical DS3. By assigning DS1 entities to an F3, Performance Monitoring data summaries are available for all of the DS1s assigned to the F3. Refer to Appendix F, Monitored PM Parameters for a description of the special summary PM parameters pertaining to an F3 entity.

An ED-F3 command is denied if:

- The specified F3 has not previously been provisioned with the ENT-F3 command.
- Any of the DS1 ports being assigned to the specified F3 have not been previously provisioned.
- Any of the DS1 ports being assigned to the specified F3 are not constituents of the DS3 containing the F3.
- Any of the DS1 ports being assigned to the F3 are defined as having framing formats different from that of the specified F3.
- Any of the DS1 ports being assigned to the F3 have already been assigned to another F3.
- A DS1 port is being assigned to a T1Nx parameter that has already been assigned a DS1 (the earlier assignment must first be removed).
- A DS1 port is listed two or more times in T1Nx parameters.
- An invalid parameter value is entered.

INPUT FORMAT

```
ED-F3 : [TID] : AID : [CTAG] : : [FMT=] [ , T1N1=] [ , T1N2=] [ , T1N3=] [ , T1N4=] [ , T1N5=]
      [ , T1N6=] [ , T1N7=] : [PST] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS1 AID, identifies the DS1 port. Restrictions: The AID must indicate an F3 AID that is located in an electrical DS3 located on an SI48 shelf or the command is denied.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
FMT=	{ESF, SF} Default: < Previously existing value > Addressing: None Description: Framing Format, identifies the framing format of all the DS1s assigned to the F3. Values are: ESF Extended SuperFrame. DS1s all are ESF formatted. SF SuperFrame. DS1s all are normal SuperFrame formatted. Restrictions: The command will be denied if the value given for FMT is not matched by the provisioned formats of all the DS1s ultimately assigned to the F3 at the completion of the ED-F3 command.

T1N1=	{<DS1_AID>, RMV}	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	Default:	< Previously existing value >
	Addressing:	None
	Description:	DS1 AID for slot Number 1, identifies one of the potential seven DS1s that are assigned to the F3. Named values are:
	RMV	Remove DS1. DS1 currently assigned to the F3 in this slot is to be removed.
	Restrictions:	The command will be denied if the value given for T1N1 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N1 identifies a DS1 that is provisioned to have a framing format different than that given in FMT. If an attempt is made to assign a DS1 value to T1N1 but T1N1 has a previously assigned DS1 value in place, the command shall be denied (the previous value must first be removed).
T1N2=	{<DS1_AID>, RMV}	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	Default:	< Previously existing value >
	Addressing:	None
	Description:	DS1 AID for slot Number 2, identifies one of the potential seven DS1s that are assigned to the F3. Named values are:
	RMV	Remove DS1. DS1 currently assigned to the F3 in this slot is to be removed.
	Restrictions:	The command will be denied if the value given for T1N2 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N2 identifies a DS1 that is provisioned to have a framing format different than that given in FMT. If an attempt is made to assign a DS1 value to T1N2 but T1N2 has a previously assigned DS1 value in place, the command shall be denied (the previous value must first be removed).
T1N3=	{<DS1_AID>, RMV}	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	Default:	< Previously existing value >
	Addressing:	None
	Description:	DS1 AID for slot Number 3, identifies one of the potential seven DS1s that are assigned to the F3. Named values are:
	RMV	Remove DS1. DS1 currently assigned to the F3 in this slot is to be removed.
	Restrictions:	The command will be denied if the value given for T1N3 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N3 identifies a DS1 that is provisioned to have a framing format different than that given in FMT. If an attempt is made to assign a DS1 value to T1N3 but T1N3 has a previously assigned DS1 value in place, the command shall be denied (the previous value must first be removed).

T1N4=	<div>{<DS1_AID>, RMV} {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#) Default: < Previously existing value > Addressing: None Description: DS1 AID for slot Number 4, identifies one of the potential seven DS1s that are assigned to the F3. Named values are: RMV Remove DS1. DS1 currently assigned to the F3 in this slot is to be removed. Restrictions: The command will be denied if the value given for T1N4 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N4 identifies a DS1 that is provisioned to have a framing format different than that given in FMT. If an attempt is made to assign a DS1 value to T1N4 but T1N4 has a previously assigned DS1 value in place, the command shall be denied (the previous value must first be removed).</div>
T1N5=	<div>{<DS1_AID>, RMV} {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#) Default: < Previously existing value > Addressing: None Description: DS1 AID for slot Number 5, identifies one of the potential seven DS1s that are assigned to the F3. Named values are: RMV Remove DS1. DS1 currently assigned to the F3 in this slot is to be removed. Restrictions: The command will be denied if the value given for T1N5 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N5 identifies a DS1 that is provisioned to have a framing format different than that given in FMT. If an attempt is made to assign a DS1 value to T1N5 but T1N5 has a previously assigned DS1 value in place, the command shall be denied (the previous value must first be removed).</div>
T1N6=	<div>{<DS1_AID>, RMV} {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#) Default: < Previously existing value > Addressing: None Description: DS1 AID for slot Number 6, identifies one of the potential seven DS1s that are assigned to the F3. Named values are: RMV Remove DS1. DS1 currently assigned to the F3 in this slot is to be removed. Restrictions: The command will be denied if the value given for T1N6 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N6 identifies a DS1 that is provisioned to have a framing format different than that given in FMT. If an attempt is made to assign a DS1 value to T1N6 but T1N6 has a previously assigned DS1 value in place, the command shall be denied (the previous value must first be removed).</div>

T1N7=	{<DS1_AID>, RMV} {T3T1-{1-4800}-{1-28}} Default: < Previously existing value > Addressing: None Description: DS1 AID for slot Number 7, identifies one of the potential seven DS1s that are assigned to the F3. Named values are: RMV Remove DS1. DS1 currently assigned to the F3 in this slot is to be removed. Restrictions: The command will be denied if the value given for T1N7 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N7 identifies a DS1 that is provisioned to have a framing format different than that given in FMT. If an attempt is made to assign a DS1 value to T1N7 but T1N7 has a previously assigned DS1 value in place, the command shall be denied (the previous value must first be removed).	(T3T1-DS3#-DS1#)
PST	{IS} Default: < Previously existing value > Addressing: None Description: Primary State. Indicates the current primary state of the DS3. Refer to Appendix G, State Transitions. Values are: IS In-Service	

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* T1 is not in partition for this user. */
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, F3 #1 in electrical DS3 T3-5 has already been provisioned with a FMT of ESF and has the three DS1s T3T1-5-3, T3T1-5-7, and T3T1-5-8 assigned to the F3 slot numbers 1, 2, and 5 respectively. The F3's T1 slot numbers 3, 4, 6, and 7 are unused.

In this example, DS1 T3T1-5-4 is added to slot 3 and DS1 T3T1-5-8 is removed from slot 5. DS1 T3T1-5-4 has already been provisioned with a framing format value of ESF.

```
ED-F3::T3F3-5-1:::T1N3=T3T1-5-4,T1N5=RMV;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pfc519. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pfc519 COMPLD  
/* ED-F3::T3F3-5-1:::T1N3=T3T1-5-4,T1N5=RMV [Pfc519] (3) */  
;
```

COMMAND CODE: **ED-FFP-OC12**
COMMAND NAME: **EDIT FAST FACILITY PROTECTION
OC-12**

PURPOSE

The ED-FFP-OC12 command modifies a facility protection group for OC-12. It associates a protecting (alternate) OC-12 with a protected (main/preferred) OC-12. It also provides for modifying the wait to restore time (WTR) associated with this protection group and changing the attributes of the facility protection group.

If ED-FFP-OC12 is issued while a WTR is already in progress, the currently in-progress WTR time is not affected. Only the WTR times of subsequent protection switching are affected.

An ED-FFP-OC12 command is denied if:

- The OC-12 specified in B1 and B2 parameters do not refer to working and protection OC-12, respectively.
- The OC-12 AIDs specified in B1 and B2 are not already defined as part of a protection group using ENT-FFP-OC12.
- The command is issued to modify the WTRTIME while RVRTV is set to N, by earlier use of ENT-FFP-OC12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ED-FFP-OC12 : [TID] : B1 , B2 : [CTAG] : : : [K2GEN=] [, PSDIRN=] [, RVRTV=] [, WTRTIME=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
B1	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the protected (working) OC-12 port. Restrictions: ED-FFP-OC12 is denied if the OC-12 specified is not an odd-numbered OC-12.
B2	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the protecting (protection) OC-12 port. Restrictions: ED-FFP-OC12 is denied if the OC-12 specified is not an even-numbered OC-12. ED-FFP-OC12 is denied if B2 is not equal to B1+1.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

K2GEN=	{PROP, STAN}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	K2 bits 1–4 Generation. Defines how the K2 bits 1 through 4 are generated. Values are:
	STAN	Standard way. The K2 bits 1–4 will be generated according to Bell-core standards.
	PROP	Proprietary non-standard way. This value is only valid if PSDIRN=UNI and RVRTV=N. In this case, the outgoing K2 bits 1–4 are set to equal the outgoing K1 bits 5 through 8.
	Restrictions:	ED–FFP–OC12 is denied if K2GEN of PROP is entered and PSDIRN and RVRTV are not specified (or defaulted to) as UNI and N, respectively.
PSDIRN=	{UNI}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Direction of Protection Switching. Indicates the direction of the protection switch operation. Values are:
	UNI	Unidirectional protection switching.
RVRTV=	{N, Y}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Revertive or non-revertive protection switching. Indicates whether the protection switching is revertive or not. Values are:
	N	No, indicates the protection switching is non-revertive.
	Y	Yes, indicates the protection switching is revertive.
WTRTIME=	{5–12}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Wait to Restore Time. Determines the wait to restore time that is used by the revertive line protection switching group. This parameter is only valid when revertive switching is selected. Values are:
	5–12	An integer value in minutes between 5 and 12.
	Restrictions:	ED–FFP–OC12 is denied if a value is entered for WTRTIME and RVRTV has been set to N by a prior ENT–FFP–OC12 command.

SUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **ED-FFP-STs1**
COMMAND NAME: **EDIT FAST FACILITY PROTECTION STS-1**

PURPOSE

The ED-FFP-STs1 command modifies the attributes of a ring facility protection group for STS-1. It also provides for changing the attributes of the facility protection group. This command modifies the Excessive Bit Error Rate, Working/Protect, Path Defect Indication Detection, Revertive/Non-revertive, Signal Degrade Threshold Switching level, and Wait to Restore Time options.

An ED-FFP-STs1 command is denied if:

- The STS-1 AIDs specified in fields B1 and B2 are not already defined as part of a Two-Way Path Ring (2WAYPR) or Two-Way Drop and Continue (2WAYDC) cross-connect.
- PROTN=P is specified when the STS-1 specified in B1 is a Protect STS-1.
- PROTN=W is specified when the STS-1 specified in B1 is not a Protect STS-1.
- RTRV=Y or RTRV=N is specified for an existing cross-connection type that is not 2WAYPR or 2WAYDC.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

	Default:	Entry Required	
	Addressing:	None	
	Description:	STS1 AID, identifies the other (Protect or working) STS-1 port within a ring OC3 or OC12.	
	Restrictions:	ED-FFP-STS1 is denied if the STS-1 specified is not embedded within a ring OC3 or OC-12.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

EBER=	{3, 4, <NoVal>}
Default:	{Previously Existing Value}
Addressing:	None
Description:	STS–1 Excessive Bit Error Rate (BER) switching threshold. Determines the value corresponding to an Excessive BER condition. Values are:
3	BER threshold of $10E^{-3}$
4	BER threshold of $10E^{-4}$ (default when FFP was created)
<NoVal>	Previously Existing Value (subsequent default)
PROTN=	{P, W, <NoVal>}
Default:	{Previously Existing Value}
Addressing:	None
Description:	Working or Protect STS–1. Indicates whether the STS–1 specified in the B1 field is the Working or Protect STS–1:
P	Protect. If it is currently a Working STS–1, interchange Working and Protect STS–1s.
W	Working. If it is currently a Protect STS–1, interchange Working and Protect STS–1s.
<NoVal>	Previously Existing Value (subsequent default)
Restrictions:	If PROTN=P and it is currently a Protect STS1, command will be denied. If PROTN=W and it is currently a Working STS1, command will be denied.
PDIDET=	{Y, N, <NoVal>}
Default:	{Previously Existing Value} Initial default = Y
Addressing:	None
Description:	Path Defect Indication Detection. Used for path switching protection in a ring. Values are:
Y	PDI defects used for ring path protection switching (default when FFP was created)
N	PDI defects not used for ring path protection switching
<NoVal>	Previously Existing Value (subsequent default)
RVRTV=	{N, Y, <NoVal>}
Default:	{Previously Existing Value} Initial default = N
Addressing:	None
Description:	Revertive switching mode for FFP selector. Indicates whether the protection switching is revertive or not. Values are:
N	Non–revertive switching mode (default when FFP was created)
Y	Revertive switching mode
<NoVal>	Previously Existing Value (subsequent default)

SDTHSW=	{5, 6, 7, 8, 9, <NoVal>}
Default:	{Previously Existing Value} Factory default = 6
Addressing:	None
Description:	STS-1 Signal Degrade Threshold Switching level. Indicates the signal degrade threshold over which Signal Degrade protection switching is initiated. Values are:
5	BER threshold of 10E ⁻⁵
6	BER threshold of 10E ⁻⁶ (default when FFP was created)
7	BER threshold of 10E ⁻⁷
8	BER threshold of 10E ⁻⁸
9	BER threshold of 10E ⁻⁹
<NoVal>	Previously Existing Value (subsequent default)
WTRTIME=	{5-12, <NoVal>}
Default:	{Previously Existing Value} Factory default = 5 minutes
Addressing:	None
Description:	Wait to Restore Time. Determines the wait to restore time that is used by the revertive path level protection switching group. This parameter is only valid when revertive switching is selected. Values are:
5-12	An integer value in minutes between 5 and 12 (factory default to 5 when FFP was created)
<NoVal>	Previously Existing Value (subsequent default)

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
IPNC	Input, Parameter Not Consistent
SAPS	Status, Already in Protection State /*Already in protection state*/
SAWS	Status, Already in Working State /*Already in working state*/
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID STRING>*/ /*RPP Database Error: <ERROR-STRING> */

SNVS Status, Not in Valid State
 /*Cannot specify RVRTV to be NO when not part of a 2WAYPR*/
 /*Protection Switch exists*/

EXAMPLES

In the following example, the EBER threshold is updated to a value of 10E-3 and the Signal Degrade threshold is updated to 10E-8 for STS-1 ports OC3STS1-14-1 and OC3STS1-13-1.

```
ED-FFP-STs1::OC3STS1-13-1,OC3STS1-14-1:::EBER=3,SDTHSW=8;
```

COMMAND CODE: **ED-FFP-VT1**
COMMAND NAME: **EDIT FAST FACILITY PROTECTION VT1**

PURPOSE

The ED-FFP-VT1 command modifies the attributes of a ring facility protection group for VT1.5. It also provides for changing the attributes of the facility protection group. This command modifies the Excessive Bit Error Rate, Working/Protect, Revertive/Non-revertive, Signal Degrade Threshold Switching level, and Wait to Restore Time options.

An ED-FFP-VT1 command is denied if:

- The VT1.5 AIDs specified in fields B1 and B2 are not already defined as part of a Two-Way Path Ring (2WAYPR) or Two-Way Drop and Continue (2WAYDC) cross-connect.
- PROTN=P is specified when the VT1.5 AID specified in B1 is a Protect VT1.
- PROTN=W is specified when the VT1.5 AID specified in B1 is not a Protect VT1.
- RVRTV=Y or RVRT=N is specified for an existing cross-connection type that is not 2WAYPR or 2WAYDC.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
ED-FFP-VT1 : [TID] : B1, B2 : [CTAG] : : : [EBER=] [, PROTN=] [, RVRTV=] [, SDTHSW=]
            [, WTRTIME=] ;
```

INPUT PARAMETERS

CTAG	<p>< 1-6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>

EBER=	{3, 4, <NoVal>}
Default:	{Previously Existing Value}
Addressing:	None
Description:	VT1.5 Excessive Bit Error Rate (BER) switching threshold. Determines the value corresponding to an Excessive BER condition. Values are:
3	BER threshold of $10E^{-3}$
4	BER threshold of $10E^{-4}$ (default when FFP was created)
<NoVal>	Previously Existing Value (subsequent default)
PROTN=	{P, W, <NoVal>}
Default:	{Previously Existing Value}
Addressing:	None
Description:	Working or Protect VT1. Indicates whether the VT1 specified in the B1 field is the Working or Protect VT1:
P	Protect. If it is currently a Working VT1, interchange Working and Protect VT1s.
W	Working. If it is currently a Protect VT1, interchange Working and Protect VT1s.
<NoVal>	Previously Existing Value (subsequent default)
RVRTV=	{N, Y, <NoVal>}
Default:	{Previously Existing Value} Initial default = N
Addressing:	None
Description:	Revertive switching mode for FFP selector. Indicates whether the protection switching is revertive or not. Values are:
N	Non-revertive switching mode (default when FFP was created)
Y	Revertive switching mode
<NoVal>	Previously Existing Value (subsequent default)
SDTHSW=	{5, 6, 7, 8, 9, <NoVal>}
Default:	{Previously Existing Value} Factory default = 6
Addressing:	None
Description:	VT1.5 Signal Degrade Threshold Switching level. Indicates the signal degrade threshold over which Signal Degrade protection switching is initiated. Values are:
5	BER threshold of $10E^{-5}$
6	BER threshold of $10E^{-6}$ (default when FFP was created)
7	BER threshold of $10E^{-7}$
8	BER threshold of $10E^{-8}$
9	BER threshold of $10E^{-9}$
<NoVal>	Previously Existing Value (subsequent default)
WTRTIME=	{5–12, <NoVal>}
Default:	{Previously Existing Value} Factory default = 5 minutes
Addressing:	None
Description:	Wait to Restore Time. Determines the wait to restore time that is used by the revertive path level protection switching group. This parameter is only valid when revertive switching is selected. Values are:
5–12	An integer value in minutes between 5 and 12 (factory default to 5 when FFP was created)
<NoVal>	Previously Existing Value (subsequent default)

RTRV-FFP-VT1

COMMAND CODE: **ED-FLTPRO-STS1**
COMMAND NAME: **EDIT FAULT PROPAGATION STS-1**

PURPOSE

The ED-FLTPRO-STS1 command modifies the fault escalation parameter values for provisioned STS-1 ports. Fault Escalation consists of two distinct provisioned capabilities, Failure Detection and Fault Propagation (described below). The ED-FLTPRO-rr commands enable and disable these capabilities on a per port basis.

The ED-FLTPRO-STS1 command is allowed on an STS-1, on any of its constituents, or on any containing facility port, which is under loopback. However the fault propagation feature will be disabled for the duration of the loopback. See OPR-LPBK-STS1 for further details.

When a port's Failure Detection (FAILDET parameter) is enabled, the *incoming* side of the specified port is monitored for failures. If FAILDET is enabled and a failure is detected, all of the incoming bandwidth on the port is *marked* with an *Escalation Request* (internal to the system.) Therefore, regardless of how an incoming port's data is cross-connected through the system, all *outgoing* ports receiving data from the failed incoming port also receive an *Escalation Request*.

When a port's Fault Propagation (FLTPRO parameter) is enabled, the *outgoing* side of the specified port is monitored to determine if any of the bandwidth in the port's outgoing signal is marked with an *Escalation Request*. If an *Escalation Request* exists, the outgoing port marks its *entire* output as failed by setting AIS-P in the output signal or by inserting PDI values in the outgoing C2 byte, depending on the STS-1 parameter PDIINS.

When a port is initially provisioned via the ENT-STS1 command, the fault propagation parameters (FAILDET and FLTPRO) are initially disabled by default. The ED-FLTPRO-STS1 command is used to enable these parameters on a per-port basis. If the port is deleted via a DLT-STS1 command and then reprovisioned, all previous fault propagation provisioning made by the ED-FLTPRO-STS1 command is lost.

When Fault Escalation occurs, the entire output path's data is lost, even if only part of the output signal originally contained failed data (this is intended since it is the method used to cause the network to protection switch to a redundant path). Note that the use of *path level* Failure Detection (as opposed to section/line Failure Detection) can result in fault propagation in *both* of the redundant network paths, along with all of the other good traffic grouped with them, if the network has not been specifically configured for its use.

An ED-FLTPRO-STS1 command is denied if:

- The specified STS-1 has not previously been provisioned with the ENT-STS1 command.
- The specified STS-1, or any embedded constituent port, or any containing port is under test access.
- The specified STS-1 port is under a loopback.
- The "Fault Escalation" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

ED-FLTPRO-STS1: [TID] :AID: [CTAG] : : : [CMDMDE=] [, FAILDET=] [, FLTPRO=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	STS1 AID, identifies the STS-1 port.

CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CMDMDE=	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced. The command is accepted and parameter values are modified even if the STS1 or one of its constituents is cross-connected. NORM Normal. The command is denied if the STS1 or any of its constituents are cross-connected.
FAILDET=	{NONE, SL, SLP} Default: <Previously existing value> or {NONE} (Factory Default) Addressing: None Description: Failure Detection (receive direction only), specifies the type of incoming STS1 failures (on EC1, OC–3 or OC–12 facilities) which result in an <i>Escalation Request</i> being issued to all outgoing ports receiving any bandwidth from this STS1 (i.e., are cross-connected to it). Values are: NONE None, no detection of STS1 level failure conditions. SL Section/Line, specifies section and line level failure detection (LOS, LOF, AIS–L, EBER, or LOP–P) is enabled. SLP Section/Line/Path, specifies section, line, and path level failure detection (LOS, LOF, AIS–L, EBER, LOP–P, or AIS–P) is enabled.
FLTPRO=	{N, Y} Default: <Previously existing value> or {N} (Factory Default) Addressing: None Description: Fault Propagation (transmit direction only), specifies whether or not any <i>Escalation Request</i> that is present for any incoming (i.e., from the matrix) constituent of the outgoing STS1 is escalated up to the STS1 Path level (i.e., AIS–P or PDI C2 byte values inserted in the output signal, depending on the STS1 parameter PDIINS). Values are: N No, Fault Escalation to the STS1 Path level is disabled. Y Yes, Fault Escalation to the STS1 Path level is enabled. Upon this setting, faults will be escalated to STS1 path level as either AIS–P or PDI depending on the value of the PDIINS (Payload Defect Indication INSection) parameter.

The interaction between FLTPRO in this command and the PDIINS in the ED–STS1 command is defined in the following table.

PDIINS = in ED–STS1 command	FLTPRO = in ED–FLTPRO–STS1	
	Y	N
Y	Fault escalation is based on selected incoming faults as defined in the Fault Propagation feature and APDI is inserted in the outgoing C2 byte.	Fault escalation is based on conditions defined in GR–253 and PDI is inserted in the outgoing C2 byte.
N	is based on selected incoming faults as defined in the Fault Propagation feature and AIS–P is inserted in the outgoing STS1.	No fault escalation (i.e., None of the PDI, APDI or AIS–P is inserted).

SUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
IPNV	Input, Parameter Not Valid
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
SNVS	Status, Not in Valid State
	/* To edit non-idle in-service port, set CMDMDE=FRCD */
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, STS-1 port EC1STS1-24 is provisioned so that any incoming section or line failure on the STS-1 causes an *Escalation Request* to be generated to any outgoing port(s) to which it or any of its bandwidth may be cross-connected.

```
ED-FLTPRO-STs1::EC1STS1-24:::::FAILDET=SL;
```

In the following example, STS-1 port OC3STS1-15-1 is provisioned so that any incoming failure on the OC-3 facility, or any failure on the upstream facility which transports the STS-1 signal, causes an *Escalation Request* to be generated to any outgoing port(s) to which it or any of its bandwidth may be cross-connected.

```
ED-FLTPRO-STs1::OC3STS1-15-1:::::FAILDET=SLP;
```

In the following example, STS-1 port OC3STS1-12-2 (with input parameter PDIINS=N) is provisioned to generate AIS-P in the outgoing STS-1 signal if an *Escalation Request* is detected on any of its bandwidth from the matrix.

```
ED-FLTPRO-STs1::OC3STS1-12-2:::::FLTPRO=Y;

RTRV-FLTPRO-VT1

RTRV-STS1

COMMAND CODE: **ED-FLTPRO-T1**
COMMAND NAME: **EDIT FAULT PROPAGATION T1**

PURPOSE

The ED-FLTPRO-T1 command modifies the failure detection parameter values for provisioned DS1 ports. The command is allowed on a facility port, or on one that is contained by a port, which is under loopback. However the fault propagation feature will be disabled for the duration of the loopback. See OPR-LPBK-T1 for further details.

The ED-FLTPRO-T1 command is allowed on a facility port, or on one that is contained by a port, which is under loopback. However the fault propagation feature will be disabled for the duration of the loopback. See OPR-LPBK-T1 for further details.

Fault propagation/escalation of faults to the DS1 level is not possible, since the system does not cross-connect DS1 constituent signals. Therefore, the ED-FLTPRO-T1 command only supports the Failure Detection capability. (Fault Propagation provisioning is not required in the ED-FLTPRO-T1 command.)

When a port is initially provisioned via the ENT-T1 command, the fault propagation parameter (FAILDET) is initially disabled as a default. The ED-FLTPRO-T1 command is used to enable this parameter on a per port basis. If the port is deleted via a DLT-T1 command and then re-provisioned, all previous fault propagation provisioning made by the ED-FLTPRO-T1 command is lost.

An ED-FLTPRO-T1 command is denied if:

- The specified DS1 has not previously been provisioned with the ENT-T1 command.
- The specified DS1 is not a physical (electrical) DS1 port.
- The specified DS1 or any containing port is under test access.
- The specified DS1 (and associated cross-connection) is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMB, TERMT}).
- The specified DS1 port is under a loopback.
- The "Fault Escalation" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

ED-FLTPRO-T1 : [TID] : AID : [CTAG] : : : [CMDMDE=] [, FAILDET=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID: {T1-{1-59392}} (T1-DS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS1 AID, identifies the DS1 port. Restrictions: ED-FLTPRO-T1 is denied if the specified AID is not a physical (electrical) DS1 port.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.

CMDMDE=	{FRCD, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	FRCD	Forced. The command is accepted and parameter values are modified even if the DS1 is cross-connected.
	NORM	Normal. The command is denied if the DS1 is cross-connected.
FAILDET=	{NONE, SL, SLP}	
	Default:	<Previously existing value> or {NONE} (Factory Default)
	Addressing:	None
	Description:	Failure Detection (receive direction only), specifies the type of incoming DS1 failures which result in an <i>Escalation Request</i> being issued to all outgoing ports receiving any bandwidth from this DS1 (i.e., are cross-connected to it). Values are:
	NONE	None, no detection of DS1 level failure conditions.
	SL	Section/Line, specifies section and line level failure detection (LOS or LOF) is enabled.
	SLP	Section/Line/Path, specifies section, line, and path level failure detection (LOS, LOF, or AIS) is enabled.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Free Form Informational Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */

COMMAND CODE: **ED-FLTPRO-T3**
COMMAND NAME: **EDIT FAULT PROPAGATION T3**

PURPOSE

The ED-FLTPRO-T3 command modifies the fault escalation parameter values for provisioned DS3 ports. Fault Escalation consists of two distinct provisioned capabilities, Failure Detection and Fault Propagation (described below). The ED-FLTPRO-rr commands enable and disable these capabilities on a per port basis.

The ED-FLTPRO-T3 command is allowed on a DS3, on any of its constituents, or on any containing facility ports, which are under loopback. However the fault propagation feature will be disabled for the duration of the loopback. See OPR-LPBK-T3 for further details.

When a port's Failure Detection (FAILDET parameter) is enabled, the *incoming* side of the specified port is monitored for failures. If FAILDET is enabled and a failure is detected, all of the incoming bandwidth on the port is *marked* with an *Escalation Request* (internal to the system.) Therefore, regardless of how an incoming port's data is cross-connected through the system, all *outgoing* ports receiving data from the failed incoming port also receive an *Escalation Request*.

Note that Failure Detection is only supported on physical (electrical) DS3s. The ED-FLTPRO-T3 command cannot be used to enable Failure Detection on DS3s embedded within STS-1s.

When a port's Fault Propagation (FLTPRO parameter) is enabled, the *outgoing* side of the specified port is monitored to determine if any of the bandwidth in the port's outgoing signal is marked with an *Escalation Request*. If an *Escalation Request* exists, the outgoing port marks its *entire* output as failed, by removing the DS3 output signal or by setting the DS3 output signal to AIS.

Note that current hardware does not support escalation to the DS3 level for DS3s embedded within STS-1s. If it is necessary to have such a capability, it is suggested that faults be escalated to the higher STS-1 level for the STS-1 that contains the DS3 in question (refer to the ED-FLTPRO-STS1 command).

When a port is initially provisioned via the ENT-T3 command, the fault propagation parameters (FAILDET and FLTPRO) are initially disabled as a default. The ED-FLTPRO-T3 command is used to enable these parameters on a per port basis. If the port is deleted via a DLT-T3 command and then re-provisioned, all previous fault propagation provisioning made by the ED-FLTPRO-T3 command is lost.

Note that for an electrical DS3 terminated on a DS3 Quad shelf, the FLTPRO parameter has no effect, even if provisioned to a value of Y, unless both HMU circuit packs are installed and operating in the Quad (i.e., a redundant pair of HUMs are required in order to remove the DS3 signal from being output).

When Fault Escalation occurs, the entire output path's data is lost, even if only part of the output signal originally contained failed data (this is intended since it is the method used to cause the network to protection switch to a redundant path). Note that the use of *path level* Failure Detection (as opposed to section/line Failure Detection) can result in fault propagation in *both* of the redundant network paths, along with all of the other good traffic grouped with them, if the network has not been specifically configured for its use.

An ED-FLTPRO-T3 command is denied if:

- The specified DS3 has not previously been provisioned with the ENT-T3 command.
- The specified DS3, or an embedded constituent port is under test access.
- The specified DS3 port is under a loopback.
- The "Fault Escalation" PFO is not enabled.
- An invalid parameter value or combination of parameter values is entered.

ED-FLTPRO-T3 : [TID] : AID : [CTAG] : : : [CMDMDE=] [, FAILDET=] [, FLTPRO=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	{EC1T3-{1-3840}}	(EC1T3-EC1/STS1/DS3#)
	{OC3T3-{1-2240}-{1-3}}	(OC3T3-OC3#-STS1/DS3#)
	{OC12T3-{1-560}-{1-4}-{1-3}}	(OC12T3-OC12#-STM1#-STS1/DS3#)
	Default: Entry Required	
CTAG	Addressing: &&-ranging and &-grouping	
	Description: DS3 AID, identifies the DS3 port.	
	Restrictions: ED-FLTPRO-T3 is denied if the specified AID is not a physical (electrical) DS3 and FAILDET of {SL, SLP} is entered.	
	ED-FLTPRO-T3 is denied if the specified AID is an STS-1 embedded DS3 and FLTPRO of {Y} is entered.	
CMDMDE=	< 1-6 VALID CTAG CHARACTERS >	
	Default: < System assigned CTAG value >	
	Addressing: None	
	Description: Correlation Tag, associates input command with its output responses.	
FAILDET=	{FRCD, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	FRCD	Forced. The command is accepted and parameter values are modified even if the DS3 or one of its constituents is cross-connected.
	NORM	Normal. The command is denied if the DS3 or any of its constituents are cross-connected.
FAILDET=	{NONE, SL, SLP}	
	Default:	<Previously existing value> or {NONE} (Factory Default)
	Addressing:	None
	Description:	Failure Detection (receive direction only), specifies the type of incoming DS3 failures which result in an <i>Escalation Request</i> being issued to all outgoing ports receiving any bandwidth from the DS3 (i.e., are cross-connected to it). Values are:
	NONE	None, no detection of DS3 level failure conditions.
	SL	Section/Line, specifies section and line level failure detection (LOS or LOF) is enabled.
	SLP	Section/Line/Path, specifies section, line, and path level failure detection (LOS, LOF, or AIS) is enabled.
	Restrictions:	ED-FLTPRO-T3 is denied if FAILDET of {SL, SLP} is entered and the specified AID is not a physical (electrical) DS3.

FLTPRO= {N, Y}

Default: <Previously existing value> or {N} (Factory Default)

Addressing: None

Description: Fault Propagation (transmit direction only). Determines whether or not *Escalation Requests* that are present for incoming (i.e., from the matrix) constituents of the outgoing DS3 will be escalated up to the DS3 Section level (i.e., output signal removed) for electrical DS3 ports terminated on a DS3 Quad shelf, or DS3 Path level (i.e., DS3 AIS inserted in the output signal) for DS3s not terminated on a DS3 Quad shelf.

Values are:

N No. Fault Escalation to the DS3 Path or Section level is disabled.

Y Yes, Fault Escalation to the DS3 Path or Section level is enabled.

Restrictions: ED-FLTPRO-T3 is denied if a value of FLTPRO=Y is entered and the specified AID is a DS3 embedded within an STS-1.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Free Form Informational Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC Input, Invalid ACcess identifier

IPNV Input, Parameter Not Valid

SDBE Status, internal Data Base Error

/* TP Database Error: <ERROR-STRING> for <AID-STRING> */

SNVS Status, Not in Valid State

/* To edit non-idle in-service port, set CMDMDE=FRCD */

SRQN Status, invalid ReQuest

EXAMPLES

In the following example, DS3 port T3–24 is provisioned so that any incoming failure on the physical (electrical) DS3 causes an *Escalation Request* to be generated to any outgoing port(s) to which it or any of its bandwidth may be cross-connected.

```
ED-FLTPRO-T3::T3-24::::FAILDET=SL;
```

In the following example, DS3 port T3–24 is provisioned so that any failure on the physical (electrical) DS3, or any failure on the upstream facility which transports the DS3 signal, causes an *Escalation Request* to be generated to any outgoing port(s) to which it or any of its bandwidth may be cross-connected.

```
ED-FLTPRO-T3::T3-24::::FAILDET=SLP;
```

In the following example, DS3 port OC3T3–16–3 (DS3 embedded in an STS–1 embedded in an OC–3) is provisioned to generate DS3 AIS in the outgoing DS3 signal if an *Escalation Request* is detected on any of its bandwidth from the matrix.

```
ED-FLTPRO-T3::OC3T3-16-3::::FLTPRO=Y;
```

Note however that current SONET I/O hardware does not yet support this capability and therefore, the command in the above example would typically be denied.

```

COMMAND CODE: **ED-FLTPRO-VT1**
COMMAND NAME: **EDIT FAULT PROPAGATION VT1**

PURPOSE

The ED-FLTPRO-VT1 command modifies the fault escalation parameter values for provisioned VT1 ports. It enables and disables fault escalation on a per port basis.

The ED-FLTPRO-VT1 command is allowed on a facility port, on any of its constituents, or on any containing facility port, which is under loopback. However the fault propagation feature will be disabled for the duration of the loopback. See OPR-LPBK-VT1 for further details.

When a port's Fault Propagation (FLTPRO parameter) is enabled, the *outgoing* side of the specified port is monitored to determine if any of the bandwidth in the port's outgoing signal is marked with an *Escalation Request*. If an *Escalation Request* exists, the outgoing port marks its *entire* output as failed, by setting the output signal to AIS.

When a port is initially provisioned via the ENT-VT1 command, the fault propagation parameter (FLTPRO) is initially disabled as a default. The ED-FLTPRO-VT1 command is used to enable this parameter on a per port basis. If the port is deleted via a DLT-VT1 command and then re-provisioned, all previous fault propagation provisioning made by the ED-FLTPRO-VT1 command is lost.

When Fault Escalation occurs, the entire output path's data is lost, even if only part of the output signal originally contained failed data (this is intended since it is the method used to cause the network to protection switch to a redundant path).

An ED-FLTPRO-VT1 command is denied if:

- The specified VT1 has not previously been provisioned with the ENT-VT1 command.
- The specified VT1, or any embedded constituent port, or any containing port is under test access.
- The specified VT1 (and associated cross-connection) is in a terminate-and-leave status (a cross-connection SST of {TERMB, TERMB, TERMT}).
- The specified VT1 port is under a loopback.
- The "Fault Escalation" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

ED-FLTPRO-VT1 : [TID] : AID : [CTAG] : : : [CMDMDE=] [, FLTPRO=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies the VT1.5 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

CMDMDE=	{FRCD, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	FRCD	Forced. The command is accepted and parameter values are modified even if the VT1 or one of its constituents is cross-connected.
	NORM	Normal. The command is denied if the VT1 or any of its constituents are cross-connected.
FLTPRO=	{N, Y}	
	Default:	<Previously existing value> or {N} (Factory Default)
	Addressing:	None
	Description:	Fault Propagation (transmit direction only), specifies whether or not any <i>Escalation Request</i> that is present for any incoming (i.e., from the matrix) constituent of the outgoing VT1 is escalated up to the VT1 Path level (i.e., AIS-V inserted in the output signal). Values are:
	N	No. Fault Escalation to the VT1 Path level is disabled.
	Y	Yes, Fault Escalation to the VT1 Path level is enabled.

COMMAND CODE: **ED-FTP-USER**
COMMAND NAME: **EDIT FTP USER**

PURPOSE

The ED-FTP-USER command allows modifying a FTP user profile in the FTP (File Transfer Protocol) User Security Database.

An ED-FTP-USER command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ED-FTP-USER : [TID] : : [CTAG] : : FTPUID , ACCTYPE ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.						
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.						
FTPUID	<5-12 VALID FTPUID CHARACTERS> Default: Entry Required Addressing: None Description: FTP User Identifier, specifies a unique user ID. Valid values for FTPUID are 5 to 12, case-sensitive alphanumeric characters where the first character must always be an alphabetic character. The following special characters are also accepted as valid characters and will be part of the FTPUID: % (percent sign), + (plus sign), # (pound sign), and _ (under score). (Note that the dash (-) character is also accepted by the system, but only characters prior to the dash become part of the FTPUID. The dash (-) and characters after that are ignored by the system.)						
ACCTYPE	{BPM, DB, ISU} Default: Entry Required Addressing: None Description: Access Type, specifies the type of access the FTP user is given. Values are: <table> <tr> <td>BPM</td><td>Binary PM, specifies that the FTP user is given access to the Binary PM data.</td></tr> <tr> <td>DB</td><td>Database, specifies that the FTP user is given access to upload/download database backup files.</td></tr> <tr> <td>ISU</td><td>In-Service Upgrade, specifies that the FTP user is given access to upload generic files.</td></tr> </table>	BPM	Binary PM, specifies that the FTP user is given access to the Binary PM data.	DB	Database, specifies that the FTP user is given access to upload/download database backup files.	ISU	In-Service Upgrade, specifies that the FTP user is given access to upload generic files.
BPM	Binary PM, specifies that the FTP user is given access to the Binary PM data.						
DB	Database, specifies that the FTP user is given access to upload/download database backup files.						
ISU	In-Service Upgrade, specifies that the FTP user is given access to upload generic files.						

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <FTPUID> [ , <ACCTYPE> ] */
[/* <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

FTPUID	<5–12 VALID FTPUID CHARACTERS> FTP User Identifier, identifies the provisioned UID value.	
ACCTYPE	{BPM, DB, ISU}	
	Access Type, identifies the type of access the FTP user is given.	
	BPM	Binary PM, specifies that the FTP user is given access to the Binary PM data.
	DB	Database, specifies that the FTP user is given access to upload/download database backup files.
	ISU	In-Service Upgrade, specifies that the FTP user is given access to upload generic files.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IPMS	Input, Parameter MiSsing

EXAMPLES

In the following example, a user profile is modified.

```
ED-FTP-USER:::::user_ftppid,new_user;
```

RELATED COMMANDS

```
DLT-FTP-USER
ENT-FTP-USER
RTRV-FTP-USER
```

COMMAND CODE: **ED-GROUP-CMD**
COMMAND NAME: **EDIT GROUP COMMAND**

PURPOSE

The ED-GROUP-CMD command modifies the specified GROUP3 CCFC security group A through Y (CCFC Group Z cannot be modified). The commands contained in the GROUP3 CCFC security group are determined by the operation performed on the GROUP1 and GROUP2 CCFC security groups. The previous contents of the GROUP3 CCFC security group is replaced when ED-GROUP-CMD is executed. The CANCEL-USER command is automatically included in the resulting GROUP3 CCFC security group.

The operation of the ED-GROUP-CMD command can be illustrated as follows:

GROUP1	OPR	GROUP2	GROUP3	Comments
A	PLUS	B	A	(B is added to A)
A	MINUS	B	A	(B is removed from A)
A	PLUS	A	B	(B is a copy of A)
A	MINUS	A	A	(Group A now only has CANCEL-USER)
A	PLUS	B	C	(C is the union of A and B)
A	MINUS	B	C	(C contains commands that are in A but not in B)

The changes requested via ED-GROUP-CMD take effect immediately.

Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC) for the system default CCAL and CCFC values for each command.

The ED-GROUP-CMD command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

ED-GROUP-CMD: [TID] : : [CTAG] : : GROUP1, GROUP2, OPR, GROUP3 ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
GROUP1	<A through Z or a through z> Default: Entry Required Addressing: None Description: CCFC Group 1, specifies the first CCFC security group. Group 1 is specified as a single upper or lower case alphabetic character A through Z.
GROUP2	<A through Z or a through z> Default: Entry Required Addressing: None Description: CCFC Group 2, specifies the second CCFC security group. Group 2 is specified as a single upper or lower case alphabetic character A through Z.

OPR	{MINUS, PLUS}	
	Default:	Entry Required
	Addressing:	None
	Description:	Operation, specifies the type of operation to be performed on GROUP1 and GROUP2 to form GROUP3. Values are:
	MINUS	Minus, subtract the commands in GROUP2 from the commands in GROUP1 to form GROUP3. The MINUS operation will result in a set of commands in GROUP3 that are in GROUP1 but not in GROUP2 plus the CANCEL-USER command.
	PLUS	Plus, add the commands in GROUP2 to the commands in GROUP1 to form GROUP3. The PLUS operation will result in a set of commands in GROUP3 that are in GROUP1 and in GROUP2 plus the CANCEL-USER command.
GROUP3	<A through Y or a through y>	
	Default:	Entry Required
	Addressing:	None
	Description:	Group 3, specifies the third CCFC security group that contains the commands that remain as a result of the operation performed on GROUP1 and GROUP2. The CANCEL-USER command is automatically included in GROUP3. The previous contents of the CCFC security group 3 is replaced when ED-GROUP-CMD is executed. GROUP3 is specified as a single upper or lower case alphabetic character A through Y.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <GROUP1> <OPR> <GROUP2> = <GROUP3> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

GROUP1	<A through Z> Group 1, identifies the first CCFC security group.
GROUP2	<A through Z> Group 2, identifies the second CCFC security group.
OPR	{PLUS, MINUS} Operation, identifies the type of operation performed on GROUP1 and GROUP2 to form GROUP3.
GROUP3	<A through Y> Group 3, indicates the resulting third CCFC security group.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV Input, Data Not Valid
IPNV Input, Parameter Not Valid
 /* Illegal Input: GROUP1 length, GROUP2 length */
 /* Illegal Input: GROUP1 length */
 /* Illegal Input: GROUP1 */
 /* Illegal Input: GROUP2 length */
 /* Illegal Input: GROUP2 */
 /* Illegal Input: GROUP3 length */
 /* Illegal Input: GROUP3 */
 /* Illegal Input: GROUP3 CANNOT MODIFY Z */
SROF Status, Requested Operation Failed
 /* Unable to write to CSDB – status = <status number> */
 /* Unable to update CSDB – status = <status number> */

EXAMPLES

In the following example, groups I, J and K contain the set of TL1 commands as shown in Table 1 below:

Table 1			
I	J	K	L
CANC-USER	CANC-USER	CANC-USER	CANC-USER
ENT-T1	RTRV-T1	ENT-T1	
ED-T1	RTRV-T3	SET-PMODE-T1	
DLT-T1	RTRV-TH-T1	RTRV-PMODE-T1	
RTRV-T1	RTRV-TH-T3		

In this example, ED-GROUP-CMD is used to combine group I and group J, resulting in group K:

```
ED-GROUP-CMD:::::i,j,PLUS,k;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P21040. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P21040 COMPLD
/* I PLUS J = K */
/* ED-GROUP-CMD:::::i,j,PLUS,k [P21040] (1) */
;
```

After the ED-GROUP-CMD command is successfully executed, groups I, J, K, and L contain the set of TL1 commands as shown in Table 2 below.

Table 2			
I	J	K	L
CANC-USER	CANC-USER	CANC-USER	CANC-USER
ENT-T1	RTRV-T1	ENT-T1	
ED-T1	RTRV-T3	ED-T1	
DLT-T1	RTRV-TH-T1	DLT-T1	
RTRV-T1	RTRV-TH-T3	RTRV-T1	
		RTRV-T3	
		RTRV-TH-T1	
		RTRV-TH-T3	

In the following example, ED-GROUP-CMD is used to remove commands that are in group J from group I, resulting in group L. The example assumes the information shown in Table 2 prior to executing the command.

```
ED-GROUP-CMD:::::I,j,MINUS,L;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P21041. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P21041 COMPLD
/* I MINUS J = L */
/* ED-GROUP-CMD:::::I,j,MINUS,L [P21041] (1) */
;
```

Assuming Table 2 information prior to executing the command, after the ED-GROUP-CMD command is successfully executed, groups I, J, K, and L contain the set of TL1 commands shown in Table 3 below.

Table 3			
I	J	K	L
CANC-USER	CANC-USER	CANC-USER	CANC-USER
ENT-T1	RTRV-T1	ENT-T1	ENT-T1
ED-T1	RTRV-T3	ED-T1	ED-T1
DLT-T1	RTRV-TH-T1	DLT-T1	DLT-T1
RTRV-T1	RTRV-TH-T3	RTRV-T1	
		RTRV-T3	
		RTRV-TH-T1	
		RTRV-TH-T3	

In the following example, ED-GROUP-CMD is used to remove commands that are in group J from group L; resulting in group Z:

```
ED-GROUP-CMD:::::L,j,MINUS,Z;
```

Since GROUP3 is specified as Z, the ED-GROUP-CMD is denied and no changes to the previously existing groups is performed.

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P21044. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P21044 DENY
IPNV
/* Illegal Input, GROUP3 CANNOT MODIFY Z */
/* Input, Parameter Not Valid */
/* ACTION: CHECK INPUT DATA */
/* ED-GROUP-CMD:::::L,j,MINUS,Z [P21044] (1) */
;
```

RELATED COMMANDS

```

RTRV-PRVG-USER
```

COMMAND CODE: **ED-IP-PRMTR**
COMMAND NAME: **EDIT IP PARAMETERS**

PURPOSE

The ED-IP-PRMTR command allows modifying of the Internet Protocol (IP) Layer parameters of the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command allows provisioning of the network layer (Layer 3) parameters pertaining to the IP layer stack.

Changes to the name-defined parameters are stored in the database and take effect when the IP stack is (re)initialized via the RST-CID command. All of the name-defined parameters survive a database backup and restore.

The ED-IP-PRMTR command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An ED-IP-PRMTR command is denied if:

- The specified CID is not provisioned as a LAN port on the ICM (via ENT-CID with PROTOCOL of TCP).
- The network address of BRDCSTADR does not equal the network address of the IPADDR.
- The Host ID portion of the specified GATEWAYADR is provisioned as all zeros (0s) or all ones (1s).
- The GATEWAYADR is provisioned in the range between 2.0.0.0 to 2.255.255.255.
- The provisioned subnet address of the specified GATEWAYADR does not equal the subnet address of the IPADDR.
- An invalid parameter value is entered.

INPUT FORMAT

ED-IP-PRMTR : [TID] : CPORT : [CTAG] : : : [BRDCSTADR=] [, GATEWAYADR=] [, NODENAME=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
BRDCSTADR=	{{(0-255)-(0-255)-(0-255)-(0-255}} Default: <Value derived from IPADDR and NETMASK> Addressing: None Description: Broadcast Address, specifies the Network Layer Broadcast Address for the specified IP Address. The Broadcast Address is the IP Address with all the host bits set to one (NOTE: the host bits are the bits in the NET-MASK that are set to zero).

GATEWAYADR=	{{(0-255)-(0-255)-(0-255)-(0-255)}, DFLT}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Gateway Address, specifies the Network Layer's Default Gateway router's IP address. Name-defined values are:
DFLT	Default, specifies the parameter is set to the factory default and the default gateway routing entry is removed from the IP routing table.
Restrictions:	The ED-IP-PRMTR command is denied if the provisioned subnet address of GATEWAYADR does not equal the subnet address of IPADDR. The ED-IP-PRMTR command is denied if the Host ID portion of the specified GATEWAYADR is provisioned as all zeros (0s) or all ones (1s). The ED-IP-PRMTR command is denied if the GATEWAYADR is provisioned in the range between 2.0.0.0 to 2.255.255.255.

NODENAME=	<1-15 ASCII printable characters>
Default:	<Previously Existing Value>
Addressing:	None
Description:	TCP/IP Network Name, specifies the TCP/IP network name of the NE. This value is not used by the NE at this time, but is set so the verification of the IP address is made at a later time.

```

COMMAND CODE: **ED-IP-STATICRT**
COMMAND NAME: **EDIT IP STATIC ROUTE**

PURPOSE

The ED-IP-STATICRT command allows modifying of an entry in the static routing table used by the Internet Protocol (IP) router running on the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command allows modification of the network layer (Layer 3) parameters pertaining to the static routing table. The IPADDR and NETMASK parameters determine which static routing table entry is to be modified.

Changes to the name-defined parameters take effect immediately and survive a database backup and restore.

The ED-IP-STATICRT command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An ED-IP-STATICRT command is denied if:

- The specified CID is not provisioned as a LAN port on the ICM (via ENT-CID with PROTOCOL of TCP).
- The specified IPADDR is within the 2.0.0.0 to 2.255.255.255 IP address range.
- An entry corresponding to the IP address specified in the IPADDR and NETMASK parameters does not exist in the static routing table.
- The specified IPADDR is not equal to its subnet address when DESTTYPE=NET (via ENT-IP-STATICRT).
- The specified IPADDR is outside the lowest and highest IP Address Range.
- The network portion of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is not subnetted.
- The subnetwork address of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is subnetted.
- The Host ID portion of the specified GATEWAYADR is provisioned as all zeros (0s) or all ones (1s).
- The GATEWAYADR is in the range between 2.0.0.0 to 2.255.255.255.
- The provisioned subnet address of the specified GATEWAYADR does not equal the subnet address of the IPADDR from ED-IP-PRMTR.
- Any portion of the default NETMASK is 255 and that portion of the specified NETMASK is a number less than 255.
- The specified NETMASK is any value other than 255.255.255.255 when DESTTYPE=HOST (via ENT-IP-STATICRT).
- The static routing table is full.
- An invalid parameter value is entered.

INPUT FORMAT

ED-IP-STATICRT: [TID] : CPORT: [CTAG] : : : [GATEWAYADR=] , IPADDR= , NETMASK= ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

GATEWAYADR= {(0–255)–(0–255)–(0–255)–(0–255)}

Default: <Previously Existing Value>

Addressing: None

Description: Gateway Address, specifies the gateway address of the gateway to which the packets are sent in order to reach the NE whose IP address is as given in the IPADDR parameter.

Restrictions: The ED–IP–STATICRT command is denied if the provisioned subnet address of GATEWAYADR does not equal the subnet address of IPADDR from ED–IP–PRMTR.
The ED–IP–STATICRT command is denied if the Host ID portion of the specified GATEWAYADR is provisioned as all zeros (0s) or all ones (1s).
The ED–IP–STATICRT command is denied if the GATEWAYADR is in the 2.0.0.0 to 2.255.255.255 IP range.

IPADDR= {(0–223)–(0–255)–(0–255)–(0–255)}

Default: Entry Required

Addressing: None

Description: Internet Protocol Address, specifies the IP Address of the NE to which the static route entry is made. The lowest and highest IP Address Range is:

IP Address Range		
Class	Lowest	Highest
A	0.1.0.0	126.0.0.0
B	128.0.0.0	191.255.0.0
C	192.0.1.0	223.225.225.0

Restrictions: The ED–IP–STATICRT command is denied if an IP Address outside of the lowest and highest IP Address Range is entered.
The ED–IP–STATICRT command is denied if the IPADDR is in the 2.0.0.0 to 2.255.255.255 IP range.
The ED–IP–STATICRT command is denied if the specified IPADDR is not equal to its subnet address when DESTTYPE=NET (via ENT–IP–STATICRT) (i.e. the logical AND of the IPADDR and NETMASK must equal the IPADDR).
The ED–IP–STATICRT command is denied if the network portion of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is not subnetted.
The ED–IP–STATICRT command is denied if the subnetwork address of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is subnetted.

NETMASK= {(0-255)-(0-255)-(0-255)-(0-255)}

Default: <Value determined by the IP Address and DESTTYPE=NET via ENT-IP-STATICRT> or {255.255.255.255} (If DESTTYPE=HOST via ENT-IP-STATICRT)

Addressing: None

Description: Subnet Mask, specifies the subnet mask of the network to which the NE with IPADDR is connected to.

Default Value Determined by the IP Address		
Class	IP Address Range	Default NETMASK (via ENT-IP-STATICRT)
A	0.0.0.0 to 127.255.255.255	255.0.0.0
B	128.0.0.0 to 191.255.255.255	255.255.0.0
C	192.0.0.0 to 223.255.255.255	255.255.255.0

Restrictions: The ED-IP-STATICRT command is denied if any portion of the default NETMASK is 255 and that portion of the specified NETMASK is a number less than 255.

The ED-IP-STATICRT command is denied if the specified NETMASK is any value other than 255.255.255.255 when DESTTYPE=HOST (via ENT-IP-STATICRT).

COMMAND CODE: **ED-LLLAN**
COMMAND NAME: **EDIT LOWER LAYER LAN PARAMETERS**

PURPOSE

The ED-LLLAN command allows provisioning of the Layer 1 (physical layer) and Layer 2 (data link layer) parameters of the SONET Data Communication Channel (DCC) network. This command allows provisioning of the OSI lower layer stack (Layer 1 and Layer 2) parameters pertaining to the LAN.

Changes to the name-defined parameters are stored in the database and take effect when the OSI stack is (re)initialized. This is accomplished by performing a RST-EQPT of the DSB or by editing the DSB into an IS state from an OOS state via ED-EQPT command. All of the name-defined parameters survive a database backup and restore.

An ED-LLLAN command is denied if:

- The specified DSB that contains this LAN is in a primary state other than OOS-MA or OOS-AUMA.
- An invalid parameter value is entered.

  /* ED-LLLAN::DSB-6-1-1:::L2INFO= 512 [P72019] (1) */
```

RELATED COMMANDS

RTRV-LLLAN

COMMAND CODE: **ED-LLLDCC**
COMMAND NAME: **EDIT LOWER LAYER LINE DCC**

PURPOSE

The ED-LLLDCC command allows provisioning of the Layer 1 (physical layer) and Layer 2 (data link layer) parameters of the SONET Data Communication Channel (DCC) network. This command allows provisioning of the OSI lower layer stack (Layer 1 and Layer 2) parameters pertaining to the Line DCC.

If the ED-LLLDCC command is successfully issued with PST of IS, the system initializes all the lower layer and upper layer OSI stack parameters pertaining to the addressed Line DCC. If the command is issued with PST of OOS, the system disables the processing of the Line DCC taken from both the working and protect OC-3/OC-12 processed by the corresponding DSB.

Changes to the name-defined parameters are stored in the database and take effect when the OSI stack is (re)initialized. This is accomplished by performing a RST-OCn (where n=3 or 12) or by editing the OC-3/OC-12 into an IS state from an OOS state using the ED-OCn command. All of the name-defined parameters survive a database backup and restore.

If ENT-FFP-OCn is issued on the addressed OC-3/OC-12, the AID is the AID of the working (odd numbered) OC-3/OC-12. If ENT-FFP-OCn is not issued on the addressed OC-3/OC-12 or ENT-RNG-OCn is issued on the addressed OC-3/OC-12, ED-LLLDCC allows both the odd numbered and even numbered OC-3s/OC-12s to be addressed.

An ED-LLLDCC command is denied if:

- The specified OC-3 that contains this DCC is in a UAS secondary state.
- The specified AID is a protection OC-3 or OC-12 (even numbered).
- Any parameter other than the PST is modified and the LLLDCC is not already in an OOS state or the PST of OOS is not specified.
- The specified PST=IS and the LLLDCC is already in an IS state.
- The specified PST=OOS and the LLLDCC is already in an OOS state.
- An invalid parameter value is entered.

INPUT FORMAT

```
ED-LLLDCC: [TID]:AID:[CTAG]:: [ALLDFLT=] [, L2IF=] [, L2INFO=] [, L2MAXCALLS=]
[, L2NOA=] [, L2RCALLTMR=] [, L2REX=] [, L2SIDE=] [, L2WAIT=]: [PST];
```

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the generic address of a DCC on the DSB.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.

ALLDFLT=	{N, Y}	
	Default:	{N}
	Addressing:	None
	Description:	All Default, specifies whether or not all the parameters are set to the factory default. If ED–LLLDCC is issued with ALLDFLT=Y, all parameters except PST are set to the factory default and all other specified parameters are ignored. If ED–LLLDCC is issued with ALLDFLT=N, all specified parameters will be changed and all other non–specified parameters will remain the previous existing value. Values are:
	N	No, specifies all parameters are not set to the factory default.
	Y	Yes, specifies all parameters are set to the factory default.
L2IF=	{1–127, DFLT}	
	Default:	<Previously existing value> or {7} {Factory default}
	Addressing:	None
	Description:	Layer 2 Outstanding I Frame, specifies the Outstanding I Frame count for Layer 2. Name–defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.
L2INFO=	{512, 1024, 1497, DFLT}	
	Default:	<Previously existing value> or {512} {Factory default}
	Addressing:	None
	Description:	Layer 2 Information Field, specifies the maximum size of the information field for Layer 2. Name–defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.
L2MAXCALLS=	{1–32, DFLT}	
	Default:	<Previously existing value> or {1} {Factory default}
	Addressing:	None
	Description:	Maximum Number of Layer 2 Retries, determines the maximum number of the Layer 2 retries connecting to the other end before it reports a connection failure to the application layer. Name–defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.
L2NOA=	{4–120, DFLT}	
	Default:	<Previously existing value> or {10} {Factory default}
	Addressing:	None
	Description:	Layer 2 No Activity Timer, specifies the Layer 2 No Activity Timer (T203) in seconds. Name–defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.
L2RCALLTMR=	{1–65535, DFLT}	
	Default:	<Previously existing value> or {60} {Factory default}
	Addressing:	None
	Description:	Layer 2 LAPD Controller, determines how long the Layer 2 LAPD controller waits (in seconds) after L2MAXCALLS are exhausted and before the Layer 2 LAPD makes another set of attempts to connect. Name–defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.

L2REX=	{2–16, DFLT}	
	Default:	<Previously existing value> or {10} {Factory default}
	Addressing:	None
	Description:	Layer 2 Retransmission Count, specifies the Layer 2 retransmissions count. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
L2SIDE=	{DFLT, NETWORK, USER}	
	Default:	<Previously existing value> or {NETWORK} {Factory default}
	Addressing:	None
	Description:	Layer 2 User Side/Network Side, defines the assignment of Layer 2 user side/network side roles. Values are: DFLT Default, specifies the parameter is set to the factory default. NETWORK Indicates the Layer 2 role is assigned on the network side. USER Indicates the Layer 2 role is assigned on the user side.
L2WAIT=	{2–200, DFLT}	
	Default:	<Previously existing value> or {5} {Factory default}
	Addressing:	None
	Description:	Layer 2 Waiting Acknowledge Timer, specifies the Layer 2 Waiting Acknowledge timer in tenths of seconds. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
PST	{IS, OOS}	
	Default:	<Previously existing value> or {OOS} {Factory default}
	Addressing:	None
	Description:	Primary State, determines the primary state in which the lower layer Line DCC is put into. Values are: IS In-Service OOS Out-Of-Service

```
RTRV-LLLDCC
```

COMMAND CODE: **ED-LLSDCC**
COMMAND NAME: **EDIT LOWER LAYER SECTION DCC**

PURPOSE

The ED-LLSDCC command allows provisioning of the Layer 1 (physical layer) and Layer 2 (data link layer) parameters of the SONET Data Communication Channel (DCC) network. This command allows provisioning of the OSI lower layer stack (Layer 1 and Layer 2) parameters pertaining to the Section DCC.

If the ED-LLSDCC command is successfully issued with PST of IS, the system initializes all the lower layer and upper layer OSI stack parameters pertaining to the addressed Section DCC. If the command is issued with PST of OOS, the system disables the processing of the Section DCC taken from both the working and protect OC-3/OC-12 processed by the corresponding DSB.

Changes to the name-defined parameters are stored in the database and take effect when the OSI stack is (re)initialized. This is accomplished by performing a RST-OCn (where n=3 or 12) or by editing the OC-3/OC-12 into an IS state from an OOS state via ED-OCn command. All of the name-defined parameters survive a database backup and restore.

If ENT-FFP-OC3 is issued on the addressed OC-3, the AID is the AID of the working (odd numbered) OC-3/OC-12. If ENT-FFP-OCn is not issued on the addressed OC-3 or ENT-RNG-OC3 is issued on the addressed OC-3/OC-12, ED-LLSDCC allows both the odd numbered and even numbered OC-3s/OC-12s to be addressed.

An ED-LLSDCC command is denied if:

- The specified OC-3/OC-12 that contains this DCC is in a UAS secondary state.
- The specified AID is a protection OC-3/OC-12 (even numbered).
- Any parameter other than the PST is modified and the LLSDCC is not already in an OOS state or the PST of OOS is not specified.
- The specified PST=IS and the LLSDCC is already in an IS state.
- The specified PST=OOS and the LLSDCC is already in an OOS state.
- The specified PST=IS is issued on an OC-3 that resides on a O1B with a controller other than L3PE2 (i.e., ED-EQPT with PROCTYPE of L3PE2 has not been issued and/or the O1B modules does not have L3PE2 processor).
- An invalid parameter value is entered.

INPUT FORMAT

```
ED-LLSDCC: [TID]:AID: [CTAG]:: [ALLDFLT=] [, L2IF=] [, L2INFO=] [, L2MAXCALLS=]  
[, L2NOA=] [, L2RCALLTMR=] [, L2REX=] [, L2SIDE=] [, L2WAIT=]: [PST];
```

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the generic address of a DCC on the DSB.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.

ALLDFLT=	{N, Y}	
	Default:	{N}
	Addressing:	None
	Description:	All Default, specifies whether or not all the parameters are set to the factory default. If ED-LLSDCC is issued with ALLDFLT=Y, all parameters except PST are set to the factory default and all other specified parameters are ignored. If ED-LLSDCC is issued with ALLDFLT=N, all specified parameters will be changed and all other non-specified parameters will remain the previous existing value. Values are:
	N	No, specifies all parameters are not set to the factory default.
	Y	Yes, specifies all parameters are set to the factory default.
L2IF=	{1-127, DFLT}	
	Default:	<Previously existing value> or {7} {Factory default}
	Addressing:	None
	Description:	Layer 2 Outstanding I Frame, specifies the Outstanding I Frame count for Layer 2. Name-defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.
L2INFO=	{512, 1024, 1497, DFLT}	
	Default:	<Previously existing value> or {512} {Factory default}
	Addressing:	None
	Description:	Layer 2 Information Field, specifies the maximum size of the information field for Layer 2. Name-defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.
L2MAXCALLS=	{1-32, DFLT}	
	Default:	<Previously existing value> or {1} {Factory default}
	Addressing:	None
	Description:	Maximum Number of Layer 2 Retries, determines the maximum number of the Layer 2 retries connecting to the other end before it reports a connection failure to the application layer. Name-defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.
L2NOA=	{4-120, DFLT}	
	Default:	<Previously existing value> or {10} {Factory default}
	Addressing:	None
	Description:	Layer 2 No Activity Timer, specifies the Layer 2 No Activity Timer (T203) in seconds. Name-defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.
L2RCALLTMR=	{1-65535, DFLT}	
	Default:	<Previously existing value> or {60} {Factory default}
	Addressing:	None
	Description:	Layer 2 LAPD Controller, determines how long the Layer 2 LAPD controller waits (in seconds) after L2MAXCALLS are exhausted and before the Layer 2 LAPD makes another set of attempts to connect. Name-defined values are:
	DFLT	Default, specifies the parameter is set to the factory default.

L2REX=	{2–16, DFLT}	
	Default:	<Previously existing value> or {10} {Factory default}
	Addressing:	None
	Description:	Layer 2 Retransmission Count, specifies the Layer 2 retransmissions count. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
L2SIDE=	{DFLT, NETWORK, USER}	
	Default:	<Previously existing value> or {NETWORK} {Factory default}
	Addressing:	None
	Description:	Layer 2 User Side/Network Side, defines the assignment of Layer 2 user side/network side roles. Values are: DFLT Default, specifies the parameter is set to the factory default. NETWORK Indicates the Layer 2 role is assigned on the network side. USER Indicates the Layer 2 role is assigned on the user side.
L2WAIT=	{2–200, DFLT}	
	Default:	<Previously existing value> or {5} {Factory default}
	Addressing:	None
	Description:	Layer 2 Waiting Acknowledge Timer, specifies the Layer 2 Waiting Acknowledge timer in tenths of seconds. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
PST	{IS, OOS}	
	Default:	<Previously existing value> or {OOS} {Factory default}
	Addressing:	None
	Description:	Primary State, determines the primary state in which the lower layer Section DCC is put into. Values are: IS In-Service OOS Out-Of-Service

COMMAND CODE: **ED-MAADDR**
COMMAND NAME: **EDIT MANUAL AREA ADDRESS**

PURPOSE

The ED-MAADDR command allows modifying of the Manual Area Address of Layer 3 (network layer) of the SONET Data Communication Channel (DCC) network.

Changes to the name-defined parameters are stored in the database and take effect when the OSI stack is (re)initialized. This is accomplished by performing a RST-EQPT of the DSB or by editing the DSB into an IS state from an OOS state via ED-EQPT command. All of the name-defined parameters are saved during a database backup and restore.

An ED-MAADDR command is denied if:

- The specified DSB is not provisioned, i.e., the DSB is in a UAS secondary state.
- The specified DSB is not in an OOS-MA or OOS-AUMA primary state.
- An invalid parameter value is entered.

INPUT FORMAT

```
ED-MAADDR: [TID]:AID:[CTAG]:: [L3IDP1=] [,L3DFI1=] [,L3ORG1=] [,L3RES1=]
[,L3ROU1=] [,L3IDP2=] [,L3DFI2=] [,L3ORG2=] [,L3RES2=] [,L3ROU2=]
[,L3IDP3=] [,L3DFI3=] [,L3ORG3=] [,L3RES3=] [,L3ROU3=] ;
```

INPUT PARAMETERS

TID	<p>< 1-20 VALID TID CHARACTERS ></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>
AID	<p>EQUIPMENT_AID:</p> <p>{DSB-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{1-2}}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: DSB AID, identifies the DSB on which the manual area addresses are being modified.</p>
CTAG	<p>< 1-6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
L3IDP1=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {39840F} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Initial Domain Part 1, identifies the Initial Domain Part of the NSAP pertaining to the 1st Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3DFI1=	<p><2 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {80} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Domain Format Identifier 1, identifies the Domain Format Identifier Field of the NSAP pertaining to the 1st Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>

L3ORG1=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {000000} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Organization Identifier 1, specifies the Organization Identifier within the NSAP pertaining to the 1st Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p> <p>Restrictions: ED-MAADDR is defined if the value for this parameter is already assigned to another L3ORGx parameter, i.e., two L3ORGs on the DSB are attempted to be provisioned at the same time.</p>
L3RES1=	<p><4 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {0000} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Reserved Space 1, specifies the Reserved Space within the NSAP pertaining to the 1st Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3ROU1=	<p><8 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {00000000} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Routing Domain 1, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 1st Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p> <p>Restrictions: ED-MAADDR is defined if the value for this parameter is already assigned to another L3ROUx parameter, i.e., two L3ROUs on the DSB are attempted to be provisioned at the same time.</p>
L3IDP2=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {000000} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Initial Domain Part 2, identifies the Initial Domain Part of the NSAP pertaining to the 2nd Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3DFI2=	<p><2 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {00} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Domain Format Identifier 2, identifies the Domain Format Identifier Field of the NSAP pertaining to the 2nd Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>

L3ORG2=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {000000} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Organization Identifier 2, specifies the Organization Identifier within the NSAP pertaining to the 2nd Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p> <p>Restrictions: ED-MAADDR is defined if the value for this parameter is already assigned to another L3ORGx parameter, i.e., two L3ORGs on the DSB are attempted to be provisioned at the same time.</p>
L3RES2=	<p><4 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {0000} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Reserved Space 2, specifies the Reserved Space within the NSAP pertaining to the 2nd Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3ROU2=	<p><8 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {00000000} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Routing Domain 2, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 2nd Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p> <p>Restrictions: ED-MAADDR is defined if the value for this parameter is already assigned to another L3ROUx parameter, i.e., two L3ROUs on the DSB are attempted to be provisioned at the same time.</p>
L3IDP3=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {000000} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Initial Domain Part 3, identifies the Initial Domain Part of the NSAP pertaining to the 3rd Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3DFI3=	<p><2 ASCII HEXADECIMAL VALUES></p> <p>Default: <Previously existing value> or {00} {Factory default}</p> <p>Addressing: None</p> <p>Description: Layer 3 Domain Format Identifier 3, identifies the Domain Format Identifier Field of the NSAP pertaining to the 3rd Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>

L3ORG3=	<6 ASCII HEXADECIMAL VALUES>	
	Default:	<Previously existing value> or {000000} {Factory default}
	Addressing:	None
	Description:	Layer 3 Organization Identifier 3, specifies the Organization Identifier within the NSAP pertaining to the 3rd Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
	Restrictions:	ED-MAADDR is defined if the value for this parameter is already assigned to another L3ORGx parameter, i.e., two L3ORGs on the DSB are attempted to be provisioned at the same time.
L3RES3=	<4 ASCII HEXADECIMAL VALUES>	
	Default:	<Previously existing value> or {0000} {Factory default}
	Addressing:	None
	Description:	Layer 3 Reserved Space 3, specifies the Reserved Space within the NSAP pertaining to the 3rd Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3ROU3=	<8 ASCII HEXADECIMAL VALUES>	
	Default:	<Previously existing value> or {00000000} {Factory default}
	Addressing:	None
	Description:	Layer 3 Routing Domain 3, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 3rd Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
	Restrictions:	ED-MAADDR is defined if the value for this parameter is already assigned to another L3ROUx parameter, i.e., two L3ROUs on the DSB are attempted to be provisioned at the same time.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IDNC      Input, Data Not Consistent
          /* Unable to read aux buffer for <AID> */
```

IDNV	Input, Data Not Valid /* Invalid parameter in the input command */ /* Duplicate organization identifier is detected. */ /* Duplicate routing domain is detected. */
IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified. */
SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */ /* INIT–SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Data base access failure */ /* Unable to update the LANDCC database */ /* Unable to read the LANDCC database. */
SNVS	Status, Not in Valid State /* DSB is not in a Maintenance state */

EXAMPLES

In the following example, the Layer 3 Domain Format Identifier 2 for is DSB–6–1–1 edited to FA.

```
ED-MAADDR::DSB-6-1-1:::L3DFI2= FA;  
  
  <SID> <YY-MM-DD> <HH:MM:SS>  
M  P72007 COMPLD  
  /* The ED-MAADDR for DSB-6-1-1 was completed. */  
  /* ED-MAADDR::DSB-6-1-1:::L3DFI2= FA [P72007] (1) */
```

RELATED COMMANDS

DLT-MAADDR
ENT-MAADDR
RTRV-MAADDR

COMMAND CODE: **ED-OC12**
COMMAND NAME: **EDIT OC12**

PURPOSE

The ED-OC12 command modifies the specified OC12 port parameter values previously provisioned using ENT-OC12.

Executing an ED-OC12 command causes the following primary state transitions for the specified OC12. Secondary states associated with the OC12 after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Current PST State is:				
	IS	OOS-AU	OOS-AU,AINS	OOS-AUMA	OOS-MA
IS,<NoVal>	Denied	Denied	Denied	OOS-AU	IS
OOS,<NoVal>	OOS-MA	OOS-AUMA	Denied	Denied	Denied
IS,AINS	OOS-AU,AINS	OOS-AU,AINS	Denied	OOS-AU,AINS	OOS-AU,AINS
IS,AINS-DEA	Denied	Denied	OOS-AU	Denied	Denied
OOS,AINS-DEA	Denied	Denied	OOS-AUMA	Denied	Denied

Note: 1. <NoVal> means no value is entered for the SST parameter.
2. No state change occurs if no value is entered for PST and SST.
3. ED-OC12 is denied if SST of AINS-DEA is entered and the current OS12 state is not OOS-AU,AINS (an SST state of AINS).

When an OC12 is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set for the specified OC12. The MAN condition type is cleared when the OC12 is provisioned to an OOS-AU or IS state.

When an OC12 is in an OOS-MA, OOS-AUMA, or OOS-AU,AINS state, no OC12 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the OC12, but OC12 alarm conditions are monitored (retrievable with the RTRV-OC12 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-OC12 command) for the OC12. An OC12 in an OOS-AU,AINS state transitions to an IS state when all OC12 near-end alarm conditions for that OC12 have cleared.

When an OC12 in ring mode (refer to ENT-RNG-OC12) is edited to an OOS state, path AIS is sent on all the pass through paths, AIS-L is also sent on the OC12 in the upstream direction, and all the switched paths switch to the redundant paths. For a 2WAY cross connection from an odd-numbered ring OC12 to either an EC1 or another non-ring OC12, no maintenance action is taken by the system.

An ED-OC12 command is denied if:

- The specified OC12 has not previously been provisioned with the ENT-OC12 command.
- The specified OC12 is being edited from an IS or OOS-AU state to an IS state.
- The specified OC12 is being edited from an OOS-MA or OOS-AUMA state to an OOS,<Null> state.
- The specified OC12 is being edited from an OOS-MA or OOS-AUMA state to an IS or OOS-AU,AINS state and the specified OC12 is in a loopback (the OC12 has an SST of LPBK).
- The specified OC12 is being edited in an IS or OOS state and the OC12 is carrying traffic (the OC12 does not have an SST of STBYH), unless CMDMDE=FRCD is used.
- The specified OC12 is defined as part of a ring (using ENT-RNG-OC12) with PST of OOS, CMDMDE is either not specified or specified as NORMAL, and the Section and/or Line DCC is enabled.
- An invalid parameter value or combination of parameter values is entered.

I/O protection switching is disabled if the OC12 port supported by the O4M and three S3M circuit packs is provisioned to an OOS-MA or OOS-AUMA state.

INPUT FORMAT

ED-OC12: [TID]:AID: [CTAG]::: [AINSTH=] [, CMDMDE=] [, S1TRANS=] [, SDTHSW=]: [PST]
[, SST];

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12–{1–560}} (OC12–OC12#) Default: Entry Required Addressing: &&–ranging and &–grouping Description: OC12 AID, identifies the OC12 port or range of ports.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH–MM:{00–48} – {00–59} } Default: Previously existing value Addressing: None Description: Automatic In–Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS–L alarm condition before the system puts the facility into the In–Service state. The factory default is 8 hours. The valid value is: HH–MM Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively. Restrictions: If 48 is entered in HH, then MM has to be 00.
CMDMDE=	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced. The command is accepted and parameter values are modified even if the OC12 is at present carrying traffic. NORM Normal. The command is denied if the OC12 is presently carrying traffic (i.e. it does not have a secondary state of STBYH).
S1TRANS=	{DUS, ACT} Default: <Previously Existing Value> Addressing: None Description: S1 byte to be transmitted, determines if the transmitted S1 byte of the specified OC12 will have the “DUS” message or will have the actual traceability of the signal. Values are: DUS Don’t USE. The S1 byte is set to “DON’T USE for Synchronization” message. ACT ACTual. The S1 byte is set to the actual traceability of the signal.

SDTHSW=	{5, 6, 7, 8, 9}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Signal Degrade Threshold Switching level, indicates the signal degrade threshold over which Signal Degrade protection switching is initiated. Values are:
	5	BER threshold of 10E-5.
	6	BER threshold of 10E-6.
	7	BER threshold of 10E-7.
	8	BER threshold of 10E-8.
	9	BER threshold of 10E-9.
PST	{IS, OOS}	
	Default:	<PST VALUE DETERMINED BY THE CURRENT OC12 STATE> (A PST value of IS if the current state is IS or OOS-AU) (A PST value of OOS if the current state is OOS-AUMA or OOS-MA)
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the OC12. Values are:
	IS	In-Service, the OC12 is provisioned to an IS or OOS-AU state.
	OOS	Out-Of-Service, the OC12 is provisioned to an OOS-AUMA or OOS-MA state.
	Restrictions:	ED-OC12 is denied if PST of OOS and SST of AINS is entered.
SST	{AINS, AINS-DEA}	
	Default:	<Null> (Unpopulated)
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the OC12. Values are:
	AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the OC12 is provisioned to an OOS-AU,AINS state.
	AINS-DEA	Automatic In-Service-Deactivate, the OC12 is not provisioned to an OOS-AU,AINS state. The OC12's SST value is entered as <Null> (unpopulated) and the SST state is determined by its provisioned PST value and system detected events.
	Restrictions:	ED-OC12 is denied if SST of AINS and PST of OOS is entered. ED-OC12 is denied if SST of AINS-DEA is entered and the current OC12 state is not OOS-AU,AINS (an SST state of AINS).

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Free Form Informational Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */

```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SAOS	Status, Already Out of Service
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating supported STS1s/STS3Cs */ /* FFP Database Error: <ERROR-STRING> for record number <RECORD- NUMBER> */ /*DCC Database Error: <ERROR-STRING> for <AID-STRING>*/
SNVS	Status, Not in Valid State /*To edit an In-Service traffic carrying port, set CMDMDE=FRCD*/ /*Section and/or Line DCC In-Service, set CMDMDE=FRCD*/ /*An In-Service non-STBYH STS1 or VT1.5 connection exists, must be FRCD*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC12 port OC12-14 provisioning is changed to the OOS-AU,AINS state. All other parameter values are unchanged.

```
ED-OC12::OC12-14:::::IS,AINS;
```

In the following example, OC12 port OC12-14 and OC12-16 have previously been provisioned, but OC12-15 has not been provisioned, with the ENT-OC12 command. An ED-OC12 command is entered to change the provisioning of OC12 ports OC12-14 through OC12-16, using &&-ranging, to the OOS-MA state. All other parameter values are unchanged.

```
ED-OC12::OC12-14&&-16:::::OOS;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 PRTL
"OC12-15:ERRCDE=SNVS"
/* Status, Not in Valid State */
/* The port is not provisioned */
/* ED-OC12::OC12-14&&-16:::::OOS [Pfc518] (1) */
;
```

COMMAND CODE: **ED-OC3**
COMMAND NAME: **EDIT OC3**

PURPOSE

The ED-OC3 command modifies the specified OC3 port parameter values previously provisioned using ENT-OC3.

Executing an ED-OC3 command causes the following primary state transitions for the specified OC3. Secondary states associated with the OC3 after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Current PST State is:				
	IS	OOS-AU	OOS-AU,AINS	OOS-AUMA	OOS-MA
IS,<NoVal>	Denied	Denied	Denied	OOS-AU	IS
OOS,<NoVal>	OOS-MA	OOS-AUMA	Denied	Denied	Denied
IS,AINS	OOS-AU,AINS	OOS-AU,AINS	Denied	OOS-AU,AINS	OOS-AU,AINS
IS,AINS-DEA	Denied	Denied	OOS-AU	Denied	Denied
OOS,AINS-DEA	Denied	Denied	OOS-AUMA	Denied	Denied

Note: 1. <NoVal> means no value is entered for the SST parameter.
2. No state change occurs if no value is entered for PST and SST.
3. ED-OC3 is denied if SST of AINS-DEA is entered and the current OS-3 state is not OOS-AU,AINS (an SST of AINS).

When an OC3 is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set for the specified OC3. The MAN condition type is cleared when the OC3 is provisioned to an OOS-AU or IS state.

When an OC3 is in an OOS-MA, OOS-AUMA, or OOS-AU,AINS state, no OC3 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the OC3, but OC3 alarm conditions are monitored (retrievable with the RTRV-OC3 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-OC3 command) for the OC3. An OC3 in an OOS-AU,AINS state transitions to an IS state when all OC3 near-end alarm conditions for that OC3 have cleared.

When an OC3 in ring mode (refer to ENT-RNG-OC3) is edited to an OOS state, path AIS is sent on all the pass through paths, AIS-L is also sent on the OC3 in the upstream direction, and all the switched paths switch to the redundant paths. For a 2WAY cross connection from an odd-numbered ring OC3 to either an EC1 or another non-ring OC3, no maintenance action is taken by the system.

An ED-OC3 command is denied if:

- The specified OC3 has not previously been provisioned with the ENT-OC3 command.
- The specified OC3 is being edited from an IS or OOS-AU state to an IS state.
- The specified OC3 is being edited from an OOS-MA or OOS-AUMA state to an OOS,<Null> state.
- The specified OC3 is being edited from an OOS-MA or OOS-AUMA state to an IS or OOS-AU,AINS state and the specified OC3 is in a loopback (the OC3 has an SST of LPBK).
- The specified OC3 is being edited in an IS or OOS state and the OC3 is carrying traffic (the OC3 does not have an SST of STBYH), unless CMDMDE=FRCD is used.
- The specified OC3 is defined as part of a ring (using ENT-RNG-OC3) with PST of OOS, CMDMDE is either not specified or specified as NORMAL, and the Section and/or Line DCC is enabled.
- An invalid parameter value or combination of parameter values is entered.

I/O protection switching is disabled if the OC3 port supported by the O1B circuit pack is provisioned to an OOS-MA or OOS-AUMA state.

INPUT FORMAT

ED-OC3 : [TID] : AID : [CTAG] : : [AINSTH=] [, CMDMDE=] [, S1TRANS=] [, SDTHSW=] : [PST]

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3–{1–2240}} (OC3–OC3#) Default: Entry Required Addressing: &&–ranging and &–grouping Description: OC3 AID, identifies the OC3 port or range of ports.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH–MM:{00–48} – {00–59} } Default: Previously existing value. Addressing: None Description: Automatic In–Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS–L alarm condition before the system puts the facility into the In–Service state. The factory default is 8 hours. The valid value is: HH–MM Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively. Restrictions: If 48 is specified in HH, then MM has to be 00.
CMDMDE=	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced. The command is accepted and parameter values are modified even if the OC3 is at present carrying traffic. NORM Normal. The command is denied if the OC3 is presently carrying traffic (i.e., it does not have a secondary state of STBYH).
S1TRANS=	{DUS, ACT} Default: <Previously Existing Value> Addressing: None Description: S1 byte to be transmitted, determines if the transmitted S1 byte of the specified OC3 will have the “DUS” message or will have the actual traceability of the signal. Values are: DUS Don’t USE. The S1 byte is set to “DON’T USE for Synchronization” message. ACT ACTual. The S1 byte is set to the actual traceability of the signal.

SDTHSW=	{5, 6, 7, 8, 9}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Signal Degrade Threshold Switching level, indicates the signal degrade threshold over which Signal Degrade protection switching is initiated. Values are:
	5	BER threshold of 10E-5.
	6	BER threshold of 10E-6.
PST	{IS, OOS}	
	Default:	<PST VALUE DETERMINED BY THE CURRENT OC3 STATE> (A PST value of IS if the current state is IS or OOS-AU) (A PST value of OOS if the current state is OOS-AUMA or OOS-MA)
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the OC3. Values are:
	IS	In-Service, the OC3 is provisioned to an IS or OOS-AU state.
	OOS	Out-Of-Service, the OC3 is provisioned to an OOS-AUMA or OOS-MA state.
SST	{AINS, AINS-DEA}	
	Default:	<Null> (Unpopulated)
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the OC3. Values are:
	AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the OC3 is provisioned to an OOS-AU,AINS state.
	AINS-DEA	Automatic In-Service-Deactivate, the OC3 is not provisioned to an OOS-AU,AINS state. The OC3's SST value is entered as <Null> (unpopulated) and the SST state is determined by its provisioned PST value and system detected events.
	Restrictions:	ED-OC3 is denied if PST of OOS and SST of AINS is entered.
		ED-OC3 is denied if SST of AINS and PST of OOS is entered.
		ED-OC3 is denied if SST of AINS-DEA is entered and the current OC3 state is not OOS-AU,AINS (an SST state of AINS).

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SAOS	Status, Already Out of Service
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating supported STS1s/STS3Cs */ /* FFP Database Error: <ERROR-STRING> for record number <RECORD- NUMBER> */ /*DCC Database Error: <ERROR-STRING> for <AID-STRING>*/
SNVS	Status, Not in Valid State /*To edit an In-Service traffic carrying port, set CMDMDE=FRCD*/ /*Section and/or Line DCC In-Service, set CMDMDE=FRCD*/ /*An In-Service non-STBYH STS1 or VT1.5 connection exists, must be FRCD*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC3 port OC3-14 provisioning is changed to the OOS-AU,AINS state. All other parameter values are unchanged.

```
ED-OC3::OC3-14:::::IS,AINS;
```

In the following example, OC3 port OC3-14 and OC3-16 have previously been provisioned, but OC3-15 has not been provisioned, with the ENT-OC3 command. An ED-OC3 command is entered to change the provisioning of OC3 ports OC3-14 through OC3-16, using &&-ranging, to the OOS-MA state. All other parameter values are unchanged.

```
ED-OC3::OC3-14&&-16:::::OOS;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pfc518 PRTL  
"OC3-15:ERRCDE=SNVS"  
/* Status, Not in Valid State */  
/* The port is not provisioned */  
/* ED-OC3::OC3-14&&-16:::::OOS [Pfc518] (1) */  
;
```

```

COMMAND CODE: **ED-OSADDR-SITE**
COMMAND NAME: **EDIT OPERATIONS SYSTEM ADDRESS
SITE**

PURPOSE

The ED-OSADDR-SITE command edits the AUTOIN parameter value associated with an X.25 incoming SVC calling address entry in the system's X.25 Incoming SVC Calling Address database. Changes to the AUTOIN parameter value in the database take affect on the next incoming X.25 SVC call request received by the system.

An ED-OSADDR-SITE command is denied if:

- The specified ADDR value is not an entry in the system's X.25 Incoming SVC Calling Address database.
- An invalid parameter value is entered.

The ED-OSADDR-SITE command only changes the AUTOIN parameter value associated with an X.25 incoming SVC calling address entry in the system's X.25 Incoming SVC Calling Address database. The ENT-OSADDR-SITE command adds an X.25 incoming SVC calling address entry to the database. The DLT-OSADDR-SITE command removes an incoming SVC calling address from the database. The RTRV-OSADDR-SITE command retrieves the contents of the system's X.25 Incoming SVC Calling Address database.

User login security is removed by provisioning an X.25 SVC with automatic UID login since anyone with access to the communication interface has the same command privileges as the UID provisioned in the AUTOIN parameter.

A virtual channel connected to a printer terminal (refer to the TYPE parameter in the ENT-USER command) should be configured for automatic UID login. If the virtual channel is configured for a normal login sequence (AUTOIN of %), the system waits for an ACT-USER command (indefinitely if an output-only printer terminal is connected).

INPUT FORMAT

ED-OSADDR-SITE: [TID] : : [CTAG] : : ADDR, [AUTOIN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ADDR	<1-15 INTEGER X.25_CALLING_ADDRESS> Default: Entry Required Addressing: None Description: X.25 Incoming SVC Calling Address, specifies the X.25 Incoming SVC Calling Address (the X.25 address for the system calling the 1631 SX) in the X.25 Incoming SVC Calling Address database for which the AUTOIN value is to be changed. If the value of ADDR is less than 10 digits, leading zeroes are truncated unless the ADDR value is entered enclosed within double quotes ("...").

AUTOIN	{%, <UID> }	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Automatic Login, specifies whether a User ID is automatically logged-in to the system when an X.25 incoming SVC call request packet is received with an incoming SVC calling address matching the entered ADDR value. Values are:
	%	No Automatic Login, a normal log-in sequence (via ACT-USER) is required to access the system.
	<UID>	UID Automatically Logged-in, the entered User ID (UID) is automatically logged-in when an X.25 incoming SVC call request packet is received with an incoming SVC calling address matching the entered ADDR value.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <ADDR>,<AUTOIN> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

ADDR	<1-15 INTEGER X.25_CALLING_ADDRESS> X.25 Incoming SVC Calling Address, indicates the X.25 Incoming SVC Calling Address (the X.25 address for the system calling the 1631 SX) in the X.25 Incoming SVC Calling Address database.
AUTOIN	{%, <UID>} Automatic Login, identifies the User ID that is automatically logged-in to the system when an X.25 incoming SVC call request packet is received with an incoming SVC calling address matching the entered ADDR value. Values are:
	% No Automatic Login, a normal log-in sequence (via ACT-USER) is required to access the system.
	<UID> UID Automatically Logged-in, the User ID (UID) is automatically logged-in when an X.25 incoming SVC call request packet is received with a calling address matching the entered ADDR value.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid /* Illegal Input: ADDR */ /* Illegal Input: AUTOIN */ /* Unable to find requested OSADDR */ /* AUTO LOGIN (Illegal AUTOIN) */ /* AUTO LOGIN (Duplicate AUTOIN in OSADDR) */ /* AUTO LOGIN (Duplicate AUTOIN in OSDB) */ /* AUTO LOGIN (Non-Existent AUTOIN) */ /* AUTO LOGIN (TABS user on non-TABS CID) */ /* AUTO LOGIN (NON-TABS user on TABS CID) */
SDBE	Status, internal Data Base Error /* Unable to read OSADDR – status = <status number> */ /* Unable to update OSADDR – status = <status number>*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, auto-login is set to no UID auto-login (normal login sequence) for the X.25 incoming SVC calling address 14045551212 database entry.

```
ED-OSADDR-SITE:::::14045551212,%;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P1e010. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P1e010 COMPLD
/* 14045551212,% */
/* ED-OSADDR-SITE:::::14045551212,% [P1e010] (1) */

COMMAND CODE: **ED-PARTITN-EC1**
COMMAND NAME: **EDIT PARTITION EC1**

PURPOSE

The ED-PARTITN-EC1 command adds or deletes the specified EC1 port to/from the specified user facility partition (PARTNAM). (Refer to the Introduction for a description of User Facility Partitioning.)

The EC1 ports assigned to an EC1 facility partition need not be contiguous (physically or logically). A facility partition is only a logical mapping of ports to the partition. Any EC1 port can be added to an EC1 facility partition regardless of whether the port is provisioned or the port exists in the system.

A facility partition is created by specifying a unique partition name with the ENT-PARTITN command. EC1 facilities are assigned to an EC1 partition with the ED-PARTITN-EC1 command. A user is associated with a facility partition with the ENT-USER and ED-PRVG-USER commands.

An ED-PARTITN-EC1 command is denied if:

- The "User Partitioning" PFO is not enabled.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ED-PARTITN-EC1 : [TID] : AID : [CTAG] : : ACT , PARTNAM ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port to be added or deleted to the user facility partition specified by PARTNAM. Restrictions: ED-PARTITN-EC1 is denied if the specified AID is a member of another user facility partition. ED-PARTITN-EC1 is denied if the specified AID is not a member of the specified user facility partition and ACT of DLT is entered.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ACT	{ADD, DLT} Default: Entry Required Addressing: None Description: Action, specifies whether the specified AID is to be added or deleted to/from the specified partition. Values are: ADD Add the specified EC1 port to the specified partition. DLT Delete the specified EC1 port from the specified partition. Restrictions: ED-PARTITN-EC1 is denied if ACT of DLT is entered and the specified AID is not a member of the specified user facility partition.
PARTNAM	<1-20 CHARACTER VALID PARTITION NAME> Default: Entry Required Addressing: None Description: Partition Name, specifies the name of the user facility partition. Restrictions: ED-PARTITN-EC1 is denied if a PARTNAM of "ALL" is entered.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENFE	Equipage, FEature Not provided
IDNV	Input, Data Not Valid /* Invalid Partition Name */ /* ALL cannot be used as a partition name */
IIAC	Input, Invalid ACcess identifier /* Port Already in other Partition */ /* Port is not assigned to a partition */ /* Port already in partition */
IIFM	Input, Invalid data ForMat /* PARTNAM length */ /* Illegal Input: ACT length */
IPNV	Input, Parameter Not Valid /* PARTNAM */ /* Illegal Input: ACT */
SDBE	Status, internal Data Base Error /* Error accessing the PARTITION DB – status = <status number> */

EXAMPLES

In the following example, EC1 ports EC1–1 through EC1–28 are added to the facility partition PARTITION1.

```
ED-PARTITN-EC1::EC1-1&&-28:::ADD, PARTITION1;
```

In the following example, EC1 port EC1–15 is deleted from the user facility partition PARTITION1.

```
ED-PARTITN-EC1::EC1-15:::DLT, PARTITION1;
```

EXAMPLES

In the following example, OC–3 ports OC3–1 through OC3–28 are added to the facility partition PARTITION1.

```
ED-PARTITN-OC3::OC3-1&&-28:::ADD, PARTITION1;
```

In the following example, OC–3 port OC3–15 is deleted from the user facility partition PARTITION1.

```
ED-PARTITN-OC3::OC3-15:::DLT, PARTITION1;
```

COMMAND CODE: **ED-PARTITN-STs1**
COMMAND NAME: **EDIT PARTITION STs-1**

PURPOSE

The ED-PARTITN-STs1 command adds or deletes the specified STs-1 port to/from the specified user facility partition (PARTNAM). (Refer to the Introduction for a description of User Facility Partitioning.)

The STs-1 ports assigned to an STs-1 facility partition need not be contiguous (physically or logically). A facility partition is only a logical mapping of ports to the partition. Any STs-1 port can be added to an STs-1 facility partition regardless of whether the port is provisioned or the port exists in the system.

A facility partition is created by specifying a unique partition name with the ENT-PARTITN command. STs-1 facilities are assigned to an STs-1 partition with the ED-PARTITN-STs1 command. A user is associated with a facility partition using the ENT-USER and ED-PRVG-USER commands.

An ED-PARTITN-STs1 command is denied if:

- The "User Partitioning" PFO is not enabled.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ED-PARTITN-STs1 : [TID] : AID : [CTAG] : : ACT, PARTNAM;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
	Default: <SID>
	Addressing: None
	Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies the STS-1 port to be added or deleted to the user facility partition specified by PARTNAM. Restrictions: ED-PARTITN-STS1 is denied if the specified AID is a member of another user facility partition. ED-PARTITN-STS1 is denied if the specified AID is not a member of the specified user facility partition and ACT of DLT is entered.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ACT	{ADD, DLT} Default: Entry Required Addressing: None Description: Action, specifies whether the specified AID is to be added or deleted to/from the specified partition. Values are: ADD Add the specified STS-1 port to the specified partition. DLT Delete the specified STS-1 port from the specified partition. Restrictions: ED-PARTITN-STS1 is denied if ACT of DLT is entered and the specified AID is not a member of the specified user facility partition.

PARTNAM	<1–20 CHARACTER VALID PARTITION NAME>
Default:	Entry Required
Addressing:	None
Description:	Partition Name, specifies the name of the user facility partition.
Restrictions:	ED–PARTITN–STS1 is denied if a PARTNAM of “ALL” is entered.

SUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **ED-PARTITN-STS3C**
COMMAND NAME: **EDIT PARTITION STS-3C**

PURPOSE

The ED-PARTITN-STS3C command adds or deletes the specified STS-3C port to/from the specified user facility partition (PARTNAM). (Refer to the Introduction for a description of User Facility Partitioning.)

The STS-3C ports assigned to an STS-3C facility partition need not be contiguous (physically or logically). A facility partition is only a logical mapping of ports to the partition. Any STS-3C port can be added to an STS-3C facility partition regardless of whether the port is provisioned or the port exists in the system.

A facility partition is created by specifying a unique partition name with the ENT-PARTITN command. STS-3C facilities are assigned to an STS-3C partition with the ED-PARTITN-STS3C command. A user is associated with a facility partition with the ENT-USER and ED-PRVG-USER commands.

An ED-PARTITN-STS3C command is denied if:

- The "User Partitioning" PFO is not enabled.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ED-PARTITN-STS3C: [TID] :AID: [CTAG] : :ACT, PARTNAM;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID, identifies the STS-3C port to be added or deleted to the user facility partition specified by PARTNAM. Restrictions: ED-PARTITN-STS3C is denied if the specified AID is a member of another user facility partition. ED-PARTITN-STS3C is denied if the specified AID is not a member of the specified user facility partition and ACT of DLT is entered.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ACT	{ADD, DLT} Default: Entry Required Addressing: None Description: Action, specifies whether the specified AID is to be added or deleted to/from the specified partition. Values are: ADD Add the specified STS-3C port to the specified partition. DLT Delete the specified STS-3C port from the specified partition. Restrictions: ED-PARTITN-STS3C is denied if ACT of DLT is entered and the specified AID is not a member of the specified user facility partition.

PARTNAM	<1–20 CHARACTER VALID PARTITION NAME>
Default:	Entry Required
Addressing:	None
Description:	Partition Name, specifies the name of the user facility partition.
Restrictions:	ED–PARTITN–STS3C is denied if a PARTNAM of “ALL” is entered.

COMMAND CODE: **ED-PARTITN-VT1**
COMMAND NAME: **EDIT PARTITION VT1**

PURPOSE

The ED-PARTITN-VT1 command adds or deletes the specified VT1.5 port to/from the specified user facility partition (PARTNAM). (Refer to the Introduction for a description of User Facility Partitioning.)

The VT1.5 ports assigned to a VT1.5 facility partition need not be contiguous (physically or logically). A facility partition is only a logical mapping of ports to the partition. Any VT1.5 port can be added to a VT1.5 facility partition regardless of whether the port is provisioned or the port exists in the system.

A facility partition is created by specifying a unique partition name with the ENT-PARTITN command. VT1.5 facilities are assigned to a VT1.5 partition with the ED-PARTITN-VT1 command. A user is associated with a facility partition using the ENT-USER and ED-PRVG-USER commands.

An ED-PARTITN-VT1 command is denied if:

- The "User Partitioning" PFO is not enabled.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENFE	Equipage, FEature Not provided
IDNV	Input, Data Not Valid
	/* Invalid Partition Name */
	/* ALL cannot be used as a partition name */
IIAC	Input, Invalid ACcess identifier
	/* Port Already in other Partition */
	/* Port is not assigned to a partition */
	/* Port already in partition */
IIFM	Input, Invalid data ForMat
	/* PARTNAM length */
	/* Illegal Input: ACT length */
IPNV	Input, Parameter Not Valid
	/* PARTNAM */
	/* Illegal Input: ACT */
SDBE	Status, internal Data Base Error
	/* Error accessing the PARTITION DB – status = <status number> */

EXAMPLES

In the following example, VT1.5 ports VT1–1–4–1 through VT1–1–4–4 are added to the facility partition PARTITION1.

```
ED-PARTITN-VT1::VT1-1-4-1&&-4:::ADD, PARTITION1;
```

In the following example, VT1.5 port VT1–125–4–2 is deleted from the user facility partition PARTITION1.

```
ED-PARTITN-VT1::VT1-125-4-2:::DLT, PARTITION1;
```

COMMAND CODE: **ED-PID**
COMMAND NAME: **EDIT PASSWORD IDENTIFIER**

PURPOSE

The ED-PID command is used to change a user's current login password to a new login password.

The user password (PID) must be changed periodically, depending on the value provisioned for the PAGE (password aging period) parameter via the SET-ATTR-SECUDFLT command.

A user other than the system administrator or the Alcatel account user may only change their own password and must enter their current password to execute the ED-PID command. The system administrator (UID of "system" or "SYSTEM") or the Alcatel account user may change any user's password without entering the user's current password.

When a PID is changed, the new password must differ from the old password by at least three characters.

The ED-PID command is denied if:

- A user other than the system administrator or the Alcatel account enters a UID for some other user.
- NEWPID differs from OLDPID by fewer than three characters.
- An invalid parameter value is entered.

INPUT FORMAT

ED-PID: [TID] :UID: [CTAG] : :OLDPID,NEWPID;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
UID	<5-12 VALID UID CHARACTERS> Default: Entry Required Addressing: None Description: User Identifier, specifies the user ID whose password is to be changed.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
OLDPID	<VALID PID CHARACTERS> Default: Entry required (For all users except the system administrator) <Existing PID for user UID> (For the system administrator) Addressing: None Description: Old Password Identifier, specifies the user's existing password (PID). Restrictions: ED-PID is denied if an OLDPID value is not entered and the user executing the command does not have a UID of {system, SYSTEM}.

NEWPID	<6–12 VALID PID CHARACTERS>
Default:	Entry Required
Addressing:	None
Description:	Password Identifier, specifies the user's new login password. Valid values for PID are a string of 6 through 12 case-sensitive alphanumeric characters. The PID must contain at least 2 alphabetic characters and at least 1 numeric character. The following special characters are also accepted as valid characters: % (percent sign), + (plus sign), # (pound sign), and _ (under score). The first character of the PID can be an alphabetic, numeric, or special character. (Note that the dash (–) character is also accepted by the system, but only characters prior to the dash become part of the PID. The dash (–) and characters after that are ignored by the system.)
Restrictions:	ED–PID is denied if the specified password identifier (NEWPID value) is the same as the specified user identifier (UID value), the reverse of the UID value, a circular shift of the UID value, a circular shift of the reverse of the UID value, or the same as the OLDPID value. ED–PID is denied if NEWPID differs from OLDPID by fewer than three characters.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * ED-PID [<CTAG>] (<CID[-VCNUM]>) */]
;
```

Note. The command echo line only includes the command code in the output response of the ED–PID command. The user's UID and following parameter values are not echoed.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Optional Suggested Action Text> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

SDBE	Status, internal Data Base Error
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, ED-PID is used by user vdt03 to change the current password "PIDvdt03" to the new password "MY_VDT03".

```
ED-PID::vdt03:::PIDvdt03,MY_VDT03;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P2c062. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P2c062 COMPLD  
/* ED-PID [P2c062] (1) */  
;

```

COMMAND CODE: **ED-PRMTR-NE**
COMMAND NAME: **EDIT PARAMETER NETWORK
ELEMENT**

PURPOSE

The ED-PRMTR-NE command is used during matrix growth to provision the system with the new size for the Center Stage Matrix.

An ED-PRMTR-NE command is denied if:

- The specified new matrix size is the same as or smaller than the current matrix size.
- The current system size is 240 ports.
- The specified new matrix size is 3360 and the current matrix size is not 2688.
- An invalid parameter value is entered.

INPUT FORMAT

ED-PRMTR-NE: [TID] :: [CTAG] :: MTXSIZE;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MTXSIZE	{1344, 2688, 3360} Default: Entry Required Addressing: None Description: Matrix Type, specifies the size of the Center Stage Matrix. 1344 1344 DS3/STS1-1 Port Center Stage Matrix. 2688 2688 DS3/STS1-1 Port Center Stage Matrix. 3360 3360 DS3/STS1-1 Port Center Stage Matrix.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* No Change Necessary. */ /* Unable to downgrade matrix size */
IDNV	Input, Data Not Valid /*Invalid MTXSIZE entered */ /*<AID> must be deprovisioned.*/ /*<AID> is not provisioned */ /*All matrix cards in <AID> must be of type <CARD_TYPE>.*/ /*ESTYPE of %s must be defined as M32.*/ /* Command is not valid for 240 port system. */
IPMS	Input, Parameter MiSsing /*Error retrieving MTXSIZE */
SCSN	Status, invalid Command SequeNce /*In service growth loopbacks on supported facilities must first be released */
SDBE	Status, internal Data Base Error /* Error reading database for <AID>. */ /* Error updating sys configuration data base. */ /* Error reading sys configuration data base. */ /* Unable to read facility database. */
SROF	Status, Requested Operation Failed /*Unable to send matrix upgrade msg to FM */ /*Requested operation failed by FM */
SSRE	Status, System Resources Exceeded /* Unable to allocate USI response buffer. */

EXAMPLES

In the following example, ED-PRMTR-NE is used to provision the system for a 1344 port Center Stage matrix size.

```
ED-PRMTR-NE:::::1344;
```

RELATED COMMANDS

```
DLT-EQPT  
RTRV-PRMTR-NE
```

COMMAND CODE: **ED-PRMTR-SITE**
COMMAND NAME: **EDIT PARAMETER SITE**

PURPOSE

The ED-PRMTR-SITE command edits the global system parameters pertaining to:

- unsuccessful login attempts (ATTCNT, LKOT parameters),
- global X.25 provisioning parameters (T1, T4, N2 parameters),
- validation of X.25 SVC calling address (VALIDATE parameter),
- disk synchronization (SYNCTIME, SYNCCNT parameters),
- the Event Log File provisioning parameters (MAXFSIZE, MAXFNBR, RSML parameters),
- reporting of the software release number in the ACT-USER response (ENRELNUM parameter),
- the Alcatel account user login access (ALCATEL parameter).

Editing changes to the X.25 T1, T4, or N2 parameters require a logical removal and restoral (RMV-CID and RST-CID) of all CPORTs before the changes take effect.

Editing changes to the disk provisioning parameters of SYNCTIME, SYNCCNT, MAXFSIZE, or MAXFNBR requires an INIT-SYS or APS system reset to occur before the changes take effect.

Editing changes to the ATTCNT, LKOT, ALCATEL, ENRELNUM, RSML or VALIDATE parameters take effect upon command completion.

The ED-PRMTR-SITE command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An ED-PRMTR-SITE command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
ED-PRMTR-SITE: [TID] : : [CTAG] : : [ATTCNT] , [LKOT] , [ALCATEL] : [ENRELNUM=] [ , FTP=]
               [ , MAXFNBR=] [ , MAXFSIZE=] [ , N2=] [ , RSML=] [ , SYNCCNT=] [ , SYNCTIME=]
               [ , T1=] [ , T4=] [ , TCPSESS=] [ , TIMEOUT=] [ , VALIDATE=] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ATTCNT	{0-15} Default: < Previously existing value > or {5} (Factory default) Addressing: None Description: Invalid Login Attempt Count, specifies the number of invalid login attempts allowed before login is disabled on a CPORT for the duration of LKOT. A value of 0 (zero) indicates this function is disabled. The ATTCNT value applies to all CPORTs and X.25 virtual channels on the system.

LKOT	{0–15}	<p>Default: < Previously existing value > or {2} (Factory default)</p> <p>Addressing: None</p> <p>Description: Login Lockout Time, specifies the number of minutes CPORT login access is disabled following the specified ATTCNT. A value of 0 (zero) indicates this function is disabled. The LKOT value applies to all CPORTs and X.25 virtual channels on the system.</p>				
ALCATEL	{OFF, ON}	<p>Default: < Previously existing value > or {ON} (Factory default)</p> <p>Addressing: None</p> <p>Description: Alcatel, specifies whether the Alcatel account user is allowed login access. Values are:</p> <table><tr><td>OFF</td><td>Login by the Alcatel account user is disabled.</td></tr><tr><td>ON</td><td>Login by the Alcatel account user is enabled.</td></tr></table>	OFF	Login by the Alcatel account user is disabled.	ON	Login by the Alcatel account user is enabled.
OFF	Login by the Alcatel account user is disabled.					
ON	Login by the Alcatel account user is enabled.					
ENRELNUM=	{N, Y}	<p>Default: < Previously existing value > or {N} (Factory default)</p> <p>Addressing: None</p> <p>Description: Enable Release Number, specifies whether the software release number is returned as parsable data in the successful response message of the ACT–USER command. Values are:</p> <table><tr><td>N</td><td>No, the software release number is not returned as parsable data in the successful response message of the ACT–USER command.</td></tr><tr><td>Y</td><td>Yes, the software release number is returned as parsable data in the successful response message of the ACT–USER command.</td></tr></table>	N	No, the software release number is not returned as parsable data in the successful response message of the ACT–USER command.	Y	Yes, the software release number is returned as parsable data in the successful response message of the ACT–USER command.
N	No, the software release number is not returned as parsable data in the successful response message of the ACT–USER command.					
Y	Yes, the software release number is returned as parsable data in the successful response message of the ACT–USER command.					
FTP=	{DISABLE, ENABLE}	<p>Default: < Previously existing value > or {ENABLE} (Factory default)</p> <p>Addressing: None</p> <p>Description: File Transfer Protocol, specifies if FTP file transfers will be supported by the system.</p> <table><tr><td>DISABLE</td><td>FTP login and any file transfers are disabled and not allowed by the system. This affects any further FTP logins but does not affect the FTP user already logged in.</td></tr><tr><td>ENABLE</td><td>FTP login and any file transfers are enabled and are allowed by the system.</td></tr></table> <p>NOTE: In Limited Mode operation FTP is enabled and cannot be disabled.</p>	DISABLE	FTP login and any file transfers are disabled and not allowed by the system. This affects any further FTP logins but does not affect the FTP user already logged in.	ENABLE	FTP login and any file transfers are enabled and are allowed by the system.
DISABLE	FTP login and any file transfers are disabled and not allowed by the system. This affects any further FTP logins but does not affect the FTP user already logged in.					
ENABLE	FTP login and any file transfers are enabled and are allowed by the system.					
MAXFNBR=	{5–100}	<p>Default: < Previously existing value > or {25} (Factory default)</p> <p>Addressing: None</p> <p>Description: Event Log File Maximum File Number, specifies the number of disk buffer files to be used for the Event Log File.</p> <p>Restrictions: ED–PRMTR–SITE is denied if the MAXFSIZE value times the MAXFNBR value is greater–than 25M (i.e., 25 megabytes).</p>				

MAXFSIZE=	{16–1024}	<p>Default: < Previously existing value > or {1024} (Factory default)</p> <p>Addressing: None</p> <p>Description: Event Log File Maximum Size, specifies the size, in 1024 byte blocks, of each Event Log File disk buffer. (e.g., if MAXFSIZE is set to 1024, 1 megabyte of disk space is allocated for each disk buffer file.)</p> <p>Restrictions: ED–PRMTR–SITE is denied if the MAXFSIZE value times the MAXFNBR value is greater than 25M (i.e., 25 megabytes).</p>
N2=	{2–16}	<p>Default: < Previously existing value > or {7} (Factory default)</p> <p>Addressing: None</p> <p>Description: X.25 N2 Number of Retries, specifies the maximum number of retries for the X.25 N2 Number of Retries parameter. When specifying T1, T4, or N2, $T1 < T4 < T1 \times N2$.</p> <p>Restrictions: ED–PRMTR–SITE is denied if the T4 value is not less–than the T1 times N2 values.</p>
RSML=	{1–2000}	<p>Default: < Previously existing value > or {2000} (Factory default)</p> <p>Addressing: None</p> <p>Description: Event Log File maximum Response Message Length, specifies the maximum size, in 1024 byte blocks, of the output response message for a RTRV–ELF command. Any output response message for a RTRV–ELF command greater than the RSML value is truncated.</p>
SYNCCNT=	{0–100}	<p>Default: < Previously existing value > or {0} (Factory default)</p> <p>Addressing: None</p> <p>Description: Disk Sync Count, specifies the maximum number of disk write cycles before a disk synchronization is performed. A value of 0 (zero) indicates no disk syncs are performed based on disk write counts.</p>
SYNCTIME=	{0–60}	<p>Default: < Previously existing value > or {0} (Factory default)</p> <p>Addressing: None</p> <p>Description: Disk Sync Time, specifies the maximum number of seconds between disk memory synchronization. A value of 0 (zero) indicates no disk syncs are performed based on time.</p>
T1=	{2–200}	<p>Default: < Previously existing value > or {30} (Factory default)</p> <p>Addressing: None</p> <p>Description: X.25 T1 Retry Timer, specifies the amount of time, in tenths of seconds for the X.25 T1 Retry Timer parameter. When specifying T1, T4, or N2, $T1 < T4 < T1 \times N2$.</p> <p>Restrictions: ED–PRMTR–SITE is denied if the T1 value is not less–than the T4 value.</p>

T4=	{40–1200}	Default:	< Previously existing value > or {200} (Factory default)
		Addressing:	None
		Description:	X.25 T4 No–Activity Timer, specifies the amount of time, in tenths of seconds, for the X.25 T4 No–Activity Timer parameter. When specifying T1, T4, or N2, $T1 < T4 < T1 * N2$.
		Restrictions:	ED–PRMTR–SITE is denied if the T1 value is not less–than the T4 value or the T4 value is not less–than the T1 times N2 values. ED–PRMTR–SITE is denied if the BLFRL value is greater than 1000.
TCPSESS=	{1–24}	Default:	{24}
		Addressing:	None
		Description:	Maximum number of Telnet sessions allowed per physical LAN port. This is a system–wide parameter, ie, specified changes are applied to all LAN ports. Changes specified do not affect sessions in progress.
TIMEOUT=	{5–7200}	Default:	{7200}
		Addressing:	None
		Description:	Telnet activity time out in seconds. This is the maximum time that a telnet session can be active without any input or output. It applies whether or not the user is logged in (e.g, by ACT–USER). Note that RMV–CID and RST–CID commands must also be executed before changes specified in this TIMEOUT parameter take effect.
VALIDATE=	{ALL, NONE}	Default:	< Previously existing value > or {ALL} (Factory default)
		Addressing:	None
		Description:	Validate X.25 SVC Calling Addresses, specifies whether X.25 SVC calling addresses received in an X.25 call request packet are validated against the X.25 Calling Address database. Validation of X.25 SVC calling addresses applies to all provisioned SVC channels in the system. (Refer to ENT–OSADDR–SITE.) Values are:
	ALL		Validate All, the system only accepts X.25 SVC calling addresses that have been provisioned in the X.25 Calling Address database.
	NONE		Validate None, the system accepts any incoming X.25 SVC calling address.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <ATTCNT>, <LKOT>, <ALCATEL>, <T1>, <T4>, <N2>, <SYNCTIME>, <SYNCCNT>,
<MAXFSIZE>, <MAXFNBR>, <RSML>, <ENRELNUM>, <FTP>, <VALIDATE> , <TIME-
OUT>, <TCPSESS> */
[/* Change(s) will take effect after an INIT-SYS */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

ATTCNT	{0–15}
	Invalid Login Attempt Count, indicates the number of invalid login attempts allowed before login is disabled on a CPORT for the duration of LKOT. A value of 0 (zero) indicates this function is disabled. The ATTCNT value applies to all CPORTs and X.25 virtual channels on the system.

LKOT	{0–15} Login Lockout Time, indicates the number of minutes CPORT login access is disabled following the specified ATTCNT. A value of 0 (zero) indicates this function is disabled. The LKOT value applies to all CPORTs and X.25 virtual channels on the system.
ALCATEL	{OFF, ON} Alcatel, indicates whether the Alcatel account user is allowed login access. Values are: OFF Login by the Alcatel account user is disabled. ON Login by the Alcatel account user is enabled.
T1	{2–200} X.25 T1 Retry Timer, indicates the amount of time, in tenths of seconds for the X.25 T1 Retry Timer parameter.
T4	{40–1200} X.25 T4 No–Activity Timer, indicates the amount of time, in tenths of seconds, for the X.25 T4 No–Activity Timer parameter.
N2	{2–16} X.25 N2 Number of Retries, indicates the maximum number of retries for the X.25 N2 Number of Retries parameter.
SYNCTIME	{0–60} Disk Sync Time, indicates the maximum number of seconds between disk memory synchronization. A value of 0 (zero) indicates no disk syncs are performed based on time.
SYNCCNT	{0–100} Disk Sync Count, indicates the maximum number of disk write cycles before a disk synchronization is performed. A value of 0 (zero) indicates no disk syncs are performed based on disk write counts.
MAXFSIZE	{16–1024} Event Log File Maximum Size, indicates the size, in 1024 byte blocks, of each Event Log File disk buffer. (e.g., if MAXFSIZE is set to 1024, 1 megabyte of disk space is allocated for each disk buffer file.)
MAXFNBR	{5–100} Event Log File Maximum File Number, indicates the maximum number of disk buffer files to be used for the Event Log File.
RSML	{1–2000} Event Log File maximum Response Message Length, indicates the maximum size, in 1024 byte blocks, of the output response message for a RTRV–ELF command. Any output response message for a RTRV–ELF command greater–than the RSML value is truncated.
ENRELNUM	{N, Y} Enable Release Number, indicates whether the software release number is returned as parsable data in the successful response message of the ACT–USER command. N No, the software release number is not returned as parsable data in the successful response message of the ACT–USER command. Y Yes, the software release number is returned as parsable data in the successful response message of the ACT–USER command.
FTP	{DISABLE, ENABLE} File Transfer Protocol, specifies if FTP file transfers will be supported by the system. DISABLE FTP login and any file transfers are disabled and not allowed by the system. This affects any further FTP logins but does not affect the FTP user already logged in.

VALIDATE	{ALL, NONE}	Validate X.25 SVC Calling Addresses, indicates whether X.25 SVC calling addresses received in an X.25 call request packet are validated against the X.25 Calling Address database. Validation of X.25 SVC calling addresses applies to all provisioned SVC channels in the system. (Refer to ENT-OSADDR-SITE.) Values are:
TIMEOUT	{5-7200}	Telnet activity time out in seconds. This is the maximum time that a telnet session can be inactive (without any input or output).
TCPSESS	{1-24}	Maximum number of Telnet sessions allowed per physical LAN port. Applies to all LAN ports in system.
	ALL	Validate All, the system only accepts X.25 SVC calling addresses that have been provisioned in its X.25 Calling Address database.
	NONE	Validate None, the system accepts any incoming X.25 SVC calling address.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/ * <Informational Error Description Text> */]
[/ * <Expanded Error Code Description> */]
[/ * <Optional Suggested Action Text> */]
[/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IPNV	Input, Parameter Not Valid
	/* MAXFSIZE * MAXFNBR can not exceed 10k size */
SDBE	Status, internal Data Base Error
	/* Unable to read platparm db record – status = <status number> */
	/* Unable to update platparm db record – status = <status number> */
	/* Unable to read security db record – status = <status number> */
SROF	Status, Requested Operation Failed
	/* Illegal Input: X.25 Requires T1 less than T4 */
	/* Illegal Input: X.25 Requires T4 less than (T1*N2) */

EXAMPLES

In the following example, ED-PRMTR-SITE is used to edit the non-X.25 global site parameter values.

```
ED-PRMTR-SITE:::3,2,ON:SYNCTIME=30,SYNCCNT=0,MAXFSIZE=1024,MAXFNBR=20,
RSML=2000,ENRENUM=N;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P0f013. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P0f013 COMPLD
/* 3,2,ON,30,200,7,30,0,128,20,1000,N,ALL */
/* Change(s) will take effect after an INIT-SYS */
/* ED-PRMTR-SITE:::::3,2,ON:SYNCTIME=30,SYNCCNT=0,MAXFSIZE=1024,
MAXFNBR=20,RSML=2000,ENRENUM=N [P0f013] (3) */
;

COMMAND CODE: **ED-PRVG-CMD**
COMMAND NAME: **EDIT PRIVILEGE COMMAND**

PURPOSE

The ED-PRVG-CMD command is used to change the command access security level (CCAL – Command Community Authorization Level) and/or security group (CCFC – Command Community Functional Category) assigned to a TL1 command.

All commands are always assigned to security (CCFC) group Z. A command is not removed from security group Z even if a CCFC value is entered without a value of Z included.

The CANCEL-USER command is always assigned to all security (CCFC) groups. The CANCEL-USER cannot be removed from any security group.

Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC) for the system default CCAL and CCFC values for each command.

An ED-PRVG-CMD command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

ED-PRVG-CMD : [TID] : : [CTAG] : : CMD, [CCFC] , [CCAL] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CMD	<TL1 COMMAND CODE> Default: Entry Required Addressing: None Description: TL1 Command Code, specifies the TL1 command code for which the security group or security level is to be changed. The value for the CMD parameter can be any one of the TL1 command codes, in upper or lower case.
CCFC	<1 –26 VALID (A–Z) CCFC CHARACTERS> Default: <Previously Existing Value> Addressing: Order Independent, Non–Case Sensitive Description: Command Community Functional Category, specifies the security group(s) to which the specified TL1 command is to be assigned. CCFC is specified as a string of 1 to 26 non–case sensitive, order independent, alphabetic characters. All commands are always assigned to security group Z. A command is not removed from security group Z even if a CCFC value is entered without a value of Z included. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC).
CCAL	{1–31} Default: <Previously Existing Value> Addressing: None Description: Command Community Authorization Level, specifies the command security level assigned to the specified TL1 command. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC).

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <CMD> <CCAL> <CCFC> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

CMD	<TL1 COMMAND CODE> Command, identifies the TL1 command code.
CCAL	{1–31} Command Community Authorization Level, indicates the security level for the command.
CCFC	<1 –26 VALID (A–Z) CCFC CHARACTERS> Command Community Functional Category, indicates the security groups the command is assigned to.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Optional Suggested Action Text> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IPNV	Input, Parameter Not Valid /* User not found in USDB */ /* COMMAND length */ /* COMMAND */ /* LEVEL */ /* CCFC length */ /* CCFC */ /* Entry in CCFC group not valid, <cmd_group>*/ /* Cannot change security of this command */ /* Cannot change Alcatel level command */ /* Invalid Command */
SDBE	Status, internal Data Base Error /* Unable to update CSDB, status = <status number> */ /* Unable to write to CSDB, status = <status number> */

EXAMPLES

In the following example, ED-PRVG-CMD is used to edit the STOP-CID command and define its CCFC as ABCZ and CCAL as 12;

```
ED-PRVG-CMD:::::STOP-CID,ABCZ,12;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P0c032. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M   P0c032 COMPLD
/* STOP-CID 12 ABCZ */
/* ED-PRVG-CMD:::::STOP-CID,ABCZ,12 [P0c032] (1) */
;
```

RELATED COMMANDS

ED-GROUP-CMD
ED-PRVG-USER
ENT-USER
RTRV-PRVG-CMD
RTRV-PRVG-USER

COMMAND CODE: **ED-PRVG-USER**
COMMAND NAME: **EDIT PRIVILEGE USER**

PURPOSE

The ED-PRVG-USER command is used to edit the existing user profile entry, identified by UID, in the User Security Database.

Only the system administrator (UID of "system" or "SYSTEM" and UCAL of 31) can edit the UCFCI and UCAL parameters, add or delete the R (Report error(R) messages) option to a user's OSL value, associate a PARTNAM (Partition Name) with a UID, or change another user's user profile database entry. Any user can change the remaining parameter values for their own user profile database entries.

Changes to the provisioned values for RUSURE, OSL, UCAL, UCFCI, UCFCO, and UNAM take affect upon command completion. Changes to the provisioned values for DM, DSKBFIND, KAMINTVL, LNKTMR, LOTO, MIPINTVL, TYPE, and PARTNAM take affect after a non-printer (TYPE other than PRN) user logs-off and logs-on (via CANC-USER and ACT-USER), or after the CID is removed and restored (via RMV-CID and RST-CID) for a printer user.

A user's provisioned password (PID) cannot be edited with the ED-PRVG-USER command. Refer to the ED-PID command.

A user's OSTYPE (provisioned via ENT-USER) cannot be edited with the ED-PRVG-USER command. To change the value of OSTYPE, the user must be deleted via DLT-USER and re-created via ENT-USER.

A user facility partition name (PARTNAM) previously associated with a user (provisioned via ENT-USER) cannot be edited (changed or deleted) with the ED-PRVG-USER command. To change a partitioned user's provisioned value for PARTNAM, the partitioned user must be deleted via DLT-USER and re-created via ENT-USER. However, the ED-PRVG-USER command allows a non-partitioned user to be associated with a user facility partition (a non-partitioned user can be made a partitioned user).

An ED-PRVG-USER command is denied if:

- The specified UID does not exist.
- The specified UID is not the UID of the user executing the command, unless the UID is "system" or "SYSTEM".
- A UCFCI, UCAL, or PARTNAM value is entered and the UID of the user executing the command is not "system" or "SYSTEM".
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
ED-PRVG-USER: [TID] : : [CTAG] : : UID, [UCFCI] , [UCFCO] , [UCAL] , [OMODE] , [OSL] ,  
[UNAM] , [RUSURE] , [DSKBFIND] , [TYPE] , [DM] , [PARTNAM] , [LNKTMR] , [LOTO] ,  
[KAMINTVL] , [MIPINTVL] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.

UID	<p><5–12 VALID UID CHARACTERS></p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: User Identifier, specifies the user ID whose user security database entry is to be changed. A user database entry cannot be created with ED–PRVG–USER (refer to ENT–USER).</p> <p>Restrictions: ED–PRVG–USER is denied if UID of {system, SYSTEM, sysprint} is entered and a PARTNAM value is entered. ED–PRVG–USER is denied if the specified UID is already associated with a PARTNAM and a PARTNAM value is entered.</p>
UCFCI	<p><1–26 VALID (A–Z) UCFCI CHARACTERS></p> <p>Default: <Previously Existing Value></p> <p>Addressing: None</p> <p>Description: User Command Functional Category, Input, specifies the command access input security CCFC group(s) for the user (defines the set of TL1 commands the user can execute). Each input security group contains one or more TL1 command. Up to 26 input security groups A–Z can be specified for the user. To execute a command, a user must belong to at least one input security group assigned to the TL1 command to be executed. UCFCI is specified as a string of up to 26 order–independent, non–case sensitive characters A–Z. If a character is entered more than once in the string the system accepts the string as if the character was only entered once. Changes to this parameter take effect immediately. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC), for the default security groups.</p> <p>Restrictions: ED–PRVG–USER is denied if a UCFCI value is entered and the user executing the command does not have a UID of “system” or “SYSTEM” (the system administrator).</p>
UCFCO	<p><1–26 VALID (A–Z) UCFCO CHARACTERS></p> <p>Default: <Previously Existing Value></p> <p>Addressing: None</p> <p>Description: User Command Functional Category, Output, specifies the command access output security group(s) for the user (defines the TL1 command output responses a user receives because of commands executed by another user). UCFCO does not filter output responses for commands executed by the user, UCFCO only filters output responses for commands executed by another user. Each output security group contains one or more TL1 commands. Up to 26 output security groups A–Z can be specified for the user. To receive output responses from a command executed by another user, a user must belong to at least one output security group assigned to the TL1 command. If a user is assigned UCFCO of Z, the user receives output results from all TL1 commands executed by another user. UCFCO is specified as a string of up to 26 order–independent, non–case sensitive characters A–Z. If a character is entered more than once in the string the system accepts the string as if the character was only entered once. Changes to this parameter take effect immediately. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC), for the default security groups.</p>

UCAL	{1–30}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	User Command Authorization Level, specifies the set of TL1 commands a user can execute based on the authorization level of the user and of the command. To execute a command, a user must have a UCAL greater than or equal to the CCAL (Command Community Authorization Level) security level assigned to the command. A user can be assigned a security level from 1 through 30. Level 31 is reserved for the system administrator. Level 32 is reserved for the Alcatel account. Changes to this parameter take effect immediately.
	Restrictions:	ED–PRVG–USER is denied if a UCAL value is entered and the user executing the command does not have a UID of “system” or “SYSTEM” (the system administrator).
OMODE	{C}	
	Default:	{ C}
	Addressing:	None
	Description:	Command Input Operational Mode, specifies the default command entry mode of operation for the user when the system initializes. The system always initializes to the Direct Command Input mode. A user can toggle between Direct Command Input mode and Command Input Menu mode by using the F7 function key on a VDT.
	C	Direct Command Input mode.
OSL	<String of characters composed of B, C, D, E, I, H, M, m, O, P, R, S, W>, A, Z}	
	Default:	< Previously existing value > (If no PARTNAM value is entered) or {O} (If a PARTNAM value is entered)
	Addressing:	None
	Description:	Output Subscription Level, specifies the unsolicited autonomous output response messages a user receives. The OSL value is a case-sensitive, order-independent character string composed of any or all of the characters in the OSL value set of {B, C, D, E, H, I, M, m, O, P, R, S, W} (e.g., CMmEDPSOWR), A or Z. If all OSL filters are to be off (no unsolicited messages reported), OSL can be set to Z. If all OSL filters in the set {B, C, D, E, H, I, M, m, O, P, S, W} are to be on, OSL can be set to A. It is suggested that users not subscribe to receive the Alcatel autonomous informational messages (do not subscribe to {R, S}). Changes to this parameter take effect immediately. Values are:
	A	All Autonomous Responses, except R. The system sets the OSL to CMmEDPOSWIB.
	B	Report Data(B)ase Change messages (via REPT^DBCHG).
	C	Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.
	D	Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)
	E	Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1 or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).
	H	Reserved for future use. This OSL value (currently) has no affect.
	I	Report (I)nitilization messages (via REPT^INITZN).
	M	Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.
	m	Report setting/clearing of (m)inor alarms (via REPT^ALM) for

	equipment alarms and facility alarms.
O	Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.
P	Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)
R	Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages. The R option can only be added to a user's OSL, by the system administrator or an Alcatel account user.)
S	Report (S)tatus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)
W	Report (W)orld responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.
Z	Zero. Turns off all of OSL filters (user will not receive unsolicited responses).
Restrictions:	<p>ED-PRVG-USER is denied if OSL of Z is entered and any other OSL values are entered.</p> <p>ED-PRVG-USER is denied if OSL of {R} is entered and the user executing the command does not have a UID of "system", "SYSTEM".</p> <p>ED-PRVG-USER is denied if OSL of {A, C, D, E, I, M, m, P, R, S, W} (i.e., not {B, O, Z}) and OSTYPE of OPSINE was entered in ENT-USER.</p> <p>ED-PRVG-USER is denied if OSL of {A, B, O} and OSTYPE of NMA was entered in ENT-USER.</p> <p>ED-PRVG-USER is denied if OSL of {A, B, C, D, E, M, m, O, P, R, S, W} (i.e., not {I, Z}) and OSTYPE of TSC was entered in ENT-USER.</p> <p>ED-PRVG-USER is denied if any OSL value is entered and OSTYPE of BINARY was entered in ENT-USER.</p> <p>ED-PRVG-USER is denied if OSL of {W} is entered and a PARTNAM value was entered in ENT-USER.</p> <p>ED-PRVG-USER is denied if OSL of {S} and OSTYPE of {TSC, NMA or OPSINE} was entered in ENT-USER.</p>
UNAM	<1-18 VALID UNAM CHARACTERS>
Default:	<Previously Existing Value>
Addressing:	None
Description:	User Name, specifies additional identifying information pertaining to the user. UNAM can be the name of the party responsible for this account, a phone extension, a location, etc. It is not necessary for UNAM to be unique. Valid values for UNAM are a string of 1 through 18, case-sensitive alphanumeric characters where the first character must always be an alphabetic character. The following special characters are also accepted as valid characters and will be part of the UNAM: % (percent sign), + (plus sign), # (pound sign), and _ (under score). Changes to this parameter take effect immediately.

RUSURE	{NO, YES}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Are You Sure Prompt, specifies whether the user is to receive an additional RUSURE prompt for the RESTORE-DB and DLT-PARTITN commands. The RUSURE prompt allows the user to cancel the execution of the command before any changes in the system are made. (Note. An OS user or a user on a SNIDER CID port should be provisioned with RUSURE of NO). Changes to this parameter take effect immediately. Values are:
	NO	No, the user will not receive an RUSURE prompt.
	YES	Yes, the user will receive an RUSURE prompt when the user enters a RESTORE-DB or DLT-PARTITN command.
DSKBFIND	{ALWAYS, NEVER}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Disk Buffer Find Indicator, specifies whether a user receives all output messages the user is subscribed to receive (via the user's OSL and UCFCO values), that were generated while the user was logged off the system, when the user re-logs in to the system. If DSKBFIND is set to ALWAYS and the disk buffering storage capacity is exceeded, the oldest response messages are discarded and a warning message indicating messages have been discarded due to buffer wrap is generated when the user re-logs in. If DSKBFIND is set to ALWAYS, the user can "skip to the end" of the disk buffered messages by specifying SKIPTOEND of END in the ACT-USER command. Disk buffering of response messages are lost when the APS control system is initialized. Changes to DSKBFIND take affect after a non-printer (TYPE other than PRN) user logs-off and logs-in (via CANCEL-USER and ACT-USER), or after the CID is removed and restored (via RMV-CID and RST-CID) for a printer user. Values are:
	ALWAYS	Always, when the user logs in, the user receives all output messages the user is subscribed to receive that were generated while the user was logged off the system.
	NEVER	Never, when the user logs in, the user does not receive disk buffered response messages. The user only receives current response messages.
TYPE	{PRN, TTY, VDT}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Terminal Type, specifies the terminal CPORT configuration for the user. Changes to TYPE take affect after a non-printer (TYPE other than PRN) user logs-off and logs-in (via CANCEL-USER and ACT-USER), or after the CID is removed and restored (via RMV-CID and RST-CID) for a printer user. Values are:
	PRN	Printer (output only) CPORT. (Note. The CPORT should be provisioned as an auto login port, i.e., AUTOIN of a UID value in the ENT-CID or ENT-CID-VC command.)
	TTY	Teletype Terminal, non-cursor addressable input/output terminal.
	VDT	Video Display Terminal, cursor addressable video display terminal.
	Restrictions:	ED-PRVG-USER is denied if TYPE of PRN and OSTYPE of TSC was entered in ENT-USER. ED-PRVG-USER is denied if TYPE of PRN is entered and a PARTNAM value is entered.

ED-PRVG-USER is denied if TYPE of TTY and DM of NA is entered.
ED-PRVG-USER is denied if TYPE other than TTY is entered and DM of {ECHO, NOECHO} is entered.

DM	<p>{ECHO, NA, NOECHO}</p> <p>Default: {ECHO} (if TYPE of TTY is entered) {NA} (If TYPE other than TTY is entered)</p> <p>Addressing: None</p> <p>Description: TTY Display Mode, specifies the display mode for a TTY terminal after a user is logged-in. Changes to DM take affect after a non-printer (TYPE other than PRN) user logs-off and logs-in (via CANC-USER and ACT-USER), or after the CID is removed and restored (via RMV-CID and RST-CID) for a printer user. Values are:</p> <p>ECHO Character Echo, input characters are echoed.</p> <p>NA Not Applicable, value used for DM when TYPE is not TTY.</p> <p>NOECHO Character Not Echo, input characters are not echoed.</p> <p>Restrictions: ED-PRVG-USER is denied if DM of NA and TYPE of TTY is entered. ED-PRVG-USER is denied if DM of {ECHO, NOECHO} is entered and TYPE other than TTY is entered.</p>
PARTNAM	<p><string of 1-20 VALID PARTITION NAME CHARACTERS></p> <p>Default: <Previously Existing Value></p> <p>Addressing: None</p> <p>Description: Partition Name, specifies the name of a valid user partition (refer to ENT-PARTITN). Valid values for PARTNAM are a string of 1 through 20, non-case sensitive alphanumeric characters where the first character must always be an alphabetic character. The PARTNAM value is automatically converted to an upper-case string of characters. The following special characters are also accepted as valid characters and will be part of the PARTNAM: % (percent sign), + (plus sign), # (pound sign), and _ (under score). It is necessary for the PARTNAM to be unique. PARTNAM cannot be specified as a string of characters resulting in a keyword ALL. If no value is entered for PARTNAM, the system will automatically assign a null (unpopulated) string as the default. Changes to PARTNAM take affect after a non-printer (TYPE other than PRN) user logs-off and logs-in (via CANC-USER and ACT-USER), or after the CID is removed and restored (via RMV-CID and RST-CID) for a printer user.</p> <p>Restrictions: ED-PRVG-USER is denied if PARTNAM of any combination of the upper or lower case word "ALL" is entered. ED-PRVG-USER is denied if the PARTNAM value entered does not exist (refer to ENT-PARTITN). ED-PRVG-USER is denied if a PARTNAM value is entered and TYPE of PRN is entered. ED-PRVG-USER is denied if a PARTNAM value is entered and UID of {system, SYSTEM, sysprint} is entered. ED-PRVG-USER is denied if a PARTNAM value is entered and the current user is a non-partitioned user with an OSL value of {W} currently provisioned or the OSL value of {W} is specified in the same command. ED-PRVG-USER is denied if a PARTNAM value is entered and the user executing the command does not have a UID of "system" or "SYSTEM" (the system administrator). ED-PRVG-USER is denied if a PARTNAM value is entered and a PARTNAM is already associated with the specified UID. ED-PRVG-USER is denied if the "User Partitioning" PFO is not enabled.</p>

LNKTMR	{0–3600 }	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	CPORT Activity Link Timer, specifies the amount of time (in seconds) that the CPORT link is inactive before a link time-out occurs. LNKTMR is not triggered by a user login, but by CPORT link communication activity after the login occurs. The LOTO parameter determines whether the user is automatically logged out if a link time-out occurs. Changes to LNKTMR take affect after a non–printer (TYPE other than PRN) user logs–off and logs–in (via CANC–USER and ACT–USER), or after the CID is removed and restored (via RMV–CID and RST–CID) for a printer user. Values are:
	0	Disabled, no link time-out will occur.
	1–3600	Time in seconds, specifies the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, specified.
LOTO	{N, Y}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Logout On Link Timer Time-out, specifies whether the user is logged off when the CPORT activity link timer (LNKTMR) times out. Changes to LOTO take affect after a non–printer (TYPE other than PRN) user logs–off and logs–in (via CANC–USER and ACT–USER), or after the CID is removed and restored (via RMV–CID and RST–CID) for a printer user. Values are:
	N	No, the user is not logged off if the link timer expires.
	Y	Yes, the user is logged off if the link timer expires.
KAMINTVL	{0, 20–300}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Keep Alive Message Interval, specifies the amount of time (in seconds) that the user must be inactive before an autonomous Keep Alive Message (KAM) is sent to the user. The user is inactive if there is no TL1 input or output (command responses, acknowledgement responses, or autonomous responses) between the user and the system. When a user logs in, the user's KAM timer is started and increments until CPORT link activity occurs. The KAM timer is reset when link activity is detected. KAM timers are not incremented when the system is in Limited Command Entry mode. Changes to KAMINTVL take affect after a non–printer (TYPE other than PRN) user logs–off and logs–in (via CANC–USER and ACT–USER), or after the CID is removed and restored (via RMV–CID and RST–CID) for a printer user. Values are:
	0	Disabled, a KAM timer is not active and the user does not automatically receive any KAM autonomous messages.
	20–300	Time in seconds, specifies the KAM time interval. A KAM message is generated if the user's CPORT link is inactive for the time, in seconds, specified.

MIPINTVL	{0, 20–3500}	
Default:	<Previously Existing Value>	
Addressing:	None	
Description:	Multiple In Progress Message Interval, specifies the amount of time (in seconds) before an additional In Progress (IP) messages is generated. Any additional IP messages occur after the initial two second IP message is generated. An additional IP message for the ACT–USER, CANC–USER, ED–PID, STOP–OPS, START–OPS, or INIT–SYS commands is not generated, regardless of the MIPINTVL value. MIPINTVL timers are deactivated when the system is in Limited Command Entry mode. Changes to MIPINTVL take affect after a non–printer (TYPE other than PRN) user logs–off and logs–in (via CANC–USER and ACT–USER), or after the CID is removed and restored (via RMV–CID and RST–CID) for a printer user. Values are:	
	0	Disabled, the user will not receive any additional IP messages after the initial two–second IP message.
	20–3500	Time in seconds, indicates that an additional IP message is generated every n seconds (n=20 to 3500) until the entered command completes execution.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

[/* <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

UID	<5–12 VALID UID CHARACTERS> User Identifier, identifies the provisioned UID value.
UCFCI	<1–26 VALID UCFCI CHARACTERS> User Command Functional Category, Input, identifies the provisioned UCFCI value. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)
UCFCO	<1–26 VALID UCFCI CHARACTERS> User Command Functional Category, Output, identifies the provisioned UCFCO value. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)
UCAL	{1–30} User Command Authorization Level, identifies the provisioned UCAL value. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)
OMODE	{C} Command Input Operational Mode, indicates the system initializes to the Direct Command Input mode.

OSL	<p>{<String of characters composed of {B, C, D, E, H, I, M, m, O, P, R, S, W}>, <NoVal>}</p> <p>Output Subscription Level, identifies the unsolicited output response messages a user receives. The OSL value reported is a case-sensitive, order-independent character string composed of any or all of the characters in the OSL value set of {B, C, D, E, H, I, M, m, O, P, R, S, W} (e.g., CMmEDPSOWR) or no value. If an OSL value of A was entered, the reported OSL value is BCDEHIMmOPSW. If an OSL value of Z was entered, no value is reported for OSL. Values are:</p> <table> <tr> <td>B</td><td>Report Data(B)ase Change messages (via REPT^DBCHG).</td></tr> <tr> <td>C</td><td>Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>D</td><td>Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)</td></tr> <tr> <td>E</td><td>Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).</td></tr> <tr> <td>H</td><td>Reserved for future use. This OSL value (currently) has no affect.</td></tr> <tr> <td>I</td><td>Report (I)nitiaization messages (via REPT^INITZN).</td></tr> <tr> <td>M</td><td>Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>m</td><td>Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>O</td><td>Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.</td></tr> <tr> <td>P</td><td>Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)</td></tr> <tr> <td>R</td><td>Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages.)</td></tr> <tr> <td>S</td><td>Report (S)tatus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)</td></tr> <tr> <td>W</td><td>Report (W)orld responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.</td></tr> <tr> <td><NoVal></td><td>No value is reported if no OSL values were provisioned (all OSL filters are off and the user will not receive unsolicited messages).</td></tr> </table>	B	Report Data(B)ase Change messages (via REPT^DBCHG).	C	Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.	D	Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)	E	Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).	H	Reserved for future use. This OSL value (currently) has no affect.	I	Report (I)nitiaization messages (via REPT^INITZN).	M	Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.	m	Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.	O	Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.	P	Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)	R	Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages.)	S	Report (S)tatus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)	W	Report (W)orld responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.	<NoVal>	No value is reported if no OSL values were provisioned (all OSL filters are off and the user will not receive unsolicited messages).
B	Report Data(B)ase Change messages (via REPT^DBCHG).																												
C	Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.																												
D	Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)																												
E	Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).																												
H	Reserved for future use. This OSL value (currently) has no affect.																												
I	Report (I)nitiaization messages (via REPT^INITZN).																												
M	Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.																												
m	Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.																												
O	Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.																												
P	Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)																												
R	Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages.)																												
S	Report (S)tatus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)																												
W	Report (W)orld responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.																												
<NoVal>	No value is reported if no OSL values were provisioned (all OSL filters are off and the user will not receive unsolicited messages).																												
UNAM	<p>{1–18 VALID UNAM CHARACTERS, <NoVal>}</p> <p>User Name, identifies the provisioned UNAM value. Values are:</p> <table> <tr> <td><Provisioned UNAM value></td><td></td></tr> <tr> <td><NoVal></td><td>No value is reported if a UNAM value was not entered.</td></tr> </table>	<Provisioned UNAM value>		<NoVal>	No value is reported if a UNAM value was not entered.																								
<Provisioned UNAM value>																													
<NoVal>	No value is reported if a UNAM value was not entered.																												
RUSURE	<p>{NO, YES}</p> <p>Are You Sure Prompt, indicates whether the user is to receive an additional RUSURE prompt for the RESTORE–DB and DLT–PARTITN commands. The RUSURE prompt allows the user to cancel the execution of the command before any changes in the system are made. Values are:</p> <table> <tr> <td>NO</td><td>No, the user will not receive an RUSURE prompt.</td></tr> <tr> <td>YES</td><td>Yes, the user will receive an RUSURE prompt when the user enters a RESTORE–DB or DLT–PARTITN command.</td></tr> </table>	NO	No, the user will not receive an RUSURE prompt.	YES	Yes, the user will receive an RUSURE prompt when the user enters a RESTORE–DB or DLT–PARTITN command.																								
NO	No, the user will not receive an RUSURE prompt.																												
YES	Yes, the user will receive an RUSURE prompt when the user enters a RESTORE–DB or DLT–PARTITN command.																												

DSKBFIND	{ALWAYS, NEVER}	Disk Buffer Find Indicator, indicates whether a user receives all output messages the user is subscribed to receive (via the user's OSL and UCFCO values), that were generated while the user was logged off the system, when the user re-logs in to the system. Values are:
	ALWAYS	Always, when the user logs in, the user receives all output messages the user is subscribed to receive that were generated while the user was logged off the system.
	NEVER	Never, when the user logs in, the user does not receive disk buffered response messages. The user only receives current response messages.
TYPE	{PRN, TTY, VDT}	Terminal Type, indicates the terminal CPORT configuration for the user. Values are:
	PRN	Printer (output only) CPORT.
	TTY	Teletype Terminal, non-cursor addressable input/output terminal.
	VDT	Video Display Terminal, cursor addressable video display terminal.
DM	{ECHO, NA, NOECHO}	TTY Display Mode, indicates the display mode for a TTY terminal after a user is logged-in. Values are:
	ECHO	Character Echo, input characters are echoed.
	NA	Not Applicable, value used for DM when TYPE is not TTY.
	NOECHO	Character Not Echo, input characters are not echoed.
OSTYPE	{NMA, OPSINE, OTHER, TSC}	Operations System Type, identifies the provisioned OSTYPE value. Values are:
	NMA	Network Monitoring and Analysis OS.
	OPSINE	Operations System for Intelligent Network Elements OS.
	OTHER	Any OS type other than NMA, OPSINE, and TSC.
	TSC	Test Session Controller OS.
LNKTMR	{0-3600}	CPORT Activity Link Timer, identifies the amount of time (in seconds) that the CPORT link is inactive before a link time-out event occurs. LNKTMR is not triggered by a user login, but by CPORT link communication activity after the login occurs. The LOTO parameter determines whether the user is automatically logged out if a link time-out occurs. Values are:
	0	Disabled, no link time-out will occur.
	1-3600	Time in seconds, indicates the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, indicated.
LOTO	{LOGOUT, NOLOGOUT}	Logout On Link Timer Time-out, indicates whether the user is logged off when the CPORT activity link timer (LNKTMR) times out.
	LOGOUT	The user is logged off when the link timer expires.
	NOLOGOUT	The user is not logged off when the link timer expires.
PARTNAM	{<1-20 VALID PARTITION NAME CHARACTERS>, <NoVal>}	Partition Name, indicates the provisioned value for PARTNAM.
	<Provisioned PARTNAM value>	
	<NoVal>	No value is reported if a PARTNAM value was not entered.

KAMINTVL	{0, 20–300}	Keep Alive Message Interval, indicates the amount of time (in seconds) that the user must be inactive before a Keep Alive Message (KAM) is automatically sent to the user. The user is inactive if there is no TL1 input or output (command responses, acknowledgement responses, or autonomous responses) between the user and the system. When a user logs in, the user's KAM timer is started and increments until CPORT link activity occurs. The KAM timer is reset when link activity is detected. KAM timers are not incremented when the system is in Limited Command Entry mode. Values are:
	0	Disabled, a KAM timer is not active and the user does not automatically receive any KAM autonomous messages.
	20–300	Time in seconds, specifies the KAM time interval. A KAM message is generated if the user's CPORT link is inactive for the time, in seconds, specified.
MIPINTVL	{0, 20–3500}	Multiple In Progress Message Interval, indicates the amount of time (in seconds) before an additional In Progress (IP) messages is generated. Any additional IP messages occur after the initial two second IP message is generated. An additional IP message for the ACT–USER, CANC–USER, ED–PID, STOP–OPS, START–OPS, or INIT–SYS commands is not generated, regardless of the MIPINTVL value. MIPINTVL timers are deactivated when the system is in Limited Command Entry mode. Values are:
	0	Disabled, the user will not receive any additional IP messages after the initial two–second IP message.
	20–3500	Time in seconds, indicates that an additional IP message is generated every n seconds (n=20 to 3500) until the entered command completes execution.

EXAMPLES

In the following example, ED-PRVG-USER is used to edit the user security database entry for user13.

```
ED-PRVG-USER:::::user13,A,A,10,,CM,user13_info,NO,NEVER,TTY,ECHO;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P0a057. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P0a057 COMPLD  
/* user13,A,A,10 */  
/* C,CM,user13_info,NO,NEVER,TTY,ECHO,OTHER,0,NOLOGOUT,,0,0 */  
/* ED-PRVG-USER:::::user13,A,A,10,,CM,user13_info,NO,NEVER,TTY,ECHO  
[P0a057] (1) */  
;
```

In the following example, ED-PRVG-USER is used to edit the user security database entry for user21.

```
ED-PRVG-USER:::::user21,Z,Z,25,,Z,user_21_info,,ALWAYS,VDT,NA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P0a061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P0a061 COMPLD  
/* user21,Z,Z,25 */  
/* C,,,YES,ALWAYS,VDT,NA,OTHER,0,NOLOGOUT,,0,20 */  
/* ED-PRVG-USER:::::user21,Z,Z,25,,Z,user_21_info,,ALWAYS,VDT,NA  
[P0a061] (1) */  
;

COMMAND CODE: **ED-RIP-PRMTR**
COMMAND NAME: **EDIT RIP PARAMETERS**

PURPOSE

The ED-RIP-PRMTR command allows provisioning of the Routing Information Protocol (RIP) parameters of the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command allows provisioning of the network layer (Layer 3) parameters for RIP. The RIP dynamic router is initialized in passive listening ("silent") mode since it is not acting as a gateway in the network.

Changes to the name-defined parameters are stored in the database and take effect only when the stack is (re)initialized via the RST-CID command. All of the name-defined parameters survive a database backup and restore.

The ED-RIP-PRMTR command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An ED-RIP-PRMTR command is denied if:

- The specified CID is not provisioned as a LAN port on the ICM (via ENT-CID with PROTOCOL of TCP).
- The specified CID is not configured as the LAN on the ICM.
- The specified CID is not configured with the RIP parameters being provisioned.
- An invalid parameter value is entered.

INPUT FORMAT

ED-RIP-PRMTR: [TID] : CPORT: [CTAG] : : : [RIPMODE=] [, RIPSTAT=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
RIPMODE=	{V1, V2, V1V2} Default: <Previously Existing Value> or {V1V2} (Factory Default) Addressing: None Addressing: None Description: Determines which RIP mode to configure in the system. Values are: V1 Version 1, allows system to receive RIP V1 broadcast updates. V2 Version 2, allows system to receive RIP V2 multicast and RIP V1 broadcast updates. V1V2 Version 1 and Version 2, allows system to receive RIP V1 broadcast and RIP V2 broadcast updates.

RIPSTAT= {DISABLE, ENABLE}
Default: <Previously Existing Value> or {DISABLE} (Factory Default)
Addressing: None
Description: Routing Information Protocol (RIP) Status, determines whether or not the RIP protocol is enabled on the router. Values are:
 DISABLE Specifies the RIP protocol is not enabled on the router.
 ENABLE Specifies the RIP protocol is enabled on the router.

COMMAND CODE: **ED-RNG-OC12**
COMMAND NAME: **EDIT RING OC-12**

PURPOSE

The ED-RNG-OC12 command modifies the parameters associated with the ring protection group pair defined in a previously executed ENT-RNG-OC12 command. The ring protection pair consists of a preferred (protected) OC-12 and its corresponding alternate (protecting) OC-12.

An ED-RNG-OC12 command is denied if:

- The OC-12s specified in B1 and B2 parameters do not refer to preferred and alternate OC-12s, respectively.
- An invalid parameter value is entered.

INPUT FORMAT

ED-RNG-OC12 : [TID] : B1 , B2 : [CTAG] : : : [WTSDEL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
B1	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the preferred (protected) OC-12 port. Restrictions: ED-RNG-OC12 is denied if the OC-12 specified is not an odd-numbered OC-12.
B2	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the alternate (protecting) OC-12 port. Restrictions: ED-RNG-OC12 is denied if the OC-12 specified is not an even-numbered OC-12. ED-RNG-OC12 is denied if B2 is not equal to B1+1.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
WTSDEL=	{DELAY, IMMED} Default: {IMMED} Addressing: None Description: Wait to Switch Delay. Determines if the path switching on the paths within the OC-12 is to be delayed by a set amount determined by the hardware or if it is immediate. Values are: <div style="margin-left: 40px;"> DELAY The path switching is to be delayed by approximately 25 milliseconds after the fault is detected. IMMED The path switching is to occur immediately upon detection of the fault. </div>

SUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **ED-RNG-OC3**
COMMAND NAME: **EDIT RING OC-3**

PURPOSE

The ED-RNG-OC3 command modifies the parameters associated with the ring protection group pair defined in a previously executed ENT-RNG-OC3 command. The ring protection pair consists of a preferred (protected) OC-3 and its corresponding alternate (protecting) OC-3.

An ED-RNG-OC3 command is denied if:

- The OC-3s specified in B1 and B2 parameters do not refer to preferred and alternate OC-3s, respectively.
- An invalid parameter value is entered.

INPUT FORMAT

ED-RNG-OC3 : [TID] : B1 , B2 : [CTAG] : : : [WTSDEL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
B1	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: None Description: OC3 AID, identifies the preferred (protected) OC-3 port. Restrictions: ED-RNG-OC3 is denied if the OC-3 specified is not an odd-numbered OC-3.
B2	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: None Description: OC3 AID, identifies the alternate (protecting) OC-3 port. Restrictions: ED-RNG-OC3 is denied if the OC-3 specified is not an even-numbered OC-3. ED-RNG-OC3 is denied if B2 is not equal to B1+1.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
WTSDEL=	{DELAY, IMMED} Default: <Previously Existing Value> Addressing: None Description: Wait to Switch Delay. Determines if the path switching on the paths within the OC-3 is to be delayed by a set amount determined by the hardware or if it is immediate. Values are: <div style="margin-left: 40px;"> DELAY The path switching is to be delayed by approximately 25 milliseconds after the fault is detected. IMMED The path switching is to occur immediately upon detection of the fault. </div>

```

COMMAND CODE: **ED-STS1**
COMMAND NAME: **EDIT STS-1**

PURPOSE

The ED-STS1 command modifies the specified STS-1 port parameter values previously provisioned using ENT-STS1.

Executing an ED-STS1 command causes the following primary state transitions for the specified STS-1. Secondary states associated with the STS-1 after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST Value	Next PST State if Current PST State is:			
	IS	OOS-AU	OOS-AUMA	OOS-MA
IS	Denied	Denied	OOS-AU	IS
OOS	OOS-MA	OOS-AUMA	Denied	Denied

Note: 1. No state change occurs if no value is entered for PST.

When an STS-1 is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set for the specified STS-1. The MAN condition type is cleared when the STS-1 is provisioned to an IS state.

When an STS-1 is in an OOS-MA, OOS-AUMA state, no STS-1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the STS-1, but STS-1 alarm conditions are monitored (retrievable with the RTRV-STS1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-STS1 command) for the STS-1.

When an STS-1 with an SST of WRK (refer to ENT-RNG-OC3 or ENT-RNG-OC12) is edited to an OOS state and the STS-1 or its subordinate VT1.5s are path switched via 2WAYPR, the system selects the STS-1/VT1.5 from the redundant ring OC-3/OC-12 (if that path has an SST of STBYH) and that STS-1/VT1.5 enters an SST of WRK. If the redundant path is not in an SST of STBYH, no switching is attempted. When the STS-1 or its subordinate VT1.5s are in a pass through connection via 2WAY, the path AIS is sent in the pass through direction.

An ED-STS1 command is denied if:

- The specified STS-1 has not previously been provisioned with the ENT-STS1 command.
- The specified STS-1s supporting EC1, OC-3 or OC-12 have not been provisioned.
- The specified STS-1 is being edited from an IS or OOS-AU state to an IS state.
- The specified STS-1 is being edited from an OOS-MA or OOS-AUMA state to an OOS,<Null> state.
- The specified STS-1 is being edited to an IS state and the STS-1 is in a loopback (the STS-1 has an SST of LPBK).
- The specified STS-1 is being edited from an IS or OOS-AU state to OOS-MA or OOS-AUMA state and the STS-1 is connected (it has an SST of TRM, ACT or BUSY), unless CMDMDE=FRCD is used.
- The specified STS-1, which is embedded within a ring OC-3 or OC-12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12), is being edited to an OOS,<Null> state and the embedded STS-1 or VT1.5s have an SST of WRK, unless CMDMDE=FRCD.
- CMDMDE=NORM is entered and the specified STS-1 has an SST of {ACT, BUSY, TRM}.
- CMDMDE=FRCD (or NORM) is entered with an attempt to alter the value of STSMAP and a mapping is currently in place (meaning that one or more embedded termination points (T3 or VT1) have been provisioned (SST of SDEE and/or TRM), or that a cross-connection is in place which connects to an embedded termination point regardless of whether or not it is provisioned (e.g., a T3 or VT1 level implied CRS), for examples).
- STSPTYEL=Y is specified.
- An invalid parameter value or combination of parameter values is entered.
- TACC=Y, and PST=IS.
- TAPPOOL is set to a valid value but TACC=N.

- TAPP AID is set to the last STS–1 value in the system, and AID+1 can not be provisioned as a FAD port.
- If the port specified by AID is involved in a redlined (RDL=Y) connection, and any parameter other than PST is specified. CMDMDE=FRCD will not override this restriction
- FADB is provisioned.

I/O protection switching is disabled if all three STS–1 ports supported by the EP3 or ES1 circuit pack are in an OOS–MA or OOS–AUMA state. I/O protection switching only occurs if at least one of the STS–1s on the supporting I/O circuit pack is provisioned to an IS or an OOS–AU state.

In order to be compatible with the older UPSRs which do not switch on the excessive BERs (EBERs) on the VT1.5, the system may insert AIS–V in all VT1.5 paths (through, drop terminated and drop non–terminated) contained in a terminated STS–1 (embedded in a ring OC–3 or OC–12) that is detected as having EBER. Whether or not to insert AIS in all VTs is provisionable via AUTOVTRINGAIS parameter.

INPUT FORMAT

```
ED–STS1 : [TID] : AID : [CTAG] : : : [AUTOVTRINGAIS=] [ , STSMAP=]
[ , STSPTYEL=] [ , CMDMDE=] [ , EXPTRC=] [ , TACC=] [ , TAP–
POOL=] [ , TRC=] [ , PDIINS=] : [PST] ;
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1–{1–3840}} (EC1STS1–EC1/STS1#) {OC3STS1–{1–2240}–{1–3}} (OC3STS1–OC3#–STS1#) {OC12STS1–{1–560}–{1–4}–{1–3}} (OC12STS1–OC12#–STM1#–STS1#) Default: Entry Required Addressing: &&–ranging and &–grouping Description: STS1 AID, identifies the STS–1 port or range of ports.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AUTOVTRINGAIS=	{3, 4, DISABLE} Default: <Previously Existing Value> Addressing: None Description: Automatic transmit VT path AIS, specifies the level of EBER on the addressed STS–1 (that is terminated) which causes Automatic transmit VT path AIS to be sent. This parameter only applies to a terminated STS–1 that is embedded within a ring OC–3 or OC–12. If the addressed STS–1 is embedded within a ring OC–3 or OC–12, the STS–1 in the redundant ring OC–3 or OC–12 is modified to the specified value. Valid values are: 3 On reaching a 10E–3 BER threshold, send AIS on all of its constituent VT1.5s. 4 On reaching a 10E–4 BER threshold, send AIS on all of its constituent VT1.5s. DISABLE Path AIS on all of the VT1.5s within the addressed STS–1 is not to be sent on EBER on STS–1.

STSMAP=	{ALL, ASYNC, VTFLOAT}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	STS payload Mapping. Determines the expected STS–1 payload type and the value of the expected path signal label (C2). Used for comparison for the Signal Label Mismatch function. Values are:
	ALL	Match ALL incoming signal labels, without creating a SLMF condition, and disallow mappings (i.e., terminating) at this STS–1. Only intact STS–1 connections are possible since ALL is intended for intermediate path monitoring only. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
	ASYNC	Asynchronous mapping for DS3 (i.e., C2=04 hex). The system will accept only incoming signal labels of type ASYNC without creating a SLMF condition. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
	VTFLOAT	Floating mode VTs (i.e., C2=02 hex).
	Restrictions:	If STSMAP=ASYNC, only ASYNC type mappings may be applied to the STS–1 (e.g., ENT–T3, ENT–CRS–T3, etc.). No visibility mappings can be made on an STS–1 (i.e., ENT–T3 is not possible even though STSMAP=ASYNC) if the STS–1 is provisioned on hardware that cannot directly support ASYNC mappings for intermediate path monitoring purposes (e.g., an ES1 card). ED–STS1 is denied if an attempt is made to alter the value of STSMAP and a mapping is currently in place.
STSPTYEL=	{N}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	STS path yellow behavior. Identifies whether STS path yellow or RDI is sent/received. Values are:
	N	No. RDI is not sent/received on appropriate defect states.
CMDMDE=	{FRCD, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	FRCD	Forced. The command is accepted and parameter values are modified even if the STS–1 is cross-connected.
	NORM	Normal. The command is denied if the STS–1 is in an IS state and is cross-connected (STS–1 has an SST of ACT or BUSY).
	Restrictions:	ED–STS1 is denied if an attempt is made to change STSMAP when a mapping is currently in place, even if CMDMDE=FRCD.

EXPTRC=	< 0–62 ASCII printable characters followed by CR and LF > Default: <Previously Existing Value> Addressing: None Description: Expected Path Trace message, specifies the expected path trace message. Value consists of 0–62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the EXPTRC message is filled with ASCII nulls followed by CR and LF. The EXPTRC value must be enclosed within double–quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the EXPTRC message is 62 ASCII nulls followed by a CR and LF. For locally generated STS–1s (i.e., not cross connected intact), the TRC value transmitted is the locally provisioned TRC value. For intact cross–connected STS1s, the TRC value transmitted is the TRC value received at the other end of the cross–connection.
TACC=	{N, Y} Default: <Previously Existing Value> Addressing: None Description: Test Access port AID, indicates that this STS1 port (specified by AID) and the AID+1 STS1 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are: N No, the specified STS1 port is not a Test Access port. Y Yes, STS1 ports specified by AID and AID+1 are Test Access ports. Restrictions: If TACC=Y, the AID of an STS1 entity embedded in an OC12, OC3, or EC1, except the 3rd STS1 within an OC3 and the {4–3}th STS1 within an OC12. Refer to Appendix B, Access Identifiers (AIDs).
TAPPOOL=	{PRIVATE, PUBLIC, <NoVal>} Default: <NoVal> if TACC = N PRIVATE if TACC = Y Addressing: None Description: TAP port Pool, defines whether the TAP port that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool. Values are: PRIVATE The TAP pair that has been created belongs to the private pool of the user that issued the ENT–STS1 command. It can only be accessed by the user that owns the pool. If any other user tries to use this TAP pair (by means of CONN–TACC–STS1), the command shall be denied. PUBLIC The TAP pair that has been created belongs to the public pool of the system. It can be accessed by any user with the privilege to use the Test Access commands. <NoVal> No Value (unpopulated), TAPPOOL does not apply if TACC=N.

TRC= < 0–62 ASCII printable characters followed by CR and LF >
Default: <Previously Existing Value>
Addressing: None
Description: Path Trace message, specifies the path trace message transmitted when the STS1 is terminated (i.e., it is not cross connected intact). Value consists of 0–62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the TRC message is filled with ASCII nulls followed by CR and LF. The TRC value must be enclosed within double-quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the TRC message is 62 ASCII nulls followed by a CR and LF.
 For intact cross connected STS1s, the TRC value transmitted is the TRC value received at the other end of the cross connection.

PDIINS= {N, Y}
Default: <Previously Existing Value>
Addressing: None
Description: Payload Defect Indication INsertion (Transmit/outgoing direction only). Controls whether PDI values will be inserted into the outgoing signal label (C2) bytes. If Fault Escalation is disabled on the STS–1 (default of FLTPRO=N via the ED–FLTPRO–STS1 command), PDI insertion is per GR–253. If Fault Escalation is enabled (FLTPRO=Y), PDI insertion is based on Alcatel's Fault Escalation type payload defects. Values are:

N	No, PDI values are not inserted into the outgoing signal label when payload defects exist.
Y	Yes, PDI values are inserted into the outgoing signal label when payload defects exist.

The interaction between PDIINS in this command and the FLTPRO in the ED–FLTPRO–STS1 command is defined in the following table.

PDIINS = in ED–STS1 command	FLTPRO = in ED–FLTPRO–STS1	
	Y	N
Y	Fault escalation is based on selected incoming faults as defined in the Fault Propagation feature and PDI=FC (also called APDI) is inserted in the outgoing C2 byte.	Fault escalation is based on conditions defined in GR–253 and PDI is inserted in the outgoing C2 byte
N	Fault escalation is based on selected incoming faults as defined in the Fault Propagation feature and AIS–P is inserted in the outgoing STS1.	No fault escalation (None of the PDI, APDI or AIS–P is generated)

PST {IS, OOS}
Default: < NO PST STATE CHANGE >
Addressing: None
Description: Primary State, specifies the primary state to provision the STS–1. Values are:

IS	In-Service
OOS	Out-Of-Service

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Invalid combination of TACC and TAPPOOL */ /* Invalid parameter change of a Red Lined connection */
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
IIFM	Input, Invalid data ForMat /* TRC and/or EXPTRC text strings too long */
PICC	Privilege, Invalid Command Code /* You are not the owner of the TAPP */ /* You do not have the privilege to make this change in TAPP */
SAIS	Status, Already In Service
SAOS	Status, Already Out of Service
SCAT	Status, Circuit Already connected to another Tap
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating supported entities */ /* STS1 Shelf info error, Error=<ERROR-STRING> */ /* Error disabling supported T3s, Error=<ERROR-STRING> */ /* Error disabling supported VT1s, Error=<ERROR-STRING> */ /* Error enabling supported T3s, Error=<ERROR-STRING> */ /* Error enabling supported VT1s, Error=<ERROR-STRING> */ /*CONN Database Error: <ERROR-STRING> for <AID-STRING>*/ /*GetSptgTps(<TP-TYPE>, <RECORD-NUMBER>): <ERROR-STRING>*/ /*GetSptdTPid(STS1, <RECORD-NUMBER>, T3): <ERROR-STRING>*/
SNVS	Status, Not in Valid State /* Cannot change STSMAP while supported entities exist */ /* Cannot change STSMAP while connected */ /*In-Service terminated or connected ports must be FRCD*/ /*The port or a VT1.5 is connected In-Service non-STBYH, must be FRCD*/
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest /* Cannot create FAD if supporting entity is in a ring */ /* Cannot edit a port to be FAD if fault propagation is active */

SSRE Status, System Resources Exceeded
 /* No more TAPPs can be assigned*/

EXAMPLE

In the following example, STS-1 port OC3STS1-1-3 (an STS-1 embedded within an OC-3) provisioning is changed to STSPTYEL to send RDI instead of STS-1 path yellow and to place the STS-1 in the IS state. All other parameter values are unchanged.

```
ED-STS1::OC3STS1-1-3:::STSPTYEL=N:IS;

COMMAND CODE: **ED-STS3C**
COMMAND NAME: **EDIT STS-3C**

PURPOSE

The ED-STS3C command modifies the specified STS-3C port parameter values previously provisioned using ENT-STS3C.

Executing an ED-STS3C command causes the following primary state transitions for the specified STS-3C. Secondary states associated with the STS-3C after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST Value	Next PST State if Current PST State is:			
	IS	OOS-AU	OOS-AUMA	OOS-MA
IS	Denied	Denied	OOS-AU	IS
OOS	OOS-MA	OOS-AUMA	Denied	Denied

Note: 1. No state change occurs if no value is entered for PST.

When an STS-3C is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set for the specified STS-3C. The MAN condition type is cleared when the STS-3C is provisioned to an IS state.

When an STS-3C is in an OOS-MA, OOS-AUMA state, no STS-3C transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the STS-3C, but STS-3C alarm conditions are monitored (retrievable using the RTRV-STS3C command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMMODE-STS3C command) for the STS-3C.

An ED-STS3C command is denied if:

- The specified STS-3C has not previously been provisioned using the ENT-STS3C command (SST of UAS).
- The specified STS-3C is being edited from an IS or OOS-AU state to an IS state.
- The specified STS-3C is being edited from an OOS-MA or OOS-AUMA state to an OOS,<Null> state.
- CMDMDE=NORM is entered (or defaulted to) and the specified STS-3C has an SST of {ACT or BUSY}.
- The port identified by AID is involved in a redlined connection, and any parameter other than PST is entered. CMDMDE=FRCD will not override this denial.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ED-STS3C: [TID] :AID: [CTAG] : : : [CMDMDE=] [, EXPTRC=] [, STSMAP=] [, TRC=] : [PST] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C–{1–2240}} (OC3STS3C–OC3#/STS3C#) {OC12STS3C–{1–560}–{1–4}} (OC12STS3C–OC12#–STM1/STS3C#) Default: Entry Required Addressing: &&–ranging and &–grouping Description: STS3C AID, identifies the STS–3C port or range of ports.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CMDMDE=	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced. The command is accepted and parameter values are modified regardless of the state of the STS–3C. NORM Normal. The command is denied if the STS–3C is in an IS state and is cross–connected (STS–3C has an SST of ACT or BUSY).
EXPTRC=	< 0–62 ASCII printable characters followed by CR and LF > Default: <Previously Existing Value> Addressing: None Description: Expected Path Trace message. Specifies the expected path trace message. Value consists of 0–62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the EXPTRC message is filled with ASCII nulls followed by CR and LF. The EXPTRC value must be enclosed within double–quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the EXPTRC message is 62 ASCII nulls followed by a CR and LF.
STSMAP=	{ALL, ATM, DQDB, DS4NA, FDDI} Default: <Previously Existing Value> Addressing: None Description: STS payload Mapping. Specifies the expected STS–3C payload type and the value of the expected path Signal Label (C2). Used for comparison for the Signal Label Mismatch function. Values are: ALL Generic STS–3C format. Contains payload of any mapping format (C2=00 hex). Since this value will match ALL signal label values, mismatch alarms are never generated. ATM STS–3C contains ATM payload (provisioned (C2=13 hex)). DQDB STS–3C contains DQDB payload (provisioned (C2=14 hex)). DS4NA STS–3C contains DS4NA payload (provisioned (C2=12 hex)). FDDI STS–3C contains FDDI payload (provisioned (C2=15 hex)).

TRC=	< 0–62 ASCII printable characters followed by CR and LF > Default: <Previously Existing Value> Addressing: None Description: Path Trace message. Specifies the path trace message to be transmitted when the STS–3c is provisioned. Value consists of 0–62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the TRC message is filled with ASCII nulls followed by CR and LF. The TRC value must be enclosed within double–quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the TRC message is 62 ASCII nulls followed by a CR and LF. For locally generated STS–3Cs (i.e., not cross–connected intact), the TRC value transmitted is the locally provisioned TRC value. For intact cross–connected STS–3Cs, the TRC value transmitted is the TRC value received at the other end of the cross–connection.
PST	{IS, OOS} Default: < NO PST STATE CHANGE > Addressing: None Description: Primary State, specifies the primary state to provision the STS–3C. Values are: IS In-Service OOS Out-Of-Service. Out-of-service for management (OOS–MA) is assumed.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Invalid parameter change while Red Lined connected */
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
IIFM	Input, Invalid data ForMat /* TRC and/or EXPTRC text string is too long */
SAIS	Status, Already In Service
SAOS	Status, Already Out of Service
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR–STRING> for <AID–STRING> */

SNVS	Status, Not in Valid State
	/* To edit a non-idle in-service port, set CMDMDE = FRCD */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, STS-3C port OC3STS3C-3 (an STS-3C embedded within an OC-3) provisioning is changed to STSMAP to match ATM payload type and to place the STS-3C in the IS state. All other parameter values are unchanged.

```
ED-ST3C::OC3STS3C-3:::STSMAP=ATM:IS;
```

RTRV-STS3C

COMMAND CODE: **ED-T1**
COMMAND NAME: **EDIT T1**

PURPOSE

The ED-T1 command modifies the specified DS1 port parameter values previously provisioned using ENT-T1. It also modifies the parameters pertaining to External DS1 Timing Reference Source (TMG).

The system establishes cross-connects to an Idle signal when a DS1 is not cross-connected to another DS1. The Idle signal used is determined by the DS1's provisioning of the IDLE parameter value. If AIS is specified as the Idle signal for a DS1 port, the AIS Idle signal is generated internally by the port hardware. If QRS (Framed or Unframed) is specified as the Idle signal for a port, an Idle Signal Source port is used to generate the Idle signal. Any DS1 port, except a DS1 contained in a VT1.5, may be provisioned as a QRSF or QRSU Idle Signal Source port. Only one DS1 in the system can be provisioned at a time as a QRSF (ESF or SF format) or QRSU Idle Signal Source port, but another port can be provisioned to replace one of these Idle Signal Source ports and the system automatically uses the replacement port as the specified Idles Signal Source. The format of an Idle Signal Source port must be specified as either SF or ESF if the Idle Signal Source port is to provide a QRSF Idle Signal. An Idle Signal Source port must be provisioned before any DS1 requiring its use is provisioned. An Idle Signal Source port provisioned as an Internal Source port (SRC of INTSRC) has both facility failure detection disabled (a facility failure condition cannot occur for an Internal Idle Signal Source port) and Performance Monitoring data collection disabled. Parameter values of an Idle Signal Source port cannot be changed (with an ED-T1 command) while in use. An Idle Signal Source port cannot be the target AID for a cross-connect.

Up to 256 electrical DS1 or DS1 embedded in an electrical DS3 port pairs in the system may be provisioned as a test access port at a time, but only to an OOS-MA or OOS-AUMA state. When this is done, the two ports identified by AID and AID+1 are both provisioned as a Test Access Port Pair (TAPP). A TAPP is always assigned as a sequential pair of ports (i.e., if port T3T1-3-5 is referenced in the command, then ports T3T1-3-5 and T3T1-3-6 are the TAPP). When using ED-T1 to provision a TAPP, AID+1 must be provisioned, AID+1 must not be a FAD of another TAPP, and both AID and AID+1 must have C-bit loopback disabled. When using ED-T1 to change the provisioning of a TAPP, either of the AIDs for FAD A or FAD B can be specified as the AID in the command and the provisioning changes are applied to both the FAD A and FAD B ports. If TAPPOOL is not specified or specified as PRIVATE, the TAPP will be associated with, or owned by, the user that provisioned the TAPP. No other user is allowed to use the TAPP for test access operations or change the TAPPs provisioning. If TAPPOOL is specified as PUBLIC, then that TAPP can be used by any user that has access to test access commands. If the TAPPs are embedded DS1s within a DS3, both DS1s of the TAPP must be embedded within the same DS3 and the supporting DS3 must be provisioned (with the ENT-T3 command) before the TAPP is provisioned. TAPPs may not be the target AID for a cross-connect.

Executing an ED-T1 command causes the following primary state transitions for the specified DS1. Secondary states associated with the DS1 after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Current PST State is:				
	IS	OOS-AU	OOS-AU,AINS	OOS-AUMA	OOS-MA
IS,<NoVal>	Denied	Denied	Denied	OOS-AU	IS
OOS,<NoVal>	OOS-MA	OOS-AUMA	Denied	Denied	Denied
IS,AINS	OOS-AU,AINS	OOS-AU,AINS	Denied	OOS-AU,AINS	OOS-AU,AINS
IS,AINS-DEA	Denied	Denied	OOS-AU	Denied	Denied
OOS,AINS-DEA	Denied	Denied	OOS-AUMA	Denied	Denied

Note: 1. <NoVal> means no value is entered for the SST parameter.
2. No state change occurs if no value is entered for PST and SST.
3. ED-T1 is denied if SST of AINS-DEA is entered and the current DS3 state is not OOS-AU,AINS (an SST state of AINS).

When a DS1 is edited to an OOS–MA or OOS–AUMA state, a MAN condition type is set for the specified DS1, unless the specified DS1 is provisioned as a Test Access Port (a MAN condition is not set on TAPPs). The MAN condition type is cleared when the DS1 is provisioned to an IS state.

When a DS1 is in an OOS–MA, OOS–AU, AINS or OOS–AUMA state, no DS1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the DS1, but DS1 alarm conditions are monitored (retrievable with the RTRV–T1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET–PMMODE–T1 command) for the DS1. A DS1 in an OOS–AU, AINS state transitions to an IS state when all DS1 near–end alarm conditions (LOS, LOF and AIS) for that DS1 have cleared.

An ED–T1 command is denied if:

- The specified DS1 has not previously been provisioned with the ENT–T1 command.
- The specified DS1 is contained in an STS–1 embedded in an OC–3 or OC–12 ring and SRC=EXTSRC or INTSRC.
- The specified DS1 is being edited from an IS or OOS–AU state to an IS state.
- The specified DS1 is being edited from an OOS–MA or OOS–AUMA state to an OOS,<Null> state.
- The specified DS1 is being edited from an OOS–MA or OOS–AUMA state to an IS state and the DS1 is in a loopback (the DS1 has an SST of LPBK).
- The specified DS1 is being edited in an IS or OOS–AU state and the DS1 is connected (it has an SST of ACT or BUSY), unless CMDMDE=FRCD is used.
- The specified DS1 is an Idle Signal Source port that is being used by another DS1.
- The specified DS1 is embedded in a VT1.5 and the DS1 is being edited to become an Idle Signal Source port.
- The specified DS1 is being edited to be provisioned as a Test Access port and PST of IS is entered, or AID+1 is not provisioned, or AID+1 is a FAD of another TAPP, or either AID or AID+1 has C–bit loopback enabled, or AID or AID+1 are embedded DS1s but not within the same DS3.
- The specified DS1 is a Test Access port being edited to a non–TACC port (TACC=N is entered) and the specified TAPP is owned by another user and the user entering the command does not have a CCAL of 31 or 32.
- TACC=Y or LINECDE is specified on a DS1 embedded within a VT formatted electrical STS–1 (EC1) or VT formatted STS–1 embedded within an OC–3 or OC–12, or the DS1 is the 28th DS1 embedded within an electrical DS3.
- TACC=Y is specified and the specified AID or AID+1 has fault propagation active, or if a supporting facility containing the DS1 has fault propagation active.
- The specified DS1 is being edited to change the Idle Signal to be transmitted while a Test Access session is currently established on the DS1.
- The specified DS1 is being edited from an OOS–MA or OOS–AUMA state to an IS or OOS–AU, AINS state and the specified DS1 is part of a test access port pair (i.e. assigned as a FADA or FADB).
- The specified DS1 is not an electrical (stand–alone) DS1 and is being edited into OOS–AU, AINS state.
- The specified object is not a timing reference (TMG) and a value for TMGREF is specified.
- The command is issued identifying both the timing reference sources as either Primary or Secondary.
- The specified object is a timing reference source and it is being edited to a OOS–AU, AINS state.
- A timing source that is being used as reference (its secondary state is BUSY) is being edited to NONE, unless the CMDMDE=FRCD is used.
- The specified DS1 is embedded within a DS3 or VT1.5 and the supporting DS3 or STS–1 is intact cross–connected (i.e., the supporting entity has an SST of {ACT, BUSY}) and FEMETHOD of ATTPOLL is entered.
- The DS1 has been previously assigned to an F3 and an attempt is being made to alter the DS1's framing format (FMT).
- The specified DS1 is embedded within a VT1.5 and FEMETHOD of {ATTPOLL} or FENDNTE of {ATT} is entered.
- An attempt to alter the value of SRC is on a connected port.
- An attempt to make or undo a connected port a FAD port.
- A TAPP is being assigned and the total number of DS1 TAPPs is already 256.
- CMDMDE=NORM and AID is a PRI or SEC timing source with an SST of BUSY.
- An invalid parameter value or combination of parameter values is entered.

- A DS3 is embedded within ECI or OCN , and AINS is specified.
- The port identified by AID is involved in a redlined connection or conference, and any parameter other than AINSTH, PST or SST is entered. CMDMDE=FRCD will not override this denial.

I/O protection switching is disabled if all the DS1 ports supported by the DSI I/O circuit pack are in an OOS-MA or OOS-AUMA state. I/O protection switching only occurs if at least one of the supporting DS1s on the supporting I/O circuit pack is provisioned to an IS or an OOS-AU state.

```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
	Default: <SID>
	Addressing: None
	Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID:
	{T1-{1-59392}} (T1-DS1#)
	{T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}} (EC1T1-EC1/STS1/DS3#-DS1#)
	{EC1T1-{1-3840}-{1-7}-{1-4}} (EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}} (OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}} (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)
	TMG_AID:
	{TMG-{0, 1}}
	Default: Entry Required
	Addressing: &&-ranging and &-grouping
	Description: DS1 AID, identifies the DS1 port and TMG AID identifies the external timing resource.
	Restrictions: ED-T1 is denied if SRC={EXTSRC, INTSRC} and &&-ranging or &-grouping is used.
	ED-T1 is denied if FEMETHOD is a value other than {NONE} and AID={TMG-0, TMG-1}.
	ED-T1 is denied if FEMETHOD is a value other than {ANSI, NONE} and AID identifies a VT1.5 embedded T1.
	ED-T1 is denied if FENDNTE is a value other than {ANSI, ANSIATT, NONE} and AID identifies a VT1.5 embedded T1.
	ED-T1 is denied if SRC is a value other than {NONE} and AID identifies a VT1.5 embedded T1.
	ED-T1 is denied if TAPPOOL={PRIVATE, PUBLIC} and the AID specifies TMG-0 or TMG-1.
	ED-T1 is denied if SST of AINS is entered and the specified AID is not for a terminated electrical DS1.
	ED-T1 is denied if a value is entered for CIECRA, SXECRA, IDLE, or LINECDE and the AID identifies a VT1.5 embedded T1.
	ED-T1 is denied if the specified DS1 is contained in an STS-1 embedded in an OC-3 or OC-12 ring and SRC=EXTSRC or INTSRC.

CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH–MM:{00–48} – {00–59} } Default: Previously existing value. Addressing: None Description: Automatic In–Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS–L alarm condition before the system puts the facility into the In–Service state. The factory default is 8 hours. The valid value is: HH–MM Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively. Restrictions: If 48 is specified in HH, then MM has to be 00. ED–T1 is denied if a value is entered for AINSTH and the AID specifies TMG–0 or TMG–1. ED–T1 is denied if SST=AINS and the AID specifies TMG–0 or TMG–1.
AISC=	{LOF, LOFLOS, LOS} Default: <Previously Existing Value> Addressing: None Description: Alarm Indication Signal insertion Criteria, specifies the condition necessary for insertion of AIS into a failed DS1 signal path. Any value for AISC can be entered if SRC=INTSRC. Values are: LOF Automatic AIS insertion on detection of LOF. LOFLOS Automatic AIS insertion on detection of LOF or LOS. LOS Automatic AIS insertion on detection of LOS. LOS only applies to a terminated electrical DS1.
AISF=	{N, Y} Default: <Previously Existing Value> Addressing: None Description: Alarm Indication Signal Failure substitution, specifies whether a failed upstream signal (as defined by the AISC parameter) should have AIS inserted in the downstream path. Any value for AISF can be entered if SRC=INTSRC. Values are: N No, AIS is not inserted in the downstream path of a failed signal, the failed signal passes through the system. Y Yes, AIS is inserted in the downstream path of a failed signal. Restrictions: ED–T1 is denied if a value is entered for AISF and the AID specifies TMG–0 or TMG–1.

CIECRA=	{A, B, Y, Z}	
	Default:	< Previously existing value >
	Addressing:	None
	Description:	Customer Installation Equipment Circuit Record Address. Used to identify the customer installation equipment relative to an AT&T TR-54016 facility data link protocol. This is significant only if the far end performance monitoring data collection is being performed via the ATPOLL method. Values are:
	A or Z	Used when requesting information from terminating equipment such as DSU/PBX/MUXs and NCTEs.
	B or Y	Used when requesting information from CSUs.
	Restrictions:	ED-T1 is denied if a value is entered for CIECRA and the AID specifies TMG-0 or TMG-1. ED-T1 is denied if a value is entered for CIECRA and the AID specifies a VT1.5 embedded T1.
CMDMDE=	{FRCD, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	FRCD	Forced. The command is accepted and parameter values are modified even if the DS1 is cross-connected.
	NORM	Normal. The command is denied if the DS1 is in an IS or OOS-AU state and is cross-connected (DS1 has an SST of ACT or BUSY).
FEMETHOD=	{ANSI, ATPOLL, NONE}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Far-End PM data collection Method. (Note that FEMETHOD and FENDNTE determine the type of far end PM that is collected/supported via an ESF FDL channel.) Values are:
	ANSI	Basic ANSI T1.403 PM data storage.
	ATPOLL	Poll for PM data using AT&T 54016 protocol to poll the data and convert into ANSI format storage registers for reporting.
	NONE	None. Far end PM is not collected on this DS1.
	Restrictions:	ED-T1 is denied if FEMETHOD=ANSI and either FENDNTE={NONE, ATT} or FMT={SF, UNFR} is entered. ED-T1 is denied if FEMETHOD=ATPOLL and either FENDNTE={ANSI, NONE} or FMT={SF, UNFR} is entered. ED-T1 is denied if FEMETHOD is a value other than {NONE} and AID={TMG-0, TMG-1}. ED-T1 is denied if FEMETHOD is a value other than {ANSI, NONE} and the AID identifies a VT1.5 embedded T1.

FENDNTE=	{ANSI, ANSIATT, ATT, NONE}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Far-End NTE performance monitoring terminal type, specifies whether the far end network terminal supports standard ANSI performance monitoring (PM) collection and reporting or AT&T TR-54016 polled PM reporting for ESF DS1 signal formats. (Note that FENDNTE and FEMETHOD determine the type of far end PM that is collected/supported via an ESF FDL channel.) Any value for FENDNTE can be entered if SRC=INTSRC. Values are:
ANSI	ANSI, the far-end NTE supports the ANSI PM standard.
ANSIATT	ANSI and AT&T, the far-end NTE supports the ANSI PM standard and the AT&T TR-54016 polled PM reporting standard.
ATT	AT&T TR-54016, the far-end NTE supports the AT&T TR-54016 polled PM reporting standard. (Refer to RTRV-FEDATA-T1)
NONE	None, the far-end NTE does not support either the ANSI PM standard or the AT&T TR-54016 standard.
Restrictions:	ED-T1 is denied if FENDNTE=NONE and FEMETHOD={ANSI, ATT-POLL}. ED-T1 is denied if FENDNTE=ANSI and FEMETHOD={ATTPOLL}. ED-T1 is denied if FENDNTE=ATT and FEMETHOD={ANSI}. ED-T1 is denied if a value is entered for FENDNTE and the AID specifies TMG-0 or TMG-1. ED-T1 is denied if FENDNTE is a value other than {ANSI, ANSIATT, NONE} and the AID identifies a VT1.5 embedded T1.
FMT=	{ESF, SF, UNFR}
Default:	<Previously Existing Value>
Addressing:	None
Description:	DS1 Format, specifies the DS1 signal format for this port. The DS1 FMT parameter determines the type of signal format used for performance monitoring data collection and transmission condition detection, or the format of the Idle Signal Source port if SRC=INTSRC. This parameter is only considered when the AID specifies a Timing Reference port (i.e.; the AID is either a TMG-0 or TMG-1). Values are:
ESF	Extended SuperFrame
SF	SuperFrame
UNFR	Unframed
Restrictions:	ED-T1 is denied if FMT={SF, UNFR} and FEMETHOD={ANSI, ATT-POLL}. ED-T1 is denied if FMT=UNFR and IDLE=QRSF. The value of FMT for an Idle Signal Source port cannot be changed if the Idle Signal Source port is being used by another DS1 port as its Idle signal source. ED-T1 is denied if FMT=UNFR, TMGREF=PRI or SEC and T1 specified is TMG-0 or TMG-1. ED-T1 is denied if the specified object is not timing reference (TMG) and a value for TMGREF is specified. ED-T1 is denied if the value given for FMT results in the previously existing value being changed and the T1 has been previously assigned to a F3 (Fractional T3).

IDLE=	<p>{AIS, QRSF, QRSU}</p> <p>Default: <Previously Existing Value></p> <p>Addressing: None</p> <p>Description: Idle signal transmit type, specifies the type of Idle signal to be transmitted by this port when it is disconnected, or determines the type of Idle signal of the Idle Signal Source port if SRC={EXTSRC, INTSRC}. Values are:</p> <table> <tr> <td>AIS</td><td>AIS (Alarm Indication Signal)</td></tr> <tr> <td>QRSF</td><td>Framed QRS (Quasi-Random Signal)</td></tr> <tr> <td>QRSU</td><td>Unframed QRS (Quasi-Random Signal)</td></tr> </table> <p>Restrictions: ED-T1 is denied if IDLE=QRSF and FMT=UNFR. ED-T1 is denied if IDLE=AIS and SRC={EXTSRC, INTSRC} (An AIS Idle Signal Source is available with each DS1 port). Only one Idle Signal Source port of each type is allowed in the system. The Idle Signal Source port must be provisioned before it can be specified to provide an Idle signal. The value of IDLE for an Idle Signal Source port cannot be changed if the Idle Signal Source port is being used by another DS1 port as its Idle signal source. ED-T1 is denied if a value is entered for IDLE and the AID specifies TMG-0 or TMG-1. ED-T1 is denied if a value is entered for IDLE and the AID specifies a VT1.5 embedded T1. ED-T1 is denied if the IDLE parameter is QRSU or QRSF and the T1 specified in the AID is within an OC3/OC12 ring.</p>	AIS	AIS (Alarm Indication Signal)	QRSF	Framed QRS (Quasi-Random Signal)	QRSU	Unframed QRS (Quasi-Random Signal)
AIS	AIS (Alarm Indication Signal)						
QRSF	Framed QRS (Quasi-Random Signal)						
QRSU	Unframed QRS (Quasi-Random Signal)						
LINECDE=	<p>{AMI, B8ZS}</p> <p>Default: <Previously Existing Value></p> <p>Addressing: None</p> <p>Description: DS1 Line Code, specifies the type of DS1 line code for an electrical DS1 or an external timing reference source. Values are:</p> <table> <tr> <td>AMI</td><td>Alternate Mark Inversion</td></tr> <tr> <td>B8ZS</td><td>Bipolar with Eight Zero Substitution</td></tr> </table> <p>Restrictions: ED-T1 is denied if a LINECDE value is entered and the specified DS1 is not an electrical (stand-alone) DS1 or an external timing reference source. ED-T1 is denied if a value is entered for LINECDE and the AID specifies a VT1.5 embedded T1.</p>	AMI	Alternate Mark Inversion	B8ZS	Bipolar with Eight Zero Substitution		
AMI	Alternate Mark Inversion						
B8ZS	Bipolar with Eight Zero Substitution						

SRC=	{EXTSRC, INTSRC, NONE}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Idle Signal Source port, indicates whether this DS1 port is to be used as a QRSF or QRSU Idle signal source. Values are:
	EXTSRC	External Idle signal Source, indicates external equipment is connected to the Signal Source port for generating an Idle signal.
	INTSRC	Internal Idle signal source, indicates the Signal Source port is to use internal generators to provide a QRS signal (as provisioned by the IDLE parameter value).
	NONE	None, indicates the specified DS1 port is not an Idle Signal Source port.
	Restrictions:	ED-T1 is denied if SRC={EXTSRC, INTSRC} and TACC=Y. ED-T1 is denied if SRC={EXTSRC, INTSRC} and IDLE=AIS. (An AIS Idle Signal Source is available with each DS1 port). Only one Idle Signal Source port of each type is allowed in the system. The values of FMT or IDLE for an Idle Signal Source port cannot be changed if the Idle Signal Source port is being used by another DS1 port as its Idle signal source. ED-T1 is denied if a value is entered for SRC and the AID specifies TMG-0 or TMG-1. ED-T1 is denied if SRC is a value other than {NONE} and the AID identifies a VT1.5 embedded T1.
SXCRA=	{C-X}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	1631SX Equipment Circuit Record Address. Used to identify the T1 port relative to an AT&T TR-54016 facility data link protocol. This is significant mainly when the far end performance monitoring data collection is being performed via the ATTPOLL method. Values are:
	C to X	Local T1 port address.
	Restrictions:	ED-T1 is denied if a value is entered for SXCRA and the AID specifies TMG-0 or TMG-1. ED-T1 is denied if a value is entered for SXCRA and the AID specifies a VT1.5 embedded T1.
SYNMSG=	{N, Y}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Synchronization Message, indicates if the addressed timing reference clock supports synch status messages. Values are:
	N	No, the addressed reference clock does not support synch status messages.
	Y	Yes, the addressed reference clock supports synch status messages.
	Restrictions:	ED-T1 is denied if a value for SYNMSG is entered and the AID does not specify TMG-0 or TMG-1. ED-T1 is denied if SYNMSG=Y for a TMG and the value of FMT is not ESF.

TACC=	{N, Y}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Test Access port, indicates that this DS1 port (specified by AID) and the AID+1 DS1 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are:
	N	No, the specified DS1 port is not a Test Access port
	Y	Yes, DS1 ports specified by AID and AID+1 are Test Access ports.
	Restrictions:	ED-T1 is denied if TACC=Y and SRC={EXTSRC, INTSRC}. ED-T1 is denied if TACC=Y and PST of IS is entered. ED-T1 is denied if TACC=N and TAPPOOL={PRIVATE, PUBLIC}. ED-T1 is denied if TACC=Y and AID+1 is not provisioned. ED-T1 is denied if TACC=Y and AID+1 is a FAD of another TAPP. ED-T1 is denied if TACC=Y and either AID or AID+1 have C-bit loop-back enabled. ED-T1 is denied if TACC=Y and the port specified by AID is an embedded DS1 port and AID+1 is not embedded within the same DS3. ED-T1 is denied if TACC=N and TAPPOOL={PRIVATE, PUBLIC}. ED-T1 is denied if a value is entered for TACC and the AID specifies TMG-0 or TMG-1.
TAPPOOL=	{PRIVATE, PUBLIC, <NoVal>}	
	Default:	<NoVal> if TACC=N. {PRIVATE} if TACC=Y.
	Addressing:	None
	Description:	TAP Pool, defines whether the TAP that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool. Values are:
	PRIVATE	Private The TAP pair that has been created is private to the user who created the TAP pair. If any other user tries to use this TAP pair (by means of CONN-TACC-T1), the command will be denied.
	PUBLIC	The TAP pair belongs to the Public pool of the system. It can be accessed by any user that has access to the test access commands.
	<NoVal>	No Value (Unpopulated), TAPPOOL does not apply if TACC=N.
	Restrictions:	ED-T1 is denied if a value for TAPPOOL is entered and TACC=Y is not explicitly entered. ED-T1 is denied if a value for TAPPOOL is entered and the AID specifies TMG-0 or TMG-1.
TMGREF=	{PRI, SEC}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Timing Reference, identifies whether the external reference source is primary or secondary. This parameter is only considered when the AID specifies a Timing Reference port (i.e, the AID is either a TMG-0 or TMG-1). Values are:
	PRI	Primary. The addressed external reference source is to be used as a primary source.
	SEC	Secondary. The addressed external reference source is to be used as a secondary source.
	Restrictions:	ED-T1 is denied if the AID is not a timing reference (TMG) and a value for TMGREF is specified.

PST	{IS, OOS}	
	Default:	< NO PST STATE CHANGE >
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the DS1. Values are:
	IS	In-Service
	OOS	Out-Of-Service
	Restrictions:	ED-T1 is denied if PST of IS and TACC=Y is entered. ED-T1 is denied if PST of OOS is entered when the addressed DS1 is the external timing reference.

SST	{AINS, AINS-DEA}
Default:	<Null> (Unpopulated)
Addressing:	None
Description:	Secondary State, specifies the secondary state to provision the DS1. Values are:
AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the DS1 is provisioned to an OOS-AU,AINS state.
AINS-DEA	Automatic In-Service-Deactivate, the DS1 is not provisioned to an OOS-AU,AINS state. The DS1's SST value is entered as <Null> (unpopulated) and the SST state is determined by its provisioned PST value and system detected events.
Restrictions:	ED-T1 is denied if SST of AINS and PST of OOS is entered. ED-T1 is denied if SST of AINS-DEA is entered and the current DS1 state is not OOS-AU,AINS (an SST state of AINS). ED-T1 is denied if the specified AID is not an electrical (stand-alone) DS1. ED-T1 is denied if a value is entered for SST and the AID specifies TMG-0 or TMG-1.

          /* No more TAPPs may be provisioned */
```

EXAMPLES

In the following example, DS1 port T3T1-1-25 provisioning is changed to ESF format, AIS insertion on LOF detection, to the IS state. All other parameter values are unchanged.

```
ED-T1::T3T1-1-25:::FMT=ESF,AISC=LOF:IS;
```

In the following example, DS1 ports T3T1-6-4 and T3T1-6-5 are changed to be test access ports (TAPPs). The example assumes both AID and AID+1 are provisioned, embedded within the same DS3, and not in use for other purposes. Since TAPPs are always assigned as sequential port pairs, the command effect is to provision both ports T3T1-6-4 and T3T1-6-5 as a TAPP with the specified provisioning applied to both ports. The TAPPs are provisioned for ESF format, to transmit QRSU Idle signal when not involved in a test access operation, and no AIS insertion on detection of a failed input signal. The TAPPs are assigned to the public pool so that anyone who has access to test access commands can use this TAPP.

```
ED-T1::T3T1-6-4:::FMT=ESF, IDLE=QRSU, AISF=N, SRC=NONE, TACC=Y,
TAPPOOL=PUBLIC:OOS-MA;
```

In the following example, DS1 port T3T1-2-1 is assumed to be an Idle Signal Source port (SRC=EXTSRC and IDLE=QRSU) that is providing an Idle signal for other disconnected DS1 ports. The following ED-T1 command is executed to change port T3T1-2-1 to not be an Idle Signal Source port.

```
ED-T1::T3T1-2-1:::SRC=NONE:IS;
```

For this example, the command is denied because port 2-2-1 is currently providing an Idle signal for other disconnected DS1 ports. The output response shown assumes CID 4 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 DENY
SRQN
/* Status, invalid Request */
/* ED-T1::T3T1-2-1:::SRC=NONE:IS [Pfc518] (4) */
;
```

COMMAND CODE: **ED-T3**
COMMAND NAME: **EDIT T3**

PURPOSE

The ED-T3 command modifies the specified DS3 port parameter values previously provisioned using ENT-T3.

Up to 256 DS3 port pairs in the system may be provisioned as a test access port at a time, but only to an OOS-MA or OOS-AUMA state. When this is done, the two ports identified by AID and AID+1 are both provisioned as a Test Access Port Pair (TAPP). A TAPP is always assigned as a sequential pair of ports (i.e., if port T3-3 is referenced in the command, then ports T3-3 and T3-4 are the TAPP). When using ED-T3 to provision a TAPP, AID+1 must be provisioned, AID+1 must not be a FAD of another TAPP. When using ED-T3 to change the provisioning of a TAPP, either of the AIDs for FAD A or FAD B can be specified as the AID in the command and the provisioning changes are applied to both the FAD A and FAD B ports. If TAPPOOL is not specified or specified as PRIVATE, the TAPP will be associated with, or owned by, the user that provisioned the TAPP. No other user is allowed to use the TAPP for test access operations or change the TAPPs provisioning. If TAPPOOL is specified as PUBLIC, then that TAPP can be used by any user that has access to test access commands. TAPPs may not be the target AID for a cross-connect. Unconnected TAPPs generate a DS3 IDLE signal.

Executing an ED-T3 command causes the following primary state transitions for the specified DS3. Secondary states associated with the DS3 after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Current PST State is:				
	IS	OOS-AU	OOS-AU,AINS	OOS-AUMA	OOS-MA
IS,<NoVal>	Denied	Denied	Denied	OOS-AU	IS
OOS,<NoVal>	OOS-MA	OOS-AUMA	Denied	Denied	Denied
IS,AINS	OOS-AU,AINS	OOS-AU,AINS	Denied	OOS-AU,AINS	OOS-AU,AINS
IS,AINS-DEA	Denied	Denied	OOS-AU	Denied	Denied
OOS,AINS-DEA	Denied	Denied	OOS-AUMA	Denied	Denied

Note: 1. <NoVal> means no value is entered for the SST parameter.
2. No state change occurs if no value is entered for PST and SST.
3. ED-T3 is denied if SST of AINS-DEA is entered and the current DS3 state is not OOS-AU,AINS (an SST state of AINS).

When a DS3 is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set for the specified DS3, unless the specified DS3 is provisioned as a Test Access Port (a MAN condition is not set on TAPPs). The MAN condition type is cleared when the DS3 is provisioned to an OOS-AU or IS state.

When a DS3 is in an OOS-MA, OOS-AUMA, or OOS-AU,AINS state, no DS3 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the DS3, but DS3 alarm conditions are monitored (retrievable with the RTRV-T3 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-T3 command) for the DS3. A DS3 in an OOS-AU,AINS state transitions to an IS state when all DS3 near-end alarm conditions for that DS3 have cleared.

An ED-T3 command is denied if:

- The specified DS3 has not previously been provisioned with the ENT-T3 command.
- The FMT is being changed from ASYNC to CBIT on a DS3 that resides on a module that is in an half shelf that is defined as EP3S48 or EP3S36.
- The specified DS3 is being edited from an OOS-AU state to an IS state.
- The specified DS3 is being edited from an OOS-MA or OOS-AUMA state to an OOS,<Null> state.
- The specified DS3 is being edited from an OOS-MA or OOS-AUMA state to an IS or OOS-AU,AINS state and the specified DS3 is in a loopback (the DS3 has an SST of LPBK).

- The specified DS3 is being edited in an IS or OOS–AU state and any of the DS3's embedded DS1s are cross–connected (the DS3 has an SST of TRM) or the DS3 is cross connected (the DS3 has an SST of ACT or BUSY), unless CMDMDE=FRCD is used.
- The specified DS3 is being edited to be provisioned as a Test Access port and PST of IS is entered, or AID+1 is not provisioned, or AID+1 is a FAD of another TAPP.
- The specified DS3 is being edited from an OOS–MA or OOS–AUMA state to an IS or OOS–AU, AINS state and the specified DS3 is part of a test access port pair (i.e., assigned as a FADA or FADB).
- The specified DS3 is not an electrical (stand–alone) DS3 and is being edited into OOS–AU, AINS state.
- AISPASS=N is specified on an embedded DS3.
- TACC=Y or LINECDE is specified on a DS3 embedded within an electrical STS–1 (EC1), OC–3, or OC–12.
- TACC=Y is specified on a DS3 embedded within an electrical STS–1 (EC1), OC–3, or OC–12.
- TACC=Y is specified and any of the DS1s embedded within the DS3 are already assigned.
- TACC=Y is specified on a connected port.
- TACC=Y is specified and AID or AID+1 has fault propagation active.
- TACC=N is specified on a DS3 TAP that belongs to a PRIVATE pool and the Command Code Authorization Level (CCAL) of the user issuing the ED–T3 command is ≤ 30 .
- TACC=N is specified on a DS3 TAP that is in BUSY secondary state.
- A TAPP is being assigned and the total number of DS1 and DS3 TAPP defined is already 256.
- An ED–T3 command is issued with FMT of FRCC, UNFR, or UNCBIT on a DS3 that has DS1s assigned.
- An invalid parameter value or combination of parameter values is entered.
- The port identified by AID is involved in a redlined connection, and any parameter other than PST is entered. CMDMDE=FRCD will not override this denial.

I/O protection switching is disabled if all three DS3 ports supported by the EP3 I/O circuit pack are provisioned to an OOS–MA or OOS–AUMA state. I/O protection switching only occurs if at least one of the supporting DS3s on the supporting EP3 I/O circuit pack is provisioned to an IS or an OOS–AU state.

        POOL=] [, XBITRCV=] [, XPOL=] : [PST] , [SST] ;
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: <div style="display: flex; justify-content: space-between;"> {T3–{1–4800}} (T3–DS3#) </div> <div style="display: flex; justify-content: space-between;"> {EC1T3–{1–3840}} (EC1T3–EC1/STS1/DS3#) </div> <div style="display: flex; justify-content: space-between;"> {OC3T3–{1–2240}–{1–3}} (OC3T3–OC3#–STS1/DS3#) </div> <div style="display: flex; justify-content: space-between;"> {OC12T3–{1–560}–{1–4}–{1–3}} (OC12T3–OC12#–STM1#–STS1/DS3#) </div> Default: Entry Required Addressing: &&–ranging and &–grouping Description: DS3 AID, identifies the DS3 port. Restrictions: ED–T3 is denied if the specified AID identifies a DS3 embedded within an STS–1 and AISPASS of N is entered.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

AINSTH=	{HH-MM:{00-48} – {00-59} }	
	Default:	Previously existing value.
	Addressing:	None
	Description:	Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a 7LOF, ISD, AICMISM, LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is:
	HH-MM	Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively.
AISC=	{LOFLOS, LOS}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Alarm Indication Signal insertion Criteria, specifies the condition at the input of a DS3 intact cross connect necessary for AIS insertion into the output of the DS3 intact cross connect. Values are:
	LOFLOS	Loss of Frame-Loss of Signal. Automatic AIS insertion upon detection of LOFLOS.
AISPASS=	{N, Y}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Alarm Indication Signal Passed, specifies whether the AIS generated by the input port which is connected to the output port is passed through the output port, or whether AIS is generated by the output port itself. Values are:
	N	No, AIS is regenerated by the output port instead of being passed through the output port.
AIST=	{NAS, OAIS, ONES}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Alarm Indication Signal Type, specifies the expected input AIS signal and generated output AIS signal for the DS3 port should a failure condition exist. Values are:
	NAS	North American Standard
	OAIS	Old AIS, the same sequence of information bits as North American Standard but with no regard to how the C-bits are set.
	ONES	Unframed All Ones (Nonstandard)

CMDMDE=	{FRCD, NORM}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	FRCD	Forced. The command is accepted and parameter values are modified even if a constituent DS1 is cross-connected (the DS3 has an SST of TRM).
	NORM	Normal. The command is denied if the DS3 is in an IS or OOS-AU state and any constituent DS1s are cross-connected (the DS3 has an SST of TRM).
DS3PTYEL=	{N, Y}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	DS3 Yellow behavior, identifies whether DS3 path yellow or RDI (remote defect indication) will be sent and detected. Values are:
	N	RDI will be sent/detected by the DS3.
	Y	DS3 path yellow will be sent/detected by the DS3.
FEAC=	{N, Y}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Far End Alarm and Control, specifies the far end alarm and control enable setting for C-bit parity format. Values are:
	N	FEAC inhibited
	Y	FEAC enabled
	Restrictions:	ED-T3 is denied if FEAC=Y and FMT=ASYNCR.
FMT=	{ASYNCR, CBIT, FRCC, UNCBIT, UNFR}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	DS3 Format, specifies the DS3 signal format for this port. Values are:
	ASYNCR	Asynchronous (M23 format)
	CBIT	C-Bit parity format
	FRCC	Framed Clear Channel.
	UNCBIT	Unchannelized C-Bit parity
	UNFR	Unframed format
	Restrictions:	ED-T3 is denied if FMT=ASYNCR and FEAC=Y. ED-T3 is denied if FMT=ASYNCR and PMMETHOD=CP or NONE. ED-T3 is denied if FMT=FRCC, UNFR, or UNCBIT and the DS3 has embedded DS1s assigned. ED-T3 is denied if FMT=UNFR and PMMETHOD is any value other than NONE.
LINECDE=	{B3ZS}	
	Default:	{B3ZS}
	Addressing:	None
	Description:	DS3 Line Code, indicates the DS3 line coding type. Only B3ZS code is supported.
	B3ZS	Bipolar with Three Zero Substitution
	Restrictions:	ED-T3 is denied if the LINECDE parameter is entered and the specified AID identifies a DS3 embedded within a SONET signal.

PMMETHOD=	{CP, FM, FMA, NONE, P}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Performance Monitoring Method, specifies the type of performance monitoring to be performed on the DS3. Values are:
	If FMT=ASYN (M13 format):
	FM F&M bit monitoring
	FMA F&M bit adjusted monitoring
	P P-bit monitoring
	If FMT=CBIT (C-Bit parity format):
	CP Only CP-bit monitoring
	FM F&M bit and CP-bit monitoring
	FMA F&M bit adjusted and CP-bit monitoring
	P P-bit and CP-bit monitoring
	If FMT=FRCC (Framed Clear Channel):
	FM F&M bit monitoring
	FMA F&M bit adjusted monitoring
	P P-bit monitoring
	If FMT=UNCBIT (Unchannelized C-Bit parity format)
	CP Only CP-bit monitoring
	FM F&M bit and CP-bit monitoring
	FMA F&M bit adjusted and CP-bit monitoring
	P P-bit and CP-bit monitoring
	If FMT=UNFR (Unframed):
	NONE Null value specified for PMMETHOD
Restrictions:	ED-T3 is denied if PMMETHOD=CP and FMT=ASYN, FRCC or UNFR. ED-T3 is denied if PMMETHOD=NONE and FMT=ASYN, CBIT, FRCC, or UNCBIT.
TACC=	{N, Y}
Default:	<Previously Existing Value>
Addressing:	None
Description:	Test Access port, indicates that this DS3 port (specified by AID) and the AID+1 DS3 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are:
	N No, the specified DS3 port is not a Test Access port
	Y Yes, DS3 ports specified by AID and AID+1 are Test Access ports.
Restrictions:	ED-T3 is denied if TACC=Y and PST of IS is entered. ED-T3 is denied if TACC=Y and AID+1 is not provisioned. ED-T3 is denied if TACC=Y and AID+1 is a FAD of another TAPP. ED-T3 is denied if TACC=Y and the port specified by AID is a DS3 embedded within an EC1, OC-3, or OC-12. ED-T3 is denied if TACC=Y and any of the DS1s embedded within the DS3 are already assigned. ED-T3 is denied if TACC=N and TAPPOOL={PRIVATE, PUBLIC}.

TAPPOOL=	{PRIVATE, PUBLIC, <NoVal>}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	TAP Pool, defines whether the TAP that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool.
	PRIVATE	Private, the TAP pair that has been created is private to the user who created the TAP pair. If any other user tries to use this TAP pair (by means of CONN-TACC-T3), the command will be denied.
XBITRCV=	PUBLIC	Public, the TAP pair belongs to the Public pool of the system. It can be accessed by any user that has access to the test access commands.
	<NoVal>	No Value (Unpopulated), TAPPOOL does not apply if TACC=N.
	Restrictions:	ED-T3 is denied if a value for TAPPPOOL is entered and TACC=Y is not explicitly entered.
	{ALM0, ALM1, IGNORE}	
	Default:	<Previously Existing Value>
XPOL=	Addressing:	None
	Description:	Receive X-Bit Translation, specifies how incoming DS3 and DS2 X-bits are translated. Values are:
	ALM0	Incoming X-bit of 0 indicates a remote alarm
	ALM1	Incoming X-bit of 1 indicates a remote alarm
	IGNORE	Ignore incoming X-bits
PST	{0, 1, ALM0, ALM1}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Transmit X-bit Polarity, indicates the value to which outgoing DS3 and DS2 X-bits are set. Values are:
	0	Force outgoing X-bits to 0
	1	Force outgoing X-bits to 1
	ALM0	Set X-bits to 0 for indicating alarm
	ALM1	Set X-bits to 1 for indicating alarm
	{IS, OOS}	
	Default:	<PST VALUE DETERMINED BY THE CURRENT DS3 STATE> (A PST value of IS if the current state is IS or OOS-AU) (A PST value of OOS if the current state is OOS-AUMA or OOS-MA)
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the DS3. Values are:
	IS	In-Service, the DS3 is provisioned to an IS or OOS-AU state.
	OOS	Out-Of-Service, the DS3 is provisioned to an OOS-AUMA or OOS-MA state.
	Restrictions:	ED-T3 is denied if PST of OOS and SST of AINS is entered.

SST	{AINS, AINS-DEA}
Default:	<Null> (Unpopulated)
Addressing:	None
Description:	Secondary State, specifies the secondary state to provision the DS3. Values are:
AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the DS3 is provisioned to an OOS-AU,AINS state.
AINS-DEA	Automatic In-Service-Deactivate, the DS3 is not provisioned to an OOS-AU,AINS state. The DS3's SST value is entered as <Null> (unpopulated) and the SST state is determined by its provisioned PST value and system detected events.
Restrictions:	ED-T3 is denied if SST of AINS and PST of OOS is entered. ED-T3 is denied if SST of AINS-DEA is entered and the current DS3 state is not OOS-AU,AINS (an SST state of AINS). ED-T3 is denied if the specified DS3 is not an electrical (stand-alone) DS3 and is being provisioned into OOS-AU,AINS state.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV	Input, Command Not Valid
IDNC	Input, Data Not Consistent
	/* Invalid combination of TACC and TAPPOOL */
	/* Invalid combination of FMT and PMMETHOD */
	/* FMT=UNCBIT, UNFR, or FRCC invalid with embedded T1s provisioned */
	/* Invalid combination of FMT and FEAC */
	/* AISC and AISPASS invalid on HMU module*/
	/* AISPASS=N invalid for an embedded T3 */
	/* AINSTH invalid for an embedded T3 */
	/* Invalid parameter change of a Red Lined connection */
IDNV	Input, Data Not Valid
	/* FMT=UNCBIT, UNFR, or FRCC invalid on DS3 Quad */
IIAC	Input, Invalid ACcess identifier
IPEX	Input, Parameter EXtra
PICC	Privilege, Invalid Command Code
	/* You are not the owner of the TAPP */
	/* You do not have the privilege to make this change in TAPP */

SAIS	Status, Already In Service
SAOS	Status, Already Out of Service
SCAT	Status, Circuit Already connected to another Tap
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* TAPP Database Error: <ERROR-STRING> for record number <RECORD-NUMBER> */
	/* T3 Shelf info error, Error=<ERROR-STRING> */
	/* Error updating supported T1s */
	/* Error updating supported F3s */
	/* Error enabling supported T1s, Error=<ERROR-STRING> */
	/* Error enabling supported F3s, Error=<ERROR-STRING> */
	/* Error disabling supported T1s, Error=<ERROR-STRING> */
	/* Error disabling supported F3s, Error=<ERROR-STRING> */
SDNC	Status, Data Not Consistent
	/* SST=AINS invalid for embedded T3*/
SNVS	Status, Not in Valid State
	/* To edit a non-idle in-service port, set CMDMDE=FRCD */
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest
	/* Cannot edit a port to be FAD if fault propagation is active */
SSRE	Status, System Resources Exceeded
	/* No more TAPPs can be assigned */

EXAMPLES

In the following example, DS3 port T3-24 provisioning is changed to C-bit format with FEAC enabled and CP-bit performance monitoring to the OOS-AU,AINS state. All other parameter values are unchanged.

```
ED-T3::T3-24:::PMMETHOD=CP,FEAC=Y,FMT=CBIT:IS,AINS;
```

In the following example, DS3 ports T3-6 and T3-7 are changed to be test access ports (TAPPs). The example assumes both AID and AID+1 are provisioned, are electrical DS3, and not in use for other purposes. Since TAPPs are always assigned as sequential port pairs, the command effect is to provision both ports T3-6 and T3-7 as a TAPP with the specified provisioning applied to both ports. The TAPPs are assigned to the public pool so that anyone who has access to test access commands can use this TAPP.

```
ED-T3::T3-6:::FMT=ASYNC,TACC=Y,TAPPOOL=PUBLIC:OOS;
```

In the following example, DS3 port T3-24 and T3-26 have previously been provisioned, but T3-25 has not been provisioned, with the ENT-T3 command. An ED-T3 command is entered to change the provisioning of DS3 ports T3-24 through T3-26, using &&-ranging, to Async M13 format, FEAC specifically disabled, and P-bit and CP-bit performance monitoring to the OOS-MA state. All other parameter values are unchanged.

```
ED-T3::T3-24&&-26:::FMT=ASYNC,PMMETHOD=P,FEAC=N:OOS;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 PRTL
"T3-25:ERRCDE=SNVS"
/* Status, Not in Valid State */
/* ED-T3::T3-24&&-26:::FMT=ASYNC,PMMETHOD=P,FEAC=N:OOS [Pfc518] (1) */
;
```

In the following example, DS3 port T3-27 is provisioned for Async M13 format, but PMMETHOD is incorrectly specified with a value of CP. All other parameter values are unchanged.

```
ED-T3::T3-27::::PMMETHOD=CP,FMT=ASYNC;
```

For this example, the output response shown assumes CID 3, Virtual Channel 2, was used to enter the command and a system generated CTAG value of Pfc519. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pfc519 DENY  
IDNC  
/*Invalid combination of FMT and PMMETHOD */  
/*Input, Data Not Consistent */  
/*ENT-T3::T3-27::::PMMETHOD=CP,FMT=ASYNC [Pfc519] (3-2) */  
;
```

COMMAND CODE: ED-TARPADJ-DCC
COMMAND NAME: EDIT TARP ADJACENCY TABLE ENTRY OF DCC

PURPOSE

The ED-TARPADJ-DCC command allows modifying the manually provisioned TID Address Resolution Protocol (TARP) adjacency table entries on the Data Communication Channel (DCC).

The TARP Protocol Data Units (PDUs) are carried by Layer 3 (network layer) of the SONET DCC network.

An ED-TARPADJ-DCC command is denied if:

- DCCTYPE=BOTH and NSAP is specified.
- A value entered for the NSAP is not in the adjacency table of the specified OC-3/OC-12.
- The specified NSAP is less than 40 ASCII characters.
- The NSAP is not specified while the ISLEVEL is specified.
- An invalid parameter value is entered.

INPUT FORMAT

ED-TARPADJ-DCC: [TID] :AID: [CTAG] : : : [DCCTYPE=] [, ENABLE=] [, ISLEVEL=] [, NSAP=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3/OC-12 whose DCC adjacency table entries are being modified.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DCCTYPE=	{BOTH, LDCC, SDCC} Default: <Previously existing value> or {SDCC} {Factory default} Addressing: None Description: DCC Type, specifies which DCC type is modified in the adjacency table. Values are: BOTH Both, specifies both the SDCC and LDCC types are modified in the adjacency table. LDCC Line DCC, specifies the LDCC type is modified in the adjacency table. SDCC Section DCC, specifies the SDCC type is modified in the adjacency table. Restrictions: ED-TARPADJ-DCC is denied if DCCTYPE=BOTH and NSAP is specified.

ENABLE=	{N, Y}	
	Default:	<Previously existing value> or {Y} {Factory default}
	Addressing:	None
	Description:	Enable, determines if the TARP propagation to the NE specified by the NSAP parameter is enabled or disabled. Values are:
	N	No, specifies the TARP propagation to the NE in the NSAP parameter is disabled.
	Y	Yes, specifies the TARP propagation to the NE in the NSAP parameter is enabled.
ISLEVEL=	{1, 2, BOTH}	
	Default:	<Previously existing value>
	Addressing:	None
	Description:	Intermediate System Level, indicates the IS Level of the NSAP that is being addressed. If the IS Level is specified, the NSAP shall also be specified. Values are:
	1	NSAP is a level 1 adjacency.
	2	NSAP is a level 2 adjacency.
	BOTH	NSAP is both level 1 and level 2 adjacency.
NSAP=	<40 ASCII HEXADECIMAL VALUES>	
	Default:	<All existing values>
	Addressing:	None
	Description:	Network Service Access Point, specifies the Network Service Access Point (NSAP) address. Values are 20 octets long encoded as 40 ASCII hexadecimals. The user enters the values in either upper or lower case (i.e. case insensitive). If NSAP is not specified, all the NSAPs configured for the specified OC-3/OC-12 for the DCCTYPE is enabled/disabled and the ISLEVEL is modified to that specified in the ISLEVEL parameter.
	Restrictions:	ED-TARPADJ-DCC is denied if the specified NSAP is less than 40 ASCII characters. ED-TARPADJ-DCC is denied if the NSAP is specified and DCCTYPE=BOTH.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
IPMS	Input, Parameter MiSsing
SDBE	Status, internal Data Base Error
	/*TP Database Error: <ERROR-STRING> for <AID-STRING>*/
	/*TPidToTarpD(): <ERROR-STRING>*/
	/*TPidToGlobTPid(): <ERROR-STRING>*/
	/*TARP_DCC Database Error: <ERROR-STRING> for record number <RECORD- NUMBER>*/
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the TARP adjacency table entries of the network layer are modified.

```
ED-TARPADJ-DCC::OC3-2:::DCCTYPE=SDCC,ENABLE=Y,ISLEVEL=1,  
NSAP=39840F8000000000000000000000000000;
```

COMMAND CODE: ED-TARPADJ-LAN
COMMAND NAME: EDIT TARP ADJACENCY TABLE ENTRY OF LAN

PURPOSE

The ED-TARPADJ-LAN command allows modifying the manually provisioned TID Address Resolution Protocol (TARP) adjacency table entries for the DSB's LAN.

The TARP Protocol Data Units (PDUs) are carried by Layer 3 (network layer) of the SONET Local Area Network (LAN).

An ED-TARPADJ-LAN command is denied if:

- A value entered for the NSAP is not in the adjacency table of the specified DSB.
- The specified NSAP is less than 40 ASCII characters.
- The NSAP is not specified while the ISLEVEL is specified.
- An invalid parameter value is entered.

INPUT FORMAT

ED-TARPADJ-LAN: [TID] :AID: [CTAG] : : : [ENABLE=] [, ISLEVEL=] [, NSAP=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB whose adjacency table entries are being modified.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ENABLE=	{N, Y} Default: <Previously existing value> or {Y} {Factory default} Addressing: None Description: Enable, determines if the TARP propagation to the NE specified by the NSAP parameter is enabled or disabled. Values are: N No, specifies the TARP propagation to the NE in the NSAP parameter is disabled. Y Yes, specifies the TARP propagation to the NE in the NSAP parameter is enabled.
ISLEVEL=	{1, 2, BOTH} Default: <Previously existing value> Addressing: None Description: Intermediate System Level, indicates the IS Level of the NSAP that is being addressed. If the IS Level is specified, the NSAP shall also be specified. Values are: 1 NSAP is a level 1 adjacency. 2 NSAP is a level 2 adjacency. BOTH NSAP is both level 1 and level 2 adjacency.

NSAP= <40 ASCII HEXADECIMAL VALUES>
Default: <Previously existing value>
Addressing: None
Description: Network Service Access Point, specifies the Network Service Access Point (NSAP) address. Values are 20 octets long encoded as 40 ASCII hexadecimals. The user enters the values in either upper or lower case (i.e. case insensitive). If NSAP is not specified, all the NSAPs on the link specified by the DSB is enabled/disabled.
Restrictions: ED-TARPADJ-LAN is denied if the specified NSAP is less than 40 ASCII characters.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID> */
IDNV	Input, Data Not Valid /* Error reading input. */ /* Error reading input for NSAP */ /* Unable to read the value of ISLEVEL */ /* Invalid value for ISLEVEL */ /* Invalid parameter in the input command */ /* NSAP address must be 40 characters long. */ /* Unable to find the requested NSAP entry */
IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified. */
IPMS	Input, Parameter MiSsing /* If ISLEVEL is specified, NSAP must be entered. */
SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */ /* INIT-SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Data base access failure. */ /* Unable to read the LANDCC database. */ /* Unable to update the LANDCC database. */

EXAMPLES

In the following example, Network Service Access Point is modified so that the IS level is set to both level 1 and 2 for DSB-6-1-1.

```
/* ED-TARPADJ-LAN::DSB-6-1-1:::ISLEVEL= BOTH,NSAP= 398406a00
000000000000000000000000000000 [P72011] (1) */

COMMAND CODE: ED-ULCOMPMPR
COMMAND NAME: EDIT UPPER LAYER COMMON
PARAMETERS

PURPOSE

The ED-ULCOMPMPR command allows provisioning of the Layer 3 (network layer) parameters of the SONET Data Communication Channel (DCC) network. This command allows provisioning of all the OSI upper layer stack (Layer 3) parameters common to both DCC and LAN.

Changes to the name-defined parameters are stored in the database and take effect immediately or when the OSI stack is (re)initialized. In each description of each input parameter for ED-ULCOMPMPR, a change made to the parameter will take effect immediately unless the description states explicitly that it will not take effect until the OSI stack is (re)initialized. This is accomplished by performing a RST-EQPT of the DSB or by editing the DSB into an IS state from an OOS state via ED-EQPT command. All of the name-defined parameters are saved during a database backup and restore. If a parameter is not specified, it defaults to the previous existing value.

An ED-ULCOMPMPR command is denied if:

- The specified DSB is not provisioned, i.e., the DSB is in a UAS secondary state.
- The specified DSB is not in a OOS-MA or OOS-AUMA primary state.
- An invalid parameter value is entered.

INPUT FORMAT

```
ED-ULCOMPMPR: [TID]:AID:[CTAG]:: [ALLDFLT=] [,L3CSNPINTTMR=] [,L3DRISISHT=]
[,L3ER=] [,L3IS1LSPBS=] [,L3IS2LSPBS=] [,L3ISLEVEL=] [,L3ISPRTREP=]

[,L3POLLESHRT=] [,L3PSNPINTTMR=] [,L3WAITTM=] [,TARPLDBFLSHTMR=]
[,TARPLDBENTTMR=] ;
```

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB whose common stack parameters are being modified.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.
ALLDFLT=	{N, Y} Default: {N} Addressing: None Description: All Default, specifies whether or not all the parameters are set to the factory default. If ED-ULCOMPMPR is issued with ALLDFLT=Y, all parameters are set to the factory default and all other specified parameters are ignored. If ED-ULCOMPMPR is issued with ALLDFLT=N, all specified parameters will be changed and all other non-specified parameters will remain the previous existing value. Values are: N No, specifies all parameters are not set to the factory default. Y Yes, specifies all parameters are set to the factory default.

L3CSNPINTTMR=	{1–600, DFLT}
Default:	<Previously existing value> or {10} {Factory default}
Addressing:	None
Description:	Layer 3 Complete SNP Interval Timer, specifies the complete SNP Interval Timer in seconds. Name–defined values are:
DFLT	Default, specifies the parameter is set to the factory default.
L3DRISISHT=	{1–665535, DFLT}
Default:	<Previously existing value> or {1} {Factory default}
Addressing:	None
Description:	Layer 3 drlSIS Hello Timer, specifies the drlSIS Hello Timer in seconds. Name–defined values are:
DFLT	Default, specifies the parameter is set to the factory default.
L3ER=	{N, Y, DFLT}
Default:	<Previously existing value> or {N} {Factory default}
Addressing:	None
Description:	Layer 3 Error Report, specifies whether an Error Report PDU is generated when a Data PDU is discarded. Values are:
DFLT	Default, specifies the parameter is set to the factory default.
N	No, specifies an Error Report PDU is not generated when a Data PDU is discarded.
Y	Yes, specifies an Error Report PDU is generated when a Data PDU is discarded.
L3IS1LSPBS=	{512–1492, DFLT}
Default:	<Previously existing value> or {512}{Factory default}
Addressing:	None
Description:	Layer 3 Intermediate System Level 1 LSP Buffer Size, specifies originating IS Level 1 LSP Buffer Size in octets. Changes to this parameter take effect only when the OSI protocol stack is (re)initialized. Name–defined values are:
DFLT	Default, specifies the parameter is set to the factory default.
L3IS2LSPBS=	{512–1492, DFLT}
Default:	<Previously existing value> or {512} {Factory default}
Addressing:	None
Description:	Layer 3 Intermediate System Level 2 LSP Buffer Size, specifies originating IS Level 2 LSP Buffer Size in octets. Changes to this parameter take effect only when the OSI protocol stack is (re)initialized. Name–defined values are:
DFLT	Default, specifies the parameter is set to the factory default.
L3ISLEVEL=	{1, 2, DFLT}
Default:	<Previously existing value> or {2} {Factory default}
Addressing:	None
Description:	Layer 3 Intermediate System Level, specifies the IS Level Provisioning. Changes to this parameter take effect only when the OSI protocol stack is (re)initialized.
DFLT	Default, specifies the parameter is set to the factory default.

L3ISPRTEP=	{N, Y, DFLT}
Default:	<Previously existing value> or {Y} {Factory default}
Addressing:	None
Description:	Layer 3 Intermediate System Partition Repair, indicates if the IS Partition Repair function is supported. Changes to this parameter take effect only when the OSI protocol stack is (re)initialized. Values are:
	DFLT Default, specifies the parameter is set to the factory default.
	N No, specifies the IS Partition Repair is not supported.
	Y Yes, specifies the IS Partition Repair is supported.
L3LC=	{1–255, DFLT}
Default:	<Previously existing value> or {20} {Factory default}
Addressing:	None
Description:	Layer 3 Lifetime Control, sets the Layer 3 Lifetime Control time in units of 500 milliseconds. Name–defined values are:
	DFLT Default, specifies the parameter is set to the factory default.
L3MAXLSPGENINT=	{1–65535, DFLT}
Default:	<Previously existing value> or {900} {Factory default}
Addressing:	None
Description:	Layer 3 Maximum LSP Transmission Interval, specifies the maximum LSP Transmission Interval in hundredths of seconds. Name–defined values are:
	DFLT Default, specifies the parameter is set to the factory default.
L3MINBLSPXMTINT=	{1–65535, DFLT}
Default:	<Previously existing value> or {33} {Factory default}
Addressing:	None
Description:	Layer 3 Minimum Broadcast LSP Transmission Interval, specifies the minimum broadcast LSP Transmission Interval in seconds. Name–defined values are:
	DFLT Default, specifies the parameter is set to the factory default.
L3MINLSPXMTINT=	{1–255, DFLT}
Default:	<Previously existing value> or {5} {Factory default}
Addressing:	None
Description:	Layer 3 Minimum LSP Transmission Interval, specifies the minimum LSP Transmission Interval in seconds. Name–defined values are:
	DFLT Default, specifies the parameter is set to the factory default.
L3POLLESHRT=	{1–65535, DFLT}
Default:	<Previously existing value> or {50} {Factory default}
Addressing:	None
Description:	Layer 3 Poll ESH Rate, specifies the Poll ESH rate in seconds. Name–defined values are:
	DFLT Default, specifies the parameter is set to the factory default.

L3PSNPINTTMR=	{1–65535, DFLT}
Default:	<Previously existing value> or {2} {Factory default}
Addressing:	None
Description:	Layer 3 Partial SNP Timer Interval, specifies the partial SNP Interval Timer in seconds. Name–defined values are:
DFLT	Default, specifies the parameter is set to the factory default.
L3WAITTM=	{1–65535, DFLT}
Default:	<Previously existing value> or {60} {Factory default}
Addressing:	None
Description:	Layer 3 Waiting Time, specifies the Waiting Time in seconds. Name–defined values are:
DFLT	Default, specifies the parameter is set to the factory default.
TARPLDBFLSHTMR=	{0–1440, DFLT}
Default:	<Previously existing value> or {5} {Factory default}
Addressing:	None
Description:	TID Address Resolution Protocol (TARP) LDB Flush Timer, specifies the TARP LDB Flush Timer in minutes. Name–defined values are:
DFLT	Default, specifies the parameter is set to the factory default.
TARPLDBENTTMR=	{1–10, DFLT}
Default:	<Previously existing value> or {5} {Factory default}
Addressing:	None
Description:	TID Address Resolution Protocol (TARP) LDB Entry Timer, specifies the TARP LDB Entry Timer in minutes. Name–defined values are:
DFLT	Default, specifies the parameter is set to the factory default.

COMMAND CODE: **ED-ULLAN**
COMMAND NAME: **EDIT UPPER LAYER LAN PARAMETERS**

PURPOSE

The ED-ULLAN command allows provisioning of the Layer 3 (network layer) parameters of the SONET Data Communication Channel (DCC) network. This command allows provisioning of the OSI upper layer stack (Layer 3) parameters pertaining to the LAN.

Changes to the name-defined parameters take effect immediately when the OSI stack is active. All of the name-defined parameters survive a database backup and restore. If a parameter is not specified, it defaults to the previous existing value.

An ED-ULLAN command is denied if:

- The specified DSB is not provisioned, i.e., the DSB is in a UAS secondary state.
- An invalid parameter value is entered.

INPUT FORMAT

```
ED-ULLAN: [TID] :AID: [CTAG] :: [ALLDFLT=] [, L3DL1ISP=] [, L3DL2ISP=] [, L3ESCTMR=]
[, L3ESISHTMR=] [, L3ISCTMR=] [, L3ISISHTMR=] [, L3RDTMR=] ;
```

INPUT PARAMETERS

TID	<1–20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB–{6–9, 12–15, 18–21, 24–43, 104–111 , 112–135, 136–141 }–{1, 3}–{1–2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB on the LAN whose upper layer parameters are being modified.
CTAG	<1–6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.
ALLDFLT=	{N, Y} Default: {N} Addressing: None Description: All Default, specifies whether or not all the parameters are set to the factory default. If ED-ULLAN is issued with ALLDFLT=Y, all parameters are set to the factory default and all other specified parameters are ignored. If ED-ULLAN is issued with ALLDFLT=N, all specified parameters will be changed and all other non-specified parameters will remain the previous existing value. Values are: N No, specifies all parameters are not set to the factory default. Y Yes, specifies all parameters are set to the factory default.
L3DL1ISP=	{1–127, DFLT} Default: <Previously existing value> or {64} {Factory default} Addressing: None Description: Layer 3 Designated Level 1 Intermediate System Priority, specifies Designated Level 1 IS Priority. Name-defined values are: DFLT Default, specifies the parameter is set to the factory default.

L3DL2ISP=	{1–127, DFLT}	Default:	<Previously existing value> or {64} {Factory default}
		Addressing:	None
		Description:	Layer 3 Designated Level 2 Intermediate System Priority, specifies Designated Level 2 IS Priority. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
L3ESCTMR=	{1–200, DFLT}	Default:	<Previously existing value> or {50} {Factory default}
		Addressing:	None
		Description:	Layer 3 End System Configuration Timer, specifies ISO 9542 Suggested ES Configuration Timer (ESCT) in seconds. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
L3ESISHTMR=	{2–63, DFLT}	Default:	<Previously existing value> or {3} {Factory default}
		Addressing:	None
		Description:	Layer 3 End System/Intermediate System Holding Time Multiplier, is used to specify ISO 9542 Holding Time. The value of L3ESISHTMR entered is multiplied by the ISO 9542 IS Configuration Timer, L3ISCTMR, to specify the ISO 9542 Holding Time. (i.e., The L3ESISHTMR factory default of 3 multiplied by the L3ISCTMR factory default of 10 yields a holding time of 30 seconds). Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
L3ISCTMR=	{1–200, DFLT}	Default:	<Previously existing value> or {10} {Factory default}
		Addressing:	None
		Description:	Layer 3 Intermediate System Configuration Timer, specifies ISO 9542 IS Configuration Timer in seconds. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
L3ISISHTMR=	{1–65535, DFLT}	Default:	<Previously existing value> or {3} {Factory default}
		Addressing:	None
		Description:	Layer 3 Intermediate System/Intermediate System Hello Timer, specifies IS–IS Hello Timer in seconds. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.
L3RDTMR=	{1–500, DFLT}	Default:	<Previously existing value> or {180} {Factory default}
		Addressing:	None
		Description:	Layer 3 Redirect Timer, specifies ISO 9542 Redirect Timer in seconds. Name–defined values are: DFLT Default, specifies the parameter is set to the factory default.

RELATED COMMANDS

RTRV-ULLAN

COMMAND CODE: **ED-ULLDCC**
COMMAND NAME: **EDIT UPPER LAYER LINE DCC**

PURPOSE

The ED-ULLDCC command allows provisioning of the Layer 3 (network layer) parameters of the SONET Data Communication Channel (DCC) network. This command allows provisioning of the OSI upper layer stack (Layer 3) parameters pertaining to the Line DCC.

If ENT-FFP-OCn (where n= 3 or 12) has been issued on the addressed OC-3/OC-12, the AID will be the working (odd-numbered) OC-3/OC-12. If a protection (even-numbered) OC-3/OC-12 is specified, then ED-ULLDCC will be denied. If ENT-FFP-OCn has not been issued on the addressed OC-3/OC-12 or if ENT-RNG-OCn has been issued on the addressed OC-3/OC-12, then ED-ULLDCC will allow both odd numbered and even numbered OC-3s/OC-12s to be addressed.

Changes to the name-defined parameters take effect immediately when the OSI stack is active. All of the name-defined parameters survive a database backup and restore. If a parameter is not specified, it defaults to the previous existing value.

An ED-ULLDCC command is denied if:

- The specified OC-3/OC-12 is not provisioned, i.e., the OC-3/OC-12 is in a UAS secondary state.
- The specified AID is a protection OC-3/OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

```
ED-ULLDCC: [TID] :AID: [CTAG] : : [ALLDFLT=] [ , L3ESCTMR=] [ , L3ESISHTMR=]
[ , L3ISCTMR=] [ , L3ISISHTMR=] ;
```

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3/OC-12 whose Line DCC parameters are being modified.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.
ALLDFLT=	{N, Y} Default: {N} Addressing: None Description: All Default, specifies whether or not all the parameters are set to the factory default. If ED-ULLDCC is issued with ALLDFLT=Y, all parameters are set to the factory default and all other specified parameters are ignored. If ED-ULLDCC is issued with ALLDFLT=N, all specified parameters will be changed and all other non-specified parameters will remain the previous existing value. Values are: N No, specifies all parameters are not set to the factory default. Y Yes, specifies all parameters are set to the factory default.

L3ESCTMR=	{1–200, DFLT}	
Default:	<Previously existing value> or {50} {Factory default}	
Addressing:	None	
Description:	Layer 3 End System Configuration Timer, specifies ISO 9542 Suggested ES Configuration Timer (ESCT) in seconds. Name-defined values are:	
	DFLT	Default, specifies the parameter is set to the factory default.
L3ESISHTMR=	{2–63, DFLT}	
Default:	<Previously existing value> or {3} {Factory default}	
Addressing:	None	
Description:	Layer 3 End System/Intermediate System Holding Time Multiplier, is used to specify ISO 9542 Holding Time. The value of L3ESISHTMR entered is multiplied by the ISO 9542 IS Configuration Timer, L3ISCTMR, to specify the ISO 9542 Holding Time. (i.e., The L3ESISHTMR factory default of 3 multiplied by the L3ISCTMR factory default of 10 yields a holding time of 30 seconds). Name-defined values are:	
	DFLT	Default, specifies the parameter is set to the factory default.
L3ISCTMR=	{1–200, DFLT}	
Default:	<Previously existing value> or {10} {Factory default}	
Addressing:	None	
Description:	Layer 3 Intermediate System Configuration Timer, specifies ISO 9542 IS Configuration Timer in seconds. Name-defined values are:	
	DFLT	Default, specifies the parameter is set to the factory default.
L3ISISHTMR=	{1–65535, DFLT}	
Default:	<Previously existing value> or {3} {Factory default}	
Addressing:	None	
Description:	Layer 3 Intermediate System/Intermediate System Hello Timer, specifies IS–IS Hello Timer in seconds. Name-defined values are:	
	DFLT	Default, specifies the parameter is set to the factory default.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*DCC Database Error: <ERROR-STRING> for <AID-STRING>*/
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the upper layer parameters pertaining to the Line DCC for OC-3 port OC3-14 are being set to the factory defaults.

```
ED-ULLDCC::OC3-14:::ALLDFLT=Y;
```

RELATED COMMANDS

```
RTRV-ULLDCC
```

COMMAND CODE: **ED-ULSDCC**
COMMAND NAME: **EDIT UPPER LAYER SECTION DCC**

PURPOSE

The ED-ULSDCC command allows provisioning of the Layer 3 (network layer) parameters of the SONET Data Communication Channel (DCC) network. This command allows provisioning of the OSI upper layer stack (Layer 3) parameters pertaining to the Section DCC.

If ENT-FFP-OCn (where n=3 or 12) has been issued on the addressed OC-3/OC-12, the AID will be the working (odd-numbered) OC-3/OC-12. If a protection (even-numbered) OC-3/OC-12 is specified, then ED-ULSDCC will be denied. If ENT-FFP-OCn has not been issued on the addressed OC-3/OC-12, or if ENT-RNG-OCn has been issued on the addressed OC-3/OC-12, then ED-ULSDCC will allow both odd numbered and even numbered OC-3s/OC-12s to be addressed.

Changes to the name-defined parameters take effect immediately, when the OSI stack is active. All of the name-defined parameters survive a database backup and restore. If a parameter is not specified, it defaults to the previous existing value.

An ED-ULSDCC command is denied if:

- The specified OC-3/OC-12 is not provisioned, i.e., the OC-3/OC-12 is in a UAS secondary state.
- The specified AID is a protection OC-3/OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

```
ED-ULSDCC: [TID] :AID: [CTAG] : : [ALLDFLT=] [, L3ESCTMR=] [, L3ESISHTMR=]
[, L3ISCTMR=] [, L3ISISHTMR=] ;
```

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3/OC-12 whose Section DCC parameters are being modified.
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.
ALLDFLT=	{N, Y} Default: {N} Addressing: None Description: All Default, specifies whether or not all the parameters are set to the factory default. If ED-ULSDCC is issued with ALLDFLT=Y, all parameters are set to the factory default and all other specified parameters are ignored. If ED-ULSDCC is issued with ALLDFLT=N, all specified parameters will be changed and all other non-specified parameters will remain the previous existing value. Values are: N No, specifies all parameters are not set to the factory default. Y Yes, specifies all parameters are set to the factory default.

L3ESCTMR=	{1–200, DFLT}	
Default:	<Previously existing value> or {50} {Factory default}	
Addressing:	None	
Description:	Layer 3 End System Configuration Timer, specifies ISO 9542 Suggested ES Configuration Timer (ESCT) in seconds. Name-defined values are:	
	DFLT	Default, specifies the parameter is set to the factory default.
L3ESISHTMR=	{2–63, DFLT}	
Default:	<Previously existing value> or {3} {Factory default}	
Addressing:	None	
Description:	Layer 3 End System/Intermediate System Holding Time Multiplier, is used to specify ISO 9542 Holding Time. The value of L3ESISHTMR entered is multiplied by the ISO 9542 IS Configuration Timer, L3ISCTMR, to specify the ISO 9542 Holding Time. (i.e., The L3ESISHTMR factory default of 3 multiplied by the L3ISCTMR factory default of 10 yields a holding time of 30 seconds). Name-defined values are:	
	DFLT	Default, specifies the parameter is set to the factory default.
L3ISCTMR=	{1–200, DFLT}	
Default:	<Previously existing value> or {10} {Factory default}	
Addressing:	None	
Description:	Layer 3 Intermediate System Configuration Timer, specifies ISO 9542 IS Configuration Timer in seconds. Name-defined values are:	
	DFLT	Default, specifies the parameter is set to the factory default.
L3ISISHTMR=	{1–65535, DFLT}	
Default:	<Previously existing value> or {3} {Factory default}	
Addressing:	None	
Description:	Layer 3 Intermediate System/Intermediate System Hello Timer, specifies IS–IS Hello Timer in seconds. Name-defined values are:	
	DFLT	Default, specifies the parameter is set to the factory default.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*DCC Database Error: <ERROR-STRING> for <AID-STRING>*/
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the upper layer parameters pertaining to the Line DCC for OC-3 port OC3-14 are being set to the factory defaults.

```
ED-ULSDCC::OC3-14:::ALLDFLT=Y;
```

RELATED COMMANDS

```
RTRV-ULSDCC
```

COMMAND CODE: **ED-VT1**
COMMAND NAME: **EDIT VT1**

PURPOSE

The ED-VT1 command modifies the specified VT1.5 port parameter values previously provisioned using ENT-VT1.

Executing an ED-VT1 command causes the following primary state transitions for the specified VT1.5. Secondary states associated with the VT1.5 after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST Value	Next PST State if Current PST State is:			
	IS	OOS-AU	OOS-AUMA	OOS-MA
IS	Denied	Denied	OOS-AU	IS
OOS	OOS-MA	OOS-AUMA	Denied	Denied

Note: 1. No state change occurs if no value is entered for PST.

When a VT1.5 is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set for the specified VT1.5. The MAN condition type is cleared when the VT1.5 is provisioned to an IS state.

When a VT1.5 is in an OOS-MA or OOS-AUMA state, no VT1.5 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the VT1.5, but VT1.5 alarm conditions are monitored (retrievable with the RTRV-VT1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-VT1 command) for the VT1.5.

When an VT1.5 with an SST of WRK (refer to ENT-RNG-OC3 or ENT-RNG-OC12) is edited to an OOS state and the VT1.5 is path switched using 2WAYPR, the system selects the VT1.5 from the redundant ring OC-3/OC-12 (if that path has an SST of STBYH) and that VT1.5 enters an SST of WRK. If the redundant path is in a PST of OOS, no switching is attempted. When the VT1.5 is in a pass through connection using 2WAY, the path AIS is sent in the pass-through direction.

An ED-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.
- The specified VT1.5s supporting EC1, OC-3 or OC-12 have not been provisioned.
- The specified VT1.5 has not previously been provisioned with the ENT-VT1 command.
- The specified VT1.5 is being edited from an IS or OOS-AU state to an IS state.
- The specified VT1.5 is being edited from an OOS-MA or OOS-AUMA state to an OOS,<Null> state.
- The specified VT1.5, which is embedded within a ring OC-3/OC-12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12), is being edited to an OOS,<Null> state and the embedded VT1.5 has an SST of WRK, unless CMDMDE=FRCD.
- CMDMDE=FRCD (or NORM) is entered with an attempt to alter the value of VTMAP and a mapping is currently in place (meaning that an embedded termination point (T1) has been provisioned (a VT1.5 SST of SDEE), or that a cross-connection is in place which connects to an embedded termination point regardless of whether or not it is provisioned (e.g., a T1 level implied CRS), for examples).
- The specified VT1.5 is being edited from an OOS-MA or OOS-AUMA state to an IS state and the VT1.5 is in a loopback (the VT1.5 has an SST of LPBK).
- The specified VT1.5 is being edited in an IS or OOS-AU state and the VT1.5 is connected (it has an SST of ACT or BUSY), unless CMDMDE=FRCD is used.
- VTPTYEL=Y is specified.
- TACC=Y, and PST=IS.
- TAPPOOL is set to a valid value but TACC=N.
- TAPP AID is set to the last VT1.5 value in the system, and AID+1 can not be provisioned as a FAD port.
- FADB is provisioned.
- The port identified by AID is involved in a redlined connection or conference, and any parameter other than PST is entered. CMDMDE=FRCD will not override this denial.

INPUT FORMAT

ED-VT1: [TID]:AID: [CTAG]::: [CMDMDE=] [, TACC=] [, TAPPOOL=]
[, VTMAP=] [, VTPTYEL=]: [PST];

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1–{1–3840}–{1–7}–{1–4}} (EC1VT1–EC1/STS1#–VTGrp#–VT1.5#) {OC3VT1–{1–2240}–{1–3}–{1–7}–{1–4}} (OC3VT1–OC3#–STS1#–VTGrp#–VT1.5#) {OC12VT1–{1–560}–{1–4}–{1–3}–{1–7}–{1–4}} (OC12VT1–OC12#–STM1#–STS1#–VTGrp#–VT1.5#) Default: Entry Required Addressing: &&–ranging and &–grouping Description: VT1 AID, identifies the VT1.5 port or a range of VT1.5 ports.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CMDMDE=	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced. The command is accepted and parameter values are modified even if the VT1.5 is cross-connected. NORM Normal. The command is denied if the VT1.5 is in an IS state and is cross-connected (VT1.5 has an SST of ACT or BUSY). Restrictions: ED–VT1 will be denied if this command is issued with CMDMDE=NORM on a VT1.5 that has TRM, ACT or BUSY secondary state.
TACC=	{N, Y} Default: <Previously Existing Value> Addressing: None Description: Test Access port AID, indicates that this VT1 port (specified by AID) and the AID+1 VT1 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are: N No, the specified VT1 port is not a Test Access port. Y Yes, VT1 ports specified by AID and AID+1 are Test Access ports.

TAPPOOL=		{PRIVATE, PUBLIC, <NoVal>}
	Default:	<NoVal> if TACC = N PRIVATE if TACC = Y
	Addressing:	None
	Description:	TAP port Pool, defines whether the TAP port that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool. Values are:
	PRIVATE	The TAP pair that has been created belongs to the private pool of the user that issued the ENT–VT1 command. It can only be accessed by the user that owns the pool. If any other user tries to use this TAP pair (by means of CONN–TACC–VT1), the command shall be denied.
	PUBLIC	The TAP pair that has been created belongs to the public pool of the system. It can be accessed by any user with the privilege to use the Test Access commands.
	<NoVal>	No Value (unpopulated), TAPPOOL does not apply if TACC=N.
VTMAP=		{ALL, ASYNC, VTBYTE}
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	VT1.5 payload type. Determines the expected VT1.5 payload type and the value of the expected path signal label. Used for comparison for the Signal Label Mismatch function. Values are:
	ALL	ALL incoming signal labels are accepted by the system, without creating a SLMF condition. ALL is intended for intermediate path monitoring only, so no mappings (i.e., terminating) of the VT1 are allowed for ALL (only intact VT1 connections are possible). Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
	ASYNC	VT Asynchronous mapping – VTFLOAT mode. (L1–L3 = 010 bin). The system will accept only incoming signal labels of type ASYNC without creating a SLMF condition. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
	VTBYTE	VT byte synchronous mapping, applicable for DS0s being mapped into VT SPE – VTFLOAT mode (L1–L3 = 100 hex). The system will accept only incoming signal labels of type VTBYTE without creating a SLMF condition. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
	Restrictions:	If VTMAP=ASYNC, only ASYNC type mappings may be applied to the VT1 (e.g., ENT–T1, ENT–CRS–T1, etc.). No visibility mappings can be made on a VT1 (i.e., ENT–T1 is not possible even though VTMAP=ASYNC) if the VT1 being provisioned is on hardware that cannot directly support ASYNC mappings for intermediate path monitoring purposes (e.g. an ES1 card). If VTMAP=VTBYTE, only VTBYTE type mappings may be applied to the VT1. Because VTBYTE type mappings are not supported by any of the current 1631 HW, no mappings can be made on that VT1 for VTMAP=VTBYTE (only intact VT1 connections are possible). ED–VT1 is denied if an attempt is made to alter the value of VTMAP and a mapping is currently in place.

VTPTYEL=	{N}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	VT1.5 path yellow behavior. Identifies whether VT path yellow or RDI will be sent/received. Values are:
	N	No. RDI will be sent/received on appropriate defect state.
	Restrictions:	ED-VT1 is denied if VTPTYEL=Y.
PST	{IS, OOS}	
	Default:	< NO PST STATE CHANGE >
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the VT1.5. Values are:
	IS	In-Service
	OOS	Out-Of-Service
	Restrictions:	ED-VT1 is denied if PST of IS is entered when the addressed VT1.5 is in loopback; i.e. it has a LPBK secondary state.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
	/* Invalid combination of TACC and TAPPOOL */
	/* Invalid parameter change of a Red Lined connection */
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
PICC	Privilege, Invalid Command Code
	/* You are not the owner of the TAPP */
SAIS	Status, Already In Service
SAOS	Status, Already Out of Service
SCAT	Status, Circuit Already connected to another Tap

SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating supported T1s */ /* VT1 Shelf info error, Error=<ERROR-STRING> */ /* Error disabling supported T1, Error=<ERROR-STRING> */ /* Error enabling supported T1, Error=<ERROR-STRING> */ /*CONN Database Error: <ERROR-STRING> for <AID-STRING>*/ /*GetSptgTps(<TP-TYPE>, <RECORD-NUMBER>): <ERROR-STRING>*/ /* GetSptdTPid(VT1, <RECORD-NUMBER>, T1): <ERROR-STRING> */ /* Error updating supported entities */
SNVS	Status, Not in Valid State /* Cannot change VTMAP while supported entity exists */ /* Cannot change VTMAP while connected */ /*In-Service terminated or connected ports must be FRCD*/ /*The port is connected In-Service non-STBYH, must be FRCD*/ /*Fad B port is not in proper state for editing*/
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest /*Cannot create FAD if supporting entity has fault propagation active*/ /*Cannot create FAD if supporting entity is connected*/
SSRE	Status, System Resources Exceeded /*No more TAPPs may be provisioned*/

EXAMPLES

In the following example, VT1.5 port EC1VT1-1-7-4 provisioning is changed to VTPTYEL to send RDI instead of VT path yellow and to the IS state. All other parameter values are unchanged.

```
ED-VT1::EC1VT1-1-7-4:::VTPTYEL=N:IS;

RTRV-RDL-ALL
```

COMMAND CODE: **ENT-CID**
COMMAND NAME: **ENTER COMMUNICATION INTERFACE
DEVICE**

PURPOSE

The ENT-CID command creates an entry for the specified CPORT (Control Port) in the system's CID (Communications Interface Device) configuration database. The CPORT is configured with the specified provisioning for the type of interface protocol, the interface baud rate, whether a UID is automatically logged-in (for non-X.25 CPORTs), and whether input characters for the ACT-USER command are echoed, by executing a RST-CID command for the specified CPORT.

An ENT-CID command is denied if:

- The specified CPORT is already provisioned (via ENT-CID).
- A UID specified for AUTOIN has not previously been provisioned (via the ENT-USER command).
- An invalid parameter value or combination of parameter values is entered.

When the system is in the Limited Command Entry Mode of operation (refer to the STOP-OPS command), the system administrator (UID of "system") is automatically logged-in on CPORT 1 and the system printer (UID of "sysprint") is automatically logged-in on CPORT 6.

CPORT 1 is not allowed to be configured for automatic UID login. Therefore, a normal login sequence (via ACT-USER) is required from CPORT 1 when the system is in the normal command entry mode (Direct Input Command Entry or Menu Mode).

If a CPORT is configured as an X.25 communication port, then:

- The ED-CID-OSPORT command is used to configure the common X.25 protocol parameters (such as packet size, range of PVC and SVC channel numbers, and the X.25 called address) for the CPORT. These parameters are applicable to all PVCs or SVCs within the CPORT.
- The ENT-CID-VC command is used to configure the CPORT for up to eight X.25 PVC or SVC channels, or combination of both. The command is also used to configure the Logical Channel Number for a PVC, and any associated automatic UID login for a PVC or outgoing SVC.
- The ENT-OSADDR-SITE and ED-OSADDR-SITE commands are used to create a database of allowable X.25 calling addresses, and any associated automatic UID login for each calling address for incoming SVCs.

If a CPORT is configured as a TCP communication port, then:

- The ED-IP-PRMTR command is used to provision the IP Layer parameters of the LAN interface on the ICM.

User login security is removed by provisioning a CPORT, or an X.25 PVC or SVC, with automatic UID login since anyone with access to the communication interface has the same command privileges as the UID provisioned in the AUTOIN parameter.

A CPORT connected to a printer terminal (refer to the TYPE parameter in the ENT-USER command) should be configured for automatic UID login. If the CPORT is configured for a normal login sequence (AUTOIN of %), the system waits for an ACT-USER command (indefinitely if an output-only printer terminal is connected).

INPUT FORMAT

ENT-CID: [TID] : CPORT: [CTAG] : : [PROTOCOL] , [BAUD] , [AUTOIN] , [ACTUSERDM] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

CPORT {1–12}
Default: Entry Required
Addressing: None
Description: Control Port, specifies the physical communication port number on the APS control system.
Restrictions: ENT–CID is denied if an invalid combination of values for PROTOCOL and CPORT is entered. Valid value combinations are shown below:

Valid Value Combinations for:	
PROTOCOL	CPORT
SNIDER	{2–12} (Up to 11 CPORTs)
TCP	{3,5,7,9,11} (Up to 3 CPORTs)
X25	{2–5, 7–12} (Up to 4 CPORTs)
XON	{1–12} (Up to 12 CPORTs)

ENT–CID is denied if CPORT of {1} and AUTOIN of {<UID>} is entered.

CTAG < 1–6 VALID CTAG CHARACTERS >
Default: < System assigned CTAG value >
Addressing: None
Description: Correlation Tag, associates input command with its output responses.

PROTOCOL {SNIDER, TCP, X25, XON}
Default: {XON}
Addressing: None
Description: Protocol, specifies the communication protocol used for the control port. Values are:
 SNIDER AT&T's SNIDER protocol.
 TCP TCP/IP protocol, implies the selected CPORT is running the TCP/IP over the Local Area Network (LAN).
 X25 X.25 protocol. The X.25 port parameters are applied to all PVCs and SVCs within the CPORT. (Refer to the ED–CID–OSPORT and ENT–CID–VC commands.)
 XON XON/XOFF protocol, specifies the asynchronous XON/XOFF (flow control) protocol.
Restrictions: ENT–CID is denied if an invalid combination of values of PROTOCOL with CPORT, BAUD, AUTOIN, and ACTUSERDM is entered.

BAUD {1200, 2400, 4800, 9600, 19200, 38400, 10}

Default: {2400} for PROTOCOL of SNIDER,
{9600} for PROTOCOL of XON,
{10} for PROTOCOL of TCP
<External DCE timing reference> for PROTOCOL of X25.

Addressing: None

Description: Baud Rate, specifies the baud rate of the control port. For CPORTs with PROTOCOL set to X25, any entered BAUD parameter value is ignored and the system automatically selects the external timing reference provided by the DCE (Data Communication Equipment). For CPORTs with PROTOCOL set to TCP, the BAUD parameter value is 10 megabit/second.

Restrictions: ENT-CID is denied if an invalid combination of values for PROTOCOL and BAUD is entered. Valid value combinations are shown below:

Valid Value Combinations for:	
PROTOCOL	BAUD
SNIDER	{1200, 2400, 4800, 9600, 19200}
TCP	{10}
X25	{1200, 2400, 4800, 9600, 19200}
XON	{1200, 2400, 4800, 9600, 19200}

AUTOIN {%, <UID>}

Default: {%} for PROTOCOL of SNIDER, X25, or XON

Addressing: None

Description: Automatic Login, specifies whether a User ID is automatically logged-in on the control port. Values are:

% No Automatic Login, a normal log-on sequence (via ACT-USER) is required to access the system, or UID Auto Login for X.25 virtual channels is specified by ENT-CID-VC for PVCs and outgoing SVCs or by ENT-OSADDR-SITE for incoming SVCs.

<UID> UID Automatically Logged-on, the entered User ID (UID) is automatically logged-on whenever the CPORT is in service.

Restrictions: ENT-CID is denied if an invalid combination of values for PROTOCOL and AUTOIN is entered. Valid value combinations are shown below:

Valid Value Combinations for:	
PROTOCOL	AUTOIN
SNIDER	{%, <UID>}
TCP	{%}
X25	{%}
XON	{%, <UID>}

ENT-CID is denied if AUTOIN of {<UID>} and CPORT of {1} is entered.
ENT-CID is denied if AUTOIN of {SYSTEM, system} is entered.

ACTUSERDM {AUECHO, AUNOECHO, <NoVal>}

Default: {AUECHO} for PROTOCOL of SNIDER, X25, XON,
{AUNOECHO} for PROTOCOL of TCP.

Addressing: None

Description: ACT–USER Display Mode, specifies whether the input characters (key-strokes) for an ACT–USER command entered over the specified CPORT, or entered over any provisioned X.25 PVCs or incoming SVCs within the CPORT, are echoed by the system. Values are:

AUECHO Character Echo, ACT–USER input characters are echoed.

AUNOECHO Character Not Echo, ACT–USER input characters are not echoed.

Restrictions: ENT–CID is denied if an invalid combination of values for PROTOCOL and ACTUSERDM is entered. Valid value combinations are shown below:

Valid Value Combinations for:	
PROTOCOL	ACTUSERDM
SNIDER	{AUECHO, AUNOECHO, <NoVal>}
TCP	{AUNOECHO, <NoVal>}
X25	{AUECHO, AUNOECHO, <NoVal>}
XON	{AUECHO, AUNOECHO, <NoVal>}

SUCCESSFUL RESPONSE FORMAT

```

[/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;

```

OUTPUT PARAMETERS

CPORT {1–12}
Control Port, identifies the physical control port number.

PROTOCOL {SNIDER, TCP, X25, XON}
Protocol, identifies the communication protocol used with the control port. Values are:

SNIDER SNIDER protocol.

TCP TCP/IP protocol, implies the selected CPORT is running the IP over the Local Area Network (LAN).

X25 X.25 protocol.

XON XON/XOFF protocol, indicates the asynchronous XON/XOFF (flow control) protocol.

BAUD {1200, 2400, 4800, 9600, 19200, 38400, 10}
Baud Rate, identifies the baud rate of the control port. (Note. The system automatically selects the external timing reference provided by the DCE (Data Communication Equipment) if PROTOCOL is X25, regardless of the value returned for BAUD.) For CPORTs with PROTOCOL set to TCP, the BAUD parameter value is 10 megabit/second.

AUTOIN	{%, <UID> Automatic Login, indicates whether a User ID is automatically logged-in on the control port. Values are: % No Automatic Login, a normal log-on sequence (via ACT-USER) is required to access the system, or UID Auto Login for X.25 virtual channels is specified by ENT-CID-VC for PVCs and outgoing SVCs or by ENT-OSADDR-SITE for incoming SVCs. <UID> UID Automatically Logged-on, the entered User ID (UID) is automatically logged-on whenever the CPORT is in service.
ACTUSERDM	{AUECHO, AUNOECHO} ACT-USER Display Mode, indicates whether the input characters (keystrokes) for an ACT-USER command entered over the indicated CPORT, or entered over any provisioned X.25 PVCs or incoming SVCs within the CPORT, are echoed by the system. Values are: AUECHO Character Echo, ACT-USER input characters are echoed. AUNOECHO Character Not Echo, ACT-USER input characters are not echoed.
MODEM	{NO, YES} Modem Controls, indicates whether the X.25 control port is provisioned (via ED-CID-OS-PORT) to use RTS (Request To Send) and CTS (Clear To Send) modem control signals. The output line for MODEM is only returned if PROTOCOL is X25.
SIZE	{128, 256} Packet Size, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 maximum packet size. The output line for SIZE is only returned if PROTOCOL is X25.
L3WIN	{1-7} Level 3 Window Size, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 level 3 window size. The output line for L3WIN is only returned if PROTOCOL is X25.
KWIN	{1-7} Level 2 Window Size, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 level 2 window size (in number of frames). The output line for KWIN is only returned if PROTOCOL is X25.
HIPVC	{0-8} Highest Incoming PVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 HIPVC number. The output line for HIPVC is only returned if PROTOCOL is X25.
LISVC	{0-4095} Lowest Incoming SVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 LISVC number. The output line for LISVC is only returned if PROTOCOL is X25.
HISVC	{0-4095} Highest Incoming SVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 HISVC number. The output line for HISVC is only returned if PROTOCOL is X25.
LTSVC	{0-4095} Lowest Two-way (Incoming or Outgoing) SVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 LTSVC number. The output line for LTSVC is only returned if PROTOCOL is X25.
HTSVC	{0-4095} Highest Two-way (Incoming or Outgoing) SVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 HTSVC number. The output line for HTSVC is only returned if PROTOCOL is X25.

LOSVC	{0–4095} Lowest Outgoing SVC Channel Number, indicates the provisioned value (via ED–CID–OSPORT) for the X.25 LOSVC number. The output line for LOSVC is only returned if PROTOCOL is X25.
HOSVC	{0–4095} Highest Outgoing SVC Channel Number, indicates the provisioned value (via ED–CID–OSPORT) for the X.25 HOSVC number. The output line for HOSVC is only returned if PROTOCOL is X25.
ADDR	<1–15 INTEGER X.25_CALLED_ADDRESS> X.25 Called Address, indicates the provisioned value (via ED–CID–OSPORT) for the X.25 Called Address (the X.25 address for the system). The output line for ADDR is only returned if PROTOCOL is X25.

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

```

IDNV      Input, Data Not Valid
          /* Illegal Input: OS error */
          /* X.25 not allowed on CID <cid> */
          /* SNIDER not allowed on CID <cid> */
          /* Maximum of <cid> CID ports already configured for X.25 */
          /* AUTO LOGIN Illegal on CID 1 */
          /* AUTO LOGIN invalid with X25 port */
          /* AUTO LOGIN (Illegal AUTOIN) */
          /* AUTO LOGIN (Duplicate AUTOIN in OSADDR) */
          /* AUTO LOGIN (Duplicate AUTOIN in OSDB) */
          /* AUTO LOGIN (Non–Existent AUTOIN) */
          /* Illegal Input: AUTOIN */
          /* Invalid CID (CPORT) entered */
          /* CID (CPORT) already exists */
SDBE      Status, internal Data Base Error
          /* Unable to write to OSDB – status = <status number> */

```

EXAMPLES

In the following example, CPORT 2 is configured to auto–login with a UID of SMITH, with a protocol of XON and a baud rate of 9600.

```
ENT-CID::2::,SMITH;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
/* 2,XON,9600,SMITH,AUECHO */
/* ENT-CID::2::,,SMITH [P71061] (1) */
;
```

In the following example, CPORT 3 is configured as an X.25 control port.

```
ENT-CID::3::X25;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71062. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71062 COMPLD
/* 3,X25,9600,%,AUECHO */
/* YES,128,2,7,0,0,0,0,0,0,0,0 */
/* ENT-CID::3::X25 [P71062] (1) */
;

COMMAND CODE: **ENT-CID-VC**
COMMAND NAME: **ENTER COMMUNICATIONS INTERFACE
DEVICE VIRTUAL CHANNEL**

PURPOSE

The ENT-CID-VC command creates a virtual channel entry for the specified X.25 CPORT (Control Port) and VCNUM (Virtual Channel Number) in the system's CID (Communication Interface Device) configuration database. The command defines the virtual channel number as a SVC (Switched Virtual Circuit) or a PVC (Permanent Virtual Circuit). For PVC channels, the PVC's LCN (Logical Channel Number) is assigned along with any UID automatic login for the PVC. For outgoing SVC channels, the X.25 Call Out Address and Autonomous Message Inactivity Timer is assigned along with the UID automatic login for the outgoing SVC. The virtual channel is configured with the specified provisioning by executing a RST-CID command for the specified CPORT.

Each CPORT provisioned as an X.25 port can be configured with up to eight PVCs, incoming or outgoing SVCs, or a combination of both.

An ENT-CID-VC command is denied if:

- The specified CPORT is not provisioned as an X.25 port (via ENT-CID with PROTOCOL of X25).
- A VCTYPE of PVC is entered and the specified LCN value is greater-than the HIPVC value in ED-CID-OSPORT.
- An invalid parameter value or combination of parameter values is entered.

User login security is removed by provisioning an X.25 PVC with automatic UID login since anyone with access to the communication interface has the same command privileges as the UID provisioned in the AUTOIN parameter.

A virtual channel connected to a printer terminal (refer to the TYPE parameter in the ENT-USER command) should be configured for automatic UID login. If the virtual channel is configured for a normal login sequence (AUTOIN of %), the system waits for an ACT-USER command (indefinitely if an output-only printer terminal is connected).

INPUT FORMAT

ENT-CID-VC: [TID] : CPORT, VCNUM: [CTAG] : : VCTYPE, [LCN] , [AUTOIN] , [X25COA] ,
[AMSGITMR] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{2-5, 7-12} Default: Entry Required Addressing: None Description: Control Port, specifies the physical communication port number on the APS control system.
VCNUM	{1-8} Default: Entry Required Addressing: None Description: Virtual Channel Number, specifies the X.25 virtual channel within the specified CPORT.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

VCTYPE	{PVC, SVC}	
	Default:	Entry Required
	Addressing:	None
	Description:	Virtual Circuit Type, specifies the type of virtual circuit for the indicated X.25 virtual channel. Values are:
	PVC	Permanent Virtual Circuit.
	SVC	Switched Virtual Circuit (incoming SVC if AUTOIN of %, outgoing SVC if AUTOIN of <UID>).
	Restrictions:	ENT-CID-VC is denied if VCTYPE of PVC is entered and an X25COA value or AMSGITMR value is entered. ENT-CID-VC is denied if VCTYPE of SVC and an LCN value is entered. ENT-CID-VC is denied if VCTYPE of SVC and AUTOIN of <UID> is entered and the TYPE parameter in ENT-USER is <i>not</i> PRN for the specified <UID>. ENT-CID-VC is denied if VCTYPE of SVC and AUTOIN of % is entered and an X25COA value or AMSGITMR value is entered.
LCN	{1-8, <NoVal>}	
	Default:	Entry required (for VCTYPE of PVC) <NoVal> (for VCTYPE of SVC)
	Addressing:	None
	Description:	Logical Channel Number, specifies the logical channel number for an X.25 PVC. Values are:
	1-8	Logical Channel Number 1 through 8 for VCTYPE of PVC.
	<NoVal>	No Value, LCN must be unpopulated if VCTYPE of SVC is entered.
	Restrictions:	ENT-CID-VC is denied if an LCN value greater-than the HIPVC value in ED-CID-OSPORT is entered. ENT-CID-VC is denied if an LCN value and VCTYPE of SVC is entered.
AUTOIN	{%, <UID>}	
	Default:	{%}
	Addressing:	None
	Description:	Automatic Login, specifies whether a User ID is automatically logged-in on the specified PVC or outgoing SVC channel. Values are:
	%	No Automatic Login, a normal log-on sequence (via ACT-USER) is required to access the system, or UID Auto Login for X.25 incoming SVCs is specified by ENT-OSADDR-SITE.
	<UID>	UID Automatically Logged-on, the entered User ID (UID) is automatically logged-on when the outgoing SVC or PVC channel is in service.
	Restrictions:	ENT-CID-VC is denied if AUTOIN of <UID> and VCTYPE of SVC is entered and the TYPE parameter in ENT-USER is <i>not</i> PRN for the specified <UID>. ENT-CID-VC is denied if AUTOIN of % and VCTYPE of SVC is entered and an X25COA value or AMSGITMR value is entered.

X25COA	{<1–15 INTEGER X.25_CALL_OUT_ADDRESS>, <NoVal>}
Default:	Entry required (for VCTYPE of SVC and AUTOIN of <UID>) <NoVal> (for VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of %)
Addressing:	None
Description:	X.25 Call Out Address, specifies the X.25 Call Out Address of the called DTE for outgoing SVCs. Leading zeros are not truncated. Values are: <CALL_OUT_ADDRESS> 1–15 Integer X.25 Call Out Address. <NoVal> No Value, X25COA must be unpopulated for VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of %.
Restrictions:	ENT–CID–VC is denied if an X25COA value is entered and VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of % is entered.
AMSGITMR	{15–3600, <NoVal>}
Default:	{15} (for VCTYPE of SVC and AUTOIN of <UID>) <NoVal> (for VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of %)
Addressing:	None
Description:	Autonomous (X.25 Call Out) Message Inactivity Timer, specifies the number of seconds the system waits for another autonomous message before terminating the X.25 outgoing SVC session. Expiration of the AMSGITMR indicates that no autonomous messages in the output message queue remain to be transmitted. Values are: 15–3600 15 to 3600 seconds. <NoVal> No Value, AMSGITMR must be unpopulated for VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of %.
Restrictions:	ENT–CID–VC is denied if an AMSGITMR value is entered and VCTYPE of PVC, or VCTYPE of SVC and AUTOIN of % is entered.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <CPORT>, <VCNUM>, <VCTYPE>, [<LCN>], <AUTOIN>[, <X25COA>, <AMSGITMR>] */
/* Warning: REMOVE and RESTORE (RMV-CID/RST-CID) to use OS parameters */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

CPORT	{2–5, 7–12} Control Port, identifies the physical control port number.
VCNUM	{1–8} Virtual Channel Number, identifies the X.25 virtual channel within the specified X.25 CPORT.
VCTYPE	{PVC, SVC} Virtual Circuit Type, identifies the type of virtual circuit for the indicated X.25 virtual channel. Values are: PVC Permanent Virtual Circuit. SVC Switched Virtual Circuit (incoming SVC if AUTOIN of %, outgoing SVC if AUTOIN of <UID>).
LCN	{1–8, <NoVal>} Logical Channel Number, identifies the logical channel number for the X.25 PVC. A value for LCN is only returned if VCTYPE is PVC.

AUTOIN	{%, <UID>}
	Automatic Login, indicates whether a User ID is automatically logged-in on the PVC or outgoing SVC virtual channel. Values are:
	% No Automatic Login, a normal log-on sequence (via ACT-USER) is required to access the system, or UID Auto Login for X.25 incoming SVCs is specified by ENT-OSADDR-SITE.
	<UID> UID Automatically Logged-in, the entered User ID (UID) is automatically logged-in whenever the PVC or outgoing SVC is in service.
X25COA	{<1-15 INTEGER X.25_CALL_OUT_ADDRESS>, <NoVal>}
	X.25 Call Out Address, indicates the X.25 Call Out Address of the called DTE for outgoing SVCs. A value for X25COA is only returned if VCTYPE is SVC and AUTOIN is <UID>.
AMSGITMR	{15-3600, <NoVal>}
	Autonomous (X.25 Call Out) Message Inactivity Timer, indicates the number of seconds the system waits for another autonomous message before terminating the X.25 outgoing SVC session. Expiration of the AMSGITMR indicates that no autonomous messages in the output message queue remain to be transmitted. A value for AMSGITMR is only returned if VCTYPE is SVC and AUTOIN is <UID>.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV Input, Data Not Valid

IPNV Input, Parameter Not Valid
 /* Illegal Input: LCN */
 /* AUTO LOGIN (Illegal AUTOIN) */
 /* AUTO LOGIN (Duplicate AUTOIN in OSADDR) */
 /* AUTO LOGIN (Duplicate AUTOIN in OSDB) */
 /* AUTO LOGIN (Non-Existent AUTOIN) */
 /* AUTO LOGIN (TABS user on non-TABS CID) */
 /* AUTO LOGIN (NON-TABS user on TABS CID) */
 /* Too many Incoming and Two-Way SVCs specified */
 /* LCN matches an existing PVC's LCN */
 /* LCN cannot be larger than HIPVC */
 /* Auto Login cannot be assigned to SVCs with this command */
 /* Invalid CID <CPORT> entered */
 /* CID <CPORT> does not exist */
 /* X25 vc <VCNUM> does not exist */
 /* This CID is pending removal */
 /* This CID <CPORT> is not an X.25 vc */
 /* The user on this CID is in the process of logging out */
 /* X25 vc <VCNUM> already exists */
 /* This CID (CPORT) is not configured for X.25 */
 SDBE Status, internal Data Base Error
 /* Unable to write to OSDB – status = <status number> */

EXAMPLES

In the following example, CPORT 2, virtual channel 1 is provisioned as an incoming SVC.

```
ENT-CID-VC::2,1::SVC;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P17022. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P17022 COMPLD
/* 2,1,SVC,,% */
/* Warning: REMOVE and RESTORE (RMV-CID/RST-CID) to use OS parameters */
/* ENT-CID-VC::2,1::SVC [P17022] (1) */
;
```

In the following example, CPORT 2, virtual channel 3 is provisioned as a PVC channel on logical channel 1 with no UID auto-login.

```
ENT-CID-VC::2,3::PVC,1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P17025. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P17025 COMPLD
/* 2,3,PVC,1,% */
/* Warning: REMOVE and RESTORE (RMV-CID/RST-CID) to use OS parameters */
/* ENT-CID-VC::2,3::PVC,1 [P17025] (1) */
;
```

In the following example, CPORT 2, virtual channel 5 is provisioned as an outgoing SVC with an auto-login UID of AUTO_MSG_OUT and an X25COA of 9085551234.

```
ENT-CID-VC::2,5:::SVC,,AUTO_MSG_OUT,9085551234;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P17029. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P17029 COMPLD
/* 2,5,SVC,,AUTO_MSG_OUT,9085551234,15 */
/* Warning: REMOVE and RESTORE (RMV-CID/RST-CID) to use OS parameters */
/* ENT-CID-VC::2,5:::SVC,,AUTO_MSG_OUT,9085551234 [P17029] (1) */
;
```

COMMAND CODE: **ENT-CONF-T1**
COMMAND NAME: **ENTER CONFERENCE T1**

PURPOSE

The ENT-CONF-T1 command creates and establishes a one-way DS1 cross-connection from the DS1 or VT1.5 port specified as the conference MASTER (the receive side, from the network, head of the broadcast conference connection) to the specified DS1 or VT1.5 TO (transmit side, to the network, tail of the broadcast conference connection) port. However both the MASTER and TO cannot be the address of a VT1.5, in which case ENT-CONF-VT1 should be used.

If a conference cross-connection already exists, ENT-CONF-T1 adds a new one-way connection from the specified conference head (MASTER) to the specified TO port.

Each conference head (MASTER) port can have a maximum of 56 one-way cross-connection conference tails. A single one-way cross-connection can be established between any conference tail to the conference head with the ENT-CRS-T1 command. Twenty-eight conference heads (MASTERS) can exist simultaneously.

Executing an ENT-CONF-T1 causes a primary state transition for the created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-CONF-T1 causes a secondary state transition for the ports involved in the cross-connection as follows:

- A secondary state of BUSY is applied to the MASTER when all 56 legs are connected and one leg is connected back to the MASTER, otherwise an SST of ACT is applied to the MASTER.
- A secondary state of ACT is applied to the TO port (the leg) when it's connected.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

Whether a VT1.5 leg to a DS1 head or DS1 leg to a VT1.5 head is allowed depends on the port provisioning as indicated below:

MASTER Port Type	MASTER Port STSMAP	MASTER Port VTMAP	TO Port Type	TO Port STSMAP	TO Port VTMAP	ENT-CONF-T1
VT1	VTFLOAT	Any Value	VT1	VTFLOAT	Any Value	Denied ¹
VT1	VTFLOAT	ALL, VTBYTE	T3T1 or T1	N/A	N/A	Denied

EC1T1, OC3T1, or OC12T1	ASYN	N/A	OC3T1 or OC12T1	ASYN	N/A	Allowed
EC1T1, OC3T1, or OC12T1	ASYN	N/A	VT1	VTFLOAT	ASYN	Allowed
EC1T1, OC3T1, or OC12T1	ASYN	N/A	VT1	VTFLOAT	ALL, VTBYTE	Denied

Note: N/A= Not Applicable. 1 = Use ENT-CONF-VT1 command.

ENT-CONF-T1 is denied if:

- The MASTER and TO port are not provisioned in a valid combination per the table above.
- Either of the specified MASTER or TO DS1 ports are not provisioned (using ENT-T1).
- Either of the specified MASTER or TO DS1 ports are previously one-way or two-way cross-connected.
- The specified MASTER and TO values are identical (the same DS1 port).
- Both the specified MASTER and TO refer to VT1.5.
- The specified MASTER port is a conference tail of another conference connection.
- The specified TO port is a conference head or tail of another conference connection.
- Either of the specified MASTER or TO ports are in a loopback (an SST of LPBK), are in a test access operation (an SST of TS), are in a roll operation (an SST of ROLL), or have C-bit loopback enabled or established (a DS1 Condition Type of ALWCBLPBK or RVCBLPBK).
- The specified MASTER or TO port is an embedded DS1 and the supporting DS3 is in a loopback (a DS3 SST of LPBK) or cross-connected (a DS3 SST of ACT or BUSY)..
- The specified MASTER or TO port is an embedded VT1.5 and the supporting STS1/OC3/OC12 is in loopback (an SST of LPBK)..
- Either of the specified MASTER or TO DS1 ports are provisioned as an Idle Signal Source port or as part of a Test Access Port Pair (FAD A or FAD B).
- The specified conference connection requires a first-stage matrix bridge connection and the first-stage matrix time slots reserved for broadcast connections are all in use (refer to RTRV-POOL).
- Either the specified MASTER or TO port is defined as part of an OC-3/OC-12 ring (using ENT-RNG-OC3/OC12).
- An invalid parameter value is entered.
- The conference head already has 56 tails.
- There are already 28 conference heads in the system.
- If RDL=Y is specified, and either the MASTER or TO port is a T1 with an ALWCBLPBK condition set.

INPUT FORMAT

ENT-CONF-T1 : [TID] : MASTER, TO : [CTAG] : : : [CKTID=] [, RDL=] ;

EXAMPLES

In the following example, a one-way broadcast conference connection is established between port T3T1-1-25 (MASTER) and each of the ports T3T1-12-8, T3T1-12-9, T3T1-12-10, and T3T1-15-28.

```
ENT-CONF-T1::T3T1-1-25,T3T1-12-8&&-10&T3T1-15-28;
```

In the following example, a one-way cross-connection is added as a new tail to the conference connection in the above example from the existing conference head port T3T1-1-25 (MASTER) to port T3T1-13-2 (TO). This cross-connection is assigned the circuit ID of TESTCKT1.

```
ENT-CONF-T1::T3T1-1-25,T3T1-13-2:::CKTID="TESTCKT1"
```

COMMAND CODE: **ENT-CONF-VT1**
COMMAND NAME: **ENTER CONFERENCE VT1**

PURPOSE

The ENT-CONF-VT1 command creates and establishes a one-way VT1.5 cross-connection from the VT1.5 port specified as the conference MASTER (the receive side, from the network, head of the broadcast conference connection) to the specified VT1.5 TO (transmit side, to the network, tail of the broadcast conference connection) port.

If a conference cross-connection already exists, ENT-CONF-VT1 adds a new one-way connection from the specified conference head (MASTER) to the specified TO port.

Each conference head (MASTER) port can have a maximum of 56 one-way cross-connection conference tails. A single one-way cross-connection can be established between any conference tail to the conference head with the ENT-CRS-VT1 command. Twenty-eight conference heads (MASTERS) can exist simultaneously.

Executing an ENT-CONF-VT1 causes a primary state transition for the created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-CONF-VT1 causes a secondary state transition for the ports involved in the cross-connection as follows:

- A secondary state of BUSY is applied to the MASTER when all 56 legs are connected and one leg is connected back to the MASTER, otherwise an SST of ACT is applied to the MASTER.
- A secondary state of ACT is applied to the TO port (the leg) when it's connected.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

Whether a VT1.5 to VT1.5 connection is allowed depends on the port provisioning as indicated below:

MASTER Port Type	MASTER Port STSMAP	MASTER Port VTMAP	TO Port Type	TO Port STSMAP	TO Port VTMAP	ENT-CONF-VT1
VT1	VTFLOAT	Any Value	VT1	VTFLOAT	Any Value	Allowed
VT1	VTFLOAT	ALL, VTBYTE	T3T1 or T1	N/A	N/A	Denied
VT1	VTFLOAT	ALL, VTBYTE	EC1T1	ASYNC	N/A	Denied
VT1	VTFLOAT	ALL, VTBYTE	OC3T1 or OC12T1	ASYNC	N/A	Denied
VT1	VTFLOAT	ASYNC	T3T1 or T1	N/A	N/A	Denied ¹
VT1	VTFLOAT	ASYNC	EC1T1	ASYNC	N/A	Denied ¹
VT1	VTFLOAT	ASYNC	OC3T1 or OC12T1	ASYNC	N/A	Denied ¹

Note: N/A= Not Applicable. 1 = Use ENT-CONF-T1 command.

ENT-CONF-VT1 is denied if:

- The MASTER and TO port are not provisioned in a valid combination per the table above.
- Either of the specified MASTER or TO VT1.5 ports are not provisioned (using ENT-VT1).
- Either of the specified MASTER or TO VT1.5 ports are previously one-way or two-way cross-connected.
- The specified MASTER and TO values are identical (the same VT1.5 port).

- The specified MASTER and TO do not refer to VT1.5.
- The specified MASTER port is a conference tail of another conference connection.
- The specified TO port is a conference head or tail of another conference connection.
- Either of the specified MASTER or TO ports are in a loopback (an SST of LPBK), are in a test access operation (an SST of TS).
- The supporting STS-1/OC-3/OC-12 of the MASTER or TO port is in a loopback (an SST of LPBK).
- The supporting STS-1 of the MASTER or TO port is intact cross-connected (an STS-1 SST of ACT or BUSY).
- The specified conference connection requires a first-stage matrix bridge connection and the first-stage matrix time slots reserved for broadcast connections are all in use (refer to RTRV-POOL).
- Either the specified MASTER or TO port is defined as part of an OC-3/OC-12 ring (using ENT-RNG-OC3 or ENT-RNG-OC12).
- An invalid parameter value is entered.
- The conference head already has 56 tails.
- There are already 28 conference heads in the system.

COMMAND CODE: **ENT-CRS-STs1**
COMMAND NAME: **ENTER CROSS-CONNECTION STs1**

PURPOSE

The ENT-CRS-STs1 command creates a cross-connection entity and establishes a one-way, two-way, two-way path ring or two-way drop and continue cross-connection between the specified STs1 ports.

If CCT of 1WAY is specified, a one-way cross-connect is established between the receive side (from the network) of the FROM port and the transmit side (to the network) of the TO port. A one-way cross-connect can be established between the receive and transmit side of the same port (FROM and TO are identical thereby establishing a loopback through the system's cross-connect matrix).

If CCT of 2WAY is specified, a two-way cross-connect is established between the FROM and TO ports. A pass-through cross-connect can be established between the FROM and TO ports if both STs1s belong to the same OC3 or OC12 ring pair (refer to ENT-RNG-OC3 or ENT-RNG-OC12) and are both in the same time-slot. An unprotected cross-connect can be established between the FROM and TO ports if one STs1 is embedded within a ring OC3/OC12 and the other STs1 is embedded within a non-ring (linear) OC3, OC12, or EC1, or another ring OC3/OC12.

If CCT of 2WAYPR is specified, a two-way path ring cross-connect is established between the FROM and TO ports. A two-way path ring cross-connect can be established as a nonterminated cross-connect if one STs1 is embedded within a ring OC3/OC12, and the other STs1 is embedded in an EC1, odd non-ring OC3/OC12, or ring OC3/OC12.

The system will allow a 2WAYPR connection even when the addressed path or its mate is involved in a matrix loopback connection.

If CCT of 2WAYDC is specified, a two-way drop and continue cross-connect is established between the FROM and TO ports. A two-way drop and continue cross-connect can be established as a nonterminated cross-connect between an STs1 embedded within a ring OC3/OC12 and an STs1 embedded in an EC1, odd non-ring OC3/OC12, or ring OC3/OC12.

Executing an ENT-CRS-STs1 causes a state transition for the created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-CRS-STs1 causes following state transition for the ports involved in the cross connect.

- If this command creates a one-way cross connect, the port will carry an ACT secondary state.
- If this command creates a two-way cross connection or a one-way cross connection to itself, the ports will carry BUSY secondary state.
- The containing port (EC1, OC3, or OC12) in which this STs1 is contained will have TRM secondary state.
- If this command creates a two-way path or a two-way drop and continue ring cross connection, a non-revertive switching STs1 FFP will be created. The STs1 specified in the command shall be the preferred path and the ring mate STs1 shall be the alternate path.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

If CCT of 1WAY and RDL=Y are specified while there is an existing TO-FROM 1WAY connection with RDL=N status, the 2WAY connection that results will have RDL=Y (redlined) status.

If CCT of 1WAY is specified but RDL status is not specified while there is an existing TO-FROM 1WAY connection with RDL=Y status, both connections will have RDL=Y (redlined) status.

If a CKTID or CKTIDTF parameter is specified for only one side (TO-FROM or FROM-TO) of a 2WAY cross-connection, both sides shall inherit this ID parameter.

If ampersand ranging (&&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

Although STS1s with different STSMAP are allowed to be cross connected, the system does not perform any mapping conversion. The system just allows what comes in on the input port to go out of the output port.

ENT-CRS-STs1 is denied if:

- Either of the specified FROM or TO STS1 ports are not provisioned (using ENT-STs1).
- The STS1 has VT1.5 assigned under it, i.e. STS1 has SDEE secondary state.
- The STS1 is in a TRM secondary state, because its subordinate objects are cross connected.
- The specified cross-connection already exists.
- The specified FROM and TO values are identical (the same STS1 port) and CCT of 2WAY is specified.
- The mate STS1 of the specified FROM or TO STS1 port within the ring OC3/OC12 is not provisioned and CCT of 2WAYPR or 2WAYDC is specified.
- The specified STS1 embedded within a ring OC3/OC12 is even and CCT of 2WAY is specified.
- Either of the specified FROM or TO port has all cross-connect capacity utilized (an SST of BUSY), or is in a test access operation (an SST of TS).
- The specified FROM or TO port is an embedded STS1 and the supporting EC1, OC3, or OC12 is in a loopback (an SST of LPBK).
- The specified FROM or TO port has subordinated VT1.5/DS1 objects in a loopback (an SST of LPBK) or in a test access operation (an SST of TS).
- The specified FROM or TO port has DS1 objects embedded within DS3 provisioned objects and that DS1 has C-bit loopback enabled or established (a DS1 Condition Type of ALWCBLPBK or RCVCLPBK).
- A one-way bridge connection is specified.
- Both the FROM and TO do not specify STS1 AID.
- The specified FROM and TO values are identical (the same STS1 port) and an ENT-RNG-OC3 or ENT-RNG-OC12 has been completed for that supporting OC3 or OC12, respectively.
- An invalid parameter value or combination of parameter values is entered.
- The system will not allow a 2WAYDC connection when the addressed path or its mate is involved in a matrix loopback connection.
- CCT=2WAYPR, the odd STS1 of the ring OCn is in a matrix loopback, and the odd+1 is not OOS-MA or OOS-AUMA.

INPUT FORMAT

ENT-CRS-STs1: [TID] : **FROM,TO** : [CTAG] : : [CCT] : [CKTID=] [,CKTIDTF=] [,RDL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >

EXAMPLES

In the following example, a one-way STS1 cross-connection is established between ports OC3STS1-1-3, an STS1 embedded within an OC3 (FROM) and EC1STS1-6, an STS1 embedded within an EC1 (TO).

```
ENT-CRS-STs1:OC3STS1-1-3,EC1STS1-6:::1WAY;
```

In the following example, a two-way STS1 cross-connection is established between ports OC3STS1-25-1 and EC1STS1-12. The connection is redlined and assigned a circuit ID of TSTCRKT7.

```
ENT-CRS-STs1:EC1STS1-12,OC3STS1-25-1:::CKTID="TSTCRKT7",RDL=Y;
```

In the following example, a two-way STS1 cross-connection is established between ports OC3STS1-25-1 and EC1STS1-12. The cross-connection is redlined. The FROM-TO side of the cross-connection is assigned a circuit ID of TSTCRKT7, and the TO-FROM side of the cross-connection is assigned a separate circuit ID of TSTCRKT7A.

```
ENT-CRS-STs1:EC1STS1-12,OC3STS1-25-1:::CKTID="TSTCRKT7",
CKTIDTF="TSTCRKT7A",RDL=Y;
```

In the following example, a two-way cross-connection is established between ports EC1STS1-1 and EC1STS1-6, between ports EC1STS1-2 and EC1STS1-12, and between ports EC1STS1-3 and EC1STS1-50, by using ranging.

```
ENT-CRS-STs1:EC1STS1-1&&-3,EC1STS1-6&-12&-50;
```

COMMAND CODE: **ENT-CRS-ST3C**
COMMAND NAME: **ENTER CROSS-CONNECTION STS-3C**

PURPOSE

The ENT-CRS-ST3C command creates a cross-connect entity and establishes a one-way or two-way cross-connection between the specified STS-3C ports.

If CCT of 1WAY is specified, a one-way cross-connect is established between the receive side (from the network) of the FROM port and the transmit side (to the network) of the TO port. A one-way cross-connect can be established between the receive and transmit side of the same port (FROM and TO are identical thereby establishing a loopback through the system's cross-connect matrix).

If CCT of 2WAY is specified, a two-way cross-connect is established between the FROM and TO ports.

Executing an ENT-CRS-ST3C causes a state transition for the created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-CRS-ST3C causes following state transition for the ports involved in the cross connect.

- If this command creates a one-way cross connect, the port will carry an ACT secondary state.
- If this command creates a two-way cross connection or a one-way cross connection to itself, the ports will carry BUSY secondary state.
- The containing port (OC-3 or OC-12) in which this STS-3C is contained will have TRM secondary state.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

If CCT of 1WAY and RDL=Y are specified while there is an existing TO-FROM 1WAY connection with RDL=N status, the 2WAY connection that results will have RDL=Y (redlined) status.

If CCT of 1WAY is specified but RDL status is not specified while there is an existing TO-FROM 1WAY connection with RDL=Y status, both connections will have RDL=Y (redlined) status.

If ampersand ranging (&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

ENT-CRS-ST3C is denied if:

- Either of the specified FROM or TO STS-3C ports are not provisioned (using ENT-ST3C).
- The specified cross-connection already exists.
- The specified FROM and TO values are identical (the same STS-3C port) and CCT of 2WAY is specified.
- Either of the specified FROM or TO port has all cross-connect capacity utilized (an SST of BUSY).
- Both the FROM and TO do not specify an ST3C AID.
- If one of the FROM or TO specifies an STS-3C embedded within a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ENT-CRS-ST3C: [TID] : **FROM, TO** : [CTAG] : : [CCT] : [CKTID=] [,CKTIDTF=] [,RDL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

FROM	<p>STS3C_AID; {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#)</p> <p>Default: Entry Required</p> <p>Addressing: &&-ranging and &-grouping</p> <p>Description: STS3C AID. If CCT=1WAY, FROM identifies the receive side (from the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY then either AID of the cross-connection may be used as the FROM AID.</p> <p>Restrictions: ENT-CRS-ST3C is denied if FROM and TO are identical and CCT of 2WAY is entered. ENT-CRS-ST3C is denied if FROM and TO both are not STS-3C. Value combinations are verified whether the value is determined from a default value or explicitly entered in the command.</p>
TO	<p>STS3C_AID; {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#)</p> <p>Default: Entry Required</p> <p>Addressing: &&-ranging and &-grouping</p> <p>Description: STS3C AID. If CCT=1WAY, TO identifies the transmit side (to the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY then either AID of the cross-connection may be used as the TO AID.</p> <p>Restrictions: ENT-CRS-ST3C is denied if FROM and TO are identical and CCT of 2WAY is entered. ENT-CRS-ST3C is denied if FROM and TO both are not STS-3C. Value combinations are verified whether the value is determined from a default value or explicitly entered in the command.</p>
CTAG	<p>< 1-6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
CCT	<p>{1WAY, 2WAY}</p> <p>Default: {2WAY}</p> <p>Addressing: None</p> <p>Description: Cross-Connect Type. Values are: 1WAY One-Way. Establish a one-way cross-connection between the FROM and TO STS-3C ports. 2WAY Two-Way. Establish a two-way cross-connection between the FROM and TO STS-3C ports.</p> <p>Restrictions: ENT-CRS-ST3C is denied if CCT of 2WAY is entered and FROM and TO are identical. Value combinations are verified whether the value is determined from a default value or explicitly entered in the command.</p>
CKTID=	<p>< 0-45 VALID TID CHARACTERS ></p> <p>Default: < No Entry ></p> <p>Addressing: None</p> <p>Description: FROM and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.</p>

CKTIDTF=	< 0–45 VALID CKTIDTF CHARACTERS >
Default:	< No Entry >
Addressing:	None
Description:	To and FROM Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.
Restrictions:	ENT–CRS–STS1 is denied if a CKTIDTF is specified, no CKTID is specified, and CCT=2WAY/2WAYPR/2WAYDC. ENT–CRS–STS1 is denied if a CKTIDTF and CCT=1WAY are specified.
RDL=	{N, Y}
Default:	{N}
Addressing:	None
Description:	N = connection is not redlined, Y = connection is redlined.
Restrictions:	ENT–CRS–STS3C is denied if RDL=Y is specified while either the FROM or TO STS3C is under LPBK (loopback). ENT–CRS–STS3C is denied if CCT=1Way and RDL=N is specified for a FROM–TO connection while there is an existing 1WAY TO–FROM RDL=Y connection.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SARB	Status, All Resources Busy
SDBE	Status, internal Data Base Error /*CONN Database Error: <ERROR-STRING> for <AID>*/ /*Failed to Update Sptg Tps: Status=<ERROR-CODE>*/ /*Failed to put B2 TP database record <RECORD-NUMBER> for status <ERROR-CODE>*/ /*Failed to put CONN database record <RECORD-NUMBER> for status <ERROR-CODE>*/ /*Failed to put TP database record <RECORD-NUMBER> for status <ERROR-CODE>*/ /*RPP Database Error: <ERROR-STRING> for <AID>*/ /*TP Database Error: <ERROR-STRING> for <AID>*/
SDNC	Status, Data Not Consistent
SNVS	Status, Not in Valid State /*Cannot connect STS3C ports in MTRX loopback*/
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest /*One Ring Port in MTRX LPBK, The Other In-Service*/ /*Ring 2 Port is in MTRX loopback*/
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, a one-way STS-3C cross-connection is established between ports OC3STS3C-3, an STS-3C embedded within an OC-3 (FROM) and OC3STS3C-7, an STS-3C embedded within an OC-3 (TO).

```
ENT-CRS-ST3C::OC3STS3C-3,OC3STS3C-7::1WAY;
```

In the following example, a two-way STS-3C cross-connection is established between ports OC3STS3C-1 and OC3STS3C-13. The cross-connection is redlined and assigned the circuit ID TSTCKT02.

```
ENT-CRS-ST3C::OC3STS3C-13,OC3STS3C-1:::CKTID="TSTCKT02",RDL=Y;
```

In the following example, a one-way STS-3C cross-connection is established between ports OC3STS3C-1 and OC3STS3C-13. The cross-connection is assigned the circuit ID of TSTCKT03.

```
ENT-CRS-ST3C::OC3STS3C-13,OC3STS3C-1:::1WAY:CKTID="TSTCKT03";
```

COMMAND CODE: **ENT-CRS-T1**
COMMAND NAME: **ENTER CROSS-CONNECT T1**

PURPOSE

The ENT-CRS-T1 command creates a cross-connect entity and establishes a one-way, two-way, two-way path or two-way drop and continue ring cross-connection between the specified DS1 ports or between the specified DS1 and VT1.5 ports. (Use ENT-CRS-VT1 if both the FROM and TO ports are VT1.5 ports.)

If CCT of 1WAY is specified, a one-way cross-connect is established between the receive side (from the network) of the FROM port and the transmit side (to the network) of the TO port. A one-way cross-connect can be established between the receive and transmit side of the same port (FROM and TO are identical thereby establishing a loopback through the system's cross-connect matrix), can be added as a bridge to an existing one-way or two-way cross-connect, or can be added from a Conference tail to the Conference head (Master) port (refer to ENT-CONF-T1). A drop T1/VT1.5 that is involved in a two-way path or a two-way drop and continue ring cross-connect can be connected to another non-ring (linear) T1/VT1.5 to establish a one-way bridge.

If CCT of 2WAY is specified, a two-way cross-connect is established between the FROM and TO ports. If the FROM or TO port is a VT1.5 embedded within a ring OC3 or OC12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12), a two-way cross-connect can be established between that VT1.5 and another non-ring (linear) DS1 port.

If CCT of 2WAYPR is specified, a two-way path ring cross-connect is established between the FROM and TO ports. A two-way path ring cross-connect can be established as a drop-terminated cross-connect between the FROM and TO ports if one port is a VT1.5 embedded within a ring OC3/OC12 and the other port is a linear drop T1.

If CCT of 2WAYDC is specified, a two-way drop and continue cross-connect is established between the FROM and TO ports. A two-way drop and continue cross-connect can be established as a drop-terminated cross-connect between the FROM and TO ports if one port is a VT1.5 embedded within a ring OC3/OC12 and the other port is a linear T1.

Executing an ENT-CRS-T1 causes a state transition for the created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-CRS-T1 causes following state transition for the ports involved in the cross connect.

- If this command creates a one-way or two-way cross connect, the port will carry an ACT secondary state.
- If this command creates a one-way bridge connection on a port that is already two-way cross connected, then it will carry BUSY secondary state.
- If this command creates a one-way bridge connection on a port that is already two-way path or two-way drop and continue ring cross connected, then the drop port will carry BUSY secondary state.
- The containing port in which this DS1 or VT1.5 is contained will have TRM secondary state.
- If this command establishes a two-way cross connect or a one-way cross connect from a VT1.5 to DS1, then the VT1.5 will have TRM secondary state.
- If this command creates a two-way path or a two-way drop and continue ring cross connection, a non-revertive switching VT1.5 FFP will be created. The VT1.5 specified in the command shall be the preferred path and the ring mate VT1.5 shall be the alternate path.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

If CCT of 1WAY and RDL=Y are specified while there is an existing TO-FROM 1WAY connection with RDL=N status, the 2WAY connection that results will have RDL=Y (redlined) status.

If CCT of 1WAY is specified but RDL status is not specified while there is an existing TO-FROM 1WAY connection with RDL=Y status, both connections will have RDL=Y (redlined) status.

If a CKTID or CKTIDTF parameter is specified for only one side (TO-FROM or FROM-TO) of a 2WAY cross-connection, both sides shall inherit this ID parameter.

If ampersand ranging (&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

Whether a VT1.5 to a DS1 cross-connection or a DS1 to a VT1.5 cross-connection is allowed depends on the port provisioning as indicated below (the FROM and TO ports can be interchanged in the table below):

FROM Port Type	FROM Port STSMAP	FROM Port VTMAP	TO Port Type	TO Port STSMAP	TO Port VTMAP	ENT-CRS-T1
VT1	VTFLOAT	Any Value	VT1	VTFLOAT	Any Value	Denied ¹
VT1	VTFLOAT	ALL, VTBYTE	T3T1 or T1	N/A	N/A	Denied
VT1	VTFLOAT	ALL, VTBYTE	EC1T1	ASYNC	N/A	Denied
VT1	VTFLOAT	ALL, VTBYTE	OC3T1 or OC12T1	ASYNC	N/A	Denied
VT1	VTFLOAT	ASYNC	T3T1 or T1	N/A	N/A	Allowed
VT1	VTFLOAT	ASYNC	EC1T1	ASYNC	N/A	Allowed
VT1	VTFLOAT	ASYNC	OC3T1 or OC12T1	ASYNC	N/A	Allowed
T3T1 or T1	N/A	N/A	T3T1 or T1	N/A	N/A	Allowed
T3T1 or T1	N/A	N/A	EC1T1	ASYNC	N/A	Allowed
T3T1 or T1	N/A	N/A	OC3T1 or OC12T1	ASYNC	N/A	Allowed
EC1T1, OC3T1, or OC12T1	ASYNC	N/A	EC1T1	ASYNC	N/A	Allowed
EC1T1, OC3T1, or OC12T1	ASYNC	N/A	OC3T1 or OC12T1	ASYNC	N/A	Allowed
Note: N/A= Not Applicable. 1 = Use ENT-CRS-VT1 command.						

Whether a VT1.5 to a DS1 two-way path /two-way drop and continue ring cross-connection or a DS1 to a VT1.5 two-way path/two-way drop and continue ring cross-connection is allowed depends on the port provisioning as indicated below (the FROM and TO ports can be interchanged in the table below):

Ring Port Type	Ring Port STSMAP	Ring Port VTMAP	Drop Port Type	Drop Port STSMAP	Drop Port VTMAP	ENT-CRS-T1
VT1	VTFLOAT	ASYNC	T3T1 or T1	N/A	N/A	Allowed
VT1	VTFLOAT	ASYNC	EC1T1	ASYNC	N/A	Allowed
VT1	VTFLOAT	ASYNC	OC3T1 or OC12T1	ASYNC	N/A	Allowed

ENT-CRS-T1 is denied if:

- The FROM and TO port are not provisioned in a valid combination per the tables above.
- Either of the specified FROM or TO DS1 ports are not provisioned (via ENT-T1).
- The specified cross-connection already exists.
- The specified FROM and TO values are identical (the same DS1 port) and CCT of 2WAY is specified.
- The specified FROM or TO VT1.5 port within the redundant ring OC3/OC12 is not provisioned and CCT of 2WAYPR or 2WAYDC is specified.
- The specified FROM port is the head (MASTER) of a broadcast conference connection, or the specified FROM port is a tail of a conference connection and the TO port is not the head of the conference connection.
- Either of the specified FROM or TO port has all cross-connect capacity utilized (an SST of BUSY), or is in a test access operation (an SST of TS).
- The specified FROM or TO port is an embedded DS1 and the supporting DS3 is in a loopback (a DS3 SST of LPBK).
- The specified FROM or TO port is an embedded VT1.5 and the supporting EC1, OC3, or OC12 is in a loopback (an SST of LPBK).
- The specified FROM or TO port is an embedded VT1.5 and the supporting STS1 is intact cross connected (an SST of ACT or BUSY).
- Either of the specified FROM or TO DS1 port is provisioned as an Idle Signal Source port or as part of a Test Access Port Pair (FAD A or FAD B).
- A one-way bridge connection is specified that requires a first-stage matrix bridge connection and the first-stage matrix time slots reserved for broadcast connections are all in use (refer to RTRV-POOL).
- An invalid parameter value or combination of parameter values is entered.
- CCT=2WAYPR, the odd VT1 of the ring OCn is in a matrix loopback, and the odd+1 is not OOS-MA or OOS-AUMA.

INPUT FORMAT

	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS1 or VT1 AID. If CCT=1WAY, TO identifies the transmit side (to the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY, 2WAYPR or 2WAYDC then either AID of the cross-connection may be used as the TO AID.
	Restrictions:	ENT-CRS-T1 is denied if FROM and TO are identical and CCT of 2WAY is entered. ENT-CRS-T1 is denied if FROM and TO are both VT1.5. ENT-CRS-T1 is denied if FROM or TO is part of a ring OC3/OC12 and CCT of 1WAY is entered.
CTAG	<1-6 VALID CTAG CHARACTERS>	
	Default:	<System Assigned CTAG Value>
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
CCT	{1WAY, 2WAY, 2WAYPR, 2WAYDC}	
	Default:	{2WAY}
	Addressing:	None
	Description:	Cross-Connect Type. Values are:
	1WAY	One-Way (through matrix) non-ring connection
	2WAY	Two-Way (through matrix) ring or non-ring connection
	2WAYPR	Two-Way Path Protected Ring connection
	2WAYDC	Two-Way Drop and Continue connection
	Restrictions:	ENT-CRS-T1 is denied if CCT of 2WAY is entered and FROM and TO are identical. ENT-CRS-T1 is denied if CCT of 1WAY is entered and FROM or TO is a part of a ring OC3/OC12. Value combinations are verified whether the value is determined from a default value or explicitly entered in the command.
CKTID=	< 0-45 VALID TID CHARACTERS >	
	Default:	< No Entry >
	Addressing:	None
	Description:	FROM and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.

CKTIDTF=	< 0–45 VALID CKTIDTF CHARACTERS >
Default:	< No Entry >
Addressing:	None
Description:	To and FROM Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.
Restrictions:	ENT–CRS–T1 is denied if a CKTIDTF parameter is entered for a 1WAY cross-connection. This parameter is valid only for command entries with a CCT of 2WAY, 2WAYPR, or 2WAYDC.
RDL=	{ N, Y}
Default:	{N}
Addressing:	None
Description:	N = connection is not redlined, Y = connection is redlined.
Restrictions:	ENT–CRS–T1 is denied if RDL=Y is specified while either FROM or TO is under LPBK (loopback). ENT–CRS–T1 is denied if a CCT of 1Way and RDL=N is specified for a FROM–TO connection while there is an existing 1WAY TO–FROM RDL=Y connection.

EXAMPLES

In the following example, a one-way DS1 cross-connection is established between ports T3T1-1-15 (FROM) and T3T1-6-4 (TO).

```
ENT-CRS-T1::T3T1-1-15,T3T1-6-4:::1WAY;
```

In the following example, a two-way DS1 cross-connection is established between ports T3T1-1-10 and T3T1-12-8. The connection is redlined and assigned a circuit ID of TSTCRKT8.

```
ENT-CRS-T1::T3T1-12-8,T3T1-1-10:::CKTID="TSTCRKT8",RDL=Y;
```

In the following example, a two-way DS1 cross-connection is established between ports T3T1-1-10 and T3T1-12-8. The FROM-TO side of the cross-connect is assigned a circuit ID of TSTCRKT8, and the TO-FROM side is assigned a separate circuit ID of TSTCRKT8A.

```
ENT-CRS-T1::T3T1-12-8,T3T1-1-10:::CKTID="TSTCRKT8",CKTIDTF="TSTCRKT8A";
```

In the following example, a two-way DS1 cross-connection is established between a DS1 port T3T1-1-10 and VT1.5 port EC1VT1-12-7-4 whose VTMAP is defined as ASYNC.

```
ENT-CRS-T1::EC1VT1-12-7-4,T3T1-1-10;
```

In the following example, a two-way cross-connection is established between ports T3T1-1-15 and T3T1-6-4, between ports T3T1-1-16 and T3T1-12-9, and between ports T3T1-1-17 and EC1T1-5-28, by using ranging.

```
ENT-CRS-T1::T3T1-1-15&&-17,T3T1-6-4&T3T1-12-9&EC1T1-5-28;
```

In the following example, a two-way DS1 cross-connection is first established between ports T3T1-5-7 and T3T1-2-18, and then a bridge (one-way cross-connection) is added between ports T3T1-5-7 and T3T1-16-24 (port T3T1-5-7 is the head of the bridge).

```
ENT-CRS-T1::T3T1-5-7,T3T1-2-18;
```

```
ENT-CRS-T1::T3T1-5-7,T3T1-16-24:::1WAY;
```

COMMAND NAME: **ENTER CROSS-CONNECT T3**

PURPOSE

The ENT-CRS-T3 command creates a cross-connect entity and establishes a one-way, two-way, two-way path or two-way drop and continue ring cross-connection between the specified DS3 ports or between the specified DS3 and STS-1 ports. (Use ENT-CRS-ST51 if both the FROM and TO ports are STS1 ports.)

If CCT of 1WAY is specified, a one-way cross-connect is established between the receive side (from the network) of the FROM port and the transmit side (to the network) of the TO port. A one-way cross-connect can be established between the receive and transmit side of the same port (FROM and TO are identical thereby establishing a loopback through the system's cross-connect matrix).

If CCT of 2WAY is specified, a two-way cross-connect is established between the FROM and TO ports. If the FROM or TO port is an STS-1 embedded within a ring OC-3 or OC-12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12), a two-way cross-connect can be established between that STS-1 and another non-ring (linear) DS3 port.

If CCT of 2WAYPR is specified, a two-way path ring cross-connect is established between the FROM and TO ports. A two-way path ring cross-connect can be established as a drop-terminated cross-connect between the FROM and TO ports if one port is an STS-1 embedded within a ring OC-3/OC-12 and the other port is a non-ring (linear) drop T3.

If CCT of 2WAYDC is specified, a two-way drop and continue cross-connect is established between the FROM and TO ports. A two-way drop and continue cross-connect can be established as a drop-terminated cross-connect between the FROM and TO ports if one port is an STS-1 embedded within a ring OC-3/OC-12 and the other port is a non-ring (linear) drop T3.

Executing an ENT-CRS-T3 causes a state transition for the created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-CRS-T3 causes following state transition for the ports involved in the cross connect.

- If this command creates a one-way, the port will carry an ACT secondary state.
- If this command creates a two-way cross connection, the port will carry BUSY secondary state.
- The containing port (EC1, OC-3, or OC-12) in which this DS3 or STS-1 is contained will have TRM secondary state.
- If this command establishes a two-way cross connect or a one-way cross connect from an STS-1 to DS3, then the STS-1 will have TRM secondary state.
- If this command creates a two-way path or a two-way drop and continue ring cross connection, a non-revertive switching STS1 FFP will be created. The STS1 specified in the command shall be the preferred path and the ring mate STS1 shall be the alternate path.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

If CCT of 1WAY and RDL=Y are specified while there is an existing TO-FROM 1WAY connection with RDL=N status, the 2WAY connection that results will have RDL=Y (redlined) status.

If CCT of 1WAY is specified but RDL status is not specified while there is an existing TO-FROM 1WAY connection with RDL=Y status, both connections will have RDL=Y (redlined) status.

If a CKTID or CKTIDTF parameter is specified for only one side (TO-FROM or FROM-TO) of a 2WAY cross-connection, both sides shall inherit this ID parameter.

If ampersand ranging (&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

Executing an ENT-CRS-T3 causes the DS3 involved to stop transmitting the fault conditions on its FEAC channel (the FEAC channel will be transmitted from input to output without any alterations).

Whether an STS-1 to a DS3 two-way path/two-way drop and continue ring cross-connection or a DS3 to an STS-1 two-way path/two-way drop and continue ring cross-connection is allowed depends on the port provisioning as indicated below (the FROM and TO ports can be interchanged in the table below):

Ring Port Type	Ring Port STSMAP	Drop Port Type	Drop Port STSMAP	ENT-CRS-T3
OC3STS1	ASYN	T3	N/A	Allowed
OC12STS1	ASYN	T3	N/A	Allowed

ENT-CRS-T3 is denied if:

- Either of the specified FROM or TO DS3 ports are not provisioned (via ENT-T3).
- The specified cross-connection already exists or the transmit side of the TO port is already connected.
- The specified FROM and TO values are identical (the same DS3 port) and CCT of 2WAY is specified.
- The mate STS1 of the specified FROM or TO STS-1 port within the ring OC-3/OC-12 is not provisioned and CCT of 2WAYPR or 2WAYDC is specified.
- Either of the specified FROM or TO port has all cross-connect capacity utilized (an SST of BUSY), or is in a test access operation (an SST of TS).
- Either of the specified FROM and TO ports have subordinated objects cross connected, i.e., DS3 or STS-1 has TRM secondary state.
- The specified FROM or TO port is an STS-1 and the supporting EC1, OC-3, or OC-12 is in a loopback (an SST of LPBK).
- The specified FROM or TO port has subordinated DS1 objects in a loopback (an SST of LPBK) or in a test access operation (an SST of TS).
- The specified FROM or TO port has DS1 objects embedded within the DS3 object and a DS1 object has C-bit loopback established (a DS1 Condition Type of RVCBLPBK).
- If an attempt is made to uni-directionally connect C to A while a uni-directional connection already exists between B to A.
- The command is used to cross connect a DS3 to STS-1 and the STS-1 has VT1.5s assigned (an SST of SDEE).
- The command is used to cross connect a DS3 embedded within an STS-1 (i.e., the FROM or TO parameter is an STS1 AID) and ASYN mapping is not supported by the STS-1 (i.e., the STS-1's STSMAP is not ASYN).
- The command is used to cross-connect a DS3 or STS-1 and one or more supported DS1s are provisioned with FEMETHOD of ATPOLL.
- The command is used to cross connect a DS3 that resides on a DS3 quad (i.e., on a HMU) or in a half shelf that is defined as EP3S48 and EP3S36.
- An invalid parameter value or combination of parameter values is entered.
- CCT=2WAYPR, the odd STS1 of the ring OCn is in a matrix loopback, and the odd+1 is not OOS-MA or OOS-AUMA.

INPUT FORMAT

ENT-CRS-T3 : [TID] : **FROM, TO** : [CTAG] : : [CCT] : [CKTID=] [,CKTIDTF=] [,RDL=] ;

INPUT PARAMETERS

TID < 1-20 VALID TID CHARACTERS >
Default: <SID>
Addressing: None
Description: Target Identifier, specifies the network node TID for the command.

FROM

DS3_AID:
{T3-{1-4800}} (T3-DS3#)

STS1_AID:
{EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#)
{OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#)
{OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#)

Default: Entry Required

Addressing: &&-ranging and &-grouping

Description: DS3 or STS1 AID. If CCT=1WAY, FROM identifies the receive side (from the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY, 2WAYPR or 2WAYDC then either AID of the cross-connection may be used as the FROM AID.

Restrictions: ENT-CRS-T3 is denied if FROM and TO are identical and CCT of 2WAY is entered.
ENT-CRS-T3 is denied if FROM or TO specifies a T3 embedded within EC1, OC-3, or OC-12.
ENT-CRS-T3 is denied if FROM and TO are both STS-1.
ENT-CRS-T3 is denied if FROM or TO is EC1STS1 and CCT of 2WAYPR/2WAYDC is entered.
ENT-CRS-T3 is denied if FROM or TO is part of a ring OC-3/OC-12 and CCT of 1WAY is entered.
Value combinations are verified whether the value is determined from a default value or explicitly entered in the command.

TO

DS3_AID:
{T3-{1-4800}} (T3-DS3#)

STS1_AID:
{EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#)
{OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#)
{OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#)

Default: Entry Required

Addressing: &&-ranging and &-grouping

Description: DS3 or STS1 AID. If CCT=1WAY, TO identifies the transmit side (to the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY, 2WAYPR or 2WAYDC then either AID of the cross-connection may be used as the TO AID.

Restrictions: ENT-CRS-T3 is denied if FROM and TO are identical and CCT of 2WAY is entered.
ENT-CRS-T3 is denied if FROM or TO specifies a T3 embedded within EC1, OC-3, or OC-12.
ENT-CRS-T3 is denied if FROM and TO are both STS-1.
ENT-CRS-T3 is denied if FROM or TO is part of a ring OC-3/OC-12 and CCT of 1WAY is entered.
Value combinations are verified whether the value is determined from a default value or explicitly entered in the command.

CTAG

< 1-6 VALID CTAG CHARACTERS >

Default: < System assigned CTAG value >

Addressing: None

Description: Correlation Tag, associates input command with its output responses.

CCT	{1WAY, 2WAY, 2WAYPR, 2WAYDC}
Default:	{2WAY}
Addressing:	None
Description:	Cross-Connect Type. Values are:
1WAY	One-Way (through matrix) non-ring connection. FROM identifies the receive side (from the network) of the cross-connection.
2WAY	Two-Way (through matrix) ring or non-ring connection. Either AID of the cross-connection may be used as the FROM AID.
2WAYPR	Two-Way Path Protected Ring connection. Either AID of the cross-connection may be used as the FROM AID.
2WAYDC	Two-Way Drop and Continue connection. Either AID of the cross-connection may be used as the FROM AID.
Restrictions:	ENT-CRS-T3 is denied if CCT of 2WAY is entered and FROM and TO are identical. ENT-CRS-T3 is denied if CCT of 1WAY is entered and FROM or TO is a part of a ring OC-3/OC-12. Value combinations are verified whether the value is determined from a default value or explicitly entered in the command.
CKTID=	< 0-45 VALID TID CHARACTERS >
Default:	< No Entry >
Addressing:	None
Description:	FROM and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.
CKTIDTF=	< 0-45 VALID CKTIDTF CHARACTERS >
Default:	< No Entry >
Addressing:	None
Description:	TO and FROM Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.
Restrictions:	ENT-CRS-T3 is denied if a CKTIDTF parameter is entered for a 1WAY cross-connection. This parameter is valid only for command entries with a CCT of 2WAY, 2WAYPR, or 2WAYDC.
RDL=	{N, Y}
Default:	{N}
Addressing:	None
Description:	N = connection is not redlined, Y = connection is redlined.
Restrictions:	ENT-CRS-T3 is denied if RDL=Y is specified while either FROM or TWO is under LPBK (loopback). ENT-CRS-T3 is denied if CCT=1Way and RDL=N is specified for a FROM-TO connection while there is an existing 1WAY TO-FROM RDL=Y connection.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
	/* Cannot connect a port that has FEMETHOD=ATTPOLL. */
IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SARB	Status, All Resources Busy
SDBE	Status, internal Data Base Error
	/*CONN Database Error: <ERROR-STRING> for <AID>*/
	/*Failed to Update Sptg Tps: Status=<ERROR-CODE>*/
	/*Failed to put B2 TP database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*Failed to put CONN database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*Failed to put TP database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*RPP Database Error: <ERROR-STRING> for <AID>*/
	/*TP Database Error: <ERROR-STRING> for <AID>*/
SDNC	Status, Data Not Consistent
SNVS	Status, Not in Valid State
	/*Cannot connect a port that has embedded facilities in TS or LPBK states.*/
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest
	/*Cannot connect a port that has embedded SRC ports.*/
	/*Cannot connect a port that has embedded TAPs.*/
	/*Cannot connect two ports in MTRX loopback*/
	/*One Ring Port in MTRX LPBK, The Other In-Service*/
	/*Ring 2 Port is in MTRX loopback*/
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, a two-way DS3 cross-connection is established between ports T3-2 and T3-12 .

```
ENT-CRS-T3::T3-12,T3-2;
```

In the following example, a one-way DS3 cross-connection is established between ports T3-1 (FROM) and T3-6 (TO). The cross-connection is redlined and assigned a circuit ID of TSTCRKT9.

```
ENT-CRS-T3::T3-1,T3-6:::1WAY:CKTID="TSTCRKT9",RDL=Y;
```

In the following example, a two-way DS3 cross-connection is established between ports T3-1 (FROM) and T3-6 (TO). The FROM-TO side of the connection is assigned a circuit ID of TSTCRKT9, and the TO-FROM side is assigned a circuit ID of TSTCRKT9A.

```
ENT-CRS-T3::T3-1,T3-6:::2WAY:CKTID="TSTCRKT9",CKTIDTF="TSTCRKT9A";
```

In the following example, a two-way DS3 cross-connection is established between a DS3 port T3-1 and STS-1 port OC3STS1-1-3 (STS-1 embedded within an OC-3) for which VTMAP is defined as ASYNC.

```
ENT-CRS-T3::OC3STS1-1-3,T3-1;
```

In the following example, a two-way cross-connection is established between ports T3-15 and T3-24, between ports T3-16 and T3-9, and between ports T3-17 and T3-28, by using ranging.

```
ENT-CRS-T3::T3-15&&-17,T3-24&-9&-28;
```

COMMAND CODE: **ENT-CRS-VT1**
COMMAND NAME: **ENTER CROSS-CONNECT VT1**

PURPOSE

The ENT-CRS-VT1 command creates a cross-connect entity and establishes a one-way, two-way, two-way path ring or two-way drop and continue cross-connection between the specified VT1.5 ports. (Use ENT-CRS-T1 if both the FROM and TO ports are not VT1.5 ports.)

If CCT of 1WAY is specified, a one-way cross-connect is established between the receive side (from the network) of the FROM port and the transmit side (to the network) of the TO port. A one-way cross-connect can be established between the receive and transmit side of the same port (FROM and TO are identical thereby establishing a loopback through the system's cross-connect matrix), can be added as a bridge to an existing one-way or two-way cross-connect, or can be added from a Conference tail to the Conference head (Master) port (refer to ENT-CONF-VT1).

If CCT of 2WAY is specified, a two-way cross-connect is established between the FROM and TO ports. A pass-through cross-connect can be established between the FROM and TO ports if both VT1.5s belong to the same OC3/OC12 ring pair (refer to ENT-RNG-OC3 or ENT-RNG-OC12) and are both in the same timeslot. An unprotected cross-connect can be established between the FROM and TO ports if one VT1.5 is embedded within a ring OC3/OC12 and the other VT1.5 is embedded within an EC1, odd non-ring (linear) OC3, OC12 or EC1, or another ring OC3/OC12.

If CCT of 2WAYPR is specified, a two-way path ring cross-connect is established between the FROM and TO ports. A two-way path ring cross-connect can be established as a nonterminated cross-connect between the FROM and TO ports if one VT1.5 is embedded within a ring OC3/OC12 and the other VT1.5 is embedded in an EC1, odd non-ring OC3/OC12, or ring OC3/OC12.

The system will allow a 2WAYPR connection even when the addressed path or its mate is involved in a matrix loopback connection.

If CCT of 2WAYDC is specified, a two-way drop and continue cross-connect is established between the FROM and TO ports. A two-way drop and continue cross-connect can be established as a nonterminated cross-connect between the FROM and TO ports if one VT1.5 is embedded within a ring OC3/OC12 and the other VT1.5 is embedded in an EC1, odd non-ring OC3/OC12, or ring OC3/OC12.

Executing an ENT-CRS-VT1 causes a state transition for the created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-CRS-VT1 causes following state transition for the ports involved in the cross-connect.

- If this command creates a one-way or a two-way cross-connect, the port will carry an ACT secondary state. If a two-way cross-connect is created which involves a ring OC-3/OC-12, both VT1.5 ports will carry a BUSY secondary state.
- If this command creates a one-way bridge connection on a port that is already two-way cross-connected, then it will carry a BUSY secondary state.
- The containing port (EC1, OC-3, OC-12, and/or STS1) in which this VT1.5 is contained will have TRM secondary state.
- If this command creates a two-way path or a two-way drop and continue ring cross connection, a non-revertive switching VT1 FFP will be created. The VT1 specified in the command shall be the preferred path and the ring mate VT1 shall be the alternate path.

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

If CCT of 1WAY and RDL=Y are specified while there is an existing TO-FROM 1WAY connection with RDL=N status, the 2WAY connection that results will have RDL=Y (redlined) status.

If CCT of 1WAY is specified but RDL status is not specified while there is an existing TO-FROM 1WAY connection with RDL=Y status, both connections will have RDL=Y (redlined) status.

If a CKTID or CKTIDTF parameter is specified for only one side (TO-FROM or FROM-TO) of a 2WAY cross-connection, both sides shall inherit this ID parameter.

If ampersand ranging (&) is used for an AID specifying CKTID or CKTIDTF, the same CKTID or CKTIDTF value shall be applied to each connection within the AID range.

If ampersand ranging (&) is used for an AID specifying an RDL value, the same RDL value shall be applied to each connection within the AID range.

Whether a VT1.5 to VT1.5 cross-connection is allowed depends on the port provisioning as indicated below (the FROM and TO ports can be interchanged in the table below):

FROM Port Type	FROM Port STSMAP	FROM Port VTMAP	TO Port Type	TO Port STSMAP	TO Port VTMAP	ENT-CRS-VT1
VT1	VTFLOAT	Any Value	VT1	VTFLOAT	Any Value	Allowed
VT1	VTFLOAT	ALL, VTBYTE	T3T1 or T1	N/A	N/A	Denied
VT1	VTFLOAT	ALL, VTBYTE	EC1T1	ASYNC	N/A	Denied
VT1	VTFLOAT	ALL, VTBYTE	OC3T1 or OC12T1	ASYNC	N/A	Denied
VT1	VTFLOAT	ASYNC	T3T1 or T1	N/A	N/A	Denied ¹
VT1	VTFLOAT	ASYNC	EC1T1	ASYNC	N/A	Denied ¹
VT1	VTFLOAT	ASYNC	OC3T1 or OC12T1	ASYNC	N/A	Denied ¹
T3T1 or T1	N/A	N/A	T3T1 or T1	N/A	N/A	Denied ¹
T3T1 or T1	N/A	N/A	EC1T1	ASYNC	N/A	Denied ¹
T3T1 or T1	N/A	N/A	OC3T1 or OC12T1	ASYNC	N/A	Denied ¹
EC1T1, OC3T1, or OC12T1	ASYNC	N/A	EC1T1	ASYNC	N/A	Denied ¹
EC1T1, OC3T1, or OC12T1	ASYNC	N/A	OC3T1 or OC12T1	ASYNC	N/A	Denied ¹

Notes: N/A= Not Applicable. 1 = Use ENT-CRS-T1 command.

Though VT1s with different VTMAP are allowed to be cross-connected, the system does not perform any mapping conversion. The system just allows what comes in on the input port to go out the output port.

ENT-CRS-VT1 is denied if:

- The FROM and TO port are not provisioned in a valid combination per the table above.
- Either of the specified FROM or TO VT1.5 ports are not provisioned (using ENT-VT1).
- The specified cross-connection already exists.
- The specified FROM and TO values are identical (the same VT1.5 port) and CCT of 2WAY is specified.
- The mate VT1.5 of the specified FROM or TO VT1.5 port within the ring OC-3/OC-12 is not provisioned and CCT of 2WAYPR or 2WAYDC is specified.
- The specified FROM or its mate and TO ports are involved in a matrix loopback and CCT of 2WAY is specified.
- Either of the specified FROM or TO port has all cross-connect capacity utilized (an SST of BUSY), is in a test access operation (an SST of TS), or is in a roll operation (an SST of ROLL).

- The specified FROM or TO port is an embedded VT1.5 and the supporting STS-1, EC1, OC-3, or OC-12 is in a loopback (an SST of LPBK), or the supporting STS-1 is intact cross-connected (an SST of ACT or BUSY).
- A one-way bridge connection is specified that requires a first-stage matrix bridge connection and the first-stage matrix time slots reserved for broadcast connections are all in use (refer to RTRV-POOL).
- An invalid parameter value or combination of parameter values is entered.
- The system will not allow a 2WAYDC connection when the addressed path or its mate is involved in a matrix loopback connection.
- CCT=2WAYPR, the odd VT1 of the ring OCn is in a matrix loopback, and the odd+1 is not OOS-MA or OOS-AUMA.
- CCT=2WAY and the even side of a ring port is specified.
- RDL=Y is specified while either FROM or TO is under LPBK (loopback).
- A CCT of 1Way and RDL=N is specified for a FROM-TO connection while there is an existing 1WAY TO-FROM RDL=Y connection.

INPUT FORMAT

ENT-CRS-VT1 : [TID] : **FROM,TO** : [CTAG] : : [CCT] : [CKTID=] [,CKTIDTF=] [,RDL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
FROM	VT1_AID; {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID. If CCT=1WAY, FROM identifies the receive side (from the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY, 2WAYPR or 2WAYDC then either AID of the cross-connection may be used as the FROM AID. Restrictions: ENT-CRS-VT1 is denied if FROM and TO are identical and CCT of 2WAY is entered. ENT-CRS-VT1 is denied if FROM and TO both are not VT1.5. ENT-CRS-VT1 is denied if FROM or TO is part of a ring OC-3/OC-12 and CCT of 1WAY is entered.
TO	VT1_AID; {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID. If CCT=1WAY, TO identifies the transmit side (to the network) of the cross-connection specified by the FROM,TO AID pair. If CCT=2WAY, 2WAYPR or 2WAYDC then either AID of the cross-connection may be used as the TO AID. Restrictions: ENT-CRS-VT1 is denied if FROM and TO are identical and CCT of 2WAY is entered.

ENT-CRS-VT1 is denied if FROM and TO both are not VT1.5.
ENT-CRS-VT1 is denied if FROM or TO is part of a ring OC-3/OC-12 and CCT of 1WAY is entered.

CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CCT	{1WAY, 2WAY, 2WAYPR, 2WAYDC} Default: {2WAY} Addressing: None Description: Cross-Connect Type. Values are: 1WAY One-Way (through matrix) non-ring connection 2WAY Two-Way drop (through matrix) ring or non-ring connection or two-way pass-through ring connection 2WAYPR Two-Way Path Protected Ring connection 2WAYDC Two-Way Drop and Continue connection Restrictions: ENT-CRS-VT1 is denied if CCT of 2WAY is entered and FROM and TO are identical. ENT-CRS-VT1 is denied if CCT of 1WAY is entered and FROM or TO is a part of a ring OC-3/OC-12.
CKTID=	< 0-45 VALID TID CHARACTERS > Default: < No Entry > Addressing: None Description: FROM and TO Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string.
CKTIDTF=	< 0-45 VALID CKTIDTF CHARACTERS > Default: < No Entry > Addressing: None Description: To and FROM Circuit ID. 0 to 45 ASCII characters within enclosing double quotes. Semicolon, asterisk, greater-than, less-than, double quote, and backslash characters are prohibited. Empty double quotes (ie "") indicate a NULL string. Restrictions: ENT-CRS-VT1 is denied if a CKTIDTF parameter is entered for a 1WAY cross-connection. This parameter is valid only for command entries with a CCT of 2WAY, 2WAYPR, or 2WAYDC.
RDL=	{N, Y} Default: {N} Addressing: None Description: N = connection is not redlined, Y = connection is redlined. Restrictions: ENT-CRS-VT1 is denied if RDL=Y is specified while either FROM or TO is under LPBK (loopback). ENT-CRS-VT1 is denied if a CCT of 1Way and RDL=N is specified for a FROM-TO connection while there is an existing 1WAY TO-FROM RDL=Y connection.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SARB	Status, All Resources Busy
SDBE	Status, internal Data Base Error
	/*CONN Database Error: <ERROR-STRING> for <AID>*/
	/*Failed to Update Sptg Tps: Status=<ERROR-CODE>*/
	/*Failed to put B2 TP database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*Failed to put CONN database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*Failed to put TP database record <RECORD-NUMBER> for status <ERROR-CODE>*/
	/*RPP Database Error: <ERROR-STRING> for <AID>*/
	/*TP Database Error: <ERROR-STRING> for <AID>*/
SDNC	Status, Data Not Consistent
SNVS	Status, Not in Valid State
	/*Can't bridge a port connected to a port in MTRX lpbk.*/
	/*Can't bridge a port in MTRX lpbk.*/
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest
	/*Cannot connect two ports in MTRX loopback*/
	/*One Ring Port in MTRX LPBK, The Other In-Service*/
	/*Ring 2 Port is in MTRX loopback*/
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, a one-way VT1.5 cross-connection is established between ports EC1VT1-1-3-3, a VT1.5 embedded within an EC1 (FROM) and OC3VT1-5-3-7-4, a VT1.5 embedded within an OC-3. (TO).

```
ENT-CRS-VT1::EC1VT1-1-3-3,OC3VT1-5-3-7-4:::1WAY;
```

In the following example, a two-way VT1.5 cross-connection is established between ports EC1VT1-1-1-4 and EC1VT1-12-3-4. The cross-connection is redlined and assigned a circuit ID of TSTCKT01

```
ENT-CRS-VT1::EC1VT1-12-3-4,EC1VT1-1-1-4:::CKTID="TSTCKT01",RDL=Y;
```

In the following example, a two-way VT1.5 cross-connection is established between ports EC1VT1-1-1-4 and EC1VT1-12-3-4. The FROM-TO side of the cross-connection is assigned a circuit ID of TSTCKT01, and the TO-FROM side is assigned a circuit ID of TSTCKT01A

```
ENT-CRS-VT1::EC1VT1-12-3-4,EC1VT1-1-1-4:::CKTID="TSTCKT01",  
CKTID="TSTCKT01A;
```

In the following example, a two-way cross-connection is established between ports EC1VT1-48-7-1 and OC3VT1-5-3-7-4, between ports EC1VT1-48-7-2 and EC1VT1-12-3-3, and between ports EC1VT1-48-7-3 and EC1VT1-5-7-2, by using ranging.

```
ENT-CRS-VT1::EC1VT1-48-7-1&&-3,OC3VT1-5-3-7-4&EC1VT1-12-3-3&EC1VT1-5-7-2;
```

COMMAND CODE: **ENT-EC1**
COMMAND NAME: **ENTER EC1**

PURPOSE

The ENT-EC1 command creates (assigns and provisions) an STSX-1 section and line object entity (AID).

The default values for the PST parameter and keyword parameters can be modified with the SET-DFLT-EC1 command. The current default values can be retrieved using the RTRV-DFLT-EC1 command.

An EC1 that has not been provisioned has a PST,SST of OOS-MA,UAS or OOS-AUMA,UAS&DSBLD (OOS-AUMA if the supporting equipment EP3 is not provisioned). Executing an ENT-EC1 command causes the following primary state transitions for the specified EC1. Secondary states associated with the EC1 before and after the command is executed depend upon events detected by the system. Refer to Appendix G State Transitions, for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Present Default Database Value is:		
	OOS	IS	IS, AINS
<NoVal>, <NoVal>	OOS-MA	IS	OOS-AU, AINS
IS, <NoVal>	IS	IS	OOS-AU, AINS
IS,AINS	OOS-AU, AINS	OOS-AU, AINS	OOS-AU, AINS
OOS,<NoVal>	OOS-MA	OOS-MA	Denied
OOS,AINS	Denied	Denied	Denied
<NoVal>,AINS	Denied	OOS-AU, AINS	OOS-AU, AINS
<NoVal>,AINS-DEA	Denied	Denied	IS
IS,AINS-DEA	Denied	Denied	IS
OOS,AINS-DEA	Denied	Denied	OOS-MA

Note: 1. <NoVal> means no value is entered for that parameter.

When the ENT-EC1 command is successfully executed on an EP3 module, the electrical DS3 corresponding to this EC1 and the remaining two electrical DS3s on the EP3 module on which this EC1 resides will enter OOS-AUMA, UAS, DSBLD states. This means that the other two ports on the module on which the provisioned EC1 resides cannot be provisioned as electrical DS3s; they have to be provisioned as EC1s.

When an EC1 is provisioned to an OOS-MA state, a MAN condition type is set for the specified EC1. The MAN condition type is cleared when the EC1 is provisioned to an IS state.

When an EC1 is in an OOS-MA, OOS-AUMA, or OOS-AU,AINS state, no EC1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the EC1, but EC1 alarm conditions are monitored (retrievable with the RTRV-EC1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-EC1 command) for the EC1. An EC1 in an OOS-AU,AINS state transitions to an IS state when all EC1 near-end alarm conditions for that EC1 have cleared.

An ENT-EC1 command is denied if:

- The specified EC1's supporting object, the EP3 I/O module, is not provisioned (i.e., EC1 has an SST of DSBLD).
- The specified EC1 resides on a module which itself resides in a half shelf that is defined as EP3S48, EP3E48, EP3S36, or EP3E36 (See ENT-EQPT).
- The specified EC1 is already provisioned.
- An invalid parameter value or combination of parameter values is entered.

When an ENT-EC1 command is executed, the default values for the following items are automatically provisioned for the specified EC1, and all PM data collection registers for the EC1 are automatically reset to zero. These default values cannot be changed, except for PM attributes, unless the specified EC1 has first been provisioned by an ENT-EC1 command.

- Condition type attributes (refer to Appendix C, Condition Types and SET-ATTR-EC1)
- Performance monitoring (PM) attributes (refer to SET-PMATTR-ALL)
- PM mode (refer to SET-PMMODE-EC1)
- PM threshold levels (refer to SET-TH-EC1)
- PM reports (refer to ALW-PMREPT-EC1)

I/O protection switching is disabled if all three EC1 ports supported by the EP3 I/O circuit pack are provisioned to an OOS-MA or OOS-AUMA state. I/O protection switching only occurs if at least one of the supporting EC1s on the supporting EP3 I/O circuit pack is provisioned to an IS or an OOS-AU state.

INPUT FORMAT

ENT-EC1 : [TID] : AID : [CTAG] : : [AINSTH=] : [PST] [, SST] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port or range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH-MM:{00-48} - {00-59} } Default: System start-up value. Factory Default = 8 hours. Addressing: None Description: Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is: HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively. Restrictions: If 48 is specified in HH, then MM has to be 00.
PST	{IS, OOS} Default: <Value retrieved with RTRV-DFLT-EC1 command> Addressing: None Description: Primary State, specifies the desired primary state of the EC1 entity when provisioned. Values are: IS In-Service, the EC1 is provisioned to an IS or OOS-AU state. OOS Out-Of-Service, the EC1 is provisioned to an OOS-AUMA or OOS-MA state. Restrictions: ENT-EC1 is denied if PST of OOS and SST of AINS is entered.

SST {AINS, AINS-DEA}

Default: <Value retrieved with RTRV-DFLT-EC1 command>

Addressing: None

Description: Secondary State, specifies the secondary state to provision the EC1.
Values are:

AINS Automatic In-Service, if PST,SST of IS,AINS is entered the EC1 is provisioned to an OOS-AU,AINS state.

AINS-DEA Automatic In-Service-Deactivate, the EC1 is not provisioned to an OOS-AU,AINS state. The EC1's SST value is entered as <Null> (unpopulated), and the SST state is determined by its provisioned PST value and system detected events.

Restrictions: ENT-EC1 is denied if SST of AINS and PST of OOS is entered.
ENT-EC1 is denied if SST of AINS-DEA is entered and the current EC1 state is not OOS-AU,AINS (a SST state of AINS).

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Free Form Informational Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* DFLT Database Error: <ERROR-STRING> */ /* EC1 Shelf info error, Error=<ERROR-STRING> */ /* Error disabling corresponding T3s, Error=<ERROR-STRING> */ /* Error enabling supported STS1, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, EC1 port EC1-24 provisioning is changed to the OOS-AU,AINS state.

```
ENT-EC1::EC1-24:::::IS,AINS;
```

In the following example, EC1 port EC1-24, EC1-25 and EC1-26 are being provisioned using &&-ranging, to the OOS-MA state, but the port EC1-25 is already provisioned.

```
ENT-EC1::EC1-24&&-26:::::OOS;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 PRTL
  "EC1-25:ERRCDE=SNVS"
  /* Status, Not in Valid State */
/* ENT-EC1::EC1-24&&-26:::::OOS [Pfc518] (1) */
;
```

RTRV-EC1
SET-DFLT-EC1
```

COMMAND CODE: **ENT-EQPT**
COMMAND NAME: **ENTER EQUIPMENT**

PURPOSE

The ENT-EQPT command assigns an equipment object entity (AID) and provisions the specified equipment, regardless of whether the equipment is installed in the system.

If the specified equipment is being entered to the IS state, any off-line diagnostic test is executed and any applicable firmware (except for an MCB), software, and provisioning data are downloaded before the equipment is placed in-service. If CMDMDE=NORM is entered and the diagnostic test or the download fails, the ENT-EQPT command is denied. If CMDMDE=FRCD is entered and the diagnostic test or the download fails, the command is completed and an equipment-specific condition type is set for the failed equipment entity.

If an AID of SHELF-2-1-1 or SHELF-3-1-1 to provision a CS SHELF and PST of IS is entered, all modules in the SHELF (i.e., M40, CDB, P56, and SPB) are provisioned. If the modules provisioned are present in the slot, power-on-diagnostics is run on the modules before they are placed in-service.

If an AID of I/O SHELF and PST of IS is entered, all modules in the I/O SHELF (i.e., EP3, ES1, O1B, O4M, S3M, IPB, CDB, SPB, P39, P56, and RPB), and all modules in the ES (i.e., M16s and M32s depending on the MTXSTYPE, CDA, CDB, P56, and SPB if not already provisioned, and cabling between I/O dual subrack and the ES) are provisioned. If the modules provisioned are present in their slots, power-on-diagnostics are run on the modules before they are placed in-service.

If an AID of SI48-O4M I/O SHELF with PST of OOS-MA and SST of MT is entered, all working O4M and S3M modules in the shelf are provisioned in OOS-MA,MT state. All protect O4M and S3M modules in the shelf are provisioned in IS,STBYH state. If provisioned modules are present in their slots, power-on-diagnostics are run on the modules before they are placed in-service.

If an AID of I/O SHELF and PST of OOS is entered, all modules in the I/O SHELF *except* EP3, ES1, O1B, O4M and S3M (i.e., IPB, RPB, CDB, SPB, P39, and P56), and all modules in the ES (i.e., M16 and M32 depending on the MTXSTYPE, CDA, CDB, P56, and SPB if not already provisioned, and cabling between I/O dual subrack and the ES) are provisioned. If the modules provisioned are present in the slot, power-on-diagnostics are run on the modules before they are placed in-service. The EP3, ES1, O1B, O4M, and S3M modules remain in an OOS-MA, UAS or OOS-AUMA, UAS state (whichever was present before ENT-EQPT was issued).

If an AID specifies a working O4M module with OOS-MA,MT state, the working O4M is provisioned in OOS-MA,MT state. If an AID specifies a working S3M module, the working S3M is provisioned in OOS-MA, MT state. If provisioned modules are present in their slots, power-on-diagnostics are run on the modules before they are placed in-service.

NOTE: Although the ON parameter value can be an integer from 0 to 999999, the user should limit the number of delayed activation commands at any given time to 500.

An equipment entity that has not been provisioned has a PST,SST of OOS-AUMA,UEQ&UAS or OOS-MA,UAS (depending on whether the equipment is installed in the system). Executing an ENT-EQPT command causes the following primary state transitions for the specified equipment entity. Secondary states associated with the equipment entity before and after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions for each type of equipment entity.

Current PST,SST	Next PST State if ENT-EQPT Entered with PST,SST Value of:		
	IS,<NoVal>	OOS,<NoVal>	OOS,MT
For EP3, ES1, M16, M32, M40, O1B, O4M, and S3M Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	OOS-AUMA	OOS-AUMA
OOS-MA,UAS	IS (if eqpt functional) IS-ANR (diags fail but downloads) OOS-AU (download fails)	OOS-AUMA (if wrong eqpt) OOS-MA (otherwise)	OOS-AUMA (if wrong eqpt) OOS-MA (otherwise)
For DSI, HMU, and LMU Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	OOS-AUMA	OOS-AUMA
OOS-MA,UAS	IS (if eqpt functional) IS-ANR (diags fail but downloads) OOS-AU (if wrong eqpt.)	OOS-AUMA (if wrong eqpt) OOS-MA (otherwise)	OOS-AUMA (if wrong eqpt) OOS-MA (otherwise)
For CDA, CDB, EOB, IOB, IPB, P39, P56, OXB, and RPB Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	OOS-AUMA	Denied
OOS-MA,UAS	IS (if eqpt functional) IS-ANR (diags fail but provisions) OOS-AU (provisioning fails)	OOS-AUMA (if wrong eqpt) OOS-MA (otherwise)	Denied
For ACM, CIM, CPU, DSB, ICM, IPU, SIO, and SPB Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	OOS-AUMA	Denied
OOS-MA,UAS	IS (if eqpt functional) OOS-AU (provisioning fails)	OOS-MA	Denied
For LT1, LT2, LT4, LT5, LT8, RDU, PDU, and SBT Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	Denied	Denied
OOS-MA,UAS	IS	Denied	Denied
For PSF Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	OOS-AUMA	Denied
OOS-MA,UAS	IS (if eqpt functional) OOS-AU (Pwr-Lock Off)	OOS-MA	Denied
For PST Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	Denied	Denied
OOS-MA,UAS	IS (if eqpt functional) OOS-AU (Pwr-Lock Off)	Denied	Denied
For DSK Equipment Entities:			
OOS-MA,UAS	IS (if disk equalizes) OOS-AU (disk equalization fails)	OOS-MA	Denied
For OPD Equipment Entities:			
OOS-MA,UAS	IS	Denied	Denied
For RSP Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	Denied	Denied

Current PST,SST	Next PST State if ENT-EQPT Entered with PST,SST Value of:		
	IS,<NoVal>	OOS,<NoVal>	OOS,MT
OOS-MA,UAS	IS (if eqpt functional) OOS-AU (if provisioning fails)	Denied	Denied
For ACL Equipment Entities:			
OOS-MA,UAS	IS (if supporting CIM is IS) OOS-AU (if CIM is not IS)	Denied	Denied
OOS-MA,UAS	IS (if supporting CIM is IS) OOS-AU (if CIM is OOS-AU) Denied otherwise	OOS-MA/OOS-AUMA (if supporting CIM is OOS-MA/OOS-AUMA) Denied otherwise	Denied
For IO SHELF and QUAD Equipment Entities:			
OOS-MA,UAS	IS	IS	IS
For CS and ES SHELF Equipment Entities :			
OOS-MA,UAS	IS	IS	Denied
For PRT and SWI Equipment Entities:			
OOS-AUMA,UEQ&UAS	OOS-AU	Denied	Denied
OOS-MA,UAS	IS	Denied	Denied

A MAN condition type is set for the specified equipment entity if ENT-EQPT with PST of OOS and SST of <No-Val> is entered (provisioned to an OOS-MA or OOS-AUMA state).

A TSA condition type is set for the specified DSI, EP3, ES1, HMU, LMU, M16, M32, O1B, O4M, or S3M circuit pack if ENT-EQPT with PST of OOS and SST of MT is entered (the specified DSI, EP3, ES1, HMU, LMU, M16, M32, O1B, O4M, or S3M circuit pack is provisioned to an OOS-MA,MT or OOS-AUMA,MT state).

An IMPROPRMVL condition type is set for the specified equipment entity if the specified equipment is not installed in the system and ENT-EQPT with PST of IS is entered (provisioned to an OOS-AU state).

A BPMISM condition type and SST of MEA are set for the specified SHELF if LHSTYPE or UHSTYPE does not match the type of shelf equipped in the system (i.e., if LHSTYPE and/or UHSTYPE specify a SI36 shelf and the actual equipped shelf type is a SI48 shelf).

When an ENT-EQPT command is successfully executed with a PST of IS, PBTYPE of RPB, while an IPB module is physically located in the RPB slot, the IPB module transits to an OOS-AU,MEA state and a PRCDRERR condition is set.

When an ENT-EQPT command is successfully executed with a PST of IS, PBTYPE of IPB, while an RPB module is physically located in the IPB slot, the RPB module transits to an OOS-AU,MEA state and a PRCDRERR condition is set.

An equipment specific condition type is set for the specified equipment entity if the equipment is partially or totally failed and ENT-EQPT with PST of IS is entered (provisioned to an OOS-AU or IS-ANR state). Refer to Appendix C, Condition Types for a list and definition of condition types.

The provisioning of supporting equipment must be performed prior to the provisioning of some types of equipment entities. The supporting equipment provisioning dependencies are:

- For DSK and OPD equipment: the associated PST equipment entity must be provisioned first.
- For ACL equipment: the associated ACM, CIM, LT4, and LT8 equipment entities must be provisioned first.
- For P39 and P56 equipment: the associated SHELF equipment entity must be provisioned first.
- For SPB equipment: the associated ACL, P56, and SHELF equipment entities must be provisioned first.
- For CDB, DSB, EP3, ES1, IPB, O1B, O4M, RPB, and S3M equipment, the associated SHELF equipment entity must be provisioned first.

- For O4M equipment: all three associated S3M equipment entities must be provisioned first.
- For EP3 equipment other than the EP3 located in the left-most card slot of an SI48 half-shelf: the EP3 equipment entity physically located to the left of the specified EP3 must be provisioned first.
- For ES1 equipment other than the ES1 located in the left-most card slot of an SI48 half-shelf: the ES1 equipment entity physically located to the left of the specified ES1 must be provisioned first.
- For DSI, PRT, and SWI equipment: the associated DS1 QUAD equipment entity must be provisioned first.
- For HMU equipment: the associated DS3 QUAD equipment entity must be provisioned first.
- For M16, M32 or M40 equipment, the associated Matrix SHELF equipment entity must be provisioned first.
- For AID=SHELF, both LHSTYPE and UHSTYPE do not refer to the same half shelf type (i.e., O1Bxx48, O4Mxx48 or {EP3/ES1}x48, {EP3/ES1}x36 half shelf type)

When the shelf 1 in Center Stage rack 2 and rack 3 is provisioned, the default cards will be M40s.

If an AID of SHELF or QUAD (identifies an I/O shelf or I/O quad) is specified in an ENT-EQPT command, the SHELF/QUAD entity transitions to a PST of IS, regardless of whether a PST of IS or OOS is entered.

If an AID of SHELF and a PST of IS is entered in an ENT-EQPT command, all of the associated equipment in the shelf, *including* the I/O circuit packs and the supporting equipment for the shelf (i.e., the EP3, ES1, O1B or O4M I/O circuit packs, the supporting S3M, CDB, IOB, IPB, RPB, P39, P56, EOB, and SPB circuit packs for the shelf, the associated End Stage CDA, CDB, M16, M32, P56, and SPB circuit packs if not previously provisioned, the associated ACL, ACM, CIM, LT4, and LT8 if not previously provisioned, the associated CDB, EOB, IOB, P56, and SPB circuit packs and the cables between the I/O shelf and the EOC shelf if not already provisioned, and any P56 and SPB circuit packs in other I/O shelves required to maintain SPB presence detection) are automatically provisioned as if an ENT-EQPT command was executed with a PST of IS for each equipment entity. If the specified SHELF is the first shelf in the rack/bay, the associated PDU is also automatically provisioned to an IS state.

If an AID of SHELF and a PST of OOS,<NoVal> is entered in an ENT-EQPT command, all of the associated equipment in the shelf (*excluding* the I/O circuit packs and the S3Ms) and the supporting equipment for the shelf are automatically provisioned as if an ENT-EQPT command was executed with a PST of IS for each equipment entity. If the specified SHELF is the first shelf in the rack/bay, the associated PDU is also automatically provisioned to an IS state.

If an AID of SHELF and a PST,SST of OOS,MT is entered in an ENT-EQPT command, all of the associated equipment in the shelf and the supporting equipment for the shelf, (*except* the I/O circuit packs, S3Ms and the supporting End Stage M16 or M32 circuit packs), are automatically provisioned as if an ENT-EQPT command was executed with a PST of IS for each equipment entity. In addition, the associated EP3, ES1, O1B, O4M, or S3M I/O circuit packs and the End Stage M16 or M32 circuit packs (if not previously provisioned) are automatically provisioned as if an ENT-EQPT command was executed with a PST,SST of OOS,MT for each EP3, ES1, M16, M32, O1B, O4M, and S3M equipment entity.

If an AID of QUAD and a PST of IS is entered in an ENT-EQPT command, all of the associated equipment in the quad, *including* the I/O circuit packs, and the supporting equipment for the quad (i.e., the DSI or LMU and HMU I/O circuit packs, the supporting IPU, OXB, PRT, PSF, and SWI if not previously provisioned, the associated End Stage CDA, CDB, M16, M32, P56, and SPB circuit packs if not previously provisioned, the associated ACL, ACM, CIM, LT4, and LT8 if not previously provisioned, the associated CDB, EOB, P56, and SPB circuit packs and the cables between the I/O quad and the EOC shelf if not already provisioned, and any IPU and PSF circuit packs in other I/O quads required to maintain IPU presence detection) are automatically provisioned as if an ENT-EQPT command was executed with a PST of IS for each equipment entity. If the specified QUAD is the first quad in the rack/bay, the associated RDU is also automatically provisioned to an IS state.

If an AID of QUAD and a PST of OOS,<NoVal> is entered in an ENT-EQPT command, all of the associated equipment in the shelf, *excluding* the I/O circuit packs, and the supporting equipment for the quad are automatically provisioned as if an ENT-EQPT command was executed with a PST of IS for each equipment entity. If the specified QUAD is the first quad in the rack/bay, the associated RDU is also automatically provisioned to an IS state.

If an AID of QUAD and a PST,SST of OOS,MT is entered in an ENT-EQPT command, all of the associated equipment in the shelf and the supporting equipment for the shelf, *except* the I/O circuit packs, and the supporting End Stage M16 or M32 circuit packs, are automatically provisioned as if an ENT-EQPT command was executed with a PST of IS for each equipment entity. In addition, the associated DSI or HMU and LMU I/O circuit packs and the End Stage M16 or M32 circuit packs (if not previously provisioned) are automatically provisioned as if an ENT-EQPT command was executed with a PST,SST of OOS,MT for each DSI, HMU, LMU, and M16, M32 equipment entity.

If an AID of SHELF is entered in an ENT-EQPT command, the system does *not* automatically provision the DSB module. When the DSB is successfully provisioned with the ENT-EQPT and a PST of IS, all of the upper layer parameters and specific lower layer parameters are initialized.

An ENT-EQPT command can be scheduled for delayed activation. However, command parsing and parameter validation is not performed until the command is executed (at the delay activated scheduled date and time).

An ENT-EQPT command is denied if:

- The specified equipment entity does not have an SST of UAS.
- A SHELF or QUAD equipment entity is specified and the SHELF or QUAD is already IS.
- A supporting equipment entity is not provisioned prior to provisioning a dependent equipment entity. (Refer to the paragraph, above, on supporting equipment provisioning dependencies.)
- The command is issued to provision a DSB module in a half-shelf that is not defined as carrying O1B, O4M, or S3M modules.
- The command is issued to provision an IPB in a shelf that is defined to carry an RPB (i.e., PBTYP=RPB).
- The command is issued to provision an RPB in a shelf that is defined to carry an IPB (i.e., PBTYP=IPB).
- The command is issued to provision LT8s in an ACL slot and if one or more LTxs in the other ACL slots is already provisioned as LT4s.
- The command is issued to provision LT4s in an ACL slot and if one or more LTxs in the other ACL slots is already provisioned as LT8s.
- The command is issued to provision an I/O SHELF above the current system size.
- An end stage SHELF and ESTYPE of M32 is entered and the specified end stage is not a high density backplane.
- The PBTYP parameter has been entered, but AID has not been set to an I/O SHELF. IPBs can be specified for I/O shelves containing EP3, ES1, or O1B modules. RPBs can be specified only in I/O shelves containing O1B or O4M modules.
- The command is issued to provision a working O4M module with OOS-MA,MT state and any of its associated working S3M modules are not in OOS-MA,MT state.
- The command is issued to provision a protection O4M module or any protection S3M module with OOS-MA,MT state.
- The command is issued with the AID of a working O4M module with no SST specified and any of the supporting S3Ms has MT secondary state.
- An invalid parameter value or combination of parameter values is entered.
- The command is issued to provision an expansion shelf that is not upgraded to LT8.
- If the LHSTYP and the UHSTYP both do not refer to O1B half shelf type or O4M half shelf type.
- The command is entered on a 240-, 2688-, or 3360-port system, and a value other than M32 is specified for ESTYPE.
- The command is entered on a 240-port system, and QTYPE=DS3 or LHSTYP/UHSTYP=EP3F36, EP3E36, EP3S36 or ES136.
- The command is entered on a 240-port system, and an LT8 AID is specified along with GRTHSTYP=LT4.
- The command is entered on a 240-port system, and MTXINTF=ELECT. 240-port system shelves can only be optically connected.
- The command is entered on a 240-port system, and an AID of CIM or LT4 is entered.
- The system size is 3360 ports, AID=SHELF, the shelf is located in the fifth clover, and MTXINTF has a value other than OPTCL.
- The system size is 3360 ports, LHSTYP/UHSTYP=EP3F36, EP3E36, EP3S36, or ES136, and the AID to be provisioned resides in leaf 5.

- The system size is 2688 ports, LHSTYPE/UHSTYPE=EP3F36, EP3E36, EP3S36, or ES136, and the AID to be provisioned resides in an expansion shelf.

Default: Entry Required
Addressing: None
Description: Equipment AID, identifies the equipment entity. Refer to Appendix B Access Identifiers (AIDs) for a definition of equipment mnemonics.
Restrictions: ENT-EQPT is denied if the specified AID does not identify an EP3 or ES1 circuit pack and a LBO1, LBO2, or LBO3 value is entered.
 ENT-EQPT is denied if a value for DFLTSIG is entered and the specified AID does not identify an EP3 circuit pack and the corresponding LHSTYPE or UHSTYPE is not provisioned as {EP3F36, EP3F48}.
 ENT-EQPT is denied if the specified AID does not identify a SHELF equipment entity and an LHSTYPE or UHSTYPE value is entered.
 ENT-EQPT is denied if the specified AID does not identify a SHELF or QUAD equipment entity and a value for MTXINTF is entered.
 ENT-EQPT is denied if the specified AID does not identify a main/working EP3, ES1, O1B, O4M, S3M entity or an M16, M32, SHELF, or QUAD entity and an SST of MT is entered.

ENT-EQPT is denied if the specified AID identifies a protection O1B, O4M, or S3M entity and an SST of MT is entered.

ENT-EQPT is denied if the specified AID identifies an ACL, LT1, LT2, LT4, LT5, LT8, OPD, PST, RSP, or SBT equipment entity and a PST value of OOS is entered.

ENT-EQPT is denied if the specified AID identifies an EP3 circuit pack and the corresponding Shelf LHSTYPE or UHSTYPE is not provisioned with {EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48}.

ENT-EQPT is denied if the specified AID identifies an ES1 circuit pack and the corresponding Shelf LHSTYPE or UHSTYPE is not provisioned with {ES136, ES148}.

ENT-EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in a mixture of SI36 and SI48 half-shelves or shelves specified within the same rack.

ENT-EQPT is denied if the specified AID identifies an EOB in a SI48 half-shelf which is not defined as a Remote I/O shelf (i.e., MTXINTF is not OPTCL).

ENT-EQPT is denied if the specified AID identifies a DSB module in a half-shelf that is not defined as carrying O1B or O4M modules.

ENT-EQPT is denied if the specified AID identifies an M16 module in an ES SHELF that is defined with ESTYPE of M32.

ENT-EQPT is denied if the specified AID identifies a SHELF-2-1-1 or SHELF-3-1-1 to provision a CS SHELF and PST of OOS is entered.

ENT-EQPT is denied when an AID of {SHELF-{9, 21, 35, 43}-1-1}, {SHELF-{15, 27, 31, 39}-3-1}, or a remote companion SHELF {SHELF-{112-135}-{1,3}-1} is entered and the LHSTYPE/UHSTYPE do not match the shelf type of O1B or O4M (OC3 or OC12, respectively) or the LHSTYPE/UHSTYPE specifies an OC3/OC12 mix in the same shelf.

ENT-EQPT is denied when an AID of {SHELF-{9, 21, 35, 43}-1-1}, {SHELF-{15, 27, 31, 39}-3-1}, or a remote companion SHELF {SHELF-{112-135}-{1,3}-1} is entered and its associated OCn companion shelf is already provisioned as an SI48-ES1, SI48-EP3, SI36, or DS_n shelf.

ENT-EQPT is denied when a main shelf is entered to provision an SI48-ES1, SI48-EP3, SI36, or DS_n shelf and the associated companion shelf is already provisioned as an OC_n companion shelf.

ENT-EQPT is denied when an AID for a remote companion SHELF {SHELF-{112-135}-{1,3}-1} is entered, but the ACL link assigned to the companion shelf is currently used by an ASYNC rack/bay.

When an ENT-EQPT command with an AID for a companion SHELF is entered, the provisioning of the ASYNC shelves which are assigned the same ACL link is denied.

CTAG	<p><1–6 VALID CTAG CHARACTERS></p> <p>Default: <System Assigned CTAG Value></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>				
ON	<p>{ON_AID:0–999999, <NoVal>}</p> <p>Default: <NoVal></p> <p>Addressing: None</p> <p>Description: Order Number, unique user–assigned integer number (up to six digits) used to identify scheduled (delay activated) commands. Values are:</p> <table> <tr> <td>{0–999999}</td><td>User–assigned Order Number. The command is scheduled to be executed as specified by DATE and TIME. If no value is entered for DATE or TIME, the command is scheduled for delayed manual activation (the command is entered in the delayed activation table and manually scheduled by using the ACT–DA command).</td></tr> <tr> <td><NoVal></td><td>No Value, the command is executed immediately. (No value is entered for ON (Order Number), DATE, and TIME if ENT–EQPT is to be executed immediately – not delay activated.)</td></tr> </table> <p>Restrictions: ENT–EQPT is denied if no value is entered for ON (Order Number) and a value is entered for either DATE, TIME, or FLAG.</p>	{0–999999}	User–assigned Order Number. The command is scheduled to be executed as specified by DATE and TIME. If no value is entered for DATE or TIME, the command is scheduled for delayed manual activation (the command is entered in the delayed activation table and manually scheduled by using the ACT–DA command).	<NoVal>	No Value, the command is executed immediately. (No value is entered for ON (Order Number), DATE, and TIME if ENT–EQPT is to be executed immediately – not delay activated.)
{0–999999}	User–assigned Order Number. The command is scheduled to be executed as specified by DATE and TIME. If no value is entered for DATE or TIME, the command is scheduled for delayed manual activation (the command is entered in the delayed activation table and manually scheduled by using the ACT–DA command).				
<NoVal>	No Value, the command is executed immediately. (No value is entered for ON (Order Number), DATE, and TIME if ENT–EQPT is to be executed immediately – not delay activated.)				

DATE	{YY-MM-DD:{00-37,70-99} – {1-12, ALL} – {1-31, ALL}, {DAY:{SUN, MON, TUE, WED, THU, FRI, SAT, EVEN, ODD, ALL} }, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	<p>Date, specifies the date the command is scheduled to be executed. A specific date is specified by the value format <YY> – <MM> – <DD> where <YY> is the year, <MM> is the month, <DD> is the day. Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and 00 through 37 are interpreted as the year 2000 through the year 2037. Values are:</p> <p><YY> – <MM> – <DD> Command is scheduled to be executed on the specified year, month, and day.</p> <p><YY> – <MM> – ALL Command is scheduled to be executed every day on the specified year and month.</p> <p><YY> –ALL– <DD> Command is scheduled to be executed every month on the specified year and day.</p> <p><YY> –ALL–ALL Command is scheduled to be executed every day of every month of the specified year.</p> <p>ALL– <MM> – <DD> Command is scheduled to be executed every year on the specified month and day.</p> <p>ALL– <MM> –ALL Command is scheduled to be executed every day of every year on the specified month.</p> <p>ALL–ALL– <DD> Command is scheduled to be executed every month of every year on the specified day.</p> <p>SUN Command is scheduled to be executed every Sunday.</p> <p>MON Command is scheduled to be executed every Monday.</p> <p>TUE Command is scheduled to be executed every Tuesday.</p> <p>WED Command is scheduled to be executed every Wednesday.</p> <p>THU Command is scheduled to be executed every Thursday.</p> <p>FRI Command is scheduled to be executed every Friday.</p> <p>SAT Command is scheduled to be executed every Saturday.</p> <p>EVEN Command is scheduled to be executed every even day (from January 1, 1970).</p> <p>ODD Command is scheduled to be executed every odd day (from January 1, 1970).</p> <p>ALL Command is scheduled to be executed every day.</p> <p><NoVal> No Value, the command is executed immediately if no value is entered for ON (Order Number), DATE, and TIME (not delay activated), or the command is scheduled to be executed at the next occurrence of the time specified by TIME.</p>
Restrictions:	ENT–EQPT is denied if a value is entered for DATE and no value is entered for ON (Order Number).

TIME	{HH-MM-SS:{0-23, ALL} – {0-59} – {0-59, HLF, QTR}, <NoVal>}
	Default: <NoVal>
	Addressing: None
	Description: Time, specifies the time the command is scheduled to be executed. A specific time is specified by the value format <HH> – <MM> – <SS> where <HH> is the hour, <MM> is the minute, and <SS> is the second. A value for <SS> must be entered, but the system uses a value of 0 when an integer value is entered. Values are:
	<HH> – <MM> – <SS> The command is scheduled to be executed at the specified hour and minute.
	ALL– <MM> – <SS> The command is scheduled to be executed every hour at the specified minute.
	<HH> – <MM> –HLF Two commands are scheduled to be executed, one command at the hour and minute specified by <HH> and <MM> and one command a half-hour (30 minutes) later. (<MM> must be less than 30.)
	<HH> – <MM> –QTR Four commands are scheduled to be executed, one command at the hour and minute specified by <HH> and <MM> and one command each quarter-hour (15 minutes) later. (<MM> must be less than 15.)
	ALL– <MM> –HLF Two commands are scheduled to be executed every hour, one command at the minute specified by <MM> and one command a half-hour (30 minutes) later. (<MM> must be less than 30.)
	ALL– <MM> –QTR Four commands are scheduled to be executed every hour, one command at the minute specified by <MM> and one command each quarter-hour (15 minutes) later. (<MM> must be less than 15.)
	<NoVal> No Value, the command is executed immediately if no value is entered for ON (Order Number), DATE, and TIME (not delay activated), or the command is scheduled to be executed at the current time on the date specified by DATE.
	Restrictions: ENT-EQPT is denied if a value is entered for TIME and no value is entered for ON (Order Number). ENT-EQPT is denied if <SS> of HLF or QTR is entered and <MM> is not less than 30 or 15, respectively.
FLAG	{0, <NoVal>}
	Default: <NoVal>
	Addressing: None
	Description: Flag. The value for FLAG is verified, but not processed by the system.
	Restrictions: ENT-EQPT is denied if a value is entered for FLAG and no value is entered for ON (Order Number).

CBLENGTH=	{<Integers in 5 meter increments from 5 through 500 meters>, <NoVal>}
Default:	Entry required if AID for QUAD entered and provisioning the first Quad in a DS1/DS3 Quad shelf, or if AID of QUAD or SHELF is entered and MTXINTF is specified as OPTCL. <NoVal> otherwise
Addressing:	None
Description:	Optical Cable Length (in meters), specifies the cable length (in meters) of the optical cable between a DS1/DS3 Quad shelf or SI36/SI48 shelves and the EOC shelf. Non-numeric values are: <NoVal> CBLENGTH is not applicable if AID does not identify a QUAD or SHELF.
Restrictions:	<p>ENT-EQPT is denied if a value for CBLENGTH is entered and the specified AID does not identify an SI36/SI48 SHELF or QUAD equipment entity.</p> <p>ENT-EQPT is denied if a value for CBLENGTH is entered and the value specified for MTXINTF is not OPTCL.</p> <p>ENT-EQPT is denied if a value for CBLENGTH is entered and all the EOBs, IOBs, or OXBs in the shelf are not in an OOS-MA or OOS-AUMA state.</p> <p>ENT-EQPT is denied if a value for CBLENGTH is not an increment of 5.</p> <p>ENT-EQPT is denied if AID=SHELF or AID=QUAD and CBLENGTH greater than 500 is entered.</p> <p>ENT-EQPT is denied if AID of a S136 SHELF and CBLENGTH greater than 350 are specified.</p> <p>ENT-EQPT is denied if CBLENGTH is greater than 350 meters, and the supporting ES shelf has been or is being grown as M16.</p>

CMDMDE=	{FRCD, NORM}
Default:	{NORM}
Addressing:	None
Description:	Command Execution Mode. ENT–EQPT is completed regardless of the value of CMDMDE.
DFLTSIG=	{ASYNC, CBIT, STS1, <NoVal>}
Default:	{ASYNC} (if specified AID identifies an EP3 circuit pack and the corresponding LHSTYPE or UHSTYPE is EP3F36 or EP3F48) <NoVal> (if specified AID does not identify an EP3 circuit pack)
Addressing:	None
Description:	Default Signal, specifies the type of (default) signal transmitted by an EP3 circuit pack (in a FlexPoint Half–Shelf), after the EP3 has powered–on and data–base down–loaded, for each of the supported un–provisioned facilities (the signal transmitted for provisioned facilities is based on the facility provisioning). Values are:
ASYNC	Asynchronous DS3, the default transmitted signal for un–provisioned ports on the specified EP3 (in a FlexPoint Half–Shelf) is M13 formatted DS3 with DS1 AIS on all embedded DS1s.
CBIT	C–Bit DS3, the default transmitted signal for un–provisioned ports on the specified EP3 (in a FlexPoint Half–Shelf) is C–Bit formatted DS3 with DS1 AIS on all embedded DS1s.
STS1	Unequipped STS–1, the default transmitted signal for un–provisioned ports on the specified EP3 (in a FlexPoint Half–Shelf) is Unequipped STS–1.
<NoVal>	DFLTSIG is not applicable if AID does not identify an EP3 circuit pack.
Restrictions:	ENT–EQPT is denied if a value for DFLTSIG is entered and the specified AID does not identify an EP3 circuit pack and the corresponding LHSTYPE or UHSTYPE is not provisioned as {EP3F36, EP3F48}.
DIST=	{LONG, MAX, MED, SHORT, <NoVal>}
Default:	{SHORT} (if specified AID identifies an DSI circuit pack) <NoVal> (if specified AID does not identify an DSI circuit pack)
Addressing:	None
Description:	Distance, specifies the cable length of the DS1 cable connected to the DSI equipment identified by AID. Values are:
LONG	DIST configured for 440–550 feet of cable.
MAX	DIST configured for 550 feet or longer of cable.
MED	DIST configured for 220–440 feet of cable.
SHORT	DIST configured for 0–220 feet of cable.
<NoVal>	DIST is not applicable if AID does not identify an DSI circuit pack.
Restrictions:	ENT–EQPT is denied if a value for DIST is entered and the specified AID does not identify an DS1 circuit pack.

ESTYPE=	{M16, M32}	
Default:	M16 (for 672– and 1344–port systems), M32 (for 240–, 2688–, and 3360–port systems)	
Addressing:	None	
Description:	Matrix shelf type, specifies the type of matrix circuit packs used in the end stage shelf. Values are:	
	M16	M16, specifies that the Standard Density end stage shelf consists of all M16 modules or that the High Density end stage shelf consists of any mix of M16 and/or M32 modules with each M32 functioning at half the capacity.
	M32	M32, specifies that the High Density end stage shelf consists of all M32 modules each functioning at full capacity.
Restrictions:	ENT–EQPT is denied if a value for end stage shelf type is entered and the specified AID does not identify an end stage shelf, I/O shelf, or I/O quad equipment entity.	
LBO1=	{LONG, SHORT, <NoVal>}	
Default:	{SHORT} (if specified AID identifies an EP3 or ES1 circuit pack) <NoVal> (if specified AID does not identify an EP3 or ES1 circuit pack)	
Addressing:	None	
Description:	Line Build Out 1, specifies the line build out for the lowest numbered DS3 on the EP3 circuit pack identified by AID. Values are:	
	LONG	LBO configured for 226–450 feet of cable.
	SHORT	LBO configured for 0–225 feet of cable.
	<NoVal>	LBO1 is not applicable if AID does not identify an EP3 circuit pack.
Restrictions:	ENT–EQPT is denied if a value for LBO1 is entered and the specified AID does not identify an EP3 or ES1 circuit pack.	
LBO2=	{LONG, SHORT, <NoVal>}	
Default:	{SHORT} (if specified AID identifies an EP3 or ES1 circuit pack) <NoVal> (if specified AID does not identify an EP3 or ES1 circuit pack)	
Addressing:	None	
Description:	Line Build Out 2, specifies the line build out for the middle numbered DS3 on the EP3 circuit pack identified by AID. Values are:	
	LONG	LBO configured for 226–450 feet of cable.
	SHORT	LBO configured for 0–225 feet of cable.
	<NoVal>	LBO2 is not applicable if AID does not identify an EP3 circuit pack.
Restrictions:	ENT–EQPT is denied if a value for LBO3 is entered and the specified AID does not identify an EP3 or ES1 circuit pack.	
LBO3=	{LONG, SHORT, <NoVal>}	
Default:	{SHORT} (if specified AID identifies an EP3 or ES1 circuit pack) <NoVal> (if specified AID does not identify an EP3 or ES1 circuit pack)	
Addressing:	None	
Description:	Line Build Out 3, specifies the line build out for the highest numbered DS3 on the EP3 circuit pack identified by AID. Values are:	
	LONG	LBO configured for 226–450 feet of cable.
	SHORT	LBO configured for 0–225 feet of cable.
	<NoVal>	LBO3 is not applicable if AID does not identify an EP3 circuit pack.
Restrictions:	ENT–EQPT is denied if a value for LBO3 is entered and the specified AID does not identify an EP3 or ES1 circuit pack.	

LHSTYPE=	{EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48, ES136, ES148, O1BFH48, O1BSH48, O4MSH48, O4MFH48, <NoVal>}
Default:	{EP3S48} (if specified AID identifies a SHELF equipment entity) <NoVal> (if specified AID does not identify a SHELF equipment entity)
Addressing:	None
Description:	Lower Half Shelf Type, specifies the type of I/O shelf if a SHELF AID is specified. Values are:
EP3E36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Enhanced capability.
EP3E48	High Density DS3 Shelf with 48 DS3s per shelf containing EP3s that have Enhanced capability.
EP3F36	High Density DS3/STS Shelf with 36 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3F48	High Density DS3/STS1 Shelf with 48 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3S36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Standard capability.
EP3S48	High Density DS3 Shelf with 48 DS3s per shelf containing EP3s that have Standard capability.
ES136	High Density STS Shelf with 36 STSs per shelf containing ES1 circuit packs.
ES148	High Density STS Shelf with 48 STS1s per shelf containing ES1 circuit packs.
O1BFH48	O1B (OC3) Shelf with 48 DS3s/STS1s per shelf, FlexPoint capability, and Half-bandwidth to the matrix.
O1BSH48	O1B (OC3) Shelf with 48 STS1s per shelf, SONET capability, and Half-bandwidth to the matrix.
O4MSH48	O4M (OC12) Standard module in Half Density SI48–O4M shelf, and Half-bandwidth to the matrix.
O4MFH48	O4M (OC12) FlexPoint module in Half Density SI48–O4M shelf, and Half-bandwidth to the matrix.
<NoVal>	LHSTYPE is not applicable if AID does not identify a SHELF.
Restrictions:	<p>ENT–EQPT is denied if a value for LHSTYPE is entered and the specified AID does not identify a SHELF equipment entity.</p> <p>ENT–EQPT is denied if either LHSTYPE or UHSTYPE are provisioned as {O1BFH48, O1BSH48} and both LHSTYPE or UHSTYPE are not provisioned as {O1BFH48, O1BSH48}.</p> <p>ENT–EQPT is denied if either LHSTYPE or UHSTYPE are provisioned as {O4MSH48, O4MFH48} and both LHSTYPE or UHSTYPE are not provisioned as {O4MSH48, O4MFH48}.</p> <p>ENT–EQPT is denied if the specified AID identifies an EP3 circuit pack and the corresponding shelf parameter LHSTYPE or UHSTYPE is not provisioned with {EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48}.</p> <p>ENT–EQPT is denied if the specified AID identifies an ES1 circuit pack and the corresponding shelf parameter LHSTYPE or UHSTYPE is not provisioned with {ES136, ES148}.</p> <p>ENT–EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in a mixture of SI36 and SI48 half-shelves or shelves specified within the same rack.</p> <p>ENT–EQPT is denied if the specified AID of {SHELF–9–1–1, SHELF–15–3–1, SHELF–21–1–1, or SHELF–27–3–1} is entered and the LHSTYPE or UHSTYPE does not specify {O1BFH48, O1BSH48} or O4MFH48, O4MSH48}.</p>

ENT-EQPT is denied if the specified AID of {SHELF-9-1-1, SHELF-15-3-1, SHELF-21-1-1, or SHELF-27-3-1} is entered and the other shelf in the SI48 rack (e.g., {SHELF-9-3-1, SHELF-15-1-1, SHELF-21-3-1, SHELF-27-1-1}, respectively) is not provisioned, or is provisioned but *not* as an OC3 or OC12 shelf (i.e., LHSTYPE and UHSTYPE of {O1BFH48, O1BSH48} or {O4MFH48, O4MSH48}).
ENT-EQPT is denied if EP3E36, EP3F36, EP3S36, ES136 is entered, and the shelf AID is 104-111 or 136-141-{1,3}-1.

MTXINTF=	{ELECT, OPTCL, <NoVal>}
Default:	{ELECT} (if specified AID identifies an SI48 I/O SHELF equipment entity and the matrix size is greater than 240) {OPTCL} (if specified AID identifies an SI36 SHELF, QUAD Shelf, or remote companion SHELF equipment entity, or identifies an SI48 I/O SHELF but the matrix size is 240) <NoVal> (if specified AID does not identify an I/O SHELF or QUAD Shelf equipment entity)
Addressing:	None
Description:	Matrix Interface, specifies the type of interface used between the I/O Shelf or QUAD Shelf and the End Stage matrix. Values are: ELECT Electrical interface between SI48 SHELF and End Stage matrix. OPTCL Optical interface between the SI48 SHELF or SI36 SHELF or DS3/DS1 QUAD and the End Stage matrix. <NoVal> MTXINTF is not applicable if AID does not identify a SHELF or QUAD.
Restrictions:	ENT-EQPT is denied if a value for MTXINTF is entered and the specified AID does not identify an IO SHELF or QUAD equipment entity. ENT-EQPT is denied if MTXINTF is specified as ELECT and the AID identifies a QUAD or a SI36 SHELF. ENT-EQPT is denied if MTXINTF is specified as ELECT and the AID identifies a remote companion SHELF {SHELF-{112-135}-{1,3}-1}. ENT-EQPT is denied if a value of ELECT is entered for one SHELF and the companion SHELF is already OPTCL, or vice versa. ENT-EQPT is denied if system size is 3360, AID=SHELF, and ES- TYPE=M16 .
PBTYPE=	{IPB, RPB}
Default:	{IPB} For all shelf types except OC12 {RPB} For OC12 shelves
Addressing:	None
Description:	Protection Board Type, specifies the type of protection board the SHELF supports. Values are: IPB Internal Protection Board circuit pack. RPB Ring Protection Board circuit pack.
Restrictions:	For shelf containing OC12 modules, only RPB modules are valid .
QTYPE=	{DS1, DS3, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	QUAD Type, specifies the quadrant type for the DS1 or DS3 I/O QUAD identified by AID. Values are: DS1 QTYPE configured for DS1 Quad. DS3 QTYPE configured for DS3 Quad. <NoVal> QTYPE is not applicable if AID does not identify an DS1 Quad.
Restrictions:	ENT-EQPT is denied if a value for QTYPE is entered and the specified AID does not identify a QUAD equipment entity.

RPLSHELF=	SI48_Shelf_AID: {SHELF-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110,136-141 }-{1, 3}-1, SHELF-{9, 21, 35, 43}-3-1, SHELF-{15, 27, 31, 39, 107,111 }-1-1}}
	<NoVal>
Default:	Entry required if AID of QUAD entered <i>and</i> provisioning the first Quad in a DS1 Quad Rack. <NoVal> otherwise.
Addressing:	None
Description:	Replacement Shelf, specifies a SI48 shelf that is to be replaced by a DS1, DS3 QUAD. Non-AID values are: <NoVal> RPLSHELF is not applicable if AID does not identify a QUAD.
Restrictions:	ENT-EQPT is denied if a value for RPLSHELF is entered and the specified AID does not identify a QUAD equipment entity.
UHSTYPE=	{EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48, ES136, ES148, O1BFH48, O1BSH48, O4MSH48, O4MFH48, <NoVal>
Default:	{EP3S48} (if specified AID identifies a SHELF equipment entity) <NoVal> (if specified AID does not identify a SHELF equipment entity)
Addressing:	None
Description:	Upper Half Shelf Type, specifies the type of I/O shelf if a SHELF AID is specified. Values are:
EP3E36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Enhanced capability.
EP3E48	High Density DS3/STS Shelf with 48 DS3s per shelf containing EP3s that have Enhanced capability.
EP3F36	High Density DS3/STS Shelf with 36 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3F48	High Density DS3/STS Shelf with 48 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3S36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Standard capability.
EP3S48	High Density DS3/STS Shelf with 48 DS3s per shelf containing EP3s that have Standard capability.
ES136	High Density STS Shelf with 36 STSs per shelf containing ES1 circuit packs.
ES148	High Density DS3/STS Shelf with 48 STSs per shelf containing ES1 circuit packs.
O1BFH48	O1B (OC-3) Shelf with 48 DS3/STS1s per shelf, FlexPoint capability, and Half-bandwidth to the matrix.
O1BSH48	O1B (OC-3) Shelf with 48 STS1s per shelf, SONET capability, and Half-bandwidth to the matrix.
O4MSH48	O4M (OC-12) Standard module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.
O4MFH48	O4M (OC-12) FlexPoint module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.
<NoVal>	UHSTYPE is not applicable if AID does not identify a SHELF.
Restrictions:	ENT-EQPT is denied if UHSTYPE is entered and the specified AID does not identify a SHELF equipment entity. ENT-EQPT is denied if either LHSTYPE or UHSTYPE are provisioned as {O1BFH48, O1BSH48} and both LHSTYPE or UHSTYPE are not provisioned as {O1BFH48, O1BSH48}.

ENT-EQPT is denied if either LHSTYPE or UHSTYPE are provisioned as {O4MSH48, O4MFH48} and both LHSTYPE or UHSTYPE are not provisioned as {O4MSH48, O4MFH48}.

ENT-EQPT is denied if the specified AID identifies an EP3 circuit pack and the corresponding Shelf LHSTYPE or UHSTYPE is not provisioned with {EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48}.

ENT-EQPT is denied if the specified AID identifies an ES1 circuit pack and the corresponding Shelf LHSTYPE or UHSTYPE is not provisioned with {ES136, ES148}.

ENT-EQPT is denied if the specified AID of SHELF is entered and the provisioning of LHSTYPE or UHSTYPE results in a mixture of SI36 and SI48 half-shelves or shelves specified within the same rack.

ENT-EQPT is denied if the specified AID of {SHELF-9-1-1, SHELF-15-3-1, SHELF-21-1-1, or SHELF-27-3-1} is entered and the LHSTYPE or UHSTYPE does not specify {O1BFH48, O1BSH48} or {O4MFH48, O4MSH48}.

ENT-EQPT is denied if the specified AID of {SHELF-9-1-1, SHELF-15-3-1, SHELF-21-1-1, or SHELF-27-3-1} is entered and the other shelf in the SI48 rack (e.g., {SHELF-9-3-1, SHELF-15-1-1, SHELF-21-3-1, SHELF-27-1-1}, respectively) is not provisioned, or is provisioned but *not* as an OC3 or OC12 shelf (i.e., LHSTYPE and UHSTYPE of {O1BFH48, O1BSH48} or {O4MFH48, O4MSH48}).

ENT-EQPT is denied if EP3E36, EP3F36, EP3S36, ES136 is entered, and the shelf AID is 104-111 or 136-141-{1,3}-1.

PST	{IS, OOS}	
	Default:	{IS}
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the specified equipment entity. Values are:
	IS	In-Service
	OOS	Out-Of-Service
	Restrictions:	ENT-EQPT is denied if PST of IS and SST of MT is entered. ENT-EQPT is denied if PST of OOS is entered and the specified AID identifies an LT1, LT2, LT4, LT5, LT8, OPD, PST, RSP, or SBT equipment entity. ENT-EQPT is denied if PST of OOS is entered and an AID of SHELF-2-1-1 or SHELF-3-1-1 to provision a CS SHELF is specified.
SST	{MT, <NoVal>}	
	Default:	<NoVal>
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the specified equipment entity. Values are:
	MT	Maintenance
	<NoVal>	No Value is provisioned for the SST.
	Restrictions:	ENT-EQPT is denied if SST of MT and PST of IS is entered. ENT-EQPT is denied if SST of MT is entered and the specified AID does not identify a main/working EP3, ES1, M16, M32, O1B, O4M, QUAD, S3M, or SHELF entity. ENT-EQPT is denied if an SST of MT is entered and the specified AID identifies a protection O1B, O4M, S3M equipment entity.

SUCCESSFUL RESPONSE FORMAT

The following successful response format is provided when the ENT-EQPT command is executed. If the command is executed as a scheduled (delay activated) command, the delay activation Order Number is provided in the command echo line.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * The ENT-EQPT for <AID> was completed. */]
  [/ * <Command Echo> [<CTAG>] ({<CID[-VCNUM]>, CRON:<Order_Number>}) */]
;
```

The following output response format is provided if the ENT-EQPT command is scheduled for delayed activation (values for ON (Order Number), DATE, and TIME were entered).

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DELAY
  [/ * Command has been scheduled */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

EXAMPLES

In the following example, I/O shelf SHELF-6-1-1 and all the supporting equipment are provisioned to an IS state (assuming the circuit packs are installed in the system and functional). The I/O modules are provisioned in OOS state.

```
ENT-EQPT::SHELF-6-1-1::::OOS;
```

In the following example, EP3-6-1-12 is provisioned to an IS state (assuming the circuit pack is installed in the system and functional) with LBO1, LBO2, and LBO3 settings of LONG, SHORT (defaulted), and LONG, respectively.

```
ENT-EQPT::EP3-6-1-12::::LBO1=LONG,LBO3=LONG:IS;
```

COMMAND CODE: **ENT-F3**
COMMAND NAME: **ENTER F3**

PURPOSE

The ENT-F3 command creates (assigns and provisions) an F3 entity.

An F3 entity is a Fractional DS3 entity that consists of a set of up to 7 DS1 entities, all of which reside within a given electrical DS3. An F3 entity is intended to be used for providing Performance Monitoring data summaries for all of the DS1s assigned to it. The ENT-F3 command allows the F3 entity to be provisioned and have a set of DS1s assigned to it. For a description of the special summary PM parameters and how they are derived from the individual DS1 PM parameters, see Appendix F, Monitored PM Parameters.

An F3 that has not been provisioned has a PST,SST of OOS-MA, UAS or OOS-AUMA,UAS&DSBLD. An F3 must be in the OOS-MA, UAS state or the ENT-F3 command will be denied (i.e., the containing T3 must first be provisioned).

An ENT-F3 command is denied if:

- The containing DS3 has not yet been provisioned.
- The containing DS3 is not an electrical DS3 located on an SI48 shelf.
- Any of the DS1 AIDs being assigned to the F3 have not been previously provisioned.
- Any of the DS1 AIDs being assigned to the F3 are not constituents of the DS3 containing the F3.
- Any of the DS1 AIDs being assigned to the F3 are defined as having framing formats different from that of the F3.
- Any of the DS1 AIDs being assigned to the F3 have already been assigned to some other F3.
- The specified F3 is already provisioned.
- The DS1 is multiply assigned.
- An invalid parameter value is entered.

INPUT FORMAT

```
ENT-F3 : [TID] : AID : [CTAG] : : [FMT=] [ , T1N1=] [ , T1N2=] [ , T1N3=] [ , T1N4=] [ , T1N5=]  
[ , T1N6=] [ , T1N7=] : [PST] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &-ranging and &-grouping Description: DS1 AID, identifies the DS1 port. Restrictions: The AID must indicate an F3 AID that is located in an electrical DS3 located on a SI48 shelf or the command will be denied.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

FMT=	<p>{ESF, SF}</p> <p>Default: {SF}</p> <p>Addressing: None</p> <p>Description: Framing Format, identifies the framing format of all the DS1s assigned to the F3. Values are:</p> <p>ESF Extended SuperFrame. DS1s all are ESF formatted.</p> <p>SF SuperFrame. DS1s all are normal SuperFrame formatted.</p> <p>Restrictions: The command will be denied if the value given for FMT is not matched by the provisioned formats of all the DS1s identified in parameters T1N1 to T1N7.</p>
T1N1=	<p>DS1_AID: {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)</p> <p>Default: <Position Not Used></p> <p>Addressing: None</p> <p>Description: DS1 Number 1, identifies one of the potential seven DS1s that are assigned to the F3</p> <p>Restrictions: The command will be denied if the value given for T1N1 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N1 identifies a DS1 that is provisioned to have a framing format different than that given in FMT.</p>
T1N2=	<p>DS1_AID: {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)</p> <p>Default: <Position Not Used></p> <p>Addressing: None</p> <p>Description: DS1 Number 2, identifies one of the potential seven DS1s that are assigned to the F3</p> <p>Restrictions: The command will be denied if the value given for T1N2 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N2 identifies a DS1 that is provisioned to have a framing format different than that given in FMT.</p>
T1N3=	<p>DS1_AID: {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)</p> <p>Default: <Position Not Used></p> <p>Addressing: None</p> <p>Description: DS1 Number 3, identifies one of the potential seven DS1s that are assigned to the F3</p> <p>Restrictions: The command will be denied if the value given for T1N3 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N3 identifies a DS1 that is provisioned to have a framing format different than that given in FMT.</p>
T1N4=	<p>DS1_AID: {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)</p> <p>Default: <Position Not Used></p> <p>Addressing: None</p> <p>Description: DS1 Number 4, identifies one of the potential seven DS1s that are assigned to the F3</p> <p>Restrictions: The command will be denied if the value given for T1N4 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N4 identifies a DS1 that is provisioned to have a framing format different than that given in FMT.</p>

T1N5=	DS1_AID:	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	Default:	<Position Not Used>
	Addressing:	None
	Description:	DS1 Number 5, identifies one of the potential seven DS1s that are assigned to the F3
T1N6=	Restrictions:	The command will be denied if the value given for T1N5 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N5 identifies a DS1 that is provisioned to have a framing format different than that given in FMT.
	DS1_AID:	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	Default:	<Position Not Used>
	Addressing:	None
T1N7=	Description:	DS1 Number 6, identifies one of the potential seven DS1s that are assigned to the F3
	Restrictions:	The command will be denied if the value given for T1N6 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N6 identifies a DS1 that is provisioned to have a framing format different than that given in FMT.
	DS1_AID:	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	Default:	<Position Not Used>
PST	Addressing:	None
	Description:	DS1 Number 7, identifies one of the potential seven DS1s that are assigned to the F3
	Restrictions:	The command will be denied if the value given for T1N7 is not a DS1 within the same DS3 as the F3 identified in the AID parameter, or has not been provisioned. It will also be denied if T1N7 identifies a DS1 that is provisioned to have a framing format different than that given in FMT.
	{IS}	
	Default:	{IS}
	Addressing:	None
	Description:	Primary State. Indicates the current primary state of the DS3. Refer to Appendix G, State Transitions. Values are:
	IS	In-Service

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;

```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* T1 is not in partition for this user. */
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* T3 Shelf info error, Error=<ERROR-STRING> */ /* Error updating supporting entity, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, F3 #1 is created in electrical DS3 T3-5. Three DS1 constituents of DS3 T3-5 are assigned to the F3 in the F3's T1 slot numbers 1, 2, and 5. The F3's T1 slot numbers 3, 4, 6, and 7 are unused. Since the default FMT value of SF is set, the 3 given DS1s must all use SuperFrame format.

```
ENT-F3::T3F3-5-1:::T1N1=T3T1-5-3,T1N2=T3T1-5-7,T1N5=T3T1-5-8;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pfc519. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc519 COMPLD
/* ENT-F3::T3F3-5-1:::T1N1=T3T1-5-3,T1N2=T3T1-5-7,T1N5=T3T1-5-8
[Pfc519] (3) */
;
```

COMMAND CODE: **ENT-FFP-OC12**
COMMAND NAME: **ENTER FAST FACILITY PROTECTION
OC-12**

PURPOSE

The ENT-FFP-OC12 command creates (assigns) a facility protection group for OC-12. It associates a protecting (alternate) OC-12 with a protected (main/preferred) OC-12. It also provides for entering attributes of the facility protection group.

On successful completion of ENT-FFP-OC12, the Section and Line DCC parameters (if provisioned on the working OC-12) are copied to the Section and Line DCC parameters of the protection OC-12.

An ENT-FFP-OC12 command is denied if:

- The OC-12 specified in B1 and B2 parameters do not refer to working and protection OC-12 respectively.
- The OC-12 specified in B1 and/or B2 is not provisioned (i.e., it is in UAS secondary state).
- An ENT-RNG-OC12 command has previously been completed for the specified OC-12 group.
- The section and/or line DCC of the even-numbered OC12 (identified by B1 or B2) is in-service and exists in the TARPADJ-DCC table.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
ENT-FFP-OC12 : [TID] : B1 , B2 : [CTAG] : : : [BDCST=] [ , K2GEN=] [ , PSDIRN=] [ , RVRTV=]  
[ , WTRTIME=] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
B1	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the protected (working) OC-12 port. Restrictions: ENT-FFP-OC12 is denied if the OC-12 specified is not provisioned or is not an odd-numbered OC-12. ENT-FFP-OC12 is denied if B2 is not equal to B1+1.
B2	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the protecting (protection) OC-12 port. Restrictions: ENT-FFP-OC12 is denied if the OC-12 specified is not provisioned or is not an even-numbered OC-12. ENT-FFP-OC12 is denied if B2 is not equal to B1+1.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

BDCST=	{Y}	
	Default:	{Y}
	Addressing:	None
	Description:	Broadcast. Indicates whether the payload is sent over the working and protection channels simultaneously or not. Values are:
	Y	Yes: applies only to 1+1 protection switch.
K2GEN=	{PROP, STAN}	
	Default:	{STAN}
	Addressing:	None
	Description:	K2 bits 1–4 Generation. Defines how the K2 bits 1 through 4 are generated. Values are:
	PROP	Proprietary non–standard way. This value is valid only if PSDIRN is UNI and RVRTV is N. In this case the outgoing K2 bits 1–4 is set to equal the outgoing K1 bits 5 thru 8.
	STAN	Standard way. The K2 bits 1–4 will be generated according to Bell-core standards.
	Restrictions:	ENT–FFP–OC12 is denied if K2GEN is specified as PROP with any other values than N for RVRTV and UNI for PSDIRN respectively.
PSDIRN=	{UNI}	
	Default:	{UNI}
	Addressing:	None
	Description:	Direction of Protection Switching. Indicates the direction of the protection switch operation for OC–12. Values are:
	UNI	Unidirectional protection switching.
RVRTV=	{N, Y}	
	Default:	{N}
	Addressing:	None
	Description:	Revertive or non–revertive protection switching. Indicates whether the OC–12 protection switching is revertive or not. Values are:
	N	No. Indicates the protection switching is non–revertive.
	Y	Yes. Protection switching is revertive.
WTRTIME=	{5–12}	
	Default:	{5}
	Addressing:	None
	Description:	Wait to Restore Time. Determines the wait to restore time that is used by the revertive line protection switching group. Values are:
	5–12	An integer value in minutes between 5 and 12.
	Restrictions:	ENT–FFP–OC12 is denied if a value is entered for WTRTIME and RVRTV is specified (or defaulted) as N.

B2	<p>OC3_AID: {OC3-{1-2240}} (OC3-OC3#)</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: OC3 AID, identifies the protecting (protection) OC-3 port.</p> <p>Restrictions: ENT-FFP-OC3 is denied if the OC-3 specified is not provisioned or is not an even-numbered OC-3. ENT-FFP-OC3 is denied if B2 is not equal to B1+1.</p>
CTAG	<p>< 1-6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>

BDCST=	{Y}	
	Default:	{Y}
	Addressing:	None
	Description:	Broadcast. Indicates whether the payload is sent over the working and protection channels simultaneously or not. Values are:
	Y	Yes: applies only to 1+1 protection switch.
K2GEN=	{PROP, STAN}	
	Default:	{STAN}
	Addressing:	None
	Description:	K2 bits 1–4 Generation. Defines how the K2 bits 1 through 4 are generated. Values are:
	PROP	Proprietary non–standard way. This value is valid only if PSDIRN is UNI and RVRTV is N. In this case the outgoing K2 bits 1–4 is set to equal the outgoing K1 bits 5 thru 8.
	STAN	Standard way. The K2 bits 1–4 will be generated according to Bell-core standards.
	Restrictions:	ENT–FFP–OC3 is denied if K2GEN is specified as PROP with any other values than N for RVRTV and UNI for PSDIRN respectively.
PSDIRN=	{UNI}	
	Default:	{UNI}
	Addressing:	None
	Description:	Direction of Protection Switching. Indicates the direction of the protection switch operation for OC–3. Values are:
	UNI	Unidirectional protection switching.
RVRTV=	{N, Y}	
	Default:	{N}
	Addressing:	None
	Description:	Revertive or non–revertive protection switching. Indicates whether the OC–3 protection switching is revertive or not. Values are:
	N	No. Indicates the protection switching is non–revertive.
	Y	Yes. Protection switching is revertive.
WTRTIME=	{5–12}	
	Default:	{5}
	Addressing:	None
	Description:	Wait to Restore Time. Determines the wait to restore time that is used by the revertive line protection switching group. Values are:
	5–12	An integer value in minutes between 5 and 12.
	Restrictions:	ENT–FFP–OC3 is denied if a value is entered for WTRTIME and RVRTV is specified (or defaulted) as N.

SUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **ENT-FTP-USER**
COMMAND NAME: **ENTER FTP USER**

PURPOSE

The ENT-FTP-USER command is used to create a new user profile in the FTP (File Transfer Protocol) User Security Database.

A user profile consists of:

- the FTP user identifier (FTPUID),
- the FTP user's password identification (FTPPID),
- the FTP user's access type (ACCTYPE).

An ENT-FTP-USER command is denied if:

- A new FTP user is entered and the maximum number of FTP users has already been defined.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ENT-FTP-USER: [TID] : : [CTAG] : : FTPPID, FTPUID, ACCTYPE;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
FTPPID	<6-12 VALID FTPPID CHARACTERS> Default: Entry Required Addressing: None Description: FTP Password Identifier, specifies the FTP user's login password. Valid values for FTPPID are a string of 6 through 12 case-sensitive alphanumeric characters. The FTPPID must contain at least 2 alphabetic characters and at least 1 numeric character. The following special characters are also accepted as valid characters and can be part of the FTPPID: % (percent sign), + (plus sign), # (pound sign), and _ (under score). The first character of the FTPPID can be an alphabetic, numeric, or a valid special character. (Note that the dash (-) character is also accepted by the system, but only characters prior to the dash become part of the FTPPID. The dash (-) and characters after that are ignored by the system.) Restrictions: ENT-FTP-USER is denied if the specified FTP password identifier (FTPPID value) is the same as the specified FTP user identifier (FTPUID value), the reverse of the FTPUID value, a circular shift of the FTPUID value, or a circular shift of the reverse of the FTPUID value.

FTPUID	<5–12 VALID FTPUID CHARACTERS>	
	Default:	Entry Required
	Addressing:	None
	Description:	FTP User Identifier, specifies a unique user ID. Valid values for FTPUID are 5 to 12, case-sensitive alphanumeric characters where the first character must always be an alphabetic character. The following special characters are also accepted as valid characters and will be part of the FTPUID: % (percent sign), + (plus sign), # (pound sign), and _ (under score). (Note that the dash (–) character is also accepted by the system, but only characters prior to the dash become part of the FTPUID. The dash (–) and characters after that are ignored by the system.)
	Restrictions:	ENT–FTP–USER is denied if the specified FTPUID already exists.
ACCTYPE	{BPM, DB, ISU}	
	Default:	Entry Required
	Addressing:	None
	Description:	Access Type, specifies the type of access the FTP user is given. Values are:
	BPM	Binary PM, specifies the FTP user is given access to the Binary PM data.
	DB	Database, specifies that the FTP user is given access to upload/download database backup files.
	ISU	In–Service Upgrade, specifies that the FTP user is given access to upload generic files.

SUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **ENT-IP-FILTER**
COMMAND NAME: **ENTER IP PACKET FILTER TABLE
ENTRY**

PURPOSE

The ENT-IP-FILTER command allows adding an entry in the packet filter table used by the Internet Protocol (IP) router of the stack running on the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command allows adding an entry in the network layer (Layer 3) parameters pertaining to the packet filter table. When the LAN port is initialized, there are no user defined IP filters in the filter table. For those IP Addresses provisioned (IPADDR, NETMASK), only Network Elements (NEs) with these IP Subnet Address(es) are allowed to communicate on that LAN port. Up to 32 IP Addresses can be concurrently provisioned by this command.

Changes to the name-defined parameters take effect immediately and survive a database backup and restore.

The ENT-IP-FILTER command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An ENT-IP-FILTER command is denied if:

- The specified CID is not provisioned as a LAN port on the ICM (via ENT-CID with PROTOCOL of TCP).
- The specified IPADDR already exists in the packet filter table.
- An entry is added in the IP packet filter table and 32 entries are already added to the IP packet filter table.
- An invalid parameter value is entered.
- The specified IPADDR is within the 2.0.0.0 to 2.255.255.255 IP address range.

INPUT FORMAT

ENT-IP-FILTER: [TID] : CPORT: [CTAG] : : IPADDR= [, NETMASK=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11}	
	Default:	Entry Required
	Addressing:	None
	Description:	CID AID, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

IPADDR= {{{(0-255)-(0-255)-(0-255)-(0-255)}}, ALL}
Default: Entry Required
Addressing: None
Description: Internet Protocol Address, specifies the IP Address of the NE to which the packet filter table entry is added. Name-defined values are:
 ALL All the packet filter table entries are added.
 The lowest and highest IP Address Range is:

IP Address Range		
Class	Lowest	Highest
A	0.1.0.0	126.0.0.0
B	128.0.0.0	191.255.0.0
C	192.0.1.0	223.225.225.0

Restrictions: The ED-IP-STATICRT command is denied if the IPADDR is in the 2.0.0.0 to 2.255.255.255 IP range.

NETMASK= {{{(0-255)-(0-255)-(0-255)-(0-255)}}}
Default: <Value determined by the IP Address>
Addressing: None
Description: Subnet Mask, specifies the subnet mask of the network to which the NE with IPADDR is connected to.

Default Value Determined by the IP Address		
Class	IP Address Range	Default NETMASK
A	0.0.0.0 to 127.255.255.255	255.0.0.0
B	128.0.0.0 to 191.255.255.255	255.255.0.0
C	192.0.0.0 to 223.255.255.255	255.255.255.0
D	224.0.0.0 to 239.255.255.255	255.255.255.255
E	240.0.0.0 to 247.255.255.255	255.255.255.255

Restrictions: The ENT-IP-FILTER command is denied if any portion of the default NETMASK is 255 and that portion of the specified NETMASK is a number less than 255.

COMMAND CODE: **ENT-IP-PRMTR**
COMMAND NAME: **ENTER IP PARAMETERS**

PURPOSE

The ENT-IP-PRMTR command allows provisioning of the Internet Protocol (IP) Layer parameters of the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command allows provisioning of the network layer (Layer 3) parameters pertaining to the IP layer stack.

Changes to the name-defined parameters are stored in the database and take effect when the IP stack is (re)initialized via the RST-CID command. All of the name-defined parameters survive a database backup and restore.

The ENT-IP-PRMTR command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An ENT-IP-PRMTR command is denied if:

- The specified CID is not provisioned as a LAN port on the ICM (via ENT-CID with PROTOCOL of TCP).
- The network address of BRDCSTADR does not equal the network address of the IPADDR.
- The specified IPADDR is within the 2.0.0.0 to 2.255.255.255 range.
- The specified IPADDR is outside the lowest and highest IP Address Range.
- The Host ID portion of the specified IPADDR is provisioned as all zeros (0s) or all ones (1s).
- The network portion of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is not subnetted.
- The subnetwork address of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is subnetted.
- The Host ID portion of the specified GATEWAYADR is provisioned as all zeros (0s) or all ones (1s).
- The specified GATEWAYADR is within the 2.0.0.0 to 2.255.255.255 range.
- The provisioned subnet address of the specified GATEWAYADR does not equal the subnet address of the IPADDR.
- Any portion of the default NETMASK is 255 and that portion of the specified NETMASK is a number less than 255.
- An invalid parameter value is entered.

INPUT FORMAT

```
ENT-IP-PRMTR: [TID] : CPORT: [CTAG] : : : [BRDCSTADR=] [ , GATEWAYADR=] , IPADDR=  
[ , NETMASK=] [ , NODENAME=] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11}	
	Default:	Entry Required
	Addressing:	None
	Description:	Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

BRDCSTADR= {(0–255)–(0–255)–(0–255)–(0–255)}

Default: <Value derived from IPADDR and NETMASK>

Addressing: None

Description: Broadcast Address, specifies the Network Layer Broadcast Address for the specified IP Address. The Broadcast Address is the IP Address with all the host bits set to one (NOTE: the host bits are the bits in the NET-MASK that are set to zero).

Restrictions: The ENT–IP–PRMTR command is denied if the network address of BRDCSTADR does not equal the network address of the IPADDR.

GATEWAYADR= {{{(0–255)–(0–255)–(0–255)–(0–255)}}, DFLT}

Default: <Previously Existing Value>

Addressing: None

Description: Gateway Address, specifies the Network Layer's Default Gateway router's IP address. Name-defined values are:

DFLT Default, specifies the parameter is set to the factory default and the default gateway routing entry is removed from the IP routing table.

Restrictions: The ENT–IP–PRMTR command is denied if the provisioned subnet address of GATEWAYADR does not equal the subnet address of IPADDR. The ENT–IP–PRMTR command is denied if the Host ID portion of the specified GATEWAYADR is provisioned as all zeros (0s) or all ones (1s). The ENT–IP–PRMTR command is denied if the GATEWAYADR is in the 2.0.0.0 to 2.255.255.255 range.

IPADDR= {(0–223)–(0–255)–(0–255)–(0–255)}

Default: Entry Required

Addressing: None

Description: Internet Protocol Address, specifies the IP Address of the Network Interface. The lowest and highest IP Address Range is:

IP Address Range		
Class	Lowest	Highest
A	0.1.0.0	126.0.0.0
B	128.0.0.0	191.255.0.0
C	192.0.1.0	223.225.225.0

Restrictions: The ENT–IP–PRMTR command is denied if an IP Address outside of the lowest and highest IP Address Range is entered.

The ENT–IP–PRMTR command is denied if the IPADDR is in the 2.0.0.0 to 2.255.255.255 range.

The ENT–IP–PRMTR command is denied if the Host ID portion of the specified IPADDR is provisioned as all zeros (0s) or all ones (1s).

The ENT–IP–PRMTR command is denied if the network portion of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is not subnetted.

The ENT–IP–PRMTR command is denied if the subnetwork address of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is subnetted.

The ENT–IP–PRMTR command is denied if the network address of IPADDR does not equal the network address of the BRDCSTADR

NETMASK= {(0–255)–(0–255)–(0–255)–(0–255)}
Default: <Value determined by the IP Address>
Addressing: None
Description: Subnet Mask, specifies the subnet mask of the network to which the NE is connected to.

Default Value Determined by the IP Address		
Class	IP Address Range	Default NETMASK
A	0.0.0.0 to 127.255.255.255	255.0.0.0
B	128.0.0.0 to 191.255.255.255	255.255.0.0
C	192.0.0.0 to 223.255.255.255	255.255.255.0

Restrictions: The ENT–IP–PRMTR command is denied if any portion of the default NETMASK is 255 and that portion of the specified NETMASK is a number less than 255.

NODENAME= <1–15 ASCII printable characters>
Default: <Previously Existing Value>
Addressing: None
Description: TCP/IP Network Name, specifies the TCP/IP network name of the NE. This value is not used by the NE at this time, but is set so the verification of the IP address is made at a later time.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]

Issue 01, February 2005

ED-IP-PRMTR
RTRV-IP-PRMTR

COMMAND CODE: **ENT-IP-STATICRT**
COMMAND NAME: **ENTER IP STATIC ROUTE**

PURPOSE

The ENT-IP-STATICRT command allows adding an entry in the static routing table used by the Internet Protocol (IP) router running on the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command allows adding an entry in the network layer (Layer 3) parameters pertaining to the static routing table. This routing table enables the IP router to route packets to distant NEs.

Changes to the name-defined parameters take effect immediately and survive a database backup and restore.

The ENT-IP-STATICRT command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An ENT-IP-STATICRT command is denied if:

- The specified CID is not provisioned as a LAN port on the ICM (via ENT-CID with PROTOCOL of TCP).
- The specified IPADDR is within the private IP address range defined in the Internet RFC 1597 for Private Internets.
- The specified IPADDR is within the 2.0.0.0 to 2.255.255.255 range.
- The specified IPADDR already exists in the static routing table.
- The specified IPADDR is not equal to its subnet address when DESTTYPE=NET.
- The specified IPADDR is outside the lowest and highest IP Address Range.
- The network portion of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is not subnetted.
- The subnetwork address of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is subnetted.
- The Host ID portion of the specified GATEWAYADR is provisioned as all zeros (0s) or all ones (1s).
- The GATEWAYADR is within the 2.0.0.0 to 2.255.255.255 range.
- The provisioned subnet address of the specified GATEWAYADR does not equal the subnet address of the IPADDR from ED-IP-PRMTR.
- Any portion of the default NETMASK is 255 and that portion of the specified NETMASK is a number less than 255.
- The static routing table is full (i.e., if 32 entries already exist in the table)
- The specified NETMASK is any value other than 255.255.255.255 when DESTTYPE=HOST.
- An invalid parameter value is entered.

INPUT FORMAT

```
ENT-IP-STATICRT: [TID] : CPORT: [CTAG] : : DESTTYPE=, GATEWAYADR=, IPADDR=
[, NETMASK=] ;
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
CPORT	{3, 5, 7, 9, 11}		
	Default:	Entry Required	
	Addressing:	None	
	Description:	Control Port, identifies the CID which is configured as the LAN on the ICM module.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

DESTTYPE= {HOST, NET}
Default: Entry Required
Addressing: None
Description: Destination Type, determines the type of the IP Address specified in the IPADDR parameter. Values are:
 HOST Specifies the IP Address type is a Host.
 NET Specifies the IP Address type is a Network.

GATEWAYADR= {(0–255)–(0–255)–(0–255)–(0–255)}
Default: Entry Required
Addressing: None
Description: Gateway Address, specifies the gateway address of the gateway to which the packets are sent in order to reach the NE whose IP address is as given in the IPADDR parameter.
Restrictions: The ENT–IP–STATICRT command is denied if the provisioned subnet address of GATEWAYADR does not equal the subnet address of IPADDR from ED–IP–PRMTR.
 The ENT–IP–STATICRT command is denied if the Host ID portion of the specified GATEWAYADR is provisioned as all zeros (0s) or all ones (1s).
 The ENT–IP–STATICRT command is denied if the GATEWAYADR is in the 2.0.0.0 to 2.255.255.255 range.

IPADDR= {(0–223)–(0–255)–(0–255)–(0–255)}
Default: Entry Required
Addressing: None
Description: Internet Protocol Address, specifies the IP Address of the NE to which the static route entry is made. The lowest and highest IP Address Range is:

IP Address Range		
Class	Lowest	Highest
A	0.1.0.0	126.0.0.0
B	128.0.0.0	191.255.0.0
C	192.0.1.0	223.225.225.0

Restrictions: The ENT–IP–STATICRT command is denied if an IP Address outside of the lowest and highest IP Address Range is entered.
 The ENT–IP–STATICRT command is denied if the IPADDR is in the 2.0.0.0 to 2.255.255.255 range.
 The ENT–IP–STATICRT command is denied if the specified IPADDR is not equal to its subnet address when DESTTYPE=NET (i.e. the logical AND of the IPADDR and NETMASK must equal the IPADDR).
 The ENT–IP–STATICRT command is denied if the network portion of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is not subnetted.
 The ENT–IP–STATICRT command is denied if the subnetwork address of the specified IPADDR is all zeros (0s) or all ones (1s) and the IPADDR is subnetted.

NETMASK= {(0-255)-(0-255)-(0-255)-(0-255)}
Default: <Value determined by the IP Address and DESTTYPE=NET> or {255.255.255.255} (If DESTTYPE=HOST)
Addressing: None
Description: Subnet Mask, specifies the subnet mask of the network to which the NE with IPADDR is connected to.

Default Value Determined by the IP Address		
Class	IP Address Range	Default NETMASK
A	0.0.0.0 to 127.255.255.255	255.0.0.0
B	128.0.0.0 to 191.255.255.255	255.255.0.0
C	192.0.0.0 to 223.255.255.255	255.255.255.0

Restrictions: The ENT-IP-STATICRT command is denied if any portion of the default NETMASK is 255 and that portion of the specified NETMASK is a number less than 255.
The ENT-IP-STATICRT command is denied if the specified NETMASK is any value other than 255.255.255.255 when DESTTYPE=HOST.

RTRV-IP-STATICRT

COMMAND CODE: **ENT-MAADDR**
COMMAND NAME: **ENTER MANUAL AREA ADDRESS**

PURPOSE

The ENT-MAADDR command allows provisioning of the Manual Area Addresses of Layer 3 (network layer) of the SONET Data Communication Channel (DCC) network.

Changes to the name-defined parameters are stored in the database and take effect when the OSI stack is (re)initialized. This is accomplished by performing a RST-EQPT of the DSB or by editing the DSB into an IS state from an OOS state via ED-EQPT command. All of the name-defined parameters survive a database backup and restore.

An ENT-MAADDR command is denied if:

- The specified DSB is not provisioned, i.e. the DSB is in a UAS secondary state.
- The specified DSB is not in an OOS-MA or OOS-AUMA primary state.
- An invalid parameter value is entered.

INPUT FORMAT

```
ENT-MAADDR: [TID]:AID:[CTAG]::[:L3IDP1=][:L3DFI1=][:L3ORG1=][:L3RES1=]
[:L3ROU1=][:L3IDP2=][:L3DFI2=][:L3ORG2=][:L3RES2=][:L3ROU2=]
[:L3IDP3=][:L3DFI3=][:L3ORG3=][:L3RES3=][:L3ROU3=];
```

INPUT PARAMETERS

TID	<p>< 1-20 VALID TID CHARACTERS ></p> <p>Default: <SID></p> <p>Addressing: None</p> <p>Description: Target Identifier, specifies the network node TID for the command.</p>
AID	<p>EQUIPMENT_AID:</p> <p>{DSB-{6-9, 12-15, 18-21, 24-43, 104-111, 112-135, 136-141}-{1, 3}-{1-2}}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: DSB AID, identifies the DSB on which the manual area addresses are being modified.</p>
CTAG	<p>< 1-6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
L3IDP1=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Default: {39840F}</p> <p>Addressing: None</p> <p>Description: Layer 3 Initial Domain Part 1, identifies the Initial Domain Part of the NSAP pertaining to the 1st Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3DFI1=	<p><2 ASCII HEXADECIMAL VALUES></p> <p>Default: {80}</p> <p>Addressing: None</p> <p>Description: Layer 3 Domain Format Identifier 1, identifies the Domain Format Identifier Field of the NSAP pertaining to the 1st Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>

L3ORG1=	<6 ASCII HEXADECIMAL VALUES> Default: {000000} Addressing: None Description: Layer 3 Organization Identifier 1, specifies the Organization Identifier within the NSAP pertaining to the 1st Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal. Restrictions: ENT-MAADDR is defined if the value for this parameter is already assigned to another L3ORGx parameter, i.e. two L3ORGs on the DSB are attempted to be provisioned at the same time.
L3RES1=	<4 ASCII HEXADECIMAL VALUES> Default: {0000} Addressing: None Description: Layer 3 Reserved Space 1, specifies the Reserved Space within the NSAP pertaining to the 1st Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3ROU1=	<8 ASCII HEXADECIMAL VALUES> Default: {00000000} Addressing: None Description: Layer 3 Routing Domain 1, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 1st Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal. Restrictions: ENT-MAADDR is defined if the value for this parameter is already assigned to another L3ROUx parameter, i.e. two L3ROUs on the DSB are attempted to be provisioned at the same time.
L3IDP2=	<6 ASCII HEXADECIMAL VALUES> Default: {000000} Addressing: None Description: Layer 3 Initial Domain Part 2, identifies the Initial Domain Part of the NSAP pertaining to the 2nd Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3DFI2=	<2 ASCII HEXADECIMAL VALUES> Default: {00} Addressing: None Description: Layer 3 Domain Format Identifier 2, identifies the Domain Format Identifier Field of the NSAP pertaining to the 2nd Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.

L3ORG2=	<6 ASCII HEXADECIMAL VALUES> Default: {000000} Addressing: None Description: Layer 3 Organization Identifier 2, specifies the Organization Identifier within the NSAP pertaining to the 2nd Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal. Restrictions: ENT-MAADDR is defined if the value for this parameter is already assigned to another L3ORGx parameter, i.e. two L3ORGs on the DSB are attempted to be provisioned at the same time.
L3RES2=	<4 ASCII HEXADECIMAL VALUES> Default: {0000} Addressing: None Description: Layer 3 Reserved Space 2, specifies the Reserved Space within the NSAP pertaining to the 2nd Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3ROU2=	<8 ASCII HEXADECIMAL VALUES> Default: {00000000} Addressing: None Description: Layer 3 Routing Domain 2, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 2nd Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal. Restrictions: ENT-MAADDR is defined if the value for this parameter is already assigned to another L3ROUx parameter, i.e. two L3ROUs on the DSB are attempted to be provisioned at the same time.
L3IDP3=	<6 ASCII HEXADECIMAL VALUES> Default: {000000} Addressing: None Description: Layer 3 Initial Domain Part 3, identifies the Initial Domain Part of the NSAP pertaining to the 3rd Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3DFI3=	<2 ASCII HEXADECIMAL VALUES> Default: {00} Addressing: None Description: Layer 3 Domain Format Identifier 3, identifies the Domain Format Identifier Field of the NSAP pertaining to the 3rd Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.

L3ORG3=	<6 ASCII HEXADECIMAL VALUES> Default: {000000} Addressing: None Description: Layer 3 Organization Identifier 3, specifies the Organization Identifier within the NSAP pertaining to the 3rd Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal. Restrictions: ENT-MAADDR is defined if the value for this parameter is already assigned to another L3ORGx parameter, i.e. two L3ORGs on the DSB are attempted to be provisioned at the same time.
L3RES3=	<4 ASCII HEXADECIMAL VALUES> Default: {0000} Addressing: None Description: Layer 3 Reserved Space 3, specifies the Reserved Space within the NSAP pertaining to the 3rd Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3ROU3=	<8 ASCII HEXADECIMAL VALUES> Default: {00000000} Addressing: None Description: Layer 3 Routing Domain 3, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 3rd Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal. Restrictions: ENT-MAADDR is defined if the value for this parameter is already assigned to another L3ROUx parameter, i.e. two L3ROUs on the DSB are attempted to be provisioned at the same time.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IDNC      Input, Data Not Consistent
          /* Unable to read aux buffer for <AID> */
IDNV      Input, Data Not Valid
          /* Invalid parameter in the input command */
          /* Duplicate organization identifier is detected. */
          /* Duplicate routing domain is detected. */

```

IIAC	Input, Invalid ACcess identifier /* Invalid or unassigned equipment identifier specified. */
SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */ /* INIT-SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Data base access failure */ /* Unable to update the LANDCC database */ /* Unable to read the LANDCC database. */
SNVS	Status, Not in Valid State /* DSB is not in a Maintenance state */

EXAMPLES

The following example, provisions the Manual Area Addresses of Layer 3 of the SONET DCC for DSB 6-1-1 with Layer 3 Initial Domain Part 1 value of A100BC and Layer 3 Organization Identifier 3 with value of 2F1234.

```
ENT-MAADDR::DSB-6-1-1:::L3IDP1= A100BC,L3ORG3= 2F1234;  
  
  <SID> <YY-MM-DD> <HH:MM:SS>

  /* The ENT-MAADDR for DSB-6-1-1 was completed. */  
  /* ENT-MAADDR::DSB-6-1-1:::L3IDP1= A100BC,L3ORG3= 2F1234 [P72004] (1)
```

RELATED COMMANDS

DLT-MAADDR
ED-MAADDR
RTRV-MAADDR

COMMAND CODE: **ENT-OC12**
COMMAND NAME: **ENTER OC12**

PURPOSE

The ENT-OC12 command creates (assigns and provisions) an OC12 object entity (AID). Both working and protection OC12 lines can be addressed by this command.

The default values for the PST parameter and keyword parameters can be modified with the SET-DFLT-OC12 command. The current default values can be retrieved with the RTRV-DFLT-OC12 command.

An OC12 that has not been provisioned has a PST,SST of OOS-MA,UAS or OOS-AUMA,UAS&DSBLD (OOS-AUMA if the supporting O4M and S3M equipment is not provisioned). Executing an ENT-OC12 command causes the following primary state transitions for the specified OC12. Secondary states associated with the OC12 before and after the command is executed depend upon events detected by the system. Refer to Appendix G State Transitions, for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Present Default Database Value is:		
	OOS	IS	IS, AINS
<NoVal>, <NoVal>	OOS-MA	IS	OOS-AU, AINS
IS, <NoVal>	IS	IS	OOS-AU, AINS
IS,AINS	OOS-AU, AINS	OOS-AU, AINS	OOS-AU, AINS
OOS,<NoVal>	OOS-MA	OOS-MA	Denied
OOS,AINS	Denied	Denied	Denied
<NoVal>,AINS	Denied	OOS-AU, AINS	OOS-AU, AINS
<NoVal>,AINS-DEA	Denied	Denied	IS
IS,AINS-DEA	Denied	Denied	IS
OOS,AINS-DEA	Denied	Denied	OOS-MA

Note: 1. <NoVal> means no value is entered for that parameter.

When an OC12 is provisioned to an OOS-MA state, a MAN condition type is set for the specified OC12. The MAN condition type is cleared when the OC12 is provisioned to an IS state.

When an OC12 is in an OOS-MA, OOS-AUMA, or OOS-AU,AINS state, no OC12 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the OC12, but OC12 alarm conditions are monitored (retrievable with the RTRV-OC12 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-OC12 command) for the OC12. An OC12 in an OOS-AU,AINS state transitions to an IS state when all OC12 near-end alarm conditions for that OC12 have cleared.

An ENT-OC12 command is denied if:

- The specified OC12's supporting O4M and all three S3M modules are not provisioned (i.e., OC12 has an SST of DSBLD).
- The specified OC12 is already provisioned.
- An invalid parameter value or combination of parameter values is entered.

I/O protection switching is disabled if the OC12 line supported by the O4M and three S3M I/O circuit packs is provisioned to an OOS-MA or OOS-AUMA state.

When an ENT-OC12 command is executed, the default values for the following items are automatically provisioned for the specified OC12, and all PM data collection registers for the OC12 are automatically reset to zero. These default values cannot be changed, except for PM attributes, unless the specified OC12 has first been provisioned by an ENT-OC12 command.

- Condition type attributes (refer to Appendix C, Condition Types and SET-ATTR-OC12)
- Performance monitoring (PM) attributes (refer to SET-PMATTR-ALL)
- PM mode (refer to SET-PMMODE-OC12)
- PM threshold levels (refer to SET-TH-OC12)
- PM reports (refer to ALW-PMREPT-OC12)

INPUT FORMAT

ENT-OC12: [TID] :AID: [CTAG] : : [AINSTH=] [, SDTHSW=] [, S1TRANS=] : [PST] [, SST] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC12 port or range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH-MM:{00-48} - {00-59} } Default: System start-up value. Factory Default = 8 hours. Addressing: None Description: Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is: HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively. Restrictions: If 48 is specified in the HH, then MM has to be 00.
SDTHSW=	{5, 6, 7, 8, 9} Default: <Value retrieved with RTRV-DFLT-OC12 command> Addressing: None Description: Signal Degrade Threshold Switching level, indicates the signal degrade threshold over which Signal Degrade protection switching is initiated. Values are: 5 BER threshold of 10E ⁻⁵ 6 BER threshold of 10E ⁻⁶ 7 BER threshold of 10E ⁻⁷ 8 BER threshold of 10E ⁻⁸ 9 BER threshold of 10E ⁻⁹

S1TRANS=	{ DUS, ACT }	
	Default:	<Value retrieved with RTRV-DFLT-OC12 command>
	Addressing:	None
	Description:	S1 byte to be transmitted, determines if the S1 byte transmitted of the specified OC12 will have the "DUS" message or will have the actual traceability of the signal. Values are:
	DUS	Don't USE. The S1 byte is set to "DON'T USE for Synchronization" message.
	ACT	ACTual. The S1 byte is set to the actual traceability of the signal.
PST	{IS, OOS}	
	Default:	<Value retrieved with RTRV-DFLT-OC12 command>
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the OC12. Values are:
	IS	In-Service, the OC12 is provisioned to an IS or OOS-AU state.
	OOS	Out-Of-Service, the OC12 is provisioned to an OOS-AUMA or OOS-MA state.
	Restrictions:	ENT-OC12 is denied if PST of OOS and SST of AINS is entered.
SST	{AINS, AINS-DEA}	
	Default:	<Value retrieved with RTRV-DFLT-OC12 command>
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the OC12. Values are:
	AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the OC12 is provisioned to an OOS-AU,AINS state.
	AINS-DEA	Automatic In-Service-Deactivate, the OC12 is not provisioned to an OOS-AU,AINS state. The OC12's SST value is entered as <NoVal> (unpopulated), and the SST state is determined by its provisioned PST value and system-detected events.
	Restrictions:	ENT-OC12 is denied if SST of AINS and PST of OOS is entered. ENT-OC12 is denied if SST of AINS-DEA is entered and the current OC12 state is not OOS-AU,AINS (an SST state of AINS).

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Free Form Informational Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* DFLT Database Error: <ERROR-STRING> */ /* Error enabling supported STS1s, Error=<ERROR-STRING> */ /* Error enabling supported DCC, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC12 port OC12-14 is provisioned to the OOS-AU,AINS state.

```
ENT-OC12::OC12-14::::IS,AINS;
```

In the following example, OC12 port OC12-14, OC12-15, and OC12-16 are being provisioned using &&-ranging, to the OOS-MA state, but the port OC12-15 is already provisioned.

```
ENT-OC12::OC12-14&&-16::::OOS;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pfc518 PRTL  
  "3-15:ERRCDE=SNVS"  
  /* Status, Not in Valid State */  
  /* ENT-OC12::OC12-14&&-16::::OOS [Pfc518] (1) */  
;
```

COMMAND CODE: **ENT-OC3**
COMMAND NAME: **ENTER OC-3**

PURPOSE

The ENT-OC3 command creates (assigns and provisions) an OC-3 object entity (AID). Both working and protection OC-3 lines can be addressed by this command.

The default values for the PST parameter and keyword parameters can be modified with the SET-DFLT-OC3 command. The current default values can be retrieved with the RTRV-DFLT-OC3 command.

An OC-3 that has not been provisioned has a PST,SST of OOS-MA,UAS or OOS-AUMA,UAS&DSBLD (OOS-AUMA if the supporting equipment O1B is not provisioned). Executing an ENT-OC3 command causes the following primary state transitions for the specified OC-3. Secondary states associated with the OC-3 before and after the command is executed depend upon events detected by the system. Refer to Appendix G State Transitions, for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Present Default Database Value is:		
	OOS	IS	IS, AINS
<NoVal>, <NoVal>	OOS-MA	IS	OOS-AU, AINS
IS, <NoVal>	IS	IS	OOS-AU, AINS
IS,AINS	OOS-AU, AINS	OOS-AU, AINS	OOS-AU, AINS
OOS,<NoVal>	OOS-MA	OOS-MA	Denied
OOS,AINS	Denied	Denied	Denied
<NoVal>,AINS	Denied	OOS-AU, AINS	OOS-AU, AINS
<NoVal>,AINS-DEA	Denied	Denied	IS
IS,AINS-DEA	Denied	Denied	IS
OOS,AINS-DEA	Denied	Denied	OOS-MA

Note: 1. <NoVal> means no value is entered for that parameter.

When an OC-3 is provisioned to an OOS-MA state, a MAN condition type is set for the specified OC-3. The MAN condition type is cleared when the OC-3 is provisioned to an IS state.

When an OC-3 is in an OOS-MA, OOS-AUMA, or OOS-AU,AINS state, no OC-3 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the OC-3, but OC-3 alarm conditions are monitored (retrievable with the RTRV-OC3 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMMODE-OC3 command) for the OC-3. An OC-3 in an OOS-AU,AINS state transitions to an IS state when all OC-3 near-end alarm conditions for that OC-3 have cleared.

An ENT-OC3 command is denied if:

- The specified OC-3's supporting object the O1B I/O module is not provisioned (i.e. OC-3 has an SST of DSBLD).
- The specified OC-3 is already provisioned.
- An invalid parameter value or combination of parameter values is entered.

I/O protection switching is disabled if the OC-3 line supported by the O1B I/O circuit pack is provisioned to an OOS-MA or OOS-AUMA state.

When an ENT-OC3 command is executed, the default values for the following items are automatically provisioned for the specified OC-3, and all PM data collection registers for the OC-3 are automatically reset to zero. These default values cannot be changed, except for PM attributes, unless the specified OC-3 has first been provisioned by an ENT-OC3 command.

- Condition type attributes (refer to Appendix C, Condition Types and SET-ATTR-OC3)
- Performance monitoring (PM) attributes (refer to SET-PMATTR-ALL)
- PM mode (refer to SET-PMMODE-OC3)
- PM threshold levels (refer to SET-TH-OC3)
- PM reports (refer to ALW-PMREPT-OC3)

INPUT FORMAT

	Addressing:	None
	Description:	S1 byte to be transmitted, determines if the S1 byte transmitted of the specified OC-3 will have the "DUS" message or will have the actual traceability of the signal. Values are:
	DUS	Don't USE. The S1 byte is set to "DON'T USE for Synchronization" message.
	ACT	ACTual. The S1 byte is set to the actual traceability of the signal.
PST	{IS, OOS}	
	Default:	<Value retrieved with RTRV-DFLT-OC3 command>
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the OC-3. Values are:
	IS	In-Service, the OC-3 is provisioned to an IS or OOS-AU state.
	OOS	Out-Of-Service, the OC-3 is provisioned to an OOS-AUMA or OOS-MA state.
	Restrictions:	ENT-OC3 is denied if PST of OOS and SST of AINS is entered.
SST	{AINS, AINS-DEA}	
	Default:	<Value retrieved with RTRV-DFLT-OC3 command>
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the OC-3. Values are:
	AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the OC-3 is provisioned to an OOS-AU,AINS state.
	AINS-DEA	Automatic In-Service-Deactivate, the OC-3 is not provisioned to an OOS-AU,AINS state. The OC-3's SST value is entered as <NoVal> (unpopulated), and the SST state is determined by its provisioned PST value and system detected events.
	Restrictions:	ENT-OC3 is denied if SST of AINS and PST of OOS is entered. ENT-OC3 is denied if SST of AINS-DEA is entered and the current OC-3 state is not OOS-AU,AINS (an SST state of AINS).

M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* DFLT Database Error: <ERROR-STRING> */ /* Error enabling supported STS1s, Error=<ERROR-STRING> */ /* Error enabling supported DCC, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC-3 port OC3-14 is provisioned to the OOS-AU,AINS state.

```
ENT-OC3::OC3-14:::::IS,AINS;
```

In the following example, OC-3 port OC3-14, OC3-15 and OC3-16 are being provisioned using &&-ranging, to the OOS-MA state, but the port OC3-15 is already provisioned.

```
ENT-OC3::OC3-14&&-16:::::OOS;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pfc518 PRTL  
  "3-15:ERRCDE=SNVS"  
  /* Status, Not in Valid State */  
  /* ENT-OC3::OC3-14&&-16:::::OOS [Pfc518] (1) */  
;
```

RELATED COMMANDS

RMV-OC3
RST-OC3
RTRV-DFLT-OC3
RTRV-OC3
RTRV-SYSTEMSG-OC3
SET-DFLT-OC3

COMMAND CODE: **ENT-OSADDR-SITE**
COMMAND NAME: **ENTER OPERATIONS SYSTEM ADDRESS
SITE**

PURPOSE

The ENT-OSADDR-SITE command enters a new X.25 Incoming SVC (Switched Virtual Circuit) calling address, and any associated automatic login User Identifier (UID), into the system's X.25 Incoming SVC Calling Address database. A maximum of 32 X.25 incoming SVC calling addresses can be entered into the database.

The calling address field in an X.25 incoming SVC call request packet received over any X.25 SVC channel is compared to the system's X.25 Incoming SVC Calling Address database. If a calling address match is found, an X.25 session is established (the system accepts the X.25 call request). If an auto-login UID database entry is associated with the calling address, the associated User is automatically logged-in to the system, otherwise a normal login sequence (via ACT-USER) is required.

If X.25 incoming SVC calling address validation is disabled (VALIDATE set to NONE in the ED-PRMTR-SITE command), the system accepts any incoming X.25 SVC call request. However, the calling address field in an X.25 incoming SVC call request packet is still compared to the system's X.25 Incoming SVC Calling Address database to determine the required login sequence. If a calling address match is found and an auto-login UID is associated with the calling address, the associated User is automatically logged-in to the system, otherwise a normal login sequence (via ACT-USER) is required.

The ENT-OSADDR-SITE command only adds an X.25 incoming SVC calling address entry to the system's X.25 Incoming SVC Calling Address database. The ED-OSADDR-SITE command changes the AUTOIN parameter value associated with a incoming SVC calling address database entry. The DLT-OSADDR-SITE command removes an incoming SVC calling address from the database. The RTRV-OSADDR-SITE command retrieves the contents of the system's X.25 Incoming SVC Calling Address database.

User login security is removed by provisioning an X.25 Incoming SVC with automatic UID login since anyone with access to the communication interface has the same command privileges as the UID provisioned in the AUTOIN parameter.

A virtual channel connected to a printer terminal (refer to the TYPE parameter in the ENT-USER command) should be configured for automatic UID login. If the virtual channel is configured for a normal login sequence (AUTOIN of %), the system waits for an ACT-USER command (indefinitely if an output-only printer terminal is connected).

An ENT-OSADDR-SITE command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

ENT-OSADDR-SITE: [TID] :: [CTAG] :: ADDR, [AUTOIN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

ADDR	<1–15 INTEGER X.25_CALLING_ADDRESS> Default: Entry Required Addressing: None Description: X.25 Incoming SVC Calling Address, specifies the X.25 Incoming SVC Calling Address (the X.25 address for the system calling the 1631 SX) to be added to the X.25 Incoming SVC Calling Address database. If the value of ADDR is less than 10 digits, leading zeroes are truncated unless the ADDR value is entered enclosed within double quotes ("...").
AUTOIN	{%, <UID> } Default: {%} Addressing: None Description: Automatic Login, specifies whether a User ID is automatically logged-in to the system when an X.25 incoming SVC call request packet is received with a calling address matching the entered ADDR value. Values are: % No Automatic Login, a normal log-in sequence (via ACT-USER) is required to access the system. <UID> UID Automatically Logged-in, the entered User ID (UID) is automatically logged-in when an X.25 incoming SVC call request packet is received with a calling address matching the entered ADDR value.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <ADDR>, <AUTOIN> */
[/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;

```

OUTPUT PARAMETERS

ADDR	<1–15 INTEGER X.25_CALLING_ADDRESS> X.25 Incoming SVC Calling Address, indicates the X.25 Incoming SVC Calling Address (the X.25 address for the system calling the 1631 SX) that was added to the X.25 Incoming SVC Calling Address database.
AUTOIN	{%, <UID>} Automatic Login, identifies the User ID that is automatically logged-in to the system when an X.25 incoming SVC call request packet is received with a calling address matching the entered ADDR value. Values are: % No Automatic Login, a normal log-in sequence (via ACT-USER) is required to access the system. <UID> UID Automatically Logged-in, the User ID (UID) is automatically logged-in when an X.25 incoming SVC call request packet is received with a calling address matching the entered ADDR value.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]

[/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid /* Illegal Input: ADDR */ /* Illegal Input: AUTOIN */ /* AUTO LOGIN (Illegal AUTOIN) */ /* AUTO LOGIN (Duplicate AUTOIN in OSADDR) */ /* AUTO LOGIN (Duplicate AUTOIN in OSDB) */ /* AUTO LOGIN (Non-Existent AUTOIN) */ /* AUTO LOGIN (TABS user on non-TABS CID) */ /* AUTO LOGIN (NON-TABS user on TABS CID) */
SDBE	Status, internal Data Base Error /* OSADDR contains max number of records – status = <status number> */ /* Unable to write to OSADDR – status = <status number> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the X.25 incoming SVC calling address 14045551212, with an associated auto-login UID of SMITH, is added to the X.25 Incoming SVC Calling Address database.

```
ENT-OSADDR-SITE:::::14045551212, SMITH;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P1e006. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P1e006 COMPLD
/* 14045551212, SMITH */
/* ENT-OSADDR-SITE:::::14045551212, SMITH [P1e006] (1) */

COMMAND CODE: **ENT-PARTITN**
COMMAND NAME: **ENTER PARTITION**

PURPOSE

The ENT-PARTITN command creates a uniquely named user facility partition. The system supports a maximum of thirty-two (32) user facility partitions.

User facility partitioning allows any OC12, OC3, EC1, STS1, STS3C, VT1, T3, T1, or F3 port to be partitioned into groups of OC12, OC3, EC1, STS1, STS3C, VT1.5, DS3, DS1, or F3 facilities (facility partitions) with each partition associated with specific "partitioned" users. A partitioned user's TL1 command access to the ports in the specified facility partition is then restricted to the facilities assigned to that partition. Restricted access is controlled by defining a user as a partitioned user and associating the user with a specific partition, by the user's CCAL and CCFC provisioning (restricts the commands the user can execute) and by the set of commands that operate on facility partitions (restricts the command operation to the facilities assigned to a partition).

The OC12, OC3, EC1, STS1, STS3C, VT1, T3, T1, or F3 ports assigned to a facility partition need not be contiguous (physically or logically). A facility partition is only a logical mapping of OC12, OC3, EC1, STS1, STS3C, VT1, T3, T1, or F3 ports to the partition. Any OC12, OC3, EC1, STS1, STS3C, VT1, T3, T1, or F3 port can be added to an OC12, OC3, EC1, STS1, STS3C, VT1.5, DS3, DS1, or F3 facility partition, respectively, regardless of whether a port is provisioned or the port exists in the system.

Any user, except the "sysprint", "system" (administrator) or Alcatel account users, can be associated with a facility partition. The commands a partitioned user can execute are determined by the user's command privileges (the user's CCAL and CCFC provisioning via ENT-USER or ED-PRVG-USER). However, execution of a command that supports facility partitions by a partitioned user only operates on the facilities in the facility partition associated with the partitioned user. Refer to the Introduction section for a list of the commands supporting user facility partitioning.

Special care should be exercised when provisioning command privileges for a partitioned user. Only those commands that support facility partitioning provide protection for facilities not in the partitioned user's facility partition. All other commands that do not support facility partitioning operate the same regardless if a partitioned user or non-partitioned user executes the command (e.g., INIT-SYS). A set of commands recommended for use by partitioned users is contained in the default CCAL Group Y (refer to Appendix H. User Command Privilege Defaults).

A facility partition is created by specifying a unique partition name with the ENT-PARTITN command. OC12, OC3, EC1, STS1, STS3C, VT1, T3, T1, or F3 ports are assigned to an OC12, OC3, EC1, STS1, STS3C, VT1.5, DS3, DS1, or F3 facility partition with the ED-PARTITN-OC12, ED-PARTITN-OC3, ED-PARTITN-EC1, ED-PARTITN-STS1, ED-PARTITN-STS3C, ED-PARTITN-VT1, ED-PARTITN-T3, ED-PARTITN-T1, or ED-PARTITN-F3 command, respectively. A user is associated with a facility partition with the ENT-USER and ED-PRVG-USER commands.

An ENT-PARTITN command is denied if:

- The specified facility partition name already exists.
- Thirty-two (32) facility partition names already exist (another partition would result in more than 32 partitions).
- The "User Partitioning" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

ENT-PARTITN: [TID] : : [CTAG] : : PARTNAM;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
PARTNAM	<1–20 VALID NON–CASE SENSITIVE ALPHANUMERIC CHARACTERS> Default: Entry Required Addressing: None Description: Partition Name, specifies the name of the user facility partition. The valid character set for PARTNAM consists of any non–case sensitive alphanumeric characters, underscore, plus–sign, percent–sign, and pound–sign, with the first character an alphabetical character, except the keyword “ALL” is not allowed as a partition name. Restrictions: ENT–PARTITN is denied if a PARTNAM of “ALL” is entered.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* Partition <PARTNAM> has been entered. */
/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

OUTPUT PARAMETERS

PARTNAM	< 1–20 VALID PARTITION NAME CHARACTERS > Partition Name, indicates the name assigned to the user facility partition.
---------	---

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
/* <Informational Error Description Text> */
/* <Expanded Error Code Description> */
/* <Optional Suggested Action Text> */
/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

ENFE	Equipage, FEature Not provided
IDNV	Input, Data Not Valid /* ALL cannot be used as a partition name */ /* Partition name's first character must be alphabetic */
IIFM	Input, Invalid data ForMat /* PARTNAM length */
IPNV	Input, Parameter Not Valid /* PARTNAM */
SAIS	Status, Already In Service /* partition <PARTNAM> already exists */
SDBE	Status, internal Data Base Error /* Error accessing the PARTITION DB – status = <status number> */
SROF	Status, Requested Operation Failed /* Unable to write to partition database */

EXAMPLES

In the following example, the partition named PARTITION1 is created.

```
ENT-PARTITN:::::PARTITION1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P25008. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P25008 COMPLD  
/* Partition PARTITION1 has been entered. */  
/* ENT-PARTITN:::::PARTITION1 [P25008] (1) */

COMMAND CODE: **ENT-RNG-OC12**
COMMAND NAME: **ENTER RING OC12**

PURPOSE

The ENT-RNG-OC12 command creates (assigns) ring protection group pairs for OC12 facilities. It associates a preferred (protected) OC12 with an alternate (protecting) OC12. If an ENT-FFP-OC12 has been entered (i.e., the ports are provisioned for linear mode), the ENT-RNG-OC12 command will fail.

Upon successful completion of the ENT-RNG-OC12 command for ring protection group pairs of OC12 facilities, *no distinction exists between the working OC12 and the protection OC12 port*. The terminology “preferred” and “alternate” is used in ring mode in place of “working (i.e., protected)” and “protection (i.e., protecting)”, respectively. Therefore, any references throughout this manual to protection OC12 and working OC12 ports refer to OC12 ports in their normal linear mode of operation. The STS-1/VT1.5 paths contained in the odd-numbered OC12s are the default preferred paths (or protected paths). The STS-1/VT1.5 paths contained in the even-numbered OC12s are the default alternate (or protecting) paths.

Executing an ENT-RNG-OC12 command causes all of the VT1.5s within the ring that are two-way cross-connected to carry an SST of BUSY.

Executing an ENT-RNG-OC12 while the STS-1s/VT1.5s within the specified OC12 is two-way cross-connected to an STS-1/VT1.5 within another OC12 that is already defined as part of an another ring will complete successfully.

An ENT-RNG-OC12 command is denied if:

- The OC12s specified in B1 and B2 parameters have not previously been provisioned (SST of UAS).
- An ENT-FFP-OC12 command has been previously completed for the specified OC12 ports (i.e., the ports have been provisioned for normal linear mode).
- The OC12s specified in B1 and B2 parameters do not refer to preferred and alternate OC12 respectively.
- Either of the specified OC12s contain an STS3C provisioned within them.
- Any of the supported objects within the specified AIDs are involved in a one-way cross-connect (an SST of ACT), in a conference (an SST of ACT), in a loopback (an SST of LPBK), in a test access operation (an SST of TS), or in a one-way rolling operation (an SST of ROLL).
- A two-way cross-connection exists between any two STS1s/VT1.5s of the same OC12.
- Any T1 within the T3 within the STS1 embedded within the addressed OC12 is cross connected.
- The STSPTYEL/VTPTYEL of the STS1/VT1 within the OC12 specified in B1/B2 is set to Y.
- The addressed STS1 or VT1 is in a 2WAYPR connection with another VT1/STS1 embedded in a ring.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ENT-RNG-OC12 : [TID] : B1 , B2 : [CTAG] : : : [WTSDEL=] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
B1	OC12_AID:		
	{OC12–{1–560}}		(OC12–OC12#)
	Default:	Entry Required	
	Addressing:	None	
	Description:	OC12 AID, identifies the preferred (protected) OC12 port.	
	Restrictions:	ENT–RNG–OC12 is denied if the OC12 specified is not an odd–num–bered OC12.	

B2	OC12_AID:	
	{OC12-{1-560}}	(OC12-OC12#)
	Default:	Entry Required
	Addressing:	None
	Description:	OC12 AID, identifies the alternate (protecting) OC12 port.
	Restrictions:	ENT-RNG-OC12 is denied if the OC12 specified is not an even-numbered OC12.
		ENT-RNG-OC12 is denied if B2 is not equal to B1+1.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
WTSDEL=	{DELAY, IMMED}	
	Default:	{IMMED}
	Addressing:	None
	Description:	Wait to Switch Delay. Determines if the path switching on the paths within the OC12 is to be delayed by a set amount determined by the hardware or if it is immediate. Values are:
	DELAY	The path switching is to be delayed by approximately 25 milliseconds after the fault is detected.
	IMMED	The path switching is to occur immediately upon detection of the fault.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Free Form Informational Text> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */

ENT-VT1  
RTRV-RNG-OC12
```

COMMAND CODE: **ENT-RNG-OC3**
COMMAND NAME: **ENTER RING OC3**

PURPOSE

The ENT-RNG-OC3 command creates (assigns) ring protection group pairs for OC3 facilities. It associates a preferred (protected) OC3 with an alternate (protecting) OC3. If an ENT-FFP-OC3 has been entered (i.e., the ports are provisioned for linear mode), the ENT-RNG-OC3 command will fail.

Upon successful completion of the ENT-RNG-OC3 command for ring protection group pairs of OC3 facilities, *no distinction exists between the working OC3 and the protection OC3 port*. The terminology “preferred” and “alternate” is used in ring mode in place of “working (i.e., protected)” and “protection (i.e., protecting)”, respectively. Therefore, any references throughout this manual to protection OC3 and working OC3 ports refer to OC3 ports in their normal linear mode of operation. The STS-1/VT1.5 paths contained in the odd-numbered OC3s are the default preferred paths (or protected paths). The STS-1/VT1.5 paths contained in the even-numbered OC3s are the default alternate (or protecting) paths.

Executing an ENT-RNG-OC3 command causes all of the VT1.5s within the ring that are two-way cross-connected to carry an SST of BUSY.

Executing an ENT-RNG-OC3 while the STS-1s/VT1.5s within the specified OC3 is two-way cross-connected to an STS-1/VT1.5 within another OC3 that is already defined as part of an another ring will complete successfully.

An ENT-RNG-OC3 command is denied if:

- The OC3s specified in B1 and B2 parameters have not previously been provisioned (SST of UAS).
- An ENT-FFP-OC3 command has been previously completed for the specified OC3 ports (i.e., the ports have been provisioned for normal linear mode).
- The OC3s specified in B1 and B2 parameters do not refer to preferred and alternate OC3, respectively.
- Either of the specified OC3s contain an STS-3C provisioned within them.
- Any of the supported objects within the specified AIDs are involved in a one-way cross-connect (an SST of ACT), in a conference (an SST of ACT), in a loopback (an SST of LPBK), in a test access operation (an SST of TS), or in a one-way rolling operation (an SST of ROLL).
- A two-way cross-connection exists between any two STS-1s/VT1.5s of the same OC3.
- Any T1 within the T3 within the STS-1 embedded within the addressed OC3 is cross connected.
- The O1Bs on which the specified OC3s reside are in a shelf that have an IPB installed.
- The specified OC3 resides on an O1B with a controller other than L3PE2.
- The protect modules in the shelf containing the addressed OC3 are IPBs or if the center stage modules are M16s. (i.e., the protect modules must be RPBs and the Center stage modules must be M40s to be able to provision OC3 rings).
- The STSPTYEL/VTPTYEL of the STS-1/VT1.5 within the OC3 specified in B1/B2 is set to Y.
- The addressed STS-1 or VT1.5 is in a 2WAYPR connection with another VT1.5/STS-1 embedded in a ring.
- An invalid parameter value or combination of parameter values is entered.
- ENT-RNG-OC3 is denied if one or more DS1 embedded in the ring are provisioned with SRC=EXTSRC or INTSRC.

INPUT FORMAT

ENT-RNG-OC3 : [TID] : B1 , B2 : [CTAG] : : : [WTSDEL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

B1	OC3_AID:	
	{OC3-{1-2240}}	(OC3-OC3#)
	Default:	Entry Required
	Addressing:	None
	Description:	OC3 AID, identifies the preferred (protected) OC3 port.
B2	Restrictions:	ENT-RNG-OC3 is denied if the OC3 specified is not an odd-numbered OC3.
	OC3_AID:	
	{OC3-{1-2240}}	(OC3-OC3#)
	Default:	Entry Required
	Addressing:	None
CTAG	Description:	OC3 AID, identifies the alternate (protecting) OC3 port.
	Restrictions:	ENT-RNG-OC3 is denied if the OC3 specified is not an even-numbered OC3.
		ENT-RNG-OC3 is denied if B2 is not equal to B1+1.
	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
WTSDEL=	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
	{DELAY, IMMED}	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Wait to Switch Delay. Determines if the path switching on the paths within the OC3 is to be delayed by a set amount determined by the hardware or if it is immediate. Values are:
	DELAY	The path switching is to be delayed by approximately 25 milliseconds after the fault is detected.
	IMMED	The path switching is to occur immediately upon detection of the fault.

```

COMMAND CODE: **ENT-ROLL-T1**
COMMAND NAME: **ENTER ROLL T1**

PURPOSE

The ENT-ROLL-T1 command disconnects the existing DS1 or VT1.5 cross-connection specified by the DS1/VT1.5 AIDs FROM and TO, and CCT. A new DS1/VT1.5 cross-connection is established as specified by the DS1/VT1.5 AIDs RFROM and RTO, and CCT, where RFROM is the DS1/VT1.5 port common with the initial cross-connection (common with either FROM or TO) and RTO is the destination of the completed rolling operation.

ENT-ROLL-T1 requires an existing cross-connection to exist between the FROM and TO ports. The DS1 or VT1.5 port being rolled to (RTO) may also be associated with an existing, unrelated cross-connection, or it may be disconnected.

The roll can be performed in one of the four modes: fully automatic (RMODE=AUTO), Semi-automatic (RMODE=MAN), Immediate (RMODE=IMM) and fully manual (RMODE=FMAN1 followed by FMAN2 and/or DLT-ROLL-T1). The following table summarizes the relationship between the various parameter of this command and the type of roll performed, where A and B are the ports that are now cross connected and C is the port to which the traffic is to be rolled.

Existing X-Conn Between A&B	FROM	TO	RFROM	RTO	CCT	Allowed RMODE	RMODE Denied	TYPE OF ROLL
2WAY	A	B	A	C	2WAY	AUTO, MAN, FMAN1/FMAN2/DLT, IMM	NONE	DUPLEX
	A	B	B	C	2WAY	AUTO, MAN, FMAN1/FMAN2/DLT, IMM	NONE	DUPLEX
	A	B	A	C	1WAY	MAN, FMAN1/DLT	AUTO, FMAN2, IMM	Simplex Transmit Side Roll. AB rolled to AC
	A	B	B	C	1WAY	AUTO, FMAN1/FMAN2, IMM	MAN	Simplex Receive Side Roll. AB rolled to CB
	B	A	B	C	1WAY	MAN, FMAN1/DLT	AUTO, FMAN2, IMM	Simplex Transmit Side Roll. BA rolled to BC
	B	A	A	C	1WAY	AUTO, FMAN1/FMAN2, IMM	MAN	Simplex Receive Side Roll. BA rolled to CA.
1WAY A to B	A	B	A	C	1WAY	MAN, FMAN1/DLT	AUTO, FMAN2, IMM	Simplex Transmit Side Roll. AB rolled to AC.
	A	B	B	C	1WAY	AUTO, FMAN1/FMAN2, IMM	MAN	Simplex Receive Side Roll. AB rolled to CB
	A	B	Don't Care		2WAY	ENT-ROLL-T1 command denied		
	B	A	ENT-ROLL-T1 command denied					

Existing X-Conn Between A&B	FROM	TO	RFROM	RTO	CCT	Allowed RMODE	RMODE Denied	TYPE OF ROLL
1WAY B to A	B	A	B	C	1WAY	MAN, FMAN1/DLT	AUTO, FMAN2, IMM	Simplex Transmit Side Roll. BA rolled to BC.
	B	A	A	C	1WAY	AUTO, FMAN1/FMAN2, IMM	MAN	Simplex Receive Side Roll. BA rolled to CA
	B	A	Don't Care		2WAY	ENT-ROLL-T1 command denied		
	A	B	ENT-ROLL-T1 command denied					

In all of the modes, except in the IMM mode, the system sets a ROLLMON condition on the port as soon as the monitoring the receiving side of the RTO has started. Once a valid signal (A signal without LOS, LOF, AIS and EOC) is present this condition is cleared. The port is monitored for EOC only if the far end PM on that port is enabled..

In all of the modes, except in the IMM mode, the roll occurs *immediately* if the RTO port has been provisioned with FMT=UNFR, regardless of a valid signal being present on the RTO port. Therefore, to enable the system to wait for a valid signal (a signal without LOS, LOF, AIS) before allowing a roll to occur, the RTO port should be provisioned or edited with FMT={ESF, SF}.

An automatic (RMODE=AUTO) *duplex* roll is performed as follows:

- on receiving an ENT-ROLL-T1 command, a bridge connection is made from RFROM to RTO port.
- RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping TO to RFROM cross connection and the old bridge connection from RFROM to TO is disconnected thereby completing the roll.

A semi-automatic (RMODE=MAN) *duplex* is performed as follows:

- On receiving an ENT-ROLL-T1 command, a bridge connection is made from RFROM to RTO port.
- RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping TO to RFROM cross connection and the old bridge connection from RFROM to TO is left intact, until a DLT-ROLL-T1 command is received.
- On subsequent DLT-ROLL-T1 command, the old bridge connection from RFROM to RTO is disconnected and the roll is completed.

A fully manual (RMODE=FMAN1) *duplex* is performed as follows:

- On receiving an ENT-ROLL-T1 command, a bridge connection is made from RFROM to RTO port.
- RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, monitoring of the RTO port is stopped and no other action is taken.
- On receiving a subsequent ENT-ROLL-T1 command with RMODE=FMAN2, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping TO to RFROM cross connection and the old bridge connection from RFROM to TO is left intact, until a DLT-ROLL-T1 command is received.
- On subsequent DLT-ROLL-T1 command, the old bridge connection from RFROM to TO is disconnected and the roll is completed.

When 1way roll of the RFROM to TO connection is requested, a simplex transmit side roll is performed and only MAN or FMAN1 modes are allowed. An automatic roll mode will not be allowed as it is not possible to monitor the signal sent out. A semi-automatic (RMODE=MAN) or a fully manual (RMODE=FMAN1) simplex transmit side roll is performed as follows:

- On receiving an ENT-ROLL-T1 command, a bridge connection is made from RFROM to RTO port.
- On subsequent DLT-ROLL-T1 command, the old bridge connection from RFROM to TO is disconnected and the roll is completed.
- Note that in the above case both the MAN and the FMAN1 modes behave the same.

When 1way roll of the FROM to RFROM connection is requested, a simplex receive side roll is performed and only AUTO or FMAN1 followed by FMAN2 are allowed. An automatic roll is performed as follows:

- On receiving the ENT-ROLL-T1 command, RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping FROM to RFROM cross connection to complete the roll operation.

A fully manual (RMODE=FMAN1) simplex receive side roll is performed as follows:

- On receiving the ENT-ROLL-T1 command, RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, monitoring of the RTO port is stopped and no other action is taken.
- On receiving a subsequent ENT-ROLL-T1 command with RMODE=FMAN2, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping FROM to RFROM cross connection to complete the roll operation.

An immediate (RMODE=IMM) transmit side roll will be denied. An immediate receive side roll is performed as follows:

- On receiving the ENT-ROLL-T1 command, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping FROM to RFROM cross connection to complete the roll operation. This is done regardless of the state of the RTO port. Also the ROLLMON is not set or cleared in this mode.

The ENT-ROLL-T1 command completes successfully for all of the roll types (AUTO, MAN, IMM, and FMAN) if the FROM and/or TO ports are not embedded within the same ring OC3/OC12, are in a 2WAY (unprotected) connection, and the RTO port is not busy.

Executing an ENT-ROLL-T1 causes a state transition for any newly created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-ROLL-T1 causes a state transition for the disconnected cross-connect entity from

- IS to Non-Existent
- OOS-AU to Non-Existent

While the roll operation is proceeding, a secondary state of ROLL will be present on the all the ports that are involved in the roll operation. The ROLL secondary state will be cleared on the completion of the roll. If the roll operation sets up a cross connection from VT1.5 to T1, then the VT1.5 will carry a secondary state of TRM. The RTO port that is involved in the roll will also carry ACT secondary state if it does not already carry one before the roll.

After the roll operation is completed, the secondary state of:

- the VT1.5 embedded within a ring OC3/OC12 is set to BUSY (if cross-connected to another VT1.5).
- the VT1.5 embedded within a ring OC3/OC12 is set to TRMBUSY (if cross-connected to a DS1).
- the VT1.5 or DS1 not embedded within a ring OC3/OC12 is set to ACT or BUSY (as applicable).

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

ENT-ROLL-T1 is denied if:

- Either of the specified FROM, TO, or RTO DS1/VT1.5 ports are not provisioned (using ENT-T1/VT1.5).
- The cross-connection specified by FROM, TO, and CCT does not exist.
- The specified FROM and TO values are identical (the same DS1 port).
- The specified RTO port has all cross-connect capacity utilized in the direction of the roll (rolling to the transmit side of the RTO port which is already cross-connected and bridged).

- Either of the specified FROM, TO or RTO DS1 ports are part of a broadcast conference connection (a CTYPE of BCST from a RTRV-CRS command), are in a loopback (a DS1 SST of LPBK), are in a test access operation (a DS1 or cross-connection SST of TS), have C-bit loopback enabled or established (a Condition Type of ALWCBLPBK or RVCCLPBK), or have been terminated (using CHG-TL-DIG, a cross-connection SST of TERMB, TERMF, TERMT).
- The specified RTO port is an embedded DS1 and the supporting DS3 is in a loopback (a DS3 SST of LPBK).
- The specified RTO DS1 port is provisioned as an Idle Signal Source port or as part of a Test Access Port Pair (FAD A or FAD B).
- The specified TO, FROM, RTO, or RFROM port is an embedded DS1 and the supporting DS3 is intact cross-connected (a DS3 SST of ACT or BUSY).
- The roll is setting a cross connection between VT1.5 and T1 and the VTMAP of the VT1.5 is not ASYNC.
- The specified TO, FROM, RTO, or RFROM address a VT1.5 and the supporting STS1 is intact cross-connected (an STS-1 SST of ACT or BUSY).
- The specified TO, FROM, RTO, or RFROM address a VT1.5/T1 embedded within a protection OC3/OC12.
- A VT1.5 is being 1WAY rolled to a DS1 and the VT1.5 specified in TO, FROM, and/or RTO is embedded within a ring OC3/OC12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12).
- The specified FROM and TO ports are in a 2WAY pass through connection.
- The specified FROM or TO port is in a 2WAYPR connection.
- The specified FROM/TO ports are in a 2WAYDC connection.
- The specified FROM, TO, or RTO port is embedded within a ring OC3/OC12 and CCT=1WAY is entered.
- The specified RTO port is a DS1 embedded within a ring OC3/OC12.
- The specified RFROM and RTO ports are embedded within the same ring OC3/OC12.
- The specified FROM, TO, RFROM, or RTO port is redlined (in RDL=Y state).
- An invalid parameter value or combination of parameter values is entered.

	Default:	Entry Required
	Addressing:	None
	Description:	Roll From, identifies the end of the cross-connection that remains fixed through the roll operation (RFROM is the DS1/VT1.5 port common to the existing connection specified by FROM,TO and the new connection after the roll operation).
	Restrictions:	ENT-ROLL-T1 is denied if the RFROM and RTO values are equal. ENT-ROLL-T1 is denied if the RFROM value is not the same as either the FROM or TO values. ENT-ROLL-T1 is denied if the RFROM and FROM values are equal and RMODE=IMM and CCT=1WAY is entered.
	RMODE= {IMM, AUTO, MAN, FMAN1, FMAN2}	
	Default:	Entry Required
	Addressing:	None
	Description:	Rolling Mode, specifies the mode of the rolling operation to be performed. Values are:
	IMM	Immediate, the rolling operation is performed at command execution, regardless of the condition of the signals involved in the roll.
	AUTO	Automatic mode. Old broadcast tail, if one present, is automatically dropped on detection of valid signal in the new path.
	MAN	Manual mode. Old broadcast tail, if one present, is to be retained on detection of valid signal in the new path.
	FMAN1	Fully manual mode part 1. Broadcast tail is set up and monitoring for valid signal begins. No action taken on detection of valid signal in the new path.
	FMAN2	Fully manual mode part 2. Connection established from RTO to RFROM ports. This is done automatically regardless of the signal condition. The roll will even be performed if no signal is present in the new path.
	Restrictions:	ENT-ROLL-T1 is denied if RMODE=IMM and CCT=1WAY is entered and the RFROM and FROM values are equal.

RTO= DS1_AID:
 {T1-{1-59392}} (T1-DS1#)
 {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IPNV	Input, Parameter Not Valid
SAIS	Status, Already In Service
SARB	Status, All Resources Busy
SCSN	Status, invalid Command Sequence
SDBE	Status, internal Data Base Error
	/* Failed to get OTHER supporting entity records */
	/* Failed to get RFROM supporting entity records */
	/* Failed to get RTO supporting entity records */
	/* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */
	/* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */
SDNC	Status, Data Not Consistent
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a one-way DS1 cross-connection is rolled from an existing connection from port T3T1-2-2 (FROM) to port T3T1-3-3 (TO) to a new connection from port T3T1-4-4 (RTO) to port T3T1-3-3 (RFROM). In this example, the existing cross-connection between T3T1-2-2 and T3T1-3-3 could be either a two-way or one-way cross-connection. (This roll operation is sometimes referred to as a one-way receive side roll.)

```
ENT-ROLL-T1::T3T1-2-2,T3T1-3-3:::RFROM=T3T1-3-3,RTO=T3T1-4-4,RMODE=IMM;
```

In the following example, a two-way DS1 cross-connection is rolled from an existing two-way cross-connection between ports T3T1-5-5 (FROM) and T3T1-6-6 (TO) to a new two-way cross-connection between ports EC1T1-7-7 (RTO) and T3T1-6-6 (RFROM). (This example illustrates a two-way roll when RFROM equals TO.)

```
ENT-ROLL-T1::T3T1-5-5,T3T1-6-6:::RFROM=T3T1-6-6,RTO=EC1T1-7-7,  
CCT=2WAY,RMODE=FMAN1;
```

In the following example, a two-way DS1 cross-connection is rolled from an existing two-way cross-connection between ports EC1T1-8-8 (FROM) and EC1T1-9-9 (TO) to a new two-way cross-connection between ports T3T1-10-10 (RTO) and EC1T1-8-8 (RFROM). (This example illustrates a two-way roll when RFROM equals FROM.)

```
ENT-ROLL-T1::EC1T1-8-8,EC1T1-9-9:::RFROM=EC1T1-8-8,RTO=T3T1-10-10,  
CCT=2WAY,RMODE=AUTO;
```

The following example sets up a 2WAY, AUTO roll for the DS1 connection between ports T3T1-1-18, and T3T1-1-19. The new connection will be between ports T3T1-1-18 and T3T1-1-20.

```
ENT-ROLL-T1::T3T1-1-18,T3T1-1-19:::RFROM=T3T1-1-18,RTO=T3T1-1-20,  
CCT=2WAY,RMODE=AUTO;
```

COMMAND CODE: **ENT-ROLL-VT1**
COMMAND NAME: **ENTER ROLL VT1**

PURPOSE

The ENT-ROLL-VT1 command disconnects the existing VT1.5 cross-connection specified by the VT1.5 AIDs FROM and TO, and CCT. A new VT1.5 cross-connection is established as specified by the VT1.5 AIDs RFROM and RTO, and CCT, where RFROM is the VT1.5 port common with the initial cross-connection (common with either FROM or TO) and RTO is the destination of the completed rolling operation.

ENT-ROLL-VT1 requires an existing cross-connection to exist between the FROM and TO ports. The VT1.5 port being rolled to (RTO) may also be associated with an existing, unrelated cross-connection, or it may be disconnected.

The roll can be performed in one of the four modes: fully automatic (RMODE=AUTO), Semi-automatic (RMODE=MAN), Immediate (RMODE=IMM) and fully manual (RMODE=FMAN1 followed by FMAN2 and/or DLT-ROLL-VT1). The following table summarizes the relationship between the various parameter of this command and the type of roll performed, where A and B are the ports that are now cross connected and C is the port to which the traffic is to be rolled.

Existing X-Conn Between A&B	FROM	TO	RFROM	RTO	CCT	Allowed RMODE	RMODE Denied	TYPE OF ROLL
2WAY	A	B	A	C	2WAY	AUTO, MAN, FMAN1/FMAN2/DLT, IMM	NONE	DUPLEX
	A	B	B	C	2WAY	AUTO, MAN, FMAN1/FMAN2/DLT, IMM	NONE	DUPLEX
	A	B	A	C	1WAY	MAN, FMAN1/DLT	AUTO, FMAN2, IMM	Simplex Transmit Side Roll. AB rolled to AC
	A	B	B	C	1WAY	AUTO, FMAN1/FMAN2, IMM	MAN	Simplex Receive Side Roll. AB rolled to CB
	B	A	B	C	1WAY	MAN, FMAN1/DLT	AUTO, FMAN2, IMM	Simplex Transmit Side Roll. BA rolled to BC
	B	A	A	C	1WAY	AUTO, FMAN1/FMAN2, IMM	MAN	Simplex Receive Side Roll. BA rolled to CA.
1WAY A to B	A	B	A	C	1WAY	MAN, FMAN1/DLT	AUTO, FMAN2, IMM	Simplex Transmit Side Roll. AB rolled to AC.
	A	B	B	C	1WAY	AUTO, FMAN1/FMAN2, IMM	MAN	Simplex Receive Side Roll. AB rolled to CB
	A	B	Don't Care		2WAY	ENT-ROLL-VT1 command denied		
	B	A	ENT-ROLL-VT1 command denied					

Existing X-Conn Between A&B	FROM	TO	RFROM	RTO	CCT	Allowed RMODE	RMODE Denied	TYPE OF ROLL
1WAY B to A	B	A	B	C	1WAY	MAN, FMAN1/DLT	AUTO, FMAN2, IMM	Simplex Transmit Side Roll. BA rolled to BC.
	B	A	A	C	1WAY	AUTO, FMAN1/FMAN2, IMM	MAN	Simplex Receive Side Roll. BA rolled to CA
	B	A	Don't Care		2WAY	ENT-ROLL-VT1 command denied		
	A	B	ENT-ROLL-VT1 command denied					

In all the modes, except in the IMM mode, the system sets a ROLLMON condition on the port as soon as the monitoring the receiving side of the RTO has started. Once a valid signal (A signal without AIS, LOP, IDLE, SLMF, or RFI) is present this condition is cleared.

An automatic (RMODE=AUTO) *duplex* roll is performed as follows:

- on receiving an ENT-ROLL-VT1 command, a bridge connection is made from RFROM to RTO port.
- RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping TO to RFROM cross connection and the old bridge connection from RFROM to TO is disconnected thereby completing the roll.

A semi-automatic (RMODE=MAN) *duplex* is performed as follows:

- On receiving an ENT-ROLL-VT1 command, a bridge connection is made from RFROM to RTO port.
- RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping TO to RFROM cross connection and the old bridge connection from RFROM to TO is left intact, until a DLT-ROLL-VT1 command is received.
- On subsequent DLT-ROLL-VT1 command, the old bridge connection from RFROM to RTO is disconnected and the roll is completed.

A fully manual (RMODE=FMAN1) *duplex* is performed as follows:

- On receiving an ENT-ROLL-VT1 command, a bridge connection is made from RFROM to RTO port.
- RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, monitoring of the RTO port is stopped and no other action is taken.
- On receiving a subsequent ENT-ROLL-VT1 command with RMODE=FMAN2, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping TO to RFROM cross connection and the old bridge connection from RFROM to TO is left intact, until a DLT-ROLL-VT1 command is received.
- On subsequent DLT-ROLL-VT1 command, the old bridge connection from RFROM to TO is disconnected and the roll is completed.

When one-way roll of the RFROM to TO connection is requested, a simplex transmit side roll is performed and only MAN or FMAN1 modes are allowed. An automatic roll mode will not be allowed as it is not possible to monitor the signal sent out. A semi-automatic (RMODE=MAN) or a fully manual (RMODE=FMAN1) simplex transmit side roll is performed as follows:

- On receiving an ENT-ROLL-VT1 command, a bridge connection is made from RFROM to RTO port.
- On subsequent DLT-ROLL-VT1 command, the old bridge connection from RFROM to TO is disconnected and the roll is completed.
- Note that in the above case both the MAN and the FMAN1 modes behave the same.

When one-way roll of the FROM to RFROM connection is requested, a simplex receive side roll is performed and only AUTO or FMAN1 followed by FMAN2 are allowed. An automatic roll is performed as follows:

- On receiving the ENT-ROLL-VT1 command, RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping FROM to RFROM cross connection to complete the roll operation.

A fully manual (RMODE=FMAN1) simplex receive side roll is performed as follows:

- On receiving the ENT-ROLL-VT1 command, RTO port's receive side is monitored for a valid signal.
- Once a valid signal is present on the receive side of the RTO port, monitoring of the RTO port is stopped and no other action is taken.
- On receiving a subsequent ENT-ROLL-VT1 command with RMODE=FMAN2, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping FROM to RFROM cross connection to complete the roll operation.

An immediate (RMODE=IMM) transmit side roll will be denied. An immediate receive side roll is performed as follows:

- On receiving the ENT-ROLL-VT1 command, a receive side switch is performed at the RFROM whereby cross connection from RTO to RFROM is made thereby dropping FROM to RFROM cross connection to complete the roll operation. This is done regardless of the state of the RTO port. Also the ROLLMON is not set or cleared in this mode.

The ENT-ROLL-VT1 command completes successfully for all of the roll types (AUTO, MAN, IMM, and FMAN) if the FROM and/or TO ports are not embedded within the same ring OC-3/OC-12, are in a 2WAY (unprotected) connection, and the RTO port is not busy.

Executing an ENT-ROLL-VT1 causes a state transition for any newly created cross-connect entity from

- Non-Existent to IS
- Non-Existent to OOS-AU

Executing an ENT-ROLL-VT1 causes a state transition for the disconnected cross-connect entity from

- IS to Non-Existent
- OOS-AU to Non-Existent

While the roll operation is proceeding, a secondary state of ROLL will be present on the all the ports that are involved in the roll operation. The ROLL secondary state will be cleared on the completion of the roll. The RTO port that is involved in the roll will also carry ACT secondary state if it does not already carry one before the roll.

After the roll operation is completed, the secondary state of:

- the VT1.5 embedded within a ring OC-3/OC-12 is set to BUSY.
- the VT1.5 not embedded within a ring OC-3/OC-12 is set to ACT or BUSY (as applicable).

(Refer to Appendix G, State Transitions for additional information on state values and state transitions.)

ENT-ROLL-VT1 is denied if:

- Either of the specified FROM, TO, or RTO VT1.5 ports are not provisioned (using ENT-VT1.5).
- The cross-connection specified by FROM, TO, and CCT does not exist.
- The specified FROM and TO values are identical (the same VT1.5 port).
- The specified RTO port has all cross-connect capacity utilized in the direction of the roll (rolling to the transmit side of the RTO port which is already cross-connected and bridged).
- Either of the specified FROM, TO or RTO VT1.5 ports are part of a broadcast conference connection (a CTYPE of BCST from a RTRV-CRS command), are in a loopback (a VT1.5 SST of LPBK), are in a test access operation (a VT1.5 or cross-connection SST of TS), or have been terminated (using CHG-TL-DIG, a cross-connection SST of TERMB, TERMF, TERMT).
- The specified RTO port's supporting STS-1 is in a loopback (an STS-1 SST of LPBK).
- The specified FROM, TO, RFROM, or RTO is a VT1.5 and the supporting STS-1 is intact cross-connected (an STS-1 SST of ACT or BUSY).
- The specified FROM, TO, RFROM, RTO parameters address a VT1.5/T1 embedded within a protection OC-3/OC-12.
- A VT1.5 is being 1WAY rolled to a VT1.5 and the VT1.5 specified in TO, FROM, and/or RTO is embedded within a ring OC-3 or OC-12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12).

- The specified FROM and TO ports are in a 2WAY pass through connection.
- The specified FROM or TO port is in a 2WAYPR connection.
- The specified FROM/TO ports are in a 2WAYDC connection.
- The specified FROM, TO, or RTO port is embedded within a ring OC-3/OC-12 and CCT=1WAY is entered.
- The specified RTO port is a DS1 embedded within a ring OC-3/OC-12.
- The specified RFROM and RTO ports are embedded within the same ring OC-3/OC-12.
- The specified FROM, TO, RFROM, or RTO port is redlined (in RDL=Y state).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

ENT-ROLL-VT1: [TID]:FROM,TO:[CTAG]::RFROM,RMODE,RTO=[,CCT=];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.
FROM	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID. If CCT=one-way, FROM identifies the receive side (from the network) of the cross-connection to be rolled. If CCT=two-way then either AID of the cross-connection may be used as the FROM AID. Restrictions: ENT-ROLL-VT1 is denied if the FROM and TO values are equal. ENT-ROLL-VT1 is denied if the RFROM value is not the same as either the FROM or TO values. ENT-ROLL-VT1 is denied if the RFROM and FROM values are equal and RMODE=IMM and CCT=one-way is entered. ENT-ROLL-VT1 is denied if all FROM, TO, RFROM and RTO do not specify VT1.5s.
TO	VT1 AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID. If CCT=one-way, TO identifies the transmit side (to the network) of the cross-connection to be rolled. If CCT=two-way then either AID of the cross-connection may be used as the TO AID. Restrictions: ENT-ROLL-VT1 is denied if the FROM and TO values are equal. ENT-ROLL-VT1 is denied if the RFROM value is not the same as either the FROM or TO values. ENT-ROLL-VT1 denied if all FROM, TO, RFROM and RTO do not specify VT1.5s.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IPNV	Input, Parameter Not Valid
SAIS	Status, Already In Service
SARB	Status, All Resources Busy
SCSN	Status, invalid Command Sequence
SDBE	Status, internal Data Base Error
	/* Failed to get OTHER supporting entity records */
	/* Failed to get RFROM supporting entity records */
	/* Failed to get RTO supporting entity records */
	/* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */
	/* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */
SDNC	Status, Data Not Consistent
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest

EXAMPLES

In the following example, a one-way VT1.5 cross-connection is rolled from an existing connection from port EC1VT1-2-2-1 (FROM) to port EC1VT1-3-3-1 (TO) to a new connection from port EC1VT1-4-4-1 (RTO) to port EC1VT1-3-3-1 (RFROM). In this example, the existing cross-connection between EC1VT1-2-2-1 and EC1VT1-3-3-1 could be either a two-way or one-way cross-connection. (This roll operation is sometimes referred to as a one-way receive side roll.)

```
ENT-ROLL-VT1::EC1VT1-2-2-1,EC1VT1-3-3-1:::RFROM=EC1VT1-3-3-1,
RTO=EC1VT1-4-4-1,RMODE=AUTO;
```

In the following example, a two-way VT1.5 cross-connection is rolled from an existing two-way cross-connection between ports EC1VT1-5-5-2 (FROM) and EC1VT1-6-6-3 (TO) to a new two-way cross-connection between ports OC3VT1-7-3-7-4 (RTO) and EC1VT1-6-6-3 (RFROM). (This example illustrates a two-way roll when RFROM equals TO.)

```
ENT-ROLL-VT1::EC1VT1-5-5-2,EC1VT1-6-6-3:::RFROM=EC1VT1-6-6-3,
RTO=OC3VT1-7-3-7-4,CCT=2WAY,RMODE=FMAN1;
```

In the following example, a two-way VT1.5 cross-connection is rolled from an existing two-way cross-connection between ports EC1VT1-8-7-3 (FROM) and EC1VT1-9-3-4 (TO) to a new two-way cross-connection between ports EC1VT1-10-6-3 (RTO) and EC1VT1-8-7-3 (RFROM). (This example illustrates a two-way roll when RFROM equals FROM.)

```
ENT-ROLL-VT1::EC1VT1-8-7-3,EC1VT1-9-3-4:::RFROM=EC1VT1-8-7-3,
RTO=EC1VT1-10-6-3,CCT=2WAY,RMODE=AUTO;
```

COMMAND CODE: **ENT-STS1**
COMMAND NAME: **ENTER STS-1**

PURPOSE

The ENT-STS1 command creates (assigns and provisions) an STS-1 path object entity (AID).

The default values for the PST parameter and keyword parameters can be modified with the SET-DFLT-STS1 command. The current default values can be retrieved with the RTRV-DFLT-STS1 command.

An STS-1 that has not been provisioned has a PST,SST of OOS-MA,UAS or OOS-AUMA,UAS&DSBLD (OOS-AUMA if the supporting EC1/OC-3/OC-12 is not provisioned). Executing an ENT-STS1 command causes the following primary state transitions for the specified STS-1. Secondary states associated with the STS-1 before and after the command is executed depend upon events detected by the system. Refer to Appendix G State Transitions, for additional information on state values and state transitions.

ENTERED PST VALUE	Next PST State if Present Default Database Value is:	
	OOS	IS
<NoVal>	OOS-MA	IS
IS	IS	IS
OOS	OOS-MA	OOS-MA
Note: 1. <NoVal> means no value is entered for that parameter.		

When an STS-1 is provisioned to an OOS-MA state, a MAN condition type is set for the specified STS-1. The MAN condition type is cleared when the STS-1 is provisioned to an IS state.

When an STS-1 is in an OOS-MA, OOS-AUMA state, no STS-1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the STS-1, but STS-1 alarm conditions are monitored (retrievable with the RTRV-STS1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMMODE-STS1 command) for the STS-1.

An ENT-STS1 command is denied if:

- The specified STS-1s supporting EC1, OC-3, or OC-12 have not been provisioned.
- The existing state for the addressed STS-1 is any PST,SST other than OOS-MA, UAS.
- STSPTYEL=Y is specified.
- An invalid parameter value or combination of parameter values is entered.
- TACC=Y, and PST=IS.
- TAPPOOL is set to a valid value but TACC=N.
- TAPP AID is set to the last STS1 value in the system, and AID+1 can not be provisioned as a FAD port.
- FADB is provisioned.

When an ENT-STS1 command is executed, the default values for the following items are automatically provisioned for the specified STS-1, and all PM data collection registers for the STS-1 are automatically reset to zero. These default values cannot be changed, except for PM attributes, unless the specified STS-1 has first been provisioned by an ENT-STS1 command.

- Condition type attributes (refer to Appendix C, Condition Types and SET-ATTR-STS1)
- Fault escalation parameters (refer to ED-FLTPRO-STS1)
- Performance monitoring (PM) attributes (refer to SET-PMATTR-ALL)
- PM mode (refer to SET-PMMODE-STS1)
- PM threshold levels (refer to SET-TH-STS1)
- PM reports (refer to ALW-PMREPT-STS1)

I/O protection switching is disabled if all three STS-1 ports on the supporting I/O circuit pack are in an OOS-MA or OOS-AUMA state. I/O protection switching only occurs if at least one of the STS-1s on the supporting I/O circuit pack is provisioned to an IS or an OOS-AU state.

In order to be compatible with the older UPSRs which do not switch on the excessive BERs (EBERs) on the VT1.5, the system may insert AIS-V in all VT1.5 paths (through, drop terminated and drop non-terminated) contained in a terminated STS-1 (embedded in a ring OC-3 or OC-12) that is detected as having EBER. Whether or not to insert AIS-V in all VTs is provisionable via AUTOVTRINGAIS parameter.

INPUT FORMAT

```
ENT-STS1 : [TID] : AID : [CTAG] : : [AUTOVTRINGAIS=] [ , EXPTRC=] [ , STSMAP=]
           [ , STSPTYEL=] [ , TACC=] [ , TAPPOOL=] [ , TRC=] [ , PDIINS=] : [PST] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: <div> <div>{EC1STS1-{1-3840}}</div> <div>(EC1STS1-EC1/STS1#)</div> </div> <div> <div>{OC3STS1-{1-2240}-{1-3}}</div> <div>(OC3STS1-OC3#-STS1#)</div> </div> <div> <div>{OC12STS1-{1-560}-{1-4}-{1-3}}</div> <div>(OC12STS1-OC12#-STM1#-STS1#)</div> </div> Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies the STS-1 port or range of ports. Restrictions: ENT-STS1 is denied if the STS1 specified in the AID is embedded in an even OC-3 or OC-12 that is not part of a ring (provisioned via the ENT-RNG-OC3 or ENT-RNG-OC12 commands, respectively).
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AUTOVTRINGAIS=	{3, 4, DISABLE} Default: { DISABLE } Addressing: None Description: Automatic transmit VT path AIS, specifies the level of EBER on the addressed STS-1 (that is terminated) which causes Automatic transmit VT path AIS to be sent. This parameter only applies to a terminated STS-1 that is embedded within a ring OC-3 or OC-12. If this parameter is specified on an STS-1 embedded within a ring OC-3 or OC-12, the STS-1 in the redundant ring OC-3 or OC-12 is modified to the specified values. Valid values are: <div> <div>3</div> <div>On reaching a 10-3 BER threshold, send AIS on all of its constituent VT1.5s.</div> </div> <div> <div>4</div> <div>On reaching a 10-4 BER threshold, send AIS on all of its constituent VT1.5s.</div> </div> <div> <div>DISABLE</div> <div>Path AIS on all of the VT1.5s within the addressed STS-1 is not to be sent on EBER on STS-1.</div> </div>

EXPTRC=	< 0–62 ASCII printable characters followed by CR and LF > Default: <Value retrieved with RTRV–DFLT–STS1 command> Addressing: None Description: Expected Path Trace message, specifies the expected path trace message. Value consists of 0–62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the EXPTRC message is filled with ASCII nulls followed by CR and LF. The EXPTRC value must be enclosed within double–quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the EXPTRC message is 62 ASCII nulls followed by a CR and LF.
STSMAP=	{ALL, ASYNC, VTFLOAT} Default: <Value retrieved with RTRV–DFLT–STS1 command> Addressing: None Description: STS payload Mapping. Determines the expected STS–1 payload type and the value of the expected path signal label (C2). Used for comparison for the Signal Label Mismatch function. Values are: ALL Match ALL incoming signal labels, without creating a SLMF condition, and disallow mappings (i.e., terminating) at this STS–1. Only intact STS–1 connections are possible since ALL is intended for intermediate path monitoring only. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types. ASYNC Asynchronous mapping for DS3 (i.e., C2=04 hex). The system will accept only incoming signal labels of type ASYNC without creating a SLMF condition. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types. VTFLOAT Floating mode VTs (i.e. C2=02 hex). Restrictions: If STSMAP=ASYNC, only ASYNC type mappings may be applied to the STS–1 (e.g., ENT–T3, ENT–CRS–T3, etc.). No visibility mappings can be made on an STS–1 (i.e., ENT–T3 is not possible even though STSMAP=ASYNC) if the STS–1 is provisioned on hardware that cannot directly support ASYNC mappings for intermediate path monitoring purposes (e.g. an ES1 card).
STSPTYEL=	{N} Default: <Value retrieved with RTRV–DFLT–STS1 command> Addressing: None Description: STS path yellow behavior. Identifies whether STS path yellow or RDI is sent/received. Values are: N No. RDI is sent/received on appropriate defect states.
TACC=	{N, Y} Default: <Previously Existing Value> Addressing: None Description: Test Access port AID, indicates that this STS1 port (specified by AID) and the AID+1 STS1 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are: N No, the specified STS1 port is not a Test Access port. Y Yes, STS1 ports specified by AID and AID+1 are Test Access ports. Restrictions: If TACC=Y, the AID of an STS1 entity embedded in an OC12, OC3, or EC1, except the 3rd STS1 within an OC3 and the {4–3}th STS1 within an OC12. Refer to Appendix B, Access Identifiers (AIDs).

TAPPOOL=	{PRIVATE, PUBLIC, <NoVal>}	
	Default:	<NoVal> if TACC = N PRIVATE if TACC = Y
	Addressing:	None
	Description:	TAP port Pool, defines whether the TAP port that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool. Values are:
	PRIVATE	The TAP pair that has been created belongs to the private pool of the user that issued the ENT–STS1 command. It can only be accessed by the user that owns the pool. If any other user tries to use this TAP pair (by means of CONN–TACC–STS1), the command shall be denied.
	PUBLIC	The TAP pair that has been created belongs to the public pool of the system. It can be accessed by any user with the privilege to use the Test Access commands.
	<NoVal>	No Value (unpopulated), TAPPOOL does not apply if TACC=N.
TRC=	< 0–62 ASCII printable characters followed by CR and LF >	
	Default:	<Value retrieved with RTRV–DFLT–STS1 command>
	Addressing:	None
	Description:	Path Trace message, specifies the path trace message transmitted when the STS–1 is provisioned. Value consists of 0–62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the TRC message is filled with ASCII nulls followed by CR and LF. The TRC value must be enclosed within double–quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the TRC message is 62 ASCII nulls followed by a CR and LF. For locally generated STS–1s (i.e., not cross–connected intact), the TRC value transmitted is the locally provisioned TRC value. For intact cross–connected STS–1s, the TRC value transmitted is the TRC value received at the other end of the cross connection.
PDIINS=	{N, Y}	
	Default:	<Value retrieved with RTRV–DFLT–STS1 command>
	Addressing:	None
	Description:	Payload Defect Indication Insertion (Transmit/outgoing direction only). Controls whether PDI values are inserted into the outgoing signal label (C2) bytes. If Fault Escalation is disabled on the STS–1 (FLTPRO=N via the ED–FLTPRO–STS1 command), PDI insertion is per GR–253. If Fault Escalation is enabled (FLTPRO=Y), PDI insertion is based on Alcatel's Fault Escalation type payload defects. Values are:
	N	No, PDI values are not inserted into the outgoing signal label when payload defects exist.
	Y	Yes, appropriate PDI is inserted into the outgoing signal label when payload defects exist.

PDIINS = in ENT-STS1 command	FLTPRO = in ED-FLTPRO-STS1	
	Y	N
Y	Fault escalation is based on selected incoming faults as defined in the Fault Propagation feature and PDI=FC (also called APDI) is inserted in the outgoing C2 byte.	Fault escalation is based on conditions defined in GR-253 and PDI is inserted in the outgoing C2 byte
N	Fault escalation is based on selected incoming faults as defined in the Fault Propagation feature and AIS-P is inserted in the outgoing STS1.	No fault escalation (None of the PDI, APDI or AIS-P is inserted)

PST {IS, OOS}
Default: <Value retrieved with RTRV-DFLT-STS1 command>
Addressing: None
Description: Primary State, specifies the primary state to provision the STS-1. Values are:
 IS In-Service
 OOS Out-Of-Service
Restrictions: ENT-STS1 is denied if the supporting EC1/OC-3/OC-12 is not provisioned.

COMMAND CODE: **ENT-STS3C**
COMMAND NAME: **ENTER STS-3C**

PURPOSE

The ENT-STS3C command creates (assigns and provisions) an STS-3C path object entity (AID).

The default values for the PST parameter and keyword parameters can be modified with the SET-DFLT-STS3C command. The current default values can be retrieved with the RTRV-DFLT-STS3C command.

An STS-3C that has not been provisioned has a PST,SST of OOS-MA,UAS, or OOS-AUMA,UAS&DSBLD (if supporting OC-3 is not provisioned), or OOS-AUMA,UAS&DSBLD (if one or more STS-3C has already been provisioned within the supporting OC-3 or OC-12). Executing an ENT-STS3C command causes the following primary state transitions for the specified STS-3C. Secondary states associated with the STS-3C before and after the command is executed depend upon events detected by the system. Refer to Appendix G State Transitions, for additional information on state values and state transitions.

Entered PST Value	Next PST State if Present Default Database Value is:	
	OOS	IS
<NoVal>	OOS-MA	IS
IS	IS	IS
OOS	OOS-MA	OOS-MA

Note: 1. <NoVal> means no value is entered for that parameter.

When an STS-3C is provisioned to an OOS-MA state, a MAN condition type is set for the specified STS-3C. The MAN condition type is cleared when the STS-3C is provisioned to an IS state.

When an STS-3C is in an OOS-MA state, no STS-3C transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the STS-3C, but STS-3C alarm conditions are monitored (retrievable with the RTRV-STS3C command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-STS3C command) for the STS-3C.

An ENT-STS3C command is denied if:

- The specified STS-3C's supporting OC-3 or OC-12 has not been provisioned.
- The existing state for the addressed STS-3C is any PST,SST other than OOS-MA, UAS.
- The specified STS-3C is embedded within a protection OC-3 or OC-12.
- The specified STS-3C is embedded within a ring OC-3 or OC-12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12).
- An invalid parameter value or combination of parameter values is entered.

When an ENT-STS3C command is executed, the default values for the following items are automatically provisioned for the specified STS-3C, and all PM data collection registers for the STS-3C are automatically reset to zero. These default values cannot be changed, except for PM attributes, unless the specified STS-3C has first been provisioned by an ENT-STS3C command.

- Condition type attributes (refer to Appendix C, Condition Types and SET-ATTR-STS3C)
- Performance monitoring (PM) attributes (refer to SET-PMATTR-ALL)
- PM mode (refer to SET-PMODE-STS3C)
- PM threshold levels (refer to SET-TH-STS3C)
- PM reports (refer to ALW-PMREPT-STS3C)

INPUT FORMAT

ENT-STS3C: [TID] :AID: [CTAG] : : [EXPTRC=] [, STSMAP=] [, TRC=] : [PST] ;

INPUT PARAMETERS

TID < 1-20 VALID TID CHARACTERS >
Default: <SID>
Addressing: None
Description: Target Identifier, specifies the network node TID for the command.

AID	STS3C_AID:	
	{OC3STS3C-{1-2240}}	(OC3STS3C-OC3#/STS3C#)
	{OC12STS3C-{1-560}-{1-4}}	(OC12STS3C-OC12#-STM1/STS3C#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	STS3C AID, identifies the STS-3C port or range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
EXPTRC=	< 0-62 ASCII printable characters followed by CR and LF >	
	Default:	<Value retrieved with RTRV-DFLT-STS3C command>
	Addressing:	None
	Description:	Expected Path Trace message, specifies the expected path trace message. Value consists of 0-62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the EXPTRC message is filled with ASCII nulls followed by CR and LF. The EXPTRC value must be enclosed within double-quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the EXPTRC message is 62 ASCII nulls followed by a CR and LF.
STSMAP=	{ALL, ATM, DQDB, DS4NA, FDDI}	
	Default:	<Value retrieved with RTRV-DFLT-STS3C command>
	Addressing:	None
	Description:	STS payload Mapping. Determines the expected STS-3C payload type and the value of the expected path signal label (C2). Used for comparison for the Signal Label Mismatch function. Values are:
	ALL	Generic STS-3C format. Contains payload of any mapping format (C2≠00 hex). Since this value will match ALL signal label values, mismatch alarms are never generated.
	ATM	STS-3C contains ATM payload (provisioned (C2=13 hex)).
	DQDB	STS-3C contains DQDB payload (provisioned (C2=14 hex)).
	DS4NA	STS-3C contains DS4NA payload (provisioned (C2=12 hex)).
	FDDI	STS-3C contains FDDI payload (provisioned (C2=15 hex)).
TRC=	< 0-62 ASCII printable characters followed by CR and LF >	
	Default:	<Previously Existing Value>
	Addressing:	None
	Description:	Path Trace message. Specifies the path trace message to be transmitted when the STS-3c is provisioned. Value consists of 0-62 ASCII printable characters followed by a CR (carriage return) and LF (line feed). If less than 62 characters are entered, the TRC message is filled with ASCII nulls followed by CR and LF. The TRC value must be enclosed within double-quotes if a character other than an alphanumeric, underscore, plus, percent or pound is entered. If "" (i.e., no characters) is entered, the TRC message is 62 ASCII nulls followed by a CR and LF. For locally generated STS-3Cs (i.e., not cross connected intact), the TRC value transmitted is the locally provisioned TRC value. For intact cross connected STS-3Cs, the TRC value transmitted is the TRC value received at the other end of the cross connection.

PST	{IS, OOS}	
	Default:	<Value retrieved with RTRV-DFLT-STS3C command>
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the STS-3C. Values are:
	IS	In-Service
	OOS	Out-Of-Service. Out-of-service for management (OOS-MA) is assumed.
	Restrictions:	ENT-STS3C is denied if the supporting OC-3 is not provisioned.

RTRV-STS3C

SET-DFLT-STS3C

COMMAND CODE: **ENT-T1**
COMMAND NAME: **ENTER T1**

PURPOSE

The ENT-T1 command creates (assigns and provisions) a DS1 object entity (AID). This command is also used to assign and provision an external timing reference source.

The default values for the PST parameter and keyword parameters, except the SRC and TACC parameters, can be modified with the SET-DFLT-T1 command. The current default values can be retrieved with the RTRV-DFLT-T1 command.

The system establishes cross-connects to an Idle signal when a DS1 is not cross-connected to another DS1. The Idle signal used is determined by the DS1's provisioning of the IDLE parameter value. If AIS is specified as the Idle signal for a DS1 port, the AIS Idle signal is generated internally by the port hardware. If QRS (Framed or Unframed) is specified as the Idle signal for a port, an Idle Signal Source port is used to generate the Idle signal. Any DS1 port, except a DS1 contained in a VT1.5, may be provisioned as a QRSF (ESF or SF format), or QRSU Idle Signal Source port. Only one DS1 in the system can be provisioned at a time as a QRSF (ESF or SF format) or QRSU Idle Signal Source port, but another port can be provisioned to replace one of these Idle Signal Source ports and the system automatically uses the replacement port as the specified Idles Signal Source. The format of an Idle Signal Source port must be specified as either SF or ESF if the Idle Signal Source port is to provide a QRSF Idle Signal. An Idle Signal Source port must be provisioned before any DS1 requiring its use is provisioned. An Idle Signal Source port provisioned as an Internal Source port (SRC of INTSRC) has both facility failure detection disabled (a facility failure condition cannot occur for an Internal Idle Signal Source port) and Performance Monitoring data collection disabled. An Idle Signal Source port cannot be the target AID for a cross-connect.

Up to 256 electrical DS1 or DS1 embedded in an electrical DS3 port pairs in the system may be provisioned as test access ports at a time, but only to an OOS-MA or OOS-AUMA state. When this is done, AID and AID+1 are both provisioned as a Test Access Port Pair (TAPP). A TAPP is always assigned as a sequential pair of ports (i.e., if port T3T1-3-5 is referenced in the command, then ports T3T1-3-5 and T3T1-3-6 are the TAPP). AID+1 inherits the provisioning of the DS1 specified by AID. If TAPPOOL is not specified or specified as PRIVATE, the TAPP is associated with, or owned by, the user that provisioned the TAPP. No other user is allowed to use the TAPP for test access operations. If TAPPOOL is specified as PUBLIC, then that TAPP can be used by any user that has access to test access commands. If the TAPPs are embedded DS1s within a DS3, both DS1s of the TAPP must reside within the same DS3 and the supporting DS3 must be provisioned (with the ENT-T3 command) before the TAPP is provisioned. TAPPs may not be the target AID for a cross-connect. When a TAPP is provisioned, the idle signal for both TAPPs defaults to QRSU.

A DS1 that has not been provisioned has a PST,SST of OOS-MA,UAS or OOS-AUMA,UAS&DSBLD (OOS-AUMA if the supporting DS3 is not provisioned). Executing an ENT-T1 command causes the following primary state transitions for the specified DS1. Secondary states associated with the DS1 before and after the command is executed depend upon events detected by the system. Refer to Appendix G State Transitions.

Entered PST,SST Value	Next PST State if Present Default Database Value is:		
	OOS	IS	IS, AINS
<NoVal>, <NoVal>	OOS-MA	IS	OOS-AU, AINS
IS, <NoVal>	IS	IS	OOS-AU, AINS
IS,AINS	OOS-AU, AINS	OOS-AU, AINS	OOS-AU, AINS
OOS,<NoVal>	OOS-MA	OOS-MA	Denied
OOS,AINS	Denied	Denied	Denied
<NoVal>,AINS	Denied	OOS-AU, AINS	OOS-AU, AINS
<NoVal>,AINS-DEA	Denied	Denied	IS

Entered PST,SST Value	Next PST State if Present Default Database Value is:		
	OOS	IS	IS, AINS
IS,AINS-DEA	Denied	Denied	IS
OOS,AINS-DEA	Denied	Denied	OOS-MA

Note: 1. <NoVal> means no value is entered for that parameter.

When a DS1 is provisioned to the OOS-MA state, a MAN condition type is set for the specified DS1, unless the specified DS1 is provisioned as a Test Access Port (a MAN condition is not set on TAPPs). The MAN condition type is cleared when the DS1 is provisioned to an IS state.

When a DS1 is in an OOS-MA, OOS-AUMA or OOS-AU, AINS state, no DS1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the DS1, but DS1 alarm conditions are monitored (retrievable with the RTRV-T1 command) and performance monitoring data is collected (if PM collection is not disabled by the SET-PMODE-T1 command) for the DS1.

An ENT-T1 command is denied if:

- The specified DS1 is an embedded DS1 and the supporting DS3/VT1.5 has not been provisioned.
- SYNCMSG=Y is specified on a TMG whose framing format (FMT) is not specified as ESF.
- The existing state for the addressed DS1 is any PST,SST other than OOS-MA, UAS.
- The supporting DS3 is provisioned with FMT=UNFR, FRCC, or UNCBIT.
- The specified DS1 is provisioned with IDLE of {QRSF, QRSU} and the specified idle signal source port is not provisioned.
- The specified DS1 is embedded in a VT1.5 and the DS1 is being provisioned as an Idle Signal Source port.
- The specified DS1 is being provisioned as a Test Access port and PST of IS is entered (a TAPP can only be provisioned to an OOS-MA or OOS-AUMA state), or either of the DS1s identified by AID or AID+1 are already provisioned, or AID or AID+1 are embedded DS1s but not within the same DS3 or AID or AID+1 are embedded DS1 within an STS1.
- TACC=Y or LINECDE is specified on a DS1 embedded within a VT-formatted electrical STS1 (EC1) or VT-formatted STS1 within an OC3/OC12 or the DS1 is the 28th DS1 embedded within an electrical DS3.
- TACC=Y is specified and the supporting entity is connected or has fault propagation.
- The specified DS1 is embedded within a DS3 TAP.
- The specified object is not a timing reference source (TMG) and a value TMGREF is specified.
- The command is issued identifying both the timing reference sources as either Primary or Secondary.
- The specified DS1 is embedded within a protection OC3/OC12.
- The specified DS1 is embedded within a DS3 or VT1.5 and the supporting DS3 or STS1 is intact cross-connected (i.e., the supporting entity has an SST of {ACT, BUSY}) and FEMETHOD of ATTPOLL is entered.
- The specified DS1 is embedded within a VT1.5 and ASYNC mapping is not supported by either the VT1.5 itself (i.e., the VT1.5's VTMAP is not ASYNC) or the VT1.5 resides on hardware that does not support VT1.5 ASYNC mapping for monitoring purposes (i.e., an ES1 card).
- The specified DS1 is embedded within a VT1.5 and FEMETHOD of {ATTPOLL} or FENDNTE of {ATT} is entered.
- A TAPP is being assigned and the total number of DS1 TAPPs is already 256.
- The specified DS1 is contained in an STS1 embedded in an OC3/OC12 ring and SRC=EXTSRC or INTSRC.
- An invalid parameter value or combination of parameter values is entered.

When an ENT-T1 command is executed, the default values for the following items are automatically provisioned for the specified DS1, and all PM data collection registers for the DS1 are automatically reset to zero. These default values cannot be changed, except for PM attributes, unless the specified DS1 has first been provisioned by an ENT-T1 command.

- Condition type attributes (refer to Appendix C, Condition Types and SET-ATTR-T1)
- Fault escalation parameters (refer to ED-FLTPRO-T1)

- Performance monitoring (PM) attributes (refer to SET-PMATTR-ALL)
- PM mode (refer to SET-PMMODE-T1)
- PM threshold levels (refer to SET-TH-T1)
- PM reports (refer to ALW-PMREPT-T1)

For DS1 ports supported by an EP3 circuit pack, I/O protection switching is disabled if all three DS3 ports supported by the EP3 I/O circuit pack are in an OOS-MA or OOS-AUMA state. I/O protection switching only occurs if at least one of the supporting DS3s on the supporting EP3 I/O circuit pack is provisioned to an IS or an OOS-AU state.

For DS1 ports supported by a DSI circuit pack, I/O protection switching is disabled if all the DS1 ports supported by the DSI I/O circuit pack are in an OOS-MA or OOS-AUMA state. I/O protection switching only occurs if at least one of the DS1s on the supporting I/O circuit pack is provisioned to an IS or an OOS-AU state.

	TMG_AID:
	{TMG-{0, 1}}
	Default: Entry Required
	Addressing: &&-ranging and &-grouping
	Description: DS1 AID, identifies the DS1 port and TMG AID identifies the external timing resource. This parameter is only considered when the AID specifies a Timing Reference port (i.e.; the AID is either a TMG-0 or TMG-1).
	Restrictions: ENT-T1 is denied if SRC={EXTSRC, INTSRC} and &&-ranging or &-grouping is used.
	ENT-T1 is denied if the specified object is not timing reference (TMG) and a value for TMGREF is specified.
	ENT-T1 is denied if FEMETHOD is a value other than {NONE} and AID={TMG-0, TMG-1}.
	ENT-T1 is denied if FEMETHOD is a value other than {ANSI, NONE} and AID identifies a VT1.5 embedded T1.
	ENT-T1 is denied if FENDNTE is a value other than {ANSI, ANSIATT, NONE} and AID identifies a VT1.5 embedded T1.
	ENT-T1 is denied if SRC is a value other than {NONE} and AID identifies a VT1.5 embedded T1.
	ENT-T1 is denied if TAPPOOL={PRIVATE, PUBLIC} and the AID specifies TMG-0 or TMG-1.

ENT-T1 is denied if a value is entered for CIECRA, SXCRA, IDLE, or LINECDE and the AID identifies a VT1.5 embedded T1.

CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH-MM:{00-48} – {00-59} } Default: System start-up value. Factory Default = 8 hours. Addressing: None Description: Automatic In-Service Threshold, specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. The factory default is 8 hours. The valid value is: HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00-48 and 00-59 (in increments of 1 minute), respectively. Restrictions: If 48 is specified in HH, then MM has to be 00. ENT-T1 is denied if a value is entered for AINSTH and the AID specifies TMG0 or TMG1. ED-T1 is denied if SST=AINS and the AID specifies TMG0 or TMG1.
AISC=	{LOF, LOFLOS, LOS} Default: <Value retrieved with RTRV-DFLT-T1 command> Addressing: None Description: Alarm Indication Signal insertion Criteria, specifies the condition necessary for insertion of AIS into a failed DS1 signal path. Any value for AISC can be entered if SRC=INTSRC. Values are: LOF Automatic AIS insertion on detection of LOF. LOFLOS Automatic AIS insertion on detection of LOF or LOS. LOS Automatic AIS insertion on detection of LOS. LOS only applies to a terminated electrical DS1.
AISF=	{N, Y} Default: <Value retrieved with RTRV-DFLT-T1 command> Addressing: None Description: Alarm Indication Signal Failure substitution, specifies whether a failed upstream signal (as defined by the AISC parameter) should have AIS inserted in the downstream path. Any value for AISF can be entered if SRC=INTSRC. Values are: N No, AIS is not inserted in the downstream path of a failed signal, the failed signal passes through the system. Y Yes, AIS is inserted in the downstream path of a failed signal. Restrictions: ENT-T1 is denied if a value is entered for AISF and the AID specifies TMG-0 or TMG-1.

CIECRA=	{A, B, Y, Z}
Default:	{A}
Addressing:	None
Description:	Customer Installation Equipment Circuit Record Address. Used to identify the customer installation equipment relative to an AT&T TR-54016 facility data link protocol. This is significant only if the far end performance monitoring data collection is being performed using the ATPOLL method. Values are:
	A or Z Used when requesting information from terminating equipment such as DSU/PBX/MUXs and NCTEs.
	B or Y Used when requesting information from CSUs.
Restrictions:	ENT-T1 is denied if a value is entered for CIECRA and the AID specifies TMG-0 or TMG-1. ENT-T1 is denied if a value is entered for CIECRA and the AID specifies a VT1.5 embedded T1.
FEMETHOD=	{ANSI, ATPOLL, NONE}
Default:	<Value retrieved with RTRV-DFLT-T1 command>
Addressing:	None
Description:	Far-End PM collection Method. (Note that FEMETHOD and FENDNTE determine the type of far end PM that is collected/supported using an ESF FDL channel.) Values are:
	ANSI Basic ANSI T1.403 PM data collection.
	ATPOLL Poll for PM data using AT&T 54016 protocol to poll the data and convert into ANSI format storage registers for reporting.
	NONE None. Far end PM is not collected on this DS1.
Restrictions:	ENT-T1 is denied if FEMETHOD=ANSI and either FENDNTE={NONE, ATT} or FMT={SF, UNFR}. ENT-T1 is denied if FEMETHOD=ATPOLL and either FENDNTE={ANSI, NONE} or FMT={SF, UNFR}. ENT-T1 is denied if FEMETHOD is a value other than {NONE} and AID={TMG-0, TMG-1}. ENT-T1 is denied if FEMETHOD is a value other than {ANSI, NONE} and the AID identifies a VT1.5 embedded T1.
FENDNTE=	{ANSI, ANSIATT, ATT, NONE}
Default:	<Value retrieved with RTRV-DFLT-T1 command>
Addressing:	None
Description:	Far-End NTE performance monitoring terminal type, specifies whether the far end network terminal supports standard ANSI performance monitoring (PM) collection and reporting or AT&T TR-54016 polled PM reporting for ESF DS1 signal formats. (Note that FENDNTE and FEMETHOD determine the type of far end PM that is collected/supported using an ESF FDL channel.) Any value for FENDNTE can be entered if SRC=INTSRC. Values are:
	ANSI ANSI, the far-end NTE supports the ANSI PM standard.
	ANSIATT ANSI and AT&T, the far-end NTE supports the ANSI PM standard and the AT&T TR-54016 polled PM reporting standard.
	ATT AT&T TR-54016, the far-end NTE supports the AT&T TR-54016 polled PM reporting standard. (Refer to RTRV-FEDATA-T1)
	NONE None, the far-end NTE does not support either the ANSI PM standard or the AT&T TR-54016 standard.
Restrictions:	ENT-T1 is denied if FENDNTE=NONE and FEMETHOD={ANSI, ATPOLL}. ENT-T1 is denied if FENDNTE=ANSI and FEMETHOD={ATPOLL}.

ENT-T1 is denied if FENDNTE=ATT and FEMETHOD={ANSI}.
ENT-T1 is denied if a value is entered for FENDNTE and the AID specifies TMG-0 or TMG-1.
ENT-T1 is denied if FENDNTE is a value other than {ANSI, ANSIATT, NONE} and the AID identifies a VT1.5 embedded T1.

FMT=	{ESF, SF, UNFR}	
	Default:	<Value retrieved with RTRV-DFLT-T1 command for DS1 AIDs or SF for TMG AIDs>
	Addressing:	None
	Description:	DS1 Format, specifies the DS1 signal format for this port. The DS1 FMT parameter determines the type of signal format used for performance monitoring data collection and transmission condition detection, or the format of the Idle Signal Source port if SRC=INTSRC. Values are:
	ESF	Extended SuperFrame
	SF	SuperFrame
	UNFR	Unframed
	Restrictions:	ENT-T1 is denied if FMT={SF, UNFR} and FEMETHOD={ANSI, ATT-POLL}. ENT-T1 is denied if FMT=UNFR and IDLE=QRSF. ENT-T1 is denied if the supporting DS3 is provisioned with FMT=UNFR, FRCC, or UNCBIT.
IDLE=	{AIS, QRSF, QRSU}	
	Default:	<Value retrieved with RTRV-DFLT-T1 command>
	Addressing:	None
	Description:	Idle signal transmit type, specifies the type of Idle signal to be transmitted by this port when it is disconnected, or determines the type of Idle signal of the Idle Signal Source port if SRC={EXTSRC, INTSRC}. Values are:
	AIS	AIS (Alarm Indication Signal)
	QRSF	Framed QRS (Quasi-Random Signal)
	QRSU	Unframed QRS (Quasi-Random Signal)
	Restrictions:	ENT-T1 is denied if IDLE=QRSF and FMT=UNFR. ENT-T1 is denied if IDLE=AIS and SRC={EXTSRC, INTSRC} (An AIS Idle Signal Source is available with each DS1 port) Only one Idle Signal Source port of each type is allowed in the system. The Idle Signal Source port must be provisioned before it can be specified to provide an Idle signal. ENT-T1 is denied if a value is entered for IDLE and the AID specifies TMG-0 or TMG-1. ENT-T1 is denied if a value is entered for IDLE and the AID specifies a VT1.5 embedded T1. ED-T1 is denied if the IDLE parameter is QRSU or QRSF and the T1 specified in the AID is within an OC3/OC12 ring.
LINECDE=	{AMI, B8ZS}	
	Default:	<Value retrieved with RTRV-DFLT-T1 command for DS1 AIDs or AMI for TMG AIDs>
	Addressing:	None
	Description:	DS1 Line Code, specifies the type of DS1 line code for a terminated electrical DS1. Values are:
	AMI	Alternate Mark Inversion
	B8ZS	Bipolar with Eight Zero Substitution
	Restrictions:	ENT-T1 is denied if a LINECDE value is entered and the specified DS1 is not a terminated electrical DS1.

ENT-T1 is denied if a value is entered for LINECDE and the AID specifies a VT1.5 embedded T1.

SRC=	{EXTSRC, INTSRC, NONE}	
	Default:	{NONE}
	Addressing:	None
	Description:	Idle Signal Source port, indicates whether this DS1 port is to be used as QRSF or QRSU Idle signal source. Values are:
	EXTSRC	External Idle signal Source, indicates external equipment is connected to the Signal Source port for generating an Idle signal.
	INTSRC	Internal Idle signal source, indicates the Signal Source port is to use internal generators to provide a QRS signal (as provisioned by the IDLE parameter value).
	NONE	None, indicates the specified DS1 port is not an Idle Signal Source port.
	Restrictions:	<p>ENT-T1 is denied if SRC={EXTSRC, INTSRC} and TACC=Y.</p> <p>ENT-T1 is denied if SRC={EXTSRC, INTSRC} and IDLE=AIS. (An AIS Idle Signal Source is available with each DS1 port).</p> <p>Only one DS1 port in the system may be provisioned as an Idle Signal Source port for each Idle type (i.e., per IDLE parameter value).</p> <p>ENT-T1 is denied if a value is entered for SRC and the AID specifies TMG-0 or TMG-1.</p> <p>ENT-T1 is denied if SRC is a value other than {NONE} and the AID identifies a VT1.5 embedded T1.</p>
SXCRA=	{C-X}	
	Default:	{C}
	Addressing:	None
	Description:	1631 SX Equipment Circuit Record Address. Used to identify the T1 port relative to an AT&T TR-54016 facility data link protocol. This is significant mainly when the far end performance monitoring data collection is being performed using the ATTPOLL method. Values are:
	C to X	Local T1 port address.
	Restrictions:	<p>ENT-T1 is denied if a value is entered for SXCRA and the AID specifies TMG-0 or TMG-1.</p> <p>ENT-T1 is denied if a value is entered for SXCRA and the AID specifies a VT1.5 embedded T1.</p>
SYNCMSG=	{N, Y}	
	Default:	{N}
	Addressing:	None
	Description:	Synchronization Message, indicates if the addressed timing reference clock supports synchronization status messages. Values are:
	N	No, the addressed reference clock does not support synchronization status messages.
	Y	Yes, the addressed reference clock supports status messages.
	Restrictions:	<p>ENT-T1 is denied if a value for SYNCMSG is entered and the AID does not specify TMG-0 or TMG-1.</p> <p>ENT-T1 is denied if SYNCMSG=Y for a TMG and the value of FMT is not ESF.</p>

TACC=	{N, Y}	
	Default:	{N}
	Addressing:	None
	Description:	Test Access port, indicates that this DS1 port (specified by AID) and the AID+1 DS1 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are:
	N	No, the DS1 ports specified by AID and AID+1 are not a TAPP.
	Y	Yes, the DS1 ports specified by AID and AID+1 are a TAPP.
	Restrictions:	ENT-T1 is denied if TACC=Y and SRC={EXTSRC, INTSRC}. ENT-T1 is denied if TACC=Y and PST of IS is entered. ENT-T1 is denied if TACC=N and TAPPOOL={PRIVATE, PUBLIC}. ENT-T1 is denied if TACC=Y and either of the DS1 ports specified by AID or AID+1 are previously provisioned. ENT-T1 is denied if TACC=Y and the port specified by AID is an embedded DS1 port and AID+1 is not embedded within the same DS3. ENT-T1 is denied if a value is entered for TACC and the AID specifies TMG-0 or TMG-1.
TAPPOOL=	{PRIVATE, PUBLIC, <NoVal>}	
	Default:	<NoVal> if TACC=N. {PRIVATE} if TACC=Y.
	Addressing:	None
	Description:	TAP Pool, defines whether the TAP that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool. Values are:
	PRIVATE	Private. The TAP pair that has been created is private to the user who created the TAP pair. If any other user tries to use this TAP pair (by means of CONN-TACC-T1), the command is denied.
	PUBLIC	Public. The TAP pair belongs to the Public pool of the system. It can be accessed by any user that has access to the test access commands.
	<NoVal>	No Value (Unpopulated), TAPPOOL does not apply if TACC=N.
	Restrictions:	ENT-T1 is denied if TAPPOOL={PRIVATE, PUBLIC} and TACC=N. ENT-T1 is denied if TAPPOOL={PRIVATE, PUBLIC} and the AID specifies TMG-0 or TMG-1.
TMGREF=	{PRI, SEC}	
	Default:	{PRI} if AID specifies TMG-0 or TMG-1 and no primary timing reference is currently provisioned. {SEC} if AID specifies TMG-0 or TMG-1 and a primary timing reference is currently provisioned.
	Addressing:	None
	Description:	Timing Reference, identifies whether the external reference source is primary or secondary. This parameter is only considered when the AID specifies a Timing Reference port (i.e.; the AID is either a TMG-0 or TMG-1). Values are:
	PRI	Primary. The addressed external reference source is to be used as a primary source.
	SEC	Secondary. The addressed external reference source is to be used as a secondary source.
	Restrictions:	ENT-T1 is denied if the AID is not a timing reference (TMG) and a value for TMGREF is specified.

PST	{IS, OOS}	
	Default:	<Value retrieved with RTRV-DFLT-T1 command if TACC=N and OOS-MA if TACC=Y>
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the DS1. Values are:
	IS	In-Service
SST	OOS	Out-Of-Service
	Restrictions:	ENT-T1 is denied if PST of IS and TACC=Y is entered. ENT-T1 is denied if PST of OOS and SST of AINS is entered.
	{AINS, AINS-DEA}	
	Default:	<Value retrieved with RTRV-DFLT-T1 command>
	Addressing:	None
	Description:	Secondary State, specifies the secondary state to provision the DS1. Values are:
	AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the DS1 is provisioned to an OOS-AU,AINS state.
	AINS-DEA	Automatic In-Service-Deactivate, the DS1 is not provisioned to an OOS-AU,AINS state. The DS1's SST value is entered as <Null> (unpopulated) and the SST state is determined by its provisioned PST value and system detected events.
	Restrictions:	ENT-T1 is denied if SST of AINS and PST of OOS is entered. ENT-T1 is denied if SST of AINS-DEA is entered and the current SST database value is not set to AINS.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

EFON	Equipage, Feature Option Not provided
ENFE	Equipage, FEature Not provided
ENPM	Equipage, Not equipped for Performance Monitoring

IDNC	Input, Data Not Consistent /* CIECRA, SXCRA, and IDLE invalid for T1 within VT1 */ /* Invalid combination of TACC and TAPPOOL */ /* FEMETHOD or FENDNTE value invalid for T1 within VT1 */ /* Invalid combination for FMT and FEMETHOD */ /* Invalid combination for FMT and IDLE */ /* Invalid combination of SRC and IDLE */ /* Invalid combination of SRC and TACC */ /* Invalid combination of FENDNTE and FEMETHOD */ /* SYNCMSG parameter only for TMG port */ /* TMGREF parameter only for TMG port */
IDNV	Input, Data Not Valid /* FEMETHOD=ATTPOLL invalid inside an intact cross connection */ /* DRVDT1 and REFOC not in same IO shelf */
IIAC	Input, Invalid ACcess identifier
IPEX	Input, Parameter EXtra
IPMS	Input, Parameter MiSsing
IPNV	Input, Parameter Not Valid
SARB	Status, All Resources Busy /* The command was rejected. */
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* T1 card status error, Error=<ERROR-STRING> */ /* DFLT Database Error, Error: <ERROR-STRING> */ /* QRS Database Error, Error: <ERROR-STRING> */ /* T1 shelf info error, Error=<ERROR-STRING> */ /* T1 FAD B shelf info error, Error=<ERROR-STRING> */ /* Error updating supporting entity, Error=<ERROR-STRING> */ /* TAPP Database Error: <ERROR-STRING> for record number <RECORD-NUMBER> */ /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating FAD B's supporting entity, Error=<ERROR-STRING> */ /* Error getting bay/shelf, Error=<ERROR-STRING> */ /* TPidToTbss (<TP-TYPE>, <RECORD-NUMBER>) Error: <ERROR-STRING> */ /* DRVDT1/CDB card status error, Error=<ERROR-STRING> */
SDNC	Status, Data Not Consistent
SNVS	Status, Not in Valid State /* Port's card is not provisioned */ /* CDB is out of service */
SROF	Status, Requested Operation Failed /* Error accessing MCB database. */ /* Error accessing auxiliary EM data area for Master MCB. */
SRQN	Status, invalid ReQuest /* Cannot create FAD if supporting entity has fault propagation active */ /* Cannot create FAD if supporting entity is connected */ /* No signal source is provisioned for IDLE type */ /* Ranging invalid when provisioning a signal source */ /* Cannot create SRC port if supporting entity is connected */ /* Cannot create SRC port if supporting entity under MATRIX loopback */ /* Cannot create SRC port within a ring protection group */ /* T1 IDLE must be AIS within a ring protection group */
SSRE	Status, System Resources Exceeded /* No more TAPPs may be provisioned */

EXAMPLES

In the following example, DS1 port T3T1-1-25 is provisioned for ESF format, AIS insertion on LOF detection, and default values for all other parameters, to the OOS-MA state.

```
ENT-T1::T3T1-1-25:::FMT=ESF,AISC=LOF,AISF=Y:OOS;
```

In the following example, DS1 port T3T1-2-1 is provisioned as the internal unframed QRS Idle Signal Source port.

```
ENT-T1::T3T1-2-1:::FMT=UNFR,IDLE=QRSU,SRC=INTSRC,TACC=N:IS;
```

In the following example, DS1 ports T3T1-1-1 and T3T1-1-2 (both ports previously unprovisioned) are provisioned as Test Access Port Pairs (TAPPs) with port T3T1-1-1 becoming FAD A and port T3T1-1-2 becoming FAD B. Note that the TAPP are being provisioned into OOS-MA state.

```
ENT-T1::T3T1-1-1:::TACC=Y,FMT=SF,IDLE=QRSF,SRC=NONE:OOS;
```

In the following example, DS1 ports T3T1-24-1 through T3T1-24-2 are provisioned, using &&-ranging addressing, for SF format and default values for all other parameters, but port T3T1-24-2 had previously been provisioned.

```
ENT-T1::T3T1-24-1&&-2:::FMT=SF;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 PRTL
  "T3T1-24-2:ERRCDE=SNVS"
/* Status, Not in Valid State */
/* ENT-T1::T3T1-24-1&&-2:::FMT=SF [Pfc518] (1) */
;
```

In the following example, the first external timing source is provisioned with SF format, AMI line code and as Primary reference source.

```
ENT-T1::TMG-0:::FMT=SF,LINECDE=AMI,TMGREF=PRI;
```

COMMAND CODE: **ENT-T3**
COMMAND NAME: **ENTER T3**

PURPOSE

The ENT-T3 command creates (assigns and provisions) a DS3 object entity (AID).

The default values for the PST, SST, and keyword parameters, except LINECDE, can be modified with the SET-DFLT-T3 command. The current default values can be retrieved with the RTRV-DFLT-T3 command.

Up to 256 DS3 port pairs in the system may be provisioned as test access ports at a time, but only to an OOS-MA or OOS-AUMA state. When this is done, AID and AID+1 are both provisioned as a Test Access Port Pair (TAPP). A TAPP is always assigned as a sequential pair of ports (i.e., if port T3-3 is referenced in the command, then ports T3-3 and T3-4 are the TAPP). AID+1 inherits the provisioning of the DS3 specified by AID. If TAPPOOL is not specified or specified as PRIVATE, the TAPP is associated with, or owned by, the user that provisioned the TAPP. No other user is allowed to use the TAPP for test access operations. If TAPPOOL is specified as PUBLIC, then that TAPP can be used by any user that has access to test access commands. Only an electrical DS3 can be defined as a TAPP. TAPPs may not be the target AID for a cross-connect. Unconnected TAPPs generate a DS3 IDLE signal.

A DS3 that has not been provisioned has a PST,SST of OOS-MA,UAS or OOS-AUMA,UAS&DSBLD (OOS-AUMA if the supporting equipment or STS-1 is not provisioned). Executing an ENT-T3 command causes the following primary state transitions for the specified DS3. Secondary states associated with the DS3 before and after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Entered PST,SST Value	Next PST State if Present Default Database Value is:		
	OOS	IS	IS, AINS
<NoVal>, <NoVal>	OOS-MA	IS	OOS-AU, AINS
IS, <NoVal>	IS	IS	OOS-AU, AINS
IS,AINS	OOS-AU, AINS	OOS-AU, AINS	OOS-AU, AINS
OOS,<NoVal>	OOS-MA	OOS-MA	Denied
OOS,AINS	Denied	Denied	Denied
<NoVal>,AINS	Denied	OOS-AU, AINS	OOS-AU, AINS
<NoVal>,AINS-DEA	Denied	Denied	IS
IS,AINS-DEA	Denied	Denied	IS
OOS,AINS-DEA	Denied	Denied	OOS-MA
Note: 1. <NoVal> means no value is entered for the SST parameter.			

When a DS3 is provisioned to an OOS-MA state, a MAN condition type is set for the specified DS3, unless the specified DS3 is provisioned as a Test Access Port (a MAN condition is not set on TAPPs).

When a DS3 is in an OOS-MA or OOS-AU,AINS state, no DS3 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the DS3, but DS3 alarm conditions are monitored (retrievable with the RTRV-T3 command) and performance monitoring data is collected (if PM collection is not disabled by the SET-PMMODE-T3 command) for the DS3. A DS3 in an OOS-AU,AINS transitions to an IS state when all DS3 near-end alarm conditions for that DS3 have cleared.

An ENT-T3 command is denied if:

- The supporting equipment (EP3) or STS-1 for the specified DS3 has not previously been provisioned (with the ENT-EQPT command).
- The supporting equipment (EP3) for the specified DS3 is provisioned to an SST of MT.
- The FMT is specified as CBIT on a DS3 that resides on a module that is in an half shelf that is defined as EP3S48.

- The specified DS3 is being provisioned as a Test Access port and PST of IS or PST, SST of OOS–AU, AINS is entered or AID+1 is not provisioned, or AID+1 is a FAD of another TAPP.
- The specified DS3 is not an electrical (stand-alone) DS3 and is being provisioned into OOS–AU,AINS state.
- AISPASS=N is specified on an embedded DS3.
- TACC=Y or LINECDE is specified on a DS3 embedded within electrical STS–1 (EC1), OC–3, or OC–12.
- TACC=Y is specified on an EP3 standard card.
- TACC=Y is specified on a DS3 which resides in a quad.
- A TAPP is being assigned and the total number of DS1 and DS3 TAPP defined is already 256.
- The specified DS3 is embedded within a protection OC–3/OC–12.
- The specified DS3 is embedded within an OC–3/OC–12 which resides in a protection group defined as O1BSH48 or O4MSH48, respectively.
- The specified DS3 lies within an STS–1 embedded within an EC1 which itself resides in a protection group defined as ES148.
- The specified DS3 is embedded within an STS–1 which has its STSMAP specified as ALL.
- The specified DS3 is embedded within an STS–1 and ASYNC mapping is not supported by either the STS–1 itself (i.e., the STS–1's STSMAP is not ASYNC) or the STS–1 resides on hardware that does not support ASYNC mapping for monitoring purposes (i.e., an ES1 card).
- The specified DS3 is already provisioned.
- An invalid parameter value or combination of parameter values is entered.

When an ENT–T3 command is executed, the default values for the following items are automatically provisioned for the specified DS3, and all PM data collection registers for the DS3 are automatically reset to zero. These default values cannot be changed, except for PM attributes, unless the specified DS3 has first been provisioned by an ENT–T3 command.

- Condition type attributes (refer to Appendix C, Condition Types and SET–ATTR–T3)
- Fault escalation parameters (refer to ED–FLTPRO–T3)
- Performance monitoring (PM) attributes (refer to SET–PMATTR–ALL)
- PM mode (refer to SET–PMMODE–T3)
- PM threshold levels (refer to SET–TH–T3)
- PM reports (refer to ALW–PMREPT–T3)

I/O protection switching is disabled if all three DS3 ports supported by the I/O circuit pack are in an OOS–MA or OOS–AUMA state. I/O protection switching only occurs if at least one of the supporting DS3s on the supporting I/O circuit pack is provisioned to an IS or an OOS–AU state.

        [, XPOL=] : [PST] , [SST] ;
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS3_AID:		
	{T3–{1–4800}}	(T3–DS3#)	
	{EC1T3–{1–3840}}	(EC1T3–EC1/STS1/DS3#)	
	{OC3T3–{1–2240}–{1–3}}	(OC3T3–OC3#–STS1/DS3#)	
	{OC12T3–{1–560}–{1–4}–{1–3}}	(OC12T3–OC12#–STM1#–STS1/DS3#)	
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	DS3 AID, identifies the DS3 port or a range of ports.	
	Restrictions:	ENT–T3 is denied if the specified AID identifies a DS3 embedded within an STS–1 and AISPASS of N is entered.	

CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
AINSTH=	{HH–MM:{00–48} – {00–59} } Default: System startup value Factory Default = 8 hours Addressing: None Description: Automatic In–Service Threshold, specifies how long a customer signal must be present on the facility without a 7LOF, ISD, AICMISM, LOS, LOF, or AIS–L alarm condition before the system puts the facility into the In–Service state. The factory default is 8 hours. The valid value is: HH–MM Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively. Restrictions: If 48 is specified in the HH, then MM has to be 00. ENT–T3 is denied if a value is entered for AINSTH and AID refers to a DS3 embedded in an OCn or EC1. ENT–T3 is denied if SST=AINS and the T3 is embedded in an OCn or an EC1.
AISC=	{LOFLOS, LOS} Default: < Value retrieved with RTRV–DFLT–T3 command > Addressing: None Description: Alarm Indication Signal insertion Criteria, specifies the condition at the input of a DS3 intact cross connect necessary for AIS insertion into the output of the DS3 intact cross connect. Values are: LOS Loss of Signal. Automatic AIS insertion upon detection of LOS. LOFLOS Loss of Frame–Loss of Signal. Automatic AIS insertion upon detection of LOFLOS.
AISPASS=	{N, Y} Default: < Value retrieved with RTRV–DFLT–T3 command > Addressing: None Description: Alarm Indication Signal Passed, specifies whether the AIS generated by the input port which is connected to the output port is passed through the output port, or whether AIS is generated by the output port itself. Values are: N AIS is regenerated by the output port instead of being passed through the output port. Y The AIS generated by the input port is passed through the output port. Restrictions: ENT–T3 is denied if AISPASS of N is entered and the specified AID identifies a DS3 embedded within an STS–1.
AIST=	{NAS, OAIS, ONES} Default: < Value retrieved with RTRV–DFLT–T3 command > Addressing: None Description: Alarm Indication Signal Type, specifies the expected input AIS signal and generated output AIS signal for the DS3 port should a failure condition exist. Values are: NAS North American Standard OAIS Old AIS, the same sequence of information bits as North American Standard but with no regard to how the C–bits are set. ONES Unframed All Ones (Nonstandard)

DS3PTYEL=	{N, Y}	
Default:	< Value retrieved with RTRV-DFLT-T3 command >	
Addressing:	None	
Description:	DS3 Yellow behavior, identifies whether DS3 path yellow or RDI (remote defect indication) is transmitted or detected. Values are:	
	N	RDI is sent/detected by the DS3.
	Y	DS3 path yellow is sent/detected by the DS3.
FEAC=	{N, Y}	
Default:	< Value retrieved with RTRV-DFLT-T3 command >	
Addressing:	None	
Description:	Far End Alarm and Control, specifies the far end alarm and control enable setting for C-bit parity format. Values are:	
	N	FEAC disabled
	Y	FEAC enabled
Restrictions:	ENT-T3 is denied if FEAC=Y and FMT=ASYNCR.	
FMT=	{ASYNCR, CBIT, FRCC, UNCBIT, UNFR}	
Default:	< Value retrieved with RTRV-DFLT-T3 command >	
Addressing:	None	
Description:	DS3 Format, specifies the DS3 signal format for this port. Values are:	
	ASYNCR	Asynchronous (M23 format)
	CBIT	C-Bit parity format
	FRCC	Framed Clear Channel.
	UNCBIT	Unchannelized C-Bit parity
	UNFR	Unframed format
Restrictions:	ENT-T3 is denied if FMT=ASYNCR and FEAC=Y. ENT-T3 is denied if FMT=ASYNCR and PMMETHOD=CP or NONE. ENT-T3 is denied if FMT=UNFR and PMMETHOD is any value other than NONE.	
LINECDE=	{B3ZS}	
Default:	{B3ZS}	
Addressing:	None	
Description:	DS3 Line Code, indicates the DS3 line coding type. Only B3ZS code is supported.	
	B3ZS	Bipolar with Three Zero Substitution
Restrictions:	ENT-T3 is denied if the LINECDE parameter is entered and the specified AID identifies a DS3 embedded within a SONET signal.	

PMMETHOD=	{CP, FM, FMA, NONE, P}
Default:	< Value retrieved with RTRV-DFLT-T3 command >
Addressing:	None
Description:	Performance Monitoring Method, specifies the type of performance monitoring to be performed on the DS3. Values are:
	If FMT=ASYN (M23 format):
	FM F&M bit monitoring
	FMA F&M bit adjusted monitoring
	P P-bit monitoring
	If FMT=CBIT (C-Bit parity format):
	CP Only CP-bit monitoring
	FM F&M bit and CP-bit monitoring
	FMA F&M bit adjusted and CP-bit monitoring
	P P-bit and CP-bit monitoring
	If FMT=FRCC (Framed Clear Channel):
	FM F&M bit monitoring
	FMA F&M bit adjusted monitoring
	P P-bit monitoring
	If FMT=UNCBIT (Unchannelized C-Bit parity format)
	CP Only CP-bit monitoring
	FM F&M bit and CP-bit monitoring
	FMA F&M bit adjusted and CP-bit monitoring
	P P-bit and CP-bit monitoring
	If FMT=UNFR (Unframed):
	NONE Null value specified for PMMETHOD
Restrictions:	ENT-T3 is denied if PMMETHOD=CP and FMT=ASYN, FRCC or UNFR. ENT-T3 is denied if PMMETHOD=NONE and FMT=ASYN, CBIT, FRCC, or UNCBIT.
TACC=	{N, Y}
Default:	{ N }
Addressing:	None
Description:	Test Access port, indicates that this DS3 port (specified by AID) and the AID+1 DS3 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are:
	N No, the DS3 ports specified by AID and AID+1 are not a TAPP.
	Y Yes, the DS3 ports specified by AID and AID+1 are a TAPP.
Restrictions:	ENT-T3 is denied if TACC=Y and PST of IS is entered. ENT-T3 is denied if TACC=Y and AID+1 is already provisioned. ENT-T3 is denied TACC=Y and the port specified by AID is a DS3 embedded within EC1, OC-3, or OC-12. ENT-T3 is denied if TACC=Y and any of the DS1s embedded within the DS3 are already assigned. ENT-T3 is denied if TACC=Y and the specified AID resides in a quad. ENT-T3 is denied if TACC=N and TAPPOOL={PRIVATE, PUBLIC}.

TAPPOOL=	{PRIVATE, PUBLIC, <NoVal>}	
	Default:	<NoVal> if TACC=N. {PRIVATE} if TACC=Y.
	Addressing:	None
	Description:	TAP Pool, whether the TAP that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool.
	PRIVATE	Private. The TAP pair that has been created is private to the user who created the TAP pair. If any other user tries to use this TAP pair (by means of CONN-TACC-T3), the command is denied.
	PUBLIC	Public. The TAP pair belongs to the Public pool of the system. It can be accessed by any user that has access to the test access commands.
	<NoVal>	No Value (Unpopulated), TAPPOOL does not apply if TACC=N.
	Restrictions:	ENT-T3 is denied if TAPPOOL={PRIVATE, PUBLIC} and TACC=N.
XBITRCV=	{ALM0, ALM1, IGNORE}	
	Default:	< Value retrieved with RTRV-DFLT-T3 command >
	Addressing:	None
	Description:	Receive X-Bit Translation, specifies how incoming DS3 and DS2 X-bits are translated. Values are:
	ALM0	Incoming X-bit of 0 indicates a remote alarm
	ALM1	Incoming X-bit of 1 indicates a remote alarm
	IGNORE	Ignore incoming X-bits
XPOL=	{0, 1, ALM0, ALM1}	
	Default:	< Value retrieved with RTRV-DFLT-T3 command >
	Addressing:	None
	Description:	Transmit X-bit Polarity, indicates the value to which outgoing DS3 and DS2 X-bits are set. Values are:
	0	Force outgoing X-bits to 0
	1	Force outgoing X-bits to 1
	ALM0	Set X-bits to 0 for indicating an alarm
	ALM1	Set X-bits to 1 for indicating an alarm
PST	{IS, OOS}	
	Default:	<Value retrieved with RTRV-DFLT-T3 command if TACC=N and OOS-MA if TACC=Y >
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the DS3. Values are:
	IS	In-Service, the DS3 is provisioned to an IS or OOS-AU state.
	OOS	Out-Of-Service, the DS3 is provisioned to an OOS-AUMA or OOS-MA state.
	Restrictions:	ENT-T3 is denied if PST of IS and TACC=Y is entered. ENT-T3 is denied if PST of OOS and SST of AINS is entered.

SST	{AINS, AINS-DEA}
Default:	< Value retrieved with RTRV-DFLT-T3 command >
Addressing:	None
Description:	Secondary State, specifies the secondary state to provision the DS3. Values are:
AINS	Automatic In-Service, if PST,SST of IS,AINS is entered the DS3 is provisioned to an OOS-AU,AINS state.
AINS-DEA	Automatic In-Service-Deactivate, the DS3 is not provisioned to an OOS-AU,AINS state. The DS3's SST value is entered as <Null> (unpopulated) and the SST state is determined by its provisioned PST value and system detected events.
Restrictions:	ENT-T3 is denied if SST of AINS and PST of OOS is entered. ENT-T3 is denied if SST of AINS-DEA is entered and the current SST database value is not set to AINS. ENT-T3 is denied if the specified DS3 is not an electrical (stand-alone) DS3 and is being provisioned into OOS-AU,AINS state.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Invalid combination of TACC and TAPPOOL */ /* Invalid combination of FMT and PMMETHOD */ /* Invalid combination of FMT and FEAC */ /* AISC and AISPASS invalid on HMU module */ /* AISPASS=N invalid for an embedded T3 */ /* AINSTH invalid for an embedded T3 */
IDNV	Input, Data Not Valid /* FMT=UNCBIT, UNFR, or FRCC invalid on DS3 Quad */
IIAC	Input, Invalid ACcess identifier
IPEX	Input, Parameter EXtra

SDBE Status, internal Data Base Error
 /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
 /* DFLT Database Error: <ERROR-STRING> */
 /* T3 Shelf info error, Error=<ERROR-STRING> */
 /* Error updating supporting entity, Error=<ERROR-STRING> */
 /* Error disabling corresponding EC1s, Error=<ERROR-STRING> */
 /* TAPP Database Error: <ERROR-STRING> for record number <RECORD-NUM-
 BER> */
 /*T3 AID conversion error, Error=<ERROR-STRING>*/
 /* Error updating FAD B's supporting entity, Error=<ERROR-STRING> */
 /* Error enabling supported T1s, Error=<ERROR-STRING> */
 /* Error enabling supported F3s, Error=<ERROR-STRING> */

SDNC Status, Data Not Consistent
 /*SST=AINS invalid for embedded T3*/

SNVS Status, Not in Valid State

SROF Status, Requested Operation Failed

SSRE Status, System Resources Exceeded

EXAMPLES

In the following example, DS3 port T3-24 is provisioned for C-bit format with FEAC enabled and CP-bit performance monitoring to the OOS-AU,AINS state and default values for all other parameters.

```
ENT-T3::T3-24:::PMMETHOD=CP,FEAC=Y,FMT=CBIT:IS,AINS;
```

In the following example, DS3 ports T3-1 and T3-2 (both ports previously unprovisioned), both are electrical DS3, are provisioned as Test Access Port Pairs (TAPPs) with port T3-1 becoming FAD A and port T3-2 becoming FAD B. The TAPPs are assigned to the public pool so that anyone who has access to test access commands can use this TAPP.

```
ENT-T3::T3-1:::FMT=ASYNC,TACC=Y,TAPPOOL=PUBLIC:OOS;
```

In the following example, DS3 ports T3-24 through T3-26 are provisioned, using &&-ranging, for Async M13 format, FEAC disabled, and P-bit and CP-bit performance monitoring to the OOS-MA state and default values for all other parameters.

```
ENT-T3::T3-24&&-26:::FMT=ASYNC,PMMETHOD=P,FEAC=N:OOS;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 COMPLD
/* ENT-T3::T3-24&&-26:::FMT=ASYNC,PMMETHOD=P,FEAC=N:OOS [Pfc518] (1)
*/
;
```

In the following example, DS3 port T3-27 is provisioned for Async M13 format, but FEAC is incorrectly specified as enabled, and default values for all other parameters.

```
ENT-T3::T3-27:::FEAC=Y,FMT=ASYNC;
```

For this example, the output response shown assumes CID 3, virtual channel 2, was used to enter the command and a system generated CTAG value of Pfc519. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc519 DENY
IDNC
/* Invalid combination of FMT and FEAC */
/* Input, Data Not Consistent */
/* ENT-T3::T3-27:::FEAC=Y,FMT=ASYNC [Pfc519] (3-2) */
;
```

COMMAND CODE: ENT-TARPADJ-DCC
COMMAND NAME: ENTER TARP ADJACENCY TABLE ENTRY OF DCC

PURPOSE

The ENT-TARPADJ-DCC command allows addition to the manually provisioned TID Address Resolution Protocol (TARP) adjacency table entries on the Data Communication Channel (DCC).

The TARP Protocol Data Units (PDUs) are carried by Layer 3 (network layer) of the SONET DCC network.

If a value entered for the NSAP does not exist in the manually entered adjacency table, but exists in the automatically created adjacency table, ENT-TARPADJ-DCC will complete successfully, entering the NSAP in the manual adjacency table and a condition of DUPTARPEENTRY (Duplicate TARP Entry) will be raised against the specified OC-3/OC-12.

An ENT-TARPADJ-DCC command is denied if:

- The specified OC-3/OC-12 is not provisioned, i.e., the OC-3/OC-12 is in an UAS secondary state.
- A value entered for the NSAP already exists in the manually entered adjacency table of the specified OC-3/OC-12 either at ISLEVEL=1 or ISLEVEL=2.
- The specified NSAP is less than 40 ASCII characters.
- An invalid parameter value is entered.

INPUT FORMAT

ENT-TARPADJ-DCC: [TID] :AID: [CTAG] : : [DCCTYPE=] [, ENABLE=] , ISLEVEL= , NSAP= ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3/OC-12 whose DCC adjacency table entries are being added.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DCCTYPE=	{LDCC, SDCC} Default: {SDCC} Addressing: None Description: DCC Type, specifies which DCC type is entered into the adjacency table. Values are: LDCC Line DCC, specifies the LDCC type is entered into the adjacency table. SDCC Section DCC, specifies the SDCC type is entered into the adjacency table.

ENABLE=	{N, Y}	
	Default:	{Y}
	Addressing:	None
	Description:	Enable, determines if the TARP propagation to the NE specified by the NSAP parameter is enabled or disabled. Values are:
	N	No, specifies the TARP propagation to the NE in the NSAP parameter is disabled.
	Y	Yes, specifies the TARP propagation to the NE in the NSAP parameter is enabled.
ISLEVEL=	{1, 2, BOTH}	
	Default:	Entry Required
	Addressing:	None
	Description:	Intermediate System Level, determines the IS Level for which the TARP adjacency table is being added. Values are:
	1	NSAP is a level 1 adjacency.
	2	NSAP is a level 2 adjacency.
	BOTH	NSAP is both level 1 and level 2 adjacency.
NSAP=	<40 ASCII HEXADECIMAL VALUES>	
	Default:	Entry Required
	Addressing:	None
	Description:	Network Service Access Point, specifies the Network Service Access Point (NSAP) address. Values are 20 octets long encoded as 40 ASCII hexadecimals. The user enters the values in either upper or lower case (i.e. case insensitive).
	Restrictions:	ENT-TARPADJ-DCC is denied if the specified NSAP is less than 40 ASCII characters.

SUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/*NSAP already exists in DCC table*/
	/*TARPADJ DCC table is full*/
	/*NSAP already exists in <AID-STRING> LAN table*/
	/*TARPADJ DCC/LAN table is full*/
IIAC	Input, Invalid ACcess identifier

SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*TPidToTbss(): <ERROR-STRING>*/ /*ChkTarpDTbl(): <ERROR-STRING>*/ /*ChkTarpLTbl(): <ERROR-STRING>*/ /*NSAP already exists in <AID-STRING> LAN table*/ /*TARPADJ DCC/LAN table is full*/ /*Unable to lock TARPADJ DCC/LAN shelf table: <ERROR-STRING>*/ /*Unable to unlock TARPADJ DCC/LAN shelf table: <ERROR-STRING>*/ /*TPidToTarpD(): <ERROR-STRING>*/ /*TPidToGlobTPid(): <ERROR-STRING>*/ /*TARP_DCC Database Error: <ERROR-STRING> for record number <RECORD- NUMBER>*/
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the TARP adjacency table entries of the network layer are provisioned.

```
ENT-TARPADJ-DCC: :OC3-2: : : :DCCTYPE=SDCC, ENABLE=Y, ISLEVEL=1,  
NSAP=39840F800000000000000000000000000000000000000000000000000000000000;

COMMAND CODE: **ENT-TARPADJ-LAN**
COMMAND NAME: **ENTER TARP ADJACENCY TABLE
ENTRY OF LAN**

PURPOSE

The ENT-TARPADJ-LAN command allows addition to the manually provisioned TID Address Resolution Protocol (TARP) adjacency table entries on the DSB.

The TARP Protocol Data Units (PDUs) are carried by Layer 3 (network layer) of the SONET Local Area Network (LAN).

If a value entered for the NSAP does not exist in the manually entered adjacency table, but exists in the automatically created adjacency table, ENT-TARPADJ-LAN will complete successfully, entering the NSAP in the manual adjacency table and a condition of DUPTARPEENTRY (Duplicate TARP Entry) will be raised against the specified DSB.

An ENT-TARPADJ-LAN command is denied if:

- The specified DSB is not provisioned, i.e., the DSB is in an UAS secondary state.
- A value entered for the NSAP already exists in the manually entered adjacency table of the specified DSB.
- The specified NSAP is less than 40 ASCII characters.
- An invalid parameter value is entered.

INPUT FORMAT

ENT-TARPADJ-LAN: [TID] :AID: [CTAG] : : [ENABLE=] , ISLEVEL= , NSAP= ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB whose adjacency table entries are being added.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ENABLE=	{N, Y} Default: {Y} Addressing: None Description: Enable, determines if the TARP propagation to the NE specified by the NSAP parameter is enabled or disabled. Values are: N No, specifies the TARP propagation to the NE in the NSAP parameter is disabled. Y Yes, specifies the TARP propagation to the NE in the NSAP parameter is enabled.

ISLEVEL=	{1, 2, BOTH}	
	Default:	Entry Required
	Addressing:	None
	Description:	Intermediate System Level, determines the IS Level for which the TARP adjacency table is being added. Values are:
	1	NSAP is a level 1 adjacency.
	2	NSAP is a level 2 adjacency.
	BOTH	NSAP is both level 1 and level 2 adjacency.

NSAP=	<40 ASCII HEXADECEIMAL VALUES>	
	Default:	Entry Required
	Addressing:	None
	Description:	Network Service Access Point, specifies the Network Service Access Point (NSAP) address. Values are 20 octets long encoded as 40 ASCII hexadecimals. The user enters the values in either upper or lower case (i.e. case insensitive).
	Restrictions:	ENT-TARPADJ-LAN is denied if the specified NSAP is less than 40 ASCII characters.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
	/* Unable to read aux buffer for <AID> */
IDNV	Input, Data Not Valid
	/* Error reading input for NSAP */
	/* NSAP address must be 40 characters long. */
	/* Invalid parameter in the input command */
	/* Error reading input for ISLEVEL */
	/* Unable to read the value of ISLEVEL */
	/* Invalid value for ISLEVEL */
	/* Error reading input for ENABLE */
	/* Requested NSAP already exists. */
	/* Requested NSAP already exists in the DCC table. */
IIAC	Input, Invalid ACcess identifier
	/* Invalid or unassigned equipment identifier specified. */
IPMS	Input, Parameter MiSsing
	/* Invalid parameter in the input command */

SARB	Status, All Resources Busy /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */ /* INIT-SYS command still active on shelf that equipment is on. */
SDBE	Status, internal Data Base Error /* Data base access failure. */ /* Unable to read the LANDCC database. */ /* Unable to update the LANDCC database */
SROF	Status, Requested Operation Failed /* Unable to lock the tarpadj control table */ /* Unable to check the LAN tarpadj table. */ /* Unable to check the DCC tarpadj table. */ /* TARPADJ table is full, unable to add a new entry. */ /* Unable to add the NSAP to the TARP table. */

EXAMPLES

In the following example, the TARP propagation is enabled, IS level is set to 1, and the Network Service Access Point is set to 398406a0000000000000000000000000 for DSB-6-1-1.

```
ENT-TARPAJ-LAN::DSB-6-1-1:::ENABLE= Y,ISLEVEL= 1,NSAP= 398406a00000000000  
00000000000000000000;
```

```

M  <SID> <YY-MM-DD> <HH:MM:SS>
   P72009 COMPLD
   /* The ENT-TARPADJ-LAN for DSB-6-1-1 was completed. */
   /* ENT-TARPADJ-LAN::DSB-6-1-1:::ENABLE= Y,ISLEVEL= 1,NSAP= 398406a00
00000000000000000000000000000000 [P72009] (1) */

```

RELATED COMMANDS

ED-TARPADJ-LAN
RTRV-TARPADJ-LAN

COMMAND CODE: **ENT-USER**
COMMAND NAME: **ENTER USER**

PURPOSE

The ENT-USER command is used to create a new user profile in the User Security Database.

A user profile consists of:

- the user identifier (UID),
- the user's password identification (PID),
- the user's command functional levels for executing commands and receiving command response messages (UCFCI – User Command Functional Category Input and UCFCO – User Command Functional Category Output),
- the user's command authorization level (UCAL),
- the user's output subscription level (OSL),
- the user's command entry operational mode (OMODE),
- the user's input/output device type (TYPE) and input/output display mode (DM),
- the user's RUSURE prompt setting (RUSURE) and buffered messages at login setting (DSKBFIND),
- any associated user name (UNAM) information,
- any associated user facility partition name (PARTNAM),
- timer values associated with the user for link activity (LNKTMR), keep-alive-messages (KAMINTVL), and multiple In Progress messages (MIPINTVL),
- the user's log-out-on-timeout setting (LOTO),
- any OS type (OSTYPE) for selecting default parameter values for OSL, TYPE, DSKBFIND, and LNKTMR.

A UID of "system", "SYSTEM", and "sysprint" (and the Alcatel account user) always exist in the system.

An ENT-USER command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
ENT-USER: [TID] : : [CTAG] : : PID,UID, [UCFCI] , [UCFCO] ,UCAL, [OMODE] , [OSL] , [UNAM] ,  
[RUSURE] , [DSKBFIND] , [TYPE] , [DM] , [PARTNAM] , [OSTYPE] , [LNKTMR] , [LOTO] ,  
[KAMINTVL] , [MIPINTVL] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

PID	<p><6–12 VALID PID CHARACTERS></p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: Password Identifier, specifies the user's login password. Valid values for PID are a string of 6 through 12 case-sensitive alphanumeric characters. The PID must contain at least 2 alphabetic characters and at least 1 numeric character. The following special characters are also accepted as valid characters and can be part of the PID: % (percent sign), + (plus sign), # (pound sign), and _ (under score). The first character of the PID can be an alphabetic, numeric, or a valid special character. (Note that the dash (–) character is also accepted by the system, but only characters prior to the dash become part of the PID. The dash (–) and characters after that are ignored by the system.)</p> <p>Restrictions: ENT–USER is denied if the specified password identifier (PID value) is the same as the specified user identifier (UID value), the reverse of the UID value, a circular shift of the UID value, or a circular shift of the reverse of the UID value.</p>
UID	<p><5–12 VALID UID CHARACTERS></p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: User Identifier, specifies a unique user ID. Valid values for UID are 5 to 12, case-sensitive alphanumeric characters where the first character must always be an alphabetic character. The following special characters are also accepted as valid characters and will be part of the UID: % (percent sign), + (plus sign), # (pound sign), and _ (under score). (Note that the dash (–) character is also accepted by the system, but only characters prior to the dash become part of the UID. The dash (–) and characters after that are ignored by the system.)</p> <p>Restrictions: ENT–USER is denied if the specified UID already exists. ENT–USER is denied if UID of {system, SYSTEM, sysprint} is entered and a PARTNAM value is entered.</p>
UCFCI	<p><1–26 VALID (A–Z) UCFCI CHARACTERS></p> <p>Default: {Z} (if no PARTNAM value is specified) {Y} (if a PARTNAM value is specified)</p> <p>Addressing: None</p> <p>Description: User Command Functional Category, Input, specifies the command access input security CCFC group(s) for the user (defines the set of TL1 commands the user can execute). Each input security group contains one or more TL1 command. Up to 26 input security groups A–Z can be specified for the user. To execute a command, a user must belong to at least one input security group assigned to the TL1 command to be executed. UCFCI is specified as a string of up to 26 order-independent, non-case sensitive characters A–Z. If a character is entered more than once in the string the system accepts the string as if the character was only entered once. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC), for the default security groups.</p>

UCFCO	<1–26 VALID (A–Z) UCFCO CHARACTERS>	Default: {Z} (if no PARTNAM is specified) {Y} (if PARTNAM is specified)	Addressing: None	Description: User Command Functional Category, Output, specifies the command access output security group(s) for the user (defines the TL1 command output responses a user receives because of commands executed by another user). UCFCO does not filter output responses for commands executed by the user, UCFCO only filters output responses for commands executed by another user. Each output security group contains one or more TL1 commands. Up to 26 output security groups A–Z can be specified for the user. To receive output responses from a command executed by another user, a user must belong to at least one output security group assigned to the TL1 command. If a user is assigned UCFCO of Z, the user receives output results from all TL1 commands executed by another user. UCFCO is specified as a string of up to 26 order-independent, non-case sensitive characters A–Z. If a character is entered more than once in the string the system accepts the string as if the character was only entered once. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC), for the default security groups.
UCAL	{1–30}	Default: Entry Required	Addressing: None	Description: User Command Authorization Level, specifies the set of TL1 commands a user can execute based on the authorization level of the user and of the command. To execute a command, a user must have a UCAL greater than or equal to the CCAL (Command Community Authorization Level) security level assigned to the command. A user can be assigned a security level from 1 through 30. Level 31 is reserved for the system administrator. Level 32 is reserved for the Alcatel account.
OMODE	{C}	Default: {C}	Addressing: None	Description: Command Input Operational Mode, specifies the default command entry mode of operation for the user when the system initializes. The system always initializes to the Direct Command Input mode. A user can toggle between Direct Command Input mode and Command Input Menu mode by using the F7 function key on a VDT. C Direct Command Input mode.

OSL {<String of characters composed of B, C, D, E, H, I, M, m, O, P, R, S, W>, A, Z}
Default: <OSL Value Defined in the Table Below> (If no PARTNAM value is entered) or {O} (If a PARTNAM value is entered)

Default OSL Value			
OSTYPE	TYPE		
	VDT	PRN	TTY
OPSINE	B	B	B
NMA	CMmEDP	CMmEDP	CMmEDP
TSC	I	Invalid	I
ITS	Invalid	Invalid	I
OTHER	CMmED POS	CMmED POSWR	CMmED POS

Addressing: None

Description: Output Subscription Level, specifies the unsolicited autonomous output response messages a user receives. The OSL value is a case-sensitive, order-independent character string composed of any or all of the characters in the OSL value set of {B, C, D, E, H, I, M, m, O, P, R, S, W} (e.g., CMmEDPSOWR), A or Z. If all OSL filters are to be off (no unsolicited messages reported), OSL can be set to Z. If all OSL filters in the set {B, C, D, E, H, I, M, m, O, P, S, W} are to be on, OSL can be set to A. It is suggested that users not subscribe to receive the Alcatel autonomous informational messages (do not subscribe to {R, S}). Values are:

- A All Autonomous Responses, except R. The system sets the OSL to CMmEDPOSWIB.
- B Report Data(B)ase Change messages (via REPT^DBCHG).
- C Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.
- D Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)
- E Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).
- H Reserved for future use. This OSL value (currently) has no affect.
- I Report (I)ntialization messages (via REPT^INITZN).
- M Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.
- m Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.
- O Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.
- P Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)

R	Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages. The R option can only be added to a user's OSL, by the system administrator or an Alcatel account user.)
S	Report (S)tatus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)
W	Report (W)orld responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.
Z	Zero. Turns off all of OSL filters (user will not receive unsolicited responses).
Restrictions:	<p>ENT-USER is denied if OSL of {Z} is entered and any other OSL values are entered.</p> <p>ENT-USER is denied if OSL of {A, C, D, E, I, M, m, P, R, S, W} (i.e., not {B, O, Z}) and OSTYPE of OPSINE is entered.</p> <p>ENT-USER is denied if OSL of {A, B, O} and OSTYPE of NMA is entered.</p> <p>ENT-USER is denied if OSL of {A, B, C, D, E, M, m, O, P, R, S, W} (i.e., not {I, Z}) and OSTYPE of TSC is entered.</p> <p>ENT-USER is denied if OSL of {R} is entered and the user executing the command does not have a UID of "system", "SYSTEM".</p> <p>ENT-USER is denied if OSL of {S} and OSTYPE of {TSC, NMA or OPSINE} is entered.</p>
UNAM	<p><1-18 VALID UNAM CHARACTERS></p> <p>Default: <Null (unpopulated) string></p> <p>Addressing: None</p> <p>Description: User Name, specifies additional identifying information pertaining to the user. UNAM can be the name of the party responsible for this account, a phone extension, a location, etc. It is not necessary for UNAM to be unique. Valid values for UNAM are a string of 1 through 18, case-sensitive alphanumeric characters where the first character must always be an alphabetic character. The following special characters are also accepted as valid characters and can be part of the UNAM: % (percent sign), + (plus sign), # (pound sign), and _ (under score).</p>
RUSURE	<p>{NO, YES}</p> <p>Default: {YES}</p> <p>Addressing: None</p> <p>Description: Are You Sure Prompt, specifies whether the user is to receive an additional RUSURE prompt for the RESTORE-DB and DLT-PARTITN commands. The RUSURE prompt allows the user to cancel the execution of the command before any changes in the system are made. (Note. An OS user or a user on a SNIDER CID port should be provisioned with RUSURE of NO). Values are:</p> <p>NO No, the user will not receive an RUSURE prompt.</p> <p>YES Yes, the user will receive an RUSURE prompt when the user enters a RESTORE-DB or DLT-PARTITN command.</p>

DSKBFIND	{ALWAYS, NEVER}	
	Default:	{ALWAYS} (if OSTYPE is OPSINE) {NEVER} (if OSTYPE is not OPSINE)
	Addressing:	None
	Description:	Disk Buffer Find Indicator, specifies whether a user receives all output messages the user is subscribed to receive (via the user's OSL and UCFCO values), that were generated while the user was logged off the system, when the user re-logs in to the system. If DSKBFIND is set to ALWAYS and the disk buffering storage capacity is exceeded, the oldest response messages are discarded and a warning message indicating messages have been discarded due to buffer wrap is generated when the user re-logs in. If DSKBFIND is set to ALWAYS, the user can "skip to the end" of the disk buffered messages by specifying SKIPTOEND of END in the ACT-USER command. Disk buffering of response messages are lost when the APS control system is initialized. Values are:
	ALWAYS	Always, when the user logs in, the user receives all output messages the user is subscribed to receive that were generated while the user was logged off the system.
	NEVER	Never, when the user logs in, the user does not receive disk buffered response messages. The user only receives current response messages.
TYPE	{PRN, TTY, VDT}	
	Default:	{VDT}
	Addressing:	None
	Description:	Terminal Type, specifies the terminal CPORT configuration for the user. Values are:
	PRN	Printer (output only) CPORT. (Note. The CPORT should be provisioned as an auto login port, i.e., AUTOIN of a UID value in the ENT-CID or ENT-CID-VC command.)
	TTY	Teletype Terminal, non-cursor addressable input/output terminal.
	VDT	Video Display Terminal, cursor addressable video display terminal.
	Restrictions:	ENT-USER is denied if TYPE of PRN and OSTYPE of TSC is entered. ENT-USER is denied if TYPE of PRN is entered and a PARTNAM value is entered. ENT-USER is denied if TYPE of TTY and DM of NA is entered. ENT-USER is denied if TYPE other than TTY is entered and DM of {ECHO, NOECHO} is entered.

DM	{ECHO, NA, NOECHO}	
	Default:	{ECHO} (if TYPE of TTY is entered) {NA} (If TYPE other than TTY is entered)
	Addressing:	None
	Description:	TTY Display Mode, specifies the display mode for a TTY terminal after a user is logged-in. Values are:
	ECHO	Character Echo, input characters are echoed.
PARTNAM	NA	Not Applicable, value used for DM when TYPE is not TTY.
	NOECHO	Character Not Echo, input characters are not echoed.
	Restrictions:	ENT-USER is denied if DM of NA and TYPE of TTY is entered. ENT-USER is denied if DM of {ECHO, NOECHO} is entered and TYPE other than TTY is entered.
	<string of 1–20 VALID PARTITION NAME CHARACTERS>	
	Default:	<Null (unpopulated) string>
	Addressing:	None
	Description:	Partition Name, specifies the name of a valid user partition (refer to ENT-PARTITN). Valid values for PARTNAM are a string of 1 through 20, non-case sensitive alphanumeric characters where the first character must always be an alphabetic character. The PARTNAM value is automatically converted to an upper-case string of characters. The following special characters are also accepted as valid characters and will be part of the PARTNAM: % (percent sign), + (plus sign), # (pound sign), and _ (under score). It is necessary for the PARTNAM to be unique. PARTNAM cannot be specified as a string of characters resulting in a keyword ALL. If no value is entered for PARTNAM, the system will automatically assign a null (unpopulated) string as the default.
	Restrictions:	ENT-USER is denied if PARTNAM of any combination of the upper or lower case word "ALL" is entered. ENT-USER is denied if the PARTNAM value entered does not exist (refer to ENT-PARTITN). ENT-USER is denied if a PARTNAM value is entered and TYPE of PRN is entered. ENT-USER is denied if a PARTNAM value is entered and UID of {system, SYSTEM, sysprint} is entered.
OSTYPE	{ITS, NMA, OPSINE, OTHER, TSC}	
	Default:	{OTHER}
	Addressing:	None
	Description:	Operations System Type, specifies the user's OS type. The value for OSTYPE determines the default values for OSL, TYPE, DSKBFIND, and LNKTMR. (Note: the value for OSTYPE for a specified UID cannot be changed after executing ENT-USER. To change the value of OSTYPE, the user must be deleted via DLT-USER and re-created via ENT-USER.) Values are:
	ITS	Integrated Test Systems. Allows the user to enter non-universal AIDs for commands while the system is in universal AID mode. Inputs that are not in the universal AID format will have the universal AID structures appended on the input and extracted on the output.
	NMA	Network Monitoring and Analysis OS.
	OPSINE	Operations System for Intelligent Network Elements OS.
	OTHER	Any OS type other than NMA, OPSINE, and TSC.
	TSC	Test Session Controller OS.
	Restrictions:	ENT-USER is denied if OSTYPE of {NMA, OPSINE, OTHER, TSC} and TYPE of {ALARM, AUDIT, CONDISC} is entered.

ENT-USER is denied if OSTYPE of TSC and TYPE of PRN is entered.
 ENT-USER is denied if OSTYPE of OPSINE and OSL of {A, C, D, E, I, M, m, P, R, S, W} (i.e., not {B, O, Z}) is entered.
 ENT-USER is denied if OSTYPE of TSC and OSL of {A, B, C, D, E, M, m, O, P, R, S, W} (i.e., not {I, Z}) is entered.
 ENT-USER is denied if OSTYPE of NMA and OSL of {A, B, O} is entered.
 ENT-USER is denied if OSTYPE of {TSC, NMA or OPSINE} and OSL of {S} is entered.
 ENT-USER is denied if OSTYPE of ITS and OSL other than {I} and TYPE other than {TTY} is entered.

LNKTMR	{0–3600}	
	Default:	{0} (if OSTYPE is not TSC) {75} (if OSTYPE is TSC)
	Addressing:	None
	Description:	CPORT Activity Link Timer, specifies the amount of time (in seconds) that the CPORT link is inactive before a link time-out occurs. LNKTMR is not triggered by a user login, but by CPORT link communication activity after the login occurs. The LOTO parameter determines whether the user is automatically logged out if a link time-out occurs. Values are:
	0	Disabled, no link time-out will occur.
	1–3600	Time in seconds, specifies the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, specified.
LOTO	{N, Y}	
	Default:	{N}
	Addressing:	None
	Description:	Logout On Link Timer Time-out, specifies whether the user is logged off when the CPORT activity link timer (LNKTMR) times out. Values are:
	N	No, the user is not logged off if the link timer expires.
	Y	Yes, the user is logged off if the link timer expires.
KAMINTVL	{0, 20–300}	
	Default:	{0}
	Addressing:	None
	Description:	Keep Alive Message Interval, specifies the amount of time (in seconds) that the user must be inactive before an autonomous Keep Alive Message (KAM) is sent to the user. The user is inactive if there is no TL1 input or output (command responses, acknowledgement responses, or autonomous responses) between the user and the system. When a user logs in, the user's KAM timer is started and increments until CPORT link activity occurs. The KAM timer is reset when link activity is detected. KAM timers are not incremented when the system is in Limited Command Entry mode. Values are:
	0	Disabled, a KAM timer is not active and the user does not automatically receive any KAM autonomous messages.
	20–300	Time in seconds, specifies the KAM time interval. A KAM message is generated if the user's CPORT link is inactive for the time, in seconds, specified.

MIPINTVL	{0, 20–3500}
Default:	{0}
Addressing:	None
Description:	Multiple In Progress Message Interval, specifies the amount of time (in seconds) before an additional In Progress (IP) messages is generated. Any additional IP messages occur after the initial two second IP message is generated. An additional IP message for the ACT–USER, CANC–USER, ED–PID, STOP–OPS, START–OPS, or INIT–SYS commands is not generated, regardless of the MIPINTVL value. MIPINTVL timers are deactivated when the system is in Limited Command Entry mode. Values are:
	0 Disabled, the user will not receive any additional IP messages after the initial two–second IP message.
	20–3500 Time in seconds, indicates that an additional IP message is generated every n seconds (n=20 to 3500) until the entered command completes execution.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <PID>, <UID>, <UCFCI>, <UCFCO>, <UCAL> */
/* <OMODE>, [<OSL>], [<UNAM>], <RUSURE>, <DSKBFIND>, <TYPE>, <DM>, <OSTYPE>,
<LNKTMR>, <LOTO>, [<PARTNAM>], <KAMINTVL>, <MIPINTVL> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

Note. The command echo line only includes the command code in the output response of the ENT–USER command. The user's PID and following parameter values are not displayed in the command echo line.

OUTPUT PARAMETERS

PID	<6 TO 12 ASTERISK CHARACTERS> Password Identifier. Each character of the password is represented by an asterisk (*). The PID is not displayed in any successful response message.
UID	<5–12 VALID UID CHARACTERS> User Identifier, identifies the provisioned UID value.
UCFCI	<1–26 VALID UCFCI CHARACTERS> User Command Functional Category, Input, identifies the provisioned UCFCI value. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)
UCFCO	<1–26 VALID UCFCI CHARACTERS> User Command Functional Category, Output, identifies the provisioned UCFCO value. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)
UCAL	{1–30} User Command Authorization Level, identifies the provisioned UCAL value. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)
OMODE	{C} Command Input Operational Mode, indicates the system initializes to the Direct Command Input mode.

OSL	<p>{<String of characters composed of {B, C, D, E, H, I, M, m, O, P, R, S, W}>, <NoVal>}</p> <p>Output Subscription Level, identifies the unsolicited output response messages a user receives. The OSL value reported is a case-sensitive, order-independent character string composed of any or all of the characters in the OSL value set of {B, C, D, E, H, I, M, m, O, P, R, S, W} (e.g., CMmEDPSOWR) or no value. If an OSL value of A was entered, the reported OSL value is BCDEHIMmOPSW. If an OSL value of Z was entered, no value is reported for OSL. Values are:</p> <table> <tr> <td>B</td><td>Report Data(B)ase Change messages (via REPT^DBCHG).</td></tr> <tr> <td>C</td><td>Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>D</td><td>Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)</td></tr> <tr> <td>E</td><td>Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).</td></tr> <tr> <td>H</td><td>Reserved for future use. This OSL value (currently) has no affect.</td></tr> <tr> <td>I</td><td>Report (I)nitilization messages (via REPT^INITZN).</td></tr> <tr> <td>M</td><td>Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>m</td><td>Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>O</td><td>Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.</td></tr> <tr> <td>P</td><td>Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)</td></tr> <tr> <td>R</td><td>Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages.)</td></tr> <tr> <td>S</td><td>Report (S)Titus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)</td></tr> <tr> <td>W</td><td>Report (W)roll responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.</td></tr> <tr> <td><NoVal></td><td>No value is reported if no OSL values were provisioned (all OSL filters are off and the user will not receive unsolicited messages).</td></tr> </table>	B	Report Data(B)ase Change messages (via REPT^DBCHG).	C	Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.	D	Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)	E	Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).	H	Reserved for future use. This OSL value (currently) has no affect.	I	Report (I)nitilization messages (via REPT^INITZN).	M	Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.	m	Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.	O	Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.	P	Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)	R	Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages.)	S	Report (S)Titus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)	W	Report (W)roll responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.	<NoVal>	No value is reported if no OSL values were provisioned (all OSL filters are off and the user will not receive unsolicited messages).
B	Report Data(B)ase Change messages (via REPT^DBCHG).																												
C	Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.																												
D	Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)																												
E	Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).																												
H	Reserved for future use. This OSL value (currently) has no affect.																												
I	Report (I)nitilization messages (via REPT^INITZN).																												
M	Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.																												
m	Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.																												
O	Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.																												
P	Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)																												
R	Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages.)																												
S	Report (S)Titus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)																												
W	Report (W)roll responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.																												
<NoVal>	No value is reported if no OSL values were provisioned (all OSL filters are off and the user will not receive unsolicited messages).																												
UNAM	<p>{1–18 VALID UNAM CHARACTERS, <NoVal>}</p> <p>User Name, identifies the provisioned UNAM value. Values are:</p> <table> <tr> <td><Provisioned UNAM value></td><td></td></tr> <tr> <td><NoVal></td><td>No value is reported if a UNAM value was not entered.</td></tr> </table>	<Provisioned UNAM value>		<NoVal>	No value is reported if a UNAM value was not entered.																								
<Provisioned UNAM value>																													
<NoVal>	No value is reported if a UNAM value was not entered.																												
RUSURE	<p>{NO, YES}</p> <p>Are You Sure Prompt, indicates whether the user is to receive an additional RUSURE prompt for the RESTORE–DB and DLT–PARTITN commands. The RUSURE prompt allows the user to cancel the execution of the command before any changes in the system are made. Values are:</p> <table> <tr> <td>NO</td><td>No, the user will not receive an RUSURE prompt.</td></tr> <tr> <td>YES</td><td>Yes, the user will receive an RUSURE prompt when the user enters a RESTORE–DB or DLT–PARTITN command.</td></tr> </table>	NO	No, the user will not receive an RUSURE prompt.	YES	Yes, the user will receive an RUSURE prompt when the user enters a RESTORE–DB or DLT–PARTITN command.																								
NO	No, the user will not receive an RUSURE prompt.																												
YES	Yes, the user will receive an RUSURE prompt when the user enters a RESTORE–DB or DLT–PARTITN command.																												

DSKBFIND	{ALWAYS, NEVER} Disk Buffer Find Indicator, indicates whether a user receives all output messages the user is subscribed to receive (via the user's OSL and UCFCO values), that were generated while the user was logged off the system, when the user re-logs in to the system. Values are: <table> <tr> <td>ALWAYS</td><td>Always, when the user logs in, the user receives all output messages the user is subscribed to receive that were generated while the user was logged off the system.</td></tr> <tr> <td>NEVER</td><td>Never, when the user logs in, the user does not receive disk buffered response messages. The user only receives current response messages.</td></tr> </table>	ALWAYS	Always, when the user logs in, the user receives all output messages the user is subscribed to receive that were generated while the user was logged off the system.	NEVER	Never, when the user logs in, the user does not receive disk buffered response messages. The user only receives current response messages.						
ALWAYS	Always, when the user logs in, the user receives all output messages the user is subscribed to receive that were generated while the user was logged off the system.										
NEVER	Never, when the user logs in, the user does not receive disk buffered response messages. The user only receives current response messages.										
TYPE	{PRN, TTY, VDT} Terminal Type, indicates the terminal CPORT configuration for the user. Values are: <table> <tr> <td>PRN</td><td>Printer (output only) CPORT.</td></tr> <tr> <td>TTY</td><td>Teletype Terminal, non-cursor addressable input/output terminal.</td></tr> <tr> <td>VDT</td><td>Video Display Terminal, cursor addressable video display terminal.</td></tr> </table>	PRN	Printer (output only) CPORT.	TTY	Teletype Terminal, non-cursor addressable input/output terminal.	VDT	Video Display Terminal, cursor addressable video display terminal.				
PRN	Printer (output only) CPORT.										
TTY	Teletype Terminal, non-cursor addressable input/output terminal.										
VDT	Video Display Terminal, cursor addressable video display terminal.										
DM	{ECHO, NA, NOECHO} TTY Display Mode, indicates the display mode for a TTY terminal after a user is logged-in. Values are: <table> <tr> <td>ECHO</td><td>Character Echo, input characters are echoed.</td></tr> <tr> <td>NA</td><td>Not Applicable, value used for DM when TYPE is not TTY.</td></tr> <tr> <td>NOECHO</td><td>Character Not Echo, input characters are not echoed.</td></tr> </table>	ECHO	Character Echo, input characters are echoed.	NA	Not Applicable, value used for DM when TYPE is not TTY.	NOECHO	Character Not Echo, input characters are not echoed.				
ECHO	Character Echo, input characters are echoed.										
NA	Not Applicable, value used for DM when TYPE is not TTY.										
NOECHO	Character Not Echo, input characters are not echoed.										
OSTYPE	{ITS, NMA, OPSINE, OTHER, TSC} Operations System Type, identifies the provisioned OSTYPE value. Values are: <table> <tr> <td>ITS</td><td>Integrated Test Systems. Allows the user to enter non-universal AIDs for commands while the system is in universal AID mode. Inputs that are not in the universal AID format will have the universal AID structures appended on the input and extracted on the output.</td></tr> <tr> <td>NMA</td><td>Network Monitoring and Analysis OS.</td></tr> <tr> <td>OPSINE</td><td>Operations System for Intelligent Network Elements OS.</td></tr> <tr> <td>OTHER</td><td>Any OS type other than NMA, OPSINE, and TSC.</td></tr> <tr> <td>TSC</td><td>Test Session Controller OS.</td></tr> </table>	ITS	Integrated Test Systems. Allows the user to enter non-universal AIDs for commands while the system is in universal AID mode. Inputs that are not in the universal AID format will have the universal AID structures appended on the input and extracted on the output.	NMA	Network Monitoring and Analysis OS.	OPSINE	Operations System for Intelligent Network Elements OS.	OTHER	Any OS type other than NMA, OPSINE, and TSC.	TSC	Test Session Controller OS.
ITS	Integrated Test Systems. Allows the user to enter non-universal AIDs for commands while the system is in universal AID mode. Inputs that are not in the universal AID format will have the universal AID structures appended on the input and extracted on the output.										
NMA	Network Monitoring and Analysis OS.										
OPSINE	Operations System for Intelligent Network Elements OS.										
OTHER	Any OS type other than NMA, OPSINE, and TSC.										
TSC	Test Session Controller OS.										
LNKTMR	{0-3600} CPORT Activity Link Timer, identifies the amount of time (in seconds) that the CPORT link is inactive before a link time-out event occurs. LNKTMR is not triggered by a user login, but by CPORT link communication activity after the login occurs. The LOTO parameter determines whether the user is automatically logged out if a link time-out occurs. Values are: <table> <tr> <td>0</td><td>Disabled, no link time-out will occur.</td></tr> <tr> <td>1-3600</td><td>Time in seconds, indicates the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, indicated.</td></tr> </table>	0	Disabled, no link time-out will occur.	1-3600	Time in seconds, indicates the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, indicated.						
0	Disabled, no link time-out will occur.										
1-3600	Time in seconds, indicates the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, indicated.										
LOTO	{LOGOUT, NOLOGOUT} Logout On Link Timer Time-out, indicates whether the user is logged off when the CPORT activity link timer (LNKTMR) times out. <table> <tr> <td>LOGOUT</td><td>The user is logged off when the link timer expires.</td></tr> <tr> <td>NOLOGOUT</td><td>The user is not logged off when the link timer expires.</td></tr> </table>	LOGOUT	The user is logged off when the link timer expires.	NOLOGOUT	The user is not logged off when the link timer expires.						
LOGOUT	The user is logged off when the link timer expires.										
NOLOGOUT	The user is not logged off when the link timer expires.										
PARTNAM	{<1-20 VALID PARTITION NAME CHARACTERS>, <NoVal>} Partition Name, indicates the provisioned value for PARTNAM. <table> <tr> <td><Provisioned PARTNAM value></td><td></td></tr> <tr> <td><NoVal></td><td>No value is reported if a PARTNAM value was not entered.</td></tr> </table>	<Provisioned PARTNAM value>		<NoVal>	No value is reported if a PARTNAM value was not entered.						
<Provisioned PARTNAM value>											
<NoVal>	No value is reported if a PARTNAM value was not entered.										

KAMINTVL	{0, 20–300}	Keep Alive Message Interval, indicates the amount of time (in seconds) that the user must be inactive before a Keep Alive Message (KAM) is automatically sent to the user. The user is inactive if there is no TL1 input or output (command responses, acknowledgement responses, or autonomous responses) between the user and the system. When a user logs in, the user's KAM timer is started and increments until CPORT link activity occurs. The KAM timer is reset when link activity is detected. KAM timers are not incremented when the system is in Limited Command Entry mode. Values are:
	0	Disabled, a KAM timer is not active and the user does not automatically receive any KAM autonomous messages.
	20–300	Time in seconds, specifies the KAM time interval. A KAM message is generated if the user's CPORT link is inactive for the time, in seconds, specified.
MIPINTVL	{0, 20–3500}	Multiple In Progress Message Interval, indicates the amount of time (in seconds) before an additional In Progress (IP) messages is generated. Any additional IP messages occur after the initial two second IP message is generated. An additional IP message for the ACT–USER, CANC–USER, ED–PID, STOP–OPS, START–OPS, or INIT–SYS commands is not generated, regardless of the MIPINTVL value. MIPINTVL timers are deactivated when the system is in Limited Command Entry mode. Values are:
	0	Disabled, the user will not receive any additional IP messages after the initial two–second IP message.
	20–3500	Time in seconds, indicates that an additional IP message is generated every n seconds (n=20 to 3500) until the entered command completes execution.

UNSUCCESSFUL RESPONSE FORMAT

SDBE	Status, internal Data Base Error /* Unable to read USDB – status = <status number> */ /* Error accessing the PARTITION DB – status = <status number> */ /* Unable to update USDB – status = <status number> */
SROF	Status, Requested Operation Failed /* Unable to write to USDB – status = <status number> */

EXAMPLES

In the following example, ENT-USER is used to create a new user profile in the user security database with a UID of "new_user" and a user's UCAL of 15.

```
ENT-USER:::::user_pid,new_user,,15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P08008. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P08008 COMPLD  
/* *****,new_user,Z,Z,15 */  
/* C,CMmEDPOS,,YES,NEVER,VDT,NA,OTHER,0,NOLOGOUT,,0,0 */  
/* ENT-USER [P08008] (1) */  
;
```

In the following example, ENT-USER is used to create a partitioned user profile in the user security database with a UID of "Jsmith", UCFCI of AF, UCFCO of ABF, UCAL of 15, OSL of CMmEDP, and a partition name of "Partition_1".

```
ENT-USER:::::user2_pid,Jsmith,AF,ABF,15,,CMmEDP,,,,,Partition_1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P08009. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P08009 COMPLD  
/* *****,Jsmith,AF,ABF,25 */  
/* C,CMmEDP,,YES,NEVER,VDT,NA,OTHER,0,NOLOGOUT,PARTITION_1,0,0 */  
/* ENT-USER [P08009] (1) */  
;

COMMAND CODE: **ENT-VT1**
COMMAND NAME: **ENTER VT1**

PURPOSE

The ENT-VT1 command creates (assigns and provisions) a VT1.5 path object entity (AID).

The default values for the PST parameter and keyword parameters can be modified with the SET-DFLT-VT1 command. The current default values can be retrieved with the RTRV-DFLT-VT1 command.

A VT1.5 that has not been provisioned has a PST,SST of OOS-AUMA,UAS&DSBLD (if the supporting STS-1 also is not provisioned) or OOS-MA, UAS (if the supporting STS-1 is provisioned). Executing an ENT-VT1 command causes the following primary state transitions for the specified VT1.5. Secondary states associated with the VT1.5 before and after the command is executed depend upon events detected by the system. Refer to Appendix G State Transitions, for additional information on state values and state transitions.

Entered PST Value	Next PST State if the Default Value for PST is (defined using ENT-DFLT-VT1) :	
	OOS	IS
<NoVal>	OOS-MA	IS
IS	IS	IS
OOS	OOS-MA	OOS-MA

Note: 1. <NoVal> means no value is entered for that parameter.

When a VT1.5 is edited to an OOS-MA or OOS-AUMA state, a MAN condition type is set for the specified VT1.5. The MAN condition type is cleared when the VT1.5 is provisioned to an IS state.

When a VT1.5 is in an OOS-MA, OOS-AUMA state, no VT1.5 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the VT1.5, but VT1.5 alarm conditions are monitored (retrievable with the RTRV-VT1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-VT1 command) for the VT1.5.

An ENT-VT1 command is denied if:

- The specified VT1.5s supporting STS-1 have not been provisioned.
- The specified VT1.5s supporting STS-1 are under matrix loopback.
- The STS-1 supporting the specified VT1.5 is cross-connected. (i.e., the STS-1 has an SST of ACT or BUSY).
- The specified VT1.5 is embedded within a protection OC-3 or OC-12.
- The specified VT1.5 is embedded within an STS-1 with STSMAP = ALL or ASYNC (i.e., VT1.5 can be provisioned only if STSMAP of the containing STS-1 is VTFLOAT).
- VTPTYEL=Y is specified.
- The specified VT1.5 is already provisioned.
- An invalid parameter value or combination of parameter values is entered.
- TACC=Y, and PST=IS.
- TAPPOOL is set to a valid value but TACC=N.
- TAPP AID is set to the last VT1.5 value in the system, and AID+1 can not be provisioned as a FAD port.
- FADB is provisioned.

When an ENT-VT1 command is executed, the default values for the following items are automatically provisioned for the specified VT1.5, and all PM data collection registers for the VT1.5 are automatically reset to zero. These default values cannot be changed, except for PM attributes, unless the specified VT1.5 has first been provisioned by an ENT-VT1 command.

- Condition type attributes (refer to Appendix C, Condition Types and SET-ATTR-VT1)
- Fault escalation parameters (refer to ED-FLTPRO-VT1)

- Performance monitoring (PM) attributes (refer to SET-PMATTR-ALL)
- PM mode (refer to SET-PMMODE-VT1)
- PM threshold levels (refer to SET-TH-VT1)
- PM reports (refer to ALW-PMREPT-VT1)

INPUT FORMAT

ENT-VT1 : [TID] : AID : [CTAG] : : : [TACC=] [, TAPPOOL=] [, VTMAP=] [, VTPTYEL=] : [PST] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies the VT1.5 port or range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
TACC=	{N, Y} Default: <Previously Existing Value> Addressing: None Description: Test Access port AID, indicates that this VT1 port (specified by AID) and the AID+1 VT1 port are to be used as a Test Access Port Pairs (TAPP). The port specified by AID becomes FAD A and the port specified by AID+1 becomes FAD B. Values are: N No, the specified VT1 port is not a Test Access port. Y Yes, VT1 ports specified by AID and AID+1 are Test Access ports. Restrictions: If TACC=Y, the AID of an STS1 entity embedded in an OC12, OC3, or EC1, except the 3rd STS1 within an OC3 and the {4-3}th STS1 within an OC12. Refer to Appendix B, Access Identifiers (AIDs).

TAPPOOL=	{PRIVATE, PUBLIC, <NoVal>}	
	Default:	<NoVal> if TACC = N PRIVATE if TACC = Y
	Addressing:	None
	Description:	TAP port Pool, defines whether the TAP port that has been created (by means of TACC=Y) belongs to the pool that is private to the creator of the pool or belongs to a public pool. Values are:
	PRIVATE	The TAP pair that has been created belongs to the private pool of the user that issued the ENT–STS1 command. It can only be accessed by the user that owns the pool. If any other user tries to use this TAP pair (by means of CONN–TACC–VT1), the command shall be denied.
VTMAP=	PUBLIC	The TAP pair that has been created belongs to the public pool of the system. It can be accessed by any user with the privilege to use the Test Access commands.
	<NoVal>	No Value (unpopulated), TAPPOOL does not apply if TACC=N.
	{ALL, ASYNC, VTBYTE}	
	Default:	<Value retrieved with RTRV–DFLT–VT1 command>
	Addressing:	None
	Description:	VT1.5 payload type. Determines the expected VT1.5 payload type and the value of the expected path signal label. Used for comparison for the Signal Label Mismatch function. Values are:
	ALL	ALL incoming signal labels are accepted by the system, without creating a SLMF condition. ALL is intended for intermediate path monitoring only, so no mappings (i.e., terminating) of the VT1 are allowed for ALL (only intact VT1 connections are possible). Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
	ASYNC	VT Asynchronous mapping – VTFLOAT mode. (L1–L3 = 010 bin). The system will accept only incoming signal labels of type ASYNC without creating a SLMF condition. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
	VTBYTE	VT byte synchronous mapping, applicable for DS0s being mapped into VT SPE – VTFLOAT mode (L1–L3 = 100 hex). The system will accept only incoming signal labels of type VTBYTE without creating a SLMF condition. Incoming idle (unequipped) signal labels will continue to produce IDLE condition types.
	Restrictions:	If VTMAP=ASYNC, only ASYNC type mappings may be applied to the VT1 (e.g., ENT–T1, ENT–CRS–T1, etc.). The DS1 embedded within the VT1 can not be made (i.e., ENT–T1 is not possible even though VTMAP=ASYNC) if the VT1 being provisioned is on hardware (e.g. an ES1 card) that cannot directly support ASYNC mappings for intermediate path monitoring purposes. If VTMAP=VTBYTE, only intact VT1 connections are possible. Because VTBYTE type mappings are not supported by any of the current 1631 HW, no mappings can be made on that VT1.
VTPTYEL=	{N}	
	Default:	<Value retrieved with RTRV–DFLT–VT1 command>
	Addressing:	None
	Description:	VT1.5 path yellow behavior. Identifies whether VT path yellow or RDI will be sent/received. Values are:
	N	No. RDI will be sent/received on appropriate defect state.
	Restrictions:	ENT–VT1 is denied if VTPTYEL=Y.

PST	{IS, OOS}	
	Default:	<Value retrieved with RTRV-DFLT-VT1 command>
	Addressing:	None
	Description:	Primary State, specifies the primary state to provision the VT1.5. Values are:
	IS	In-Service
	OOS	Out-Of-Service

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* DFLT Database Error: <ERROR-STRING> */
	/* Error updating supporting entity, Error=<ERROR-STRING> */
	/* VT1 Shelf info error, Error=<ERROR-STRING> */
	/* Error enabling supported T1, Error=<ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, VT1.5 port OC3VT1-16-1-3-4 (a VT1.5 embedded within an OC-3) is being provisioned with VTPTYEL to send RDI, with VTMAP of ASYNC and with the VT1.5 in the IS state. All other parameter values shall be as retrievable from RTRV-DFLT-VT1.

COMMAND CODE: **FLTLOC-PATH-STS1**
COMMAND NAME: **FAULT LOCATE PATH STS-1**

PURPOSE

The FLTLOC-PATH-STS1 command collects, analyzes, and displays fault isolation data pertaining to the redundant internal paths through the system for the cross-connection specified by the FROM and TO STS1 AIDs.

The redundant internal paths through the system that are reported are the paths from the specified FROM AID to the specified TO AID. FLTLOC-PATH-STS1 does not report on the paths through the system from the specified TO AID to the specified FROM AID for a two-way cross-connection.

To execute a FLTLOC-PATH-STS1 command, the specified FROM and TO STS1 ports must identify an STS1 one-way or two-way cross-connection (an STS1 SST of ACT or BUSY and cross-connected together).

The successful response to a FLTLOC-PATH-STS1 command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 or copy 1 clock and data paths through the system, and any associated fault isolation data, pertaining to the indicated entity. In addition, zero, one, or more lines of error information may be included for each element of the clock and data paths, except for the FROM and TO STS1 port lines. Refer to the Successful Response Format, below.

A FLTLOC-PATH-STS1 command is denied if:

- The FROM and TO STS1 AIDs do not identify either a one-way or two-way cross-connection (an STS1 SST of ACT or BUSY and cross-connected together).
- The FROM and TO STS1 AIDs identify a maintenance loopback connection (an STS1 SST of UAS&MT&LPBK).
- The specified STS1 is embedded within a protection OC3/OC12.
- An invalid parameter value is entered.

INPUT FORMAT

FLTLOC-PATH-STS1 : [TID] : FROM, TO : [CTAG] : : [PATH] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
FROM	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: None Description: STS1 AID, specifies the STS1 port in a cross-connection or loopback that is the beginning of the internal system path to be analyzed.
TO	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: None Description: STS1 AID, specifies the STS1 port in a cross-connection or loopback that is the end of the internal system path to be analyzed.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

PATH	{0–28}	
	Default:	{ 0 }
	Addressing:	None
	Description:	Path, specifies which of the paths, that the intact STS1 is divided into, is analyzed. Values are:
	0	The path over which the overhead is being transmitted is analyzed.
	1 – 28	The path over which the 1–28 VT1.5 equivalent components are being transmitted is analyzed.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

 Equipment AID, identifies the I/O, matrix, clock and cable entities associated with the redundant internal system paths from the FROM port to the TO port.

DATA

{ALM, CLKSEL0, CLKSEL1, CLKSELOPP, CLKSELREC, CLKSELSAM, CULPRIT, DATASEL0, DATASEL1, DEO, DIO, DMX, DS, DUEO, DUIO, DUMX, FEO, FIO, FMX, FS, FUEO, FUIO, FUMX, HW, MT, OOS, TEO, TIO, TMX, TS, TUEO, TUIO, TUMX, fault data not received from <L2P EQPT AID>, not responding}

Fault Location Data, indicates pertinent fault location information concerning the identified equipment entity. If a fault condition exists, one or more of the following values, separated by a comma, are displayed:

ALM	Alarmed, the indicated equipment entity is alarmed.
CLKSEL0	Copy 0 Clock Selected, the indicated circuit pack is selecting the copy 0 clock.
CLKSEL1	Copy 1 Clock Selected, the indicated circuit pack is selecting the copy 1 clock.
CLKSELOPP	Opposite copy of Clock Selected, the indicated circuit pack is selecting the opposite copy of clock.
CLKSELREC	Recovered Clock Selected, the indicated circuit pack is selecting the recovered clock.
CLKSELSAM	Same copy of Clock Selected, the indicated circuit pack is selecting the same copy of clock.
CULPRIT	Culprit, the indicated equipment entity is the source of the fault.
DATASEL0	Copy 0 matrix Data Selected by the indicated TO port.
DATASEL1	Copy 1 matrix Data Selected by the indicated TO port.
DEO	Data Electrical/Optical, a data error at the electrical-to–

DIO	optical side of the indicated equipment entity is detected. Data Input/Output, a data error at the I/O side of the indicated equipment entity is detected.
DMX	Data Matrix, a data error at the matrix side of the indicated equipment entity is detected.
DS	Data Suspect, the indicated equipment entity may be the source of the data errors.
DUEO	Data Upstream Electrical/Optical, a data error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
DUIO	Data Upstream Input/Output, a data error upstream from the I/O side of the indicated equipment entity is detected.
DUMX	Data Upstream Matrix, a data error upstream from the matrix side of the indicated equipment entity is detected.
FEO	Facility Electrical/Optical, a facility failure at the electrical-to-optical side of the indicated equipment entity is detected.
FIO	Facility Input/Output, a facility failure at the I/O side of the indicated equipment entity is detected.
FMX	Facility Matrix, a facility failure at the matrix side of the indicated equipment entity is detected.
FS	Facility Suspect, the indicated equipment entity may be the source of the facility failures.
FUEO	Facility Upstream Electrical/Optical, a facility failure upstream from the electrical-to-optical side of the indicated equipment entity is detected.
FUIO	Facility Upstream Input/Output, a facility failure upstream from the I/O side of the indicated equipment entity is detected.
FUMX	Facility Upstream Matrix, a facility failure upstream from the matrix side of the indicated equipment entity is detected.
HW	Hardware, a hardware fault on the indicated equipment entity is detected.
MT	Maintenance, the indicated equipment entity has a SST of MT.
OOS	Out-of-Service, the indicated equipment entity is OOS.
TEO	Timing Electrical/Optical, a timing error at the electrical-to-optical side of the indicated equipment entity is detected.
TIO	Timing Input/Output, a timing error at the I/O side of the indicated equipment entity is detected.
TMX	Timing Matrix, a timing error at the matrix side of the indicated equipment entity is detected.
TS	Timing Suspect, the indicated equipment entity may be the source of the timing errors.
TUEO	Timing Upstream Electrical/Optical, a timing error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
TUIO	Timing Upstream Input/Output, a timing error upstream from the I/O side of the indicated equipment entity is detected.
TUMX	Timing Upstream Matrix, a timing error upstream from the matrix side of the indicated equipment entity is detected.

fault data not received from <L2P EQPT AID> not responding	The supporting Level 2 Processor did not respond. The indicated equipment entity is not OOS and no re- sponse from the entity was received.
--	---

ERROR_INFO {CID, CONN RAM, COPY0 ASYMAIS, COPY0 CID, COPY0 FPE, COPY0 PBIT, COPY0 STM1 LOF, COPY0 STM1 LOSSYNC, COPY0 STM1 RAIL, COPY0 WPE, COPY1 ASYMAIS, COPY1 CID, COPY1 FPE, COPY1 PBIT, COPY1 STM1 LOF, COPY1 STM1 LOSSYNC, COPY1 STM1 RAIL, COPY1 WPE, DS3/STS1 LOA, DS3/STS1 LOF, DS3/STS1 LOS, DS3/STS1 RCLK, OC3 AIS, OC3 LOA, OC3 LOF, OC3 LOS, OC12 AIS, OC12 LOA, OC12 LOF, OC12 LOS, PATH NOT SELECTED, STM1 LOF, STM1 LOSSYNC, STM1 OF, STM1 RAIL, STM1 SPILL, STM1 UF, STM4 B1, STM4 CABLE DELAY, STM4 DXCLK, STM4 DXSPILL, STM4 LOF, STM4 LOS, STM4 MXCLK, STM4 MXSPILL, STS3C/STS1 AIS, STS3C/STS1 LOP, XMIT LASER OFF}

Equipment Error Information, indicates additional error information detected by the system pertaining to the equipment AID identified in the output line above this line and the specified path through the system. Multiple lines of <ERROR_INFO> may be displayed, with multiple values of <ERROR_INFO>, separated by a comma, per line.

CID	Connect IDentification error detected.
CONN RAM	Connection RAM error detected.
COPY0 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 0 signal and not on Copy1
COPY0 CID	Connect IDentification error detected on Copy 0 signal.
COPY0 FPE	Frame Parity Error detected on Copy 0 signal.
COPY0 PBIT	Parity Bit Error detected on Copy 0 signal.
COPY0 STM1 LOF	Loss of Frame detected on STM1 Copy 0 signal.
COPY0 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 0 signal.
COPY0 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 0 signal.
COPY0 WPE	Word Parity Error detected on Copy 0 signal.
COPY1 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 1 signal and not on Copy1.
COPY1 CID	Connect IDentification error detected on Copy 1 signal.
COPY1 FPE	Frame Parity Error detected on Copy 1 signal.
COPY1 PBIT	Parity Bit Error detected on Copy 1 signal.
COPY1 STM1 LOF	Loss of Frame detected on STM1 Copy 1 signal.
COPY1 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 1 signal.
COPY1 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 1 signal.
COPY1 WPE	Word Parity Error detected on Copy 1 signal.
DS3/STS1 LOA	Loss of Activity detected on DS3/STS-1.
DS3/STS1 LOF	Loss of Frame detected on DS3/STS-1.
DS3/STS1 LOS	Loss of Signal detected on DS3/STS-1.
DS3/STS1 RCLK	Loss of Recovered Clock detected on DS3/STS-1.
OC3 AIS	AIS signal detected on OC-3 signal.
OC3 LOA	Loss of Activity detected on OC-3.
OC3 LOF	Loss of Frame detected on OC-3.
OC3 LOS	Loss of Signal detected on OC-3.
OC12 AIS	AIS signal detected on OC-12 signal.
OC12 LOA	Loss of Activity detected on OC-12.
OC12 LOF	Loss of Frame detected on OC-12.
OC12 LOS	Loss of Signal detected on OC-12.
PATH NOT SELECTED	Specified path is not selected.
STM1 LOF	Loss of Frame detected on STM1 signal.
STM1 LOSSYNC	Loss of Sync pulse detected on STM1 signal.
STM1 OF	Over-Flow buffer spill detected on STM1 signal.

STM1 RAIL	Lower or upper limit delay Rail detected on STM1.
STM1 SPILL	Buffer Spill detected on STM1 signal.
STM1 UF	Under-Flow buffer spill detected on STM1 signal.
STM4 B1	B1 error detected on STM4 signal.
STM4 CABLE DELAY	Cable Delay error detected on STM4 signal.
STM4 DXCLK	Demux Clock error detected on STM4 signal.
STM4 DXSPILL	Demux Clock Spill detected on STM4 signal.
STM4 LOF	Loss of Frame detected on STM4 signal.
STM4 LOS	Loss of Signal detected on STM4 signal.
STM4 MXCLK	Mux Clock error detected on STM4 signal.
STM4 MXSPILL	Mux Clock Spill detected on STM4 signal.
STS3C/STS1 AIS	AIS signal detected on STS-3C/STS-1 signal.
STS3C/STS1 LOP	Loss of Pointer detected on STS-3C/STS-1 signal.
XMIT LASER OFF	EOB, IOB, or OXB Transmit Laser has been turned off.

TO STS1_AID:
 {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#)
 {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#)
 {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#)
 STS1 AID, identifies the TO STS-1 port.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Both FROM and TO facility must be STS1 AID. */ /* Unable to retrieve PATH NUMBER parameter. */ /* Invalid PATH NUMBER <path number> specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid FROM AID entered. */ /* Invalid TO AID entered. */
SARB	Status, All Resources Busy /* Too many FLTLOC-PATH commands already in progress. */

SDBE Status, internal Data Base Error

```
/* Failed to get FROM TP DB record <TP record number> error <errnum>. */
/* Failed to get TO TP DB record <TP record number> error <errnum>. */
/* Unable to get connection pointer for TP type <TP type>, TP num <TP number>, error
   <errnum>. */
/* FROM TPid to supported TPid conversion error <errnum>. */
/* TO TPid to supported TPid conversion error <errnum>. */
/* TPid to first stage Tmsl conversion error <error number>. */
/* TPid to third stage Tmsl conversion error <error number>. */
/* Tmsl Path Retrieve error <error number>. */
/* Path not found. */
/* Unable to retrieve <FROM AID> level 2 processor id. */
/* Unable to retrieve <TO AID> level 2 processor id. */
/* Unable to retrieve inbound EOB entry for EOC shelf copy <copy number>. */
/* Unable to retrieve shelf entry for first stage copy <copy number> <SPB AID>. */
/* Unable to retrieve shelf entry for center stage copy <copy number> <SPB AID>. */
/* Unable to retrieve shelf entry for third stage copy <copy number> <SPB AID>. */
/* Unable to retrieve outbound EOB entry for EOC shelf copy <copy number>. */
/* Unable to create FLTLOC-PATH report file. */
/* Unable to open FLTLOC-PATH report file. */
/* Error reading matrix cable input database for bay <bay number> shelf <shelf number>.
   */
/* Error reading eoc to es1 cable database for cable <cable number>. */
/* Error reading es1 to cs cable database for cable <cable number>. */
/* Error reading cs to es3 cable database for cable <cable number>. */
/* Error reading matrix cable output database for cable <cable number>. */
/* Error reading eoc to io cable database for cable <cable number>. */
/* Unable to print FLTLOC-PATH report file. */
/* Unable to convert card_type <card type number>, card_num <card number>, l2p_id
   <level two processor number> to AID */
```

SNVS Status, Not in Valid State

```
/* FROM AID not as provisioned. */
/* TO AID not as provisioned. */
/* FROM AID must be in a provisioned or maintenance state. */
/* TO AID must be in a provisioned or maintenance state. */
/* Cross connection does not exist between FROM and TO AIDs. */
```

SROF Status, Requested Operation Failed

/* Hardware provisioning in progress. Try again later. */
/* Unable to convert FROM AID to string, error <error number>. */
/* Unable to convert TO AID to string, error <error number>. */
/* Unable to access memory for FI auxiliary data. */
/* Unable to convert <FROM AID> to global TP id, error <error number>. */
/* Unable to convert <TO AID> to global TP id, error <error number>. */
/* Invalid level 2 processor type (<level two processor type number>) encountered for <FROM AID>. */
/* Invalid level 2 processor type (<level two processor type number>) encountered for <TO AID>. */
/* Unable to convert the FROM TP type (<TP type number>) to a string error <error number>. */
/* Unable to convert the TO TP type (<TP type number>) to a string error <error number>. */
/* Unable to compute matrix input cable number for <FROM AID>. */
/* Unable to compute matrix input cable number for <TO AID>. */
/* Unable to retrieve first stage copy <copy number> SPB id, error <error number>. */
/* Unable to retrieve first stage copy <copy number> shelf timeslot, error <error number>. */
/*Unable to determine first stage card type for bay <bay number> shelf <shelf number> slot <slot number>.*/
/* Unable to retrieve center stage copy <copy number> SPB id, error <error number>. */
/* Unable to retrieve center stage copy <copy number> shelf timeslot, error <error number>. */
/*Unable to determine center stage card type for bay <bay number> shelf <shelf number> slot <slot number>.*/
/* Unable to retrieve third stage copy <copy number> SPB id, error <error number>. */
/* Unable to retrieve third stage copy <copy number> shelf timeslot, error <error number>. */
/*Unable to determine third stage card type for bay <bay number> shelf <shelf number> slot <slot number>.*/
/* Unable to send fault locate path message to ACL for <SPB AID>. */
/* Unable to send fault locate path message to ACL for <IPU AID>. */
/* Unable to queue FI auxiliary buffer for fault locate path request. */
/* Invalid matrix copy (<copy number>) returned in response message from <SPB AID>. */
/* Unable to re-queue FI auxiliary buffer for fault locate path request. */
/* I/O IPU response not received for <FROM AID> from <IPU AID>. */
/* I/O IPU response not received for <TO AID> from <IPU AID>. */
/* The FLTLOC-PATH-STS1 for <FROM AID>,<TO AID> was aborted. */
/* Did not receive a response for message sent to <SPB AID>. */
/* Did not receive a response for message sent to <IPU AID>. */
/* Cross connect path has been re-arranged during execution of this command. */
/* Invalid FROM subrack type (<subrack type number>) encountered. */
/* Invalid matrix interface (<matrix interface type number>) encountered for <FROM AID>. */
/* Invalid matrix interface (<matrix interface type number>) encountered for <TO AID>. */
/*Cross connect type has been changed during execution of this command.*/

EXAMPLES

In the following example, fault isolation information for the path between STS-1 port EC1STS1-195 and STS-1 port EC1STS1-207 is retrieved.

```
FLTLOC-PATH-STS1::EC1STS1-195,EC1STS1-207;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

;

```

In the following example, fault isolation information for the pass through connection path between STS-1 port OC3STS1-65-1 and STS-1 port OC3STS1-66-1 is retrieved.

```
FLTLOC-PATH-STS1::OC3STS1-65-1,OC3STS1-66-1;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **FLTLOC-PATH-STS3C**
COMMAND NAME: **FAULT LOCATE PATH STS-3C**

PURPOSE

The FLTLOC-PATH-STS3C command collects, analyzes, and displays fault isolation data pertaining to the redundant internal paths through the system for the cross-connection specified by the FROM and TO STS-3C AIDs.

The redundant internal paths through the system that are reported are the paths from the specified FROM AID to the specified TO AID. FLTLOC-PATH-STS3C does not report on the paths through the system from the specified TO AID to the specified FROM AID for a two-way cross-connection.

To execute a FLTLOC-PATH-STS3C command, the specified FROM and TO STS-3C ports must identify an STS-3C one-way or two-way cross-connection (an STS-3C SST of ACT or BUSY and cross-connected together).

The successful response to a FLTLOC-PATH-STS3C command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 or copy 1 clock and data paths through the system, and any associated fault isolation data, pertaining to the indicated entity. In addition, zero, one, or more lines of error information may be included for each element of the clock and data paths, except for the FROM and TO STS-3C port lines. Refer to the Successful Response Format, below.

A FLTLOC-PATH-STS3C command is denied if:

- The FROM and TO STS-3C AIDs do not identify either a one-way or two-way cross-connection (an STS-3C SST of ACT or BUSY and cross-connected together).
- The FROM and TO STS-3C AIDs identify a maintenance loopback connection (an STS-3C SST of UAS&MT&LPBK).
- Both the FROM and TO AIDs do not identify an STS-3C.
- The specified STS-3C is embedded within a protection OC-3/OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

FLTLOC-PATH-STS3C: [TID] :FROM, TO: [CTAG] : : [PATH] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
FROM	STS3C_AID:		
	{OC3STS3C–{1–2240}}	(OC3STS3C–OC3#/STS3C#)	
	{OC12STS3C–{1–560}–{1–4}}	(OC12STS3C–OC12#–STM1/STS3C#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	STS3C AID, specifies the STS–3C port in a cross–connection or loop–back that is the beginning of the internal system path to be analyzed.	
TO	STS3C_AID:		
	{OC3STS3C–{1–2240}}	(OC3STS3C–OC3#/STS3C#)	
	{OC12STS3C–{1–560}–{1–4}}	(OC12STS3C–OC12#–STM1/STS3C#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	STS3C AID, specifies the STS–3C port in a cross–connection or loop–back that is the end of the internal system path to be analyzed.	

CTAG	<1–6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.
PATH	{0–86} Default: { 0 } Addressing: None Description: Path, specifies which of the paths, that the intact STS–3C is divided into, is analyzed. Values are: 0, 1, 2 The path over which the overhead is being transmitted is analyzed. 3 – 86 The path over which the 3–86 VT1.5 equivalent components are being transmitted is analyzed.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD

;

```

OUTPUT PARAMETERS

FROM	STS3C_AID: {OC3STS3C–{1–2240}} (OC3STS3C–OC3#/STS3C#) {OC12STS3C–{1–560}–{1–4}} (OC12STS3C–OC12#–STM1/STS3C#) STS3C AID, identifies the FROM port.
PATH=	{0–86} Path, identifies which of the paths, that the intact STS–3C is divided into, is being reported. Values are: 0, 1, 2 The path over which the overhead is being transmitted is being reported. 3 – 86 The path over which the 3–86 VT1.5 equivalent components are being transmitted is being reported.

 Equipment AID, identifies the I/O, matrix, clock and cable entities associated with the redundant internal system paths from the FROM port to the TO port.

DATA

{ALM, CLKSEL0, CLKSEL1, CLKSELOPP, CLKSELREC, CLKSELSAM, CULPRIT, DATASEL0, DATASEL1, DEO, DIO, DMX, DS, DUEO, DUIO, DUMX, FEO, FIO, FMX, FS, FUEO, FUIO, FUMX, HW, MT, OOS, TEO, TIO, TMX, TS, TUEO, TUIO, TUMX, fault data not received from <L2P EQPT AID>, not responding}

Fault Location Data, indicates pertinent fault location information concerning the identified equipment entity. If a fault condition exists, one or more of the following values, separated by a comma, are displayed:

ALM	Alarmed, the indicated equipment entity is alarmed.
CLKSEL0	Copy 0 Clock Selected, the indicated circuit pack is selecting the copy 0 clock.
CLKSEL1	Copy 1 Clock Selected, the indicated circuit pack is selecting the copy 1 clock.
CLKSELOPP	Opposite copy of Clock Selected, the indicated circuit pack is selecting the opposite copy of clock.
CLKSELREC	Recovered Clock Selected, the indicated circuit pack is selecting the recovered clock.
CLKSELSAM	Same copy of Clock Selected, the indicated circuit pack is selecting the same copy of clock.
CULPRIT	Culprit, the indicated equipment entity is the source of the fault.
DATASEL0	Copy 0 matrix Data Selected by the indicated TO port.
DATASEL1	Copy 1 matrix Data Selected by the indicated TO port.
DEO	Data Electrical/Optical, a data error at the electrical-to-optical side of the indicated equipment entity is detected.
DIO	Data Input/Output, a data error at the I/O side of the indicated equipment entity is detected.
DMX	Data Matrix, a data error at the matrix side of the indicated equipment entity is detected.
DS	Data Suspect, the indicated equipment entity may be the source of the data errors.
DUEO	Data Upstream Electrical/Optical, a data error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
DUIO	Data Upstream Input/Output, a data error upstream from the I/O side of the indicated equipment entity is detected.
DUMX	Data Upstream Matrix, a data error upstream from the matrix side of the indicated equipment entity is detected.
FEO	Facility Electrical/Optical, a facility failure at the electrical-to-optical side of the indicated equipment entity is detected.
FIO	Facility Input/Output, a facility failure at the I/O side of the indicated equipment entity is detected.
FMX	Facility Matrix, a facility failure at the matrix side of the indicated equipment entity is detected.

FS	Facility Suspect, the indicated equipment entity may be the source of the facility failures.
FUEO	Facility Upstream Electrical/Optical, a facility failure upstream from the electrical-to-optical side of the indicated equipment entity is detected.
FUIO	Facility Upstream Input/Output, a facility failure upstream from the I/O side of the indicated equipment entity is detected.
FUMX	Facility Upstream Matrix, a facility failure upstream from the matrix side of the indicated equipment entity is detected.
HW	Hardware, a hardware fault on the indicated equipment entity is detected.
MT	Maintenance, the indicated equipment entity has a SST of MT.
OOS	Out-of-Service, the indicated equipment entity is OOS.
TEO	Timing Electrical/Optical, a timing error at the electrical-to-optical side of the indicated equipment entity is detected.
TIO	Timing Input/Output, a timing error at the I/O side of the indicated equipment entity is detected.
TMX	Timing Matrix, a timing error at the matrix side of the indicated equipment entity is detected.
TS	Timing Suspect, the indicated equipment entity may be the source of the timing errors.
TUEO	Timing Upstream Electrical/Optical, a timing error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
TUIO	Timing Upstream Input/Output, a timing error upstream from the I/O side of the indicated equipment entity is detected.
TUMX	Timing Upstream Matrix, a timing error upstream from the matrix side of the indicated equipment entity is detected.
fault data not received from <L2P EQPT AID> not responding	The supporting Level 2 Processor did not respond. The indicated equipment entity is not OOS and no response from the entity was received.

ERROR_INFO {CID, CONN RAM, COPY0 ASYMAIS, COPY0 CID, COPY0 FPE, COPY0 PBIT, COPY0 STM1 LOF, COPY0 STM1 LOSSYNC, COPY0 STM1 RAIL, COPY0 WPE, COPY1 ASYMAIS, COPY1 CID, COPY1 FPE, COPY1 PBIT, COPY1 STM1 LOF, COPY1 STM1 LOSSYNC, COPY1 STM1 RAIL, COPY1 WPE, OC3 AIS, OC3 LOA, OC3 LOF, OC3 LOS, OC12 AIS, OC12 LOA, OC12 LOF, OC12 LOS, PATH NOT SELECTED, STM1 LOF, STM1 LOSSYNC, STM1 OF, STM1 RAIL, STM1 SPILL, STM1 UF, STM4 B1, STM4 CABLE DELAY, STM4 DXCLK, STM4 DXSPILL, STM4 LOF, STM4 LOS, STM4 MXCLK, STM4 MXSPILL, STS3C LOA, STS3C LOF, STS3C LOS, STS3C RCLK, STS3C/STS1 AIS, STS3C/STS1 LOP, XMIT LASER OFF}

Equipment Error Information, indicates additional error information detected by the system pertaining to the equipment AID identified in the output line above this line and the specified path through the system. Multiple lines of <ERROR_INFO> may be displayed, with multiple values of <ERROR_INFO>, separated by a comma, per line.

CID	Connect IDentification error detected.
CONN RAM	Connection RAM error detected.
COPY0 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 0 signal and not on Copy1
COPY0 CID	Connect IDentification error detected on Copy 0 signal.
COPY0 FPE	Frame Parity Error detected on Copy 0 signal.
COPY0 PBIT	Parity Bit Error detected on Copy 0 signal.
COPY0 STM1 LOF	Loss of Frame detected on STM1 Copy 0 signal.
COPY0 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 0 signal.
COPY0 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 0 signal.
COPY0 WPE	Word Parity Error detected on Copy 0 signal.
COPY1 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 1 signal and not on Copy1
COPY1 CID	Connect IDentification error detected on Copy 1 signal.
COPY1 FPE	Frame Parity Error detected on Copy 1 signal.
COPY1 PBIT	Parity Bit Error detected on Copy 1 signal.
COPY1 STM1 LOF	Loss of Frame detected on STM1 Copy 1 signal.
COPY1 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 1 signal.
COPY1 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 1 signal.
COPY1 WPE	Word Parity Error detected on Copy 1 signal.
OC3 AIS	AIS signal detected on OC-3 signal.
OC3 LOA	Loss of Activity detected on OC-3.
OC3 LOF	Loss of Frame detected on OC-3.
OC3 LOS	Loss of Signal detected on OC-3.
OC12 AIS	AIS signal detected on OC-12 signal.
OC12 LOA	Loss of Activity detected on OC-12.
OC12 LOF	Loss of Frame detected on OC-12.
OC12 LOS	Loss of Signal detected on OC12.
PATH NOT SELECTED	Specified path is not selected.
STM1 LOF	Loss of Frame detected on STM1 signal.
STM1 LOSSYNC	Loss of Sync pulse detected on STM1 signal.
STM1 OF	Over-Flow buffer spill detected on STM1 signal.
STM1 RAIL	Lower or upper limit delay Rail detected on STM1.
STM1 SPILL	Buffer Spill detected on STM1 signal.
STM1 UF	Under-Flow buffer spill detected on STM1 signal.
STM4 B1	B1 error detected on STM4 signal.

STM4 CABLE DELAY	Cable Delay error detected on STM4 signal.
STM4 DXCLK	Demux Clock error detected on STM4 signal.
STM4 DXSPILL	Demux Clock Spill detected on STM4 signal.
STM4 LOF	Loss of Frame detected on STM4 signal.
STM4 LOS	Loss of Signal detected on STM4 signal.
STM4 MXCLK	Mux Clock error detected on STM4 signal.
STM4 MXSPILL	Mux Clock Spill detected on STM4 signal.
STS3C LOA	Loss of Activity detected on STS-3C.
STS3C LOF	Loss of Frame detected on STS-3C.
STS3C LOS	Loss of Signal detected on STS-3C.
STS3C RCLK	Loss of Recovered Clock detected on STS-3C.
STS3C/STS1 AIS	AIS signal detected on STS-3C/STS-1 signal.
STS3C/STS1 LOP	Loss of Pointer detected on STS-3C/STS-1 signal.
XMIT LASER OFF	EOB, IOB, or OXB Transmit Laser has been turned off.

TO STS3C_AID:
 {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#)
 {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#)
 STS3C AID, identifies the TO STS-3C port.

UNSUCCESSFUL RESPONSE FORMAT

```

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Both FROM and TO facility must be STS3C AID. */ /* Unable to retrieve PATH NUMBER parameter. */ /* Invalid PATH NUMBER <path number> specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid FROM AID entered. */ /* Invalid TO AID entered. */
SARB	Status, All Resources Busy /* Too many FLTLOC-PATH commands already in progress. */

SDBE Status, internal Data Base Error

```
/* Failed to get FROM TP DB record <TP record number> error <errnum>. */
/* Failed to get TO TP DB record <TP record number> error <errnum>. */
/* Unable to get connection pointer for TP type <TP type>, TP num <TP number>, error

```

EXAMPLES

In the following example, fault isolation information for the path between STS-3C port OC3STS3C-3 and STS-3C port OC3STS3C-15 is retrieved.

```
FLTLOC-PATH-STS3C: :OC3STS3C-3, OC3STS3C-15;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **FLTLOC-PATH-T1**
COMMAND NAME: **FAULT LOCATE PATH T1**

PURPOSE

The FLTLOC-PATH-T1 command collects, analyzes, and displays fault isolation data pertaining to the redundant internal paths through the system for the cross-connection or maintenance loopback (refer to OPR-ISGLP-T1 and OPR-ISGLP-T3) specified by the FROM and TO DS1 or VT1.5 AIDs.

The redundant internal paths through the system that are reported are the paths from the specified FROM AID to the specified TO AID. FLTLOC-PATH-T1 does not report on the paths through the system from the specified TO AID to the specified FROM AID for a two-way cross-connection.

To execute a FLTLOC-PATH-T1 command, the specified FROM and TO DS1 or VT1.5 ports must identify a DS1 or VT1.5 one-way or two-way cross-connection (a DS1 or VT1.5 SST of ACT or BUSY and cross-connected together) or a maintenance loopback connection (a DS1 or VT1.5 SST of UAS&MT&LPBK and the FROM and TO ports are identical).

The successful response to a FLTLOC-PATH-T1 command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 or copy 1 clock and data paths through the system, and any associated fault isolation data, pertaining to the indicated entity. In addition, zero, one, or more lines of error information may be included for each element of the clock and data paths, except for the FROM and TO DS1 or VT1.5 port lines. Refer to the Successful Response Format, below.

A FLTLOC-PATH-T1 command is denied if:

- The FROM and TO DS1 or VT1.5 AIDs do not identify either a one-way or two-way cross-connection (a DS1 or VT1.5 SST of ACT or BUSY and cross-connected together), or a maintenance loopback connection (a DS1 or VT1.5 SST of UAS&MT&LPBK and the FROM and TO ports are identical).
- Both FROM and TO AIDs specify a VT1.5.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

FLTLOC-PATH-T1 : [TID] : FROM, TO : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
FROM	DS1_AID:		
	{T1-{1-59392}}		(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}		(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}		(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}		(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}		(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}		(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}		(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	None	
	Description:	DS1 or VT1 AID, specifies the DS1 or VT1.5 port in a cross-connection or loopback that is the beginning of the internal system path to be analyzed.	
	Restrictions:	FLTLOC-PATH-T1 is denied if both the specified FROM and TO values are VT1.5 AIDs.	

TO	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	Default:	Entry Required
	Addressing:	None
	Description:	DS1 or VT1 AID, specifies the DS1 or VT1.5 port in a cross-connection or loopback that is the end of the internal system path to be analyzed.
	Restrictions:	FLTLOC-PATH-T1 is denied if both the specified TO and FROM values are VT1.5 AIDs.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

Equipment AID, identifies the I/O, matrix, clock and cable entities associated with the redundant internal system paths from the FROM port to the TO port.

DATA

{ALM, CLKSEL0, CLKSEL1, CLKSELOPP, CLKSELREC, CLKSELSAM, CULPRIT, DATASEL0, DATASEL1, DEO, DIO, DMX, DS, DUEO, DUIO, DUMX, FEO, FIO, FMX, FS, FUEO, FUIO, FUMX, HW, MT, OOS, TEO, TIO, TMX, TS, TUEO, TUIO, TUMX, fault data not received from <L2P EQPT AID>, not responding}

Fault Location Data, indicates pertinent fault location information concerning the identified equipment entity. If a fault condition exists, one or more of the following values, separated by a comma, are displayed:

ALM	Alarmed, the indicated equipment entity is alarmed.
CLKSEL0	Copy 0 Clock Selected, the indicated circuit pack is selecting the copy 0 clock.
CLKSEL1	Copy 1 Clock Selected, the indicated circuit pack is selecting the copy 1 clock.
CLKSELOPP	Opposite copy of Clock Selected, the indicated circuit pack is selecting the opposite copy of clock.
CLKSELREC	Recovered Clock Selected, the indicated circuit pack is selecting the recovered clock.
CLKSELSAM	Same copy of Clock Selected, the indicated circuit pack is selecting the same copy of clock.
CULPRIT	Culprit, the indicated equipment entity is the source of the fault.
DATASEL0	Copy 0 matrix Data Selected by the indicated TO port.
DATASEL1	Copy 1 matrix Data Selected by the indicated TO port.
DEO	Data Electrical/Optical, a data error at the electrical-to-optical side of the indicated equipment entity is detected.
DIO	Data Input/Output, a data error at the I/O side of the indicated equipment entity is detected.

DMX	Data Matrix, a data error at the matrix side of the indicated equipment entity is detected.
DS	Data Suspect, the indicated equipment entity may be the source of the data errors.
DUEO	Data Upstream Electrical/Optical, a data error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
DUIO	Data Upstream Input/Output, a data error upstream from the I/O side of the indicated equipment entity is detected.
DUMX	Data Upstream Matrix, a data error upstream from the matrix side of the indicated equipment entity is detected.
FEO	Facility Electrical/Optical, a facility failure at the electrical-to-optical side of the indicated equipment entity is detected.
FIO	Facility Input/Output, a facility failure at the I/O side of the indicated equipment entity is detected.
FMX	Facility Matrix, a facility failure at the matrix side of the indicated equipment entity is detected.
FS	Facility Suspect, the indicated equipment entity may be the source of the facility failures.
FUEO	Facility Upstream Electrical/Optical, a facility failure upstream from the electrical-to-optical side of the indicated equipment entity is detected.
FUIO	Facility Upstream Input/Output, a facility failure upstream from the I/O side of the indicated equipment entity is detected.
FUMX	Facility Upstream Matrix, a facility failure upstream from the matrix side of the indicated equipment entity is detected.
HW	Hardware, a hardware fault on the indicated equipment entity is detected.
MT	Maintenance, the indicated equipment entity has an SST of MT.
OOS	Out-of-Service, the indicated equipment entity is OOS.
TEO	Timing Electrical/Optical, a timing error at the electrical-to-optical side of the indicated equipment entity is detected.
TIO	Timing Input/Output, a timing error at the I/O side of the indicated equipment entity is detected.
TMX	Timing Matrix, a timing error at the matrix side of the indicated equipment entity is detected.
TS	Timing Suspect, the indicated equipment entity may be the source of the timing errors.
TUEO	Timing Upstream Electrical/Optical, a timing error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
TUIO	Timing Upstream Input/Output, a timing error upstream from the I/O side of the indicated equipment entity is detected.
TUMX	Timing Upstream Matrix, a timing error upstream from the matrix side of the indicated equipment entity is detected.
fault data not received from <L2P EQPT AID> not responding	The supporting Level 2 Processor did not respond. The indicated equipment entity is not OOS and no response from the entity was received.

ERROR_INFO {CID, CONN RAM, COPY0 ASYMAIS, COPY0 CID, COPY0 FPE, COPY0 PBIT, COPY0 STM1 LOF, COPY0 STM1 LOSSYNC, COPY0 STM1 RAIL, COPY0 WPE, COPY1 ASYMAIS, COPY1 CID, COPY1 FPE, COPY1 PBIT, COPY1 STM1 LOF, COPY1 STM1 LOSSYNC, COPY1 STM1 RAIL, COPY1 WPE, DS1 AIS, DS1 CLKLOS, DS1 INSPILL, DS1 LOF, DS1 LOS, DS1 OUTLOF, DS1 OUTSPILL, DS1 QRS, DS2 LOF, DS2 OUTSPILL, DS3 BLUE, DS3 DPE, DS3 DXCLK, DS3 IDLE, DS3 LOF, DS3 LOS, DS3 LOS44MRCLK, DS3 ONES, DS3/STS1 LOA, DS3/STS1 LOF, DS3/STS1 LOS, DS3/STS1 RCLK, OC3 AIS, OC3 LOA, OC3 LOF, OC3 LOS, OC12 AIS, OC12 LOA, OC12 LOF, OC12 LOS, PATH NOT SELECTED, SFF BITMATCH ERR, STM1 LOF, STM1 LOSSYNC, STM1 OF, STM1 RAIL, STM1 SPILL, STM1 UF, STM4 B1, STM4 CABLE DELAY, STM4 DXCLK, STM4 DXSPILL, STM4 LOF, STM4 LOS, STM4 MXCLK, STM4 MXSPILL, STS3C/STS1 AIS, STS3C/STS1 LOP, VT1 AIS, VT1 LOP, XMIT LASER OFF}

Equipment Error Information, indicates additional error information detected by the system pertaining to the equipment AID identified in the output line above this line and the specified path through the system. Multiple lines of <ERROR_INFO> may be displayed, with multiple values of <ERROR_INFO>, separated by a comma, per line.

CID	Connect IDentification error detected.
CONN RAM	Connection RAM error detected.
COPY0 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 0 signal and not on Copy1
COPY0 CID	Connect IDentification error detected on Copy 0 signal.
COPY0 FPE	Frame Parity Error detected on Copy 0 signal.
COPY0 PBIT	Parity Bit Error detected on Copy 0 signal.
COPY0 STM1 LOF	Loss of Frame detected on STM1 Copy 0 signal.
COPY0 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 0 signal.
COPY0 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 0 signal.
COPY0 WPE	Word Parity Error detected on Copy 0 signal.
COPY1 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 1 signal and not on Copy1
COPY1 CID	Connect IDentification error detected on Copy 1 signal.
COPY1 FPE	Frame Parity Error detected on Copy 1 signal.
COPY1 PBIT	Parity Bit Error detected on Copy 1 signal.
COPY1 STM1 LOF	Loss of Frame detected on STM1 Copy 1 signal.
COPY1 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 1 signal.
COPY1 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 1 signal.
COPY1 WPE	Word Parity Error detected on Copy 1 signal.
DS1 AIS	Alarm Indication Signal detected on DS1.
DS1 CLKLOS	Loss of Clock detected on DS1.
DS1 INSPILL	Spill of In-bound buffer detected on DS1.
DS1 LOF	Loss of Frame detected on DS1.
DS1 LOS	Loss of Signal detected on DS1.
DS1 OUTLOF	Outbound Loss Of Frame detected on DS1.
DS1 OUTSPILL	Spill of Out-bound buffer detected on DS1.
DS1 QRS	Quasi Random Signal detected on DS1.
DS2 LOF	Loss of Frame detected on DS2.
DS2 OUTSPILL	Spill of Out-bound buffer detected on DS2.
DS3 BLUE	Blue signal detected on DS3.
DS3 DPE	Data parity error detected on DS3
DS3 DXCLK	Demux Clock error detected on DS3.

DS3 IDLE	Idle signal detected on DS3
DS3 LOF	Loss of Frame detected on DS3.
DS3 LOS	Loss of Signal detected on DS3.
DS3 LOS44MRCLK	Loss of 44 MHz Recovered Clock detected on DS3.
DS3 ONES	All Ones signal detected on DS3.
DS3/STS1 LOA	Loss of Activity detected on DS3/STS-1.
DS3/STS1 LOF	Loss of Frame detected on DS3/STS-1.
DS3/STS1 LOS	Loss of Signal detected on DS3/STS-1.
DS3/STS1 RCLK	Loss of Recovered Clock detected on DS3/STS-1.
OC3 AIS	AIS signal detected on OC3 signal.
OC3 LOA	Loss of Activity detected on OC3.
OC3 LOF	Loss of Frame detected on OC3.
OC3 LOS	Loss of Signal detected on OC3.
OC12 AIS	AIS signal detected on OC-12 signal.
OC12 LOA	Loss of Activity detected on OC-12.
OC12 LOF	Loss of Frame detected on OC-12.
OC12 LOS	Loss of Signal detected on OC-12.
PATH NOT SELECTED	Specified path is not selected.
SFF BITMATCH ERR	Bit Match Error detected on (LMU to DSI) Switch Frame Format (SFF) signal.
STM1 LOF	Loss of Frame detected on STM1 signal.
STM1 LOSSYNC	Loss of Sync pulse detected on STM1 signal.
STM1 OF	Over-Flow buffer spill detected on STM1 signal.
STM1 RAIL	Lower or upper limit delay Rail detected on STM1 signal.
STM1 SPILL	Buffer Spill detected on STM1 signal.
STM1 UF	Under-Flow buffer spill detected on STM1 signal.
STM4 B1	B1 error detected on STM4 signal.
STM4 CABLE DELAY	Cable Delay error detected on STM4 signal.
STM4 DXCLK	Demux Clock error detected on STM4 signal.
STM4 DXSPILL	Demux Clock Spill detected on STM4 signal.
STM4 LOF	Loss of Frame detected on STM4 signal.
STM4 LOS	Loss of Signal detected on STM4 signal.
STM4 MXCLK	Mux Clock error detected on STM4 signal.
STM4 MXSPILL	Mux Clock Spill detected on STM4 signal.
STS3C/STS1 AIS	AIS signal detected on STS3C/STS1 signal.
STS3C/STS1 LOP	Loss of Pointer detected on STS3C/STS1 signal.
VT1 AIS	AIS signal detected on VT1.5 signal.
VT1 LOP	Loss of Pointer detected on VT1.5 signal.
XMIT LASER OFF	EOB, IOB, or OXB Transmit Laser has been turned off.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* FROM and/or TO facility must be T1 AID. */
IIAC	Input, Invalid ACcess identifier /* Invalid FROM AID entered. */ /* Invalid TO AID entered. */
SARB	Status, All Resources Busy /* Too many FLTLOC-PATH commands already in progress. */
SDBE	Status, internal Data Base Error /* Failed to get FROM TP DB record <TP record number> error <errnum>. */ /* Failed to get TO TP DB record <TP record number> error <errnum>. */ /* Unable to get connection pointer for TP type <TP type>, TP num <TP number>, error <errnum>. */ /* Unable to get QRS pointer for TP type <TP type>, TP num <TP number>, error <errnum>. */ /* Invalid from_cid <connect id num> in connection database for TP type <TP type>, TP num <TP number>. */ /* TPid to first stage Tmsl conversion error <error number>. */ /* TPid to third stage Tmsl conversion error <error number>. */ /* Tmsl Path Retrieve error <error number>. */ /* Path not found. */ /* Unable to retrieve <FROM AID> level 2 processor id. */ /* Unable to retrieve <TO AID> level 2 processor id. */ /* Unable to retrieve inbound EOB entry for EOC shelf copy <copy number>. */ /* Unable to retrieve shelf entry for first stage copy <copy number> <SPB AID>. */ /* Unable to retrieve shelf entry for center stage copy <copy number> <SPB AID>. */ /* Unable to retrieve shelf entry for third stage copy <copy number> <SPB AID>. */ /* Unable to retrieve outbound EOB entry for EOC shelf copy <copy number>. */ /* Unable to create FLTLOC-PATH report file. */ /* Unable to open FLTLOC-PATH report file. */ /* Error reading matrix cable input database for bay <bay number> shelf <shelf number>. */ /* Error reading eoc to es1 cable database for cable <cable number>. */ /* Error reading es1 to cs cable database for cable <cable number>. */ /* Error reading cs to es3 cable database for cable <cable number>. */ /* Error reading matrix cable output database for cable <cable number>. */ /* Error reading eoc to i/o cable database for cable <cable number>. */ /* Unable to print FLTLOC-PATH report file. */ /* Unable to convert card_type <card type number>, card_num <card number>, l2p_id <level two processor number> to AID */
SNVS	Status, Not in Valid State /* FROM AID not as provisioned. */ /* TO AID not as provisioned. */ /* FROM AID must be in a provisioned or maintenance state. */ /* TO AID must be in a provisioned or maintenance state. */ /* Cross connection does not exist between FROM and TO AIDs. */

SROF Status, Requested Operation Failed

/* Hardware provisioning in progress. Try again later. */
/* Unable to convert FROM AID to string, error <error number>. */
/* Unable to convert TO AID to string, error <error number>. */
/* Unable to access memory for FI auxiliary data. */
/* Unable to convert <FROM AID> to global TP id, error <error number>. */
/* Unable to convert <TO AID> to global TP id, error <error number>. */
/* Invalid level 2 processor type (<level two processor type number>) encountered for <FROM AID>. */
/* Invalid level 2 processor type (<level two processor type number>) encountered for <TO AID>. */
/* Unable to convert the FROM TP type (<TP type number>) to a string error <error number>. */
/* Unable to convert the TO TP type (<TP type number>) to a string error <error number>. */
/* Unable to compute matrix input cable number for <FROM AID>. */
/* Unable to compute matrix input cable number for <TO AID>. */
/* Unable to retrieve first stage copy <copy number> SPB id, error <error number>. */
/* Unable to retrieve first stage copy <copy number> shelf timeslot, error <error number>. */
/*Unable to determine first stage card type for bay <bay number> shelf <shelf number> slot <slot number>.*/
/* Unable to retrieve center stage copy <copy number> SPB id, error <error number>. */
/* Unable to retrieve center stage copy <copy number> shelf timeslot, error <error number>. */
/*Unable to determine center stage card type for bay <bay number> shelf <shelf number> slot <slot number>.*/
/* Unable to retrieve third stage copy <copy number> SPB id, error <error number>. */
/* Unable to retrieve third stage copy <copy number> shelf timeslot, error <error number>. */
/*Unable to determine third stage card type for bay <bay number> shelf <shelf number> slot <slot number>.*/
/* Unable to send fault locate path message to ACL for <SPB AID>. */
/* Unable to send fault locate path message to ACL for <IPU AID>. */
/* Unable to queue FI auxiliary buffer for fault locate path request. */
/* Invalid matrix copy (<copy number>) returned in response message from <SPB AID>. */
/* Unable to re-queue FI auxiliary buffer for fault locate path request. */
/* I/O IPU response not received for <FROM AID> from <IPU AID>. */
/* I/O IPU response not received for <TO AID> from <IPU AID>. */
/* The FLTLOC-PATH-T1 for <FROM AID>,<TO AID> was aborted. */
/* Did not receive a response for message sent to <SPB AID>. */
/* Did not receive a response for message sent to <IPU AID>. */
/* Cross connect path has been re-arranged during execution of this command. */
/* Invalid FROM subrack type (<subrack type number>) encountered. */
/* Invalid matrix interface (<matrix interface type number>) encountered for <FROM AID>. */
/* Invalid matrix interface (<matrix interface type number>) encountered for <TO AID>. */
/*Cross connect type has been changed during execution of this command.*/

EXAMPLES

In the following example, fault isolation information for the path between DS1 port T3T1-1156-2 and DS1 port T3T1-1178-6 is retrieved.

```
FLTLOC-PATH-T1::T3T1-1156-2,T3T1-1178-6;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **FLTLOC-PATH-T3**
COMMAND NAME: **FAULT LOCATE PATH T3**

PURPOSE

The FLTLOC-PATH-T3 command collects, analyzes, and displays fault isolation data pertaining to the redundant internal paths through the system for the cross-connection specified by the FROM and TO DS3 or STS-1 AIDs.

The redundant internal paths through the system that are reported are the paths from the specified FROM AID to the specified TO AID. FLTLOC-PATH-T3 does not report on the paths through the system from the specified TO AID to the specified FROM AID for a two-way cross-connection.

To execute a FLTLOC-PATH-T3 command, the specified FROM and TO DS3 or STS-1 ports must identify a DS3 or STS-1 one-way or two-way cross-connection (a DS3 or STS-1 SST of ACT or BUSY and cross-connected together).

The successful response to a FLTLOC-PATH-T3 command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 or copy 1 clock and data paths through the system, and any associated fault isolation data, pertaining to the indicated entity. In addition, zero, one, or more lines of error information may be included for each element of the clock and data paths, except for the FROM and TO DS3 or STS-1 port lines. Refer to the Successful Response Format, below.

A FLTLOC-PATH-T3 command is denied if:

- The FROM and TO DS3 or STS-1 AIDs do not identify either a one-way or two-way cross-connection (a DS3 or STS-1 SST of ACT or BUSY and cross-connected together).
- The FROM and TO DS3 AIDs identify a maintenance loopback connection (a DS3 SST of UAS&MT&LPBK).
- The specified STS1 is embedded within a protection OC-3.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

FLTLOC-PATH-T3 : [TID] : FROM, TO : [CTAG] : : [PATH] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

FROM	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	None
	Description:	DS3 or STS1 AID, specifies the DS3 or STS-1 port in a cross-connection or loopback that is the beginning of the internal system path to be analyzed. (Note that the STS1 AID is used to identify a T3 embedded in an STS-1.)
	Restrictions:	FLTLOC-PATH-T3 is denied if both the specified FROM and TO values are an STS-1 AID.
TO	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	None
	Description:	DS3 or STS1 AID, specifies the DS3 or STS-1 port in a cross-connection or loopback that is the end of the internal system path to be analyzed. (Note that the STS1 AID is used to identify a T3 embedded in an STS-1.)
	Restrictions:	FLTLOC-PATH-T3 is denied if both the specified TO and FROM values are a STS-1 AID.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
PATH	{0-28}	
	Default:	{ 0 }
	Addressing:	None
	Description:	Path, specifies which of the paths, that the intact T3 is divided into, is analyzed. Values are:
	0	The path over which the overhead is being transmitted is analyzed.
	1-28	The path over which the 1-28 T1 equivalent components are being transmitted is analyzed.

OUTPUT PARAMETERS

FROM	DS3_AID: {T3-{1-4800}} (T3-DS3#)
	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#)
	DS3 or STS1 AID, identifies the FROM port.
PATH=	{0-28} Path, identifies which of the paths, that the intact T3 is divided into, is being reported. Values are:
	0 The path over which the overhead is being transmitted is being reported.
	1-28 The path over which the 1-28 T1 equivalent components are being transmitted is being reported.

 Equipment AID, identifies the I/O, matrix, clock and cable entities associated with the redundant internal system paths from the FROM port to the TO port.

DATA	{ALM, CLKSEL0, CLKSEL1, CLKSELOPP, CLKSELREC, CLKSELSAM, CULPRIT, DATASEL0, DATASEL1, DEO, DIO, DMX, DS, DUEO, DUIO, DUMX, FEO, FIO, FMX, FS, FUEO, FUIO, FUMX, HW, MT, OOS, TEO, TIO, TMX, TS, TUEO, TUIO, TUMX, fault data not received from <L2P EQPT AID>, not responding}
	Fault Location Data, indicates pertinent fault location information concerning the identified equipment entity. If a fault condition exists, one or more of the following values, separated by a comma, are displayed:
ALM	Alarmed, the indicated equipment entity is alarmed.
CLKSEL0	Copy 0 Clock Selected, the indicated circuit pack is selecting the copy 0 clock.
CLKSEL1	Copy 1 Clock Selected, the indicated circuit pack is selecting the copy 1 clock.
CLKSELOPP	Opposite copy of Clock Selected, the indicated circuit pack is selecting the opposite copy of clock.
CLKSELREC	Recovered Clock Selected, the indicated circuit pack is selecting the recovered clock.
CLKSELSAM	Same copy of Clock Selected, the indicated circuit pack is selecting the same copy of clock.
CULPRIT	Culprit, the indicated equipment entity is the source of the fault.
DATASEL0	Copy 0 matrix Data Selected by the indicated TO port.
DATASEL1	Copy 1 matrix Data Selected by the indicated TO port.
DEO	Data Electrical/Optical, a data error at the electrical-to-optical side of the indicated equipment entity is detected.
DIO	Data Input/Output, a data error at the I/O side of the indicated equipment entity is detected.
DMX	Data Matrix, a data error at the matrix side of the indicated equipment entity is detected.
DS	Data Suspect, the indicated equipment entity may be the source of the data errors.
DUEO	Data Upstream Electrical/Optical, a data error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
DUIO	Data Upstream Input/Output, a data error upstream from the I/O side of the indicated equipment entity is detected.
DUMX	Data Upstream Matrix, a data error upstream from the matrix side of the indicated equipment entity is detected.
FEO	Facility Electrical/Optical, a facility failure at the electrical-to-optical side of the indicated equipment entity is detected.
FIO	Facility Input/Output, a facility failure at the I/O side of the indicated equipment entity is detected.

FMX	Facility Matrix, a facility failure at the matrix side of the indicated equipment entity is detected.
FS	Facility Suspect, the indicated equipment entity may be the source of the facility failures.
FUEO	Facility Upstream Electrical/Optical, a facility failure upstream from the electrical-to-optical side of the indicated equipment entity is detected.
FUIO	Facility Upstream Input/Output, a facility failure upstream from the I/O side of the indicated equipment entity is detected.
FUMX	Facility Upstream Matrix, a facility failure upstream from the matrix side of the indicated equipment entity is detected.
HW	Hardware, a hardware fault on the indicated equipment entity is detected.
MT	Maintenance, the indicated equipment entity has an SST of MT.
OOS	Out-of-Service, the indicated equipment entity is OOS.
TEO	Timing Electrical/Optical, a timing error at the electrical-to-optical side of the indicated equipment entity is detected.
TIO	Timing Input/Output, a timing error at the I/O side of the indicated equipment entity is detected.
TMX	Timing Matrix, a timing error at the matrix side of the indicated equipment entity is detected.
TS	Timing Suspect, the indicated equipment entity may be the source of the timing errors.
TUEO	Timing Upstream Electrical/Optical, a timing error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
TUIO	Timing Upstream Input/Output, a timing error upstream from the I/O side of the indicated equipment entity is detected.
TUMX	Timing Upstream Matrix, a timing error upstream from the matrix side of the indicated equipment entity is detected.
fault data not received from <L2P EQPT AID> not responding	The supporting Level 2 Processor did not respond. The indicated equipment entity is not OOS and no response from the entity was received.

ERROR_INFO {CID, CONN RAM, COPY0 ASYMAIS, COPY0 CID, COPY0 FPE, COPY0 PBIT, COPY0 STM1 LOF, COPY0 STM1 LOSSYNC, COPY0 STM1 RAIL, COPY0 WPE, COPY1 ASYMAIS, COPY1 CID, COPY1 FPE, COPY1 PBIT, COPY1 STM1 LOF, COPY1 STM1 LOSSYNC, COPY1 STM1 RAIL, COPY1 WPE, DS3 BLUE, DS3 DPE, DS3 DXCLK, DS3 IDLE, DS3 LOF, DS3 LOS, DS3 LOS44MRCLK, DS3 ONES, DS3/STS1 LOA, DS3/STS1 LOF, DS3/STS1 LOS, DS3/STS1 RCLK, OC3 AIS, OC3 LOA, OC3 LOF, OC3 LOS, OC12 AIS, OC12 LOA, OC12 LOF, OC12 LOS, PATH NOT SELECTED, STM1 LOF, STM1 LOSSYNC, STM1 OF, STM1 RAIL, STM1 SPILL, STM1 UF, STM4 B1, STM4 CABLE DELAY, STM4 DXCLK, STM4 DXSPILL, STM4 LOF, STM4 LOS, STM4 MXCLK, STM4 MXSPILL, STS3C/STS1 AIS, STS3C/STS1 LOP, XMIT LASER OFF}

Equipment Error Information, indicates additional error information detected by the system pertaining to the equipment AID identified in the output line above this line and the specified path through the system. Multiple lines of <ERROR_INFO> may be displayed, with multiple values of <ERROR_INFO>, separated by a comma, per line.

CID	Connect IDentification error detected.
CONN RAM	Connection RAM error detected.
COPY0 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 0 signal and not on Copy1
COPY0 CID	Connect IDentification error detected on Copy 0 signal.
COPY0 FPE	Frame Parity Error detected on Copy 0 signal.
COPY0 PBIT	Parity Bit Error detected on Copy 0 signal.
COPY0 STM1 LOF	Loss of Frame detected on STM1 Copy 0 signal.
COPY0 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 0 signal.
COPY0 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 0 signal.
COPY0 WPE	Word Parity Error detected on Copy 0 signal.
COPY1 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 1 signal and not on Copy1
COPY1 CID	Connect IDentification error detected on Copy 1 signal.
COPY1 FPE	Frame Parity Error detected on Copy 1 signal.
COPY1 PBIT	Parity Bit Error detected on Copy 1 signal.
COPY1 STM1 LOF	Loss of Frame detected on STM1 Copy 1 signal.
COPY1 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 1 signal.
COPY1 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 1 signal.
COPY1 WPE	Word Parity Error detected on Copy 1 signal.
DS3 BLUE	Blue signal detected on DS3.
DS3 DPE	Data parity error detected on DS3.
DS3 DXCLK	Demux Clock error detected on DS3.
DS3 IDLE	Idle signal detected on DS3
DS3 LOF	Loss of Frame detected on DS3.
DS3 LOS	Loss of Signal detected on DS3.
DS3 LOS44MRCLK	Loss of 44 MHz Recovered Clock detected on DS3.
DS3 ONES	All Ones signal detected on DS3.
DS3/STS1 LOA	Loss of Activity detected on DS3/STS-1.
DS3/STS1 LOF	Loss of Frame detected on DS3/STS-1.
DS3/STS1 LOS	Loss of Signal detected on DS3/STS-1.
DS3/STS1 RCLK	Loss of Recovered Clock detected on DS3/STS-1.
OC3 AIS	AIS signal detected on OC3 signal.
OC3 LOA	Loss of Activity detected on OC3.
OC3 LOF	Loss of Frame detected on OC3.

	OC3 LOS	Loss of Signal detected on OC3.
	OC12 AIS	AIS signal detected on OC-12 signal.
	OC12 LOA	Loss of Activity detected on OC-12.
	OC12 LOF	Loss of Frame detected on OC-12.
	OC12 LOS	Loss of Signal detected on OC-12.
	PATH NOT SELECTED	Specified path is not selected.
	STM1 LOF	Loss of Frame detected on STM1 signal.
	STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1.
	STM1 OF	Over-Flow buffer spill detected on STM1 signal.
	STM1 RAIL	Lower or upper limit delay Rail detected on STM1 signal.
	STM1 SPILL	Buffer Spill detected on STM1 signal.
	STM1 UF	Under-Flow buffer spill detected on STM1 signal.
	STM4 B1	B1 error detected on STM4 signal.
	STM4 CABLE DELAY	Cable Delay error detected on STM4 signal.
	STM4 DXCLK	Demux Clock error detected on STM4 signal.
	STM4 DXSPILL	Demux Clock Spill detected on STM4 signal.
	STM4 LOF	Loss of Frame detected on STM4 signal.
	STM4 LOS	Loss of Signal detected on STM4 signal.
	STM4 MXCLK	Mux Clock error detected on STM4 signal.
	STM4 MXSPILL	Mux Clock Spill detected on STM4 signal.
	STS3C/STS1 AIS	AIS signal detected on STS3C/STS1 signal.
	STS3C/STS1 LOP	Loss of Pointer detected on STS3C/STS1 signal.
	XMIT LASER OFF	EOB, IOB, or OXB Transmit Laser has been turned off.
TO	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	DS3 or STS1 AID, identifies the TO DS3 or STS-1 port.	

UNSUCCESSFUL RESPONSE FORMAT

```

;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/* FROM and/or TO facility must be T3 AID. */
	/* Unable to retrieve PATH NUMBER parameter. */
	/* Invalid PATH NUMBER <path number> specified. */
IIAC	Input, Invalid ACcess identifier
	/* Invalid FROM AID entered. */
	/* Invalid TO AID entered. */
SARB	Status, All Resources Busy
	/* Too many FLTLOC-PATH commands already in progress. */

SDBE Status, internal Data Base Error

```
/* Failed to get FROM TP DB record <TP record number> error <errnum>. */
/* Failed to get TO TP DB record <TP record number> error <errnum>. */
/* Unable to get connection pointer for TP type <TP type>, TP num <TP number>, error
   <errnum>. */
/* FROM TPid to supported TPid conversion error <errnum>. */
/* TO TPid to supported TPid conversion error <errnum>. */
/* TPid to first stage Tmsl conversion error <error number>. */
/* TPid to third stage Tmsl conversion error <error number>. */
/* Tmsl Path Retrieve error <error number>. */
/* Path not found. */
/* Unable to retrieve <FROM AID> level 2 processor id. */
/* Unable to retrieve <TO AID> level 2 processor id. */
/* Unable to retrieve inbound EOB entry for EOC shelf copy <copy number>. */
/* Unable to retrieve shelf entry for first stage copy <copy number> <SPB AID>. */
/* Unable to retrieve shelf entry for center stage copy <copy number> <SPB AID>. */
/* Unable to retrieve shelf entry for third stage copy <copy number> <SPB AID>. */
/* Unable to retrieve outbound EOB entry for EOC shelf copy <copy number>. */
/* Unable to create FLTLOC-PATH report file. */
/* Unable to open FLTLOC-PATH report file. */
/* Error reading matrix cable input database for bay <bay number> shelf <shelf number>.
   */
/* Error reading eoc to es1 cable database for cable <cable number>. */
/* Error reading es1 to cs cable database for cable <cable number>. */
/* Error reading cs to es3 cable database for cable <cable number>. */
/* Error reading matrix cable output database for cable <cable number>. */
/* Error reading eoc to i/o cable database for cable <cable number>. */
/* Unable to print FLTLOC-PATH report file. */
/* Unable to convert card_type <card type number>, card_num <card number>, l2p_id
   <level two processor number> to AID*/
```

SNVS Status, Not in Valid State

```
/* FROM AID not as provisioned. */
/* TO AID not as provisioned. */
/* FROM AID must be in a provisioned or maintenance state. */
/* TO AID must be in a provisioned or maintenance state. */
/* Cross connection does not exist between FROM and TO AIDs. */
```

SROF Status, Requested Operation Failed

```
/* Hardware provisioning in progress. Try again later. */
/* Unable to convert FROM AID to string, error <error number>. */
/* Unable to convert TO AID to string, error <error number>. */
/* Unable to access memory for FI auxiliary data. */
/* Unable to convert <FROM AID> to global TP id, error <error number>. */
/* Unable to convert <TO AID> to global TP id, error <error number>. */
/* Invalid level 2 processor type (<level two processor type number>) encountered for
   <FROM AID>. */
/* Invalid level 2 processor type (<level two processor type number>) encountered for
   <TO AID>. */
/* Unable to convert the FROM TP type (<TP type number>) to a string error <error num-
   ber>. */
/* Unable to convert the TO TP type (<TP type number>) to a string error <error number>.
   */
/* Unable to compute matrix input cable number for <FROM AID>. */
/* Unable to compute matrix input cable number for <TO AID>. */
/* Unable to retrieve first stage copy <copy number> SPB id, error <error number>. */
/* Unable to retrieve first stage copy <copy number> shelf timeslot, error <error number>.
   */
/*Unable to determine first stage card type for bay <bay number> shelf <shelf number>
   slot <slot number>.*
/* Unable to retrieve center stage copy <copy number> SPB id, error <error
   number>. */
/* Unable to retrieve center stage copy <copy number> shelf timeslot, error <error num-
   ber>. */
/*Unable to determine center stage card type for bay <bay number> shelf <shelf number>
   slot <slot number>.*
/* Unable to retrieve third stage copy <copy number> SPB id, error <error number>. */
/* Unable to retrieve third stage copy <copy number> shelf timeslot, error <error number>.
   */
/*Unable to determine third stage card type for bay <bay number> shelf <shelf number>
   slot <slot number>.*
/* Unable to send fault locate path message to ACL for <SPB AID>. */
/* Unable to send fault locate path message to ACL for <IPU AID>. */
/* Unable to queue FI auxiliary buffer for fault locate path request. */
/* Invalid matrix copy (<copy number>) returned in response message from <SPB
   AID>. */
/* Unable to re-queue FI auxiliary buffer for fault locate path request. */
/* I/O IPU response not received for <FROM AID> from <IPU AID>. */
/* I/O IPU response not received for <TO AID> from <IPU AID>. */
/* The FLTLOC-PATH-T3 for <FROM AID>,<TO AID> was aborted. */
/* Did not receive a response for message sent to <SPB AID>. */
/* Did not receive a response for message sent to <IPU AID>. */
/* Cross connect path has been re-arranged during execution of this command. */
/* Invalid FROM subrack type (<subrack type number>) encountered. */
/* Invalid matrix interface (<matrix interface type number>) encountered for <FROM
   AID>. */
/* Invalid matrix interface (<matrix interface type number>) encountered for <TO
   AID>. */
/*Cross connect type has been changed during execution of this command.*
```

EXAMPLES

In the following example, fault isolation information for the path between DS3 port EC1STS1–195 and DS3 port T3–1167 is retrieved.

```
FLTLOC-PATH-T3: : EC1STS1-195, T3-1167;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **FLTLOC-PATH-VT1**
COMMAND NAME: **FAULT LOCATE PATH VT1**

PURPOSE

The FLTLOC-PATH-VT1 command collects, analyzes, and displays fault isolation data pertaining to the redundant internal paths through the system for the cross-connection or maintenance loopback (refer to OPR-ISGLP-VT1 and OPR-ISGLP-STs1) specified by the FROM and TO VT1.5 AIDs.

The redundant internal paths through the system that are reported are the paths from the specified FROM AID to the specified TO AID. FLTLOC-PATH-VT1 does not report on the paths through the system from the specified TO AID to the specified FROM AID for a two-way cross-connection.

To execute a FLTLOC-PATH-VT1 command, the specified FROM and TO VT1.5 ports must identify a VT1.5 one-way or two-way cross-connection (a VT1.5 SST of ACT or BUSY and cross-connected together) or a maintenance loopback connection (a VT1.5 SST of UAS&MT&LPBK and the FROM and TO ports are identical).

The successful response to a FLTLOC-PATH-VT1 command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 or copy 1 clock and data paths through the system, and any associated fault isolation data, pertaining to the indicated entity. In addition, zero, one, or more lines of error information may be included for each element of the clock and data paths, except for the FROM and TO VT1.5 port lines. Refer to the Successful Response Format, below.

A FLTLOC-PATH-VT1 command is denied if:

- The FROM and TO VT1.5 AIDs do not identify either a one-way or two-way cross-connection (a VT1.5 SST of ACT or BUSY and cross-connected together), or a maintenance loopback connection (a VT1.5 SST of UAS&MT&LPBK and the FROM and TO ports are identical).
- An invalid parameter value is entered.

INPUT FORMAT

FLTLOC-PATH-VT1 : [TID] : FROM, TO : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
FROM	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID, specifies the VT1.5 port in a cross-connection or loopback that is the beginning of the internal system path to be analyzed.
TO	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID, specifies the VT1.5 port in a cross-connection or loopback that is the end of the internal system path to be analyzed.

CTAG	< 1-6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

 Equipment AID, identifies the I/O, matrix, clock and cable entities associated with the redundant internal system paths from the FROM port to the TO port.

DATA

{ALM, CLKSEL0, CLKSEL1, CLKSELOPP, CLKSELREC, CLKSELSAM, CULPRIT, DATASEL0, DATASEL1, DEO, DIO, DMX, DS, DUEO, DUIO, DUMX, FEO, FIO, FMX, FS, FUEO, FUIO, FUMX, HW, MT, OOS, TEO, TIO, TMX, TS, TUEO, TUIO, TUMX, fault data not received from <L2P EQPT AID>, not responding}
 Fault Location Data, indicates pertinent fault location information concerning the identified equipment entity. If a fault condition exists, one or more of the following values, separated by a comma, are displayed:

ALM	Alarmed, the indicated equipment entity is alarmed.
CLKSEL0	Copy 0 Clock Selected, the indicated circuit pack is selecting the copy 0 clock.
CLKSEL1	Copy 1 Clock Selected, the indicated circuit pack is selecting the copy 1 clock.
CLKSELOPP	Opposite copy of Clock Selected, the indicated circuit pack is selecting the opposite copy of clock.
CLKSELREC	Recovered Clock Selected, the indicated circuit pack is selecting the recovered clock.
CLKSELSAM	Same copy of Clock Selected, the indicated circuit pack is selecting the same copy of clock.
CULPRIT	Culprit, the indicated equipment entity is the source of the fault.
DATASEL0	Copy 0 matrix Data Selected by the indicated TO port.
DATASEL1	Copy 1 matrix Data Selected by the indicated TO port.
DEO	Data Electrical/Optical, a data error at the electrical-to–

DIO	optical side of the indicated equipment entity is detected. Data Input/Output, a data error at the I/O side of the indicated equipment entity is detected.
DMX	Data Matrix, a data error at the matrix side of the indicated equipment entity is detected.
DS	Data Suspect, the indicated equipment entity may be the source of the data errors.
DUEO	Data Upstream Electrical/Optical, a data error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
DUIO	Data Upstream Input/Output, a data error upstream from the I/O side of the indicated equipment entity is detected.
DUMX	Data Upstream Matrix, a data error upstream from the matrix side of the indicated equipment entity is detected.
FEO	Facility Electrical/Optical, a facility failure at the electrical-to-optical side of the indicated equipment entity is detected.
FIO	Facility Input/Output, a facility failure at the I/O side of the indicated equipment entity is detected.
FMX	Facility Matrix, a facility failure at the matrix side of the indicated equipment entity is detected.
FS	Facility Suspect, the indicated equipment entity may be the source of the facility failures.
FUEO	Facility Upstream Electrical/Optical, a facility failure upstream from the electrical-to-optical side of the indicated equipment entity is detected.
FUIO	Facility Upstream Input/Output, a facility failure upstream from the I/O side of the indicated equipment entity is detected.
FUMX	Facility Upstream Matrix, a facility failure upstream from the matrix side of the indicated equipment entity is detected.
HW	Hardware, a hardware fault on the indicated equipment entity is detected.
MT	Maintenance, the indicated equipment entity has an SST of MT.
OOS	Out-of-Service, the indicated equipment entity is OOS.
TEO	Timing Electrical/Optical, a timing error at the electrical-to-optical side of the indicated equipment entity is detected.
TIO	Timing Input/Output, a timing error at the I/O side of the indicated equipment entity is detected.
TMX	Timing Matrix, a timing error at the matrix side of the indicated equipment entity is detected.
TS	Timing Suspect, the indicated equipment entity may be the source of the timing errors.
TUEO	Timing Upstream Electrical/Optical, a timing error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
TUIO	Timing Upstream Input/Output, a timing error upstream from the I/O side of the indicated equipment entity is detected.
TUMX	Timing Upstream Matrix, a timing error upstream from the matrix side of the indicated equipment entity is detected.

fault data not received
from <L2P EQPT AID> The supporting Level 2 Processor did not respond.
not responding The indicated equipment entity is not OOS and no response from the entity was received.

ERROR_INFO {CID, CONN RAM, COPY0 ASYMAIS, COPY0 CID, COPY0 FPE, COPY0 PBIT, COPY0 STM1 LOF, COPY0 STM1 LOSSYNC, COPY0 STM1 RAIL, COPY0 WPE, COPY1 ASYMAIS, COPY1 CID, COPY1 FPE, COPY1 PBIT, COPY1 STM1 LOF, COPY1 STM1 LOSSYNC, COPY1 STM1 RAIL, COPY1 WPE, DS3/STS1 LOA, DS3/STS1 LOF, DS3/STS1 LOS, DS3/STS1 RCLK, OC3 AIS, OC3 LOA, OC3 LOF, OC3 LOS, OC12 AIS, OC12 LOA, OC12 LOF, OC12 LOS, PATH NOT SELECTED, STM1 LOF, STM1 LOSSYNC, STM1 OF, STM1 RAIL, STM1 SPILL, STM1 UF, STM4 B1, STM4 CABLE DELAY, STM4 DXCLK, STM4 DXSPILL, STM4 LOF, STM4 LOS, STM4 MXCLK, STM4 MXSPILL, STS3C/STS1 AIS, STS3C/STS1 LOP, VT1 AIS, VT1 LOP, XMIT LASER OFF}

Equipment Error Information, indicates additional error information detected by the system pertaining to the equipment AID identified in the output line above this line and the specified path through the system. Multiple lines of <ERROR_INFO> may be displayed, with multiple values of <ERROR_INFO>, separated by a comma, per line.

CID	Connect IDentification error detected.
CONN RAM	Connection RAM error detected.
COPY0 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 0 signal and not on Copy1
COPY0 CID	Connect IDentification error detected on Copy 0 signal.
COPY0 FPE	Frame Parity Error detected on Copy 0 signal.

COPY0 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 0 signal.
COPY0 WPE	Word Parity Error detected on Copy 0 signal.
COPY1 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 1 signal and not on Copy1
COPY1 CID	Connect IDentification error detected on Copy 1 signal.
COPY1 FPE	Frame Parity Error detected on Copy 1 signal.
COPY1 PBIT	Parity Bit Error detected on Copy 1 signal.
COPY1 STM1 LOF	Loss of Frame detected on STM1 Copy 1 signal.
COPY1 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 1 signal.
COPY1 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 1 signal.
COPY1 WPE	Word Parity Error detected on Copy 1 signal.
DS3/STS1 LOA	Loss of Activity detected on DS3/STS-1.
DS3/STS1 LOF	Loss of Frame detected on DS3/STS-1.
DS3/STS1 LOS	Loss of Signal detected on DS3/STS-1.
DS3/STS1 RCLK	Loss of Recovered Clock detected on DS3/STS-1.
OC3 AIS	AIS signal detected on OC3 signal.
OC3 LOA	Loss of Activity detected on OC3.
OC3 LOF	Loss of Frame detected on OC3.
OC3 LOS	Loss of Signal detected on OC3.
OC12 AIS	AIS signal detected on OC-12 signal.
OC12 LOA	Loss of Activity detected on OC-12.
OC12 LOF	Loss of Frame detected on OC-12.

OC12 LOS	Loss of Signal detected on OC-12.
PATH NOT SELECTED	Specified path is not selected.
STM1 LOF	Loss of Frame detected on STM1 signal.
STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1.
STM1 OF	Over-Flow buffer spill detected on STM1 signal.
STM1 RAIL	Lower or upper limit delay Rail detected on STM1.
STM1 SPILL	Buffer Spill detected on STM1 signal.
STM1 UF	Under-Flow buffer spill detected on STM1 signal.
STM4 B1	B1 error detected on STM4 signal.
STM4 CABLE DELAY	Cable Delay error detected on STM4 signal.
STM4 DXCLK	Demux Clock error detected on STM4 signal.
STM4 DXSPILL	Demux Clock Spill detected on STM4 signal.
STM4 LOF	Loss of Frame detected on STM4 signal.
STM4 LOS	Loss of Signal detected on STM4 signal.
STM4 MXCLK	Mux Clock error detected on STM4 signal.
STM4 MXSPILL	Mux Clock Spill detected on STM4 signal.
STS3C/STS1 AIS	AIS signal detected on STS3C/STS1 signal.
STS3C/STS1 LOP	Loss of Pointer detected on STS3C/STS1 signal.
VT1 AIS	AIS signal detected on VT1.5 signal.
VT1 LOP	Loss of Pointer detected on VT1.5 signal.
XMIT LASER OFF	EOB, IOB, or OXB Transmit Laser has been turned off.

TO VT1_AID:
 {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
 {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)

/* Did not receive a response for message sent to <SPB AID>. */
/* Did not receive a response for message sent to <IPU AID>. */
/* Cross connect path has been re-arranged during execution of this command. */
/* Invalid FROM subrack type (<subrack type number>) encountered. */
/* Invalid matrix interface (<matrix interface type number>) encountered for <FROM
   AID>. */
/* Invalid matrix interface (<matrix interface type number>) encountered for <TO
   AID>. */
/*Cross connect type has been changed during execution of this command.*
```

EXAMPLES

In the following example, fault isolation information for the path between VT1.5 port EC1VT1-195-1-2 and VT1.5 port EC1VT1-217-2-2 is retrieved.

```
FLTLOC-PATH-VT1::EC1VT1-195-1-2,EC1VT1-217-2-2;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad569 COMPLD
/* FROM VT1: EC1VT1-195-1-2 */
/* EP3-8-1-2:HW,ALM,CLKSEL0 */
/* Copy 0: CDB-8-1-1:CLKSELSAM */
/* Copy 1: CDB-8-1-2:OOS */
/* Copy 0: IPB-8-1-1:CLKSEL0 */

COMMAND CODE: **INH-CBIT-T1**
COMMAND NAME: **INHIBIT CBIT T1**

PURPOSE

The INH-CBIT-T1 command disables a received C-bit loop back request in the supporting DS2 signal from causing a DS1 loop back of the specified embedded DS1.

Successful execution of an INH-CBIT-T1 command also releases any existing C-bit loopback caused by a received C-bit loop back request in the supporting DS2 signal.

Executing an INH-CBIT-T1 clears an ALWCBLPBK condition type, and any RCVCBLPBK condition type that may exist, for the specified DS1.

An INH-CBIT-T1 command is denied if:

- The specified DS1 port is not provisioned.
- C-bit loop back is not enabled for the specified DS1 port (ALWCBLPBK condition type is not set).
- The specified DS1 port is either embedded within VT1.5 or is an electrical (stand-alone) DS1.
- An invalid parameter value is entered.

INPUT FORMAT

INH-CBIT-T1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	DS1 AID, identifies the DS1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SAIN	Status, Already INhibited /* Cbit already inhibited */
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */
SNVS	Status, Not in Valid State /* Port is unprovisioned */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, INH-CBIT-T1 disables any automatic loop back on DS1 port T3T1-1009-5 that would occur if a C-bit loop back request is received in the supporting DS2 signal.

```
INH-CBIT-T1::T3T1-1009-5;
```

RELATED COMMANDS

```
ALW-CBIT-T1  
RTRV-COND-ALL  
RTRV-COND-T1
```

COMMAND CODE: **INH-FL-EQPT**
COMMAND NAME: **INHIBIT FAULT LOCATION EQUIPMENT**

PURPOSE

The INH-FL-EQPT command disables (inhibits) fault location (isolation) data collection and updating of the system's fault isolation database and disables the setting and clearing of equipment INTERR condition types. When INH-FL-EQPT is executed, the system's fault isolation database is no longer updated with any changes in equipment status that occurs until re-enabled (via the ALW-FL-EQPT command). As a result, INTERR condition types that subsequently occur are not set and INTERR condition types that no longer exist are not cleared. Executing an INH-FL-EQPT command also sets an INHFL condition type.

An INH-FL-EQPT command is denied if:

- Fault location data collection is already disabled/inhibited.
- An invalid parameter value is entered.

INPUT FORMAT

INH-FL-EQPT: [TID] : [AID] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID {ALL} Default: {ALL} Addressing: None Description: Equipment AID. ALL is the only entry accepted by the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* The INH-FL-EQPT completed. */]
  [/* Fault isolation inhibited. */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENRE	Equipage, Not Recognized Equipage /*The command was rejected. */ /* Invalid or unassigned equipment identifier specified. */
ICNV	Input, Command Not Valid /* Invalid command requested on equipment. */
IPNV	Input, Parameter Not Valid /* The INH-FL-EQPT was rejected. */ /* Invalid or unassigned equipment identifier specified. */
SAIN	Status, Already INhibited /* The INH-FL-EQPT was rejected. */ /* Fault isolation already inhibited. */
SDBE	Status, internal Data Base Error /* The INH-FL-EQPT aborted due to system error. */ /* Error reading system configuration data base. */ /* Error updating system configuration data base. */

EXAMPLES

In the following example, updating of the system's fault isolation data base and the setting and clearing of equipment INTERR condition types is disabled.

```
INH-FL-EQPT;
```

COMMAND CODE: **INH-PMREPT-EC1**
COMMAND NAME: **INHIBIT PERFORMANCE MONITORING
REPORT EC1**

PURPOSE

The INH-PMREPT-EC1 command inhibits scheduled PM reporting (using the scheduled REPT^PM^EC1 message and binary PM report through RS-232) for the specified EC1 port.

Execution of an INH-PMREPT-EC1 command does not discontinue the collection of PM data for the specified EC1 port and the collected PM data can be retrieved with a RTRV-PM-EC1 command.

If NUMREPT (using SET-DFLTPMREPT-EC1) is any value other than {0} or {NULL}, it will still be decremented even while scheduled PM reporting is inhibited.

Executing an INH-PMREPT-EC1 causes an INHPMREPT condition type to be set for the specified EC1.

An INH-PMREPT-EC1 command is denied if:

- The specified EC1 port is not provisioned (using ENT-EC1).
- PM reporting is already inhibited (a EC1 condition type of INHPMREPT is set) for the specified EC1.
- An invalid parameter value is entered.

INPUT FORMAT

INH-PMREPT-EC1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

COMMAND CODE: **INH-PMREPT-F3**
COMMAND NAME: **INHIBIT PERFORMANCE MONITORING
REPORT F3**

PURPOSE

The INH-PMREPT-F3 command inhibits scheduled PM reporting (using the scheduled REPT^PM^F3 message and binary PM report through RS-232) for the specified F3 port.

Execution of an INH-PMREPT-F3 command does not discontinue the collection of PM data for the specified F3 port and the collected PM data can be retrieved with a RTRV-PM-F3 command.

If NUMREPT (using SET-DFLTPMREPT-F3) is any value other than {0} or {NULL}, it will still be decremented even while scheduled PM reporting is inhibited.

Executing an INH-PMREPT-F3 causes an INHPMREPT condition type to be set for the specified F3.

An INH-PMREPT-F3 command is denied if:

- The specified F3 port is not provisioned (using ENT-F3).
- PM reporting is already inhibited (an F3 condition type of INHPMREPT is set) for the specified F3.
- An invalid parameter value is entered.

INPUT FORMAT

INH-PMREPT-F3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the F3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

COMMAND CODE: **INH-PMREPT-OC12**
COMMAND NAME: **INHIBIT PERFORMANCE MONITORING
REPORT OC-12**

PURPOSE

The INH-PMREPT-OC12 command inhibits scheduled PM reporting (using the scheduled REPT^PM^OC12 message and binary PM report through RS-232) for the specified OC-12 port.

Execution of an INH-PMREPT-OC12 command does not discontinue the collection of PM data for the specified OC-12 port and the collected PM data can be retrieved using a RTRV-PM-OC12 command.

If NUMREPT (using SET-DFLT-PMREPT-OC12) is any value other than {0} or {NULL}, it will still be decremented even while scheduled PM reporting is inhibited.

Executing an INH-PMREPT-OC12 causes an INH-PMREPT condition type to be set for the specified OC-12.

An INH-PMREPT-OC12 command is denied if:

- The specified OC-12 port is not provisioned (using ENT-OC12).
- PM reporting is already inhibited (an OC-12 condition type of INH-PMREPT is set) for the specified OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

INH-PMREPT-OC12 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV	Input, Command Not Valid /* Invalid command requested. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
SAIN	Status, Already INhibited /* PM report already inhibited. */
SDBE	Status, internal Data Base Error /* Error reading pm report database. */ /* Error updating pm report database. */ /* Failed to set pointer to FM OC12 record. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type. */

EXAMPLES

In the following example, the PM reporting for OC-12 port OC12-118 is inhibited.

```

COMMAND CODE: **INH-PMREPT-OC3**
COMMAND NAME: **INHIBIT PERFORMANCE MONITORING
REPORT OC-3**

PURPOSE

The INH-PMREPT-OC3 command inhibits scheduled PM reporting (using the scheduled REPT^PM^OC3 message and binary PM report through RS-232) for the specified OC-3 port.

Execution of an INH-PMREPT-OC3 command does not discontinue the collection of PM data for the specified OC-3 port and the collected PM data can be retrieved using a RTRV-PM-OC3 command.

If NUMREPT (using SET-DFLTPMREPT-OC3) is any value other than {0} or {NULL}, it will still be decremented even while scheduled PM reporting is inhibited.

Executing an INH-PMREPT-OC3 causes an INHPMREPT condition type to be set for the specified OC-3.

An INH-PMREPT-OC3 command is denied if:

- The specified OC-3 port is not provisioned (using ENT-OC3).
- PM reporting is already inhibited (an OC-3 condition type of INHPMREPT is set) for the specified OC-3.
- An invalid parameter value is entered.

INPUT FORMAT

INH-PMREPT-OC3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

COMMAND CODE: **INH-PMREPT-STs1**
COMMAND NAME: **INHIBIT PERFORMANCE MONITORING
REPORT STS-1**

PURPOSE

The INH-PMREPT-STs1 command inhibits scheduled PM reporting (using the scheduled REPT^PM^STs1 message and binary PM report through RS-232) for the specified STS-1 port.

Execution of an INH-PMREPT-STs1 command does not discontinue the collection of PM data for the specified STS-1 port and the collected PM data can be retrieved using a RTRV-PM-STs1 command.

If NUMREPT (using SET-DFLTPMREPT-STs1) is any value other than {0} or {NULL}, it will still be decremented even while scheduled PM reporting is inhibited.

Executing an INH-PMREPT-STs1 causes an INHPMREPT condition type to be set for the specified STS-1.

An INH-PMREPT-STs1 command is denied if:

- The specified STS-1 port is not provisioned (using ENT-STs1).
- The specified STS-1 port is embedded within a protection OC-3/OC-12.
- PM reporting is already inhibited (an STS-1 condition type of INHPMREPT is set) for the specified STS-1.
- An invalid parameter value is entered.

INPUT FORMAT

INH-PMREPT-STs1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies the STS-1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

COMMAND CODE: **INH-PMREPT-STS3C**
COMMAND NAME: **INHIBIT PERFORMANCE MONITORING
REPORT STS-3C**

PURPOSE

The INH-PMREPT-STS3C command inhibits scheduled PM reporting (using the scheduled REPT^PM^STS3C message and binary PM report through RS-232) for the specified STS-3C port.

Execution of an INH-PMREPT-STS3C command does not discontinue the collection of PM data for the specified STS-3C port and the collected PM data can be retrieved with a RTRV-PM-STS3C command.

If NUMREPT (using SET-DFLTPMREPT-STS3C) is any value other than {0} or {NULL}, it will still be decremented even while scheduled PM reporting is inhibited.

Executing an INH-PMREPT-STS3C causes an INHPMREPT condition type to be set for the specified STS-3C.

An INH-PMREPT-STS3C command is denied if:

- The specified STS-3C port is not provisioned (using ENT-STS3C).
- PM reporting is already inhibited (an STS-3C condition type of INHPMREPT is set) for the specified STS-3C, unless a range of STS-3C ports is specified.
- An invalid parameter value is entered.

INPUT FORMAT

INH-PMREPT-STS3C: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID, identifies the STS-3C port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

COMMAND CODE: INH-PMREPT-T1
COMMAND NAME: INHIBIT PERFORMANCE MONITORING REPORT T1

PURPOSE

The INH-PMREPT-T1 command inhibits scheduled PM reporting (using the scheduled REPT^PM^T1 message and binary PM report through RS-232) for the specified DS1 port.

Execution of an INH-PMREPT-T1 command does not discontinue the collection of PM data for the specified DS1 port and the collected PM data can be retrieved using a RTRV-PM-T1 command.

If NUMREPT (using SET-DFLTPMREPT-T1) is any value other than {0} or {NULL}, it will still be decremented even while scheduled PM reporting is inhibited.

Executing an INH-PMREPT-T1 causes an INHPMREPT condition type to be set for the specified DS1.

An INH-PMREPT-T1 command is denied if:

- The specified DS1 port is not provisioned (using ENT-T1).
- The specified DS1 port is embedded within a protection OC-3/OC-12.
- PM reporting is already inhibited (a DS1 condition type of INHPMREPT is set) for the specified DS1.
- An invalid parameter value is entered.

INPUT FORMAT

COMMAND CODE: INH-PMREPT-VT1
COMMAND NAME: INHIBIT PERFORMANCE MONITORING REPORT VT1

PURPOSE

The INH-PMREPT-VT1 command inhibits scheduled PM reporting (using the scheduled REPT^PM^VT1 message and binary PM report through RS-232) for the specified VT1.5 port.

Execution of an INH-PMREPT-VT1 command does not discontinue the collection of PM data for the specified VT1.5 port and the collected PM data can be retrieved with a RTRV-PM-VT1 command.

If NUMREPT (using SET-DFLTPMREPT-VT1) is any value other than {0} or {NULL}, it will still be decremented even while scheduled PM reporting is inhibited.

Executing an INH-PMREPT-VT1 causes an INHPMREPT condition type to be set for the specified VT1.5.

An INH-PMREPT-VT1 command is denied if:

- The specified VT1.5 port is not provisioned (using ENT-VT1).
- The specified VT1.5 port is embedded within a protection OC-3/OC-12.
- PM reporting is already inhibited (a VT1.5 condition type of INHPMREPT is set) for the specified VT1.5.
- An invalid parameter value is entered.

INPUT FORMAT

COMMAND CODE: **INH-SW-EQPT**
COMMAND NAME: **INHIBIT SWITCH EQUIPMENT**

PURPOSE

The INH-SW-EQPT command disables (inhibits) automatic, but not manual, copy switching for the specified one-for-one redundant (duplex) CPU, IPU, or SPB equipment. Either copy of equipment can be specified; the command disables automatic copy switching for both copies of equipment.

Executing an INH-SW-EQPT command sets a SST of ASI for the specified equipment entity and the corresponding opposite copy equipment entity.

Executing an INH-SW-EQPT command sets an INHSWDX condition type for the specified equipment entity and the corresponding opposite copy equipment entity.

An INH-SW-EQPT command is denied if:

- Both copies of the specified equipment entity have not previously been provisioned with the ENT-EQPT command.
- Copy switching for the specified equipment is already disabled/inhibited (a SST of ASI and a condition type of INHSWDX).
- An invalid parameter value is entered.

Although an INH-SW-EQPT command is not inherently service affecting, execution of the command disables automatic copy switching for the specified equipment. Any hardware fault that occurs on the active copy of equipment after the execution of the command could be service affecting.

INPUT FORMAT

INH-SW-EQPT: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {CPU-1-2-{1-2}} {IPU-{44-63}-{1-4}-{1-8}} {SPB-{2-43, 102-111 , 112-135, 136-141 }-{1, 3}-{1-2}} {SPB-{5}-{1, 3}-{1, 2}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment object entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
[/* The INH-SW-EQPT for <AID> was completed. */]
[/* Automatic switching inhibited for <AID>. */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID EQUIPMENT_AID:
 {CPU-1-2-{1-2}}
 {IPU-{44-63}-{1-4}-{1-8}}
 {SPB-{2-43, **102-111**, 112-135, **136-141**}-{1, 3}-{1-2}}
 {SPB-{5}-{1, 3}-{1, 2}}
Equipment AID, identifies the equipment entity.

COMMAND CODE: **INH-SWTOPROTN-EQPT**
COMMAND NAME: **INHIBIT SWITCH TO PROTECTION
EQUIPMENT**

PURPOSE

The INH-SWTOPROTN-EQPT command disables (inhibits) both automatic and manual I/O protection switching of a main (working) I/O circuit pack to a protection I/O circuit pack for the specified equipment entity. If an AID for a protection circuit pack is entered, automatic and manual I/O protection switching is inhibited for all I/O circuit packs in the protection group associated with the specified I/O protection circuit pack.

Executing an INH-SWTOPROTN-EQPT command sets a SST of PSI for the specified equipment entity.

Executing an INH-SWTOPROTN-EQPT command sets an INHSWPR condition type for the specified equipment entity.

An INH-SWTOPROTN-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned with the ENT-EQPT command.
- Protection switching for the specified equipment is already inhibited (a SST of PSI and a condition type of INHSWPR).
- An invalid parameter value is entered.

Although an INH-SWTOPROTN-EQPT command is not inherently service affecting, execution of the command disables automatic and manual I/O protection switching for the specified I/O circuit pack. Any hardware fault that occurs on the I/O circuit pack after the execution of the command could be service affecting.

INPUT FORMAT

INH-SWTOPROTN-EQPT: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSI-{44-63}-{1-4}-{1-32}} {SI48: EP3-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110, 136-141 }-{1, 3}-{1-18}, EP3-{9, 21, 35, 43, 107 }-3-{1-18}, EP3-{15, 27, 31, 39, 111 }-1-{1-18}} {SI36: EP3-{6-8, 12-14}-{1, 3}-{1-14}, EP3-9-3-{1-14}, EP3-15-1-{1-14}} {SI48: ES1-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106,108-110,136-141 }-{1, 3}-{1-18}, ES1-{9, 21, 35, 43, 107 }-3-{1-18}, ES1-{15, 27, 31, 39, 111 }-1-{1-18}} {SI36: ES1-{6-8, 12-14}-{1, 3}-{1-14}, ES1-9-3-{1-14}, ES1-15-1-{1-14}} {HMU-{44-53}-{1-4}-{1-8}} {LMU-{44-53}-{1-4}-{1-32}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment object entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.

CTAG < 1–6 VALID CTAG CHARACTERS >
Default: < System assigned CTAG value >
Addressing: None
Description: Correlation Tag, associates input command with its output responses.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC Input, Data Not Consistent
 /* Unable to read aux buffer for <AID>. */

IIAC Input, Invalid ACcess identifier
 /* The command was rejected. */
 /* Invalid command for a TGR card. */
 /* Invalid AID for the given slot. */
 /* Invalid or unassigned equipment identifier specified. */
 /* The INH-SWTOPROTN-EQPT for <AID> was rejected. */

SAIN Status, Already INhibited
 /* Switching to protection already inhibited. */
 /* The INH-SWTOPROTN-EQPT for <AID> was rejected. */

SARB Status, All Resources Busy
 /* The command was rejected. */
 /* Command already in progress on equipment. */
 /* Automatic system configuration active on equipment. */
 /* INIT-SYS command still active on shelf that equipment is on. */
 /* Automatic configuration of parent processor in progress */
 /* Level 2 processor software download in progress. Try again later. */

SDBE Status, internal Data Base Error
 /* Data base access failure. */
 /* The command was rejected. */
 /* HMU data base access failure. */
 /* LMU/DSI data base access failure. */
 /* The INH-SWTOPROTN-EQPT for <AID> was aborted. */

SNVS Status, Not in Valid State
 /* The INH-SWTOPROTN-EQPT for <AID> was rejected. */

SSRE Status, System Resources Exceeded
 /* The command was rejected. */
 /* Unable to allocate USI response buffer. */

EXAMPLES

In the following example, automatic and manual I/O protection switching is inhibited for EP3-8-1-4.

```
INH-SWTOPROTN-EQPT::EP3-8-1-4;  
  
  <SID> <YY-MM-DD> <HH:MM:SS>  
M  P70002 COMPLD  
  /* The INH-SWTOPROTN-EQPT for EP3-8-1-4 was completed. */  
  /* Switching to protection inhibited. */  
  /* INH-SWTOPROTN-EQPT::EP3-8-1-4: [P70002] (1) */
```

In the following example, automatic and manual I/O protection switching is inhibited for the EP3 circuit packs (EP3-9-3-2 through EP3-9-3-9) in the protection group associated with the protection circuit pack EP3-9-1-1.

```
INH-SWTOPROTN-EQPT::EP3-9-3-1;  
  
  <SID> <YY-MM-DD> <HH:MM:SS>  
M  P70004 COMPLD  
  /* The INH-SWTOPROTN-EQPT for EP3-9-3-1 was completed. */  
  /* Switching to protection inhibited. */  
  /* INH-SWTOPROTN-EQPT::EP3-9-3-1 [P70004] (1) */
```

RELATED COMMANDS

ALW-SWTOPROTN-EQPT
ALW-SWTOWKG-EQPT
ENT-EQPT
INH-SWTOWKG-EQPT
RTRV-EQPT
RTRV-STATE-EQPT
SW-TOPROTN-EQPT
SW-TOWKG-EQPT

COMMAND CODE: **INH-SWTOWKG-EQPT**
COMMAND NAME: **INHIBIT SWITCH TO WORKING
EQUIPMENT**

PURPOSE

The INH-SWTOWKG-EQPT command disables (inhibits) both automatic and manual I/O protection switching from the protection I/O circuit pack to the main (working) I/O circuit pack for the specified equipment entity. If an AID for a protection circuit pack is entered, automatic and manual I/O protection switching from the protection circuit pack back to the main (working) circuit pack is inhibited for any I/O circuit pack that is switched to the specified I/O protection circuit pack.

Executing an INH-SWTOWKG-EQPT command sets a SST of PRI for the specified equipment entity.

Executing an INH-SWTOWKG-EQPT command sets an INHSWWKG condition type for the specified equipment entity.

An INH-SWTOWKG-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned with the ENT-EQPT command.
- Protection switching from the protection circuit pack to the main (working) circuit pack for the specified equipment is already inhibited (a SST of PRI and a condition type of INHSWWKG).
- An invalid parameter value is entered.

Although an INH-SWTOWKG-EQPT command is not inherently service affecting, execution of the command disables automatic and manual I/O switching from the I/O protection circuit pack to the specified I/O (working) circuit pack. Consequently, the I/O protection circuit pack would not be available to protect any hardware fault that occurs on a different I/O circuit pack within the protection group after the execution of the command, which could be service affecting.

INPUT FORMAT

INH-SWTOWKG-EQPT: [TID] :AID: [CTAG] ;

COMMAND CODE: **INIT-REG-EC1**
COMMAND NAME: **INITIALIZE PERFORMANCE
MONITORING REGISTER EC1**

PURPOSE

The INIT-REG-EC1 command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified EC1 port to the value specified by MONVAL.

An INIT-REG-EC1 command is denied if:

- The specified EC1 port is not provisioned (using ENT-EC1).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-REG-EC1: [TID] : AID: [CTAG] :: [MONTYPE] , [MONVAL] , [LOCN] ,
[DIRN] , [TMPER] [,] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE {ALL},
NEAR_END_PARAMETERS:{CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, LOSS, LOSS-S, SEFS, SEFS-S, SES-L, SESL, UAS-L, UASL},
FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, ES-L, ESL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default: {ALL}
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All, all monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register. (Far-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register. (Far-end only.)
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.

Restrictions: INIT-REG-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).

MONVAL {0-4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TMBER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15-Minute PM Register	1-Day PM Register
ALL	{0-150}	{0-14400}
CV-L	{0-4294967295}	{0-4294967295}
FC-L	{0-150}	{0-14400}
<All other MONTYPES>	{0-900}	{0-65535}

Restrictions: INIT-REG-EC1 is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN	{FEND, NEND}	
	Default:	< All applicable locations for the selected monitored parameters >
	Addressing:	None
	Description:	Location, specifies whether PM registers for near-end or far-end PM monitoring are to be initialized. Values are:
	FEND	Far-End
DIRN	NEND	Near-End
	Restrictions:	INIT-REG-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
TMPER	Addressing:	None
	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT-REG-EC1 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:
	15-MIN	15-Minute PM collection register.
	1-DAY	1-Day (24 hour) PM collection register.

COMMAND CODE: **INIT-REG-F3**
COMMAND NAME: **INITIALIZE PERFORMANCE
MONITORING REGISTER F3**

PURPOSE

The INIT-REG-F3 command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified Fractional-T3 to the value specified by MONVAL.

An INIT-REG-F3 command is denied if:

- The specified Fractional-T3 is not provisioned (using ENT-F3).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-REG-F3 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONVAL] , [LOCN] ,
[DIRN] , [TMPER] [,] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the Fractional-T3.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE {ALL, CV–N, CVN, ES–N, ESN, ESA–N, ESAN, ESB–N, ESBN, FC–N, FCN, SAS–N, SASN, SES–N, SESN, UAS–N, UASN}
Default: {ALL}
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (–). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL All, all monitored parameter PM registers.
CV–N, CVN Coding Violations – N, CV–N register contains a summary of CV–P counts for all DS1s assigned to the F3.
ES–N, ESN Errored Seconds – N, ES–N register contains a summary of ES–P counts for all DS1s assigned to the F3.
ESA–N, ESAN Errored Seconds type A – N, ESA–N register contains a summary of ESA–P counts for all DS1s assigned to the F3.
ESB–N, ESBN Errored Seconds type B – N, ESB–N register contains a summary of ESB–P counts for all DS1s assigned to the F3.
FC–N, FCN Failure Count – N, FC–N register contains a summary of FC–P counts for all DS1s assigned to the F3.
SAS–N, SASN Severe AIS Seconds – N, SAS–N register contains a summary of SAS–P counts for all DS1s assigned to the F3.
SES–N, SESN Severely Errored Seconds – N, SES–N register contains a summary of SES–P counts for all DS1s assigned to the F3.
UAS–N, UASN Unavailable Seconds – N, UAS–N register contains a summary of UAS–P counts for all DS1s assigned to the F3.

MONVAL {0–4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TPER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15–Minute PM Register	1–Day PM Register
ALL	{0–150}	{0–14400}
CV–N	{0–4294967295}	{0–4294967295}
FC–N	{0–150}	{0–14400}
<All other MONTYPES>	{0–900}	{0–65535}

Restrictions: INIT–REG–F3 is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN {NEND}
Default: <All applicable locations for the selected monitored parameters>
Addressing: None
Description: Location, specifies PM registers for near–end PM monitoring are to be retrieved. Value is:

NEND Near–End

DIRN	{NA, RCV, TRMT}
	Default: < All applicable directions >
	Addressing: None
	Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT-REG-F3 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, specifies whether the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:
	15-MIN 15-Minute PM collection register
	1-DAY 1-Day (24 hour) PM collection register

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV	Input, Command Not Valid /* Invalid command requested. */
IDNV	Input, Data Not Valid /* Invalid direction in request message. */ /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monitor value in request message. */ /* Invalid time period in request message. */ /* Monitor value for this montype must not be greater than <max_monval>. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM F3 record. */ /* Could not get controlling level 2 processor id. */

SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type. */ /* Number of montypes exceeds the maximum number of montypes allowed. */ /* Unable to allocate memory for user data. */ /* Unable to send message to the Level 2 Processor. */ /* Unable to determine supporting facility entity. */ /* Unable to process montype <NUM>. */

EXAMPLES

In the following example, both the 15-minute severely errored seconds (SES-N) PM collection register for Fractional-T3 T3F3-1495-3 is initialized to zero.

```
INIT-REG-F3::T3F3-1495-3::SESN,,,15-MIN;
```

In the following example, all daily (1-Day) PM collection registers for Fractional-T3 T3F3-1495-4 are initialized to zero.

```
INIT-REG-F3::T3F3-1495-4::ALL,,,1-DAY;

```

COMMAND CODE: **INIT-REG-OC12**
COMMAND NAME: **INITIALIZE PERFORMANCE
MONITORING REGISTER OC-12**

PURPOSE

The INIT-REG-OC12 command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified OC-12 port to the value specified by MONVAL.

An INIT-REG-OC12 command is denied if:

- The specified OC-12 port is not provisioned (using ENT-OC12).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-REG-OC12 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONVAL] , [LOCN] ,
[DIRN] , [TMPER] [,] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All, all monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-S, ESS	Errored Seconds – Section, ES-S register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register.
ESA-S, ESAS	Errored Seconds type A – Section, ESA-S register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register.
ESB-S, ESBS	Errored Seconds type B – Section, ESB-S register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register.
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
PSC, PSC-L, PSCL	Protection Switch Counts – Line, PSC-L register. (Near-end only.)
PSD, PSD-L, PSDL	Protection Switch Duration – Line, PSD-L register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	INIT-REG-OC12 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

MONVAL {0-4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TMPER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15-Minute PM Register	1-Day PM Register
ALL	{0-150}	{0-14400}
CV-L, CV-S	{0-4294967295}	{0-4294967295}
FC-L	{0-150}	{0-14400}
<All other MONTYPES>	{0-900}	{0-65535}

Restrictions: INIT-REG-OC12 is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether PM registers for near-end or far-end PM monitoring are to be initialized. Values are:
 FEND Far-End
 NEND Near-End
Restrictions: INIT-REG-OC12 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT-REG-OC12 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15-MIN, 1-DAY}
Default: {15-MIN}
Addressing: None
Description: Time Period, specifies whether the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:
 15-MIN 15-Minute PM collection register.
 1-DAY 1-Day (24 hour) PM collection register.

COMMAND CODE: **INIT-REG-OC3**
COMMAND NAME: **INITIALIZE PERFORMANCE
MONITORING REGISTER OC-3**

PURPOSE

The INIT-REG-OC3 command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified OC-3 port to the value specified by MONVAL.

An INIT-REG-OC3 command is denied if:

- The specified OC-3 port is not provisioned (using ENT-OC3).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-REG-OC3 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONVAL] , [LOCN] ,
[DIRN] , [TMPER] [,] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All, all monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-S, ESS	Errored Seconds – Section, ES-S register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register.
ESA-S, ESAS	Errored Seconds type A – Section, ESA-S register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register.
ESB-S, ESBS	Errored Seconds type B – Section, ESB-S register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register.
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
PSC, PSC-L, PSCL	Protection Switch Counts – Line, PSC-L register. (Near-end only.)
PSD, PSD-L, PSDL	Protection Switch Duration – Line, PSD-L register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	INIT-REG-OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

MONVAL {0–4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TMPER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15–Minute PM Register	1–Day PM Register
ALL	{0–150}	{0–14400}
CV–L, CV–S	{0–4294967295}	{0–4294967295}
FC–L	{0–150}	{0–14400}
<All other MONTYPES>	{0–900}	{0–65535}

Restrictions: INIT–REG–OC3 is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether PM registers for near–end or far–end PM monitoring are to be initialized. Values are:
 FEND Far–End
 NEND Near–End
Restrictions: INIT–REG–OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV–S and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT–REG–OC3 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether the 15–minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:
 15–MIN 15–Minute PM collection register.
 1–DAY 1–Day (24 hour) PM collection register.

COMMAND CODE: INIT-REG-STS1
COMMAND NAME: INITIALIZE PERFORMANCE
MONITORING REGISTER STS-1

PURPOSE

The INIT-REG-STS1 command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified STS-1 port to the value specified by MONVAL.

An INIT-REG-STS1 command is denied if:

- The specified STS-1 port is not provisioned (using ENT-STS1).
- The specified STS-1 port is embedded within a protection OC-3/OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-REG-STS1: [TID] :AID: [CTAG] : : [MONTYPE] , [MONVAL] , [LOCN] ,
[DIRN] , [TMPER] [,] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS1 AID, identifies the STS-1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE {ALL},
NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP,
ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP},
FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP,
ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}
Default: {ALL}
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All, all monitored parameter PM registers.
ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.
CV-P, CVP	Coding Violations – Path, CV-P register.
ES-P, ESP	Errored Seconds – Path, ES-P register.
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.
FC-P, FCP	Failure Counts – Path, FC-P register.
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.

MONVAL {0-4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TMPER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15-Minute PM Register	1-Day PM Register
ALL	{0-150}	{0-14400}
CV-P	{0-4294967295}	{0-4294967295}
FC-P	{0-150}	{0-14400}
<All other MONTYPES>	{0-900}	{0-65535}

Restrictions: INIT-REG-STs1 is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether PM registers for near-end or far-end PM monitoring are to be initialized. Values are:

FEND	Far-End
NEND	Near-End

DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT-REG-STS1 command.
	NA	Not Applicable
TMPER	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:
	15-MIN	15-Minute PM collection register.
	1-DAY	1-Day (24 hour) PM collection register.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV	Input, Command Not Valid
	/* Invalid command requested. */
IDNV	Input, Data Not Valid
	/* Invalid direction in request message. */
	/* Invalid location in request message. */
	/* Invalid montype in request message. */
	/* Invalid monitor value in request message. */
	/* Invalid time period in request message. */
	/* Monitor value for this montype must not be greater than <max_monval>. */
IIAC	Input, Invalid ACcess identifier
	/* Invalid AID entered. */
	/* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping
	/* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error
	/* Failed to set pointer to FM STS1 record. */
	/* Could not get controlling level 2 processor id. */

SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type. */ /* Number of montypes exceeds the maximum number of montypes allowed. */ /* Unable to allocate memory for user data. */ /* Unable to send message to the Level 2 Processor. */ /* Unable to determine supporting facility entity. */ /* Unable to process montype <NUM>. */

EXAMPLES

In the following example, the near-end and far-end 15-minute coding violations, path (CV-P) PM collection register for STS-1 port EC1STS1-632 is initialized to zero.

```
INIT-REG-STs1::EC1STS1-632::CVP,,,15-MIN;
```

In the following example, all near-end and far-end daily (1-Day) PM collection registers for STS-1 port EC1STS1-633 are initialized to zero.

```
INIT-REG-STs1::EC1STS1-633::ALL,,,1-DAY;

COMMAND CODE: INIT-REG-STS3C
COMMAND NAME: INITIALIZE PERFORMANCE
MONITORING REGISTER STS-3C

PURPOSE

The INIT-REG-STS3C command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified STS-3C port to the value specified by MONVAL.

An INIT-REG-STS3C command is denied if:

- The specified STS-3C port is not provisioned (using ENT-STS3C).
- The specified STS-3C port is embedded within a protection OC-3/OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-REG-STS3C: [TID] :AID: [CTAG] : : [MONTYPE] , [MONVAL] , [LOCN] ,
[DIRN] , [TMPER] [,] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.																		
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID, identifies the STS-3C port.																		
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.																		
MONTYPE	{ALL}, NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}, FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP} Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are: <table> <tr> <td>ALL</td><td>All, all monitored parameter PM registers.</td></tr> <tr> <td>ALS-P, ALSP</td><td>Alarm Indication Signal/Loss of Pointer - Path, ALS-P register.</td></tr> <tr> <td>CV-P, CVP</td><td>Coding Violations - Path, CV-P register.</td></tr> <tr> <td>ES-P, ESP</td><td>Errored Seconds - Path, ES-P register.</td></tr> <tr> <td>ESA-P, ESAP</td><td>Errored Seconds type A - Path, ESA-P register.</td></tr> <tr> <td>ESB-P, ESBP</td><td>Errored Seconds type B - Path, ESB-P register.</td></tr> <tr> <td>FC-P, FCP</td><td>Failure Counts - Path, FC-P register.</td></tr> <tr> <td>SES-P, SESP</td><td>Severely Errored Seconds - Path, SES-P register.</td></tr> <tr> <td>UAS-P, UASP</td><td>Unavailable Seconds - Path, UAS-P register.</td></tr> </table>	ALL	All, all monitored parameter PM registers.	ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer - Path, ALS-P register.	CV-P, CVP	Coding Violations - Path, CV-P register.	ES-P, ESP	Errored Seconds - Path, ES-P register.	ESA-P, ESAP	Errored Seconds type A - Path, ESA-P register.	ESB-P, ESBP	Errored Seconds type B - Path, ESB-P register.	FC-P, FCP	Failure Counts - Path, FC-P register.	SES-P, SESP	Severely Errored Seconds - Path, SES-P register.	UAS-P, UASP	Unavailable Seconds - Path, UAS-P register.
ALL	All, all monitored parameter PM registers.																		
ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer - Path, ALS-P register.																		
CV-P, CVP	Coding Violations - Path, CV-P register.																		
ES-P, ESP	Errored Seconds - Path, ES-P register.																		
ESA-P, ESAP	Errored Seconds type A - Path, ESA-P register.																		
ESB-P, ESBP	Errored Seconds type B - Path, ESB-P register.																		
FC-P, FCP	Failure Counts - Path, FC-P register.																		
SES-P, SESP	Severely Errored Seconds - Path, SES-P register.																		
UAS-P, UASP	Unavailable Seconds - Path, UAS-P register.																		

MONVAL {0–4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TMPER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15–Minute PM Register	1–Day PM Register
ALL	{0–150}	{0–14400}
CV–P	{0–4294967295}	{0–4294967295}
FC–P	{0–150}	{0–14400}
<All other MONTYPES>	{0–900}	{0–65535}

Restrictions: INIT–REG–STS3C is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether PM registers for near–end or far–end PM monitoring are to be initialized. Values are:

FEND	Far–End
NEND	Near–End

DIRN {NA, RCV, TRMT}
Default: {NA}
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT–REG–STS3C command.

NA	Not Applicable
RCV	Receive side
TRMT	Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether the 15–minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:

15–MIN	15–Minute PM collection register.
1–DAY	1–Day (24 hour) PM collection register.

COMMAND CODE: INIT-REG-T1
COMMAND NAME: INITIALIZE PERFORMANCE
MONITORING REGISTER T1

PURPOSE

The INIT-REG-T1 command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified DS1 port to the value specified by MONVAL.

An INIT-REG-T1 command is denied if:

- The specified DS1 port is not provisioned (using ENT-T1).
- The specified DS1 port is embedded within a protection OC-3/OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-REG-T1: [TID] :AID: [CTAG] :: [MONTYPE] , [MONVAL] , [LOCN] ,
[DIRN] , [TMPER] [,] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{EC1T1-{1-3840}-{1-7}-{1-4}}	(EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS1 AID, identifies the DS1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, ES-L, ESL, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, LOSS, LOSS-L, LOSSL, QRSSS, QRSSS-P, QRSSSP, SAS-P, SASP, SES-L, SESL, SES-P, SESP, UAS-P, UASP}, FAR_END_PARAMETERS:{CSS, CSS-P, CSSP, CV-P, CVP, ES-L, ESL, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SEFS, SEFS-P, SEFSP, SES-P, SESP, UAS-P, UASP}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All, all monitored parameter PM registers.
AISS, AISS-P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near-end only.)
CSS, CSS-P, CSSP	Controlled Slip Seconds – Path, CSS register. (Far-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end electrical T1 only.)
CV-P, CVP	Coding Violations – Path, CV-P register.
ES-L, ESL	Errored Seconds – Line, ES-L register. (Near-end electrical T1 or Far-end embedded T1.)
ES-P, ESP	Errored Seconds – Path, ES-P register.
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.
FC-P, FCP	Failure Count – Path, FC-P register.
LOSS, LOSS-L, LOSSL	Loss of Signal Seconds – Line, LOSS register. (Near-end electrical T1 only.)
QRSSS, QRSSS-P, QRSSSP	QRSS Seconds – Path, QRSSS-P register. (Near-end only.)
SAS-P, SASP	Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
SEFS, SEFS-P, SEFSP	Severely Errored Frame Seconds, SEFS register. (Far-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register. (Near-end electrical T1 only.)
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.
Restrictions:	INIT-REG-T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

MONVAL {0–4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TMPER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15–Minute PM Register	1–Day PM Register
ALL	{0–150}	{0–14400}
CV–L, CV–P	{0–4294967295}	{0–4294967295}
FC–P	{0–150}	{0–14400}
<All other MONTYPES>	{0–900}	{0–65535}

Restrictions: INIT–REG–T1 is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether PM registers for near–end or far–end PM monitoring are to be initialized. Values are:
 FEND Far–End
 NEND Near–End
Restrictions: INIT–REG–T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT–REG–T1 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15–MIN, 1–DAY}
Default: {15–MIN}
Addressing: None
Description: Time Period, specifies whether the 15–minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:
 15–MIN 15–Minute PM collection register
 1–DAY 1–Day (24 hour) PM collection register

COMMAND CODE: **INIT-REG-T3**
 COMMAND NAME: **INITIALIZE PERFORMANCE
 MONITORING REGISTER T3**

PURPOSE

The INIT-REG-T3 command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified DS3 port to the value specified by MONVAL.

An INIT-REG-T3 command is denied if:

- The specified DS3 port is not provisioned (using ENT-T3).
- The specified DS3 port is embedded within a protection OC-3/OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
INIT-REG-T3: [TID]:AID:[CTAG]:[MONTYPE], [MONVAL], [LOCN],
[DIRN], [TMPER] [, ] [, ];
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) {EC1T3-{1-3840}} (EC1T3-EC1/STS1/DS3#) {OC3T3-{1-2240}-{1-3}} (OC3T3-OC3#-STS1/DS3#) {OC12T3-{1-560}-{1-4}-{1-3}} (OC12T3-OC12#-STM1#-STS1/DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS3 AID, identifies the DS3 port.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, CVCP-P, CVCPP, ES-L, ESL, ES-P, ESP, ESA-L, ESAL, ESA-P, ESAP, ESACP-P, ESACPP, ESB-L, ESDL, ESB-P, ESBP, EBCP-P, EBCPP, ESCP-P, ESCPP, FC-P, FCP, LOSS, LOSS-L, LOSSL, SAS-P, SASP, SES-L, SESL, SES-P, SESP, SESCP-P, SESCPP, UAS-P, UASP, UASCP-P, UASCPP}, FAR_END_PARAMETERS:{CVCP-P, CVCPP, ESACP-P, ESACPP, EBCP-P, EBCPP, ESCP-P, ESCPP, FCCP-P, FCCPP, SASCP-P, SASCPP, SESC-P, SESCP, UASCP-P, UASCPP} Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without dashes.

without the dash (–). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All, all monitored parameter PM registers.
AISS, AISS–P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near–end only.)
CV–L, CVL	Coding Violations – Line, CV–L register. (Near–end electrical T3 only.)
CV–P, CVP	Coding Violations – Path, CV–P register. (Near–end only.)
CVCP–P, CVCPP	Code Violations, CP–bit parity – Path, CVCP–P register.
ES–L, ESL	Errored Seconds – Line, ES–L register. (Near–end electrical T3 only.)
ES–P, ESP	Errored Seconds – Path, ES–P register. (Near–end only.)
ESA–L, ESAL	Errored Seconds type A – Line, ESA–L register. (Near–end electrical T3 only.)
ESA–P, ESAP	Errored Seconds type A – Path, ESA–P register. (Near–end only.)
ESACP–P, ESACPP	Errored Seconds type A, CP–bit parity – Path, ESACP–P register.
ESB–L, ESBL	Errored Seconds type B – Line, ESB–L register. (Near–end electrical T3 only.)
ESB–P, ESBP	Errored Seconds type B – Path, ESB–P register. (Near–end only.)
ESBCP–P, ESBCPP	Errored Seconds type B, CP–bit parity – Path, ESBCP–P register.
ESCP–P, ESCPP	Errored Seconds, CP–bit parity – Path, ESCP–P register.
FC–P, FCP	Failure Counts – Path, FC–P register. (Near–end only.)
FCCP–P, FCCPP	Failure Counts, CP–bit parity – Path, FC–P register. (Far–end only.)
LOSS, LOSS–L, LOSSL	Loss Of Signal Seconds – Line, LOSS register. (Near–end electrical T3 only.)
SAS–P, SASP	Severe AIS Seconds – Path, SAS–P register. (Near–end only.)
SASCP–P, SASCPP	Severe AIS Seconds, CP–bit parity – Path, SASCP–P register. (Far–end only.)
SES–L, SESL	Severely Errored Seconds – Line, SES–L register. (Near–end electrical T3 only.)
SES–P, SESP	Severely Errored Seconds – Path, SES–P register. (Near–end only.)
SESCP–P, SES CPP	Severely Errored Seconds, CP–bit parity – Path, SESCP–P register.

UAS-P, UASP Unavailable Seconds – Path, UAS-P register. (Near-end only.)
UASCP-P, UASCPP Unavailable Seconds, CP-bit parity – Path, UASCP-P register.

Restrictions: INIT-REG-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

MONVAL {0-4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TMPER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15-Minute PM Register	1-Day PM Register
ALL	{0-150}	{0-14400}
CV-L, CV-P, CVCP-P	{0-4294967295}	{0-4294967295}
FC-P, FCCP-P	{0-150}	{0-14400}
<All other MONTYPES>	{0-900}	{0-65535}

Restrictions: INIT-REG-T3 is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether PM registers for near-end or far-end PM monitoring are to be initialized. Values are:
 FEND Far-End
 NEND Near-End
Restrictions: INIT-REG-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

DIRN {NA, RCV, TRMT}
Default: < All applicable directions >
Addressing: None
Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT-REG-T3 command.
 NA Not Applicable
 RCV Receive side
 TRMT Transmit direction

TMPER {15-MIN, 1-DAY}
Default: {15-MIN}
Addressing: None
Description: Time Period, specifies whether the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:
 15-MIN 15-Minute PM collection register.
 1-DAY 1-Day (24 hour) PM collection register.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV	Input, Command Not Valid /* Invalid command requested. */
IDNV	Input, Data Not Valid /* Invalid direction in request message. */ /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monitor value in request message. */ /* Invalid time period in request message. */ /* Monitor value for this montype must not be greater than <max_monval>. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM T3 record. */ /* Could not get controlling level 2 processor id. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type. */ /* Number of montypes exceeds the maximum number of montypes allowed. */ /* Unable to allocate memory for user data. */ /* Unable to send message to the Level 2 Processor. */ /* Unable to determine supporting facility entity. */ /* Unable to process montype <NUM>. */

EXAMPLES

In the following example, the near-end 15-minute coding violations, line (CV-L) PM collection register for DS3 port T3-1592 is initialized to zero.

```
INIT-REG-T3::T3-1592::CVL,,,15-MIN;
```

In the following example, all near-end and far-end daily (1-Day) PM collection registers for DS3 port T3-1593 are initialized to zero.

```
INIT-REG-T3::T3-1593::ALL,,,1-DAY;
```

COMMAND CODE: INIT-REG-VT1
COMMAND NAME: INITIALIZE PERFORMANCE
MONITORING REGISTER VT1

PURPOSE

The INIT-REG-VT1 command initializes the current 15-Minute or current 1-Day (specified by TMPER) PM collection registers for the monitored parameters (specified by MONTYPE and LOCN) pertaining to the specified VT1.5 port to the value specified by MONVAL.

An INIT-REG-VT1 command is denied if:

- The specified VT1.5 port is not provisioned (using ENT-VT1).
- The specified VT1.5 port is embedded within a protection OC-3/OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-REG-VT1: [TID] : AID: [CTAG] :: [MONTYPE] , [MONVAL] , [LOCN] ,
[DIRN] , [TMPER] [,] [,] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	VT1 AID, identifies the VT1.5 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE {ALL},
NEAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV,
ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV},
FAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV,
ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV}
Default: {ALL}
Addressing: None
Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

ALL	All, all monitored parameter PM registers.
ALS-V, ALSV	Alarm Indication Signal/Loss of Pointer – VT Path, ALS-V register.
CV-V, CVV	Coding Violations – VT Path, CV-V register.
ES-V, ESV	Errored Seconds – VT Path, ES-V register.
ESA-V, ESAV	Errored Seconds type A – VT Path, ESA-V register.
ESB-V, ESBV	Errored Seconds type B – VT Path, ESB-V register.
FC-V, FCV	Failure Counts – VT Path, FC-V register.
SES-V, SESV	Severely Errored Seconds – VT Path, SES-V register.
UAS-V, UASV	Unavailable Seconds – VT Path, UAS-V register.

MONVAL {0-4294967295}
Default: { 0 }
Addressing: None
Description: Monitor Value, specifies the value to be set in the register specified by the MONTYPE, LOCN, and TMPER. Values for each monitored parameter are:

MONVAL Values vs. MONTYPE		
MONTYPE	15-Minute PM Register	1-Day PM Register
ALL	{0-150}	{0-14400}
CV-V	{0-4294967295}	{0-4294967295}
FC-V	{0-150}	{0-14400}
<All other MONTYPES>	{0-900}	{0-65535}

Restrictions: INIT-REG-VT1 is denied if the entered MONVAL value is not valid for the specified MONTYPE.

LOCN {FEND, NEND}
Default: < All applicable locations for the selected monitored parameters >
Addressing: None
Description: Location, specifies whether PM registers for near-end or far-end PM monitoring are to be initialized. Values are:

FEND	Far-End
NEND	Near-End

DIRN	{NA, RCV, TRMT}					
	Default: < All applicable directions >					
	Addressing: None					
	Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the INIT-REG-VT1 command.					
	<table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT
NA	Not Applicable					
RCV	Receive side					
TRMT	Transmit direction					
TMPER	{15-MIN, 1-DAY}					
	Default: {15-MIN}					
	Addressing: None					
	Description: Time Period, specifies whether the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be initialized. Values are:					
	<table> <tr> <td>15-MIN</td><td>15-Minute PM collection register.</td></tr> <tr> <td>1-DAY</td><td>1-Day (24 hour) PM collection register.</td></tr> </table>	15-MIN	15-Minute PM collection register.	1-DAY	1-Day (24 hour) PM collection register.	
15-MIN	15-Minute PM collection register.					
1-DAY	1-Day (24 hour) PM collection register.					

SUCCESSFUL RESPONSE FORMAT

```

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV	Input, Command Not Valid /* Invalid command requested. */
IDNV	Input, Data Not Valid /* Invalid direction in request message. */ /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monitor value in request message. */ /* Invalid time period in request message. */
IDRG	Input, Data RanGe /* Monitor value for this montype must not be greater than <max_monval>. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in Partition. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */

SDBE	Status, internal Data Base Error /* Failed to set pointer to FM VT1 record. */ /* Could not get controlling level 2 processor id. */
SNVS	Status, Not in Valid State /* Facility is unprovisioned. */ /* AID not as provisioned. */
SROF	Status, Requested Operation Failed /* Unable to determine facility type. */ /* Number of montypes exceeds the maximum number of montypes allowed. */ /* Unable to allocate memory for user data. */ /* Unable to send message to the Level 2 Processor. */ /* Unable to determine supporting facility entity. */ /* Unable to process montype <NUM>. */

EXAMPLES

In the following example, the near-end and far-end 15-minute coding violations, VT path (CV-V) PM collection register for VT1.5 port EC1VT1-632-5-2 is initialized to zero.

```
INIT-REG-VT1::EC1VT1-632-5-2:::CVV, , , 15-MIN;
```

In the following example, all near-end and far-end daily (1-Day) PM collection registers for VT1.5 port EC1VT1-633-3-4 are initialized to zero.

```
INIT-REG-VT1::EC1VT1-633-3-4:::ALL, , , 1-DAY;

COMMAND CODE: **INIT-SYS**
COMMAND NAME: **INITIALIZE SYSTEM**

PURPOSE

The INIT-SYS command resets and downloads (initializes) the processor-based circuit packs in the system. All existing cross-connections remain intact during the system initialization. A REPT^INITZN autonomous response is generated when the system initialization is complete.

The INIT-SYS command provides three levels (defined by the PH parameter) of “cold start” and “warm start” of the processor-based circuit packs that are provisioned and installed in the system, where a cold start results in a processor reset and download of both the processor executable (the software object code) and database and a warm start results in a download of only the processor database.

- If PH of 1 is entered, the (Administration Processing System) level-one processor-based circuit packs (ACM, CPU, CIM, ICM, SIO circuit packs) are cold started and the level-two (IPU, SPB) and level-three (DSB, EP3, ES1, M16, M32, M40, O1B, OXB, RPB) processor-based circuit packs are warm started.
- If PH of 2 is entered, the level-one and level-two (ACM, CPU, CIM, ICM, IPU, SIO, SPB) processor-based circuit packs are cold started and the level-three (DSB, EP3, ES1, M16, M32, M40, O1B, OXB, RPB) processor-based circuit packs are warm started.
- If PH of 3 is entered, the level-one, level-two, and level-three (ACM, CPU, CIM, ICM, IPU, SIO, SPB, DSB, EP3, ES1, M16, M32, M40, O1B, OXB, RPB) processor-based circuit packs are all cold started.

When an INIT-SYS is executed, all users are logged-off the system. During the system initialization process, CPORTs (Communication Ports) provisioned as a UID auto-login communication port are automatically initialized with the auto-login user logged-in. Non-auto-login users can login (via an ACT-USER command) to the system before the system initialization is complete when a CID (Communications Interface Device) receives a login prompt.

An INIT-SYS command can be scheduled for delayed activation. However, command parsing and parameter validation is not performed until the command is executed (at the delay activated scheduled date and time).

An INIT-SYS command is denied if:

- An invalid parameter value or combination of parameter values is entered.

An INIT-SYS does not affect existing cross-connections, but may prevent a user from adding or deleting cross-connections while the system initialization is in-progress. In addition, if an I/O circuit pack fails while the download to the supporting IPU or SPB circuit pack is in-progress, I/O protection switching of the failed I/O circuit pack will not occur until the supporting IPU or SPB circuit pack and the I/O protection circuit pack have completed downloading.

NOTE: Although the ON parameter value can be an integer from 0 to 999999, the user should limit the number of delayed activation commands at any given time to 500.

INPUT FORMAT

INIT-SYS: [TID] : [AID] : [CTAG] : [ON] , [DATE] , [TIME] , [FLAG] : PH;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	{SHELF_AID:{SHELF-{6-9, 12-15, 18-21, 24-43, 104-111, 136-141 }-{1, 3}-1}, <NoVal>} Default: < NoVal > Addressing: None Description: SHELF AID, specifies the Access IDentifier of the SHELF to be initialized.

CTAG	<p>< 1–6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>																														
ON	<p>{ON_AID:0–999999, <NoVal>}</p> <p>Default: <NoVal></p> <p>Addressing: None</p> <p>Description: Order Number, unique user–assigned integer number (up to six digits) used to identify scheduled (delay activated) commands. Values are:</p> <table> <tr> <td>{0–999999}</td><td>User–assigned Order Number. The command is scheduled to be executed as specified by DATE and TIME. If no value is entered for DATE or TIME, the command is scheduled for delayed manual activation (the command is entered in the delayed activation table and manually scheduled by using the ACT–DA command).</td></tr> <tr> <td><NoVal></td><td>No Value, the command is executed immediately. (No value is entered for ON (Order Number), DATE, and TIME if INIT–SYS is to be executed immediately – not delay activated.)</td></tr> </table> <p>Restrictions: INIT–SYS is denied if no value is entered for ON (Order Number) and a value is entered for either DATE, TIME, or FLAG.</p>	{0–999999}	User–assigned Order Number. FLAG	<p>{0, <NoVal>}</p> <p>Default: <NoVal></p> <p>Addressing: None</p> <p>Description: Flag. The value for FLAG is verified, but not processed by the system.</p> <p>Restrictions: INIT–SYS is denied if a value is entered for FLAG and no value is entered for ON (Order Number).</p>

PH	{1, 2, 3}	
	Default:	Entry Required
	Addressing:	None
	Description:	Initialization Phase, specifies the level of system initialization for processor-based circuit packs that are provisioned and installed in the system. A cold start results in a processor reset and download of both the processor executable and database. A warm start results in a download of only the processor database. Values are:
	1	Cold start of the level-one processor-based circuit packs and warm start of any level-two and level-three processor-based circuit packs.
	2	Cold start of the level-one and level-two processor-based circuit packs and warm start of any level-three processor-based circuit packs.
	3	Cold start of the level-one, level-two, and level-three processor-based circuit packs.
	Restrictions:	If the AID is SHELF, an INIT-SYS command is only allowed with a PH value of 3 and is only allowed on I/O shelves.

SUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent "Invalid or unassigned equipment identifier specified."
IDNV	Input, Data Not Valid "Specified AID must be of type SHELF." "Error retrieving initialization level for shelf." "Error retrieving AID."
IIAC	Input, Invalid ACcess identifier "The INIT-SYS was rejected."
IPMS	Input, Parameter MiSSing "No AID was specified." "Initialization level for shelf not specified."
IPNV	Input, Parameter Not Valid "Invalid initialization level <NUM> specified."

SARB	Status, All Resources Busy "Command already in progress on equipment." "Automatic system configuration active on equipment."
SDBE	Status, internal Data Base Error "<AID> database read error."
SNVS	Status, Not in Valid State "Command not valid during system restart." "Only shelves that are IS can be initialized." "At least 1 SPB must be active in order to initialize this shelf."
SROF	Status, Requested Operation Failed "No response received."
SSRE	Status, System Resources Exceeded "Unable to allocate USI response buffer."

EXAMPLES

In the following example, the executable and database is downloaded for all processor-based circuit packs that are provisioned and installed in the system (i.e., a cold start of the system is performed).

```
INIT-SYS:::::3;
```

The output responses, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P19003. The response headers would contain the provisioned Site ID of the system. The example assumes the INIT-SYS command was executed at 16:12:40 on 8/30/94.

For simplicity, only some of the autonomous output messages that could be generated are shown. The example also assumes that the user is not provisioned with an OSL containing R or S (the user is not provisioned to receive REPT^HWSW, REPT^INFORMATION, or REPT^STAT autonomous messages – refer to the ENT-USER or ED-PRVG-USER commands).

```

COMMAND CODE: **INIT-SYS-NEW**
COMMAND NAME: **INITIALIZE SYSTEM WITH NEW
UPGRADE**

PURPOSE

The INIT-SYS-NEW command performs the actual commit of the upgraded generic as the current executing software/firmware load in the system. This command uses information created and stored on a separate disk partition by a previously issued STA-ISU command and makes it active in the system. Generic upgrade indicators are redirected to indicate the newly upgraded load is now the active load for the system. On successful execution of INIT-SYS-NEW, the system is reset as if an INIT-SYS, Phase 3 (INIT-SYS:::3), had been issued.

The INIT-SYS-NEW command returns a completion message to the user prior to system initialization and sets/clears the INIT condition as is set/cleared for the INIT-SYS command.

An INIT-SYS-NEW command is denied if:

- A STA-ISU command has not been previously and successfully completed, and/or an STP-ISU command has been previously entered.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-SYS-NEW: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Optional Suggested Action Text> */]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the executable and database is downloaded for all processor-based circuit packs that are provisioned and installed in the system (i.e., a cold start of the system is performed).

```
INIT-SYS-NEW;
```

The output responses, shown below, assumes CID 9-2 was used to enter the command and a system generated CTAG value of P58079. The response headers would contain the provisioned Site ID of the system. The example assumes the INIT-SYS-NEW command was executed at 09:17:32 on 4/9/00.

For simplicity, only some of the autonomous output messages that could be generated are shown. The example also assumes that the user is not provisioned with an OSL containing R or S (the user is not provisioned to receive REPT^HWSW, REPT^INFORMATION, or REPT^STAT autonomous messages – refer to the ENT-USER or ED-PRVG-USER commands).

INIT-SYS-OLD
RMV-ISU-OLD
RTRV-ISU-STATUS
STA-ISU
STP-ISU

COMMAND CODE: **INIT-SYS-OLD**
COMMAND NAME: **INITIALIZE SYSTEM WITH OLD
UPGRADE**

PURPOSE

The INIT-SYS-OLD command allows the reversion of the system to the previous generic software and data-base disk partition file system that was available on the hard disk prior to the latest Generic Upgrade process. All system indicators are reset and the system restarted to indicate the currently active generic is a previous release generic. The system is reset as if an INIT-SYS, Phase 3 (INIT-SYS:::3) has been issued.

The INIT-SYS-OLD command returns a completion message to the user prior to system initialization and sets/clears the INIT condition as is set/cleared for the INIT-SYS command.

The INIT-SYS-OLD command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An INIT-SYS-OLD command is denied if:

- An INIT-SYS-NEW is not in-progress or successfully completed.
- A STA-ISU command is in progress.
- No previous generic partition exists (including a system that does not have the larger disk drive).
- An In-Service Upgrade Key (ISUKEY) does not match the ISUKEY of the P1 in the STA-ISU command.
- The command is issued subsequent to a RMV-ISU-OLD command.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

INIT-SYS-OLD: [TID] : : [CTAG] : : ISUKEY, [MODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.
ISUKEY	<1-5 ALPHANUMERIC CHARACTERS>
Default:	Entry Required
Addressing:	None
Description:	In-Service Upgrade Key, specifies the logical in-service upgrade reversion key. Valid values for ISUKEY are a string of 1 through 5 ASCII alphanumeric characters from the set {0-9, A-Z}. Note that spaces and special characters are not included.
Restrictions:	INIT-SYS-OLD is denied if the ISUKEY does not match the ISUKEY of the P1 entered in the STA-ISU command.
MODE=	{NORM, FRCD}
Default:	{NORM}
Addressing:	None
Description:	Command Execution Mode. Values are:
NORM	Normal. The command is accepted and the system is initialized with a previous software generic.
FRCD	Forced. The command is accepted even if a previous INIT-SYS-NEW command is not successfully completed.

COMMAND CODE: **OPR-ACO-ALL**
COMMAND NAME: **OPERATE AUDIBLE ALARM CUTOFF
ALL**

PURPOSE

The OPR-ACO-ALL command actuates a system-wide audible alarm cutoff (ACO) causing any existing audible alarm indication in the system to be turned-off (silenced) and the ACO lamp in the APS bay/rack to be activated.

Visual alarm indications and alarm reporting through the man-machine interface are not affected by the OPR-ACO-ALL command. Future audible alarm indications are generated for any alarm conditions occurring after the command is executed.

An OPR-ACO-ALL command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

OPR-ACO-ALL: [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* ACO set on bay <APS_BAY_ID>. */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

APS_BAY_ID {1}
Bay/Rack Identification number of the Administration Processing System (APS).

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]

;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ICNV Input, Command Not Valid

EXAMPLES

In the following example, the OPR-ACO-ALL command is used to silence any current audible alarm.

```
OPR-ACO-ALL;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P18004. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P18004 COMPLD  
/* ACO set on bay 1 */  
/* OPR-ACO-ALL [P18004] (2) */  
;
```

RELATED COMMANDS

RTRV-ACO-ALL

SET-ACO-ALL

COMMAND CODE: **OPR-ISGLP-STS1**
COMMAND NAME: **OPERATE IN-SERVICE GROWTH
LOOPBACK STS1**

PURPOSE

The OPR-ISGLP-STS1 command provides a pre-service path verification test for newly installed STS-1 I/O equipment when the supporting end-stage equipment is not provisioned to carry traffic. The command performs a center-stage matrix loopback test (using the specified center-stage) of the embedded VT1.5s in the specified STS-1 prior to the in-service provisioning of the supporting I/O and matrix equipment or the provisioning of the STS-1 port. Results of the loopback are obtained by executing a FLTLOC-PATH-VT1 command and specifying the AID of the supported VT1.5 port.

The OPR-ISGLP-STS1 command performs a matrix loopback of a generated VT1.5 idle signal in the specified center-stage equipment for each of the embedded VT1.5s in the specified STS-1. "Inversion" of the time-slot assignments for the VT1.5 signals through the first-stage and third-stage matrix is specified by the MODE parameter.

While an OPR-ISGLP-STS1 command is in effect, the default signal on any of the other unused ports on the supporting EP3 or ES1 circuit pack changes to the STS-1 default signal.

For an OPR-ISGLP-STS1 command to execute, the supporting I/O circuit pack and the four supporting M16/M32 end-stage circuit packs (one in each redundant copy of the first-stage and third-stage matrix) must be in an OOS-MA,MT or OOS-AUMA,UEQ&MT state, and the specified STS-1 port must not be provisioned (the STS-1 is in an OOS-AUMA,UAS&MT state). Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing an OPR-ISGLP-STS1 causes an STS-1 SST of LPBK to be applied to the specified STS-1 and a VT1.5 SST of LPBK to be applied to each of the embedded VT1.5s in the STS-1.

A maximum of 672 STS-1, VT1.5, T3, and/or T1 ISGLP operations can be in-progress at any given time. The 672 OPR-ISGLP-STS1|VT1|T3|T1 commands can be executed in any combination without being released (using RLS-ISGLP-STS1|VT1|T3|T1, but the 673rd OPR-ISGLP-STS1|VT1|T3|T1 command will be denied.

An OPR-ISGLP-STS1 command is denied if:

- The supporting I/O circuit pack and the four supporting M16/M32 end-stage circuit packs (one in each redundant copy of the first-stage and third-stage matrix) are not in an OOS-MA,MT or OOS-AUMA,UEQ&MT state.
- The specified STS-1 port is not in an OOS-AUMA,UAS&MT state.
- Any of the embedded VT1.5s in the specified STS-1 are in an in-service growth loopback (a VT1.5 state of OOS-AUMA,UAS&MT&LPBK).
- An OPR-ISGLP-T1|T3 is in effect on any of the other two ports supported by the EP3 circuit pack that supports the specified STS-1 (i.e., an STS-1 in-service-growth-loopback cannot be performed on an EP3, O1B, O4M or S3M that is currently supporting DS3 ports).
- The required bandwidth in the End-Stage to Center-Stage matrix cable (selected by the specified AID and CS parameters) is already being utilized by another In-Service-Growth loopback or by existing connections. Typically, three ISG loopback per ES-CS cable can be established at a time, provided the specified STS-1 AIDs are not a multiple of three apart, e.g., STS-1 ports EC1STS1-1, EC1STS1-3, EC1STS1-6, etc. are a multiple of 3 apart. The matrix bandwidth could also be utilized by connections within an existing I/O shelf that shares that same End-Stage module.
- The specified STS-1 port resides on an EP3, O1B, O4M or module that itself resides in a half shelf that is defined as standard or enhanced.
- The specified STS-1 is embedded within a protection OC-3/OC-12.
- An invalid parameter value is entered.
- The value of CS is greater than 4 on a 240 port system.

COMMAND CODE: **OPR-ISGLP-T1**
COMMAND NAME: **OPERATE IN-SERVICE GROWTH**
LOOPBACK T1

PURPOSE

The OPR-ISGLP-T1 command provides a pre-service path verification test for newly installed DS3 or DS1 I/O equipment when the supporting end-stage equipment is provisioned to carry traffic (the supporting I/O circuit pack is connected to end-stage equipment that is already provisioned to carry traffic). The command performs a center-stage matrix loopback test of the specified DS1 prior to the in-service provisioning of the supporting I/O circuit pack, the provisioning of a supporting DS3 port, or the provisioning of the DS1 port. Results of the loopback are obtained by executing a FLTLOC-PATH-T1 command and specifying the AID of the DS1 port.

When OPR-ISGLP-T1 is executed, either an internally generated ESF QRS signal, or an external signal connected to the DS1 port, is transmitted and looped back to itself through the matrix.

While an OPR-ISGLP-T1 command is in effect, the default signal on any of the other unused ports on a supporting EP3, O1B, O4M or S3M circuit pack changes to the DS3 default signal.

For an OPR-ISGLP-T1 command to execute, the supporting I/O circuit pack must be in an OOS-MA,MT state, and the specified DS1 port must not be provisioned (the DS1 is in an OOS-AUMA,UAS&MT state). Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing an OPR-ISGLP-I1 causes a DS1 SST of LPBK to be applied to the specified DS1, and a DS3 SST change from UAS&MT to UAS&DSBLD&MT on the supporting DS3, if it exists.

A maximum of 672 STS-1, VT1.5, T3, and/or T1 ISGLP operations can be in-progress at any given time. The 672 OPR-ISGLP-STs1|VT1|T3|T1 commands can be executed in any combination without being released (using RLS-ISGLP-STs1|VT1|T3|T1, but the 673rd OPR-ISGLP-STs1|VT1|T3|T1 command will be denied.

An OPR-ISGLP-T1 command is denied if:

- The supporting I/O circuit pack is not in an OOS—MA,MT state
- The specified DS1 port is not in an OOS—AUMA,UAS&MT state.
- The specified DS1 is stand-alone and the CS parameter is specified and all four end-stage modules (2 in copy 0 and 2 in copy 1) to which the I/O shelf is connected, are not in an MT state.
- The specified DS1 is stand-alone and all available bandwidth has been used up between the I/O equipment supported by the end-stage equipment and the specified CS matrix module.
- The supporting DS3 is in an in-service growth loopback (a DS3 state of OOS—AUMA,UAS&MT&LPBK, this causes a DS1 state of OOS—AUMA,UAS&MT&LPBK).
- Five In-Service-Growth-Loopback connections are already established for DS3 I/O equipment supported by the end-stage equipment in the same end-stage shelf.
- An invalid parameter value is entered.
- CS value is greater than 4 on a 240 port system.

INPUT FORMAT

```
OPR-ISGLP-T1:[TID]:AID:[CTAG]::[CS],[SIGSRC];
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS1_AID:	
	{T1–{1–59392}}	(T1–DS1#)
	{T3T1–{1–4800}–{1–28}}	(T3T1–DS3#–DS1#)
	Default:	Entry Required
	Addressing:	&&–ranging and &–grouping
	Description:	DS1 AID, identifies the DS1 port to be looped back.

CTAG	< 1–6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
CS	{1–32}	
	Default:	<System assigned CS value>
	Addressing:	None
	Description:	Logical Center–Stage Number, identifies the copy 0 and copy 1 center–stage circuit packs to be used in the matrix loopback test. The CS value corresponds to the logical slot/location number of the center–stage equipment AID. On a 240–port system, values 1–4 correspond to M40 – 5 – {1,3} – {4, 5, 9, 10}.
	Restrictions:	OPR–ISGLP–T1 is denied if the CS parameter is specified and the AID does not specify an electrical (stand–alone) T1. OPR–ISGLP–T1 is denied for a 240–port LMC system if the CS value entered is greater than 4.
SIGSRC	{EXTERNAL, INTERNAL}	
	Default:	{INTERNAL}
	Addressing:	None
	Description:	Loopback Signal Source, specifies whether an internally generated signal source or an external signal source connected to the I/O port, is to be used for the loopback signal. Values are:
	EXTERNAL	An externally connected signal is used as the loopback signal.
	INTERNAL	An internally generated signal is used as the loopback signal.

COMMAND CODE: **OPR-ISGLP-T3**
COMMAND NAME: **OPERATE IN-SERVICE GROWTH
LOOPBACK T3**

PURPOSE

The OPR-ISGLP-T3 command provides a pre-service path verification test for newly installed DS3 I/O equipment when the supporting end-stage equipment is not provisioned to carry traffic. The command performs a center-stage matrix loopback test (using the specified center-stage) of the embedded DS1s in the specified DS3 prior to the in-service provisioning of the supporting I/O and matrix equipment or the provisioning of the DS3 port. Results of the loopback are obtained by executing a FLTLOC-PATH-T1 command and specifying the AID of the supported DS1 port.

The OPR-ISGLP-T3 command performs a matrix loopback of a generated ESF QRS signal in the specified center-stage equipment for each of the embedded DS1s in the specified DS3. "Inversion" of the time-slot assignments for the DS1 signals through the first-stage and third-stage matrix is specified by the MODE parameter.

While an OPR-ISGLP-T3 command is in effect, the default signal on any of the other unused ports on the supporting EP3 circuit pack changes to the DS3 default signal.

For an OPR-ISGLP-T3 command to execute, the supporting I/O circuit pack and the four supporting M16/M32 end-stage circuit packs (one in each redundant copy of the first-stage and third-stage matrix) must be in an OOS-MA,MT or OOS-AUMA,UEQ&MT state, and the specified DS3 port must not be provisioned (the DS3 is in an OOS-AUMA,UAS&MT state). Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing an OPR-ISGLP-T3 causes a DS3 SST of LPBK to be applied to the specified DS3 and a DS1 SST of LPBK to be applied to each of the embedded DS1s in the DS3.

A maximum of 672 STS-1, VT1.5, T3, and/or T1 ISGLP operations can be in-progress at any given time. The 672 OPR-ISGLP-STs1|VT1|T3|T1 commands can be executed in any combination without being released (using RLS-ISGLP-STs1|VT1|T3|T1, but the 673rd OPR-ISGLP-STs1|VT1|T3|T1 command will be denied.

An OPR-ISGLP-T3 command is denied if:

- The supporting I/O circuit pack and the four supporting M16/32 end-stage circuit packs (one in each redundant copy of the first-stage and third-stage matrix) are not in an OOS-MA,MT or OOS-AUMA,UEQ&MT state.
- The specified DS3 port is not in an OOS-AUMA,UAS&MT state.
- Any of the embedded DS1s in the specified DS3 are in an in-service growth loopback (a DS1 state of OOS-AUMA,UAS&MT&LPBK).
- An OPR-ISGLP-STs1|VT1 is in effect on any of the other two ports supported by the EP3 circuit pack that supports the specified DS3 (i.e., a DS3 in-service-growth-loopback cannot be performed on an EP3 that is currently supporting STS-1 ports).
- The required bandwidth in the End-Stage to Center-Stage matrix cable (selected by the specified AID and CS parameters) is already being utilized by another In-Service-Growth loopback or by existing connections. Typically, three ISG loopbacks per ES-CS cable can be established at a time, provided the specified DS3 AIDs are not a multiple of three apart, e.g., DS3 ports T3T1-961, T3T1-963, T3T1-966, etc. are a multiple of 3 apart. The matrix bandwidth could also be utilized by connections within an existing I/O shelf that shares that same End-Stage module.
- The specified T3 resides on an HMU that does not have all of the LMUs in the MT state.
- An invalid parameter value is entered.
- CS value is greater than 4 on a 240 port system.

COMMAND CODE: **OPR-ISGLP-VT1**
COMMAND NAME: **OPERATE IN-SERVICE GROWTH
LOOPBACK VT1**

PURPOSE

The OPR-ISGLP-VT1 command provides a pre-service path verification test for newly installed STS-1 I/O equipment when the supporting end-stage equipment is provisioned to carry traffic (the supporting I/O circuit pack is connected to end-stage equipment that is already provisioned to carry traffic). The command performs a center-stage matrix loopback test of the specified embedded VT1.5 prior to the in-service provisioning of the supporting I/O circuit pack, the provisioning of the supporting STS-1 port, or the provisioning of the VT1.5 port. Results of the loopback are obtained by executing a FLTLOC-PATH-VT1 command and specifying the AID of the VT1.5 port.

When OPR-ISGLP-VT1 is executed, a VT idle signal is generated on the VT1.5 port and looped back to itself through the matrix.

While an OPR-ISGLP-VT1 command is in effect, the default signal on any of the other unused ports on the supporting EP3, O1B, O4M, or S3M circuit pack changes to the STS-1 default signal.

For an OPR-ISGLP-VT1 command to execute, the supporting I/O circuit pack must be in an OOS-MA,MT state, and the specified VT1.5 port must not be provisioned (the VT1.5 is in an OOS-AUMA,UAS&MT state). Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing an OPR-ISGLP-VT1 causes an SST of LPBK to be applied to the specified VT1.5, and an STS1 SST change from UAS&MT to UAS&DSBLD&MT on the supporting STS1.

A maximum of 672 STS1, VT1.5, T3, and/or T1 ISGLP operations can be in-progress at any given time. The 672 OPR-ISGLP-STS1|VT1|T3|T1 commands can be executed in any combination without being released (using RLS-ISGLP-STS1|VT1|T3|T1, but the 673rd OPR-ISGLP-STS1|VT1|T3|T1 command is denied.

An OPR-ISGLP-VT1 command is denied if:

- The supporting I/O circuit pack is not in an OOS-MA,MT state
- The specified VT1.5 port is not in an OOS-AUMA,UAS&MT state.
- The supporting STS-1 is in an in-service growth loopback (an STS-1 state of OOS-AUMA,UAS&MT&LPBK – this causes a VT1.5 state of OOS-AUMA,UAS&MT&LPBK).
- Five In-Service-Growth-Loopback connections are already established for STS-1 I/O equipment supported by the end-stage equipment in the same end-stage shelf.
- The specified VT1.5 port resides on an EP3, O1B, O4M, or S3M module that itself resides in a half shelf that is defined as standard or enhanced.
- The specified VT1.5 is embedded within a protection OC3/OC12.
- An invalid parameter value is entered.

COMMAND NAME: **OPERATE LOOPBACK EC1**

PURPOSE

The OPR-LPBK-EC1 command establishes a near-end (in the system) EC1 loopback on the specified EC1 port.

A near-end loopback can be established at the receive-side (from the network) of the specified EC1 port (a facility loopback).

To execute an OPR-LPBK-EC1, the specified EC1 must have a PST of OOS-AUMA or OOS-MA and not have an SST of TRM or LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing OPR-LPBK-EC1 sets an ACTLPBK condition type on the specified EC1 port.

An OPR-LPBK-EC1 command is denied if:

- The specified EC1 port is not provisioned.
- The specified EC1 port does not have a PST of OOS-AUMA or OOS-MA.
- The specified EC1 port is already in a loopback (a EC1 SST of LPBK).
- Any embedded STS-1s, DS3s, DS1s, or VT1.5s within the specified EC1 port are cross-connected (an EC1 SST of TRM, are connected to a Test Access Port (an STS-1/DS3/VT1.5 SST of TS), are involved in a rolling operation (a VT1.5/DS1 SST of ROLL).
- The specified EC1 port has fault propagation active on it, or any of its embedded facilities have fault propagation set.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

OPR-LPBK-EC1 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: None Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is established. Value is: NEND Near-End, specifies that the loopback is to occur in the system.
LPBKTYPE	{FACILITY} Default: {FACILITY} Addressing: None Description: Loopback Type, specifies the type of loopback. Values are: FACILITY Facility, specifies a EC1 loopback at the receive-side (from the network) of the specified EC1 port.

COMMAND CODE: **OPR-LPBK-OC12**
COMMAND NAME: **OPERATE LOOPBACK OC12**

PURPOSE

The OPR-LPBK-OC12 command establishes a near-end (in the system) OC12 loopback on the specified OC12 port.

A near-end loopback can be established at the receive-side (from the network) of the specified OC12 port (a facility loopback).

To execute an OPR-LPBK-OC12, the specified OC12 must have a PST of OOS-AUMA or OOS-MA and not have an SST of WRK or LPBK (i.e., the OC12 is not carrying traffic and is not in a loopback). Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing OPR-LPBK-OC12 sets an ACTLPBK condition type on the specified OC12 port, and causes the fault propagation feature to be disabled on this port if set.

An OPR-LPBK-OC12 command is denied if:

- The specified OC12 port is not provisioned.
- The specified OC12 port does not have a PST of OOS-AUMA or OOS-MA.
- The specified OC12 port is already in a loopback (i.e., has an OC12 SST of LPBK).
- The specified OC12 is carrying traffic (i.e., has an OC12 SST of WRK).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

OPR-LPBK-OC12 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} Default: Entry Required Addressing: None Description: OC12 AID, identifies the OC12 port. (OC12-OC12#)
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is established. Value is: NEND Near-End, specifies that the loopback is to occur in the system.
LPBKTYPE	{FACILITY} Default: {FACILITY} Addressing: None Description: Loopback Type, specifies the type of loopback. Values are: FACILITY Facility, specifies an OC12 loopback at the receive-side (from the network) of the specified OC12 port.

```

COMMAND CODE: **OPR-LPBK-OC3**
COMMAND NAME: **OPERATE LOOPBACK OC3**

PURPOSE

The OPR-LPBK-OC3 command establishes a near-end (in the system) OC3 loopback on the specified OC3 port.

A near-end loopback can be established at the receive-side (from the network) of the specified OC3 port (a facility loopback).

To execute an OPR-LPBK-OC3, the specified OC3 must have a PST of OOS-AUMA or OOS-MA and not have an SST of WRK or LPBK (i.e., the OC3 is not carrying traffic and is not in a loopback). Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing OPR-LPBK-OC3 sets an ACTLPBK condition type on the specified OC3 port, and causes the fault propagation feature to be disabled on this port if set.

An OPR-LPBK-OC3 command is denied if:

- The specified OC3 port is not provisioned.
- The specified OC3 port does not have a PST of OOS-MA or OOS-AUMA.
- The specified OC3 port is already in a loopback (i.e., has an OC3 SST of LPBK).
- The specified OC3 is carrying traffic (i.e., has an OC3 SST of WRK).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
OPR-LPBK-OC3:[TID]:AID:[CTAG]::[LOCN],,,[LPBKTYPE];
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3–{1–2240}} (OC3–OC3#) Default: Entry Required Addressing: None Description: OC3 AID, identifies the OC3 port.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near–end) where the loopback is established. Value is: NEND Near–End, specifies that the loopback is to occur in the system.
LPBKTYPE	{FACILITY} Default: {FACILITY} Addressing: None Description: Loopback Type, specifies the type of loopback. Values are: FACILITY Facility, specifies an OC3 loopback at the receive–side (from the network) of the specified OC3 port.

COMMAND CODE: **OPR-LPBK-STST1**
COMMAND NAME: **OPERATE LOOPBACK STST1**

PURPOSE

The OPR-LPBK-STST1 command establishes a near-end (in the system) STST1 loopback on the specified STST1 port in the system cross-connect matrix (a matrix loopback). A loopback is allowed on an STST1 port that is not cross-connected, or that is one-way or two-way cross-connected.

To execute an OPR-LPBK-STST1, the specified STST1 must have a PST of OOS-AUMA or OOS-MA and the SST cannot be {TS, LPBK, TRM}. If the STST1 is cross-connected (it has an SST of ACT or BUSY), the command is completed and STST1 AIS is sent in the outgoing direction (the incoming signal is prevented from going out). Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing OPR-LPBK-STST1 to establish a near-end loopback sets an ACTLPBK condition type on the specified STST1 port, and causes the fault propagation feature to be disabled on this port if set.

If OPR-LPBK-STST1 is issued to set up a matrix loopback on an STST1, embedded within a ring OC3/OC12, and is 2WAYPR cross-connected, both the addressed STST1 and its mate STST1 will enter SST of LPBK.

When OPR-LPBK-STST1 is successfully issued on an STST1, embedded within a ring OC3/OC12, with LPBKTYPE as PAYLOAD, the system will loopback the specified path inside the RPB.

When OPR-LPBK-STST1 is successfully issued on an STST1, embedded within a ring OC3/OC12, with LPBKTYPE as PAYLOAD and the specified path is cross-connected to its mate path to form a pass through path, the system will allow the "preferred" and "alternate" STST1 paths to be under PAYLOAD loopback at the same time.

An OPR-LPBK-STST1 command is denied if:

- The specified STST1 port is not provisioned.
- The specified STST1 port does not have a PST of OOS-AUMA or OOS-MA.
- The specified STST1 is already in a loopback (an STST1 SST of LPBK).
- OPR-LPBK-STST1 is issued with LPBKTYPE of MATRIX and the specified STST1 is cross-connected to another port which is also in a matrix loopback (an SST of ACT&LPBK or BUSY&LPBK).
- The specified STST1 is connected to a Test Access port (an STST1 SST of TS).
- The subordinated objects within the STST1 (i.e., VT1.5, DS3, or DS1) are cross-connected (i.e., the STST1 has a secondary state of TRM).
- Any embedded VT1.5s within the specified STST1 are under roll operation (a VT1.5 SST of ROLL) or are under test access operation (a VT1.5 SST of TS).
- Any embedded VT1.5s within the specified STST1 are provisioned (an STST1 SST of SDEE) and LPBKTYPE is specified as MATRIX.
- The specified STST1 is embedded within a protection OC3/OC12.
- The mate port of the specified STST1, embedded within a ring OC3/OC12, is not provisioned or not in a OOS-MA or OOS-AUMA state and a 2WAYDC connection exists.
- The specified STST1 whose mate STST1, embedded within a ring OC3/OC12, is already 2WAY cross-connected to an STST1, embedded within a non-ring OC3/OC12 or a different ring OC3/OC12, to form an unprotected 2WAY cross-connect.
- The specified STST1, embedded within a ring OC3/OC12, is unconnected and an attempt is made to perform matrix loopback on one path while its mate path is in matrix loopback.
- The value of LPBKTYPE is PAYLOAD and the specified STST1 is not embedded within a ring OC3/OC12.
- The port identified by the AID is involved in a redlined (RDL=Y) connection.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

OPR-LPBK-STST1 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1–{1–3840}} (EC1STS1–EC1/STS1#) {OC3STS1–{1–2240}–{1–3}} (OC3STS1–OC3#–STS1#) {OC12STS1–{1–560}–{1–4}–{1–3}} (OC12STS1–OC12#–STM1#–STS1#) Default: Entry Required Addressing: None Description: STS1 AID, identifies the STS1 port. Restrictions: OPR–LPBK–STS1 is denied if the VT1.5, DS3, or DS1 within it are cross–connected are under test access connection.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near–end) where the loopback is established. Values are: NEND Near–End, specifies that the loopback is to occur in the system.
LPBKTYPE	{MATRIX, PAYLOAD} Default: {MATRIX} Addressing: None Description: Loopback Type; specifies the type of loopback. Values are: MATRIX Matrix, specifies an STS1 loopback in the system matrix. PAYLOAD Payload, specifies an STS1 loopback in the system payload. Payload is only valid on STS1s embedded within a ring OC3/OC12 and performs loopback of the addressed STS1 in the RPB. Restrictions: OPR–LPBK–STS1 is denied if the specified STS1 has one or more embedded VT1.5s provisioned.

RTRV-STs1
```

COMMAND CODE: **OPR-LPBK-ST3C**
COMMAND NAME: **OPERATE LOOPBACK ST3C**

PURPOSE

The OPR-LPBK-ST3C command establishes a near-end (in the system) ST3C loopback on the specified ST3C port in the system cross-connect matrix (a matrix loopback). A loopback is allowed on an ST3C port that is not cross-connected.

To execute an OPR-LPBK-ST3C, the specified ST3C must have a PST of OOS-AUMA or OOS-MA and the SST cannot be TS, LPBK, or TRM. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing OPR-LPBK-ST3C to establish a near-end loopback sets a MAN condition type on the specified ST3C port, and causes the fault propagation feature to be disabled on this port if set.

An OPR-LPBK-ST3C command is denied if:

- The specified ST3C port is not provisioned.
- The specified ST3C port does not have a PST of OOS-AUMA or OOS-MA.
- The specified ST3C is already in a loopback (an ST3C SST of LPBK).
- OPR-LPBK-ST3C is issued with LPBKTYPE of MATRIX and the specified ST3C is cross-connected to another port which is also in a matrix loopback (an SST of ACT&LPBK or BUSY&LPBK).
- The specified ST3C is connected to a Test Access port (an ST3C SST of TS).
- The subordinated objects within the ST3C (i.e., OC3/OC12) are cross connected (i.e., the ST3C has a secondary state of TRM).
- The specified ST3C is cross-connected (i.e., has a secondary state of ACT or BUSY).
- The specified ST3C is embedded within a protection OC3/OC12.
- The port identified by the AID is involved in a redlined (RDL=Y) connection.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

OPR-LPBK-ST3C: [TID] :AID: [CTAG] :: [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: None Description: STS3C AID, identifies the STS3C port. Restrictions: OPR-LPBK-ST3C is denied if the OC3/OC12 within it are cross-connected are under test access connection.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is established. Values are: NEND Near-End, specifies that the loopback is to occur in the system.

LPBKTYPE	{MATRIX}
Default:	{MATRIX}
Addressing:	None
Description:	Loopback Type; specifies the type of loopback. Values are: MATRIX Matrix, specifies an STS3C loopback in the system matrix.
Restrictions:	OPR-LPBK-STS3C is denied if the specified STS3C has one or more embedded OC3s/OC12s provisioned and LPBKTYPE=MATRIX.

```

RELATED COMMANDS

ENT-STS3C
RLS-LPBK-STS3C
RTRV-COND-STS3C
RTRV-LPBK-STS3C
RTRV-STS3C

COMMAND CODE: **OPR-LPBK-T1**
COMMAND NAME: **OPERATE LOOPBACK T1**

PURPOSE

The OPR-LPBK-T1 command establishes a near-end (in the system) DS1 loopback or far-end DS1 C-bit loopback request (to the far-end of the facility) on the specified DS1 port.

A near-end loopback can be established at the receive-side (from the network) of the specified DS1 port (a facility loopback) or in the system cross-connect matrix (a matrix loopback).

A near-end facility or matrix loopback is allowed on a DS1 port that is not cross-connected, or that is one-way or two-way cross-connected, but is not allowed on a DS1 port that is the head (Master) or tail of a broadcast conference cross-connection. If the facility or matrix loopback is executed on a DS1 that is one-way or two-way cross-connected (i.e., it has an SST of ACT or BUSY), DS1 AIS is transmitted in the outgoing direction if cross-connected to a DS1, or VT1.5 AIS is transmitted in the outgoing direction if cross-connected to a VT1.5, and the incoming DS1 signal is looped back.

A far-end C-bit loopback request is established by transmitting a C-bit loopback request in the supporting DS2 signal to the far-end of the facility for the specified DS1, regardless of whether the specified port is cross connected.

Only one loopback at a time (near-end or far-end) can be established for each DS1 port.

To execute an OPR-LPBK-T1, the specified DS1 must have a PST of OOS-AUMA or OOS-MA. If a facility (near-end or far-end) or matrix loopback is specified, the SST cannot be {TS, LPBK}. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing OPR-LPBK-T1 to establish a near-end loopback sets an ACTLPBK condition type on the specified DS1 port. Executing OPR-LPBK-T1 to establish a far-end loopback request sets an XMTCLPBK condition type on the specified DS1 port.

Executing OPR-LPBK-T1 causes the fault propagation feature to be disabled on the specified port if set.

An OPR-LPBK-T1 command is denied if:

- The specified DS1 port is not provisioned.
- The specified DS1 port is provisioned as a Idle Signal Source port.
- The specified DS1 port does not have a PST of OOS-AUMA or OOS-MA.
- The specified DS1 is already in a loopback (a DS1 SST of LPBK).
- OPR-LPBK-T1 is issued with LPBKTYPE of MATRIX and the specified DS1 is cross-connected to another port which is also in a matrix loopback (a DS1 SST of ACT&LPBK or BUSY&LPBK).
- The specified DS1 is connected to a Test Access port (a DS1 SST of TS) or is a connected Test Access port (a DS1 SST of TS).
- The specified DS1 is the head (Master) or tail of a broadcast conference cross-connection.
- The specified DS1 is embedded within VT1.5.
- The specified port is in roll operation (a DS1 SST of ROLL).
- The specified DS1 is embedded within a protection OC3/OC12.
- The specified DS1 is embedded within an OC3 that is part of an OC3/OC12 ring (using ENT-RNG-OC3 or ENT-RNG-OC12).
- The port identified by the AID is involved in a redlined (RDL=Y) connection.
- An invalid parameter value or combination of parameter values is entered.

- The following combinations of specified AIDs and LPBKTYPE, when the LOCN is NEND, are specified:

AID	LOCN of NEND and LPBKTYPE of :	
	FACILITY	MATRIX
Electrical T1	Allowed	Allowed
DS1 embedded within T3	Allowed	Allowed
DS1 embedded within DS3 which itself is embedded within an EC1, OC3 or OC12	Allowed	Allowed
DS1 embedded within VT1.5 which itself is embedded within an EC1, OC3 or OC12	Denied. Use OPR-LPBK-VT1	Denied. Use OPR-LPBK-VT1

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*The alternate VT1 is already in PAYLOAD/MTRX lpbk */ /*MATRIX lpbktype is invalid on a 2WAYPR port */ /*The alternate VT1 is in 2WAYPR connection */
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAOP	Status Already Operated
SDBE	Status, internal Data Base Error /* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */ /* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */ /* Failed to update the STS database,status=<STATUS> */
SNVS	Status, Not in Valid State /* Port is embedded in ring OC3 */
SROF	Status, Requested Operation Failed
SRQN	Status, invalid ReQuest /* Loopback not allowed when supporting entities are connected */ /* Loopback not allowed when supporting entity under MATRIX loopback */ /* Loopback not allowed on head or tail of a bridge */ /* T1 is connected to a port in MTRX lpbk */

EXAMPLES

In the following example, a loopback in the system's matrix is established for DS1 port T3T1-1398-3.

```
OPR-LPBK-T1::T3T1-1398-3::,,MATRIX;
```

In the following example, a far-end loopback for DS1 port T3T1-1398-4 is established by transmitting a C-bit loopback request in the supporting DS2 signal.

```
OPR-LPBK-T1::T3T1-1398-4:::FEND;
```

COMMAND CODE: **OPR-LPBK-T3**
COMMAND NAME: **OPERATE LOOPBACK T3**

PURPOSE

The OPR-LPBK-T3 command establishes a near-end (in the system) DS3 loopback on the specified electrical DS3 port.

A near-end loopback can be established at the receive-side (from the network) of the specified DS3 port (a facility loopback) or in the system cross-connect matrix (a matrix loopback).

A near-end facility or matrix loopback is allowed on a DS3 port that is not cross-connected, or that is one-way or two-way cross-connected (it has an SST of ACT or BUSY), in which case DS3 AIS is transmitted in the outgoing direction and the incoming signal is looped back.

To execute an OPR-LPBK-T3, the specified DS3 must have a PST of OOS-AUMA or OOS-MA. If a facility or matrix loopback is specified, the SST cannot be {TS, LPBK, TRM}. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing OPR-LPBK-T3 sets an ACTLPBK condition type on the specified DS3 port, and causes the fault propagation feature to be disabled on this port if set.

An OPR-LPBK-T3 command is denied if:

- The specified DS3 port is not provisioned.
- The specified DS3 is embedded within an OC3 or OC12 that is part of an OC3/OC12 ring (using ENT-RNG-OC3 or ENT-RNG-OC12).
- The specified DS3 port does not have a PST of OOS-AUMA or OOS-MA.
- The specified DS3 port is already in a loopback (a DS3 SST of LPBK).
- OPR-LPBK-T3 is issued with LPBKTYPE of MATRIX and the specified DS3 is cross-connected to another port which is also in a matrix loopback (a DS3 SST of ACT&LPBK or BUSY&LPBK).
- The specified DS3 port is connected to a Test Access port (a DS3 SST of TS).
- Any embedded DS1s within the specified DS3 port are cross-connected (a DS3 SST of TRM, or a DS1 SST of ACT or BUSY), are connected to a Test Access port (a DS1 SST of TS), are a connected Test Access port (a DS1 SST of TS), are under Roll operation (a DS1 SST of ROLL), or are in loopback (a DS1 SST of LPBK) and LPBKTYPE of MATRIX is specified.
- The specified DS3 has fault propagation active on it, or any of its embedded facilities have fault propagation set.
- The specified DS3 is an electrical (stand-alone) DS3 which resides in a quad or an Standard EP3 shelf.
- The port identified by the AID is involved in a redlined (RDL=Y) connection.
- An invalid parameter value or combination of parameter values is entered.
- The following combinations of specified AIDs and LPBKTYPE, when the LOCN is NEND, are specified:

AID	LOCN of NEND and LPBKTYPE of:		
	FACILITY	MATRIX	TERMINAL
Electrical DS3	Allowed	Allowed	Denied
DS3 embedded within EC1, OC3 or OC12	Denied	Denied. Use OPR-LPBK-STS1	Denied

INPUT FORMAT

OPR-LPBK-T3 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID < 1-20 VALID TID CHARACTERS >
Default: <SID>
Addressing: None
Description: Target Identifier, specifies the network node TID for the command.

AID	DS3_AID: {T3-{1-4800}} Default: Entry Required Addressing: None Description: DS3 AID, identifies the DS3 port.	(T3-DS3#)
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.	
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is established. Value is: NEND Near-End, specifies that the loopback is to occur in the system.	
LPBKTYPE	{FACILITY, MATRIX} Default: {FACILITY} Addressing: None Description: Loopback Type, specifies the type of loopback. Values are: FACILITY Facility, specifies a DS3 loopback at the receive-side (from the network) of the specified DS3 port. MATRIX Matrix, specifies a DS3 loopback in the system matrix.

```

COMMAND CODE: **OPR-LPBK-VT1**
COMMAND NAME: **OPERATE LOOPBACK VT1**

PURPOSE

The OPR-LPBK-VT1 command establishes a near-end (in the system) VT1.5 loopback on the specified VT1.5 port.

A near-end loopback can be established in the system cross-connect matrix (a matrix loopback). A matrix loopback is allowed on a VT1.5 port that is not cross-connected, or that is one-way or two-way cross-connected (i.e., it has an SST of ACT or BUSY), but is not allowed on a VT1.5 port that is the head (Master) or tail of a broadcast conference cross-connection. If the matrix loopback is executed on a VT1.5 that is one-way or two-way cross-connected, VT1.5 AIS is transmitted in the outgoing direction and the incoming signal is looped back.

To execute an OPR-LPBK-VT1, the specified VT1.5 must have a PST of OOS-AUMA or OOS-MA. If a matrix loopback is specified, the SST cannot be {TS, LPBK}. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing OPR-LPBK-VT1 to establish a near-end loopback sets an ACTLPBK condition type on the specified VT1.5 port.

Executing OPR-LPBK-VT1 causes the fault propagation feature to be disabled on the specified port if set.

If OPR-LPBK-VT1 is issued to set up a matrix loopback on an VT1.5, embedded within a ring OC3/OC12, and is 2WAYPR cross-connected, both the addressed VT1.5 and its mate VT1.5 will enter an SST of LPBK.

When OPR-LPBK-VT1 is successfully issued on a VT1.5, embedded within a ring OC3/OC12, with LPBKTYPE as PAYLOAD, the system will loopback the specified path inside the RPB.

When OPR-LPBK-VT1 is successfully issued on a VT1.5, embedded within a ring OC3/OC12, with LPBKTYPE as PAYLOAD and the specified path is cross-connected to its mate path to form a pass-through path, the system will allow the "preferred" and "alternate" VT1.5 paths to be under PAYLOAD loopback at the same time.

An OPR-LPBK-VT1 command is denied if:

- The specified VT1.5 port is not provisioned.
- The specified VT1.5 port does not have a PST of OOS-AUMA or OOS-MA.
- The specified VT1.5 is already in a loopback (a VT1.5 SST of LPBK).
- OPR-LPBK-VT1 is issued LPBKTYPE of MATRIX and the specified VT1.5 is cross-connected to another port which is also in a matrix loopback (an SST of ACT&LPBK or BUSY&LPBK).
- The specified VT1.5 is connected to a Test Access port (a VT1.5 SST of TS).
- The specified VT1.5 is embedded within an STS-1 which itself is embedded within a protection OC3/OC12.
- The specified VT1.5 is the head (Master) or tail of a broadcast conference cross-connection.
- The specified VT1.5 is under roll operation (a VT1.5 SST of ROLL).
- The mate port of the specified VT1.5, embedded within a ring OC3/OC12, is not provisioned or not in a OOS-MA or OOS-AUMA state.
- The specified VT1.5 whose mate VT1.5, embedded within a ring OC3/OC12, is already 2WAY cross-connected to an VT1.5, embedded within a non-ring EC1 or a different ring OC3/OC12, to form an unprotected 2WAY cross-connect.
- The specified VT1.5, embedded within a ring OC3/OC12, is unconnected and an attempt is made to perform matrix loopback on one path while its mate path is in matrix loopback.
- The value of LPBKTYPE is PAYLOAD and the specified VT1.5 is not embedded within a ring OC3/OC12.
- The port identified by the AID is involved in a redlined (RDL=Y) connection.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

OPR-LPBK-VT1 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1–{1–3840}–{1–7}–{1–4}} (EC1VT1–EC1/STS1#–VTGrp#–VT1.5#) {OC3VT1–{1–2240}–{1–3}–{1–7}–{1–4}} (OC3VT1–OC3#–STS1#–VTGrp#–VT1.5#) {OC12VT1–{1–560}–{1–4}–{1–3}–{1–7}–{1–4}} (OC12VT1–OC12#–STM1#–STS1#–VTGrp#–VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID, identifies the VT1.5 port.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near–end) where the loopback is established. Values are: NEND Near–End, specifies that the loopback is to occur in the system.
LPBKTYPE	{MATRIX, PAYLOAD} Default: {MATRIX} Addressing: None Description: Loopback Type; specifies the type of loopback. Values are: MATRIX Matrix, specifies a VT1.5 loopback in the system matrix. PAYLOAD Payload, specifies a VT1.5 loopback in the system payload. Payload is only valid on VT1.5s embedded within a ring OC3/OC12 and performs loopback of the addressed VT1.5 in the RPB.

RTRV-VT1
```

COMMAND CODE: **OPR-PROTNSW-OC12**
COMMAND NAME: **OPERATE PROTECTION SWITCH OC-12**

PURPOSE

The OPR-PROTNSW-OC12 command instructs the system to initiate a SONET line (OC-12) protection switch. User switch requests initiated with this command (i.e., forced switch, lockout and manual switch) remain active until they are released using RLS-PROTNSW-OC12 command or overridden by a higher priority protection switch request.

This command may not require a switch to occur. It may be used to upgrade the priority of the OC-12 line already on protection, for example, to upgrade the priority of a channel automatically switched to protection to a “forced switch”.

An OPR-PROTNSW-OC12 command is denied if:

- The specified OC-12 and its redundant OC-12 line have not been defined as an FFP pair (using ENT-FFP-OC12).
- The command is issued with SC=MAN and a Forced Switch, automatic switch due to Signal failure, or an automatic switch due to Signal Degrade or lockout of protection is in effect.
- The command is issued with SC=FRCD and either another Forced Switch is being honored, or there is a lockout of protection.
- The redundant OC-12 line is not provisioned.
- An invalid parameter value is entered.

INPUT FORMAT

```
OPR-PROTNSW-OC12:[TID]:AID:[CTAG]::SC:[DIRN];
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12–{1–560}} (OC12–OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the OC–12 port to be switched to protection.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SC	{FRCD, LOCKOUT, MAN}	
	Default:	Entry Required
	Addressing:	None
	Description:	The Switch Command that is to be initiated on the specified line. Values are:
	FRCD	Forced Switch. If the AID refers to working line (odd numbered OC–12), the Forced Switch of Working Line (to Protection Line – even numbered OC–12) will be executed only if the protection line is not satisfying a higher or equal priority request. If the AID identifies a working line that has already been switched to protection by an automatic or manual switch, no switch occurs. However, the priority of the existing switch will be raised to “forced”. If the AID refers to the protection line (even numbered OC–12), the Forced Switch of the Protection Line to Working line (odd numbered OC–12) will be executed only if the working line is not satisfying a higher or equal priority request. If the AID identifies a protection line that has already been switched to working by an automatic or manual switch, no switch occurs. However, the priority of the existing switch will be raised to “forced”. The forced switch of protection to working is applicable only to 1+1 unidirectional APS architecture.
	LOCKOUT	Lockout. If the AID identifies a protection line, then any working line will be prevented from using the protection resources. If the working line is on protection at the time of issuance of this command, the service will be switched back to working line. Since in a 1+1 architecture there is only one working line, the lockout of the working line and protection line are the same, hence no lockout of the working line will be supported in this release.
	MAN	Manual Switch. If the AID refers to working line (odd numbered OC–12), the Manual Switch of Working Line (to Protection Line – even numbered OC–12) will be executed only if the protection line is not in a Signal Fail (SF) state or is not satisfying a higher or equal priority request. If the AID refers to the protection line (even numbered OC–12), the Manual Switch of the Protection Line to Working line (odd numbered OC–12) will be executed only if the working line is not in a Signal Fail (SF) state or is not satisfying a higher or equal priority request. The manual switch of protection to working is applicable only to 1+1 unidirectional APS architecture.
DIRN	{RCV}	
	Default:	{ RCV }
	Addressing:	None
	Description:	Direction. This parameter determines the direction of transmission in which the switching is to be made and is relative to the SONET line identified by the AID. Values are:
	RCV	Receive direction.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SARB	Status, All Resources Busy /* A manual switch is in progress for this protection group. */
SDBE	Status, internal Data Base Error /* Failure in FFPidToGlobFFPid, ffp %d, status %d */ /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* FFP Database Error: <ERROR-STRING> */
SROF	Status, Requested Operation Failed /* No response received from L3P. */ /* SPB timeout occurred. */ /* SPB failure response, status=%d */
SSRD	Status, Switch Request Denied /* Signal Failure detected. */ /* Signal Degrade detected. */ /* A higher priority switch request is being serviced. */

EXAMPLES

In the following example, a manual switch of the working OC-12 line OC12-1 to protection line OC12-2 is done. It is assumed that the OC12-1 and OC12-2 are good lines and no other manual switch/automatic switch is present on these lines.

```
OPR-PROTNSW-OC12::OC12-1::MAN;
```

In the following example, a manual switch of the working line OC12-1 is requested while there is signal failure on the line OC12-2.

```
OPR-PROTNSW-OC12::OC12-1::MAN;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 PRTL
"OC12-1:ERRCDE=SSRD"
/* Status, Switch Request Denied. */
/* Signal Failure detected. */
```

RELATED COMMANDS

```
RLS-PROTNSW-OC12
```

COMMAND CODE: **OPR-PROTNSW-OC3**
COMMAND NAME: **OPERATE PROTECTION SWITCH OC-3**

PURPOSE

The OPR-PROTNSW-OC3 command instructs the system to initiate a SONET line (OC-3) protection switch. User switch requests initiated with this command (i.e., forced switch, lockout and manual switch) remain active until they are released using RLS-PROTNSW-OC3 command or overridden by a higher priority protection switch request.

This command may not require a switch to occur. It may be used to upgrade the priority of the OC-3 line already on protection, for example, to upgrade the priority of a channel automatically switched to protection to a "forced switch".

An OPR-PROTNSW-OC3 command is denied if:

- The specified OC-3 and its redundant OC-3 line have not been defined as an FFP pair (using ENT-FFP-OC3).
- The command is issued with SC=MAN and a Forced Switch, automatic switch due to Signal failure, or an automatic switch due to Signal Degrade or lockout of protection is in effect.
- The redundant OC-3 line is not provisioned.
- An invalid parameter value is entered.

INPUT FORMAT

OPR-PROTNSW-OC3 : [TID] : AID : [CTAG] : : SC : [DIRN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >

	Description:	Target Identifier, specifies the network node TID for the command.	
AID	OC3_AID:		
	{OC3-{1-2240}}		(OC3-OC3#)
	Default:	Entry Required	
	Addressing:	None	
	Description:	OC3 AID, identifies the OC-3 port to protection switched.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SC	{FRCD, LOCKOUT, MAN}	
	Default:	Entry Required
	Addressing:	None
	Description:	The Switch Command that is to be initiated on the specified line. Values are:
	FRCD	Forced Switch. If the AID refers to working line (odd numbered OC-3), the Forced Switch of Working Line (to Protection Line – even numbered OC-3) will be executed only if the protection line is not satisfying a higher or equal priority request. If the AID identifies a working line that has already been switched to protection by an automatic or manual switch, no switch occurs. however, the priority of the existing switch will be raised to “forced”. If the AID refers to the protection line (even numbered OC-3), the Forced Switch of the Protection Line to Working line (odd numbered OC-3) will be executed only if the working line is not satisfying a higher or equal priority request. If the AID identifies a protection line that has already been switched to working by an automatic or manual switch, no switch occurs. however, the priority of the existing switch will be raised to “forced”. The forced switch of protection to working is applicable only to 1+1 unidirectional APS architecture.
	LOCKOUT	Lockout. If the AID identifies a protection line, then any working line will be prevented from using the protection resources. If the working line is on protection at the time of issuance of this command, the service will be switched back to working line. Since in a 1+1 architecture there is only one working line, the lockout of the working line and protection line are the same, hence no lockout of the working line will be supported in this release.
	MAN	Manual Switch. If the AID refers to working line (odd numbered OC-3), the Manual Switch of Working Line (to Protection Line – even numbered OC-3) will be executed only if the protection line is not in a Signal Fail (SF) state or is not satisfying a higher or equal priority request. If the AID refers to the protection line (even numbered OC-3), the Manual Switch of the Protection Line to Working line (odd numbered OC-3) will be executed only if the working line is not in a Signal Fail (SF) state or is not satisfying a higher or equal priority request. The manual switch of protection to working is applicable only to 1+1 unidirectional APS architecture.
DIRN	{RCV}	
	Default:	{ RCV }
	Addressing:	None
	Description:	Direction. This parameter determines the direction of transmission in which the switching is to be made and is relative to the SONET line identified by the AID. Values are:
	RCV	Receive direction.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SARB	Status, All Resources Busy /* A manual switch is in progress for this protection group. */
SDBE	Status, internal Data Base Error /* Failure in FFPidToGlobFFPid, ffp %d, status %d */ /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* FFP Database Error: <ERROR-STRING> */
SROF	Status, Requested Operation Failed /* No response received from L3P. */ /* SPB timeout occurred. */ /* SPB failure response, status=%d */
SSRD	Status, Switch Request Denied /* Signal Failure detected. */ /* Signal Degrade detected. */ /* A higher priority switch request is being serviced. */

EXAMPLES

In the following example, a manual switch of the working OC3 line OC3-1 to protection line OC3-2 is done. It is assumed that the OC3-1 and OC3-2 are good lines and no other manual switch/automatic switch is present on these lines.

```
OPR-PROTNSW-OC3::OC3-1:::MAN;
```

In the following example, a manual switch of the working line OC3-1 is requested while there is a failed signal on the line OC3-2.

```
OPR-PROTNSW-OC3::OC3-1:::MAN;
```

For this example, the output response shown assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 PRTL
"OC3-1:ERRCDE=SSRD"
/* Status, Switch Request Denied. */
/* Signal Failure detected. */
```

RELATED COMMANDS

```
RLS-PROTNSW-OC3
```

COMMAND CODE: **OPR-PROTNSW-ST51**
COMMAND NAME: **OPERATE PROTECTION SWITCH ST5-1**

PURPOSE

The OPR-PROTNSW-ST51 command instructs the system to initiate a SONET ST5-1 path level protection switch. User switch requests initiated with this command (i.e., forced switch, manual switch) remain active until they are released via RLS-PROTNSW-ST51 command or overridden by a higher priority protection switch request. Switch requests are not queued; a switch request overridden by a higher priority request is not saved. This command is only applicable to ring configurations (refer to ENT-RNG-OC3).

This command may not require a switch to occur. It may be used to upgrade the priority of the ST5-1 path already on alternate (i.e., protecting), for example, to upgrade the priority of a channel automatically switched to alternate (i.e., protecting) to a "forced switch".

Executing an OPR-PROTNSW-ST51 command causes the path to which the traffic was switched to carry an SST of WRK and the path from which the traffic was switched (if the path has a PST of IS) to carry an SST of STBYH.

An OPR-PROTNSW-ST51 command is denied if:

- The specified ST5-1 and its alternate (i.e., protecting) ST5-1 ring path are not dropped (i.e., CCT is not equal to 2WAYPR/2WAYDC).
- The command is issued with SC=MAN, while an automatic switch, FS (Forced Switch), or MS (Manual Switch) exists on the ST5-1 path pair.
- The command is issued with SC=FRCD, and FS exists on the ST5-1 path pair.
- The command is issued with SC=MAN or FRCD, and the alternate facility to which the ST51 would switch or the O1B module in which the facility resides is logically removed (i.e., in the OOS-MA state) or faulty (OOS-AU).
- An invalid parameter value is entered.

INPUT FORMAT

OPR-PROTNSW-ST51 : [TID] : AID : [CTAG] : : SC : [DIRN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	STS1 AID, identifies the STS-1 path from which to switch.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SC	{FRCD, MAN}	
	Default:	Entry Required
	Addressing:	None
	Description:	The Switch Command that is to be initiated on the specified STS–1 path. Values are:
	FRCD	Forced Switch. If the AID refers to preferred (i.e., protected) path, the Forced Switch of preferred path (to alternate path) will be executed unless another Forced Switch (e.g., Forced Switch of alternate path to preferred path) is in effect. If the AID identifies a preferred path that has already been switched to alternate by an automatic or manual switch, no switch occurs. However, the priority of the existing switch will be raised to “forced”. If the AID refers to the alternate (i.e., protecting) path, the Forced Switch of the alternate path (to preferred path) will be executed unless another Forced Switch (e.g., Forced Switch of preferred path to alternate path) is in effect. If the AID identifies an alternate path that has already been switched to preferred by an automatic or manual switch, no switch occurs. However, the priority of the existing switch will be raised to “forced”.
	MAN	Manual Switch. If the AID refers to preferred (i.e., protected) path, the Manual Switch of preferred path (to alternate path) will be executed unless a request of equal or higher priority (e.g., Forced Switch or Automatic Selector Criteria (e.g., AIS)) is in effect. If the AID refers to the alternate (i.e., protecting) path, the Manual Switch of the alternate path (to preferred path) will be executed unless a request of equal or higher priority (e.g., Forced Switch or Automatic Selector Criteria (e.g., AIS)) is in effect.
DIRN	{RCV}	
	Default:	{ RCV }
	Addressing:	None
	Description:	Direction. This parameter determines the direction of transmission in which the switching is to be made. Values are:
	RCV	Receive direction only.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

ENT-CRS-STs1  
RLS-PROTNSW-STs1
```

COMMAND CODE: **OPR-PROTNSW-VT1**
COMMAND NAME: **OPERATE PROTECTION SWITCH VT1**

PURPOSE

The OPR-PROTNSW-VT1 command instructs the system to initiate a SONET VT-1 path level protection switch. User switch requests initiated with this command (i.e., forced switch or manual switch) remain active until they are released using RLS-PROTNSW-VT1 command or overridden by a higher priority protection switch request. Switch requests are not queued; a switch request overridden by a higher priority request is not saved. This command is only applicable to ring configurations (refer to ENT-RNG-OC3 or ENT-RNG-OC12).

This command may not require a switch to occur. It may be used to upgrade the priority of the VT1.5 path already on alternate (protecting), for example, to upgrade the priority of a channel automatically switched to alternate (protecting) to a “forced switch”.

Executing an OPR-PROTNSW-VT1 command causes the path to which the traffic was switched to carry an SST of WRK and the path from which the traffic was switched (if the path has a PST of IS) to carry an SST of STBYH.

An OPR-PROTNSW-VT1 command is denied if:

- The specified VT1.5 and its alternate (i.e., protecting) VT1.5 ring path are not dropped (i.e., CCT is not equal to 2WAYPR/2WAYDC).
- The command is issued with SC=MAN, while an automatic switch, FS (Forced Switch), or MS (Manual Switch) exists on the VT1.5 path pair.
- The command is issued with SC=FRCD, and FS exists on the VT1.5 path pair.
- The command is issued with SC=MAN or FRCD, and the alternate facility to which the VT1.5 would switch or the O1B module in which the facility resides is logically removed (i.e., in the OOS-MA state) or faulty (OOS-AU).
- An invalid parameter value is entered.

INPUT FORMAT

```
OPR-PROTNSW-VT1:[TID]:AID:[CTAG]::SC:[DIRN];
```

INPUT PARAMETERS

```

COMMAND CODE: **OPR-SYNCNSW**
COMMAND NAME: **OPERATE SYNCHRONIZATION SWITCH**

PURPOSE

The OPR-SYNCNSW command causes the clock subsystem to select (switch to) the specified (Primary or Secondary) clock reference source for system clock synchronization.

When a clock synchronization switch is initiated (via an OPR-SYNCNSW), the system continues to select the specified clock reference source until the synchronization switch is released (via a RLS-SYNCNSW) or the synchronization switch is automatically overridden because of a clock reference source failure.

An OPR-SYNCNSW command is denied if:

- The specified clock reference source has failed.
- The specified clock reference is switched to a clock reference having a lower synchronization status message.
- The MCB subsystem is provisioned for the internal timing reference mode of operation (refer to the MCB TMG parameter in the ED-EQPT command).
- An OPR-SYNCNSW command is currently active (OPR-SYNCNSW entered but not released via a RLS-SYNCNSW command).
- The MCB subsystem is currently in the Free Running, Holdover, or Fast Tracking mode of operation (due to a SET-SYNCN command).
- An invalid parameter value is entered.

INPUT FORMAT

OPR-SYNCNSW: [TID] : : [CTAG] : : SWITCHTO;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.
SWITCHTO	{PRI, SEC}
Default:	Entry Required
Addressing:	None
Description:	Switch To Reference, specifies the clock reference source that is to be selected as the system clock synchronization source. Values are:
PRI	Primary, the primary clock reference source is selected as the system clock synchronization source.
SEC	Secondary, the secondary clock reference source is selected as the system clock synchronization source.

COMMAND CODE: **REPT-INITZN**
COMMAND NAME: **REPORT INITIALIZATION**

PURPOSE

The REPT-INITZN command disconnects all existing Test Access Port Pair (TAPP) connections established by the user that are link associated (refer to the CONN-TACC-Tx commands); TAPP connections that are not link associated are not disconnected. After REPT-INITZN is executed, the disconnected TAPPs are available for other test access operations.

The REPT-INITZN command only operates on TAPP connections.

An OK acknowledgement response is generated upon completion of the REPT-INITZN command. REPT-INITZN does not generate a successful output response.

Executing a REPT-INITZN command removes the SST value of TS from the affected TAPPs and any equipment-side and facility-side DS1, DS3, STS1 or VT1 ports involved in the associated test access operations. If an associated cross-connection exists, the cross-connection SST of TS is removed from the cross-connection entity.

A REPT-INITZN command is denied if:

- The user does not have any test access connections established.
- An invalid parameter value is entered.

INPUT FORMAT

COMMAND CODE: **RESTORE-DB**
COMMAND NAME: **RESTORE DATABASE**

PURPOSE

The RESTORE-DB command restores the existing system database with that stored on the optical disk media that is inserted in the specified optical disk drive. The existing system database is overwritten by the successful execution of this command.

The RESTORE-DB command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode. If the RESTORE-DB command is executed while in the Normal Command Execution mode (as opposed to the Limited Command Execution mode), full TL1 functionality (commands to perform provisioning, cross-connection, manual protection switching, etc.) is allowed, and the existing system database is overwritten only after the execution of the START-OPS command.

After completion of the database restoral operation by either the Limited Command Execution mode or the Normal Command Execution mode and the restored database is the desired active database, the START-OPS command is issued in order to install the restored database and reset the system.

After completion of the database restoral operation by only the Normal Command Execution mode and the restored database is not the desired active database, the INIT-SYS command is issued to invalidate the restored database and restart the system on the old database. (Note: Since the system remains on the previous database, the INIT-SYS command is not absolutely necessary; however, to prevent START-OPS from installing the restored database at a later time, the INIT-SYS command is used).

The database restoral operation verifies the System Type, Release Stream, software Release Number, and Site ID (SID) of the system against that stored on the optical disk media. A database restoral with a System Type and Release Stream mismatch cannot be performed. A database restoral with a software Release Number or SID mismatch cannot be performed unless CMDMDE of FRCD is specified.

The database restoral operation also verifies the 32-bit CRC (Cyclic Redundancy Code) calculated from the data stored on the optical disk media against the CRC stored on the media. A database restoral with a CRC mismatch cannot be performed.

If the user executing the RESTORE-DB command is provisioned with RUSURE of YES (refer to ENT-USER or ED-PRVG-USER), an R-U-Sure prompt text message is transmitted to the user before the database restoral operation is performed. The R-U-Sure prompt provides the user with an intermediate step to manually accept the software Release Number and SID stored on the backup media or to stop the database restoral operation, if desired, before the system database is overwritten. Refer to the R-U-SURE RESPONSE FORMAT section, below, for the possible prompt messages.

The RUSURE step is not available currently in normal mode.

If the user does not enter "YES" within 120 seconds after the R-U-Sure prompt, the RESTORE-DB command is cancelled (a CANCLD response message is transmitted to the user).

The RESTORE-DB command is denied if:

- The read operation from the optical disk drive cannot be performed (e.g., the media is not inserted in the drive, the drive door is not closed, the drive is currently in use, the media cannot be read, etc.).
- A database restoral operation is currently in-progress.
- The type of system (1631 SX) does not match the System Type stored on the media.
- The system's SID and Software Release number do not match the SID and Software Release number, respectively, stored on the media, unless CMDMDE of FRCD is specified.
- The 32-bit CRC calculated from the data stored on the media does not match the CRC stored on the media.
- The database restoral media has not been loaded into the required drive.
- The Normal Command mode is executed and the larger hard disk is not installed.
- The DSK AID specified is not in an in-service state.
- An invalid parameter value is entered.

INPUT FORMAT

RESTORE-DB: [TID] :AID: [CTAG] :: [CMDMDE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSK-1-3-1, DSK-1-4-2} {OPD-1-3-1, OPD-1-4-2} Default: Entry Required Addressing: None Description: Equipment AID, specifies the equipment entity that contains the backup database to be loaded onto the system. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics. For both DSK and OPD devices, 1-3-1 indicates Copy 0, and 1-4-2 indicates Copy1.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CMDMDE	{FRCD, NORM} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: FRCD Forced, the database restoral operation is performed regardless of whether there is a match between the SID or software release number of the system and that stored on the optical disk media. NORM Normal, the command is denied if there is a mismatch between the SID or software release number of the system and that stored on the optical disk media.

ACKNOWLEDGEMENT RESPONSE FORMAT

If CMDMDE of FRCD is specified and a Software Version (Release Number) mismatch is detected, the following IP message is generated.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
IP  <CTAG>
/* Warning: Software Version Mismatch */
/* <SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>,<DBSID> */
/* Creation Date: <DBDATE> <DBTIME> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
<

```

If CMDMDE of FRCD is specified and a SID mismatch is detected, the following IP message is generated.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
IP  <CTAG>
/* Warning: SID Mismatch */
/* <SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>,<DBSID> */
/* Creation Date: <DBDATE> <DBTIME> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
<

```

If CMDMDE of FRCD is specified and a SID mismatch and Software Version (Release Number) mismatch is detected, the following IP message is generated.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
IP  <CTAG>
    /* Warning: SID and Software Version Mismatch */
    /* <SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>,<DBSID> */
    /* Creation Date: <DBDATE> <DBTIME> */
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
<

```

If the SID and Software Version (Release Number) match, the following IP message is generated.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
IP  <CTAG>
    /* Media Header Matched */
    /* <SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>,<DBSID> */
    /* Creation Date: <DBDATE> <DBTIME> */
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
<

```

R-U-SURE RESPONSE FORMAT

If a Software Version (Release Number) mismatch is detected and the user executing the RESTORE-DB command is provisioned with RUSURE of YES (refer to ENT-USER or ED-PRVG-USER), the following R-U-Sure text message is transmitted to the user.

```

Software Version Mismatch: Continue Restore? [YES/NO]
Confirm <CTAG>:

```

If a SID mismatch is detected and the user executing the RESTORE-DB command is provisioned with RUSURE of YES (refer to ENT-USER or ED-PRVG-USER), the following R-U-Sure text message is transmitted to the user.

```

SID Mismatch: Continue Restore? [YES/NO]
Confirm <CTAG>:

```

If a SID mismatch and Software Version (Release Number) mismatch is detected and the user executing the RESTORE-DB command is provisioned with RUSURE of YES (refer to ENT-USER or ED-PRVG-USER), the following R-U-Sure text message is transmitted to the user.

```

SID and Software Version Mismatch: Continue Restore? [YES/NO]
Confirm <CTAG>:

```

If the SID and Software Version (Release Number) match and the user executing the RESTORE-DB command is provisioned with RUSURE of YES (refer to ENT-USER or ED-PRVG-USER), the following R-U-Sure text message is transmitted to the user.

```

Media Header Match: Continue Restore? [YES/NO]
Confirm <CTAG>:

```

SUCCESSFUL RESPONSE FORMAT

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* DATABASE RESTORAL COMPLETE */
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

UNSUCCESSFUL RESPONSE FORMAT

The following unsuccessful response format is generated if an incorrect or invalid command is entered.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Optional Suggested Action Text> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following unsuccessful response message is generated if a System Type or Release Stream mismatch is detected.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>,<DBSID> */
  /* Creation Date: <DBDATE> <DBTIME> */
  /* Media Write Count: <WRCNT> */
  /* System Type mismatch */
  /* Restore cannot be forced. Please use proper media. */
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following unsuccessful response message is generated if a SID or Software Version (Release Number) mismatch is detected and CMDMDE of NORM is entered.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>,<DBSID> */
  /* Creation Date: <DBDATE> <DBTIME> */
  /* Media Write Count: <WRCNT> */
  /* SID or Software Version mismatch */
  /* Restore may be forced by using FRCD in CMDMDE field of RESTORE-DB */
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following unsuccessful response message is generated if a CRC mismatch or media read error is detected.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* CRC Mismatch or Read Error */
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following unsuccessful response is generated if the command is cancelled after an R-U-Sure prompt.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> CANCLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

SYSTYPE	{1631SX} System Type of the system software for the database on the optical disk or tape media.
STREAM	{LMC-APS} Release Stream of the system software for the database on the optical disk media. Value is: LMC-APS Large Matrix Configuration-Administration Processing System.
RLSTYPE	{F, P, R} Software Release Type of the system software for the database on the optical disk media. Refer to the Software Support Agreement for applicable terms and conditions. Values are: F First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints. P Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions. R Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.
RLSNUM	{06} Software Release Number of the system software for the database on the optical disk media.
IREV	{00-99} Intermediate Release Revision of the system software for the database on the optical disk media. Refer to the Software Support Agreement.
MREV	{00-99} Maintenance Release Revision of the system software for the database on the optical disk media. Refer to the Software Support Agreement.
DBSID	<1-20 CHARACTER SID> Data Base Backup Site Identification, identifies the SID of the system from which the database on the optical disk media originated.
DBDATE	{YY-MM-DD:{00-37,70-99} - {1-12} - {1-31} } Database Backup Date, identifies the date the data was written to the optical disk media. The format of DBDATE is <YY> - <MM> - <DD> where <YY> is the year, <MM> is the month, <DD> is the day. Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and 00 through 37 are interpreted as the year 2000 through the year 2037.
DBTIME	{ {00-23}:{00-59}:{00-59} } Database Backup Time, identifies the time of the database backup stored on the optical disk media. The format of TIME is <HH>:<MM>:<SS> where <HH> is the hour, <MM> is the minute, and <SS> is the second.
WRCNT	{0-999} Disk/Tape Write Count, indicates the number of times data has been written to the optical disk media.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IITA	Input, Invalid TArget identifier /* Invalid AID specified */
SROF	Status, Requested Operation Failed /* CRC Mismatch or Read Error */ /* Media does not contain a valid DB Backup label */ /* Couldn't build database command */ /* Invalid AID specified, operation terminated */ /* Communication error termination, DBBU/DSKMGR */ /* SIGTERM received, operation terminated */ /* Media permission denied, operation terminated */ /* Unknown termination code, operation terminated */ /* disk open error, operation terminated */ /* disk seek error, operation terminated */ /* super block read error, operation terminated */ /* Media drive open error, operation aborted */ /* free block seek error, operation terminated */ /* disk data seek error, operation terminated */ /* disk read error, operation terminated */ /* media read error, operation terminated */ /* media verification error, operation terminated */ /* free block read error, operation terminated */ /* Media write protected, operation aborted */ /* The CRC and the data on the media do not match */ /* 1631 SX <Version> <SID> */ /* Creation Date: <DATE> <TIME> */ /* Media Write Count: <WRITECOUNT> */ /* SID or Software Version mismatch */ /* Restore may be forced by using FRCD in CMDMDE field of RESTORE-DB */ /* System Type mismatch */ /* Restore cannot be forced. Please use proper media */ /* CRC Mismatch or Read Error */

EXAMPLES

In the following example, the system database is restored to that stored on the disk media in OPD-1-3-1.

```
RESTORE-DB::OPD-1-3-1;
```

The output responses, shown below, assume CID 3 was used to enter the command and a system generated CTAG value of P26023. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The example assumes the command is issued by a user provisioned with the RUSURE parameter (in ENT-USER) enabled. The Site ID field in the IP message below would contain the SID stored on the media, which in this example would also match the system's SID.

```
<SID> <YY-MM-DD> <HH:MM:SS>
IP P26023
/* Media Header Matched */
/* 1631SX,LMC-APS,R06.00.00,ANSDSL672 */
/* Creation Date: 95-09-03 14:05:01 */
/* RESTORE-DB::OPD-1-3-1 [P26023] (3) */
;
Media Header Match: Continue Restore? [YES/NO]
Confirm [P26023]:YES;
<SID> <YY-MM-DD> <HH:MM:SS>
M P26023 COMPLD
/* DATABASE RESTORAL COMPLETE */
/* RESTORE-DB::OPD-1-3-1 [P26023] (3) */
;
```

COMMAND CODE: **RLS-ISGLP-STs1**
COMMAND NAME: **RELEASE IN-SERVICE GROWTH
LOOPBACK STs-1**

PURPOSE

The RLS-ISGLP-STs1 command releases the matrix loopback of the embedded VT1.5s in the specified STs-1 previously established by an OPR-ISGLP-STs1 command. Generation of the VT1.5 idle signals being looped back is discontinued.

For a RLS-ISGLP-STs1 command to execute, the specified STs-1 must be in an OOS-AUMA,UAS&MT&LPBK state. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing a RLS-ISGLP-STs1 removes the STs-1 SST of LPBK from the specified STs-1 and removes the VT1.5 SST of LPBK from each of the embedded VT1.5s in the STs-1.

A RLS-ISGLP-STs1 command is denied if:

- The specified STs-1 port is not in an OOS-AUMA,UAS&MT&LPBK state.
- The specified STs-1 is embedded within a protection OC-3 or OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

RLS-ISGLP-STs1: [TID]:AID:[CTAG];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies the STs-1 port whose embedded VT1.5s are being looped back.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **RLS-ISGLP-T1**
COMMAND NAME: **RELEASE IN-SERVICE GROWTH
LOOPBACK T1**

PURPOSE

The RLS-ISGLP-T1 command releases the matrix loopback of the specified DS1 previously established by an OPR-ISGLP-T1 command. Generation of the ESF QRS signal being looped back is discontinued.

For a RLS-ISGLP-T1 command to execute, the specified DS1 must be in an OOS-AUMA,UAS&MT&LPBK state. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing a RLS-ISGLP-T1 removes the DS1 SST of LPBK from the specified DS1, and causes a DS3 SST change from UAS&DSBLD&MT to UAS&MT on the supporting DS3 when the DS1 SST of LPBK is removed from all of the DS1s supported by the DS3.

A RLS-ISGLP-T1 command is denied if:

- The specified DS1 port is not in an OOS-AUMA,UAS&MT&LPBK state.
- An invalid parameter value is entered.

INPUT FORMAT

RLS-ISGLP-T1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID: {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#) {T1-{1-59392}} (T1-DS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS1 AID, identifies the DS1 port being looped back.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

COMMAND CODE: **RLS-ISGLP-T3**
COMMAND NAME: **RELEASE IN-SERVICE GROWTH
LOOPBACK T3**

PURPOSE

The RLS-ISGLP-T3 command releases the matrix loopback of the embedded DS1s in the specified DS3 previously established by an OPR-ISGLP-T3 command. Generation of the ESF QRS signals being looped back is discontinued.

For a RLS-ISGLP-T3 command to execute, the specified DS3 must be in an OOS-AUMA,UAS&MT&LPBK state. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing a RLS-ISGLP-T3 removes the DS3 SST of LPBK from the specified DS3 and removes the DS1 SST of LPBK from each of the embedded DS1s in the DS3.

A RLS-ISGLP-T3 command is denied if:

- The specified DS3 port is not in an OOS-AUMA,UAS&MT&LPBK state.
- An invalid parameter value is entered.

INPUT FORMAT

RLS-ISGLP-T3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

COMMAND CODE: **RLS-ISGLP-VT1**
COMMAND NAME: **RELEASE IN-SERVICE GROWTH
LOOPBACK VT1**

PURPOSE

The RLS-ISGLP-VT1 command releases the matrix loopback of the specified VT1.5 previously established by an OPR-ISGLP-VT1 command. Generation of the VT1.5 idle signal being looped back is discontinued.

For a RLS-ISGLP-VT1 command to execute, the specified VT1.5 must be in an OOS-AUMA,UAS&MT&LPBK state. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing a RLS-ISGLP-VT1 removes the VT1.5 SST of LPBK from the specified VT1.5, and causes an STS-1 SST change from UAS&DSBLD&MT to UAS&MT on the supporting STS-1 when the VT1.5 SST of LPBK is removed from all of the VT1.5s supported by the STS-1.

A RLS-ISGLP-VT1 command is denied if:

- The specified VT1.5 port is not in an OOS-AUMA,UAS&MT&LPBK state.
- The specified VT1.5 is embedded within a protection OC-3/OC-12.
- An invalid parameter value is entered.

INPUT FORMAT

RLS-ISGLP-VT1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies the VT1.5 port being looped back.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* Error getting shelf information for record <RECORD NUMBER> for status <STATUS> */
	/* Failed to Update Sptg Tps: Status=<STATUS> */
	/* Failed to get supporting entity records */
	/* Failed(status <STATUS>) to convert STS TP <RECORD_NUMBER> to T3 TP */
	/* Failed(status <STATUS>) to convert T3 TP <RECORD_NUMBER> to EC1 TP */
	/* Failed(status <STATUS>) to send PROV message for TP <RECORD NUMBER> */
	/* Failed(status <STATUS>) to get supported entity of TP <RECORD NUMBER> */
	/* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */
	/* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */
	/* <DATABASE TYPE> Database Error: <STATUS> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the matrix loop back of VT1.5 port OC3VT1-166-1-5-2 is released.

```
RLS-ISGLP-VT1::OC3VT1-166-1-5-2;
```

COMMAND CODE: **RLS-LPBK-EC1**
COMMAND NAME: **RELEASE LOOPBACK EC1**

PURPOSE

The RLS-LPBK-EC1 command releases a facility loopback (at the receive-side of the port), previously established by an OPR-LPBK-EC1 command, on the specified EC1 port.

To execute an RLS-LPBK-EC1, the specified EC1 must have a PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing RLS-LPBK-EC1 clears the ACTLPBK condition type on the specified EC1 port.

A RLS-LPBK-EC1 command is denied if:

- The specified EC1 is not in a loopback (an EC1 PST,SST of OOS–AUMA,LPBK or OOS–MA,LPBK).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
RLS-LPBK-EC1:[TID]:AID:[CTAG]::[LOCN],,,[LPBKTYPE];
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: None Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is to be released. Values are: NEND Near-End, specifies that the loopback in the system is to be released.
LPBKTYPE	{FACILITY} Default: <Any Existing Loopback Type> Addressing: None Description: Loopback Type, specifies the type of loopback to be released. Value is: FACILITY Facility, specifies an EC1 loopback at the receive-side (from the network) of the specified EC1 port.

SUCCESSFUL RESPONSE FORMAT

```

RTRV-EC1
```

COMMAND CODE: **RLS-LPBK-OC12**
COMMAND NAME: **RELEASE LOOP BACK OC12**

PURPOSE

The RLS-LPBK-OC12 command releases a facility loopback (at the receive-side of the port), previously established by an OPR-LPBK-OC12 command, on the specified OC12 port.

To execute a RLS-LPBK-OC12, the specified OC12 must have a PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing RLS-LPBK-OC12 clears the ACTLPBK condition type on the specified OC12 port, and causes the fault propagation feature to be again enabled if it was disabled when the corresponding OPR-LPBK-OC12 was issued.

A RLS-LPBK-OC12 command is denied if:

- The specified OC12 is not in a loopback (an OC12 PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RLS-LPBK-OC12 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the OC12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is to be released. Values are: NEND Near-End, specifies that the loopback in the system is to be released.
LPBKTYPE	{FACILITY} Default: <Any Existing Loopback Type> Addressing: None Description: Loopback Type, specifies the type of loopback to be released. Value is: FACILITY Facility, specifies an OC12 loopback at the receive-side (from the network) of the specified OC12 port.

SUCCESSFUL RESPONSE FORMAT

<SID> <YY-MM-DD> <HH:MM:SS>

RTRV-OC12
```

COMMAND CODE: **RLS-LPBK-OC3**
COMMAND NAME: **RELEASE LOOPBACK OC3**

PURPOSE

The RLS-LPBK-OC3 command releases a facility loopback (at the receive-side of the port), previously established by an OPR-LPBK-OC3 command, on the specified OC3 port.

To execute an RLS-LPBK-OC3, the specified OC3 must have a PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing RLS-LPBK-OC3 clears the ACTLPBK condition type on the specified OC3 port, and causes the fault propagation feature to be again enabled if it was disabled when the corresponding OPR-LPBK-OC3 was issued.

A RLS-LPBK-OC3 command is denied if:

- The specified OC3 is not in a loopback (an OC3 PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RLS-LPBK-OC3 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: None Description: OC3 AID, identifies the OC3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is to be released. Values are: NEND Near-End, specifies that the loopback in the system is to be released.
LPBKTYPE	{FACILITY} Default: <Any Existing Loopback Type> Addressing: None Description: Loopback Type, specifies the type of loopback to be released. Value is: FACILITY Facility, specifies an OC3 loopback at the receive-side (from the network) of the specified OC3 port.

```

COMMAND CODE: **RLS-LPBK-STs1**
COMMAND NAME: **RELEASE LOOPBACK STs1**

PURPOSE

The RLS-LPBK-STs1 command releases the near-end (in the system) STs1 loopback, previously established by an OPR-LPBK-STs1 command, on the specified STs1 port. If the port was cross-connected prior to establishing a loopback, then the cross-connection is re-established when the RLS-LPBK-STs1 is executed.

To execute an RLS-LPBK-STs1, the specified STs1 must have a PST of OOS-AUMA or OOS-MA and a SST of LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing RLS-LPBK-STs1 clears the ACTLPBK condition type on the specified STs1 port.

A RLS-LPBK-STs1 command is denied if:

- The specified STs1 is not in a loopback (an STs1 PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK).
- The specified STs1 is embedded within a protection OC3 or OC12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RLS-LPBK-STs1: [TID] :AID: [CTAG] :: [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STs1_AID: {EC1STs1-{1-3840}} (EC1STs1-EC1/STs1#) {OC3STs1-{1-2240}-{1-3}} (OC3STs1-OC3#-STs1#) {OC12STs1-{1-560}-{1-4}-{1-3}} (OC12STs1-OC12#-STM1#-STs1#) Default: Entry Required Addressing: None Description: STs1 AID, identifies the STs1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is to be released. Values are: NEND Near-End, specifies that the loopback in the system is to be released.
LPBKTYPE	{MATRIX, PAYLOAD} Default: <Any Existing Loopback Type> Addressing: None Description: Loopback Type, specifies the type of loopback to be released. Value is: MATRIX Matrix, specifies an STs1 loopback in the system matrix to be released. PAYLOAD Payload, specifies an STs1 loopback in the RPB module to be released.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
	/* PAYLOAD valid only on a port within a ring */
IIAC	Input, Invalid ACcess identifier
SARB	Status, All Resources Busy
SARL	Status, Already ReLeased
	/* There is no loopback on the port */
SDBE	Status, internal Data Base Error
	/* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */
	/* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */
	/* Failure to update the STS database, status <STATUS> */
	/* Failed to get supported entity records */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
	/* The requested port is supporting loopback */
	/* The requested loopback does not match the existing loopback */

EXAMPLES

In the following example, the RLS-LPBK-STs1 releases the STS1 matrix loopback on STS1 port OC3STS1-113-1.

```
RLS-LPBK-STs1::OC3STS1-113-1;
```

RELATED COMMANDS

RTRV-COND-STs1
RTRV-LPBK-STs1
RTRV-STs1

COMMAND CODE: **RLS-LPBK-STS3C**
COMMAND NAME: **RELEASE LOOPBACK STS3C**

PURPOSE

The RLS-LPBK-STS3C command releases the near-end (in the system) STS3C loopback, previously established by an OPR-LPBK-STS3C command, on the specified STS3C port. If the port was cross-connected prior to establishing a loopback, then the cross-connection is re-established when the RLS-LPBK-STS3C is executed.

To execute an RLS-LPBK-STS3C, the specified STS3C must have a PST of OOS-AUMA or OOS-MA and an SST of LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing RLS-LPBK-STS3C clears the secondary state of LPBK on the specified STS3C port.

A RLS-LPBK-STS3C command is denied if:

- The specified STS3C is not in a loopback (an STS3C PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK).
- The specified STS3C is not in a secondary state of LPBK, i.e., no loopback exists on this STS3C.
- The specified STS3C is embedded within a protection OC3/OC12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RLS-LPBK-STS3C: [TID] :AID: [CTAG] :: [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: None Description: STS3C AID, identifies the STS3C port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is to be released. Values are: NEND Near-End, specifies that the loopback in the system is to be released.
LPBKTYPE	{MATRIX} Default: <Any Existing Loopback Type> Addressing: None Description: Loopback Type, specifies the type of loopback to be released. Value is: MATRIX Matrix, specifies an STS3C loopback in the system matrix.

```

COMMAND CODE: **RLS-LPBK-T1**
COMMAND NAME: **RELEASE LOOPBACK T1**

PURPOSE

The RLS-LPBK-T1 command releases the near-end (in the system) DS1 loopback or far-end DS1 loopback request (to the far-end of the facility), previously established by an OPR-LPBK-T1 command, on the specified DS1 port. If the port was cross-connected prior to establishing a near-end loopback, then the cross-connection is re-established when the RLS-LPBK-T1 is executed.

To execute an RLS-LPBK-T1, the specified DS1 must have a PST of OOS-AUMA or OOS-MA and an SST of LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing RLS-LPBK-T1 to release a near-end loopback clears the ACTLPBK condition type on the specified DS1 port. Executing RLS-LPBK-T1 to release a far-end loopback request clears the XMTCLPBK condition type on the specified DS1 port.

Executing RLS-LPBK-T1 also causes the fault propagation feature to again be enabled on the specified port if it was disabled when the corresponding OPR-LPBK-T1 was issued.

A RLS-LPBK-T1 command is denied if:

- The specified DS1 is not in a loopback (a DS1 PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK).
- The specified type of loopback (values for LOCN and LPBKTYPE are explicitly entered) to be released does not exist.
- The specified DS1 is embedded within a protection OC3/ OC12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RLS-LPBK-T1 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	Default:	Entry Required
	Addressing:	None
	Description:	DS1 AID, identifies the DS1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

LOCN	{FEND, NEND}	
	Default:	<Any Existing Near-End or Far-End loopback>
	Addressing:	None
	Description:	Location, specifies the location (near-end or far-end) where the loopback is to be released. Values are:
	FEND	Far-End, specifies that the C-bit loopback request being transmitted in the supporting DS2 signal to loopback the specified DS1 at the far-end of the facility is to be released.
	NEND	Near-End, specifies that the loopback in the system is to be released.
	Restrictions:	RLS-LPBK-T1 is denied if LOCN of FEND and LPBKTYPE of MATRIX is entered.
LPBKTYPE	{FACILITY, MATRIX}	
	Default:	<Any Existing Loopback Type>
	Addressing:	None
	Description:	Loopback Type, specifies the type of loopback to be released. Values are:
	FACILITY	Facility, if LOCN of NEND is entered, specifies the DS1 loopback at the receive-side (from the network) of the specified DS1 port is to be released, or if LOCN of FEND is entered, specifies the C-bit loopback request being transmitted is to be released.
	MATRIX	Matrix, specifies the DS1 loopback in the system matrix is to be released.
	Restrictions:	RLS-LPBK-T1 is denied if LPBKTYPE of MATRIX and LOCN of FEND is entered.

```

COMMAND CODE: **RLS-LPBK-T3**
COMMAND NAME: **RELEASE LOOPBACK T3**

PURPOSE

The RLS-LPBK-T3 command releases the near-end (in the system) DS3 loopback, previously established by an OPR-LPBK-T3 command, on the specified DS3 port. If the port was cross-connected prior to establishing a near-end loopback, then the cross-connection is re-established when the RLS-LPBK-T3 is executed.

To execute an RLS-LPBK-T3, the specified DS3 must have a PST of OOS-AUMA or OOS-MA and an SST of LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing RLS-LPBK-T3 clears the ACTLPBK condition type on the specified DS3 port.

A RLS-LPBK-T3 command is denied if:

- The specified DS3 is not in a loopback (a DS3 PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK).
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RLS-LPBK-T3 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) Default: Entry Required Addressing: None Description: DS3 AID, identifies the DS3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is to be released. Values are: NEND Near-End, specifies that the loopback in the system is to be released.
LPBKTYPE	{FACILITY, MATRIX} Default: <Any Existing Loopback Type> Addressing: None Description: Loopback Type, specifies the type of loopback to be released. Values are: FACILITY Facility, specifies a DS3 loopback at the receive-side (from the network) of the specified DS3 port. MATRIX Matrix, specifies a DS3 loopback in the system matrix.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SARB	Status, All Resources Busy
SARL	Status, Already ReLeased
	/* There is no loopback on the port */
SDBE	Status, internal Data Base Error
	/* <DATABASE TYPE> Database Error: <STATUS> for <AID STRING> */
	/* <DATABASE TYPE> Database Error: <STATUS> for record number <RECORD NUMBER> */
	/* Failed to update the STS database,status=<STATUS> */
	/* Failure in GetSptdTPid, status <STATUS> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed
	/* The requested port is supporting loopback */
	/* The requested loopback does not match the existing loopback */

EXAMPLES

In the following example, the RLS-LPBK-T3 releases the DS3 facility loopback on DS3 port EC1T3-1297.

```
RLS-LPBK-T3::EC1T3-1297;
```

RTRV-LPBK-T3
RTRV-T3
```

COMMAND CODE: **RLS-LPBK-VT1**
COMMAND NAME: **RELEASE LOOPBACK VT1**

PURPOSE

The RLS-LPBK-VT1 command releases the near-end (in the system) VT1.5 loopback, previously established by an OPR-LPBK-VT1 command, on the specified VT1.5 port. If the port was cross-connected prior to establishing a near-end loopback, then the cross-connection is re-established when the RLS-LPBK-T1 is executed.

To execute an RLS-LPBK-VT1, the specified VT1.5 must have a PST of OOS-AUMA or OOS-MA and an SST of LPBK. Refer to Appendix G, State Transitions for additional information on state values and state transitions.

Executing RLS-LPBK-VT1 to release a near-end loopback clears the ACTLPBK condition type on the specified VT1.5 port.

Executing RLS-LPBK-VT1 also causes the fault propagation feature to be again enabled if it was disabled when the corresponding OPR-LPBK-VT1 was issued.

A RLS-LPBK-VT1 command is denied if:

- The specified VT1.5 is not in a loopback (a VT1.5 PST,SST of OOS-AUMA,LPBK or OOS-MA,LPBK).
- The specified type of loopback (values for LOCN and LPBKTYPE are explicitly entered) to be released does not exist.
- The specified VT1.5 is embedded within a protection OC3/OC12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RLS-LPBK-VT1 : [TID] : AID : [CTAG] : : [LOCN] , , , [LPBKTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID, identifies the VT1.5 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: {NEND} Addressing: None Description: Location, specifies the location (near-end) where the loopback is to be released. Values are: NEND Near-End, specifies that the loopback in the system is to be released.

LPBKTYPE	{MATRIX, PAYLOAD}
Default:	<Any Existing Loopback Type>
Addressing:	None
Description:	Loopback Type, specifies the type of loopback to be released. Values are:
	MATRIX Matrix, specifies the VT1.5 loopback in the system matrix to be released.
	PAYLOAD Payload, specifies the VT1.5 loopback in the RPB module to be released.

SUCCESSFUL RESPONSE FORMAT

```

```

COMMAND CODE: **RLS-PROTNSW-OC12**
COMMAND NAME: **RELEASE PROTECTION SWITCH OC-12**

PURPOSE

The RLS-PROTNSW-OC12 command instructs the system to release or clear an OC-12 line protection switch request between the working OC-12 line and protection OC-12 line.

On successful completion of this command, the system will reassess the switching conditions existing on the pair of lines, one of which is specified by the AID, and will honor the highest priority request. This request might not have been honored earlier because of an earlier requested higher priority protection switch command.

Executing an RLS-PROTNSW-OC12 command causes the OC-12 object entity to be released to a Normal state. The FSW (Forced Switch of Working to Protection), MSW (Manual Switch of Working to Protection), FSP (Forced Switch of Protection to Working), MSP (Manual Switch of Protection to Working), or LKP (Lockout of protection) protection switching controls are released or the ESW (Excessive Switching) condition is cleared.

Note that the ESW condition is set by the system after four consecutive switch transitions from the working line to the protection line and back to the working line occur within a 10 minute period. The ESW condition is cleared by the system at midnight or can be cleared by a restart of the SPB controller which supports the OC12 interface.

WARNING: A RLS-PROTNSW-OC12 command is the preferred way to clear an ESW auto lockout condition. When an ESW is active on an OC-12 pair, the user should not RMV/RST-OC12 FRCD on the main facility, for it causes a hard facility failure which affects downstream traffic.

An RLS-PROTNSW-OC12 command is denied if:

- At the time of issuance of this command, no FSW, MSW, ESW, FSP, MSP or LKP protection switching controls or conditions are present, i.e., a OPR-PROTNSW-OC12 was not performed.
- An invalid parameter value is entered.

INPUT FORMAT

```
RLS-PROTNSW-OC12: [TID] :AID: [CTAG] :: [DIRN] ;
```

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: OC12 AID, identifies the OC-12 port that is to be cleared of protection.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DIRN	{RCV} Default: { RCV } Addressing: None Description: Direction. This parameter determines the direction of transmission in which the switching is to be made and is relative to the SONET line identified by the AID. Values are: RCV Receive direction.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SARB	Status, All Resources Busy /*A manual switch is in progress for this protection group.*/
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* RPP Database Error: <ERROR-STRING>*/

EXAMPLES

In the following example, a manual switch of the working OC-12 line OC12-1 to protection line OC12-2 is in effect and is being cleared.

```
RLS-PROTNSW-OC12::OC12-1;
```

RELATED COMMANDS

```
OPR-PROTNSW-OC12
```

COMMAND CODE: **RLS-PROTNSW-OC3**
COMMAND NAME: **RELEASE PROTECTION SWITCH OC-3**

PURPOSE

The RLS-PROTNSW-OC3 command instructs the system to release or clear an OC-3 line protection switch request between the working OC-3 line and protection OC-3 line.

On successful completion of this command, the system will reassess the switching conditions existing on the pair of lines, one of which is specified by the AID, and will honor the highest priority request. This request might not have been honored earlier because of an earlier requested higher priority protection switch command.

Executing an RLS-PROTNSW-OC3 command causes the OC-3 object entity to be released to a Normal state. The FSW (Forced Switch of Working to Protection), MSW (Manual Switch of Working to Protection), FSP (Forced Switch of Protection to Working), MSP (Manual Switch of Protection to Working), or LKP (Lockout of protection) protection switching controls are released or the ESW (Excessive Switching) condition is cleared.

Note that the ESW condition is set by the system after four consecutive switch transitions from the working line to the protection line and back to the working line occur within a 10 minute period. The ESW condition is cleared by the system at midnight or can be cleared by a restart of the SPB controller which supports the O1B interface module.

WARNING: A RLS-PROTNSW-OC3 command is the preferred way to clear an ESW auto lockout condition. When an ESW is active on an OC-3 pair, the user should not RMV/RST-OC3 FRCD on the main facility, for it causes a hard facility failure which affects downstream traffic.

An RLS-PROTNSW-OC3 command is denied if:

- At the time of issuance of this command, no FSW, MSW, ESW, FSP, MSP or LKP protection switching controls or conditions are present, i.e., a OPR-PROTNSW-OC3 was not performed.
- An invalid parameter value is entered.

INPUT FORMAT

RLS-PROTNSW-OC3 : [TID] : AID : [CTAG] : : [DIRN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: None Description: OC3 AID, identifies the OC-3 port that is to be cleared of protection.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DIRN	{RCV} Default: { RCV } Addressing: None Description: Direction. This parameter determines the direction of transmission in which the switching is to be made and is relative to the SONET line identified by the AID. Values are: RCV Receive direction.

COMMAND CODE: **RLS-PROTNSW-STS1**
COMMAND NAME: **RELEASE PROTECTION SWITCH STS-1**

PURPOSE

The RLS-PROTNSW-STS1 command instructs the system to release or clear an STS-1 path protection switch request initiated by the OPR-PROTNSW-STS1 command between the preferred STS-1 path and alternate STS-1 path.

On successful completion of this command, the system will reassess the switching conditions existing on the pair of paths, one of which is specified by the AID, and will honor the highest priority request. This request might not have been honored earlier because of an earlier requested higher priority protection switch command.

Executing an RLS-PROTNSW-STS1 command causes the STS-1 object entity to be released to a Normal state. The FSW (Forced Switch of Working to Protection), MSW (Manual Switch of Working to Protection), FSP (Forced Switch of Protection to Working), or MSP (Manual Switch of Protection to Working) protection switching controls are released.

An RLS-PROTNSW-STS1 command is denied if:

- At the time of issuance of this command, no FSW, MSW, FSP, or MSP protection switching controls are present.
- An invalid parameter value is entered.

INPUT FORMAT

RLS-PROTNSW-STS1: [TID] :AID: [CTAG] :: [DIRN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: None Description: STS1 AID, identifies the STS-1 path (preferred or alternate) that is to be cleared of protection.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DIRN	{RCV} Default: { RCV } Addressing: None Description: Direction. This parameter determines the direction of transmission in which the switching is to be made and is relative to the SONET line identified by the AID. Values are: RCV Receive direction.

SUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RLS-PROTNSW-VT1**
COMMAND NAME: **RELEASE PROTECTION SWITCH VT1**

PURPOSE

The RLS-PROTNSW-VT1 command instructs the system to release or clear a VT1.5 path protection switch request initiated by the OPR-PROTNSW-VT1 command between the preferred VT1.5 path and alternate VT1.5 path.

On successful completion of this command, the system will reassess the switching conditions existing on the pair of paths, one of which is specified by the AID, and will honor the highest priority request. This request might not have been honored earlier because of an earlier requested higher priority protection switch command.

Executing an RLS-PROTNSW-VT1 command causes the VT1.5 object entity to be released to a Normal state. The FSW (Forced Switch of Working to Protection), MSW (Manual Switch of Working to Protection), FSP (Forced Switch of Protection to Working), or MSP (Manual Switch of Protection to Working) protection switching controls are released.

An RLS-PROTNSW-VT1 command is denied if:

- At the time of issuance of this command, no FSW, MSW, FSP, or MSP protection switching controls are present.
- An invalid parameter value is entered.

INPUT FORMAT

RLS-PROTNSW-VT1 : [TID] : AID : [CTAG] : : [DIRN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID, identifies the VT1.5 path (preferred or alternate) that is to be cleared of protection.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DIRN	{RCV} Default: { RCV } Addressing: None Description: Direction. This parameter determines the direction of transmission in which the switching is to be made and is relative to the SONET line identified by the AID. Values are: RCV Receive direction.

COMMAND CODE: **RLS-SYNCNSW**
COMMAND NAME: **RELEASE SYNCHRONIZATION SWITCH**

PURPOSE

The RLS-SYNCNSW command releases a previously executed clock reference source synchronization switch (initiated via an OPR-SYNCNSW command). If the MCB clock subsystem is provisioned for reverive clock reference source switching (refer to the RVRTV parameter in the ED-EQPT command), the clock reference is switched back to the previously primary clock reference source, provided the clock reference source is not failed.

A RLS-SYNCNSW command is denied if:

- An OPR-SYNCNSW command is not currently active.
- The clock reference source that would be selected has failed.
- The MCB subsystem is provisioned for the internal timing reference mode of operation (refer to the MCB TMG parameter in the ED-EQPT command).
- An invalid parameter value is entered.

INPUT FORMAT

RLS-SYNCNSW: [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
