COMMAND CODE: **RMV-CID**
COMMAND NAME: **REMOVE COMMUNICATIONS
INTERFACE DEVICE**

PURPOSE

The RMV-CID command logically removes the specified CPORT and any associated specified X.25 virtual channels and TCP session, and logs-off any user currently logged-on to the specified CPORT and virtual channel.

The RMV-CID command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command).

A RMV-CID command with a value for VCNUM specified logically removes the specified VCNUM(s). A RMV-CID with <NoVal> specified for VCNUM must be executed to logically remove the X.25 or TCP CPORT.

A RMV-CID command must be executed before any provisioned configuration changes (made via an ED-CID command) are applied to the CPORT by executing a RST-CID command.

A RMV-CID command must be executed from a CPORT or virtual channel other than the CPORT or virtual channel that is being logically removed (a user is not allowed to logically remove the communication interface that the user is using to execute the RMV-CID command).

A RMV-CID command is denied if:

- The specified CPORT has not previously been provisioned (via ENT-CID).
- The CPORT is already logically removed (via a RMV-CID).
- A VCNUM value of {1-8} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is not set to X25.
- The RMV-CID command is executed from the CPORT, X.25 virtual channel, or TCP session, specified by the CPORT and VCNUM parameters.
- A value for VCNUM is entered and the specified CPORT refers to a LAN (i.e. CPORT's PROTOCOL is TCP) on the ICM.
- A value for VCNUM is entered and the system is in Limited Command Execution mode.
- System is in Limited Command Execution mode, and CPORT other than 3, 5, 7, 9 or 11 is specified.
- An invalid parameter value is entered.

INPUT FORMAT

RMV-CID: [TID] :CPORT, [VCNUM] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{1-12} Default: Entry Required Addressing: None Description: Control Port, specifies the physical communication port number on the APS control system. Restrictions: RMV-CID is denied if system is in Limited Command Execution mode, and CPORT other than 3, 5, 7, 9 or 11 is specified.

VCNUM	{1–24, <NoVal>}
	Default: <All applicable provisioned virtual channels>
	Addressing: None
	Description: Virtual Channel Number, specifies the X.25 virtual channel within the specified CPORT. Values are:
	<div> <div>{1–24}</div> <div>X.25 virtual channel number within the specified X.25 CPORT.</div> </div> <div> <div><NoVal></div> <div>No Value, all applicable provisioned virtual channels are selected.</div> </div>
	Restrictions:
	RMV–CID is denied if VCNUM is entered and the CPORT's PROTOCOL parameter (refer to ENT–CID and ED–CID commands) is not set to either X.25 or TCP.
	RMV–CID is denied if VCNUM is entered, and the Virtual Channel does not exist.
	RMV–CID is denied if VCNUM is entered, and the system is in the Limited Command Execution mode.
CTAG	< 1–6 VALID CTAG CHARACTERS >
	Default: < System assigned CTAG value >
	Addressing: None
	Description: Correlation Tag, associates input command with its output responses.

COMMAND CODE: **RMV-EC1**
COMMAND NAME: **REMOVE EC1**

PURPOSE

The RMV-EC1 command causes the specified EC1 port to be placed in an OOS-MA or OOS-AUMA state.

Executing a RMV-EC1 command causes a state transition for the specified EC1 from

- IS to OOS-MA
- OOS-AU to OOS-AUMA

When an EC1 is in an OOS-MA or OOS-AUMA state, all EC1 transmission condition types are cleared and a MAN condition type is set for the specified EC1.

When an EC1 is in an OOS-MA or OOS-AUMA state, no EC1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the EC1, but EC1 alarm conditions are monitored (retrievable with the RTRV-EC1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-EC1 command) for the EC1.

A RMV-EC1 command is denied if:

- The specified EC1 is not previously provisioned (with the ENT-EC1 command).
- The specified EC1 is already in an OOS-MA or OOS-AUMA state.
- The specified EC1 is in a TRM secondary state and the command is issued with MODE as NORM.
- The specified EC1 is in OOS-AU, AINS state.
- An invalid parameter value is entered.

INPUT FORMAT

RMV-EC1 : [TID] : AID : [CTAG] : : [MODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MODE	{NORM, FRCD} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: NORM Normal. The command is denied if the EC1 is terminated (i.e. the EC1 has a SST of TRM). FRCD Forced. The command is accepted even if the EC1 is terminated.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAOS	Status, Already Out of Service
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error updating supported STS1 */
SNVS	Status, Not in Valid State
	/* To remove a terminated port, CMDMDE must be FRCD*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, EC1 port EC1-21 placed in an OOS-MA state by executing a RMV-EC1 command.

```
RMV-EC1::EC1-21;
```

RELATED COMMANDS

```
RTRV-EC1
ENT-EC1
ED-EC1
RST-EC1
DLT-EC1
```

COMMAND CODE: **RMV-EQPT**
COMMAND NAME: **REMOVE EQUIPMENT**

PURPOSE

The RMV-EQPT command causes the specified equipment entity to be placed in an OOS-MA or OOS-AUMA state (the command logically removes the equipment entity from equipment-specific alarm reporting service).

Executing a RMV-EQPT command on a one-for-one redundant equipment entity causes an automatic-copy switch (if the "master" equipment unit is being removed). The master MCB denies attempts to RMV-EQPT, but the slave MCB can be logically removed from service. The RMV-EQPT command on MCB denies, unless the CONSTAT=SLAVE. The master will never be removed; the unit must first be switched to CONSTAT=SLAVE. Executing a RMV-EQPT command on an EP3 or DSI equipment entity does not cause a protection switch to the entity's redundant equipment unit. If RMV-EQPT is executed on an EP3 or ES1 with MODE of FRCD, the command completes successfully regardless of whether the equipment unit is switched to protection.

If a one-plus-one redundant equipment entity (i.e., a DSB, IOB, or SI48 EOB) is specified and MODE of NORM is entered and the redundant equipment is in an IS state, RMV-EQPT completes successfully if and only if all functions supported are transferred (switched) to the redundant equipment. Upon successful completion, an NSA MAN condition is set and any clock references are switched to the applicable redundant module. If an IOB or EOB is specified and MODE of FRCD is entered, RMV-EQPT completes successfully regardless of the state of the redundant copy. If all functions supported are switched to the redundant equipment, an NSA MAN condition is set and clock references are switched. If not all functions are switched to the redundant equipment, an SA MAN condition is set.

Executing a RMV-EQPT command on a one-plus-one redundant equipment entity (i.e., an IOB or SI48 EOB) which supports an active data or clock copy causes a protection switch (of all functions) to the entity's redundant equipment unit. In this case, the data or clock copy switch is non-revertive.

Executing a RMV-EQPT command causes the following state transition for the specified equipment, provided the indicated state is supported by the specified equipment. Secondary states associated with the equipment entity before and after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions for each type of equipment entity.

- IS to OOS-MA
- IS-ANR to OOS-MA
- OOS-AU to OOS-AUMA

When an equipment entity is in an OOS-MA or OOS-AUMA state, any equipment specific condition types are cleared and a MAN condition type is set for the specified entity. If an OC-3 or OC-12 had a ESW condition set due to excessive switching, the ESW condition is cleared for the facility residing on the specified O1B or O4M, respectively.

When the DSB is successfully edited to a PST of OOS, the OSIPARMISM, DUPTARPENRTY, DUPMACADDR, CARLOS, or DCCEQPT conditions are cleared if set, on the addressed DSB or its mate.

When an O1B or O4M is successfully edited to an OOS state with MODE of FRCD, the Section and/or Line DCC on the contained OC-3 or OC-12 (if enabled) is disabled and the DUPTARPENRTY (if set) is cleared on the addressed facility.

WARNING: A RLS-PROTNSW-OC3 or RLS-PROTNSW-OC12 command is the preferred way to clear an ESW auto lockout condition. When an ESW is active on an OC-3 or OC-12 pair, the user should not RMV/RST FRCD on the main facility, for it causes a hard facility failure which affects downstream traffic.

A RMV-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned via the ENT-EQPT command.
- The specified equipment entity is already in an OOS-MA or OOS-AUMA state without an SST of MT.
- A DSI, HMU, LMU, EP3, ES1, O1B, or O4M circuit pack is specified and has a PST of IS or IS-ANR without an SST of STBYH, unless MODE of FRCD is entered.
- An O1B or O4M circuit pack is specified and it has an SST of MT and any of the supported STS-1 ports or embedded VT1.5 ports are in a loopback (an STS-1 or VT1.5 state of OOS-AUMA,UAS&MT&LPBK).

- An EP3 circuit pack is specified and it has an SST of MT and any of the supported DS3 ports or embedded DS1 ports are in a loop back (a DS3 or DS1 state of OOS–AUMA,UAS&MT&LPBK).
- An ES1 circuit pack is specified and it has an SST of MT and any of the supported STS–1 ports or embedded VT1.5 ports are in a loop back (an STS–1 or VT1.5 state of OOS–AUMA,UAS&MT&LPBK).
- A DSI circuit pack is specified and it has an SST of MT and any of the supported DS1 ports are in a loop back (a DS1 state of OOS–AUMA,UAS&MT&LPBK).
- A HMU/LMU circuit pack is specified and it has an SST of MT and any of the supported DS3 ports or embedded DS1 ports are in a loop back (a DS3 or DS1 state of OOS–AUMA,UAS&MT&LPBK).
- A one–for–one redundant equipment entity, other than a CPU or SIO is specified and the corresponding redundant equipment is not available but required for service (e.g., the “master” is to be removed and the “slave” unit does not have a PST of IS or automatic copy switching is inhibited), unless MODE of FRCD is entered.
- A CPU circuit pack is specified and its corresponding opposite copy CPU is not available for service (regardless if MODE of NORM or FRCD is entered).
- An ICM or SIO circuit pack and MODE of NORM is specified and its corresponding opposite copy ICM or SIO is not available for service, or MODE of FRCD is specified and all of the ICM’s or SIO’s supported LTx circuit packs have not been deleted.
- An EP3, ES1, or O1B circuit pack and MODE of NORM is specified and the EP3, ES1, or O1B circuit pack is not switched to protection (regardless of the circuit pack having a PST of IS, IS–ANR, or OOS–AU).
- An O1B circuit pack and MODE of NORM is specified and any of the supported STS1 or VT1.5 ports are involved in path switching and are in a WRK state.
- An O1B circuit pack is specified, MODE is either not specified or specified as NORM, the OC–3 on the O1B is defined as part of a ring (via ENT–RNG–OC3), and the Section and/or Line DCC is enabled.
- A P56 circuit pack and MODE of NORM or FRCD is specified and the P56 provides power to an MCB that is simultaneously involved in a copy switch with another MCB.
- An I/O or matrix P39 or P56 and MODE of NORM is specified, and that P39 or P56 would cause a copy lock to a copy residing on a shelf with GTI alarms.
- An SI36 CDB or SI48 CDB and MODE of NORM is specified, and the CDB’s opposite copy of IOB/EOB in the shelf has GTI alarms.
- An end–stage or center–stage matrix module and MODE of NORM is specified, and the module’s opposite copy has GTI alarms.
- An IPB or RPB and MODE of NORM is specified, and the IPB’s or RPB’s opposite copy has GTI alarms on the matrix modules (i.e., IOB, IOB, IPB, M16, M32, M40, OXB, RPB).
- A one–plus–one protected circuit pack (i.e., a DSB, IOB or SI48 EOB) AID is specified and MODE of NORM is entered and the redundant equipment is in an OOS or IS–ANR state (not fully functional or already removed).
- An invalid parameter value is entered.

Executing a RMV–EQPT command with MODE of FRCD is service–affecting in the following situations:

- A DSI, EP3, ES1, HMU, LMU, or O1B circuit pack is specified and the DSI, HMU, LMU, EP3, ES1 or O1B is not switched to the corresponding protection circuit pack.
- A DSB, IOB, or SI48 EOB circuit pack is specified and not all functions supported by the specified equipment have been switched to the corresponding protection circuit pack.
- A CDA, CDB, IPB, M16, M32, M40, MCB, or RPB circuit pack/entity is specified and the corresponding redundant equipment is not in an IS state, or the opposite copy of the cross–connect matrix has lost signal transmission.
- A CIM, CPU, DSK, EOB, ICM, IPU, OXB, SIO, or SPB circuit pack/entity is specified and the corresponding redundant equipment is not in an IS state.
- A P39, P56, or PSF circuit pack in an I/O bay/rack or APS bay/rack is specified and all of the power supplies within the specified power supply’s power group are not in an IS state (one or more of power supplies in the power group have a fault or have been removed).
- A P39, P56, or PSF circuit pack in an end–stage or matrix bay/rack is specified and one or more of the power supplies within the specified power supply’s power group are not in an IS state and the redundant matrix power supply group is similarly limited in power capacity, or the associated I/O shelves are not able to switch to the opposite copy of the matrix.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID>. */
IIAC	Input, Invalid ACcess identifier /* An invalid module type specified in request. */ /* Invalid or unassigned equipment identifier specified. */ /* Invalid MODE for the TGR card */ /* Invalid AID for the given slot. */ /* SHELF has been provisioned the PBTYPE as <CARD_TYPE> */ /* Invalid AID specified */
SARB	Status, All Resources Busy /* The command was rejected. */ /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* INIT-SYS command still active on shelf that equipment is on. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */
SCSN	Status, invalid Command SequeNce /* In service growth Loopbacks on supported facilities must first be released */
SDBE	Status, internal Data Base Error /* Database read error for <AID>. */ /* Invalid or unassigned equipment identifier specified. */ /* <CARD_TYPE> data base access failure */ /* Error accessing auxiliary EM data area. */ /* Error in get_rec_ptr accessing record of the Mate <AID>. */ /* Error accessing auxiliary buffer for card <AID>. */ /* Error reading database for <AID>. */ /* Error reading database for <AID> or its mate. */ /* Error updating database for card <AID>. */ /* OC facility database access failure. */ /* DCC database access failure. */ /* Unable to read facility database */ /* Error reading MCB clock copy table - <AID> not found */ /* Error reading <AID> database. */ /* Error updating <AID> database. */ /* Error reading <AID> auxiliary buffer. */

SDNA Status, Duplex unit Not Available
 /* MCB Switching Inhibited */
 /* MCB equipment not ready to switch. Try again later. */
 /* MCB equipment not warmed up. Try again later. */
 /* MCB link not up. It must be repaired. */
 /* OXB locked to a copy */

SNVS Status, Not in Valid State
 /* Command not valid for current state of equipment. */
 /* Restore response message not valid for current state for card <AID> */
 /* MCB master cannot be removed normally. */
 /* MCB master cannot be removed forced */
 /* Card is Protect Card. */
 /* To remove a traffic carrying port, CMDMDE must be FRCD */
 /* An STS1 or VT1.5 is in WRK state, CMDMDE must be FRCD */
 /* Section and/or Line DCC In-Service, CMDMDE must be FRCD */
 /* Only FRCD mode is valid for removing TGRs */
 /* Invalid MODE for the TGR card. Only FRCD mode is valid for removing TGRs */
 /* <AID> must be taken out of maintenance state first */

SROF Status, Requested Operation Failed
 /* Error accessing auxiliary EM data area. */
 /* Switch to working must be done first. */
 /* Switch to protection must be done first. */
 /* Did not receive a response from parent processor card */
 /* The request could cause service effect if performed. */
 /* Could not retrieve the aux buffer for <AID>. */
 /* <AID> has command active on it. */
 /* Automatic system configuration active on <AID>. */
 /* Switchover not possible. */
 /* No equipment available for switchover. */
 /* SPB failed activate request for <AID>. */
 /* No response from SPB for MCB on-line request. */
 /* The CDB's on <AID> can not switch. */
 /* IO <AID> can not switch. */
 /* <AID> can not switch. */
 /* No response from the IPB. */

/* Could not retrieve auxiliary buffer for <AID>. */  
SSRE      Status, System Resources Exceeded  
          /* Unable to allocate USI response buffer. */
```

EXAMPLES

In the following example, EP3-6-1-2 is placed in an OOS-MA state by executing a RMV-EQPT command.

```
RMV-EQPT: :EP3-6-1-2;
```

RELATED COMMANDS

```
DLT-EQPT  
ED-EQPT  
ENT-EQPT  
RST-EQPT  
RTRV-EQPT  
RTRV-STATE-EQPT
```

COMMAND CODE: **RMV-ISU-OLD**
COMMAND NAME: **REMOVE IN-SERVICE UPGRADE OLD**

PURPOSE

The RMV-ISU-OLD command allows the deletion of previous Generic Upgrade disk partitions and the setting of the current generic as the permanently active generic. The command removes the disk partition as well as all database, interim, and load files used by the previous Generic Upgrade process. It effectively prevents reversion back to a previous software generic once it has been determined that the capability is no longer required and the command is executed.

After successful completion of the RMV-ISU-OLD command (subsequent to the STA-ISU and INIT-SYS-NEW commands), all generic/database indicators are set to indicate that the current generic is now the permanently active generic. The system remains in service on the currently active release and all system functionalities remain operational. The RMV-ISU-OLD command also invalidates the In-Service Upgrade Key (ISUKEY) entered in the STA-ISU command.

A RMV-ISU-OLD command is denied if:

- A STA-ISU command is in progress.
- No previous generic partition exists (including a system that does not have the larger disk drive).
- An In-Service Upgrade Key (ISUKEY) does not match the ISUKEY of the P1 in the STA-ISU command.
- The command is issued prior to a STA-ISU command.
- The command is issued subsequent to a STA-ISU command but prior to an INIT-SYS-NEW command.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RMV-ISU-OLD: [TID] : : [CTAG] : : ISUKEY;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
ISUKEY	<1-5 ALPHANUMERIC CHARACTERS> Default: Entry Required Addressing: None Description: In-Service Upgrade Key, specifies the logical in-service upgrade reversion key. Valid values for ISUKEY are a string of 1 through 5 ASCII alphanumeric characters from the set {0-9, A-Z}. Note that spaces and special characters are not included. Restrictions: RMV-ISU-OLD is denied if the ISUKEY does not match the ISUKEY of the P1 entered in the STA-ISU command.

SUCCESSFUL RESPONSE FORMAT

```

STA-ISU
```

COMMAND CODE: **RMV-OC12**
COMMAND NAME: **REMOVE OC-12**

PURPOSE

The RMV-OC12 command causes the specified OC-12 port to be placed in an OOS-MA or OOS-AUMA state.

Executing an RMV-OC12 command causes a state transition for the specified OC-12 from

- IS to OOS-MA
- OOS-AU to OOS-AUMA

When an OC-12 is in an OOS-MAN or OOS-AUMA state, all OC-12 transmission condition types are cleared and a MAN condition type is set for the specified OC-12. Additionally, the ESW condition is cleared for the specified OC-12 if it had a ESW condition set due to excessive switching.

When an OC-12 is in an OOS-MA or OOS-AUMA state, no OC-12 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the OC-12, but OC-12 alarm conditions are monitored (retrievable with the RTRV-OC12 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMMODE-OC12 command) for the OC-12.

When an OC-12 in ring mode (refer to ENT-RNG-OC12) is in an OOS state, path AIS is sent on all the pass through paths, AIS-L is also sent on the OC-12 in the upstream direction, and all the switched paths switch to the redundant paths. For a 2WAY cross connection from an odd-numbered ring OC-12 to either an EC1 or another non-ring OC-12, no maintenance action is taken by the system.

When an OC-12 in ring mode is in an OOS state and the STS1 or its subordinate VT1.5s are path switched via 2WAYPR, the system selects the STS1/VT1.5 from the redundant ring OC-12 (if that path has an SST of STBYH) and that STS1/VT1.5 enters an SST of WRK.

When an OC-12 is successfully edited to an OOS state with MODE of FRCD, the Section and/or Line DCC is disabled if enabled and the DUPTARPEENTRY is cleared if set on the addressed OC-12.

WARNING: A RLS-PROTNSW-OC12 command is the preferred way to clear an ESW auto lockout condition. When an ESW is active on an OC-12 pair, the user should not RMV/RST-OC12 FRCD on the main facility, for it causes a hard facility failure which affects downstream traffic.

An RMV-OC12 command is denied if:

- The specified OC-12 is not previously provisioned (with the ENT-OC12 command).
- The specified OC-12 is already in an OOS-MA or OOS-AUMA state.
- The specified OC-12 is carrying traffic and the command is issued with MODE as NORM.
- The specified OC-12 is in OOS-AU, AINS state.
- The specified OC-12 in ring mode has STS-1s or VT1.5s that are involved in path switching and have an SST of WRK, unless MODE=FRCD.
- The specified OC-12 in ring mode is issued with MODE either not specified or specified as NORMAL and all the STS-1s or VT1.5s within the OC-12 have an SST of WRK.
- The specified OC-12 is defined as part of a ring (via ENT-RNG-OC12) with MODE either not specified or specified as NORMAL and the Section and/or Line DCC is enabled.
- An invalid parameter value is entered.

I/O protection switching is disabled if the OC-12 line supported by the O4M I/O circuit pack is provisioned to an OOS-MA or OOS-AUMA state.

INPUT FORMAT

RMV-OC12: [TID] :AID: [CTAG] :: [MODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	OC12_AID:	
	{OC12-{1-560}}	(OC12-OC12#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	OC12 AID, identifies the OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
MODE	{NORM, FRCD}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	NORM	Normal. The command is denied if the OC-12 is carrying traffic.
	FRCD	Forced. The command is accepted even if the OC-12 is terminated.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAOS	Status, Already Out of Service
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error updating supported STS1s */
	/* DCC Database Error: <ERROR-STRING> for <AID-STRING> */
SNVS	Status, Not in Valid State
	/* To remove a traffic carrying port, CMDMDE must be FRCD*/
	/*Section and/or Line DCC In-Service, CMDMDE must be FRCD*/
	/*An In-Service non-STBYH STS1 or VT1.5 connection exists, must be FRCD*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC-12 port OC12-21 placed in an OOS-MA state by executing an RMV-OC12 command.

```
RMV-OC12::OC12-21;
```

RELATED COMMANDS

RTRV-OC12
ENT-OC12
ED-OC12
RST-OC12
DLT-OC12

COMMAND CODE: **RMV-OC3**
COMMAND NAME: **REMOVE OC-3**

PURPOSE

The RMV-OC3 command causes the specified OC-3 port to be placed in an OOS-MA or OOS-AUMA state.

Executing a RMV-OC3 command causes a state transition for the specified OC-3 from

- IS to OOS-MA
- OOS-AU to OOS-AUMA

When a OC-3 is in an OOS-MA or OOS-AUMA state, all OC-3 transmission condition types are cleared and a MAN condition type is set for the specified OC-3. Additionally, the ESW condition is cleared for the specified OC-3 if it had a ESW condition set due to excessive switching.

When an OC-3 is in an OOS-MA or OOS-AUMA state, no OC-3 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the OC-3, but OC-3 alarm conditions are monitored (retrievable with the RTRV-OC3 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMMODE-OC3 command) for the OC-3.

When an OC-3 in ring mode (refer to ENT-RNG-OC3) is in an OOS state, path AIS is sent on all the pass through paths, AIS-L is also sent on the OC-3 in the upstream direction, and all the switched paths switch to the redundant paths. For a 2WAY cross connection from an odd-numbered ring OC-3 to either an EC1 or another non-ring OC-3, no maintenance action is taken by the system.

When an OC-3 in ring mode is in an OOS state and the STS1 or its subordinate VT1.5s are path switched via 2WAYPR, the system selects the STS1/VT1.5 from the redundant ring OC-3 (if that path has an SST of STBYH) and that STS1/VT1.5 enters an SST of WRK.

When an OC-3 is successfully edited to an OOS state with MODE of FRCD, the Section and/or Line DCC is disabled if enabled and the DUPTARPEENTRY is cleared if set on the addressed OC-3.

WARNING: A RLS-PROTNSW-OC3 command is the preferred way to clear an ESW auto lockout condition. When an ESW is active on an OC3 pair, the user should not RMV/RST-OC3 FRCD on the main facility, for it causes a hard facility failure which affects downstream traffic.

A RMV-OC3 command is denied if:

- The specified OC-3 is not previously provisioned (with the ENT-OC3 command).
- The specified OC-3 is already in an OOS-MA or OOS-AUMA state.
- The specified OC-3 is carrying traffic and the command is issued with MODE as NORM.
- The specified OC-3 is in OOS-AU, AINS state.
- The specified OC-3 in ring mode has STS-1s or VT1.5s that are involved in path switching and have an SST of WRK, unless MODE=FRCD.
- The specified OC-3 in ring mode is issued with MODE either not specified or specified as NORMAL and all the STS-1s or VT1.5s within the OC-3 have an SST of WRK.
- The specified OC-3 is defined as part of a ring (using ENT-RNG-OC3 or ENT-RNG-OC12) with MODE either not specified or specified as NORMAL and the Section and/or Line DCC is enabled.
- An invalid parameter value is entered.

I/O protection switching is disabled if the OC-3 line supported by the O1B I/O circuit pack is provisioned to an OOS-MA or OOS-AUMA state.

	{OC3-{1-2240}}	(OC3-OC3#)
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	OC3 AID, identifies the OC-3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
MODE	{NORM, FRCD}	
	Default:	{NORM}
	Addressing:	None
	Description:	Command Execution Mode. Values are:
	NORM	Normal. The command is denied if the OC-3 is carrying traffic.
	FRCD	Forced. The command is accepted even if the OC-3 is terminated.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SAOS	Status, Already Out of Service
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* Error updating supported STS1s */
	/* DCC Database Error: <ERROR-STRING> for <AID-STRING> */
SNVS	Status, Not in Valid State
	/* To remove a traffic carrying port, CMDMDE must be FRCD*/
	/*Section and/or Line DCC In-Service, CMDMDE must be FRCD*/
	/*An In-Service non-STBYH STS1 or VT1.5 connection exists, must be FRCD*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC-3 port OC3-21 placed in an OOS-MA state by executing a RMV-OC3 command.

```
RMV-OC3 : : OC3-21 ;
```

RELATED COMMANDS

COMMAND CODE: **RMV-STS1**
COMMAND NAME: **REMOVE STS-1**

PURPOSE

The RMV-STS1 command causes the specified STS-1 port to be placed in an OOS-MA or OOS-AUMA state.

Executing a RMV-STS1 command causes a state transition for the specified STS-1 from

- IS to OOS-MA
- OOS-AU to OOS-AUMA

When an STS-1 is in an OOS-MA or OOS-AUMA state, all STS-1 transmission condition types are cleared and a MAN condition type is set for the specified STS-1.

When an STS-1 is in an OOS-MA or OOS-AUMA state, no STS-1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the STS-1, but STS-1 alarm conditions are monitored (retrievable using the RTRV-STS1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-STS1 command) for the STS-1.

When an STS1 with an SST of WRK (refer to ENT-RNG-OC3 or ENT-RNG-OC12) is in an OOS state and the STS-1 or its subordinate VT1.5s are path switched using 2WAYPR, the system selects the STS-1/VT1.5 from the redundant ring OC-3/OC-12 (if that path has an SST of STBYH) and that STS-1/VT1.5 enters an SST of WRK. If the redundant path is in a PST of OOS-MA or OOS-AUMA, no switching is attempted. When the STS-1 or its subordinate VT1.5s are in a pass through connection using 2WAY, a path AIS is sent in the pass through direction.

A RMV-STS1 command is denied if:

- The specified STS-1 is not previously provisioned (using the ENT-STS1 command).
- The specified STS-1 is already in an OOS-MA or OOS-AUMA state.
- The specified STS-1 is in a TRM, ACT or BUSY secondary state and the command is issued with MODE as NORM.
- The specified STS-1, which is embedded within a ring OC-3/OC-12, and the embedded STS-1 or VT1.5s have an SST of WRK, unless MODE=FRCD.
- An invalid parameter value is entered.

INPUT FORMAT

RMV-STS1: [TID] :AID: [CTAG] :: [MODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS1 AID, identifies the STS-1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MODE	{NORM, FRCD}
Default:	{NORM}
Addressing:	None
Description:	Command Execution Mode. Values are:
NORM	Normal. The command is denied if the STS-1 is terminated or cross connected (i.e., the STS-1 has an SST of TRM, ACT, or BUSY).
FRCD	Forced. The command is accepted even if the STS-1 is terminated or cross connected.

RTRV-DFLT-STS1
RTRV-STS1

```

SET-DFLT-STS1

COMMAND CODE: **RMV-STS3C**
COMMAND NAME: **REMOVE STS-3C**

PURPOSE

The RMV-STS3C command causes the specified STS-3C port to be placed in an OOS-MA or OOS-AUMA state.

Executing a RMV-STS3C command causes a state transition for the specified STS-3C from

- IS to OOS-MA
- OOS-AU to OOS-AUMA

When an STS-3C is in an OOS-MA state, the STS-3C continues to detect occurrence and clearing of failures (LOS, LOF, AIS) and once detected transits into and out of OOS-AUMA, FAF state, respectively. However, no alarms are sent/cleared in this event.

When an STS-3C is in an OOS-MA or OOS-AUMA state, all STS-3C transmission condition types are cleared and a MAN condition type is set for the specified STS-3C.

When an STS-3C is in an OOS-MA or OOS-AUMA state, no STS-3C transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the STS-3C, but STS-3C alarm conditions are monitored (retrievable using the RTRV-STS3C command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-STS3C command) for the STS-3C.

A RMV-STS3C command is denied if:

- The specified STS-3C is not previously provisioned (using the ENT-STS3C command).
- The specified STS-3C is already in an OOS-MA or OOS-AUMA state.
- The specified STS-3C is in an ACT or BUSY secondary state and the command is issued with MODE as NORM.
- An invalid parameter value is entered.

INPUT FORMAT

RMV-STS3C: [TID] :AID: [CTAG] :: [MODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID, identifies the STS-3C port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MODE	{NORM, FRCD} Default: {NORM} Addressing: None Description: Command Execution Mode. Values are: NORM Normal. The command is denied if the STS-3C is cross connected (i.e., the STS-3C has an SST of ACT or BUSY). FRCD Forced. The command is accepted even if the STS-3C is cross connected.

```

COMMAND CODE: **RMV-T1**
COMMAND NAME: **REMOVE T1**

PURPOSE

The RMV-T1 command causes the specified DS1 port to be placed in an OOS-MA or OOS-AUMA state.

Executing a RMV-T1 command causes a state transition for the specified DS1 from

- IS to OOS-MA
- OOS-AU to OOS-AUMA

When a DS1 is in an OOS-MA or OOS-AUMA state, all DS1 transmission condition types are cleared and a MAN condition type is set for the specified DS1.

When a DS1 is in an OOS-MA or OOS-AUMA state, no DS1 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the DS1, but DS1 alarm conditions are monitored (retrievable using the RTRV-T1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-T1 command) for the DS1.

A RMV-T1 command is denied if:

- The specified DS1 is not previously provisioned (using the ENT-T1 command).
- The specified DS1 is already in an OOS-MA or OOS-AUMA state.
- The specified DS1 is cross-connected (it has an SST of ACT or BUSY), unless MODE of FRCD is used.
- The specified DS1 is in OOS-AU, AINS state.
- An invalid parameter value is entered.

INPUT FORMAT

RMV-T1 : [TID] : AID : [CTAG] : : [MODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:

	/* To remove a cross connected port, set CMDMDE = FRCD*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, DS1 port T3T1-15-21 placed in an OOS-MA state by executing a RMV-T1 command.

```
RMV-T1::T3T1-15-21;
```

RELATED COMMANDS

```

RTRV-T1
ENT-T1
ED-T1
RST-T1
DLT-T1
```

COMMAND CODE: **RMV-T3**
COMMAND NAME: **REMOVE T3**

PURPOSE

The RMV-T3 command causes the specified DS3 port to be placed in an OOS-MA or OOS-AUMA state.

Executing a RMV-T3 command causes a state transition for the addressed DS3 from

- IS to OOS-MA
- OOS-AU to OOS-AUMA (Note. RMV-T3 is denied if the specified DS3 is in an OOS-AU,AINS state.)

When a DS3 is in an OOS-MA or OOS-AUMA state, all DS3 transmission condition types are cleared and a MAN condition type is set for the specified DS3.

When a DS3 is in an OOS-MA or OOS-AUMA state, no DS3 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the DS3, but DS3 alarm conditions are monitored (retrievable using the RTRV-T3 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-T3 command) for the DS3.

A RMV-T3 command is denied if:

- The specified DS3 has not previously been provisioned using the ENT-T3 command.
- The specified DS3 is already in an OOS-MA or OOS-AUMA state.
- The specified DS3 is in an OOS-AU,AINS state.
- Any of the specified DS3's embedded DS1s are cross-connected (the DS3 has an SST of TRM), unless MODE=FRCD is used.
- The specified DS3 is cross-connected (the DS3 has an SST of ACT or BUSY), unless MODE=FRCD is used.
- An invalid parameter value is entered.

I/O protection switching is disabled if all three DS3 ports supported by the I/O circuit pack are in an OOS-MA or OOS-AUMA state. I/O protection switching only occurs if at least one of the supporting DS3s on the supporting I/O circuit pack is provisioned to an IS or an OOS-AU state.

INPUT FORMAT

RMV-T3 : [TID] : AID : [CTAG] : : [MODE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS3_AID:

```

COMMAND CODE: **RMV-VT1**
COMMAND NAME: **REMOVE VT1**

PURPOSE

The RMV-VT1 command causes the specified VT1.5 port to be placed in an OOS-MA or OOS-AUMA state.

Executing a RMV-VT1 command causes a state transition for the specified VT1.5 from

- IS to OOS-MA
- OOS-AU to OOS-AUMA

When a VT1.5 is in an OOS-MA or OOS-AUMA state, all VT1.5 transmission condition types are cleared and a MAN condition type is set for the specified VT1.5.

When a VT1.5 is in an OOS-MA or OOS-AUMA state, no VT1.5 transmission condition types or performance monitoring threshold crossing alerts are autonomously reported for the VT1.5, but VT1.5 alarm conditions are monitored (retrievable using the RTRV-VT1 command) and performance monitoring data is collected (if provisioned for PM collection by the SET-PMODE-VT1 command) for the VT1.5.

When a VT1.5 with an SST of WRK (refer to ENT-RNG-OC3 or ENT-RNG-OC12) is in an OOS state and the VT1.5 is path switched using 2WAYPR, the system selects the VT1.5 from the redundant ring OC-3/OC-12 (if that path has an SST of STBYH) and that VT1.5 enters an SST of WRK. If the redundant path is in a PST of OOS, no switching is attempted. When the VT1.5 is in a pass through connection using 2WAY, a path AIS is sent in the pass through direction.

A RMV-VT1 command is denied if:

- The specified VT1.5 is not previously provisioned (using the ENT-VT1 command).
- The specified VT1.5 is already in an OOS-MA or OOS-AUMA state.
- The specified VT1.5 is in a TRM, ACT or BUSY secondary state and the command is issued with MODE as NORM.
- The specified VT1.5, which is embedded within a ring OC-3/OC-12, and the embedded VT1.5 has an SST of WRK, unless MODE=FRCD.
- An invalid parameter value is entered.

INPUT FORMAT

RMV-VT1 : [TID] : AID : [CTAG] : : [MODE] ;

INPUT PARAMETERS

COMMAND CODE: **RPGM-EQPT**
COMMAND NAME: **REPROGRAM EQUIPMENT**

PURPOSE

The RPGM-EQPT command reprograms (downloads) the Flash EEPROM (read/write non-volatile memory) on the specified MCB equipment with the appropriate application software, or application software and embedded firmware, from the system disk. RPGM-EQPT allows the application software and embedded firmware for these circuit packs to be upgraded (during a software generic upgrade, if necessary) without physically removing or modifying the circuit pack.

To execute a RPGM-EQPT command, the specified equipment entity must be installed and provisioned to an out-of-service state (has a PST of OOS-MA and does not have a SST of UEQ or UAS).

A RPGM-EQPT command is denied if:

- The specified equipment entity is not installed (has a SST of UEQ) or not provisioned (has SST of UAS).
- The specified equipment entity is not in an out-of-service state (has a PST of IS or IS-ANR).
- The reprogram operation cannot be executed due to a system hardware failure or because the appropriate files are not on the system disk.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RPGM-EQPT: [TID] :AID: [CTAG] : :TYPE;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {MCB-{2,3}-3-1} {MCB-{5}-{1, 3}-{1}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
TYPE	{ALL, APPS} Default: Entry Required Addressing: None Description: Type of software/firmware to be reprogrammed. Values are: ALL All, reprogram the embedded firmware and the application software. APPS Application Software, reprogram the application software only.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* The RPGM-EQPT for <AID> was completed. */
  /* The RPGM-EQPT for <AID> was completed with errors. */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENRE	Equipage, Not Recognized Equipage /* Invalid or unassigned equipment identifier specified. */
IDNC	Input, Data Not Consistent /* Unable to read aux buffer for <AID>. */
IDNV	Input, Data Not Valid /* The RPGM-EQPT was rejected. */ /* Requested TYPE parameter in command is not valid. */
IIAC	Input, Invalid ACcess identifier /* The command was rejected. */ /* Command not supported for this equipment. */ /* Invalid or unassigned equipment identifier specified. */
IPMS	Input, Parameter MiSsing /* The RPGM-EQPT was rejected. */ /* TYPE parameter not specified in command. */
SARB	Status, All Resources Busy /* The command was rejected. */ /* Command already in progress on equipment. */ /* Automatic system configuration active on equipment. */ /* INIT-SYS command still active on shelf that equipment is on. */ /* Automatic configuration (database download) of parent processor in progress. */ /* Level 2 processor software download in progress. Try again later. */
SDBE	Status, internal Data Base Error /* Invalid or unassigned equipment identifier specified. */ /* The command was rejected. */ /* Data base access failure. */ /* Error accessing auxiliary EM data area. */
SNVS	Status, Not in Valid State /* Command not valid for current state of equipment. */ /* The RMV-EQPT for <AID> was rejected. */
SROF	Status, Requested Operation Failed /* The RPGM-EQPT for <AID> was rejected. */ /* The firmware version loaded already matches the disk. */ /* The equipment was not reprogrammed successfully. */ /* The command was aborted. */ /* Auto system action caused override. */
SSRE	Status, System Resources Exceeded /* The command was rejected. */ /* Unable to allocate USI response buffer. */

EXAMPLES

In the following example, the application software in the Flash EPROM of MCB-2-3-1 is reprogrammed.

```
RPGM-EQPT::MCB-2-3-1:::APPS;
```

RST-EQPT

RTRV-EQPT

RTRV-STATE-EQPT

COMMAND CODE: **RST-CID**
COMMAND NAME: **RESTORE COMMUNICATIONS
INTERFACE DEVICE**

PURPOSE

The RST-CID command restores the specified CPORT and any associated specified X.25 virtual channels to service. The restored CPORT is configured with the provisioning contained in the system's CID (Communications Interface Device) configuration database for the specified CPORT (refer to the ENT-CID and ED-CID commands).

The RST-CID command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command)..

If the specified CPORT or virtual channel is provisioned for automatic UID login and the CPORT is connected to a terminal, the provisioned UID is automatically logged-in upon completion of the restoral.

On successful completion of this command on the CID that is configured as the LAN on the ICM module, the lower layer parameters specific to the LAN on the working ICM and the parameters pertaining to the enabled Static, RIP and OSPF routers are initialized.

A RST-CID command is denied if:

- The specified CPORT has not previously been provisioned (via ENT-CID).
- The CPORT has not been logically removed (via a RMV-CID).
- A VCNUM value of {1-8} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is not set to X25.
- A value for VCNUM is entered and the specified CPORT refers to a LAN on the ICM.
- System is in Limited Command Execution mode, and CPORT other than 3, 5, 7, 9 or 11 is specified.
- System is in Limited Command Execution mode, and a value for VCNUM is entered.
- An invalid parameter value is entered.

INPUT FORMAT

RST-CID: [TID] : CPORT, [VCNUM] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
CPORT	{1-12}	
	Default:	Entry Required
	Addressing:	None
	Description:	Control Port, specifies the physical communication port number on the APS control system.
VCNUM	{1-8}	
	Default:	<All applicable provisioned virtual channels>
	Addressing:	None
	Description:	Virtual Channel Number, specifies the X.25 virtual channel within the specified CPORT.
	Restrictions:	RST-CID is denied if VCNUM of {1-8} is entered and the CPORT's PROTOCOL parameter (refer to ENT-CID and ED-CID commands) is not set to X25. RST-CID is denied if a value for VCNUM is entered and the specified CPORT refers to a LAN on the ICM. RST-CID is denied if a value for VCNUM is entered while in the Limited Command Execution mode.

CTAG	<1-6 VALID CTAG CHARACTERS>
Default:	<System Assigned CTAG Value>
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IPNV	Input, Parameter Not Valid
	/* Invalid CID <CPORT> entered */
	/* CID <CPORT> does not exist */
	/* X25 vc <VCNUM> does not exist */
SDBE	Status, internal Data Base Error
SROF	Status, Requested Operation Failed
	/* port must be restored before vc */
	/* Unable to restore due to EQPT error */
	/* Cannot restore yourself */
	/* This CID is pending removal */
	/* This CID <CPORT> is in a RUNNING state */
	/* This X.25 vc is in a RUNNING state */

EXAMPLES

In the following example, CPORT 3 is logically restored.

```
RST-CID::3;

COMMAND CODE: **RST-EC1**
COMMAND NAME: **RESTORE EC1**

PURPOSE

The RST-EC1 command causes an EC1 port to be placed in an IS or OOS-AU state.

Executing an RST-EC1 command causes a state transition for the specified EC1 from

- OOS-MA to IS
- OOS-AUMA to OOS-AU

When an EC1 is provisioned from the OOS-MA or OOS-AUMA to an IS or OOS-AU state, a MAN condition type is cleared, any existing EC1 condition types are set, and performance monitoring threshold crossing alerts are enabled (if provisioned for PM collection by the SET-PMODE-EC1 command) for the specified EC1.

A RST-EC1 command is denied if:

- The specified EC1 is not previously provisioned (using the ENT-EC1 command).
- The specified EC1 is not in an OOS-MA or OOS-AUMA state.
- The specified EC1 is in a loopback (it has an SST of LPBK).
- An invalid parameter value is entered.

INPUT FORMAT

RST-EC1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating supported STS1 */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, EC1 port EC1-15 is placed in an IS state by executing a RST-EC1 command.

```
RST-EC1::EC1-15;
```

RELATED COMMANDS

```
RTRV-EC1  
ENT-EC1  
ED-EC1  
RMV-EC1  
DLT-EC1
```

COMMAND CODE: **RST-EQPT**
COMMAND NAME: **RESTORE EQUIPMENT**

PURPOSE

The RST-EQPT command causes the specified equipment entity to be placed in an IS, IS-ANR, or OOS-AU state (the command logically restores the equipment entity to equipment specific alarm reporting service).

Upon execution of a RST-EQPT command, an off-line diagnostic test is executed and any applicable firmware (except for a MCB), software and provisioning data is downloaded before the equipment is placed in-service. If MODE of NORM is entered and the download fails, the RST-EQPT command is denied. If MODE of NORM or FRCD is entered and the diagnostic test fails, the RST-EQPT command is completed, the equipment entity transitions to the appropriate state, and an equipment specific failure condition type is set. If a CIM, CPU, DSK, SIO, or SPB equipment entity is specified and a MODE of FRCD is entered and any download fails, the RST-EQPT command is denied (MODE of FRCD is treated the same as a MODE of NORM for a CIM, CPU, DSK, SIO, or SPB equipment entity). If MODE of FRCD is entered and an equipment entity other than a CIM, CPU, DSK, SIO, or SPB is specified and the download fails, the command is completed and an equipment specific condition type is set for the failed equipment entity.

Executing a RST-EQPT command causes the following state transition for the specified equipment, provided the indicated state is supported by the specified equipment. Secondary states associated with the equipment entity before and after the command is executed depend upon events detected by the system. Refer to Appendix G, State Transitions for additional information on state values and state transitions for each type of equipment entity.

- OOS-AU to OOS-AU (if equipment fails diagnostic tests and fails to download)
- OOS-AU to IS-ANR (if equipment fails diagnostic tests but downloads)
- OOS-AU to OOS-AU (if equipment fails diagnostic tests and fails to download)
- OOS-AUMA to OOS-AU
- OOS-MA to IS (if equipment passes diagnostic tests and downloads)
- OOS-MA to IS-ANR (if equipment fails diagnostic tests but downloads)
- OOS-MA to OOS-AU (if equipment fails diagnostic tests and fails to download)

When the specified equipment entity is restored to an IS, IS-ANR, or OOS-AU state, a MAN condition type is cleared. An IMPROPRMVL condition type is set for the specified equipment entity if the specified equipment is not installed in the system. If the specified equipment is installed in the system but is partially or totally failed, an equipment specific condition type is set for the specified equipment entity.

When the DSB is successfully restored to a PST of IS with the RST-EQPT command, all of the upper layer parameters and specific lower layer parameters are initialized.

If an AID for an DSI, EP3, ES1, HMU, LMU, O1B, M16, or M32 circuit pack is specified and it has an SST of MT, a TSA condition type is cleared for the specified DSI, EP3, ES1, HMU, LMU, O1B, M16, or M32.

Refer to Appendix C, Condition Types for a list and definition of condition types.

A RST-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned with the ENT-EQPT command.
- The specified equipment entity is already in an IS or IS-ANR state.
- An O1B circuit pack is specified and it has an SST of MT and any of the supported STS-1 ports or embedded VT1.5 ports are in a loop back (an STS-1 or VT1.5 state of OOS-AUMA,UAS&MT&LPBK).
- An EP3 circuit pack is specified and it has an SST of MT and any of the supported DS3 ports or embedded DS1 ports are in a loop back (a DS3 or DS1 state of OOS-AUMA,UAS&MT&LPBK).
- An ES1 circuit pack is specified and it has an SST of MT and any of the supported STS1 ports or embedded VT1.5 ports are in a loopback (an STS-1 or VT1.5 state of OOS-AUMA,UAS&MT&LPBK).
- A DSI circuit pack is specified and it has an SST of MT and any of the supported DS1 ports are in a loopback (a DS1 state of OOS-AUMA,UAS&MT&LPBK).
- A HMU/LMU circuit pack is specified and it has an SST of MT and any of the supported DS3 ports or embedded DS1 ports are in a loopback (a DS3 or DS1 state of OOS-AUMA,UAS&MT&LPBK).
- An invalid parameter value or combination of parameter values is entered.

EXAMPLES

In the following example, EP3–6–1–2 is placed in an IS, IS–ANR, or OOS–AU state, depending on the results of diagnostic tests and software download, by executing a RST–EQPT command.

```
RST-EQPT: :EP3-6-1-2;
```

RMV-EQPT
RTRV-EQPT
RTRV-STATE-EQPT

COMMAND CODE: **RST-OC12**
COMMAND NAME: **RESTORE OC-12**

PURPOSE

The RST-OC12 command causes an OC-12 port to be placed in an IS or OOS-AU state.

Executing an RST-OC12 command causes a state transition for the specified OC-12 from

- OOS-MA to IS
- OOS-AUMA to OOS-AU

When an OC-12 is provisioned from the OOS-MA or OOS-AUMA to an IS or OOS-AU state, a MAN condition type is cleared, any existing OC-12 condition types are set, and performance monitoring threshold crossing alerts are enabled (if provisioned for PM collection by the SET-PMMODE-OC12 command) for the specified OC-12.

An RST-OC12 command is denied if:

- The specified OC-12 is not previously provisioned (with the ENT-OC12 command).
- The specified OC-12 is not in an OOS-MA or OOS-AUMA state.
- The specified OC-12 is in a loopback (it has an SST of LPBK).
- An invalid parameter value is entered.

On successful completion of this command on an OC-12, if the specified OC-12 or its mate has a LOCKOUT condition set due to excessive protection switching, then it will be cleared.

INPUT FORMAT

RST-OC12: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating supported STS1s/STS3Cs */ /* FPP Database Error: <ERROR-STRING> for record number <RECORD-NUMBER> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, OC-12 port OC12-15 is placed in an IS state by executing an RST-OC12 command.

```
RST-OC12::OC12-15;
```

COMMAND CODE: **RST-OC3**
COMMAND NAME: **RESTORE OC-3**

PURPOSE

The RST-OC3 command causes an OC-3 port to be placed in an IS or OOS-AU state.

Executing an RST-OC3 command causes a state transition for the specified OC-3 from

- OOS-MA to IS
- OOS-AUMA to OOS-AU

When an OC-3 is provisioned from the OOS-MA or OOS-AUMA to an IS or OOS-AU state, a MAN condition type is cleared, any existing OC-3 condition types are set, and performance monitoring threshold crossing alerts are enabled (if provisioned for PM collection by the SET-PMODE-OC3 command) for the specified OC-3.

An RST-OC3 command is denied if:

- The specified OC-3 is not previously provisioned (with the ENT-OC3 command).
- The specified OC-3 is not in an OOS-MA or OOS-AUMA state.
- The specified OC-3 is in a loopback (it has an SST of LPBK).
- An invalid parameter value is entered.

On successful completion of this command on an OC-3, if the specified OC-3 or its mate has a LOCKOUT condition set due to excessive protection switching, then it will be cleared.

INPUT FORMAT

RST-OC3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RST-STS1**
COMMAND NAME: **RESTORE STS-1**

PURPOSE

The RST-STS1 command causes the specified STS-1 port to be placed in an IS or OOS-AU state.

Executing an RST-STS1 command causes a state transition for the specified STS-1 from

- OOS-MA to IS
- OOS-AUMA to OOS-AU

When an STS-1 is provisioned from an OOS-MA or OOS-AUMA to an IS or OOS-AU state, a MAN condition type is cleared, any existing STS-1 condition types are set, and performance monitoring threshold crossing alerts are enabled (if provisioned for PM collection by the SET-PMMODE-STS1 command) for the specified STS-1.

A RST-STS1 command is denied if:

- The specified STS-1 is not provisioned (using the ENT-STS1 command).
- The specified STS-1 is not in an OOS-MA or OOS-AUMA state.
- The specified STS-1 is in a loopback (the STS-1 has an SST of LPBK).
- An invalid parameter value is entered.

INPUT FORMAT

RST-STS1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies the STS-1 port.

DLT-T

COMMAND CODE: **RST-TAP-DIG**
COMMAND NAME: **RESTORE TEST ACCESS PORT DIGROUP**

PURPOSE

The RST-TAP-DIG command disconnects all existing Test Access Port Pair (TAPP) connections established by the user regardless of whether the TAPP connection is link associated (refer to the CONN-TACC-Tx commands). After RST-TAP-DIG is executed, the disconnected TAPPs are available for other test access operations.

The RST-TAP-DIG command only operates on TAPP connections.

Executing a RST-TAP-DIG command removes the SST value of TS from the affected TAPPs and any equipment-side and facility-side ports involved in the associated test access operations. If an associated cross-connection exists, the cross-connection SST of TS is removed from the cross-connection entity.

A RST-TAP-DIG command is denied if:

- The user does not have any test access connections established to TAPPs.
- An invalid parameter value is entered.

INPUT FORMAT

RST-TAP-DIG: [TID] : [TST] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
TST	{ALL} Default: {ALL} Addressing: None Description: Test Access ports to be released. All existing test access connections established by the user are disconnected (DS1, DS3, STS1, and VT1 TAPPs).
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SRQN Status, invalid ReQuest

EXAMPLES

In the following example, the RST-TAP-DIG will take down all TACC connections (DS1, DS3, VT1 and STS1) owned by the user issuing the command:

```
RST-TAP-DIG::;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pae956. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pae956 COMPLD  
/* RST-TAP-DIG::: [Pae956] (2) */  
;
```

COMMAND CODE: **RST-VT1**
COMMAND NAME: **RESTORE VT1**

PURPOSE

The RST-VT1 command causes a VT1.5 port to be placed in an IS or OOS-AU state.

Executing an RST-VT1 command causes a state transition for the specified VT1.5 from

- OOS-MA to IS
- OOS-AUMA to OOS-AU

When a VT1.5 is provisioned from the OOS-MA or OOS-AUMA to an IS or OOS-AU state, a MAN condition type is cleared, any existing VT1.5 condition types are set, and performance monitoring threshold crossing alerts are enabled (if provisioned for PM collection by the SET-PMODE-VT1 command) for the specified VT1.5.

A RST-VT1 command is denied if:

- The specified VT1.5 is not previously provisioned (using the ENT-VT1 command).
- The specified VT1.5 is not in an OOS-MA or OOS-AUMA state.
- The specified VT1.5 is in a loopback (it has an SST of LPBK).
- An invalid parameter value is entered.

INPUT FORMAT

RST-VT1: [TID]:AID: [CTAG];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies the VT1.5 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SAIS	Status, Already In Service
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* Error updating supported T1 */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, VT1.5 port EC1VT1-15-7-4 is placed in an IS state by executing a RST-VT1 command.

```
RST-VT1::EC1VT1-15-7-4;
```

COMMAND CODE: **RTRV-AAID-EQPT**
COMMAND NAME: **RETRIEVE ALTERNATE AID
EQUIPMENT**

PURPOSE

The RTRV-AAID-EQPT command retrieves the Alcatel standard equipment AID format when an alternate equipment AID format is specified, or conversely, the alternate equipment AID format when the Alcatel standard equipment AID format is specified.

If an alternate AID database has not been previously created, issuing the RTRV-AAID-EQPT command with an ANSAID will return the same AID.

A RTRV-AAID-EQPT command is denied if:

- Values are entered for both ANSAID and ALTAID.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-AAID-EQPT: [TID] : [ANSAID] [, ALTAID] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

ANSAID

Default: None. Either ANSAID or ALTAID must be entered, but not both.
Addressing: None
Description: Alcatel Equipment AID, identifies an equipment entity using the Alcatel standard AID format. The Equipment ANSAID format is:
{<Equipment mnemonic> - <Rack # within the system> - <Shelf # within the Rack> - <Equipment # within the Shelf>}
Restrictions: RTRV-AAID-EQPT is denied if values for both ANSAID and ALTAID are entered.

TGR-{9, 21, 35, 43}-3-{9, 18}, TGR-{15, 27, 31, 39}-1-{9, 18}}

Default: None. Either ALTAID or ANSAID must be entered, but not both.

Addressing: None

Description: Alternate Equipment AID, identifies an equipment entity using the alternate equipment AID format. The Equipment ALTAID format is:
{<Equipment mnemonic> – <Alternate Rack # within the system> – <Shelf # within the Rack> – <Equipment # within the Shelf>}

Restrictions: RTRV-AAID-EQPT is denied if values for both ALTAID and ANSAID are entered.

CTAG < 1-6 VALID CTAG CHARACTERS >

Default: < System assigned CTAG value >

Addressing: None

Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<ANSAID>,<ALTAID>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

```

Alternate Equipment AID, identifies the alternate AID format for an equipment entity.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IIAC      Input, Invalid ACcess identifier
/* AID not found */

```

IPNC Input, Parameter Not Consistent
 /* Cannot retrieve both */
SROF Status, Requested Operation Failed
 /* AID retrieve error */

EXAMPLES

The following example illustrates the command and response when the alternate equipment AID is known.

```
RTRV-AAID-EQPT: : , EP3-91-3-1 ;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pad567 COMPLD  
"EP3-9-3-1, EP3-91-3-1"  
/* RTRV-AAID-EQPT: : EP3-91-3-1, [Pad567] (2) */  
;
```

The following example illustrates the command and response when the Alcatel standard AID is known.

```
RTRV-AAID-EQPT: : SPB-8-1-2 ;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad568. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pad568 COMPLD  
"SPB-8-1-2, SPB-65-1-2"  
/* RTRV-AAID-EQPT: : SPB-8-1-2 [Pad568] (3) */  
;
```

RELATED COMMANDS

None

COMMAND CODE: **RTRV-ACO-ALL**
COMMAND NAME: **RETRIEVE AUDIBLE ALARM CUTOFF
ALL**

PURPOSE

The RTRV-ACO-ALL command retrieves the current Audible Alarm Cutoff (ACO) mode setting.

The three modes of ACO operation are:

- Delayed ACO Mode: Any audible alarm is generated for five seconds and then automatically silenced by the system.
- Immediate ACO Mode: No audible alarms are generated; all audible alarms are automatically cutoff immediately.
- Manual ACO Mode: Audible alarms are not automatically silenced by the system. Audible alarms are only cutoff manually by executing an OPR-ACO-ALL command, manually actuating an ACO switch, or by clearing the alarm condition.

The ACO mode applies to all alarmed conditions in the system. The ACO mode does not affect visual alarm indications (lamps or contact closures) or alarm reporting through the man-machine interface.

A RTRV-ACO-ALL command is denied:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ACO-ALL: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
":<ACOMODE>"  
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

OUTPUT PARAMETERS

ACOMODE	{DELD, IMED, MAN}
	ACO Mode, indicates the Alarm Cutoff mode. Values are:
DELD	Delayed ACO, an audible alarm cutoff is automatically generated five seconds after the detection of an alarm (the audible alarm is automatically silenced after five seconds).
IMED	Immediate ACO, an audible alarm cutoff is automatically generated immediately upon detection of an alarm (no audible alarm occurs).
MAN	Manual ACO, an audible alarm cutoff is not automatically generated. Audible alarms are only silenced manually by executing an OPR-ACO-ALL command, manually actuating an ACO switch, or by clearing the alarm condition.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SDBE Status, internal Data Base Error

EXAMPLES

In the following example, the current setting of the ACO mode is retrieved.

```
RTRV-ACO-ALL;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P18004. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P18004 COMPLD
":MAN"
/* RTRV-ACO-ALL [P18004] (2) */
;
```

RELATED COMMANDS

OPR-ACO-ALL
SET-ACO-ALL

COMMAND CODE: **RTRV-ALM-ALL**
COMMAND NAME: **RETRIEVE ALARM ALL**

PURPOSE

The RTRV-ALM-ALL command retrieves the current status of any existing alarm conditions in the system, or any alarm conditions matching a specified combination of condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFCNCDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters).

The successful response for a RTRV-ALM-ALL command contains one line of parsable output data for each alarm condition being reported. If multiple alarm conditions exist, a line of output is provided for

- each equipment entity alarm, in ascending order by date and time of occurrence,
- each common (no specific entity) alarm, in ascending order by date and time of occurrence,
- each DS1 alarm, in ascending order by DS1 port number and ascending order by date and time of occurrence within each DS1 port number,
- each Timing Reference (TMG) alarm, in ascending order by TMG AID and ascending order by date and time of occurrence within each TMG AID,
- each F3 alarm, in ascending order by F3 port number and ascending order by date and time of occurrence within each F3 port number,
- each DS3 alarm, in ascending order by DS3 port number and ascending order by date and time of occurrence within each DS3 port number,
- each OC3/OC12 alarm, in ascending order by OC3/OC12 port number and ascending order by date and time of occurrence within each OC3/OC12 port number,
- each EC1 alarm, in ascending order by EC1 port number and ascending order by date and time of occurrence within each EC1 port number,
- each STS1 alarm, in ascending order by STS1 port number and ascending order by date and time of occurrence within each STS1 port number,
- each STS3C alarm, in ascending order by STS3C port number and ascending order by date and time of occurrence within each STS3C port number,
- each VT1.5 alarm, in ascending order by VT1.5 port number and ascending order by date and time of occurrence within each VT1.5 port number.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ALM-ALL command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-ALL: [TID] : [AID] : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	{ ALL } Default: {ALL} Addressing: None Description: Access Identifier, specifies all alarms in the system are to be retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

NTFCNCDE	{CR, MJ, MN}
Default:	< All applicable notification codes listed above >
Addressing:	None
Description:	Notification Code, specifies the notification code of the condition type to be retrieved. Values are:
	CR Critical Alarm
	MJ Major Alarm
	MN Minor Alarm
CONDTYPE	<p>EQUIPMENT_CONDTYPE:{ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DATALCK0, DATALCK1, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKS WPR, MISC-1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC12, TERM-OC3, TERM-T1, TERM-T3, TERM-T3EC1, TSA, TSI, WKS WPR, XIDMISM},</p> <p>COMMON_CONDTYPE:{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-ST51, GOS-ST53C, GOS-T1, GOS-T3, GOS-VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDATACPY0, MANSELDATACPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688},</p> <p>DS1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, DS1ISD, EOC, INHPMREPT, LOF, LOS, MAN, RVCBLPBK, ROLLMON, XMTCBLPBK},</p> <p>DS1_FAR-END_CONDTYPE:{RAI, RAI-CI},</p> <p>TMG_NEAR-END_CONDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL},</p> <p>F3_CONDTYPE:{INHPMREPT},</p> <p>DS3_NEAR-END_CONDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN},</p> <p>DS3_FAR-END_CONDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI},</p> <p>OC12_NEAR-END_CONDTYPE:{ACTLPBK, AIS, DUPTARPENTRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAL, L2SCONFAL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR},</p> <p>OC12_FAR-END_CONDTYPE:{RFI},</p> <p>OC3_NEAR-END_CONDTYPE:{ACTLPBK, AIS, DUPTARPENTRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAL, L2SCONFAL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR},</p> <p>OC3_FAR-END_CONDTYPE:{RFI},</p> <p>EC1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, INHPMREPT, LOF, LOS, MAN},</p> <p>EC1_FAR-END_CONDTYPE:{RFI},</p> <p>STS1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKS WBK, FRCDWKS WPR, IDLE, INHPMREPT, LOP, MAN, MANWKS WBK, MANWKS WPR, PDI, SDBER, SLMF},</p> <p>STS1_FAR-END_CONDTYPE:{RFI},</p> <p>STS3C_NEAR-END_CONDTYPE:{ACTLPBK, AIS, IDLE, INHPMREPT, LOP, MAN, SLMF},</p> <p>STS3C_FAR-END_CONDTYPE:{RFI},</p> <p>VT1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKS WBK, FRCDWKS WPR, IDLE, INHPMREPT, LOP, MAN, MANWKS WBK, MANWKS WPR, ROLLMON, SDBER, SLMF},</p>

VT1_FAR-END_CONDTYPE:{RFI}

Default: < All applicable condition types listed above >

Addressing: None

Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:

Input Values for EQUIPMENT CONDITION TYPES are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected.
BKUPMEMP	Backup Memory—Primary, magnetic disk backup failure.
BKUPMEMS	Backup Memory—Secondary, optical disk/tape drive back-up failure.
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane.
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf.
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN.
CD	Control and Display interface audit error detected.
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0.
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1.
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB.
CONTBUS	Control Bus, shelf control bus interface failure.
CONTCOM	Control Communication equipment failure.
CONTR	Control processor equipment failure.
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure.
DATALCK0	Data Lock 0, I/O shelf/quad locked to databus 0.
DATALCK1	Data Lock 1, I/O shelf/quad locked to databus 1.
DBF	Database Backup Failure, OPD database backup failure detected (on second try).
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try.
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed.
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified.
DUPMACADDR	Duplicate MAC Address detected on the LAN.
DUPTARPENTRY	Duplicate TARP adjacency table.
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed.
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed.
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database.
GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited.

INHSSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
INIT	Initialization, shelf initialization in-process.
INTERR	Internal Error, internal error suspected on equipment.
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
LOTRI	Loss of Offboard Timing Reference Input from mate Master Clock Board circuit pack.
MAN	Manual removal (logical removal was performed on a circuit pack).
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
MISC-1	Miscellaneous Class-1, slave MCB is not ready.
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs.
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning.
PWR	Power, internal power failure detected.
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
SWFTDWN	Software Download is in process on a circuit pack.
SYNCEQPT	Synchronization Equipment failure detected.
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure.
TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure.
TERM-T1	Termination Equipment-T1, DSI circuit pack failure.
TERM-T3	Termination Equipment-T3, HMU circuit pack failure.
TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure.
TSA	Test Session Active, maintenance test session is active on the equipment.
TSI	Time Slot Interchange equipment failure.
WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.
Input Values for COMMON CONDITION TYPES are:	
DATAFLT	Data integrity Fault, CRC error detected during a database read.
EUA	Emergency User Access activated.
FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC12 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC3 GOS threshold reached.
GOS-STS1	Grade of Service-STS1, system-wide STS1 GOS threshold reached.

GOS–STS3C	Grade of Service–STS3C, system–wide STS3C GOS threshold reached.
GOS–T1	Grade of Service–T1, system–wide DS1 GOS threshold reached.
GOS–T3	Grade of Service–T3, system–wide DS3 GOS threshold reached.
GOS–VT1	Grade of Service–VT1, system–wide VT1.5 GOS threshold reached.
HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system–wide fault isolation inhibited.
INIT	Initialization, system initialization in–process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATACPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT–COPY command.
MANSELDATACPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT–COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system–wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
Input Values for DS1, TMG, F3, and DS3 CONDITION TYPES are:	
1TO6LOF	One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3. (DS3 Near–End.)
7LOF	Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3. (DS3 Near–End.)
ACTLPBK	Active Loopback, the port is in loop back. (DS1, DS3 Near–End.)
AICMIS	Application Identification Channel Mismatch, AIC mismatch detected. (DS3 Near–End.)
AIS	Alarm Indication Signal, AIS detected. (DS1, TMG, DS3 Near–End, DS3 Far–End.)
AIS–CI	Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near–End)
ALWCBLPBK	Allow C–Bit Loopback. (DS1 Near–End.)
DS1ISD	DS1 Idle Signal Detected, Incoming. (DS1 Near–End.)
DS2YEL	DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3. (DS3 Far–End.)
EOC	Embedded Operations Channel, EOC failure detected. (DS1 Near–End.)
FEACEQPT	Far–End Alarm & Control (FEAC) Equipment detected. (DS3 Far–End.)
FLTESC	Facility Fault Escalation active. (DS3 Near–End.)
INHMPREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (DS1, DS3, F3 Near–End.)
ISD	Idle Signal Detected. (DS3 Near–End, DS3 Far–End.)

LOF	Loss Of Frame detected. (DS1, TMG, DS3 Near-End, DS3 Far-End.)
LOS	Loss Of Signal detected. (DS1, TMG, DS3 Near-End, DS3 Far-End.)
MAN	Manual removal (logical removal was performed on the facility). (DS1, DS3 Near-End.)
RAI	Remote Alarm Indication detected. (DS1, DS3 Far-End.)
RAI-CI	Remote Alarm Indication for Customer Installation detected. (DS1 Far-End.)
RCVCBLPBK	Receive (DS1) C-Bit Loopback. (DS1 Near-End.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (DS1 Near-End.)
SLTMSIG	Slipping Timing Reference Signal detected. (TMG Near-End.)
SYNCPRI	Primary Reference Synchronization failure. (TMG Near-End.)
SYNCSEC	Secondary Reference Synchronization failure. (TMG Near-End.)
SYNCSTATQUAL	Synchronization Status Quality. (TMG Near-End.)
XMTCBLPBK	Transmit (DS1) C-Bit Loopback. (DS1 Near-End.)
Input Values for OC12, OC3, EC1, STS1, STS3C, and VT1.5 CONDITION TYPES are:	
ACTLPBK	Active Loopback, the port is in loop back. (OC12, OC3, EC1, STS1, STS3C, VT1.5 Near-End.)
AIS	Alarm Indication Signal, AIS detected. (OC12, OC3, EC1, STS1, STS3C, VT1.5 Near-End.)
DUPTARPENTRY	Duplicate TARP adjacency table. (OC12, OC3 Near-End.)
EBER	Excessive Bit Error Rate detected. (OC12, OC3, STS1, VT1.5 Near-End.)
ESW	Excessive Switching, lockout of automatic revertive (OC12, OC3) switching due to excessive switching. (OC12, OC3 Near-End.)
FLTESC	Facility Fault Escalation active. (STS1, VT1.5 Near-End.)
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (OC12, OC3, STS1, VT1.5 Near-End.)
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (OC12, OC3, STS1, VT1.5 Near-End.)
IDLE	Idle, incoming idle detected. (STS1, STS3C, VT1.5 Near-End.)
INHMPREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (OC12, OC3, EC1, STS1, STS3C, VT1.5 Near-End.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (OC12, OC3 Near-End.)
L2SCONFAIL	Layer 2 Section DCC Connection Failure. (OC12, OC3 Near-End.)
LDCCDLFL	Line DCC Data Link Failure. (OC12, OC3 Near-End.)
LOCKOUTOFPR	LockOut Of Protection facility. (OC12, OC3 Near-End.)
LOF	Loss Of Frame detected. (OC12, OC3, EC1 Near-End.)
LOP	Loss Of Pointer detected. (STS1, STS3C, VT1.5 Near-End.)
LOS	Loss Of Signal detected. (OC12, OC3, EC1 Near-End.)

	MAN	Manual removal (logical removal was performed on the facility). (OC12, OC3, EC1, STS1, STS3C, VT1.5 Near-End.)
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (OC12, OC3, STS1, VT1.5 Near-End.)
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (OC12, OC3, STS1, VT1.5 Near-End.)
	PDI	Incoming PDI signal detected (STS1).
	RFI	Remote Failure Indication detected. (OC12, OC3, EC1, STS1, STS3C, VT1.5 Far-End.)
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (VT1.5 Near-End.)
	SDBER	Signal Degrade Bit Error Rate detected. (OC12, OC3, STS1, VT1.5 Near-End.)
	SDCCDLFL	Section DCC Data Link Failure. (OC12, OC3 Near-End.)
	SLMF	Signal Label Match Failure detected. (STS1, STS3C, VT1.5 Near-End.)
	WTR	Wait To Restore of protection facility. (OC12, OC3 Near-End.)
	Restrictions:	RTRV-ALM-ALL is denied if the specified CONDTYPE value is not supported for the specified LOCN value (e.g., CONDTYPE of RAI and LOCN of NEND) is entered. RTRV-ALM-ALL is denied if the DS1 CI/NI Trouble Sectionalization Premium Feature Option (PFO) is not enabled and an input value of AIS-CI, DS1ISD or RAI-CI is entered.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting
LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
	Restrictions:	RTRV-ALM-ALL is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-ALL command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction

TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-ALL command.

Access IDentifier, identifies the specific entity pertaining to the condition type being retrieved.

AIDTYPE {EC1, EQPT, F3, OC12, OC3, STS1, STS3C, T1, T3, VT1}
AID Type, identifies the type of AID for the condition type being retrieved. Values are:

EC1	EC1 AID being reported
EQPT	Equipment AID being reported
F3	F3 AID being reported
OC12	OC12 AID being reported
OC3	OC3 AID being reported
STS1	STS1 AID being reported
STS3C	STS3C AID being reported
T1	DS1 or TMG AID being reported
T3	DS3 AID being reported
VT1	VT1.5 AID being reported

NTFCNCDE {CR, MJ, MN}
Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:

CR	Critical Alarm
MJ	Major Alarm
MN	Minor Alarm

CONDTYPE EQUIPMENT_CONDTYPE:{ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DATALCK0, DATALCK1, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKSWPR, MISC-1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC12, TERM-OC3, TERM-T1, TERM-T3, TERM-T3EC1, TSA, TSI, WKSWPR, XIDMISM},

Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:

Output Values for EQUIPMENT CONDITION TYPES are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected.
BKUPMEMP	Backup Memory—Primary, magnetic disk backup failure.
BKUPMEMS	Backup Memory—Secondary, optical disk/tape drive back-up failure.
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane.
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf.
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN.
CD	Control and Display interface audit error detected.
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0.
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1.
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB.
CONTBUS	Control Bus, shelf control bus interface failure.
CONTCOM	Control Communication equipment failure.
CONTR	Control processor equipment failure.
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure.
DATALCK0	Data Lock 0, I/O shelf/quad locked to databus 0.

DATALCK1	Data Lock 1, I/O shelf/quad locked to databus 1.
DBF	Database Backup Failure, OPD database backup failure detected (on second try).
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try.
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed.
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified.
DUPMACADDR	Duplicate MAC Address detected on the LAN.
DUPTARPEENTRY	Duplicate TARP adjacency table.
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed.
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed.
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database.
GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.
INHSDWR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited.
INHSDWKG	Inhibit Switch To Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
INIT	Initialization, shelf initialization in-process.
INTERR	Internal Error, internal error suspected on equipment.
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
LOTRI	Loss of Offboard Timing Reference Input from mate Master Clock Board circuit pack.
MAN	Manual removal (logical removal was performed on a circuit pack).
MANWKSWR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
MISC-1	Miscellaneous Class-1, slave MCB is not ready.
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs.
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning.
PWR	Power, internal power failure detected.
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
SWFTDWN	Software Download is in process on a circuit pack.
SYNCEQPT	Synchronization Equipment failure detected.
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure.
TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure.
TERM-T1	Termination Equipment-T1, DSI circuit pack failure.

TERM-T3	Termination Equipment-T3, HMU circuit pack failure.
TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure.
TSA	Test Session Active, maintenance test session is active on the equipment.
TSI	Time Slot Interchange equipment failure.
TSTEQPT	Test Equipment failure.
WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.
Output Values for COMMON CONDITION TYPES are:	
DATAFLT	Data integrity Fault, CRC error detected during a database read.
EUA	Emergency User Access activated.
FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC12 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC3 GOS threshold reached.
GOS-ST1	Grade of Service-ST1, system-wide ST1 GOS threshold reached.
GOS-ST3C	Grade of Service-ST3C, system-wide ST3C GOS threshold reached.
GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
INIT	Initialization, system initialization in-process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
MANSELDATAOPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.

UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
Output Values for DS1, TMG, F3, and DS3 CONDITION TYPES are:	
1TO6LOF	One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3.
7LOF	Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3.
ACTLPBK	Active Loopback, the port is in loop back.
AICMIS	Application Identification Channel Mismatch, AIC mismatch detected.
AIS	Alarm Indication Signal, AIS detected.
AIS-CI	Remote Alarm Indication for Customer Installation detected.
ALWCBLPBK	Allow C-Bit Loopback.
DS1ISD	DS1 Idle Signal Detected, Incoming.
DS2YEL	DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3.
EOC	Embedded Operations Channel, EOC failure detected.
FEACEQPT	Far-End Alarm & Control (FEAC) Equipment detected.
FLTESC	Facility Fault Escalation active.
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
ISD	Idle Signal Detected.
LOF	Loss Of Frame detected.
LOS	Loss Of Signal detected.
MAN	Manual removal (logical removal was performed on the facility).
RAI	Remote Alarm Indication detected.
RAI-CI	Remote Alarm Indication for Customer Installation detected.
RCVCBLPBK	Receive (DS1) C-Bit Loopback.
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
SLTMSIG	Slipping Timing Reference Signal detected.
SYNCPRI	Primary Reference Synchronization failure.
SYNCSEC	Secondary Reference Synchronization failure.

	SYNCSTATQUAL	Synchronization Status Quality.
	XMTCBLPBK	Transmit (DS1) C-Bit Loopback.
	Output Values for OC12, OC3, EC1, STS1, STS3C, and VT1.5 CONDITION TYPES are:	
	ACTLPBK	Active Loopback, the port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	DUPTARPENTRY	Duplicate TARP adjacency table.
	EBER	Excessive Bit Error Rate detected.
	ESW	Excessive Switching, lockout of automatic revertive (OC12, OC3) switching due to excessive switching.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	L2LCONFAIL	Layer 2 Line DCC Connection Failure.
	L2SCONFAIL	Layer 2 Section DCC Connection Failure.
	LDCCDLFL	Line DCC Data Link Failure.
	LOCKOUTOFPR	LockOut Of Protection facility.
	LOF	Loss Of Frame detected.
	LOP	Loss Of Pointer detected.
	LOS	Loss Of Signal detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	PDI	Incoming PDI signal detected.
	RFI	Remote Failure Indication detected.
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
	SDBER	Signal Degrade Bit Error Rate detected.
	SDCCDLFL	Section DCC Data Link Failure.
	SLMF	Signal Label Match Failure detected.
	WTR	Wait To Restore of protection facility.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are: NSA Non-Service Affecting SA Service Affecting	
OCRDAT	{MONTH-DAY:{01-12} - {01-31}} Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59}} Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.	

LOCN	{FEND, NEND}	Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system. (A value of NEND is always reported for equipment or common condition types.)
DIRN	{TRMT, <NoVal>}	Direction, identifies the direction of the condition type being monitored. Values are: TRMT Transmit Direction, value returned for CONDTYPE of FLTESC. <NoVal> No Value (null) returned for all conditions other than FLTESC.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

EFON	Equipage, Feature Option Not provided
IDNC	Input, Data Not Consistent /*Location is not consistent with <CONDITION TYPE STRING>.*/*
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>.*/* /* Invalid service effect specified: <SERVICE EFFECT STRING>.*/* /* Invalid location specified: <LOCATION STRING>.*/* /* Invalid condition type specified: <CONDITION TYPE STRING>.*/* /* Condition type is not MISC but has a -#: <CONDITION TYPE STRING>.*/* /* Condition type is MISC but has no -#.*/ /* Condition type is TERM but - <STRING> is not valid.*/* /* Condition type is GOS but -<STRING> is not valid.*/* /* Invalid parameter specified.*/*
IIAC	Input, Invalid ACcess identifier /* AID for RTRV-ALM-ALL command must be ALL.*/*
SROF	Status, Requested Operation Failed /* rpt_file error - <ERRNO>, status = <STATUS>.*/* /* Cannot open <FILENAME>.*/* /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE>.*/* /* rpt_print error - <ERRNO>, status = <STATUS>.*/*

EXAMPLES

In the following example, all existing alarms in the system are retrieved.

```
RTRV-ALM-ALL: :ALL;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **RTRV-ALM-COM**
COMMAND NAME: **RETRIEVE ALARM COMMON**

PURPOSE

The RTRV-ALM-COM command retrieves the current status of any existing common (no specific entity) alarm conditions for any matching combination of a specified condition type, notification code, and service effect (i.e., the CONDTYPE, NTFNCNDE, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters).

The successful response for a RTRV-ALM-COM command contains one line of parsable output data, in ascending order by date and time of occurrence, for each alarm condition being reported.

If there are no existing alarm conditions with attributes matching the specified combination of condition type, notification code, and service effect, then the command is completed with no line of parsable output data provided.

A RTRV-ALM-COM command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ALM-COM: [TID] : [AID] : [CTAG] :: [NTFCNCNDE] , [CONDTYPE] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.						
AID	{COM} Default: {COM} Addressing: None Description: Common AID, used when a specific AID is not identified.						
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.						
NTFCNCNDE	{CR, MJ, MN} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm
CR	Critical Alarm						
MJ	Major Alarm						
MN	Minor Alarm						
CONDTYPE	{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-ST31, GOS-ST33C, GOS-T1, GOS-T3, GOS-VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDTACPY0, MANSELDTACPY1, MANSWTOPRI, MANSWTOTSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOTSEC, UPGRD1344, UPGRD2688} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are: <table><tr><td>DATAFLT</td><td>Data integrity Fault, CRC error detected during a database read.</td></tr></table>	DATAFLT	Data integrity Fault, CRC error detected during a database read.				
DATAFLT	Data integrity Fault, CRC error detected during a database read.						

EUA	Emergency User Access activated.
FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
GOS-ST1	Grade of Service-ST1, system-wide STS-1 GOS threshold reached.
GOS-ST3C	Grade of Service-ST3C, system-wide STS-3C GOS threshold reached.
GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
INIT	Initialization, system initialization in-process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
MANSELDATAOPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
SRVEFF	{NSA, SA}
	Default: < Both service effect values >
	Addressing: None
	Description: Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA Non-Service Affecting
	SA Service Affecting

```

OUTPUT PARAMETERS

NTFCNCDE	{CR, MJ, MN}	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
CONDTYPE	{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-STS1, GOS-STS3C, GOS-T1, GOS-T3, GOS-VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDATAOPY0, MANSELDATAOPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPRD1344, UPRD2688}	Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	DATAFLT	Data integrity Fault, CRC error detected during a database read.
	EUA	Emergency User Access activated.
	FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
	FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
	GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
	GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
	GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
	GOS-STS1	Grade of Service-STS1, system-wide STS-1 GOS threshold reached.
	GOS-STS3C	Grade of Service-STS3C, system-wide STS-3C GOS threshold reached.
	GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
	GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
	GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
	HLDVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
	INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
	INIT	Initialization, system initialization in-process.
	ITMIP	Installation Test and Maintenance (ITM) mode is set.
	MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
	MANSELDATAOPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.

MANSWTOPRI
MANSWTOSEC

Manual Switch To Primary Synchronization Reference.
Manual Switch To Secondary Synchronization Reference.

	PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
	RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
	SWTOPRI	Automatic Switch To Primary Synchronization Reference.
	SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
	UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
	UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
SRVEFF	{NSA, SA}	Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} }	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} }	Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.
LOCN	{NEND}	Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/ * <Informational Error Description Text> */]
[/ * <Expanded Error Code Description> */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IDNV      Input, Data Not Valid
          /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
          /* Invalid service effect specified: <SERVICE EFFECT STRING>. */
          /* Invalid condition type specified: <CONDITION TYPE STRING>. */
          /* Condition type not valid for: COM. */
          /* Condition type is GOS but -<STRING> is not valid. */
          /* Invalid parameter specified. */
IIAC      Input, Invalid ACcess identifier
          /* AID must be COM. */
SROF      Status, Requested Operation Failed
          /* rpt_file error - <ERRNO>, status = <STATUS>. */
          /* Cannot open <FILENAME>. */
          /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE>. */
          /* rpt_print error - <ERRNO>, status = <STATUS>. */

```

EXAMPLES

In the following example, any existing alarms for a condition type of INHFL are retrieved.

```
RTRV-ALM-COM::::, INHFL;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71042 COMPLD  
"COM:MN, INHFL, NSA, 07-01, 07-30-28, NEND, ,"

COMMAND CODE: **RTRV-ALM-EC1**
COMMAND NAME: **RETRIEVE ALARM EC1**

PURPOSE

The RTRV-ALM-EC1 command retrieves the current status of any existing alarm conditions for the specified EC1 port, or for the specified EC1 port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFNCNDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the EC1 port is provisioned.

The successful response for a RTRV-ALM-EC1 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ALM-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-EC1 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port. Name-defined values are: ALL All provisioned EC1 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: CR Critical Alarm MJ Major Alarm MN Minor Alarm

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, INHPMREPT, LOF, LOS, MAN}, FAR-END_CONDDTYPE:{RFI} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are: <table> <tr> <td>ACTLPBK</td><td>Active Loopback, the EC1 port is in loop back. (Near-End only.)</td></tr> <tr> <td>AIS</td><td>Alarm Indication Signal, AIS detected. (Near-End only.)</td></tr> <tr> <td>INHPMREPT</td><td>Inhibit Performance Monitoring Report, PM report capability Inhibited. (Near-End only.)</td></tr> <tr> <td>LOF</td><td>Loss Of Frame detected. (Near-End only.)</td></tr> <tr> <td>LOS</td><td>Loss Of Signal detected. (Near-End only.)</td></tr> <tr> <td>MAN</td><td>Manual removal (logical removal was performed on the facility). (Near-End only.)</td></tr> <tr> <td>RFI</td><td>Remote Failure Indication detected. (Far-End only.)</td></tr> </table> Restrictions: RTRV-ALM-EC1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).	ACTLPBK	Active Loopback, the EC1 port is in loop back. (Near-End only.)	AIS	Alarm Indication Signal, AIS detected. (Near-End only.)	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited. (Near-End only.)	LOF	Loss Of Frame detected. (Near-End only.)	LOS	Loss Of Signal detected. (Near-End only.)	MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)	RFI	Remote Failure Indication detected. (Far-End only.)
ACTLPBK	Active Loopback, the EC1 port is in loop back. (Near-End only.)														
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)														
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited. (Near-End only.)														
LOF	Loss Of Frame detected. (Near-End only.)														
LOS	Loss Of Signal detected. (Near-End only.)														
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)														
RFI	Remote Failure Indication detected. (Far-End only.)														
SRVEFF	{NSA, SA} Default: < Both service effect values > Addressing: None Description: Service Effect, specifies the service effect of the condition type to be retrieved. Values are: <table> <tr> <td>NSA</td><td>Non-Service Affecting</td></tr> <tr> <td>SA</td><td>Service Affecting</td></tr> </table>	NSA	Non-Service Affecting	SA	Service Affecting										
NSA	Non-Service Affecting														
SA	Service Affecting														
LOCN	{FEND, NEND} Default: < All location values applicable to the specified condition type > Addressing: None Description: Location, specifies the location where the condition type is monitored. Values are: <table> <tr> <td>FEND</td><td>Far-End, events occurring at a distant network element.</td></tr> <tr> <td>NEND</td><td>Near-End, events occurring at the system.</td></tr> </table> Restrictions: RTRV-ALM-EC1 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).	FEND	Far-End, events occurring at a distant network element.	NEND	Near-End, events occurring at the system.										
FEND	Far-End, events occurring at a distant network element.														
NEND	Near-End, events occurring at the system.														
DIRN	{NA, RCV, TRMT} Default: < All applicable directions > Addressing: None Description: Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-EC1 command. <table> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT	Transmit direction								
NA	Not Applicable														
RCV	Receive side														
TRMT	Transmit direction														
TMPER	{15-MIN, 1-DAY} Default: {15-MIN} Addressing: None Description: Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-EC1 command.

CONDTYPE	<p>NEAR-END_CONDTYPE:{ACTLPBK, AIS, INHPMREPT, LOF, LOS, MAN}, FAR-END_CONDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:</p> <table> <tr> <td>ACTLPBK</td><td>Active Loopback, the EC1 port is in loop back.</td></tr> <tr> <td>AIS</td><td>Alarm Indication Signal, AIS detected.</td></tr> <tr> <td>INHPMREPT</td><td>Inhibit Performance Monitoring Report, PM report capability Inhibited.</td></tr> <tr> <td>LOF</td><td>Loss Of Frame detected.</td></tr> <tr> <td>LOS</td><td>Loss Of Signal detected.</td></tr> <tr> <td>MAN</td><td>Manual removal (logical removal was performed on the facility).</td></tr> <tr> <td>RFI</td><td>Remote Failure Indication detected.</td></tr> </table>	ACTLPBK	Active Loopback, the EC1 port is in loop back.	AIS	Alarm Indication Signal, AIS detected.	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.	LOF	Loss Of Frame detected.	LOS	Loss Of Signal detected.	MAN	Manual removal (logical removal was performed on the facility).	RFI	Remote Failure Indication detected.
ACTLPBK	Active Loopback, the EC1 port is in loop back.														
AIS	Alarm Indication Signal, AIS detected.														
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.														
LOF	Loss Of Frame detected.														
LOS	Loss Of Signal detected.														
MAN	Manual removal (logical removal was performed on the facility).														
RFI	Remote Failure Indication detected.														
SRVEFF	<p>{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:</p> <table> <tr> <td>NSA</td><td>Non-Service Affecting</td></tr> <tr> <td>SA</td><td>Service Affecting</td></tr> </table>	NSA	Non-Service Affecting	SA	Service Affecting										
NSA	Non-Service Affecting														
SA	Service Affecting														
OCRDAT	<p>{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.</p>														
OCRTM	<p>{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.</p>														
LOCN	<p>{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:</p> <table> <tr> <td>FEND</td><td>Far-End, events occurring at a distant network element.</td></tr> <tr> <td>NEND</td><td>Near-End, events occurring at the system.</td></tr> </table>	FEND	Far-End, events occurring at a distant network element.	NEND	Near-End, events occurring at the system.										
FEND	Far-End, events occurring at a distant network element.														
NEND	Near-End, events occurring at the system.														

UNSUCCESSFUL RESPONSE FORMAT

```

M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* Cannot open <FILENAME>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, all existing alarms for EC1 port EC1-347 are retrieved.

```
RTRV-ALM-EC1::EC1-347;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
  "EC1-347,EC1:MJ,LOF,SA,07-02,08-44-30,NEND,,"
  "EC1-347,EC1:MN,MAN,NSA,07-02,09-05-12,NEND,,"
  /* RTRV-ALM-EC1::EC1-347 [P71066] (2) */
;
```

REPT^ALM^EC1

COMMAND CODE: **RTRV-ALM-EQPT**
COMMAND NAME: **RETRIEVE ALARM EQUIPMENT**

PURPOSE

The RTRV-ALM-EQPT command retrieves the current status of any existing alarm conditions for the specified equipment AID, or for the specified equipment AID and any matching combination of a specified condition type, notification code, and service effect (i.e., the CONDTYPE, NTFNCNDE, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the equipment entity is provisioned.

The successful response for a RTRV-ALM-EQPT command contains one line of parsable output data, in ascending order by date and time of occurrence, for each alarm condition being reported. If an AID of ALL is entered, a line of output is provided for each AID with an existing alarm condition.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, and service effect, then the command is completed with no line of parsable output data provided.

A RTRV-ALM-EQPT command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-EQPT: [TID]:AID:[CTAG]::[NTFNCNDE],[CONDTYPE],[SRVEFF];

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	{ACM, ALL, CDA, CDB, CID, CIM, CKB, CPU, DSB, DSI, DSK, EOB, EP3, ES1, ESA, FAN, FUSE, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1M16, G1M32, G1M40, G1MRPB, G1O1B, G1O4M, G1S3M, G4EOB, G4IOB, G4OXB, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OPD, OXB, P39, P56, PDU, PRT, PSF, PST, QUAD, RDU, RPB, RSP, S3M, SBT, SHELF, SIO, SPB, SWI} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment entities. Values are: ACM All Administrative Communications Module circuit packs. ALL All applicable AIDs pertaining to the specified CONDTYPE. CDA All Clock Distribution A circuit packs. CDB All Clock Distribution B circuit packs. CID All Communications Interface Devices (VDT, TTY, PRN). CIM All Communications Interface Module circuit packs. CKB All Circuit Breakers, circuit breakers in the PDU/RDU/RSP. CPU All Central Processing Unit circuit packs. DSB All DCC Server Boards. DSI All DS1 Input/Output circuit packs. DSK All Disk Drives. EOB All Electrical to Optical Board circuit packs. EP3 All Electrical Plesiochronous DS3/STS1 Interface circuit packs. ES1 All Electrical Plesiochronous STS1 Interface circuit packs. ESA All External DS1 Signal Adapter circuit packs.

FAN	All Fan/Blower assemblies.
FUSE	All Fuses, PDU fuses.
G1EOB	All GTI cables carrying an STM1 signal and terminating on an EOB.
G1EP3	All GTI cables carrying an STM1 signal and terminating on an EP3.
G1ES1	All GTI cables carrying an STM1 signal and terminating on an ES1.
G1IOB	All GTI cables coming into IOB module and carrying STM–1 signal.
G1IRPB	All GTI cables carrying an STM1 signal and terminating on the I/O side of the RPB circuit pack.
G1M16	All GTI cables carrying an STM1 signal and terminating on a M16.
G1M32	All GTI cables carrying an STM1 signal and terminating on a M32.
G1M40	All GTI cables carrying an STM1 signal and terminating on a M40.
G1MRPB	All GTI cables carrying an STM1 signal and terminating on the matrix side of the RPB circuit pack.
G1O1B	All GTI cables carrying an STM1 signal and terminating on an O1B.
G1O4M	All GTI cables carrying an STM1 signal and terminating on an O4M.
G1S3M	All GTI cables carrying an STM1 signal and terminating on an S3M.
G4EOB	All GTI cables carrying an STM4 signal and terminating on an EOB.
G4IOB	All GTI cables coming into IOB module and carrying STM–4 signal.
G4OXB	All GTI cables carrying an STM4 signal and terminating on an OXB.
HMU	All High Speed Muldem Unit (M23 multiplexing) circuit packs.
ICM	All Intelligent Communications Module circuit packs.
IOB	Inter–rack Optics Board
IPB	All Internal Protection Board circuit packs.
IPU	All Interface Processing Unit circuit packs.
LMU	All Low Speed Muldem Unit (M12 multiplexing) circuit packs.
LT1	All Level 1 Translator (RS–232) circuit packs.
LT2	All Level 2 Translator (RS–449/422) circuit packs.
LT4	All Level 4 Translator (ACL) circuit packs.
LT5	All Level 5 Translator (RS449/423 & LAN) circuit packs.
LT8	All Level 8 Translator (ACL) circuit packs.
M16	All Matrix End/Center Stage 16 circuit packs.
M32	All Matrix End Stage 32 circuit packs.
M40	All Matrix End/Center Stage 40 circuit packs.
MCB	All Master Clock Board circuit packs.
O1B	All Optical Interface Level 1 (OC–3) Board circuit packs.
O4M	All OC–12 Muldem (OC–12) circuit packs.
OPD	All Optical Disk Drives.
OXB	All Optical Transceiver Board circuit packs.
P39	All Power Supply, 3.9V circuit packs.
P56	All Power Supply, 5.6V circuit packs.
PDU	All Power Distribution Units.
PRT	All DS1 Protect circuit packs.
PSF	All Power Supply, 5V circuit packs.
PST	All Power Supply, 12V circuit packs.
QUAD	All DS1 Shelf Quadrants.
RDU	All Rack Distribution Units.
RPB	All Ring Protection Board circuit packs.
RSP	Rack Status Panel.
S3M	All STS3 Module circuit packs.
SBT	All System Bus Termination circuit packs.
SHELF	All I/O, EOC, End Stage, or Center Stage Shelves.
SIO	All Serial Input/Output circuit packs.

	SPB	All Satellite Processor Board circuit packs.
	SWI	All DS1 Switch circuit packs.
	Restrictions:	RTRV-ALM-EQPT is denied if the specified AID is not valid for the specified CONDTYPE. (Refer to Appendix C and CONDTYPE below.) RTRV-ALM-EQPT is denied for a 240-port LMC system if an AID of CDA is entered.
CTAG	<1-6 VALID CTAG CHARACTERS>	
	Default:	<System Assigned CTAG Value>
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN}	
	Default:	< All applicable notification codes listed above >
	Addressing:	None
	Description:	Notification Code, specifies the notification code of the condition type to be retrieved. Values are:
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
CONDTYPE	{ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPNTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKSWPR, MISC-1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC3, TERM-OC12, TERM-T1, TERM-T3, TERM-T3EC1, TSA, TSI, WKSWPR, XIDMISM}	
	Default:	< All applicable condition types listed above >
	Addressing:	None
	Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	ALMCKT	Alarm Circuit, RDU/RSP failure detected. (Valid for an AID of ALL, RDU, RSP.)
	BKUPMEMP	Backup Memory-Primary, magnetic disk backup failure. (Valid for an AID of ALL, DSK.)
	BKUPMEMS	Backup Memory-Secondary, optical disk/tape drive backup failure. (Valid for an AID of ALL, OPD.)
	BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane. (Valid for an AID of ALL, SHELF.)
	BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf. (Valid for an AID of ALL, SHELF.)
	CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN. (Valid for an AID of ALL, CID, DSB.)
	CD	Control and Display interface audit error detected. (Valid for an AID of ALL, CID.)
	CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0. (Valid for an AID of ALL, QUAD, SHELF.)
	CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1. (Valid for an AID of ALL, QUAD,

	SHELF.)
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB. (Valid for an AID of ALL, DSB.)
CONTBUS	Control Bus, shelf control bus interface failure. (Valid for an AID of ALL, IPU, SPB.)
CONTCOM	Control Communication equipment failure. (Valid for an AID of ALL, ACM, CIM, ICM, SIO.)
CONTR	Control processor equipment failure. (Valid for an AID of ALL, CPU, IPU, SPB.)
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure. (Valid for an AID of ALL, EOB, IOB, IPB, LMU, OXB, RPB, S3M.)
DBF	Database Backup Failure, OPD database backup failure detected (on second try). (Valid for an AID of ALL, OPD.)
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try. (Valid for an AID of ALL, OPD.)
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed. (Valid for an AID of ALL, DSB.)
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified. (Valid for an AID of ALL, SHELF, QUAD.)
DUPMACADDR	Duplicate MAC Address detected on the LAN. (Valid for an AID of ALL, DSB.)
DUPTARPEENTRY	Duplicate TARP adjacency table. (Valid for an AID of ALL, DSB.)
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed. (Valid for an AID of ALL, CKB, FUSE.)
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed. (Valid for an AID of ALL, FAN.)
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database. (Valid for an AID of ALL, MCB.)
GT1	GTI Cable fault for GTI cable carrying an STM1 signal (Valid for an AID of ALL, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1M16, G1M32, G1M40, G1MRPB, G1S3M, G1O1B, G1O4M.)
GT4	GTI Cable fault for GTI cable carrying an STM4 signal (Valid for an AID of ALL, G4EOB, G4IOB, G4OXB.)
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal. (Valid for AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, EOB, EP3, ES1, ESA, FAN, HMU, ICM, IOB, IPB, IPU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PDU, PRT, PSF, PST, RDU, RPB, S3M, SBT, SIO, SPB, SWI.)
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited. (Valid for an AID of ALL, CPU, IPU, SPB.)
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
INHSDWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.

	(Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
INIT	Initialization, shelf initialization in-process. (Valid for an AID of ALL, SHELF.)
INTERR	Internal Error, internal error suspected on equipment. (Valid for an AID of ALL, CDA, CDB, DSI, EOB, EP3, ES1, HMU, IOB, IPB, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, RPB, S3M.)
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
LOTRI	Loss Of Offboard Timing Reference Input from mate Master Clock Board circuit pack. (Valid for an AID of ALL, MCB.)
MAN	Manual removal (logical removal was performed on a circuit pack). (Valid for an AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, DSK, EOB, EP3, ES1, HMU, ICM, IOB, IPB, IPU, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PSF, RPB, S3M, SIO, SPB.)
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
MISC-1	Miscellaneous Class-1, slave MCB is not ready. (Valid for an AID of ALL, MCB.)
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs. (Valid for an AID of ALL, DSB.)
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning. (Valid for an AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, EOB, EP3, ES1, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, OXB, O1B, O4M, P39, P56, PRT, RPB, S3M, SIO, SWI.)
PWR	Power, internal power failure detected. (Valid for an AID of ALL, P39, P56, PSF, PST, RSP.)
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem. (Valid for an AID of ALL, M16, M32, M40, SPB.)
SWFTDWN	Software Download is in process on a circuit pack. (Valid for an AID of ALL, ACM, CIM, DSB, EP3, ES1, ICM, IPU, M16, M32, M40, MCB, O1B, O4M, OXB, RPB, S3M, SPB.)
SYNCEQPT	Synchronization Equipment failure detected. (Valid for an AID of ALL, CDA, CDB, MCB.)
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure. (Valid for an AID of ALL, ES1.)
TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure. (Valid for an AID of ALL, O1B.)
TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure. (Valid for an AID of ALL, O4M.)
TERM-T1	Termination Equipment-T1, DSI circuit pack failure. (Valid for an AID of ALL, DSI.)
TERM-T3	Termination Equipment-T3, HMU circuit pack failure. (Valid for an AID of ALL, HMU.)

	TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure. (Valid for an AID of ALL, EP3.)
	TSA	Test Session Active, maintenance test session active on the equipment. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU, M16, M32, O1B, O4M, S3M.)
	TSI	Time Slot Interchange equipment failure. (Valid for an AID of ALL, M16, M32, M40.)
	WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
	XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad. (Valid for an AID of ALL, QUAD, SHELF)
	Restrictions:	RTRV-ALM-EQPT is denied if the specified CONDDTYPE is not valid for the specified AID.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

 Equipment AID, identifies the equipment entity.

NTFCNCDE	{CR, MJ, MN} Notification Code, identifies the notification code generated by the system when the condition occurred. Values are: CR Critical Alarm MJ Major Alarm MN Minor Alarm
CONDTYPE	{ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPEENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKSWPR, MISC-1, OSIPARMISM, PRCDREERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC3, TERM-OC12, TERM-T1, TERM-T3, TERM-T3EC1, TSA, TSI, WKSWPR, XIDMISM} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are: ALMCKT Alarm Circuit, RDU/RSP failure detected. BKUPMEMP Backup Memory-Primary, magnetic disk backup failure. BKUPMEMS Backup Memory-Secondary, optical disk/tape drive backup failure. BPMISM Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane. BPTERM Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf. CARLOS Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN. CD Control and Display interface audit error detected. CLKLCK0 Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0. CLKLCK1 Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1. CNTRLRFL Controller Failure, LAPD or LAN controller failed set on the DSB. CONTBUS Control Bus, shelf control bus interface failure. CONTCOM Control Communication equipment failure. CONTR Control processor equipment failure. CTNEQPT Connection Equipment, facility/circuit interconnection equipment failure. DBF Database Backup Failure, OPD database backup failure detected (on second try). DBFFT Database Backup Failed on First Try, OPD database backup failure detected on first try. DCCEQPT Data Communication Channel Equipment, DCC Server Board failed. DTLCKCPYFL Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified. DUPMACADDR Duplicate MAC Address detected on the LAN. DUPTARPEENTRY Duplicate TARP adjacency table. FA Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed. FANEQPT Fan Equipment, one or more of the fans in a fan assembly failed. FWMISM Firmware Mismatch, firmware version number does not match that in the system database.

	GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
	GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
	IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
	INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.
	INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited.
	INHSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
	INIT	Initialization, shelf initialization in-process.
	INTERR	Internal Error, internal error suspected on equipment.
	LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
	LOTRI	Loss Of Offboard Timing Reference Input from mate Master Clock Board circuit pack.
	MAN	Manual removal (logical removal was performed on a circuit pack).
	MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
	MISC-1	Miscellaneous Class-1, slave MCB is not ready.
	OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs.
	PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning.
	PWR	Power, internal power failure detected.
	RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
	SWFTDWN	Software Download is in process on a circuit pack.
	SYNCEQPT	Synchronization Equipment failure detected.
	TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
	TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure.
	TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure.
	TERM-T1	Termination Equipment-T1, DSI circuit pack failure.
	TERM-T3	Termination Equipment-T3, HMU circuit pack failure.
	TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure.
	TSA	Test Session Active, maintenance test session active on the equipment.
	TSI	Time Slot Interchange equipment failure.
	WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
	XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.
SRVEFF	{NSA, SA}	Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} }	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.

OCRTM {HOUR-MINUTE-SECOND:{00-23} – {00-59} – {00-59} }
Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR> –<SECOND_OF_MINUTE>.

LOCN {NEND}
Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV Input, Data Not Valid
/* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
/* Invalid service effect specified: <SERVICE EFFECT STRING>. */
/* Invalid condition type specified: <CONDITION TYPE STRING>. */
/* Condition type is not MISC but has a -#: <CONDITION TYPE STRING>. */
/* Condition type is MISC but has no -#. */
/* Condition type is TERM but – <STRING> is not valid. */
/* Condition type not valid for: EQPT. */
/* Invalid parameter specified. */

IIAC Input, Invalid ACcess identifier
/* Invalid card type specified: <CARD TYPE STRING>. */

SROF Status, Requested Operation Failed
/* rpt_file error – <ERRNO>, status = <STATUS>. */
/* Cannot open <FILENAME>. */
/* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */
/* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, all existing alarms with a condition type of TERM-T3EC1 for all applicable equipment types are retrieved.

```
RTRV-ALM-EQPT::ALL::, TERM-T3EC1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
  "EP3-9-3-8,EQPT:MN,TERM-T3EC1,NSA,07-01,07-30-28,NEND,, "
  "EP3-7-1-3,EQPT:MN,TERM-T3EC1,NSA,07-02,16-12-33,NEND,, "
  /* RTRV-ALM-EQPT::ALL::, TERM-T3EC1 [P71042] (1) */
;
```

REPT^ALM^EQPT

COMMAND CODE: **RTRV-ALM-F3**
COMMAND NAME: **RETRIEVE ALARM F3**

PURPOSE

The RTRV-ALM-F3 command retrieves the current status of any existing alarm conditions for the specified F3 port, or for the specified F3 port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFNCNDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the F3 port is provisioned.

If the specified F3 is not provisioned, i.e., it is in an UAS secondary state, the command completes successfully without producing any output.

The successful response for a RTRV-ALM-F3 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ALM-F3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-F3 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the F3 port. Name-defined values are: ALL All provisioned F3 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: CR Critical Alarm MJ Major Alarm MN Minor Alarm

CONDTYPE	{INHMPREPT}	
	Default:	< All applicable condition types listed above >
	Addressing:	None
	Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	INHMPREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting
LOCN	{NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	NEND	Near-End, events occurring at the system.
DIRN	{NA, RCV}	
	Default:	{NA}
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-F3 command.
	NA	Not Applicable
	RCV	Receive side
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-F3 command.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

```

OUTPUT PARAMETERS

AID	F3_AID:	
	{T3F3-{1-4800}-{1-14}}	(T3F3-DS3#-Fractional_DS3#)
	F3 AID, identifies the F3 port.	
NTFCNCDE	{CR, MJ, MN}	
	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm

CONDTYPE	{INHPMREPT} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are: INHPMREPT Inhibit Performance Monitoring Report, PM report capability Inhibited.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are: NSA Non-Service Affecting SA Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> - <SECOND_OF_MINUTE>.
LOCN	{NEND} Location, identifies the location where the condition type is monitored. Values are: NEND Near-End, events occurring at the system.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /*Invalid Access ID specified.*/
SROF	Status, Requested Operation Failed /*rpt_file error – <ERRNO>, status = <STATUS>*/ /*Cannot open <FILENAME>*/ /*nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>*/ /* rpt print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, all existing alarms for F3 port T3F3-4-14 are retrieved.

```
RTRV-ALM-F3::T3F3-4-14;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71066 COMPLD  
"T3F3-4-14,F3:MJ,INHMPREPT,NSA,07-02,08-44-30,NEND,, "

COMMAND CODE: **RTRV-ALM-OC12**
COMMAND NAME: **RETRIEVE ALARM OC-12**

PURPOSE

The RTRV-ALM-OC12 command retrieves the current status of any existing alarm conditions for the specified OC-12 port, or for the specified OC-12 port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFNCDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the OC-12 port is provisioned.

The successful response for a RTRV-ALM-OC12 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ALM-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-OC12 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port. Name-defined values are: ALL All provisioned OC-12 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: CR Critical Alarm MJ Major Alarm MN Minor Alarm

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRY, EBER, ESW, FRCDWKSWBK, FRCDWKSWPR, INHPMREPT, L2LCONFAIL, L2SCONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKSWBK, MANWKSWPR, SDBER, SDCCDLFL, WTR},	
	FAR-END_CONDDTYPE:{RFI}	
	Default:	< All applicable condition types listed above >
	Addressing:	None
	Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK	Active Loopback, the OC-12 port is in loopback. (Near-End only.)
	AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
	DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
	EBER	Excessive Bit Error Rate detected. (Near-End only.)
	ESW	Excessive Switching, lock out of automatic revertive (OC-12) switching due to excessive switching. (Near-End only.)
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
	L2SCONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
	LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
	LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)

	LOS	Loss Of Signal detected. (Near-End only.)
	MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched back to the main facility. (Near-End only.)
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
	RFI	Remote Failure Indication detected. (Far-End only.)
	SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
	SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
	WTR	Wait To Restore of protection facility. (Near-End only.)
	Restrictions:	RTRV-ALM-OC12 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	RTRV-ALM-OC12 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RFI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-OC12 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-OC12 command.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* Cannot open <FILENAME>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing alarm with a condition type of LOF for OC-12 ports OC12-113 through OC12-114 is retrieved.

```
RTRV-ALM-OC12::OC12-113&&-114:::,LOF;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
  "OC12-113,OC12:MJ,LOF,SA,07-02,07-30-28,NEND,, "
  /* RTRV-ALM-OC12::OC12-113&&-114:::,LOF [P71061] (1) */
;

```

In the following example, all existing alarms for OC12 port OC12-123 are retrieved.

```
RTRV-ALM-OC12::OC12-123;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
"OC12-123,OC12:MJ,LOF,SA,07-02,08-44-30,NEND,, "
"OC12-123,OC12:MN,MAN,SA,07-02,09-05-12,NEND,, "
/* RTRV-ALM-OC12::OC12-123 [P71066] (2) */
;

COMMAND CODE: **RTRV-ALM-OC3**
COMMAND NAME: **RETRIEVE ALARM OC-3**

PURPOSE

The RTRV-ALM-OC3 command retrieves the current status of any existing alarm conditions for the specified OC-3 port, or for the specified OC-3 port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFCNCDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the OC-3 port is provisioned.

The successful response for a RTRV-ALM-OC3 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ALM-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-OC3 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port. Name-defined values are: ALL All provisioned OC-3 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: CR Critical Alarm MJ Major Alarm MN Minor Alarm

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRTY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAIL, L2S CONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR},	
	FAR-END_CONDDTYPE:{RFI}	
	Default:	< All applicable condition types listed above >
	Addressing:	None
	Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK	Active Loopback, the OC-3 port is in loopback. (Near-End only.)
	AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
	DUPTARPENRTY	Duplicate TARP adjacency table. (Near-End only.)
	EBER	Excessive Bit Error Rate detected. (Near-End only.)
	ESW	Excessive Switching, lock out of automatic revertive (OC-3) switching due to excessive switching. (Near-End only.)
	FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
	FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
	L2S CONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
	LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
	LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
	LOF	Loss Of Frame detected. (Near-End only.)
	LOS	Loss Of Signal detected. (Near-End only.)
	MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
	MANWKS WBK	Manual Working Switched Back, working facility was manually switched back to the main facility. (Near-End only.)
	MANWKS WPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
	RFI	Remote Failure Indication detected. (Far-End only.)
	SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
	SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
	WTR	Wait To Restore of protection facility. (Near-End only.)
	Restrictions:	RTRV-ALM-OC3 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
DIRN	NEND	Near-End, events occurring at the system.
	Restrictions:	RTRV-ALM-OC3 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RFI and LOCN of NEND is entered).
	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
TMPER	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-OC3 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-OC3 command.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* Cannot open <FILENAME>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing alarm with a condition type of LOF for OC-3 ports OC3-113 through OC3-114 is retrieved.

```
RTRV-ALM-OC3::OC3-113&&-114:::,LOF;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
"OC3-113,OC3:MJ,LOF,SA,07-02,07-30-28,NEND,, "
/* RTRV-ALM-OC3::OC3-113&&-114:::,LOF [P71061] (1) */
;
```

In the following example, all existing alarms for OC-3 port OC3-123 are retrieved.

```
RTRV-ALM-OC3::OC3-123;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-ALM-STS1**
COMMAND NAME: **RETRIEVE ALARM STS-1**

PURPOSE

The RTRV-ALM-STS1 command retrieves the current status of any existing alarm conditions for the specified STS-1 port, or for the specified STS-1 port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFNCDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the STS-1 port is provisioned.

The successful response for a RTRV-ALM-STS1 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified STS-1 is embedded within a protection OC-3 or OC-12.

A RTRV-ALM-STS1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-STS1: [TID] :AID: [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	ALL_AID:	
	{ALL}	
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	STS1 AID, identifies the STS-1 port. Name-defined values are:
	ALL	All provisioned STS-1 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN}	
	Default:	< All applicable notification codes listed above >
	Addressing:	None
	Description:	Notification Code, specifies the notification code of the condition type to be retrieved. Values are:
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI}
	Default: < All applicable condition types listed above >
	Addressing: None
	Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK Active Loopback, the STS-1 port is in loop back. (Near-End only.)
	AIS Alarm Indication Signal, AIS detected. (Near-End only.)
	EBER Excessive Bit Error Rate detected. (Near-End only.)
	FLTESC Facility Fault Escalation active. (Near-End only.)
	FRCDWKSWBK Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
	FRCDWKSWPR Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
	IDLE Idle, incoming idle detected. (Near-End only.)
	INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	LOP Loss Of Pointer detected. (Near-End only.)
	MAN Manual removal (logical removal was performed on the facility). (Near-End only.)
	MANWKSWBK Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
	MANWKSWPR Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
	PDI Incoming PDI signal detected (STS1)
	RFI Remote Failure Indication detected. (Far-End only.)
	SDBER Signal Degrade Bit Error Rate detected. (Near-End only.)
	SLMF Signal Label Match Failure detected. (Near-End only.)
	Restrictions: RTRV-ALM-STs1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).
SRVEFF	{NSA, SA}
	Default: < Both service effect values >
	Addressing: None
	Description: Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA Non-Service Affecting
	SA Service Affecting

LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
DIRN	NEND	Near-End, events occurring at the system.
	Restrictions:	RTRV-ALM-STS1 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of AIS and LOCN of FEND is entered).
	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
TMPER	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-STS1 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-STS1 command.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<AID>, STS1:<NTFCNCDE>,<CONDTYPE>,<SRVEFF>,<OCRDAT>,<OCRTM>,<LOCN>,<DIRN>"],"]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;

```

OUTPUT PARAMETERS

AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	STS1 AID, identifies the STS-1 port.	
NTFCNCDE	{CR, MJ, MN}	
	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the STS-1 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	EBER	Excessive Bit Error Rate detected.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	LOP	Loss Of Pointer detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	PDI	Incoming PDI signal detected (STS1)
	RFI	Remote Failure Indication detected.
	SDBER	Signal Degrade Bit Error Rate detected.
	SLMF	Signal Label Match Failure detected.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.	
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* Cannot open <FILENAME>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, all existing alarms for STS-1 port EC1STS1-337 through EC1STS1-338 are retrieved.

```
RTRV-ALM-STs1: : EC1STS1-337&&-338;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
  "EC1STS1-337, STS1: MJ, LOP, SA, 07-02, 08-44-30, NEND, , "
  / * RTRV-ALM-STs1: : EC1STS1-337&&-338 [P71066] (2) */
;

REPT^ALM^STS1

COMMAND CODE: **RTRV-ALM-STS3C**
COMMAND NAME: **RETRIEVE ALARM STS-3C**

PURPOSE

The RTRV-ALM-STS3C command retrieves the current status of any existing alarm conditions for the specified STS-3C port, or for the specified STS-3C port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFCNCDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the STS-3C port is provisioned.

The successful response for a RTRV-ALM-STS3C command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified STS-3C is embedded within a protection OC-3 or OC-12.

A RTRV-ALM-STS3C command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-STS3C: [TID] :AID: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID, identifies the STS-3C port. Name-defined values are: ALL All provisioned STS-3C ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: CR Critical Alarm MJ Major Alarm MN Minor Alarm

COMMAND CODE: **RTRV-ALM-SUM**
COMMAND NAME: **RETRIEVE ALARM SUMMARY**

PURPOSE

The RTRV-ALM-SUM command provides a summary of the number and severity of declared alarms in the system. The command can be configured to provide an abbreviated alarm summary for use by machine-machine interfaces (as for graphic user interface or GUI) or a longer summary for easy reading.

A RTRV-ALM-SUM command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ALM-SUM: [TID] :: [CTAG] :: : [VERBOSE=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
VERBOSE=	{Y,N} Default: {Y} Addressing: None Description: Y = Verbose response activated. System produces longer, easy-to-read alarm summary output. N = Verbose response not activated. System produces abbreviated representation of alarm summary. Selected when summary output to be parsed through machine-machine interface to provide graphic user interface (GUI) interaction capability.

SUCCESSFUL RESPONSE FORMAT

Response For VERBOSE=Y Input Parameter

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD

"Highest Severity Alarm is <HIGHNTFCNCDE>"
"<NUMCR> Critical Alarms Reported"
"<NUMMJ> Major Alarms Reported"
"<NUMMN> Minor Alarms Reported"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

Response For VERBOSE=N Input Parameter

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD

"<HIGHNTFCNCDE>, <NUMCR>, <NUMMJ>, <NUMMN>"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

HIGHNTFCNCDE Highest Notification Code, identifies the highest severity alarm currently reported in the system. Values are:

CR	Critical Alarm
MJ	Major Alarm
MN	Minor Alarm
NA	Not Applicable. No existing alarms reported in system.

NUMCR {0-#} Number of Critical Alarms Reported

NUMMJ {0-#} Number of Major Alarms Reported

NUMMN {0-#} Number of Minor Alarms Reported

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV Input, Data Not Valid
/*Invalid parameter value.*/

EXAMPLES

In the following example, a summary of all system alarms has been requested:

```
RTRV-ALM-SUM;
```

The output response, shown below, is relatively easy to read and understand.

```
LMC3 01-02-22 15:30:05
M C00002 COMPLD
  "Highest Severity Alarm is CR"
  "2 Critical Alarms Reported"
  "3 Major Alarms Reported"
  "11 Minor Alarms Reported"
/* RTRV-ALM-SUM:::C00002 [C00002] (2) */
```

An abbreviated summary of the the same system alarms can be requested as follows:

```
RTRV-ALM-SUM:::::VERBOSE=N;
```

The abbreviated output response returned provides input for a screen display through a machine-machine interface.

```
LMC3 01-02-22 15:35:01
M C00004 COMPLD
  "CR,2,3,11"
/* RTRV-ALM-SUM:::C00004:::VERBOSE=N [C00004] (2) */
```

RELATED COMMANDS

COMMAND CODE: **RTRV-ALM-T1**
COMMAND NAME: **RETRIEVE ALARM T1**

PURPOSE

The RTRV-ALM-T1 command retrieves the current status of any existing alarm conditions for the specified DS1 or Timing Reference (TMG) port, or for the specified DS1 or TMG port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFNCNDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the DS1 or TMG port is provisioned.

The successful response for a RTRV-ALM-T1 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified DS1 is embedded within a protection OC3.

A RTRV-ALM-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-T1 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T1-{1-59392}}	(T1-DS1#)	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-7}-{1-4}}	(EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)		
	TMG_AID:		
	{TMG-{0, 1}}		
	ALL_AID:		
	{ALL}		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	DS1/TMG AID, identifies the DS1 or Timing Reference port. Name-defined values are:	
	ALL	All provisioned DS1 and TMG ports in the system.	
	Restrictions:	RTRV-ALM-T1 is denied if the specified AID does not support the specified CONDTYPE (e.g., DS1 AID and CONDTYPE of SYNCSEC).	
CTAG	<1-6 VALID CTAG CHARACTERS>		
	Default:	<System Assigned CTAG Value>	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

NTFCNCDE	{CR, MJ, MN}
Default:	< All applicable notification codes listed above >
Addressing:	None
Description:	Notification Code, specifies the notification code of the condition type to be retrieved. Values are:
	CR Critical Alarm
	MJ Major Alarm
	MN Minor Alarm
CONDTYPE	DS1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, DS1ISD, EOC, INHPMREPT, LOF, LOS, MAN, RVCBLPBK, ROLLMON, XMTCLPBK}, DS1_FAR-END_CONDTYPE:{RAI, RAI-CI}, TMG_NEAR-END_CONDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK Active Loopback, the DS1 port is in loop back. (DS1 Near-End only.)
	AIS Alarm Indication Signal, AIS detected. (DS1 or TMG Near-End only.)
	AIS-CI Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near-End)
	ALWCBLPBK Allow C-Bit Loopback. (DS1 Near-End only.)
	DS1ISD DS1 Idle Signal Detected, Incoming. (DS1 Near-End.)
	EOC Embedded Operations Channel, EOC failure detected. (DS1 Near-End only.)
	INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited. (DS1 Near-End only.)
	LOF Loss Of Frame detected. (DS1 or TMG Near-End only.)
	LOS Loss Of Signal detected. (DS1 or TMG Near-End only.)
	MAN Manual removal (logical removal was performed on the facility). (DS1 Near-End only.)
	RAI Remote Alarm Indication detected. (DS1 Far-End only.)
	RAI-CI Remote Alarm Indication for Customer Installation detected. (DS1 Far-End only.)
	RVCBLPBK Receive (DS1) C-Bit Loopback. (DS1 Near-End only.)
	ROLLMON Roll Monitoring, receive-side RTO port being monitored for valid signal. (DS1 Near-End only.)
	SLTMSIG Slipping Timing Reference Signal detected. (TMG Near-End only.)
	SYNCPRI Primary Reference Synchronization failure. (TMG Near-End only.)
	SYNCSEC Secondary Reference Synchronization failure. (TMG Near-End only.)
	SYNCSTATQUAL Synchronization Status Quality. (TMG Near-End only.)
	XMTCLPBK Transmit (DS1) C-Bit Loopback. (DS1 Near-End only.)
Restrictions:	RTRV-ALM-T1 is denied if the specified CONDTYPE is not supported for the specified AID (e.g., CONDTYPE of SYNCSEC and DS1 AID). RTRV-ALM-T1 is denied if the specified CONDTYPE value is not supported for the specified LOCN value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).

RTRV-ALM-T1 is denied if the DS1 CI/NI Trouble Sectionalization Premium Feature Option (PFO) is not enabled and an input value of AIS-CI, DS1ISD or RAI-CI is entered.

SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting
LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
	Restrictions:	RTRV-ALM-T1 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-T1 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-T1 command.

OUTPUT PARAMETERS

AID	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{EC1T1-{1-3840}-{1-7}-{1-4}}	(EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)
	TMG_AID:	
	{TMG-{0, 1}}	
	DS1/TMG AID, identifies the DS1 or Timing Reference port.	
NTFCNCDE	{CR, MJ, MN}	
	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
CONDTYPE	DS1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, EOC, INHPMREPT, LOF, LOS, MAN, RVCBLPBK, ROLLMON, XMTCLPBK},	
	DS1_FAR-END_CONDTYPE:{RAI, RAI-CI},	
	TMG_NEAR-END_CONDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL}	
	Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the DS1 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	AIS-CI	Remote Alarm Indication for Customer Installation detected.
	ALWCBLPBK	Allow C-Bit Loopback.
	DS1ISD	DS1 Idle Signal Detected, Incoming.
	EOC	Embedded Operations Channel, EOC failure detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	LOF	Loss Of Frame detected.
	LOS	Loss Of Signal detected.
	MAN	Manual removal (logical removal was performed on the facility).
	RAI	Remote Alarm Indication detected.
	RAI-CI	Remote Alarm Indication for Customer Installation detected.
	RVCBLPBK	Receive (DS1) C-Bit Loopback.
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
	SLTMSIG	Slipping Timing Reference Signal detected.
	SYNCPRI	Primary Reference Synchronization failure.
	SYNCSEC	Secondary Reference Synchronization failure.
	SYNCSTATQUAL	Synchronization Status Quality.
	XMTCLPBK	Transmit (DS1) C-Bit Loopback.

SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are: NSA Non-Service Affecting SA Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

EFON	Equipage, Feature Option Not provided
IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* rpt_file error - <ERRNO>, status = <STATUS>. */ /* Cannot open <FILENAME>. */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error - <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing alarm with a condition type of LOF for DS1 ports T3T1-1297-4 through T3T1-1297-5 is retrieved.

```
RTRV-ALM-T1::T3T1-1297-4&&-5:::,LOF;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
  "T3T1-1297-4,T1:MN,LOF,SA,07-02,07-30-28,NEND,, "
/* RTRV-ALM-T1::T3T1-1297-4&&-5::,LOF [P71061] (1) */
:
```

In the following example, all existing alarms for DS1 port T3T1-1297-10 are retrieved.

```
RTRV-ALM-T1::T3T1-1297-10;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
  "T3T1-1297-10,T1:MN,LOF,SA,07-02,08-44-30,NEND,, "
/* RTRV-ALM-T1::T3T1-1297-10 [P71066] (2) */
;

COMMAND CODE: **RTRV-ALM-T3**
COMMAND NAME: **RETRIEVE ALARM T3**

PURPOSE

The RTRV-ALM-T3 command retrieves the current status of any existing alarm conditions for the specified DS3 port, or for the specified DS3 port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFNCNDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the DS3 port is provisioned.

The successful response for a RTRV-ALM-T3 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified DS3 is embedded within a protection OC3.

A RTRV-ALM-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-T3 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	{EC1T3-{1-3840}}	(EC1T3-EC1/STS1/DS3#)
	{OC3T3-{1-2240}-{1-3}}	(OC3T3-OC3#-STS1/DS3#)
	{OC12T3-{1-560}-{1-4}-{1-3}}	(OC12T3-OC12#-STM1#-STS1/DS3#)
	ALL_AID:	
	{ALL}	
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS3 AID, identifies the DS3 port. Name-defined values are:
	ALL	All provisioned DS3 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN}	
	Default:	< All applicable notification codes listed above >
	Addressing:	None
	Description:	Notification Code, specifies the notification code of the condition type to be retrieved. Values are:
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm

CONDTYPE	NEAR-END_CONDDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN}, FAR-END_CONDDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	1TO6LOF One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3. (Near-End only.)
	7LOF Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3. (Near-End only.)
	ACTLPBK Active Loopback, the DS3 port is in loop back. (Near-End only.)
	AICMIS Application Identification Channel Mismatch, AIC mismatch detected. (Near-End only.)
	AIS Alarm Indication Signal, AIS detected. (Near-End or Far-End.)
	DS2YEL DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3. (Far-End only.)
	FEACEQPT Far-End Alarm & Control (FEAC) Equipment detected. (Far-End only.)
	FLTESC Facility Fault Escalation active. (Near-End only.)
	INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	ISD Idle Signal Detected. (Near-End or Far-End.)
	LOF Loss Of Frame detected. (Near-End or Far-End.)
	LOS Loss Of Signal detected. (Near-End or Far-End.)
	MAN Manual removal (logical removal was performed on the facility. (Near-End only.)
	RAI Remote Alarm Indication detected. (Far-End only.)
	Restrictions: RTRV-ALM-T3 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of 7LOF and LOCN of FEND is entered).
SRVEFF	{NSA, SA} Default: < Both service effect values > Addressing: None Description: Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA Non-Service Affecting
	SA Service Affecting
LOCN	{FEND, NEND} Default: < All location values applicable to the specified condition type > Addressing: None Description: Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
	Restrictions: RTRV-ALM-T3 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of 7LOF and LOCN of FEND is entered).

DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-T3 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-T3 command.

SUCCESSFUL RESPONSE FORMAT

	{OC12T3-{1-560}-{1-4}-{1-3}}	(OC12T3-OC12#-STM1#-STS1/DS3#)
	DS3 AID, identifies the DS3 port.	
NTFCNCDE	{CR, MJ, MN}	
	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm

CONDTYPE	NEAR-END_CONDDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN}, FAR-END_CONDDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	1TO6LOF One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3.
	7LOF Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3.
	ACTLPBK Active Loopback, the DS3 port is in loop back.
	AICMIS Application Identification Channel Mismatch, AIC mismatch detected.
	AIS Alarm Indication Signal, AIS detected.
	DS2YEL DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3.
	FEACEQPT Far-End Alarm & Control (FEAC) Equipment detected.
	FLTESC Facility Fault Escalation active.
	INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited.
	ISD Idle Signal Detected.
	LOF Loss Of Frame detected.
	LOS Loss Of Signal detected.
	MAN Manual removal (logical removal was performed on the facility).
	RAI Remote Alarm Indication detected.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:
	NSA Non-Service Affecting
	SA Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> - <SECOND_OF_MINUTE>.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:
	TRMT Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal> No Value (null) returned for all conditions other than FLTESC.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing alarm with a condition type of LOF for DS3 ports T3–1297 through T3–1298 is retrieved.

```
RTRV-ALM-T3::T3-1297&&-1298:::,LOF;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71061 COMPLD  
"T3-1297,T3:MJ,LOF,SA,07-02,07-30-28,NEND,, "  
/* RTRV-ALM-T3::T3-1297&&-1298:::,LOF [P71061] (1) */  
;
```

In the following example, all existing alarms for DS3 port T3–1307 are retrieved.

```
RTRV-ALM-T3::T3-1307;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-ALM-VT1**
COMMAND NAME: **RETRIEVE ALARM VT1**

PURPOSE

The RTRV-ALM-VT1 command retrieves the current status of any existing alarm conditions for the specified VT1.5 port, or for the specified VT1.5 port and any matching combination of a specified condition type, notification code, location, and service effect (i.e., the CONDTYPE, NTFNCNDE, LOCN, and SRVEFF parameters provide a filter for retrieving existing alarm conditions satisfying the specified input parameters). The command is completed regardless of whether the VT1.5 port is provisioned.

The successful response for a RTRV-ALM-VT1 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each alarm condition being reported. If an AID of ALL is entered, all AIDs with an existing alarm condition are reported.

If there are no existing alarm conditions with attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified VT1.5 is embedded within a protection OC3.

A RTRV-ALM-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ALM-VT1: [TID] : AID: [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [SRVEFF] , [LOCN] ,
[DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies the VT1.5 port. Name-defined values are: ALL All provisioned VT1.5 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: CR Critical Alarm MJ Major Alarm MN Minor Alarm

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the VT1.5 port is in loop back. (Near-End only.)
	AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
	EBER	Excessive Bit Error Rate detected. (Near-End only.)
	FLTESC	Facility Fault Escalation active. (Near-End only.)
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
	IDLE	Idle, incoming idle detected. (Near-End only.)
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
	LOP	Loss Of Pointer detected. (Near-End only.)
	MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
	RFI	Remote Failure Indication detected. (Far-End only.)
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (Near-End only.)
	SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
	SLMF	Signal Label Match Failure detected. (Near-End only.)
	Restrictions:	RTRV-ALM-VT1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).
SRVEFF	{NSA, SA} Default: < Both service effect values > Addressing: None Description: Service Effect, specifies the service effect of the condition type to be retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting

LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	RTRV-ALM-VT1 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of AIS and LOCN of FEND is entered).
DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ALM-VT1 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ALM-VT1 command.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, all existing alarms for VT1.5 port EC1VT1-337-7-1 through EC1VT1-337-7-2 are retrieved.

```
RTRV-ALM-VT1: :EC1VT1-337-7-1&&-2;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
  "EC1VT1-337-7-1,VT1:MJ,LOP,SA,07-02,08-44-30,NEND,, "
  /* RTRV-ALM-VT1: :EC1VT1-337-7-1&&-2 [P71066] (2) */
;

COMMAND CODE: **RTRV-ATTR-COM**
COMMAND NAME: **RETRIEVE ATTRIBUTE COMMON**

PURPOSE

The RTRV-ATTR-COM command retrieves the provisioned common (no specific entity) condition type attributes (notification code and service effect) for the matching combination of the specified condition type, notification code, and/or service effect (i.e., the CONDTYPE, NTFNCDE, and SRVEFF parameters provide a filter for retrieving condition type attributes satisfying the specified input parameters).

The successful response for a RTRV-ATTR-COM command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified combination of condition type, notification code, and service effect, then the command is completed with no line of parsable output data provided.

A RTRV-ATTR-COM command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ATTR-COM: [TID] : [AID] : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , , , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
AID	{COM} Default: {COM} Addressing: None Description: Common AID, used when a specific AID is not identified.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported

CONDTYPE	{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-ST1, GOS-ST3C, GOS-T1, GOS-T3, GOS-VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDATAOPY0, MANSELDATAOPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPRD1344, UPRD2688}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
DATAFLT	Data integrity Fault, CRC error detected during a database read.
EUA	Emergency User Access activated.
FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
GOS-ST1	Grade of Service-ST1, system-wide STS-1 GOS threshold reached.
GOS-ST3C	Grade of Service-ST3C, system-wide STS-3C GOS threshold reached.
GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
HLDVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
INIT	Initialization, system initialization in-process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
MANSELDATAOPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
UPRD1344	672 Port to 1344 Port Upgrade in Progress.
UPRD2688	1344 Port to 2688 Port Upgrade in Progress.

SRVEFF	{NSA, SA}
Default:	< Both service effect values >
Addressing:	None
Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA Non-Service Affecting
	SA Service Affecting

OUTPUT PARAMETERS

NTFCNCDE	{CR, MJ, MN, NA, NR}
	Notification Code, identifies the notification code of the condition type and service effect being retrieved. Values are:
	CR Critical Alarm
	MJ Major Alarm
	MN Minor Alarm
	NA Not Alarmed
	NR Not Reported
CONDTYPE	{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-ST1, GOS-ST3C, GOS-T1, GOS-T3, GOS-VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDATAOPY0, MANSELDATAOPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688}
	Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	DATAFLT Data integrity Fault, CRC error detected during a database read.
	EUA Emergency User Access activated.
	FRNGSYNC Free Running Synchronization, manual switch to free running clock reference synchronization mode.
	FSTSYNC Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
	GOS-EC1 Grade of Service-EC1, system-wide EC1 GOS threshold reached.
	GOS-OC12 Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
	GOS-OC3 Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
	GOS-ST1 Grade of Service-ST1, system-wide STS-1 GOS threshold reached.
	GOS-ST3C Grade of Service-ST3C, system-wide STS-3C GOS threshold reached.
	GOS-T1 Grade of Service-T1, system-wide DS1 GOS threshold reached.
	GOS-T3 Grade of Service-T3, system-wide DS3 GOS threshold

	GOS-VT1	reached. Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
	HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
	INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
	INIT	Initialization, system initialization in-process.
	ITMIP	Installation Test and Maintenance (ITM) mode is set.
	MANSELDATACPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
	MANSELDATACPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
	MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
	MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
	PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
	RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
	SWTOPRI	Automatic Switch To Primary Synchronization Reference.
	SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
	UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
	UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
LOCN	{NEND}	Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.
SRVEFF	{NSA, SA}	Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

COMMAND CODE: **RTRV-ATTR-EC1**
COMMAND NAME: **RETRIEVE ATTRIBUTE EC1**

PURPOSE

The RTRV-ATTR-EC1 command retrieves the provisioned condition type attributes (notification code and service effect) for the specified EC1 port. The CONDTYPE, NTFNCODE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the EC1 port is provisioned.

The successful response for a RTRV-ATTR-EC1 command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition types attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ATTR-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ATTR-EC1 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. ```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */ /* This command does not support keyword ALL for AID. */
SDBE	Status, internal Data Base Error /* Error <ERROR NUMBER> reading record from <FILENAME>. */
SROF	Status, Requested Operation Failed /* Failed to convert tp id <TP ID NUMBER> to AID string. */ /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, the notification code attribute for the near-end, non-service affecting LOS condition type for EC1 ports EC1-195 through EC1-196 is retrieved.

```
RTRV-ATTR-EC1: : EC1-195&&-196: : , LOS, , , NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71080 COMPLD
"EC1-195, EC1:MN, LOS, NEND, , , NSA"
"EC1-196, EC1:MN, LOS, NEND, , , NSA"
/* RTRV-ATTR-EC1: : EC1-195&&-196: : , LOS, , , NSA [P71080] (1) */
;
```

In the following example, all condition type attributes for EC1 port EC1-207 are retrieved.

```
RTRV-ATTR-EC1::EC1-207;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-ATTR-EQPT**
COMMAND NAME: **RETRIEVE ATTRIBUTE EQUIPMENT**

PURPOSE

The RTRV-ATTR-EQPT command retrieves the provisioned condition type attributes (notification code and service effect) for the specified equipment AID. The CONDTYPE, NTFNCNDE, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the equipment entity is provisioned.

The successful response for a RTRV-ATTR-EQPT command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported. If an AID of ALL is entered, a line of output is provided for each AID applicable to each condition type, in alphabetical order by AID within each condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of AID, condition type, notification code, and service effect, then the command is completed with no line of parsable output data provided.

A RTRV-ATTR-EQPT command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ATTR-EQPT: [TID]:AID:[CTAG]::[NTFNCNDE],[CONDTYPE],,,,[SRVEFF];

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS>
	Default: <SID>
	Addressing: None
	Description: Target Identifier, specifies the network node TID for the command.
AID	{ACM, ALL, CDA, CDB, CID, CIM, CKB, CPU, DSB, DSI, DSK, EOB, EP3, ES1, ESA, FAN, FUSE, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1M16, G1M32, G1M40, G1MRPB, G1O1B, G1O4M, G1S3M, G4EOB, G4IOB, G4OXB, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OPD, OXB, P39, P56, PDU, PRT, PSF, PST, QUAD, RDU, RPB, RSP, S3M, SBT, SHELF, SIO, SPB, SWI}
	Default: Entry Required
	Addressing: None
	Description: Equipment AID, identifies the equipment entity name/type. Values are:
	ACM All Administrative Communications Module circuit packs.
	ALL All applicable AIDs pertaining to the specified CONDTYPE.
	CDA All Clock Distribution A circuit packs.
	CDB All Clock Distribution B circuit packs.
	CID All Communications Interface Devices (VDT, TTY, PRN).
	CIM All Communications Interface Module circuit packs.
	CKB All Circuit Breakers, circuit breakers in the PDU/RDU/RSP.
	CPU All Central Processing Unit circuit packs.
	DSB All DCC Server Boards.
	DSI All DS1 Input/Output circuit packs.
	DSK All Disk Drives.
	EOB All Electrical to Optical Board circuit packs.
	EP3 All Electrical Plesiochronous DS3/STS1 Interface circuit packs.
	ES1 All Electrical Plesiochronous STS1 Interface circuit packs.

ESA	All External DS1 Signal Adapter circuit packs.
FAN	All Fan/Blower assemblies.
FUSE	All Fuses, PDU fuses.
G1EOB	All GTI cables carrying an STM1 signal and terminating on an EOB.
G1EP3	All GTI cables carrying an STM1 signal and terminating on an EP3.
G1ES1	All GTI cables carrying an STM1 signal and terminating on an ES1.
G1IOB	All GTI cables coming into IOB module and carrying STM–1 signal.
G1IRPB	All GTI cables carrying an STM1 signal and terminating on the I/O side of the RPB circuit pack.
G1M16	All GTI cables carrying an STM1 signal and terminating on a M16.
G1M32	All GTI cables carrying an STM1 signal and terminating on a M32.
G1M40	All GTI cables carrying an STM1 signal and terminating on a M40.
G1MRPB	All GTI cables carrying an STM1 signal and terminating on the matrix side of the RPB circuit pack.
G1O1B	All GTI cables carrying an STM1 signal and terminating on an O1B.
G1O4M	All GTI cables carrying an STM1 signal and terminating on an O4M.
G1S3M	All GTI cables carrying an STM1 signal and terminating on an S3M.
G4EOB	All GTI cables carrying an STM4 signal and terminating on an EOB.
G4IOB	All GTI cables coming into IOB module and carrying STM–4 signal.
G4OXB	All GTI cables carrying an STM4 signal and terminating on an OXB.
HMU	All High Speed Muldem Unit (M23 multiplexing) circuit packs.
ICM	All Intelligent Communications Module circuit packs.
IOB	Inter–rack Optics Board
IPB	All Internal Protection Board circuit packs.
IPU	All Interface Processing Unit circuit packs.
LMU	All Low Speed Muldem Unit (M12 multiplexing) circuit packs.
LT1	All Level 1 Translator (RS–232) circuit packs.
LT2	All Level 2 Translator (RS–449/422) circuit packs.
LT4	All Level 4 Translator (ACL) circuit packs.
LT5	All Level 5 Translator (RS449/423 & LAN) circuit packs.
LT8	All Level 8 Translator (ACL) circuit packs.
M16	All Matrix End/Center Stage 16 circuit packs.
M32	All Matrix End Stage 32 circuit packs.
M40	All Matrix End/Center Stage 40 circuit packs.
MCB	All Master Clock Board circuit packs.
O1B	All Optical Interface Level 1 (OC–3) Board circuit packs.
O4M	All OC–12 Muldem (OC–12) Board circuit packs.
OPD	All Optical Disk Drives.
OXB	All Optical Transceiver Board circuit packs.
P39	All Power Supply, 3.9V circuit packs.
P56	All Power Supply, 5.6V circuit packs.
PDU	All Power Distribution Units.
PRT	All DS1 Protect circuit packs.
PSF	All Power Supply, 5V circuit packs.
PST	All Power Supply, 12V circuit packs.
QUAD	All DS1 Shelf Quadrants.
RDU	All Rack Distribution Units.
RPB	All Ring Protection Board circuit packs.
RSP	Rack Status Panel.
S3M	All STS3C Module circuit packs.
SBT	All System Bus Termination circuit packs.
SHELF	All I/O, EOC, End Stage, or Center Stage Shelves.

	SIO	All Serial Input/Output circuit packs.
	SPB	All Satellite Processor Board circuit packs.
	SWI	All DS1 Switch circuit packs.
	Restrictions:	RTRV-ATTR-EQPT is denied if the specified AID is not valid for the specified CONDTYPE. (Refer to Appendix C and CONDTYPE below.) RTRV-ATTR-EQPT is denied for a 240-port LMC system if an AID of CDA is entered.
CTAG	<1-6 VALID CTAG CHARACTERS>	
	Default:	<System Assigned CTAG Value>
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN, NA, NR}	
	Default:	< All applicable notification codes listed above >
	Addressing:	None
	Description:	Notification Code, specifies the notification code of the condition type to be retrieved. Values are:
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
	NA	Not Alarmed
	NR	Not Reported

CONDTYPE {ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPEENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKSWPR, MISC-1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC12, TERM-OC3, TERM-T1, TERM-T3, TERM-T3EC1, TSA, TSI, WKSWPR, XIDMISM}

Default: < All applicable condition types listed above >

Addressing: None

Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected. (Valid for an AID of ALL, RDU, RSP.)
BKUPMEMP	Backup Memory—Primary, magnetic disk backup failure. (Valid for an AID of ALL, DSK.)
BKUPMEMS	Backup Memory—Secondary, optical disk/tape drive backup failure. (Valid for an AID of ALL, OPD.)
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane. (Valid for an AID of ALL, SHELF.)
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf. (Valid for an AID of ALL, SHELF.)
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN. (Valid for an AID of ALL, CID, DSB.)
CD	Control and Display interface audit error detected. (Valid for an AID of ALL, CID.)
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0. (Valid for an AID of ALL, QUAD, SHELF.)
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1. (Valid for an AID of ALL, QUAD, SHELF.)
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB. (Valid for an AID of ALL, DSB.)
CONTBUS	Control Bus, shelf control bus interface failure. (Valid for an AID of ALL, IPU, SPB.)
CONTCOM	Control Communication equipment failure. (Valid for an AID of ALL, ACM, CIM, ICM, SIO.)
CONTR	Control processor equipment failure. (Valid for an AID of ALL, CPU, IPU, SPB.)
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure. (Valid for an AID of ALL, EOB, IOB, IPB, LMU, OXB, RPB, S3M.)
DBF	Database Backup Failure, OPD database backup failure detected (on second try). (Valid for an AID of ALL, OPD.)
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try. (Valid for an AID of ALL, OPD.)
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed. (Valid for an AID of ALL, DSB.)
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked

	to the copy specified. (Valid for an AID of ALL, SHELF, QUAD.)
DUPMACADDR	Duplicate MAC Address detected on the LAN. (Valid for an AID of ALL, DSB.)
DUPTARPENTRY	Duplicate TARP adjacency table. (Valid for an AID of ALL, DSB.)
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed. (Valid for an AID of ALL, CKB, FUSE.)
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed. (Valid for an AID of ALL, FAN.)
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database. (Valid for an AID of ALL, MCB.)
GT1	GTI Cable fault for GTI cable carrying an STM1 signal (Valid for an AID of ALL, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1S3M, G1M16, G1M32, G1M40, G1MRPB, G1O1B, G1O4M.)
GT4	GTI Cable fault for GTI cable carrying an STM4 signal (Valid for an AID of ALL, G4EOB, G4IOB, G4OXB.)
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal. (Valid for AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, EOB, EP3, ES1, ESA, FAN, HMU, ICM, IOB, IPB, IPU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PDU, PRT, PSF, PST, RDU, RPB, S3M, SBT, SIO, SPB, SWI.)
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited. (Valid for an AID of ALL, CPU, IPU, SPB.)
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
INHSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
INIT	Initialization, shelf initialization in-process. (Valid for an AID of ALL, SHELF.)
INTERR	Internal Error, internal error suspected on equipment. (Valid for an AID of ALL, CDA, CDB, DSI, EOB, EP3, ES1, HMU, IOB, IPB, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, RPB, S3M.)
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
LOTRI	Loss Of Offboard Timing Reference Input from mate Master Clock Board circuit pack. (Valid for an AID of ALL, MCB.)
MAN	Manual removal (logical removal was performed on a circuit pack). (Valid for an AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, DSK, EOB, EP3, ES1, HMU, ICM, IOB, IPB, IPU, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PSF, RPB, S3M, SIO, SPB.)
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)

MISC-1	Miscellaneous Class-1, slave MCB is not ready. (Valid for an AID of ALL, MCB.)
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs. (Valid for an AID of ALL, DSB.)
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning. (Valid for an AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, EOB, EP3, ES1, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, OXB, O1B, O4M, P39, P56, PRT, RPB, S3M, SIO, SWI.)
PWR	Power, internal power failure detected. (Valid for an AID of ALL, P39, P56, PSF, PST, RSP.)
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem. (Valid for an AID of ALL, M16, M32, M40, SPB.)
SWFTDWN	Software Download is in process on a circuit pack. (Valid for an AID of ALL, ACM, CIM, DSB, EP3, ES1, ICM, IPU, M16, M32, M40, MCB, O1B, O4M, OXB, RPB, S3M, SPB.)
SYNCEQPT	Synchronization Equipment failure detected. (Valid for an AID of ALL, CDA, CDB, MCB.)
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure. (Valid for an AID of ALL, ES1.)
TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure. (Valid for an AID of ALL, O4M.)
TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure. (Valid for an AID of ALL, O1B.)
TERM-T1	Termination Equipment-T1, DSI circuit pack failure. (Valid for an AID of ALL, DSI.)
TERM-T3	Termination Equipment-T3, HMU circuit pack failure. (Valid for an AID of ALL, HMU.)
TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure. (Valid for an AID of ALL, EP3.)
TSA	Test Session Active, maintenance test session active on the equipment. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU, M16, M32, O1B, O4M, S3M.)
TSI	Time Slot Interchange equipment failure. (Valid for an AID of ALL, M16, M32, M40.)
WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad. (Valid for an AID of ALL, QUAD, SHELF)

	Restrictions:	RTRV-ATTR-EQPT is denied if the specified CONDDTYPE is not valid for the specified AID.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

OUTPUT PARAMETERS

AID	{ACM, ALL, CDA, CDB, CID, CIM, CKB, CPU, DSB, DSI, DSK, EOB, EP3, ES1, ESA, FAN, FUSE, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1M16, G1M32, G1M40, G1MRPB, G1O1B, G1O4M, G1S3M, G4EOB, G4IOB, G4OXB, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OPD, OXB, P39, P56, PDU, PRT, PSF, PST, QUAD, RDU, RPB, RSP, S3M, SBT, SHELF, SIO, SPB, SWI}
	Equipment AID, identifies the equipment entity name/type. Values are:
	ACM All Administrative Communications Module circuit packs.
	ALL All applicable AIDs pertaining to the specified CONDDTYPE.
	CDA All Clock Distribution A circuit packs.
	CDB All Clock Distribution B circuit packs.
	CID All Communications Interface Devices (VDT, TTY, PRN).
	CIM All Communications Interface Module circuit packs.
	CKB All Circuit Breakers, circuit breakers in the PDU/RDU/RSP.
	CPU All Central Processing Unit circuit packs.
	DSB All DCC Server Boards.
	DSI All DS1 Input/Output circuit packs.
	DSK All Disk Drives.
	EOB All Electrical to Optical Board circuit packs.
	EP3 All Electrical Plesiochronous DS3/STS1 Interface circuit packs.
	ES1 All Electrical Plesiochronous STS1 Interface circuit packs.
	ESA All External DS1 Signal Adapter circuit packs.
	FAN All Fan/Blower assemblies.
	FUSE All Fuses, PDU fuses.
	G1EOB All GTI cables carrying an STM1 signal and terminating on an EOB.
	G1EP3 All GTI cables carrying an STM1 signal and terminating on an EP3.
	G1ES1 All GTI cables carrying an STM1 signal and terminating on an ES1.
	G1IOB All GTI cables coming into IOB module and carrying STM-1 signal.
	G1IRPB All GTI cables carrying an STM1 signal and terminating on the I/O side of the RPB circuit pack.
	G1M16 All GTI cables carrying an STM1 signal and terminating on a M16.
	G1M32 GTI cables carrying an STM1 signal and terminating on an M32.
	G1M40 All GTI cables carrying an STM1 signal and terminating on a M40.
	G1MRPB All GTI cables carrying an STM1 signal and terminating on the matrix side of the RPB circuit pack.

G1O1B	All GTI cables carrying an STM1 signal and terminating on an O1B.										
G1O4M	All GTI cables carrying an STM1 signal and terminating on an O4M.										
G1S3M	All GTI cables carrying an STM1 signal and terminating on an S3M.										
G4EOB	All GTI cables carrying an STM4 signal and terminating on an EOB.										
G4IOB	All GTI cables coming into IOB module and carrying STM-4 signal.										
G4OXB	All GTI cables carrying an STM4 signal and terminating on an OXB.										
HMU	All High Speed Muldem Unit (M23 multiplexing) circuit packs.										
ICM	All Intelligent Communications Module circuit packs.										
IOB	Inter-rack Optics Board										
IPB	All Internal Protection Board circuit packs.										
IPU	All Interface Processing Unit circuit packs.										
LMU	All Low Speed Muldem Unit (M12 multiplexing) circuit packs.										
LT1	All Level 1 Translator (RS-232) circuit packs.										
LT2	All Level 2 Translator (RS-449/422) circuit packs.										
LT4	All Level 4 Translator (ACL) circuit packs.										
LT5	All Level 5 Translator (RS449/423 & LAN) circuit packs.										
LT8	All Level 8 Translator (ACL) circuit packs.										
M16	All Matrix End/Center Stage 16 circuit packs.										
M32	Matrix End Stage 32 circuit packs.										
M40	All Matrix End/Center Stage 40 circuit packs.										
MCB	All Master Clock Board circuit packs.										
O1B	All Optical Interface Level 1 (OC-3) Board circuit packs.										
O4M	All OC-12 Muldem (OC-12) Board circuit packs.										
OPD	All Optical Disk Drives.										
OXB	All Optical Transceiver Board circuit packs.										
P39	All Power Supply, 3.9V circuit packs.										
P56	All Power Supply, 5.6V circuit packs.										
PDU	All Power Distribution Units.										
PRT	All DS1 Protect circuit packs.										
PSF	All Power Supply, 5V circuit packs.										
PST	All Power Supply, 12V circuit packs.										
QUAD	All DS1 Shelf Quadrants.										
RDU	All Rack Distribution Units.										
RPB	All Ring Protection Board circuit packs.										
RSP	Rack Status Panel.										
S3M	All STS3C Module circuit packs.										
SBT	All System Bus Termination circuit packs.										
SHELF	All I/O, EOC, End Stage, or Center Stage Shelves.										
SIO	All Serial Input/Output circuit packs.										
SPB	All Satellite Processor Board circuit packs.										
SWI	All DS1 Switch circuit packs.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Notification Code, identifies the notification code of the condition type and service effect being retrieved. Values are: <table> <tr> <td>CR</td><td>Critical Alarm</td></tr> <tr> <td>MJ</td><td>Major Alarm</td></tr> <tr> <td>MN</td><td>Minor Alarm</td></tr> <tr> <td>NA</td><td>Not Alarmed</td></tr> <tr> <td>NR</td><td>Not Reported</td></tr> </table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported
CR	Critical Alarm										
MJ	Major Alarm										
MN	Minor Alarm										
NA	Not Alarmed										
NR	Not Reported										
CONDTYPE	{ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTerm, CARLOS, CD, CLKLCK0,										

CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKSWPR, MISC-1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC12, TERM-OC3, TERM-T1, TERM-T3, TERM-T3EC1, TSA, TSI, WKSWPR, XIDMISM}

Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected.
BKUPMEMP	Backup Memory—Primary, magnetic disk backup failure.
BKUPMEMS	Backup Memory—Secondary, optical disk/tape drive back-up failure.
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf Backplane.
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf.
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN.
CD	Control and Display interface audit error detected.
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0.
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1.
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB.
CONTBUS	Control Bus, shelf control bus interface failure.
CONTCOM	Control Communication equipment failure.
CONTR	Control processor equipment failure.
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure.
DBF	Database Backup Failure, OPD database backup failure detected (on second try).
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try.
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed.
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified.
DUPMACADDR	Duplicate MAC Address detected on the LAN.
DUPTARPENTRY	Duplicate TARP adjacency table. (Valid for an AID of ALL, DSB.)
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed.
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed.
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database.
GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
INHSWDX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.

	INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited.
	INHSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
	INIT	Initialization, shelf initialization in-process.
	INTERR	Internal Error, internal error suspected on equipment.
	LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
	LOTRI	Loss Of Offboard Timing Reference Input from mate Master Clock Board circuit pack.
	MAN	Manual removal (logical removal was performed on a circuit pack).
	MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
	MISC-1	Miscellaneous Class-1, slave MCB is not ready.
	OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs.
	PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning.
	PWR	Power, internal power failure detected.
	RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
	SWFTDWN	Software Download is in process on a circuit pack.
	SYNCEQPT	Synchronization Equipment failure detected.
	TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
	TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure.
	TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure.
	TERM-T1	Termination Equipment-T1, DSI circuit pack failure.
	TERM-T3	Termination Equipment-T3, HMU circuit pack failure.
	TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure.
	TSA	Test Session Active, maintenance test session is active on the equipment.
	TSI	Time Slot Interchange equipment failure.
	WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
	XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.
LOCN	{NEND}	Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.
SRVEFF	{NSA, SA}	Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
	/* Invalid service effect specified: <SERVICE EFFECT STRING>. */
	/* Condition type not valid for: EQPT. */
	/* Condition type is not MISC but has a -#: <CONDITION TYPE STRING>. */
	/* Condition type is MISC but has no -#. */
	/* Condition type is TERM but - <STRING> is not valid. */
	/* Invalid condition type specified: <CONDITION TYPE STRING>. */
	/* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier
	/* Invalid card type specified: <CARD TYPE STRING>. */
SDBE	Status, internal Data Base Error
	/* Error <ERROR NUMBER> reading record from <FILENAME>. */
SROF	Status, Requested Operation Failed
	/* Cannot open <FILENAME>. */
	/* rpt_file error - <ERRNO>, status = <STATUS>. */
	/* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE>. */
	/* rpt_print error - <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, the notification code attribute for the non-service affecting BKUPMEMS condition type for all applicable equipment name/types is retrieved.

```
RTRV-ATTR-EQPT: :ALL: : , BKUPMEMS , , , NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
  "OPD,EQPT:MN,BKUPMEMS,NEND,,NSA"
  /* RTRV-ATTR-EQPT: :ALL: : , BKUPMEMS , , , NSA [P71042] (1) */
;

```

In the following example, the notification code and service affect attributes for all SPB condition types are retrieved.

```
RTRV-ATTR-EQPT: :SPB;
```

The output response, shown below, assumes CID 2 was used to enter the command, and a system generated a CTAG value of P71056. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
"SPB,EQPT:MJ,CONTBUS,NEND,,,SA"
"SPB,EQPT:MN,CONTBUS,NEND,,,NSA"
"SPB,EQPT:MJ,CONTR,NEND,,,SA"
"SPB,EQPT:MN,CONTR,NEND,,,NSA"

COMMAND CODE: **RTRV-ATTR-F3**
COMMAND NAME: **RETRIEVE ATTRIBUTE F3**

PURPOSE

The RTRV-ATTR-F3 command retrieves the provisioned condition type attributes (notification code and service effect) for the specified F3 port. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the F3 port is provisioned.

The successful response for a RTRV-ATTR-F3 command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition types attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ATTR-F3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ATTR-F3 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the F3 port.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported
CR	Critical Alarm										
MJ	Major Alarm										
MN	Minor Alarm										
NA	Not Alarmed										
NR	Not Reported										

CONDTYPE	{INHPMREPT}	
	Default:	< All applicable condition types listed above >
	Addressing:	None
	Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
LOCN	{NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the monitoring location of the condition type to be retrieved. Values are:
	NEND	Near-End, events occurring at the system.
DIRN	{NA, RCV}	
	Default:	{NA}
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ATTR-F3 command.
	NA	Not Applicable
	RCV	Receive side
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ATTR-F3 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

SUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RTRV-ATTR-OC12**
COMMAND NAME: **RETRIEVE ATTRIBUTE OC-12**

PURPOSE

The RTRV-ATTR-OC12 command retrieves the provisioned condition type attributes (notification code and service effect) for the specified OC-12 port. The CONDTYPE, NTFCNCDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the OC-12 port is provisioned.

The successful response for a RTRV-ATTR-OC12 command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition types attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ATTR-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ATTR-OC12 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported
CR	Critical Alarm										
MJ	Major Alarm										
MN	Minor Alarm										
NA	Not Alarmed										
NR	Not Reported										

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAIL, L2S CONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC-12 port is in loopback. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lockout of automatic revertive (OC-12) switching due to excessive switching. (Near-End only.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
L2S CONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
LOF	Loss Of Frame detected. (Near-End only.)
LOS	Loss Of Signal detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKS WBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKS WPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
WTR	Wait To Restore of protection facility. (Near-End only.)
Restrictions:	RTRV-ATTR-OC12 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).

LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the monitoring location of the condition type to be retrieved. Values are:
	FEND	Far-End, events occurring at a distant network element.
DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ATTR-OC12 command.
	NA	Not Applicable
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ATTR-OC12 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

```

OUTPUT PARAMETERS

AID	OC12_AID:	
	{OC12-{1-560}}	(OC12-OC12#)
	OC12 AID, identifies the OC-12 port.	
NTFCNCDE	{CR, MJ, MN, NA, NR}	
	Notification Code, identifies the notification code of the condition type and service effect being retrieved. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
	NA	Not Alarmed
	NR	Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRTY, EBER, ESW, FRCDWKSWBK, FRCDWKSWPR, INHPMREPT, L2LCONFAIL, L2SCONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKSWBK, MANWKSWPR, SDBER, SDCCDLFL, WTR}, FAR-END_CONDDTYPE:{RFI} Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the OC-12 port is in loopback.
	AIS	Alarm Indication Signal, AIS detected.
	DUPTARPENRTY	Duplicate TARP adjacency table. (Near-End only.)
	EBER	Excessive Bit Error Rate detected.
	ESW	Excessive Switching, lockout of automatic revertive (OC-12) switching due to excessive switching.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facili- ty.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capabil- ity inhibited.
	L2LCONFAIL	Layer 2 Line DCC Connection Failure.
	L2SCONFAIL	Layer 2 Section DCC Connection Failure.
	LDCCDLFL	Line DCC Data Link Failure.
	LOCKOUTOFPR	LockOut Of Protection facility.
	LOF	Loss Of Frame detected.
	LOS	Loss Of Signal detected.
	MAN	Manual removal (logical removal was performed on the fa- cility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	RFI	Remote Failure Indication detected.
	SDBER	Signal Degrade Bit Error Rate detected.
	SDCCDLFL	Section DCC Data Link Failure.
	WTR	Wait To Restore of protection facility.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code be- ing retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */ /* This command does not support keyword ALL for AID. */
SDBE	Status, internal Data Base Error /* Error <ERROR NUMBER> reading record from <FILENAME>. */
SROF	Status, Requested Operation Failed /* Failed to convert tp id <TP ID NUMBER> to AID string. */ /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, the notification code attribute for the far-end, non-service affecting RFI condition type for OC-12 ports OC12-339 through OC12-340 is retrieved.

```
RTRV-ATTR-OC12::OC12-339&&-340:::,ISD,, ,NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71080 COMPLD
"OC12-339,OC12:NA,RFI,FEND,, ,NSA"
"OC12-340,OC12:NA,RFI,FEND,, ,NSA"
/* RTRV-ATTR-OC12::OC12-339&&-340:::,ISD,, ,NSA [P71080] (1) */
;
```

In the following example, all condition type attributes for OC12 port OC12-345 are retrieved.

```
RTRV-ATTR-OC12::OC12-345;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-ATTR-OC3**
COMMAND NAME: **RETRIEVE ATTRIBUTE OC-3**

PURPOSE

The RTRV-ATTR-OC3 command retrieves the provisioned condition type attributes (notification code and service effect) for the specified OC-3 port. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the OC-3 port is provisioned.

The successful response for a RTRV-ATTR-OC3 command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition types attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-ATTR-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ATTR-OC3 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported
CR	Critical Alarm										
MJ	Major Alarm										
MN	Minor Alarm										
NA	Not Alarmed										
NR	Not Reported										

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAIL, L2S CONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC-3 port is in loopback. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lockout of automatic revertive (OC-3) switching due to excessive switching. (Near-End only.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited. (Near-End only.)

L2S CONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
LOF	Loss Of Frame detected. (Near-End only.)
LOS	Loss Of Signal detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKS WBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKS WPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
WTR	Wait To Restore of protection facility. (Near-End only.)
Restrictions:	RTRV-ATTR-OC3 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).

LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the monitoring location of the condition type to be retrieved. Values are:
	FEND	Far-End, events occurring at a distant network element.
DIRN	NEND	Near-End, events occurring at the system.
	Restrictions:	RTRV-ATTR-OC3 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RFI and LOCN of NEND is entered).
	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
TMPER	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ATTR-OC3 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
SRVEFF	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ATTR-OC3 command.
	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

COMMAND CODE: **RTRV-ATTR-STS1**
COMMAND NAME: **RETRIEVE ATTRIBUTE STS-1**

PURPOSE

The RTRV-ATTR-STS1 command retrieves the provisioned condition type attributes (notification code and service effect) for the specified STS-1 port. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the STS-1 port is provisioned.

The successful response for a RTRV-ATTR-STS1 command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition types attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified STS-1 is embedded within a protection OC-3 or OC-12.

A RTRV-ATTR-STS1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

OUTPUT PARAMETERS

AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	STS1 AID, identifies the STS-1 port.	
NTFCNCDE	{CR, MJ, MN, NA, NR}	
	Notification Code, identifies the notification code of the condition type and service effect being retrieved. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
	NA	Not Alarmed
	NR	Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the STS-1 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	EBER	Excessive Bit Error Rate detected.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	LOP	Loss Of Pointer detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	PDI	Incoming PDI signal detected (STS1)
	RFI	Remote Failure Indication detected.
	SDBER	Signal Degrade Bit Error Rate detected.
	SLMF	Signal Label Match Failure detected.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */ /* This command does not support keyword ALL for AID. */
SDBE	Status, internal Data Base Error /* Error <ERROR NUMBER> reading record from <FILENAME>. */
SROF	Status, Requested Operation Failed /* Failed to convert tp id <TP ID NUMBER> to AID string. */ /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, the notification code attribute for the near-end, non-service affecting IDLE condition type for STS-1 ports EC1STS1-195 through EC1STS1-196 is retrieved.

```
RTRV-ATTR-STs1::EC1STS1-195&&-196:::,IDLE,, ,NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71080 COMPLD
"EC1STS1-195,STs1:MN,IDLE,NEND,, ,NSA"
"EC1STS1-196,STs1:MN,IDLE,NEND,, ,NSA"
/* RTRV-ATTR-STs1::EC1STS1-195&&-196:::,IDLE,, ,NSA [P71080] (1) */
;
```

In the following example, all condition type attributes for STS-1 port EC1STS1-203 are retrieved.

```
RTRV-ATTR-STS1: : EC1STS1-203 ;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P12082. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-ATTR-STS3C**
COMMAND NAME: **RETRIEVE ATTRIBUTE STS-3C**

PURPOSE

The RTRV-ATTR-STS3C command retrieves the provisioned condition type attributes (notification code and service effect) for the specified STS-3C port. The CONDTYPE, NTFCNCDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the STS-3C port is provisioned.

The successful response for a RTRV-ATTR-STS3C command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition types attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified STS-3C is embedded within a protection OC-3 or OC-12.

A RTRV-ATTR-STS3C command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ATTR-STS3C: [TID] :AID: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS3C AID, identifies the STS-3C port.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported

COMMAND CODE: **RTRV-ATTR-T1**
COMMAND NAME: **RETRIEVE ATTRIBUTE T1**

PURPOSE

The RTRV-ATTR-T1 command retrieves the provisioned condition type attributes (notification code and service effect) for the specified DS1 or Timing Reference (TMG) port. The CONDTYPE, NTFCNCDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the DS1 or TMG port is provisioned.

The successful response for a RTRV-ATTR-T1 command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified DS1 is embedded within a protection OC3.

A RTRV-ATTR-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

	TMG_AID:	
	{TMG-{0, 1}}	
	Default:	Entry Required
	Addressing:	&&-ranging and &-grouping
	Description:	DS1/TMG AID, identifies the DS1 or Timing Reference port.
	Restrictions:	RTRV-ATTR-T1 is denied if the specified AID does not support the specified CONDTYPE (e.g., DS1 AID and CONDTYPE of SYNCSEC).
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

NTFCNCDE	{CR, MJ, MN, NA, NR}
Default:	< All applicable notification codes listed above >
Addressing:	None
Description:	Notification Code, specifies the notification code of the condition type to be retrieved. Values are:
	CR Critical Alarm
	MJ Major Alarm
	MN Minor Alarm
	NA Not Alarmed
	NR Not Reported
CONDTYPE	DS1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, DS1ISD, EOC, INHPMREPT, LOF, LOS, MAN, RCVCLPBK, ROLLMON, XMTCLPBK}, DS1_FAR-END_CONDTYPE:{RAI, RAI-CI}, TMG_NEAR-END_CONDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	ACTLPBK Active Loopback, the DS1 port is in loop back. (DS1 Near-End only.)
	AIS Alarm Indication Signal, AIS detected. (DS1 or TMG Near-End only.)
	AIS-CI Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near-End)
	ALWCBLPBK Allow C-Bit Loopback. (DS1 Near-End only.)
	DS1ISD DS1 Idle Signal Detected, Incoming. (DS1 Near-End.)
	EOC Embedded Operations Channel, EOC failure detected. (DS1 Near-End only.)
	INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited. (DS1 Near-End only.)
	LOF Loss Of Frame detected. (DS1 or TMG Near-End only.)
	LOS Loss Of Signal detected. (DS1 or TMG Near-End only.)
	MAN Manual removal (logical removal was performed on the facility). (DS1 Near-End only.)
	RAI Remote Alarm Indication detected. (DS1 Far-End only.)
	RAI-CI Remote Alarm Indication for Customer Installation detected. (DS1 Far-End only.)
	RCVCLPBK Receive (DS1) C-Bit Loopback. (DS1 Near-End only.)
	ROLLMON Roll Monitoring, receive-side RTO port being monitored for valid signal. (DS1 Near-End only.)
	SLTMSIG Slipping Timing Reference Signal detected. (TMG Near-End only.)
	SYNCPRI Primary Reference Synchronization failure. (TMG Near-End only.)
	SYNCSEC Secondary Reference Synchronization failure. (TMG Near-End only.)
	SYNCSTATQUAL Synchronization Status Quality. (TMG Near-End only.)
	XMTCLPBK Transmit (DS1) C-Bit Loopback. (DS1 Near-End only.)
Restrictions:	RTRV-ATTR-T1 is denied if the specified CONDTYPE is not supported for the specified AID (e.g., CONDTYPE of SYNCSEC and DS1 AID). RTRV-DFLTATTR-T1 is denied if the specified CONDTYPE value is not supported for the specified LOCN value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).

LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the monitoring location of the condition type to be retrieved. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	RTRV-ATTR-T1 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ATTR-T1 command.
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ATTR-T1 command.
SRVEFF	{NSA, SA}
Default:	< Both service effect values >
Addressing:	None
Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA Non-Service Affecting
	SA Service Affecting

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

EFON	Equipage, Feature Option Not provided
IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */ /* This command does not support keyword ALL for AID. */
SDBE	Status, internal Data Base Error /* Error <Error Number> reading record from <File Name>. */
SROF	Status, Requested Operation Failed /* Failed to convert tp id <TP ID NUMBER> to AID string. */ /* Unable to determine supporting facility entity. */ /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, the notification code for the non-service affecting MAN condition type for DS1 ports T3T1-1297-4 through T3T1-1297-5 is retrieved.

```
RTRV-ATTR-T1::T3T1-1297-4&&-5:::,MAN,, ,NSA;
```

The output responses, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
  "T3T1-1297-4,T1:NA,MAN,NEND,, ,NSA"
  "T3T1-1297-5,T1:NA,MAN,NEND,, ,NSA"
  /* RTRV-ATTR-T1::T3T1-1297-4&&-5:::,MAN,,,NSA [P71061] (1) */
;

```

In the following example, all condition type attributes for DS1 port T3T1-1297-10 are retrieved.

```
RTRV-ATTR-T1::T3T1-1297-10;
```

The output responses, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71068. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-ATTR-T3**
COMMAND NAME: **RETRIEVE ATTRIBUTE T3**

PURPOSE

The RTRV-ATTR-T3 command retrieves the provisioned condition type attributes (notification code and service effect) for the specified DS3 port. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the DS3 port is provisioned.

The successful response for a RTRV-ATTR-T3 command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition types attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified DS3 is embedded within a protection OC3.

A RTRV-ATTR-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ATTR-T3 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) {EC1T3-{1-3840}} (EC1T3-EC1/STS1/DS3#) {OC3T3-{1-2240}-{1-3}} (OC3T3-OC3#-STS1/DS3#) {OC12T3-{1-560}-{1-4}-{1-3}} (OC12T3-OC12#-STM1#-STS1/DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS3 AID, identifies the DS3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: CR Critical Alarm MJ Major Alarm MN Minor Alarm NA Not Alarmed NR Not Reported

CONDTYPE	<p>NEAR-END_CONDDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN}, FAR-END_CONDDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:</p> <table> <tr> <td>1TO6LOF</td><td>One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3. (Near-End only.)</td></tr> <tr> <td>7LOF</td><td>Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3. (Near-End only.)</td></tr> <tr> <td>ACTLPBK</td><td>Active Loopback, the DS3 port is in loop back. 	NR	Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN}, FAR-END_CONDDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	1TO6LOF	One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3.
	7LOF	Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3.
	ACTLPBK	Active Loopback, the DS3 port is in loop back.
	AICMIS	Application Identification Channel Mismatch, AIC mismatch detected.
	AIS	Alarm Indication Signal, AIS detected.
	DS2YEL	DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3.
	FEACEQPT	Far-End Alarm & Control (FEAC) Equipment detected.
	FLTESC	Facility Fault Escalation active.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	ISD	Idle Signal Detected.
	LOF	Loss Of Frame detected.
	LOS	Loss Of Signal detected.
	MAN	Manual removal (logical removal was performed on the facility).
	RAI	Remote Alarm Indication detected.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */ /* This command does not support keyword ALL for AID. */
SDBE	Status, internal Data Base Error /* Error <ERROR NUMBER> reading record from <FILENAME>. */
SROF	Status, Requested Operation Failed /* Failed to convert tp id <TP ID NUMBER> to AID string. */ /* Unable to determine supporting facility entity. */ /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, the notification code attribute for the near-end and far-end, non-service affecting ISD condition type for DS3 ports T3-1155 through T3-1156 is retrieved.

```
RTRV-ATTR-T3::T3-1155&&-1156::, ISD, , , NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71080 COMPLD
"T3-1155,T3:MN,ISD,NEND, , ,NSA"
"T3-1155,T3:NA,ISD,FEND, , ,NSA"
"T3-1156,T3:MN,ISD,NEND, , ,NSA"
"T3-1156,T3:NA,ISD,FEND, , ,NSA"
/* RTRV-ATTR-T3::T3-1155&&-1156::,ISD, , ,NSA [P71080] (1) */
;
```

In the following example, all condition type attributes for DS3 port T3–1163 are retrieved.

```
RTRV-ATTR-T3::T3-1163;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-ATTR-VT1**
COMMAND NAME: **RETRIEVE ATTRIBUTE VT1**

PURPOSE

The RTRV-ATTR-VT1 command retrieves the provisioned condition type attributes (notification code and service effect) for the specified VT1.5 port. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving condition type attributes satisfying the specified input parameters. The command is completed regardless of whether the VT1.5 port is provisioned.

The successful response for a RTRV-ATTR-VT1 command contains one line of parsable output data, in alphabetical order, for each condition type being reported per specified AID. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition types attributes matching the specified (valid) combination of AID, condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified VT1.5 is embedded within a protection OC3.

A RTRV-ATTR-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ATTR-VT1 : [TID] : AID : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies the VT1.5 port.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported
CR	Critical Alarm										
MJ	Major Alarm										
MN	Minor Alarm										
NA	Not Alarmed										
NR	Not Reported										

CONDTYPE	NEAR-END_CONDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the VT1.5 port is in loop back. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
FLTESC	Facility Fault Escalation active. (Near-End only.)
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
IDLE	Idle, incoming idle detected. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
LOP	Loss Of Pointer detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (Near-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SLMF	Signal Label Match Failure detected. (Near-End only.)
Restrictions:	RTRV-ATTR-VT1 is denied if the specified CONDTYPE value is not supported for the specified LOCN value (e.g., CONDTYPE of AIS and LOCN of FEND is entered).
LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the monitoring location of the condition type to be retrieved. Values are:
FEND	Far-End, events occurring at a distant network element.
NEND	Near-End, events occurring at the system.
Restrictions:	RTRV-ATTR-VT1 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of AIS and LOCN of FEND is entered).

DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-ATTR-VT1 command.
	NA	Not Applicable
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-ATTR-VT1 command.
	RCV	Receive side
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

OUTPUT PARAMETERS

AID	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
NTFCNCDE	VT1 AID, identifies the VT1.5 port.	
	{CR, MJ, MN, NA, NR}	
	Notification Code, identifies the notification code of the condition type and service effect being retrieved. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
	NA	Not Alarmed
	NR	Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the VT1.5 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	EBER	Excessive Bit Error Rate detected.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	LOP	Loss Of Pointer detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	RFI	Remote Failure Indication detected.
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
	SDBER	Signal Degrade Bit Error Rate detected.
	SLMF	Signal Label Match Failure detected.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */ /* This command does not support keyword ALL for AID. */
SDBE	Status, internal Data Base Error /* Error <ERROR NUMBER> reading record from <FILENAME>. */
SROF	Status, Requested Operation Failed /* Failed to convert tp id <TP ID NUMBER> to AID string. */ /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, the notification code attribute for the near-end, non-service affecting IDLE condition type for VT1.5 ports EC1VT1-195-2-3 through EC1VT1-195-2-4 is retrieved.

```
RTRV-ATTR-VT1: : EC1VT1-195-2-3&&-4: : , IDLE, , , NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71080 COMPLD
"EC1VT1-195-2-3, VT1:NA, IDLE, NEND, , , NSA"
"EC1VT1-195-2-4, VT1:NA, IDLE, NEND, , , NSA"
/* RTRV-ATTR-VT1: : EC1VT1-195-2-3&&-4: : , IDLE, , , NSA [P71080] (1) */
;
```

In the following example, all condition type attributes for VT1.5 port EC1VT1-203-7-4 are retrieved.

```
RTRV-ATTR-VT1::EC1VT1-203-7-4;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P12083. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-BUS-STATUS**
COMMAND NAME: **RETRIEVE BUS STATUS**

PURPOSE

Retrieve-Status-Bus command retrieves the status of the intra-shelf ICL, MTL, MDT, PDT, RI and PBUS communication bus to/from the SPB identified by the AID.

The successful response for a RTRV-BUS-STATUS command either displays all pertinent data about the ICL, MTL, PBUS, MDT, PDT, and RI bus or only the card error counts pertaining to them.

A RTRV-BUS-STATUS command is denied if:

- An invalid parameter value or combination of parameter values is entered.
- The standby SPB AID is entered.

INPUT FORMAT

RTRV-BUS-STATUS : [TID] : AID : [CTAG] : : [DISPTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {SPB-{2-43, 102-111, 112-135, 136-141}-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: Equipment AID: identifies the equipment object entity.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
DISPTYPE	{ALLDATA, CNTONLY} Default: All Data Addressing: None Description: Display Type, specifies the type of data to be displayed. ALLDATA All data; specifies the entire data about the bus status is displayed. CNTONLY Count Only; specifies only the count of the bus status is displayed.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

[/* <CARDAID>:<CARDSTATUS>[ , ]+ */]+
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

BUSTYPE	{ICL, MTL, PBUS, MDT, PDT, RI} Bus Type, identifies the communication bus type. Values are: ICL Interface Communications Link MTL Memory Transfer Link PBUS Processor communications BUS MDT Main Data Transfer Bus PDT Protect Data Transfer Bus RI Remote Inventory bus
BUSNUM	{1–6} Bus Number, identifies the ICL, MTL, PBUS, MDT, PDT, and RI bus number. There are a maximum of two ICL, MTL, PBUS, MDT, and PDT type buses and six RI type buses.
BUSSTATUS	{OK, ERR,NAV} Bus Status, identifies the state of the ICL, MTL, PBUS, MDT, PDT, and RI bus. Values are: OK OK, no errors detected ERR Error; Errors detected NAV Not Available; no cards on the bus
CARDERRCNT	{1–18} Card Error Count, specifies the number of cards reporting errors detected on the ICL, MTL, PBUS, MDT, PDT, and/or RI bus. CARDERRCNT is only reported if BUSSTATUS= ERR.

CARDAID= EQUIPMENT_AID:

I/O Equipment Card ID specifies the equipment AID for cards on the ICL, MTL, PBUS, MDT, PDT, and/or RI bus. CARDERRCNT is only reported if DISPTYPE= ALLDATA.

CARDSTATUS {OK,ERR,NAV}

Card Status identifies the state of the cards on the ICL, MTL, PBUS, MDT, PDT and/or RI bus. Values are:

OK	OK, no errors detected
ERR	Error; Errors detected
NAV	Not Available; Module is out of service

CARDERRCNT is only reported if DISTYPE= ALLDATA.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENRE	Equipment, Not Recognized Equipment /*The command was rejected */
IDNV	Input, Data Not Valid /*Invalid DISPTYPE <disptype> */ /*Unable to retrieve DISPTYPE parameter. */
IIAC	Input, Invalid ACcess identifier /*Unable to retrieve level 2 processor id. */
SARB	Status, All Resources Busy /*Command already in progress on equipment. */ /*Activity timer <timer id> active on equipment. */
SNVS	Status, Not in Valid State /*<SPB AID> not in IS state */
SROF	Status, Requested Operation Failed /*Timeout waiting for response from level two processor */
SSRE	Status, System Resources Exceeded /*Unable to allocate aux buffer for <SPB AID> */

EXAMPLES

The system response varies greatly according to the type of shelf in which the SPB card is located. In the following example, the SPB is located in S136/S148. The two examples after this illustrate responses for other SPB locations.

All data about the communication bus related to SPB-6-1-1 will be displayed.

```
RTRV-BUS-STATUS::SPB-6-1-1::ALLDATA;
```

The output response, shown below, assumes CID 3-1 was used to enter the command and that the system generated a CTAG value of P49531. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P49531 COMPLD
/* ICL-1:OK */
/* ICL-2:OK */
/* MTL-1:OK */
/* MTL-2:ERR,CARDERRCNT=3 */
/* EP3-6-1-10:OK, EP3-6-1-11:OK, EP3-6-1-12:ERR, EP3-6-1-13:ERR */
/* EP3-6-1-14:ERR, EP3-6-1-15:OK, EP3-6-1-16:OK, EP3-6-1-17:NAV */
/* EP3-6-1-18:OK
/* PBUS-1:OK */
/* PBUS-2:OK */
/* MDT-1:OK */
/* MDT-2:OK */
/* PDT-1:OK */
/* PDT-2:OK */
/* RI-1:OK */
/* RI-2:OK */
/* RI-3:OK */
/* RI-4:OK */
/* RI-5:NA */
/* RI-6:OK */
/* RTRV-BUS-STATUS::SPB-6-1-1::ALLDATA [P49531] (3-1) */
;
```

RTRV-BUS-STATUS::SPB-5-3-2;

The output response below illustrates the result from a center or end stage SPB placement.

This response assumes CID 7-1 was used to enter the command and that the system generated a CTAG value of P4f271. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P4f271 COMPLD
/* ICL-1:OK */
/* ICL-2:OK */
/* PBUS-1:OK */
/* PBUS-2:OK */
/* RI-1:OK */
/* RI-2:OK */
/* RI-4:OK */
/* RI-5:OK */
/* RTRV-BUS-STATUS::SPB-5-3-2 [P4f271] (7-1) */
```

RTRV-BUS-STATUS::SPB-5-1-2;

This example shows a response for an SPB within an IRO shelf.

This response assumes CID 7-1 was used to enter the command and that the system generated a CTAG value of P4f280. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M   P4f80 COMPL
/* ICL-1:OK */
   /* ICL-2:OK */
   /* RI-1:OK */
   /* RI-2:OK */
   /* RI-3:OK */
   /* RI-4:OK */
   /* RI-5:OK */
   /* RI-6:OK */
/* RTRV-BUS-STATUS::SPB-5-1-2 [P4f280] (7-1)
```

RELATED COMMANDS

RTRV-ALM-ALL

RTRV-EQPT

COMMAND CODE: **RTRV-CID**
COMMAND NAME: **RETRIEVE COMMUNICATIONS
INTERFACE DEVICE**

PURPOSE

The RTRV-CID command retrieves the current configuration for the specified CPORT (and any associated X.25 virtual channels or TCP sessions) and identifies any user currently logged-in to the system over the CPORT or virtual channel.

The RTRV-CID command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

The successful response for a RTRV-CID command contains one or more lines of parsable output data, in ascending order, for each specified CPORT that is provisioned. No line of output data is provided for CPORTs that have not been provisioned (via ENT-CID).

- For CPORTs provisioned as non-X.25 and non-TCP ports, a single line of output data is provided for each specified CPORT.
- For CPORTs provisioned as X.25 ports, a line of output is provided to report information common to the X.25 CPORT, followed by a line of data for each provisioned virtual channel within the X.25 CPORT.
- For CPORTs provisioned as TCP ports, a line of output is provided to report information common to the TCP CPORT, followed by a line of data for each active session within the TCP CPORT.

A RTRV-CID command is denied if:

- An invalid parameter value is entered.
- System is in Limited Command Execution mode, and CPORT other than 3, 5, 7, 9 or 11 is specified.

INPUT FORMAT

RTRV-CID: [TID] : [CPORT] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{1-12} Default: <All provisioned CPORTs in the system> Addressing: &&-ranging and &-grouping Description: Control Port, specifies the physical communication port number on the APS control system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

;

```

Note: The first format line of output data is used for each provisioned non-X.25 and non-TCP CPORT being reported.

The second format line of output data is used for each provisioned X.25 CPORT being reported.

The third format line of output data is used for each provisioned virtual channel within an X.25 CPORT being reported.

The fourth format line of output data is used for each provisioned TCP CPORT being reported.

The fifth format line of output data is used for each active session within each provisioned TCP CPORT being reported.

OUTPUT PARAMETERS

ACTUSERDM	{AUECHO, AUNOECHO}	ACT-USER Display Mode, indicates whether the input characters (keystrokes) for an ACT-USER command entered over the indicated CPORT, or entered over any provisioned X.25 PVCs or incoming SVCs within the CPORT, are echoed by the system. Values are:
	AUECHO	Character Echo, ACT-USER input characters are echoed.
	AUNOECHO	Character Not Echo, ACT-USER input characters are not echoed.
AMSGITMR	{15-3600, <NoVal>}	Autonomous (X.25 Call Out) Message Inactivity Timer, indicates the number of seconds the system waits for another autonomous message before terminating the X.25 outgoing SVC session. Expiration of the AMSGITMR indicates that no autonomous messages in the output message queue remain to be transmitted. A value for AMSGITMR is only returned if provisioning for an outgoing SVC (VCTYPE is SVC and AUTOIN is <UID>) is being reported.
AUTOIN	{%, <UID>}	Automatic Login, indicates whether a User ID is automatically logged-in on the control port or virtual channel. Values are:
	%	No Automatic Login, a normal log-on sequence (via ACT-USER) is required to access the system.
	<UID>	UID Automatically Logged-in, the User ID (UID) is automatically logged-in whenever the CPORT or virtual channel is in service.
BAUD	{1200, 2400, 4800, 9600, 19200, 38400, 10}	Baud Rate, identifies the baud rate of the control port. (Note. The system automatically selects the external timing reference provided by the DCE (Data Communication Equipment) if PROTOCOL is X25, regardless of the value returned for BAUD.) For CPORTs with PROTOCOL set to TCP, the BAUD parameter value is 10 megabit/second.

CIDSTATE	{AOOS, INSTALL, REMOVED, RUNNING, UNKNOWN} Current State/Status of the indicated CPORT or indicated X.25 virtual channel. Values are:	
	AOOS	Automatic Out-Of-Service, the system has automatically removed the CPORT or virtual channel from service. (e.g., an unusual, non-auto-recoverable system error occurred; an INIT-SYS:::1 must be executed to recover from the error.)
	INSTALL	CID Install Failed, while starting the CID software, the system could not configure the necessary equipment due to an equipment failure or similar problem. (Correct the problem and execute a RST-CID to recover.)
	REMOVED	Removed/Out-Of-Service, a RMV-CID was executed, or a RST-CID was not executed after the CID was provisioned.
	RUNNING	Running/In-Service, the CID is operational.
	UNKNOWN	Unknown, the state/status of the CID is not recognized by the system.
CPORT	{1-12} Control Port, identifies the physical control port number.	
DM	{ECHO, NA, NOECHO, <NoVal>} Display Mode, identifies whether input character echo is on or off after a user logs-in for a user provisioned (via ENT-USER) as a TTY CID type. A value for DM is only returned if a user is currently logged-in to the indicated CPORT or indicated X.25 virtual channel. Values are:	
	ECHO	Echo On, input characters from a TTY terminal are echoed.
	NOECHO	Echo Off, input characters from a TTY terminal are not echoed.
	NA	Not Applicable, the user is not provisioned as a TTY terminal type.
ENABLE	{STARTED, STOPPED} Output Display Enable, indicates whether output transmission on the indicated CPORT or indicated X.25 virtual channel is enabled or disabled (via START-CID or STOP-CID). Values are:	
	STARTED	Enabled, output transmission is enabled.
	STOPPED	Disabled, output transmission is stopped (disabled).
LCN	{1-8, <NoVal>} Logical Channel Number, indicates the provisioned value (via ENT-CID-VC) for the logical channel number (LCN) for the reported PVC X.25 virtual channel or the active LCN of a connected SVC for the reported SVC X.25 virtual channel . A value for LCN is <i>not</i> returned for if an inactive, unconnected SVC is being reported.	
PROTOCOL	{SNIDER, TCP, X25, XON} Protocol, identifies the communication protocol used with the control port. Values are:	
	SNIDER	SNIDER protocol.
	TCP	TCP/IP protocol, implies the selected CPORT is running the TCP/IP over the Local Area Network (LAN).
	X25	X.25 protocol.
	XON	XON/XOFF protocol, indicates the asynchronous XON/XOFF (flow control) protocol.
SESNUM	{1-32} Session Number, indicates the TCP session/connection number associated with the session on the LAN being reported. A value for SESNUM is only returned if provisioning for a LAN CPORT is being reported.	

TYPE	<p>{PRN, TTY, VDT, <NoVal>}</p> <p>CID Type, identifies the type of CID provisioned (via ENT-USER) for the user currently logged-in to the indicated CPORT or indicated X.25 virtual channel. A value for TYPE is only returned if a user is currently logged-in to the indicated CPORT or indicated X.25 virtual channel. Values are:</p> <p>Terminal Type, indicates the terminal CPORT configuration for the user. Values are:</p> <table> <tr> <td>PRN</td><td>Printer (output only) CPORT.</td></tr> <tr> <td>TTY</td><td>Teletype Terminal, non-cursor addressable input/output terminal.</td></tr> <tr> <td>VDT</td><td>Video Display Terminal, cursor addressable video display terminal.</td></tr> </table>	PRN	Printer (output only) CPORT.	TTY	Teletype Terminal, non-cursor addressable input/output terminal.	VDT	Video Display Terminal, cursor addressable video display terminal.
PRN	Printer (output only) CPORT.						
TTY	Teletype Terminal, non-cursor addressable input/output terminal.						
VDT	Video Display Terminal, cursor addressable video display terminal.						
UID	<p>{<USER_ID>, <NoVal>}</p> <p>User Identifier, identifies the UID of the user currently logged-in (via ACT-USER) to the indicated CPORT or indicated X.25 virtual channel. A value for UID is only returned if a user is currently logged-in to the indicated CPORT or indicated X.25 virtual channel.</p>						
VCNUM	<p>{1-32}</p> <p>Virtual Channel Number, identifies the X.25 virtual channel within the specified X.25 CPORT or the TCP session number within a TCP CPORT. A value for VCNUM is only returned if provisioning for a virtual channel is being reported.</p>						
VCTYPE	<p>{PVC, SVC}</p> <p>Virtual Circuit Type, identifies the type of virtual circuit for the indicated X.25 virtual channel. A value for VCTYPE is only returned if provisioning for a virtual channel is being reported. Values are:</p> <table> <tr> <td>PVC</td><td>Permanent Virtual Circuit</td></tr> <tr> <td>SVC</td><td>Switched Virtual Circuit</td></tr> </table>	PVC	Permanent Virtual Circuit	SVC	Switched Virtual Circuit		
PVC	Permanent Virtual Circuit						
SVC	Switched Virtual Circuit						
X25COA	<p>{<1-15 INTEGER X.25_CALL_OUT_ADDRESS>, <NoVal>}</p> <p>X.25 Call Out Address, indicates the X.25 Call Out Address of the called DTE for outgoing SVCs. A value for X25COA is only returned if provisioning for an outgoing SVC (VCTYPE is SVC and AUTOIN is <UID>) is being reported.</p>						
ADDR=	<p>< 1-15 INTEGER X.25_CALLED_ADDRESS ></p> <p>X.25 Called Address, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 Called Address (the X.25 address for the system). A value for ADDR is only returned for an X.25 CPORT.</p>						
HIPVC=	<p>{0-8}</p> <p>Highest Incoming PVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 HIPVC number. A value for HIPVC is only returned for an X.25 CPORT.</p>						
HISVC=	<p>{0-4095}</p> <p>Highest Incoming SVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 HISVC number. A value for HISVC is only returned for an X.25 CPORT.</p>						
HOSVC=	<p>{0-4095}</p> <p>Highest Outgoing SVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 HOSVC number. A value for HOSVC is only returned for an X.25 CPORT.</p>						
HTSVC=	<p>{0-4095}</p> <p>Highest Two-way (Incoming or Outgoing) SVC Channel Number, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 HTSVC number. A value for HTSVC is only returned for an X.25 CPORT.</p>						
KWIN=	<p>{1-7}</p> <p>Level 2 Window Size, indicates the provisioned value (via ED-CID-OSPORT) for the X.25 level 2 window size (in number of frames). A value for KWIN is only returned for an X.25 CPORT.</p>						

L3WIN=	{1–7} Level 3 Window Size, indicates the provisioned value (via ED–CID–OSPORT) for the X.25 level 3 window size. A value for L3WIN is only returned for an X.25 CPORT.
LISVC=	{0–4095} Lowest Incoming SVC Channel Number, indicates the provisioned value (via ED–CID–OSPORT) for the X.25 LISVC number. A value for LISVC is only returned for an X.25 CPORT.
LOSVC=	{0–4095} Lowest Outgoing SVC Channel Number, indicates the provisioned value (via ED–CID–OSPORT) for the X.25 LOSVC number. A value for LOSVC is only returned for an X.25 CPORT.
LTSVC=	{0–4095} Lowest Two–way (Incoming or Outgoing) SVC Channel Number, indicates the provisioned value (via ED–CID–OSPORT) for the X.25 LTSVC number. A value for LTSVC is only returned for an X.25 CPORT.
MODEM=	{NO, YES} Modem Controls, indicates whether the X.25 control port is provisioned (via ED–CID–OSPORT) to use RTS (Request To Send) and CTS (Clear To Send) modem control signals. A value for MODEM is only returned for an X.25 CPORT.
SIZE=	{128, 256} Packet Size, indicates the provisioned value (via ED–CID–OSPORT) for the X.25 maximum packet size. A value for SIZE is only returned for an X.25 CPORT.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Optional Suggested Action Text> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* CID <CPORT> does not exist*/ /* X25 vc <VCNUM> does not exist */ /* This CID <CPORT> is an X.25 vc */
SDBE	Status, internal Data Base Error /* Unable to read OSDB – status = <status number> */

EXAMPLES

In the following example, CPORT information for all provisioned CPORTs and provisioned virtual channels is retrieved.

```
RTRV–CID;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P07003. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P07003 COMPLD
"1:XON,9600,%,AUECHO::STARTED,RUNNING"
"2:XON,9600,%,AUECHO,system,VDT,NA::STARTED,RUNNING"
"3:X25,9600,AUNOECHO:MODEM=YES,SIZE=256,L3WIN=2,KWIN=7,HIPVC=4,

COMMAND CODE: **RTRV-CKTID**
COMMAND NAME: **RETRIEVE CIRCUIT IDENTIFICATION**

PURPOSE

RTRV-CKTID retrieves a list of Symbolic Circuit IDs previously assigned to flag specific cross-connects with alphanumeric IDs (using ENT/ED-CRS/CONF commands). The search keys for this Circuit ID list are the CKTID and CKTIDTF parameters.

A separate line of parsable output data is provided for each of the following cross-connect types containing a CKTID or CKTIDTF parameter matching the input Circuit ID:

- 1WAY: One line of data for each one-way cross-connection, including the case of a one-way bridge connection, or a connection from a conference tail connected back to the conference head.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connect or as two one-way cross-connects.
- 2WAYPR: One line of data for each two-way path ring cross-connection. (Only preferred side is shown.)
- 2WAYDC: One line of data for each two-way drop and continue cross-connection. (Only preferred side is shown.)
- BCST: One line of data for each one-way cross-connection from the conference head to each conference tail.

A RTRV-CKTID command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-CKTID: [TID] :: [CTAG] :: CKTID;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CKTID	< 0-45 VALID TID CHARACTERS > Default: <Entry Required> Addressing: None Description: FROM and TO Circuit ID. 1 to 45 ASCII characters (excluding semi-colon, double quote, greater than, lesser than and backslash characters) within enclosing double quotes. An asterisk (*) may be used as a wildcard character.

STS3C	STS-3C cross connection, only displayed for an STS-3C to STS-3C cross connection.	T1	DS1 cross connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross connection.	T3	DS3 cross connection, displayed for a DS3 to DS3 and DS3 to STS-1 cross connection.	VT1	VT1.5 cross connection, only displayed for a VT1.5 to VT1.5 cross connection.
STS1	STS-1 cross connection, only displayed for an STS-1 to STS-1 cross connection.										
STS3C	STS-3C cross connection, only displayed for an STS-3C to STS-3C cross connection.										
T1	DS1 cross connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross connection.										
T3	DS3 cross connection, displayed for a DS3 to DS3 and DS3 to STS-1 cross connection.										
VT1	VT1.5 cross connection, only displayed for a VT1.5 to VT1.5 cross connection.										
RDL	<p>{Y}</p> <p>Indicates whether the red line feature is enabled:</p> <table><tr><td>Y</td><td>Red line is enabled</td></tr></table>	Y	Red line is enabled								
Y	Red line is enabled										
CKTID	<p><1-45 valid TID characters></p> <p>FROM to TO circuit ID. Valid Values are 1 to 45 ASCII characters (matches input CKTID parameter)</p>										
CKTIDTF	<p><0-45 valid TID characters></p> <p>TO to FROM circuit ID. Valid Values are 1 to 45 ASCII characters (matches input CKTID parameter)</p>										
PST	<p>{IS, OOS-AU}</p> <p>Primary State, indicates the current primary state of the cross-connection. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:</p> <table><tr><td>IS</td><td>In-Service</td></tr><tr><td>OOS-AU</td><td>Out-Of-Service-Autonomous</td></tr></table>	IS	In-Service	OOS-AU	Out-Of-Service-Autonomous						
IS	In-Service										
OOS-AU	Out-Of-Service-Autonomous										

SST	{ROLL, SGEO, STBYH, TERMB, TERMF, TERMT, TS, WRK}
	Secondary State, indicates any secondary states associated with the cross-connection. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the cross-connection at the time of the RTRV-CRS. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:
ROLL	Roll, indicates the ports in the cross connection are under rolling operation.
SGEO	Supporting Entity Outage
STBYH	Stand-by Hot. Applies when CTYPE = 2WAYPR and 2WAYDC. STBYH indicates all the entities required for the cross connection are in-service. But the path is not selected in the RPB module and is ready to be selected if a failure is detected in the working connection.
TERMB	Terminated-Both, indicates both the TO and FROM ports of the cross-connection are terminated.
TERMF	Terminated-From, indicates the FROM port of the cross-connection is terminated.
TERMT	Terminated-To, indicates the TO port of the cross-connection is terminated.
TS	Test, indicates the port is connected to a Test Access port.
WRK	Working. Applies when CTYPE = 2WAYPR and 2WAYDC. WRK indicates all entities required for the cross connection are in-service and the path is selected in the RPB module.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
	/* CONF Database Error: <ERROR-STRING> for record number <RECORD-NUMBER> */
	/* RIP Database Error: <ERROR-STRING> for record number <RECORD-NUMBER> */
SROF	Status, Requested Operation Failed

EXAMPLES

The following example illustrates the command and associated output for a search on connections having a Circuit ID of TESTCKT. Note that CKTFROM showing in the response is a previously entered CKTIDTF ID for the TO FROM connection linked with the TESTCKT (FROM TO) connection.

```
RTRV-CKTID:::::"TESTCKT" ;

<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "T3T1-1-6,T3T1-5-3:2WAY,T1:CKTID=\"TESTCKT\",CKTIDTF=\"CKTFROM\":IS"
  "T3T1-1-7,T3T1-5-4:1WAY,T1:,RDL=Y,CKTID=\"TESTCKT\":IS"
/* RTRV-CKTID [Pad567] (2) */
;
```

The following example shows the command and associated output for a search on all connections having Circuit IDs that begin with the letters TEST.

```
RTRV-CKTID:::::"TEST*";

<SID> <YY-MM-DD> <HH:MM:SS>
M Pad568 COMPLD
  "T3T1-1-6,T3T1-5-3:2WAY,T1:CKTID=\"TESTCKT\",CKTIDTF=\"CKTFROM\":IS"
  "T3T1-1-7,T3T1-5-4:1WAY,T1:,RDL=Y,CKTID=\"TESTCKT\":IS"
  "T3T1-600-13,T3T1-5-5:1WAY,T1:CKTID=\"TESTCKT02\":IS"
/* RTRV-CKTID [Pad568] (2) */
;

COMMAND CODE: **RTRV-COND-ALL**
COMMAND NAME: **RETRIEVE CONDITION ALL**

PURPOSE

The RTRV-COND-ALL command retrieves the current status of any existing non-alarmed or not-reported standing conditions in the system, or any non-alarmed or not-reported standing conditions matching the specified combination of condition type or location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters).

The successful response for a RTRV-COND-ALL command contains one line of parsable output data for each non-alarmed or not-reported standing condition being reported. If multiple non-alarmed or not-reported standing conditions exist, a line of output is provided for

- each equipment entity alarm, in ascending order by date and time of occurrence,
- each common (no specific entity) alarm, in ascending order by date and time of occurrence,
- each DS1 alarm, in ascending order by DS1 port number and ascending order by date and time of occurrence within each DS1 port number,
- each Timing Reference (TMG) alarm, in ascending order by TMG AID and ascending order by date and time of occurrence within each TMG AID,
- each F3 alarm, in ascending order by F3 port number and ascending order by date and time of occurrence within each F3 port number,
- each DS3 alarm, in ascending order by DS3 port number and ascending order by date and time of occurrence within each DS3 port number,
- each OC-3 alarm, in ascending order by OC-3 port number and ascending order by date and time of occurrence within each OC-3 port number,
- each OC-12 alarm, in ascending order by OC-12 port number and ascending order by date and time of occurrence within each OC-12 port number,
- each EC1 alarm, in ascending order by EC1 port number and ascending order by date and time of occurrence within each EC1 port number,
- each STS-1 alarm, in ascending order by STS-1 port number and ascending order by date and time of occurrence within each STS-1 port number,
- each STS-3C alarm, in ascending order by STS-3C port number and ascending order by date and time of occurrence within each STS-3C port number,
- each VT1.5 alarm, in ascending order by VT1.5 port number and ascending order by date and time of occurrence within each VT1.5 port number.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of condition type and location, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-COND-ALL command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-ALL: [TID] : [AID] : [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	{ ALL }	
	Default:	{ALL}
	Addressing:	None
	Description:	Access Identifier, specifies all non-alarmed or not-reported standing conditions in the system are to be retrieved.

CTAG	<p>< 1–6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
CONDTYPE	<p>EQUIPMENT_CONDTYPE:{ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPEENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKS WPR, MISC–1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM–EC1, TERM–OC3, TERM–OC12, TERM–T1, TERM–T3EC1, TSA, TSI, TSTEQPT, WKS WPR, XIDMISM},</p> <p>COMMON_CONDTYPE:{DATAFLT, EUA, FRNGSYN, FSTSYN, GOS–EC1, GOS–OC12, GOS–OC3, GOS–STS1, GOS–STS3C, GOS–T1, GOS–T3, GOS–VT1, HLDVRSYN, INHFL, INIT, ITMIP, MANSELDATA CPY0, MANSELDATA CPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688},</p> <p>DS1_NEAR–END_CONDTYPE:{ACTLPBK, AIS, AIS–CI, ALWCBLPBK, DS1ISD, EOC, INHPMREPT, LOF, LOS, MAN, RVCBLPBK, ROLLMON, XMTCLPBK},</p> <p>DS1_FAR–END_CONDTYPE:{RAI, RAI–C},</p> <p>TMG_NEAR–END_CONDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL},</p> <p>F3_CONDTYPE:{INHPMREPT},</p> <p>DS3_NEAR–END_CONDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN},</p> <p>DS3_FAR–END_CONDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI},</p> <p>OC3_NEAR–END_CONDTYPE:{ACTLPBK, AIS, DUPTARPEENTRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAL, L2SCONFAL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR},</p> <p>OC3_FAR–END_CONDTYPE:{RFI},</p> <p>OC12_NEAR–END_CONDTYPE:{ACTLPBK, AIS, DUPTARPEENTRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAL, L2SCONFAL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR},</p> <p>OC12_FAR–END_CONDTYPE:{RFI},</p> <p>EC1_NEAR–END_CONDTYPE:{ACTLPBK, AIS, INHPMREPT, LOF, LOS, MAN},</p> <p>EC1_FAR–END_CONDTYPE:{RFI},</p> <p>STS1_NEAR–END_CONDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKS WBK, FRCDWKS WPR, IDLE, INHPMREPT, LOP, MAN, MANWKS WBK, MANWKS WPR, PDI, SDBER, SLMF},</p> <p>STS1_FAR–END_CONDTYPE:{RFI},</p> <p>STS3C_NEAR–END_CONDTYPE:{ACTLPBK, AIS, IDLE, INHPMREPT, LOP, MAN, SLMF},</p> <p>STS3C_FAR–END_CONDTYPE:{RFI},</p> <p>VT1_NEAR–END_CONDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKS WBK, FRCDWKS WPR, IDLE, INHPMREPT, LOP, MAN, MANWKS WBK, MANWKS WPR, ROLLMON, SDBER, SLMF},</p> <p>VT1_FAR–END_CONDTYPE:{RFI}</p> <p>Default: < All applicable condition types listed above ></p> <p>Addressing: None</p> <p>Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:</p>

Input Values for EQUIPMENT CONDITION TYPES are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected.
BKUPMEMP	Backup Memory—Primary, magnetic disk backup failure.
BKUPMEMS	Backup Memory—Secondary, optical disk/tape drive back-up failure.
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf.
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN.
CD	Control and Display interface audit error detected.
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0.
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1.
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB.
CONTBUS	Control Bus, shelf control bus interface failure.
CONTCOM	Control Communication equipment failure.
CONTR	Control processor equipment failure.
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure.
DBF	Database Backup Failure, OPD database backup failure detected (on second try).
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try.
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed.
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified.
DUPMACADDR	Duplicate MAC Address, detected on the LAN.
DUPTARPEENTRY	Duplicate TARP adjacency table.
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed.
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed.
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database.
GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited.
INHSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
INIT	Initialization, shelf initialization in-process.
INTERR	Internal Error, internal error suspected on equipment.
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
LOTRI	Loss Of Offboard Timing Reference Input from mate Mas-

MAN	ter Clock Board circuit pack. Manual removal (logical removal was performed on a circuit pack).
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
MISC-1	Miscellaneous Class-1, slave MCB is not ready.
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs.
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning.
PWR	Power, internal power failure detected.
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
SWFTDWN	Software Download is in process on a circuit pack.
SYNCEQPT	Synchronization Equipment failure detected.
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure.
TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure.
TERM-T1	Termination Equipment-T1, DSI circuit pack failure.
TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure.
TSA	Test Session Active, maintenance test session is active on the equipment.
TSI	Time Slot Interchange equipment failure.
TSTEQPT	Test Equipment failure.
WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.
Input Values for COMMON CONDITION TYPES are:	
DATAFLT	Data integrity Fault, CRC error detected during a database read.
EUA	Emergency User Access activated.
FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
GOS-STS1	Grade of Service-STS1, system-wide STS-1 GOS threshold reached.
GOS-STS3C	Grade of Service-STS3C, system-wide STS-3C GOS threshold reached.
GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.

GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
INIT	Initialization, system initialization in-process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATACPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
MANSELDATACPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
Input Values for DS1, TMG, F3, and DS3 CONDITION TYPES are:	
1TO6LOF	One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3. (DS3 Near-End.)
7LOF	Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3. (DS3 Near-End.)
ACTLPBK	Active Loopback, the port is in loop back. (DS1, DS3 Near-End.)
AICMIS	Application Identification Channel Mismatch, AIC mismatch detected. (DS3 Near-End.)
AIS	Alarm Indication Signal, AIS detected. (DS1, TMG, DS3 Near-End, DS3 Far-End.)
AIS-CI	Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near-End)
ALWCBLPBK	Allow C-Bit Loopback. (DS1 Near-End.)
DS2YEL	DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3. (DS3 Far-End.)

DS1ISD	DS1 Idle Signal Detected, Incoming. (DS1 Near-End.)
EOC	Embedded Operations Channel, EOC failure detected. (DS1 Near-End.)
FEACEQPT	Far-End Alarm & Control (FEAC) Equipment detected. (DS3 Far-End.)
FLTESC	Facility Fault Escalation active. (DS3 Near-End.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (DS1, DS3, F3 Near-End.)
ISD	Idle Signal Detected. (DS3 Near-End, DS3 Far-End.)
LOF	Loss Of Frame detected. (DS1, TMG, DS3 Near-End, DS3 Far-End.)
LOS	Loss Of Signal detected. (DS1, TMG, DS3 Near-End, DS3 Far-End.)
MAN	Manual removal (logical removal was performed on the facility). (DS1, DS3 Near-End.)
RAI	Remote Alarm Indication detected. (DS1, DS3 Far-End.)
RAI-CI	Remote Alarm Indication for Customer Installation detected. (DS1 Far-End.)
RCVCBLPBK	Receive (DS1) C-Bit Loopback. (DS1 Near-End.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (DS1 Near-End.)
SLTMSIG	Slipping Timing Reference Signal detected. (TMG Near-End.)
SYNCPRI	Primary Reference Synchronization failure. (TMG Near-End.)
SYNCSEC	Secondary Reference Synchronization failure. (TMG Near-End.)
SYNCSTATQUAL	Synchronization Status Quality. (TMG Near-End.)
XMTCBLPBK	Transmit (DS1) C-Bit Loopback. (DS1 Near-End.)
Input Values for OC-3, OC-12, EC1, STS-1, STS-3C, and VT1.5 CONDITION TYPES are:	
ACTLPBK	Active Loopback, the port is in loop back. (OC-3, OC-12, EC1, STS-1, STS-3C, VT1.5 Near-End.)
AIS	Alarm Indication Signal, AIS detected. (OC-3, OC-12, EC1, STS-1, STS-3C, VT1.5 Near-End.)
DUPTARPENTRY	Duplicate TARP adjacency table. (OC-3, OC-12 Near-End.)
EBER	Excessive Bit Error Rate detected. (OC-3, OC-12, STS-1, VT1.5 Near-End.)
ESW	Excessive Switching, lockout of automatic revertive (OC-3, OC-12) switching due to excessive switching. (OC-3, OC-12 Near-End.)
FLTESC	Facility Fault Escalation active. (STS-1, VT1.5 Near-End.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (OC-3, OC-12, STS-1 , VT1.5 Near-End.)
FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (OC-3, OC-12, STS-1 , VT1.5 Near-End.)
IDLE	Idle, incoming idle detected. (STS-1, STS-3C, VT1.5 Near-End.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (OC-3, OC-12, EC1, STS-1, STS-3C,

	VT1.5 Near-End.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (OC-3, OC-12 Near-End.)
L2SCONFAIL	Layer 2 Section DCC Connection Failure. (OC-3, OC-12 Near-End.)
LDCCDLFL	Line DCC Data Link Failure. (OC-3, OC-12 Near-End.)
LOCKOUTOFPR	LockOut Of Protection facility. (OC-3, OC-12 Near-End.)
LOF	Loss Of Frame detected. (OC-3, OC-12, EC1 Near-End.)
LOP	Loss Of Pointer detected. (STS-1, STS-3C, VT1.5 Near-End.)
LOS	Loss Of Signal detected. (OC-3, OC-12, EC1 Near-End.)
MAN	Manual removal (logical removal was performed on the facility). (OC-3, OC-12, EC1, STS-1, STS-3C, VT1.5 Near-End.)
MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (OC-3, OC-12, STS-1, VT1.5 Near-End.)
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (OC-3, OC-12, STS-1, VT1.5 Near-End.)
PDI	Incoming PDI signal detected (STS1)
RFI	Remote Failure Indication detected. (OC-3, OC-12, EC1, STS-1, STS-3C, VT1.5 Far-End.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (VT1.5 Near-End.)
SDBER	Signal Degrade Bit Error Rate detected. (OC-3, OC-12, STS-1, VT1.5 Near-End.)
SDCCDLFL	Section DCC Data Link Failure. (OC-3, OC-12 Near-End.)
SLMF	Signal Label Match Failure detected. (STS-1, STS-3C, VT1.5 Near-End.)
WTR	Wait To Restore of protection facility. (OC-3, OC-12 Near-End.)
Restrictions:	RTRV-COND-ALL is denied if the specified CONDTYPE value is not supported for the specified LOCN value (e.g., CONDTYPE of RAI and LOCN of NEND is entered). RTRV-COND-ALL is denied if the DS1 CI/NI Trouble Sectionalization Premium Feature Option (PFO) is not enabled and an input value of AIS-CI, DS1ISD or RAI-CI is entered.

LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
FEND	Far-End, events occurring at a distant network element.
NEND	Near-End, events occurring at the system.
Restrictions:	RTRV-COND-ALL is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).

DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-COND-ALL command.
	NA	Not Applicable
TMPER	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-COND-ALL command.

Access Identifier, identifies the specific entity pertaining to the condition type being retrieved.	
AIDTYPE	{EC1, EQPT, F3, OC3, OC12, STS1, STS3C, T1, T3, VT1}
	AID Type, identifies the type of AID for the condition type being retrieved. Values are:
	EC1 EC1 AID being reported.
	EQPT Equipment AID being reported.
	F3 F3 AID being reported.
	OC3 OC3 AID being reported.
	OC12 OC12 AID being reported.
	STS1 STS-1 AID being reported.
	STS3C STS-3C AID being reported.
	T1 DS1 or TMG AID being reported.
	T3 DS3 AID being reported.
	VT1 VT1.5 AID being reported.
NTFCNCDE	{NA, NR}
	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:
	NA Not Alarmed
	NR Not Reported
CONDTYPE	EQUIPMENT_CONDTYPE:{ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKSWPR, MISC-1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC3, TERM-OC12, TERM-T1, TERM-T3EC1, TSA, TSI, TSTEQPT, WKSWPR, XIDMISM}, COMMON_CONDTYPE:{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-STs1, GOS-STs3C, GOS-T1, GOS-T3, GOS-VT1, HLDovRSync, INHFL, INIT, ITMIP, MANSELDataCPY0, MANSELDataCPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688}, DS1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, EOC, INHPMREPT, LOF, LOS, MAN, RCVCBLPBK, ROLLMON, XMTCLPBK}, DS1_FAR-END_CONDTYPE:{RAI, RAI-CI}, TMG_NEAR-END_CONDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL}, F3_CONDTYPE:{INHPMREPT}, DS3_NEAR-END_CONDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN}, DS3_FAR-END_CONDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI}, OC3_NEAR-END_CONDTYPE:{ACTLPBK, AIS, DUPTARPENTRY, EBER, ESW, FRCDWKSWBK, FRCDWKSWPR, INHPMREPT, L2LCONFAL, L2SCONFAL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKSWBK, MANWKSWPR, SDBER, SDCCDLFL, WTR}, OC3_FAR-END_CONDTYPE:{RFI}, OC12_NEAR-END_CONDTYPE:{ACTLPBK, AIS, DUPTARPENTRY, EBER, ESW,

STS1_FAR-END_CONDTYPE:{RFI},
STS3C_NEAR-END_CONDTYPE:{ACTLPBK, AIS, IDLE, INHPMREPT, LOP, MAN,
SLMF},
STS3C_FAR-END_CONDTYPE:{RFI},
VT1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK,
FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK,
MANWKSWPR, ROLLMON, SDBER, SLMF},
VT1_FAR-END_CONDTYPE:{RFI}

Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:

Output Values for EQUIPMENT CONDITION TYPES are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected.
BKUPMEMP	Backup Memory—Primary, magnetic disk backup failure.
BKUPMEMS	Backup Memory—Secondary, optical disk/tape drive back-up failure.
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane.
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf.
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN.
CD	Control and Display interface audit error detected.
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0.
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1.
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB.
CONTBUS	Control Bus, shelf control bus interface failure.
CONTCOM	Control Communication equipment failure.
CONTR	Control processor equipment failure.
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure.
DBF	Database Backup Failure, OPD database backup failure detected (on second try).
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try.
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed.
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified.
DUPMACADDR	Duplicate MAC Address detected on the LAN.
DUPTARPENTRY	Duplicate TARP adjacency table.
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed.

FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed.
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database.
GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
INHSWDX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited.
INHSWWKG	Inhibit Switch To Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
INIT	Initialization, shelf initialization in-process.
INTERR	Internal Error, internal error suspected on equipment.
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
LOTRI	Loss of Offboard Timing Reference Input from mate Master Clock Board circuit pack.
MAN	Manual removal (logical removal was performed on a circuit pack).
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
MISC-1	Miscellaneous Class-1, slave MCB is not ready.
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs.
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning.
PWR	Power, internal power failure detected.
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
SWFTDWN	Software Download is in process on a circuit pack.
SYNCEQPT	Synchronization Equipment failure detected.
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
TERM-OC3	Termination equipment-OC3, O1B circuit pack failure.
TERM-OC12	Termination equipment-OC12, O4M circuit pack failure.
TERM-T1	Termination equipment-T1, DSI circuit pack failure.
TERM-T3EC1	Termination equipment-T3/EC1, EP3 circuit pack failure.
TSA	Test Session Active, maintenance test session is active on the equipment.
TSI	Time Slot Interchange equipment failure.
TSTEQPT	Test Equipment failure.
WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.
Output Values for COMMON CONDITION TYPES are:	
DATAFLT	Data integrity Fault, CRC error detected during a database read.
EUA	Emergency User Access activated.

FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
GOS-ST51	Grade of Service-ST51, system-wide STS-1 GOS threshold reached.
GOS-ST53C	Grade of Service-ST53C, system-wide STS-3C GOS threshold reached.
GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
INIT	Initialization, system initialization in-process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
MANSELDATAOPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
Output Values for DS1, TMG, F3, and DS3 CONDITION TYPES are:	
1TO6LOF	One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3.
7LOF	Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3.
ACTLPBK	Active Loopback, the port is in loop back.
AICMIS	Application Identification Channel Mismatch, AIC mismatch detected.
AIS	Alarm Indication Signal, AIS detected.
AIS-CI	Remote Alarm Indication for Customer Installation detected.
ALWCBLPBK	Allow C-Bit Loopback.
DS1ISD	DS1 Idle Signal Detected, Incoming.

DS2YEL	DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3.
EOC	Embedded Operations Channel, EOC failure detected.
FEACEQPT	Far-End Alarm & Control (FEAC) Equipment detected.
FLTESC	Facility Fault Escalation active.
INHMPREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
ISD	Idle Signal Detected.
LOF	Loss Of Frame detected.
LOS	Loss Of Signal detected.
MAN	Manual removal (logical removal was performed on the facility).
RAI	Remote Alarm Indication detected.
RAI-CI	Remote Alarm Indication for Customer Installation detected.
RCVCBLPBK	Receive (DS1) C-Bit Loopback.
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
SLTMSIG	Slipping Timing Reference Signal detected.
SYNCPRI	Primary Reference Synchronization failure.
SYNCSEC	Secondary Reference Synchronization failure.
SYNCSTATQUAL	Synchronization Status Quality.
XMTCBLPBK	Transmit (DS1) C-Bit Loopback.
Output Values for OC-3, OC-12, EC1, STS-1, STS-3C, and VT1.5 CONDITION TYPES are:	
ACTLPBK	Active Loopback, the port is in loop back.
AIS	Alarm Indication Signal, AIS detected.
DUPTARPENTRY	Duplicate TARP adjacency table.
EBER	Excessive Bit Error Rate detected.
ESW	Excessive Switching, lockout of automatic revertive (OC-3, OC-12) switching due to excessive switching.
FLTESC	Facility Fault Escalation active.
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
IDLE	Idle, incoming idle detected.
INHMPREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
L2LCONFAIL	Layer 2 Line DCC Connection Failure.
L2SCONFAIL	Layer 2 Section DCC Connection Failure.
LDCCDLFL	Line DCC Data Link Failure.
LOCKOUTOFPR	LockOut Of Protection facility.
LOF	Loss Of Frame detected.
LOP	Loss Of Pointer detected.
LOS	Loss Of Signal detected.
MAN	Manual removal (logical removal was performed on the facility).
MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.

	PDI	Incoming PDI signal detected.
	RFI	Remote Failure Indication detected.
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
	SDBER	Signal Degrade Bit Error Rate detected.
	SDCCDLFL	Section DCC Data Link Failure.
	SLMF	Signal Label Match Failure detected.
	WTR	Wait To Restore of protection facility.
SRVEFF	{NSA, SA}	Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} }	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} }	Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.
LOCN	{FEND, NEND}	Location, identifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system. (A value of NEND is always reported for equipment or common condition types.)
DIRN	{TRMT, <NoVal>}	Direction, identifies the direction of the condition type being monitored. Values are:
	TRMT	Transmit Direction, value returned for CONDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY

  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

EFON    Equipage, Feature Option Not provided
IDNC    Input, Data Not Consistent
        /*Location is not consistent with <CONDITION TYPE STRING>.*//

```

IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Condition type is not MISC but has a -#: <CONDITION TYPE STRING>. */ /* Condition type is MISC but has no -#. */ /* Condition type is TERM but - <STRING> is not valid. */ /* Condition type is GOS but -<STRING> is not valid. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* AID for RTRV-COND-ALL command must be ALL. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error - <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error - <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, all existing non-alarmed or not-reported standing conditions in the system are retrieved.

```
RTRV-COND-ALL: :ALL;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **RTRV-COND-COM**
COMMAND NAME: **RETRIEVE CONDITION COMMON**

PURPOSE

The RTRV-COND-COM command retrieves the current status of any existing non-alarmed or not-reported standing common (no specific entity) conditions for the specified condition type.

The successful response for a RTRV-COND-COM command contains one line of parsable output data, in ascending order by date and time of occurrence, for each non-alarmed or not-reported standing condition being reported.

If there are no existing non-alarmed or not-reported standing conditions for the specified condition type, then the command is completed with no line of parsable output data provided.

A RTRV-COND-COM command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-COND-COM: [TID] : [AID] : [CTAG] : : [CONDTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	{COM} Default: {COM} Addressing: None Description: Common AID, used when a specific AID is not identified.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CONDTYPE	{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-ST51, GOS-ST53C, GOS-T1, GOS-T3, GOS-VT1, HLDVRSYNC, INHFL, INIT, ITMIP, MANSELDATACPY0, MANSELDATACPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are: DATAFLT Data integrity Fault, CRC error detected during a database read.

EUA	Emergency User Access activated.
FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
GOS-ST1	Grade of Service-ST1, system-wide STS-1 GOS threshold reached.
GOS-ST3C	Grade of Service-ST3C, system-wide STS-3C GOS threshold reached.
GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
INIT	Initialization, system initialization in-process.
ITMIP	Installation Test and Maintenance (ITM) mode is set.
MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of SELECT-COPY command.
MANSELDATAOPY1	Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
RCVRY	Recovery. The System level recovery has been executed.
SWTOPRI	Automatic Switch To Primary Synchronization Reference.
SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.

SUCCESSFUL RESPONSE FORMAT

If matching conditions are found, the following response is sent:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["COM:<NTFCNCDE>,<CONDTYPE>,<SRVEFF>,<OCRDAT>,<OCRTM>,<LOCN>,, "]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

NTFCNCDE	{NA, NR}	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:
	NA	Not Alarmed
	NR	Not Reported
CONDTYPE	{DATAFLT, EUA, FRNGSYNC, FSTSYNC, GOS-EC1, GOS-OC12, GOS-OC3, GOS-ST1, GOS-ST3C, GOS-T1, GOS-T3, GOS-VT1, HLDOVRSYNC, INHFL, INIT, ITMIP, MANSELDATAOPY0, MANSELDATAOPY1, MANSWTOPRI, MANSWTOSEC, PAINTGRT, RCVRY, SWTOPRI, SWTOSEC, UPGRD1344, UPGRD2688}	Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
	DATAFLT	Data integrity Fault, CRC error detected during a database read.
	EUA	Emergency User Access activated.
	FRNGSYNC	Free Running Synchronization, manual switch to free running clock reference synchronization mode.
	FSTSYNC	Fast Acquisition Synchronization, manual or automatic switch to fast acquisition clock reference synchronization mode.
	GOS-EC1	Grade of Service-EC1, system-wide EC1 GOS threshold reached.
	GOS-OC12	Grade of Service-OC12, system-wide OC-12 GOS threshold reached.
	GOS-OC3	Grade of Service-OC3, system-wide OC-3 GOS threshold reached.
	GOS-ST1	Grade of Service-ST1, system-wide STS-1 GOS threshold reached.
	GOS-ST3C	Grade of Service-ST3C, system-wide STS-3C GOS threshold reached.
	GOS-T1	Grade of Service-T1, system-wide DS1 GOS threshold reached.
	GOS-T3	Grade of Service-T3, system-wide DS3 GOS threshold reached.
	GOS-VT1	Grade of Service-VT1, system-wide VT1.5 GOS threshold reached.
	HLDOVRSYNC	Synchronization Holdover, manual or automatic switch to holdover clock reference synchronization mode.
	INHFL	Inhibit Fault Locating, automatic system-wide fault isolation inhibited.
	INIT	Initialization, system initialization in-process.
	ITMIP	Installation Test and Maintenance (ITM) mode is set.
	MANSELDATAOPY0	Manual Selection/Lock to Data Copy 0 due to execution of

	MANSELDATACPY1	SELECT-COPY command. Manual Selection/Lock to Data Copy 1 due to execution of SELECT-COPY command.
	MANSWTOPRI	Manual Switch To Primary Synchronization Reference.
	MANSWTOSEC	Manual Switch To Secondary Synchronization Reference.
	PAINTGRT	Path Integrity Failure, a system-wide data or clock failure detected.
	RCVRY	Recovery. The System level recovery has been executed. The user must issue INIT-SYS command.
	SWTOPRI	Automatic Switch To Primary Synchronization Reference.
	SWTOSEC	Automatic Switch To Secondary Synchronization Reference.
	UPGRD1344	672 Port to 1344 Port Upgrade in Progress.
	UPGRD2688	1344 Port to 2688 Port Upgrade in Progress.
SRVEFF	{NSA, SA}	Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are: NSA Non-Service Affecting SA Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} }	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} }	Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.
LOCN	{NEND}	Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]

REPT^EVT^COM

COMMAND CODE: **RTRV-COND-EC1**
COMMAND NAME: **RETRIEVE CONDITION EC1**

PURPOSE

The RTRV-COND-EC1 command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified EC1 port, or for the specified EC1 port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the EC1 port is provisioned.

The successful response for a RTRV-COND-EC1 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-COND-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-EC1 : [TID] : AID : [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port. Name-defined values are: ALL All provisioned EC1 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, INHPMREPT, LOF, LOS, MAN}, FAR-END_CONDDTYPE:{RFI} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are: <table> <tr> <td>ACTLPBK</td><td>Active Loopback, the EC1 port is in loop back. (Near-End only.)</td></tr> <tr> <td>AIS</td><td>Alarm Indication Signal, AIS detected. (Near-End only.)</td></tr> <tr> <td>INHPMREPT</td><td>Inhibit Performance Monitoring Report, PM report capability Inhibited. (Near-End only.)</td></tr> <tr> <td>LOF</td><td>Loss Of Frame detected. ```

OUTPUT PARAMETERS

AID	EC1_AID: {EC1-{1-3840} } EC1 AID, identifies the EC1 port.	(EC1-EC1/STS1#)
-----	--	-----------------

NTFCNCDE	{NA, NR} Notification Code, identifies the notification code generated by the system when the condition occurred. Values are: NA Not Alarmed NR Not Reported
CONDTYPE	NEAR-END_CONDTYPE:{ACTLPBK, AIS, INHPMREPT, LOF, LOS, MAN}, FAR-END_CONDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are: ACTLPBK Active Loopback, the EC1 port is in loop back. AIS Alarm Indication Signal, AIS detected. INHPMREPT Inhibit Performance Monitoring Report, PM report capability Inhibited. LOF Loss Of Frame detected. LOS Loss Of Signal detected. MAN Manual removal (logical removal was performed on the facility). RFI Remote Failure Indication detected.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are: NSA Non-Service Affecting SA Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, all existing non-alarmed or not-reported standing conditions for EC1 port EC1-337 through EC1-338 are retrieved.

```
RTRV-COND-EC1: : EC1-337&&-338;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
"EC1-337, EC1:MN, LOF, NSA, 07-02, 08-44-30, NEND, ,"

COMMAND CODE: **RTRV-COND-EQPT**
COMMAND NAME: **RETRIEVE CONDITION EQUIPMENT**

PURPOSE

The RTRV-COND-EQPT command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified equipment AID, or for any matching combination of a specified equipment AID and condition type. The command is completed regardless of whether the equipment entity is provisioned.

The successful response for a RTRV-COND-EQPT command contains one line of parsable output data, in ascending order by date and time of occurrence, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, a line of output is provided for each AID with an existing non-alarmed or not-reported standing condition.

If there are no existing non-alarmed or not-reported standing conditions matching the specified (valid) combination of AID and condition type, then the command is completed with no line of parsable output data provided.

A RTRV-COND-EQPT command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-EQPT : [TID] : AID : [CTAG] : : [CONDTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	{ACM, ALL, CDA, CDB, CID, CIM, CKB, CPU, DSB, DSI, DSK, EOB, EP3, ES1, ESA, FAN, FUSE, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1M16, G1M32, G1M40, G1MRPB, G1O1B, G1O4M, G1S3M, G4EOB, G4IOB, G4OXB, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OPD, OXB, P39, P56, PDU, PRT, PSF, PST, QUAD, RDU, RPB, RSP, S3M, SBT, SHELF, SIO, SPB, SWI} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment entities. Values are: ACM All Administrative Communications Module circuit packs. ALL All applicable AIDs pertaining to the specified CONDTYPE. CDA All Clock Distribution A circuit packs. CDB All Clock Distribution B circuit packs. CID All Communications Interface Devices (VDT, TTY, PRN). CIM All Communications Interface Module circuit packs. CKB All Circuit Breakers, circuit breakers in the PDU/RDU/RSP. CPU All Central Processing Unit circuit packs. DSB All DCC Server Boards. DSI All DS1 Input/Output circuit packs. DSK All Disk Drives. EOB All Electrical to Optical Board circuit packs. EP3 All Electrical Plesiochronous DS3/STS1 Interface circuit packs. ES1 All Electrical Plesiochronous STS1 Interface circuit packs. ESA All External DS1 Signal Adapter circuit packs. FAN All Fan/Blower assemblies. FUSE All Fuses, PDU fuses.

G1EOB	All GTI cables carrying an STM1 signal and terminating on an EOB.
G1EP3	All GTI cables carrying an STM1 signal and terminating on an EP3.
G1ES1	All GTI cables carrying an STM1 signal and terminating on an ES1.
G1IOB	All GTI cables coming into IOB module and carrying STM–1 signal.
G1IRPB	All GTI cables carrying an STM1 signal and terminating on the I/O side of the RPB circuit pack.
G1M16	All GTI cables carrying an STM1 signal and terminating on a M16.
G1M32	All GTI cables carrying an STM1 signal and terminating on a M32.
G1M40	All GTI cables carrying an STM1 signal and terminating on a M40.
G1MRPB	All GTI cables carrying an STM1 signal and terminating on the matrix side of the RPB circuit pack.
G1O1B	All GTI cables carrying an STM1 signal and terminating on an O1B.
G1O4M	All GTI cables carrying an STM1 signal and terminating on an O4M.
G1S3M	All GTI cables carrying an STM1 signal and terminating on an S3M.
G4EOB	All GTI cables carrying an STM4 signal and terminating on an EOB.
G4IOB	All GTI cables coming into IOB module and carrying STM–4 signal.
G4OXB	All GTI cables carrying an STM4 signal and terminating on an OXB.
HMU	All High Speed Muldem Unit (M23 multiplexing) circuit packs.
ICM	All Intelligent Communications Module circuit packs.
IOB	Inter–rack Optics Board
IPB	All Internal Protection Board circuit packs.
IPU	All Interface Processing Unit circuit packs.
LMU	All Low Speed Muldem Unit (M12 multiplexing) circuit packs.
LT1	All Level 1 Translator (RS–232) circuit packs.
LT2	All Level 2 Translator (RS–449/422) circuit packs.
LT4	All Level 4 Translator (ACL) circuit packs.
LT5	All Level 5 Translator (RS449/423 & LAN) circuit packs.
LT8	All Level 8 Translator (ACL) circuit packs.
M16	All Matrix End/Center Stage 16 circuit packs.
M32	All Matrix End Stage 32 circuit packs.
M40	All Matrix End/Center Stage 40 circuit packs.
MCB	All Master Clock Board circuit packs.
O1B	All OC3 Module (STM1) Board circuit packs.
O4M	All OC12 Module (STM4) Board circuit packs.
OPD	All Optical Disk Drives.
OXB	All Optical Transceiver Board circuit packs.
P39	All Power Supply, 3.9V circuit packs.
P56	All Power Supply, 5.6V circuit packs.
PDU	All Power Distribution Units.
PRT	All DS1 Protect circuit packs.
PSF	All Power Supply, 5V circuit packs.
PST	All Power Supply, 12V circuit packs.
QUAD	All DS1 Shelf Quadrants.
RDU	All Rack Distribution Units.
RPB	All Ring Protection Board circuit packs.
RSP	All Rack Status Panels.
S3M	All STS3C Module circuit packs.
SBT	All System Bus Termination circuit packs.
SHELF	All I/O, EOC, End Stage, or Center Stage Shelves.
SIO	All Serial Input/Output circuit packs.
SPB	All Satellite Processor Board circuit packs.
SWI	All DS1 Switch circuit packs.

Restrictions: RTRV-COND-EQPT is denied if the specified AID is not valid for the specified CONDTYPE. (Refer to Appendix C and CONDTYPE below.)
RTRV-COND-EQPT is denied for a 240-port LMC system if an AID of CDA is entered.

CTAG < 1-6 VALID CTAG CHARACTERS >
Default: < System assigned CTAG value >
Addressing: None
Description: Correlation Tag, associates input command with its output responses.

CONDTYPE {ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKSUPR, MISC-1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC3, TERM-OC12, TERM-T1, TERM-T3, TERM-T3EC1, TSA, TSI, WKSUPR, XIDMISM}

Default: < All applicable condition types listed above >
Addressing: None
Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:

ALMCKT	Alarm Circuit, RDU/RSP failure detected. (Valid for an AID of ALL, RDU, RSP.)
BKUPMEMP	Backup Memory-Primary, magnetic disk backup failure. (Valid for an AID of ALL, DSK.)
BKUPMEMS	Backup Memory-Secondary, optical disk/tape drive backup failure. (Valid for an AID of ALL, OPD.)
BPMISM	Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane. (Valid for an AID of ALL, SHELF.)
BPTERM	Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf. (Valid for an AID of ALL, SHELF.)
CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN. (Valid for an AID of ALL, CID, DSB.)
CD	Control and Display interface audit error detected. (Valid for an AID of ALL, CID.)
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0. (Valid for an AID of ALL, QUAD, SHELF.)
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1. (Valid for an AID of ALL, QUAD, SHELF.)
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB. (Valid for an AID of ALL, DSB.)
CONTBUS	Control Bus, shelf control bus interface failure. (Valid for an AID of ALL, IPU, SPB.)
CONTCOM	Control Communication equipment failure. (Valid for an AID of ALL, ACM, CIM, ICM, SIO.)
CONTR	Control processor equipment failure. (Valid for an AID of ALL, CPU, IPU, SPB.)
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure. (Valid for an AID of ALL, EOB, IOB, IPB,

	LMU, OXB, RPB, S3M.)
DBF	Database Backup Failure, OPD database backup failure detected (on second try). (Valid for an AID of ALL, OPD.)
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try. (Valid for an AID of ALL, OPD.)
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed. (Valid for an AID of ALL, DSB.)
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified. (Valid for an AID of ALL, SHELF, QUAD.)
DUPMACADDR	Duplicate MAC Address detected on the LAN. (Valid for an AID of ALL, DSB.)
DUPTARENTRY	Duplicate TARP adjacency table. (Valid for an AID of ALL, DSB.)
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed. (Valid for an AID of ALL, CKB, FUSE.)
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed. (Valid for an AID of ALL, FAN.)
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database. (Valid for an AID of ALL, MCB.)
GT1	GTI Cable fault for GTI cable carrying an STM1 signal (Valid for an AID of ALL, G1EOB, G1EP3, G1ES1, G1IOB, G1IRPB, G1S3M, G1M16, G1M32, G1M40, G1MRPB, G1O1B, G1O4M.)
GT4	GTI Cable fault for GTI cable carrying an STM4 signal (Valid for an AID of ALL, G4EOB, G4IOB, G4OXB.)
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal. (Valid for AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, EOB, EP3, ES1, ESA, FAN, HMU, ICM, IOB, IPB, IPU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PDU, PRT, PSF, PST, RDU, RPB, S3M, SBT, SIO, SPB, SWI.)
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited. (Valid for an AID of ALL, CPU, IPU, SPB.)
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
INHSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
INIT	Initialization, shelf initialization in-process. (Valid for an AID of ALL, SHELF.)
INTERR	Internal Error, internal error suspected on equipment. (Valid for an AID of ALL, CDA, CDB, DSI, EOB, EP3, ES1, HMU, IOB, IPB, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, RPB, S3M.)
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
LOTRI	Loss Of Offboard Timing Reference Input from mate Mas-

	ter Clock Board circuit pack. (Valid for an AID of ALL, MCB.)
MAN	Manual removal (logical removal was performed on a circuit pack). (Valid for an AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, DSK, EOB, EP3, ES1, HMU, ICM, IOB, IPB, IPU, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PSF, RPB, S3M, SIO, SPB.)
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
MISC-1	Miscellaneous Class-1, slave MCB is not ready. (Valid for an AID of ALL, MCB.)
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two redundant DSBs. (Valid for an AID of ALL, DSB.)
PRCDRERR	Procedure Error, installed equipment does not support the facility provisioning. (Valid for an AID of ALL, ACM, CDA, CDB, CIM, CPU, DSB, DSI, EOB, EP3, ES1, HMU, ICM, IOB, IPB, IPU, LMU, LT1, LT2, LT4, LT5, LT8, M16, M32, M40, MCB, OXB, O1B, O4M, P39, P56, PRT, RPB, S3M, SIO, SWI.)
PWR	Power, internal power failure detected. (Valid for an AID of ALL, P39, P56, PSF, PST, RSP.)
RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem. (Valid for an AID of ALL, M16, M32, M40, SPB.)
SWFTDWN	Software Download is in process on a circuit pack. (Valid for an AID of ALL, ACM, CIM, DSB, EP3, ES1, ICM, IPU, M16, M32, M40, MCB, O1B, O4M, OXB, RPB, S3M, SPB.)
SYNCEQPT	Synchronization Equipment failure detected. (Valid for an AID of ALL, CDA, CDB, MCB.)
TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure. (Valid for an AID of ALL, ES1.)
TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure. (Valid for an AID of ALL, O1B.)
TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure. (Valid for an AID of ALL, O4M.)
TERM-T1	Termination Equipment-T1, DSI circuit pack failure. (Valid for an AID of ALL, DSI.)
TERM-T3	Termination Equipment-T3, HMU circuit pack failure. (Valid for an AID of ALL, HMU.)
TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure. (Valid for an AID of ALL, EP3.)
TSA	Test Session Active, maintenance test session active on the equipment. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU, M16, M32, O1B, O4M, S3M.)
TSI	Time Slot Interchange equipment failure. (Valid for an AID of ALL, M16, M32, M40.)
WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit. (Valid for an AID of ALL, DSI, EP3, ES1, HMU, LMU.)
XIDMISM	Connection ID Mismatch, internal Connection ID Mis-

match detected in the I/O shelf/quad. (Valid for an AID of ALL, QUAD, SHELF)

Restrictions: RTRV-COND-EQPT is denied if the specified CONDTYPE is not valid for the specified AID.

 Equipment AID, identifies the equipment entity.

NTFCNCDE {NA, NR}
 Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:
 NA Not Alarmed
 NR Not Reported

CONDTYPE {ALMCKT, BKUPMEMP, BKUPMEMS, BPMISM, BPTERM, CARLOS, CD, CLKLCK0, CLKLCK1, CNTRLRFL, CONTBUS, CONTCOM, CONTR, CTNEQPT, DBF, DBFFT, DCCEQPT, DTLCKCPYFL, DUPMACADDR, DUPTARPENTRY, FA, FANEQPT, FWMISM, GT1, GT4, IMPROPRMVL, INHSWDX, INHSWPR, INHSWWKG, INIT, INTERR, LOCKOUT, LOTRI, MAN, MANWKSWPR, MISC-1, OSIPARMISM, PRCDRERR, PWR, RARFAIL, SWFTDWN, SYNCEQPT, TERM-EC1, TERM-OC3, TERM-OC12, TERM-T1, TERM-T3, TERM-T3EC1, TSA, TSI, WKSWPR, XIDMISM}
 Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
 ALMCKT Alarm Circuit, RDU/RSP failure detected.
 BKUPMEMP Backup Memory-Primary, magnetic disk backup failure.
 BKUPMEMS Backup Memory-Secondary, optical disk/tape drive backup failure.
 BPMISM Backplane Mismatch, mismatch between the provisioned shelf and the installed shelf backplane.
 BPTERM Backplane Termination failure detected in the SI48 I/O, EOC, End Stage, or Center Stage shelf.

CARLOS	Carrier Loss, loss of carrier event during IEEE 802.3 frame transmission on the LAN.
CD	Control and Display interface audit error detected.
CLKLCK0	Clock Lock 0, the clock path of the I/O, EOC, ES, and CS locked to clock bus 0.
CLKLCK1	Clock Lock 1, the clock path of the I/O, EOC, ES, and CS locked to clock bus 1.
CNTRLRFL	Controller Failure, LAPD or LAN controller failed set on the DSB.
CONTBUS	Control Bus, shelf control bus interface failure.
CONTCOM	Control Communication equipment failure.
CONTR	Control processor equipment failure.
CTNEQPT	Connection Equipment, facility/circuit interconnection equipment failure.
DBF	Database Backup Failure, OPD database backup failure detected (on second try).
DBFFT	Database Backup Failed on First Try, OPD database backup failure detected on first try.
DCCEQPT	Data Communication Channel Equipment, DCC Server Board failed.
DTLCKCPYFL	Data Lock Copy Fail, I/O modules in shelf/quad not locked to the copy specified.
DUPMACADDR	Duplicate MAC Address detected on the LAN.
DUPTARPENTRY	Duplicate TARP adjacency table.
FA	Fuse Alarm, a PDU/RDU/RSP circuit breaker or PDU fuse has failed.
FANEQPT	Fan Equipment, one or more of the fans in a fan assembly failed.
FWMISM	Firmware Mismatch, firmware version number does not match that in the system database.
GT1	GTI Cable fault for GTI cable carrying an STM1 signal.
GT4	GTI Cable fault for GTI cable carrying an STM4 signal.
IMPROPRMVL	Improper Removal, result of a physical circuit pack removal that was not preceded by a logical removal.
INHSDWX	Inhibit Switch Duplex, automatic copy switching of duplex equipment inhibited.
INHSWPR	Inhibit Switch to Protection, automatic protection switching of a main circuit pack to protection unit is inhibited.
INHSWWKG	Inhibit Switch to Working, automatic switching of a main circuit pack back to working (from protection) is inhibited.
INIT	Initialization, shelf initialization in-process.
INTERR	Internal Error, internal error suspected on equipment.
LOCKOUT	LockOut of automatic revertive switching due to excessive protection switching.
LOTRI	Loss Of Offboard Timing Reference Input from mate Master Clock Board circuit pack.
MAN	Manual removal (logical removal was performed on a circuit pack).
MANWKSWPR	Manual Working Switched to Protection, main/working unit was manually switched to the protection unit.
MISC-1	Miscellaneous Class-1, slave MCB is not ready.
OSIPARMISM	OS Initialization Parameter Mismatch, upper layer parameters or lower layer parameters specific to the LAN or manual area addresses are mismatched between two re-

	PRCDRERR	dundant DSBs. Procedure Error, installed equipment does not support the facility provisioning.
	PWR	Power, internal power failure detected.
	RARFAIL	Re-Arrangement Failed, cross-connect rearrangement through the matrix failed due to SPB communication problem.
	SWFTDWN	Software Download is in process on a circuit pack.
	SYNCEQPT	Synchronization Equipment failure detected.
	TERM-EC1	Termination Equipment-EC1, ES1 circuit pack failure.
	TERM-OC3	Termination Equipment-OC3, O1B circuit pack failure.
	TERM-OC12	Termination Equipment-OC12, O4M circuit pack failure.
	TERM-T1	Termination Equipment-T1, DSI circuit pack failure.
	TERM-T3	Termination Equipment-T3, HMU circuit pack failure.
	TERM-T3EC1	Termination Equipment-T3/EC1, EP3 circuit pack failure.
	TSA	Test Session Active, maintenance test session active on the equipment.
	TSI	Time Slot Interchange equipment failure.
	WKSWPR	Working Switched to Protection, main/working unit automatically switched to the protection unit.
	XIDMISM	Connection ID Mismatch, internal Connection ID Mismatch detected in the I/O shelf/quad.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are: NSA Non-Service Affecting SA Service Affecting	
OCRDAT	{MONTH-DAY:{01-12} - {01-31}} Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59}} Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> - <SECOND_OF_MINUTE>.	
LOCN	{NEND} Location, identifies the location where the condition type is monitored. A value of NEND (Near-End) is always reported.	

UNSUCCESSFUL RESPONSE FORMAT

```

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV Input, Data Not Valid
 /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
 /* Invalid service effect specified: <SERVICE EFFECT STRING>. */
 /* Invalid condition type specified: <CONDITION TYPE STRING>. */
 /* Condition type not valid for: EQPT. */
 /* Condition type is not MISC but has a -#: <CONDITION TYPE STRING>. */
 /* Condition type is MISC but has no -#. */
 /* Condition type is TERM but - <STRING> is not valid. */
 /* Invalid parameter specified. */

IIAC Input, Invalid ACcess identifier
 /* Invalid card type specified: <CARD TYPE STRING>. */

SROF Status, Requested Operation Failed
 /* Cannot open <FILENAME>. */
 /* rpt_file error - <ERRNO>, status = <STATUS>. */
 /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE>. */
 /* rpt_print error - <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing DBF non-alarmed or not-reported condition is retrieved.

```
RTRV-COND-EQPT: :ALL: : :DBF;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71052. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71052 COMPLD  
"OPD-1-3-1, EQPT:NA,DBF,NSA,07-02,09-30-28,NEND, ,"  
/* RTRV-COND-EQPT: :ALL: : :DBF [P71052] (2) */

COMMAND CODE: **RTRV-COND-F3**
COMMAND NAME: **RETRIEVE CONDITION F3**

PURPOSE

The RTRV-COND-F3 command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified F3 port, or for the specified F3 port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the F3 port is provisioned.

The successful response for a RTRV-COND-F3 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-COND-F3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-F3 : [TID] : AID : [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the F3 port. Name-defined values are: ALL All provisioned F3 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
CONDTYPE	{INHPMREPT} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are: INHPMREPT Inhibit Performance Monitoring Report, PM report capability Inhibited.
LOCN	{NEND} Default: < All location values applicable to the specified condition type > Addressing: None Description: Location, specifies the location where the condition type is monitored. Values are: NEND Near-End, events occurring at the system.

DIRN	{NA, RCV}	
	Default:	{NA}
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-COND-F3 command.
	NA	Not Applicable
	RCV	Receive side
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-COND-F3 command.

SUCCESSFUL RESPONSE FORMAT

```

  ["<AID>, F3 : <NTFCNCDE>, <CONDTYPE>, <SRVEFF>, <OCRDAT>, <OCRTM>, <LOCN>, , "]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

AID	F3_AID:	
	{T3F3-{1-4800}-{1-14}}	(T3F3-DS3#-Fractional_DS3#)
	F3 AID, identifies the F3 port.	
NTFCNCDE	{NA, NR}	
	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:	
	NA	Not Alarmed
	NR	Not Reported
CONDTYPE	{INHPMREPT}	
	Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.
SRVEFF	{NSA, SA}	
	Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31}}	
	Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59}}	
	Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> - <SECOND_OF_MINUTE>.	
LOCN	{NEND}	
	Location, identifies the location where the condition type is monitored. Values are:	
	NEND	Near-End, events occurring at the system.

UNSUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RTRV-COND-OC12**
COMMAND NAME: **RETRIEVE CONDITION OC-12**

PURPOSE

The RTRV-COND-OC12 command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified OC-12 port, or for the specified OC-12 port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the OC-12 port is provisioned.

The successful response for a RTRV-COND-OC12 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-COND-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-OC12 : [TID] : AID : [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port. Name-defined values are: ALL All provisioned OC-12 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAIL, L2S CONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC-12 port is in loopback. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lock out of automatic revertive (OC-12) switching due to excessive switching. (Near-End only.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
L2S CONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
LOF	Loss Of Frame detected. (Near-End only.)
LOS	Loss Of Signal detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKS WBK	Manual Working Switched Back, working facility was manually switched back to the main facility. (Near-End only.)
MANWKS WPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
WTR	Wait To Restore of protection facility. (Near-End only.)
Restrictions:	RTRV-COND-OC12 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).

LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	RTRV-COND-OC12 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RFI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-COND-OC12 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-COND-OC12 command.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing non-alarmed or not-reported standing conditions for OC-12 ports OC12-124 through OC12-125 are retrieved.

```
RTRV-COND-OC12::OC12-124&&-125;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
  "OC12-124,OC12:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,, "
  "OC12-125,OC12:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,, "
  /* RTRV-COND-OC12::OC12-124&&-125 [P71061] (1) */
;

```

In the following example, all existing non–alarmed or not–reported standing conditions for OC–12 port OC12–113 are retrieved.

```
RTRV-COND-OC12::OC12-113;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD

COMMAND CODE: **RTRV-COND-OC3**
COMMAND NAME: **RETRIEVE CONDITION OC-3**

PURPOSE

The RTRV-COND-OC3 command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified OC-3 port, or for the specified OC-3 port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the OC-3 port is provisioned.

The successful response for a RTRV-COND-OC3 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-COND-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-OC3 : [TID] : AID : [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) ALL_AID: {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port. Name-defined values are: ALL All provisioned OC-3 ports in the system.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAIL, L2S CONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC-3 port is in loopback. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lock out of automatic revertive (OC-3) switching due to excessive switching. (Near-End only.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
L2S CONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
LOF	Loss Of Frame detected. (Near-End only.)
LOS	Loss Of Signal detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKS WBK	Manual Working Switched Back, working facility was manually switched back to the main facility. (Near-End only.)
MANWKS WPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
WTR	Wait To Restore of protection facility. (Near-End only.)
Restrictions:	RTRV-COND-OC3 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).

LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND	Far-End, events occurring at a distant network element.
DIRN	NEND	Near-End, events occurring at the system.
	Restrictions:	RTRV-COND-OC3 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RFI and LOCN of NEND is entered).
	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
TMPER	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-COND-OC3 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-COND-OC3 command.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing non-alarmed or not-reported standing conditions for OC-3 ports OC3-124 through OC3-125 are retrieved.

```
RTRV-COND-OC3::OC3-124&&-125;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  P71061 COMPLD

COMMAND CODE: **RTRV-COND-STS1**
COMMAND NAME: **RETRIEVE CONDITION STS-1**

PURPOSE

The RTRV-COND-STS1 command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified STS-1 port, or for the specified STS-1 port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the STS-1 port is provisioned.

The successful response for a RTRV-COND-STS1 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified STS-1 is embedded within a protection OC-3 or OC-12.

A RTRV-COND-STS1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-STS1: [TID] :AID: [CTAG] :: [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	ALL_AID:		
	{ALL}		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS1 AID, identifies the STS-1 port. Name-defined values are:	
	ALL	All provisioned STS-1 ports in the system.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

CONDTYPE	<p>NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI}</p> <p>Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)																																
PDI	Incoming PDI signal detected (STS1)																																
RFI	Remote Failure Indication detected. (Far-End only.)																																
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)																																
SLMF	Signal Label Match Failure detected. (Near-End only.)																																
LOCN	<p>{FEND, NEND}</p> <p>Default: < All location values applicable to the specified condition type > Addressing: None Description: Location, specifies the location where the condition type is monitored. Values are:</p> <table> <tr> <td>FEND</td><td>Far-End, events occurring at a distant network element.</td></tr> <tr> <td>NEND</td><td>Near-End, events occurring at the system.</td></tr> </table> <p>Restrictions: RTRV-COND-STS1 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).</p>	FEND	Far-End, events occurring at a distant network element.	NEND	Near-End, events occurring at the system.																												
FEND	Far-End, events occurring at a distant network element.																																
NEND	Near-End, events occurring at the system.																																

DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-COND-STS1 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-COND-STS1 command.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

;

```

OUTPUT PARAMETERS

AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	STS1 AID, identifies the STS-1 port.	
NTFCNCDE	{NA, NR}	
	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:	
	NA	Not Alarmed
	NR	Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the STS-1 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	EBER	Excessive Bit Error Rate detected.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	LOP	Loss Of Pointer detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	PDI	Incoming PDI signal detected (STS1)
	RFI	Remote Failure Indication detected.
	SDBER	Signal Degrade Bit Error Rate detected.
	SLMF	Signal Label Match Failure detected.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.	
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.

UNSUCCESSFUL RESPONSE FORMAT

```

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
	/* Condition type is not consistent with <FACILITY TYPE STRING>. */
	/* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid
	/* Invalid notification code specified: <NOTIFICATION CODE STRING>. */
	/* Invalid service effect specified: <SERVICE EFFECT STRING>. */
	/* Invalid location specified: <LOCATION STRING>. */
	/* Invalid condition type specified: <CONDITION TYPE STRING>. */
	/* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier
	/* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed
	/* Cannot open <FILENAME>. */
	/* rpt_file error – <ERRNO>, status = <STATUS>. */
	/* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */
	/* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing non-alarmed or not-reported standing conditions for STS-1 ports EC1STS1-349 through EC1STS1-350 are retrieved.

```
RTRV-COND-STs1::EC1STS1-349&&-350;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
  "EC1STS1-349,STS1:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,, "
  "EC1STS1-350,STS1:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,, "
  [/ * RTRV-COND-STs1::EC1STS1-349&&-350 [P71061] (1) */]
;

```

In the following example, all existing non-alarmed or not-reported standing conditions for STS-1 port EC1STS1-337 are retrieved.

```
RTRV-COND-STs1::EC1STS1-337;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M  P71066  COMPLD

COMMAND CODE: **RTRV-COND-STS3C**
COMMAND NAME: **RETRIEVE CONDITION STS-3C**

PURPOSE

The RTRV-COND-STS3C command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified STS-3C port, or for the specified STS-3C port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the STS-3C port is provisioned.

The successful response for a RTRV-COND-STS3C command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified STS-3C is embedded within a protection OC-3 or OC-12.

A RTRV-COND-STS3C command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-STS3C: [TID] :AID: [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing non–alarmed or not–reported standing conditions for STS–3C ports OC3STS3C–12 through OC3STS3C–13 are retrieved.

```
RTRV-COND-STS3C::OC3STS3C-12&&-13;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
"OC3STS3C-12,STS3C:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,, "
"OC3STS3C-13,STS3C:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,, "
/* RTRV-COND-STS3C::OC3STS3C-12&&-13 [P71061] (1) */
;
```

In the following example, all existing non–alarmed or not–reported standing conditions for STS–3C port OC3STS3C–1 are retrieved.

```
RTRV-COND-STS3C::OC3STS3C-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
"OC3STS3C-1,STS3C:NA,INHMPREPT,NSA,07-02,09-05-12,NEND,, "
"OC3STS3C-1,STS3C:NA,MAN,NSA,07-02,09-25-42,NEND,, "
/* RTRV-COND-STS3C::OC3STS3C-1 [P71066] (2) */
;

REPT^EVT^STS3C

COMMAND CODE: **RTRV-COND-T1**
COMMAND NAME: **RETRIEVE CONDITION T1**

PURPOSE

The RTRV-COND-T1 command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified DS1 or Timing Reference (TMG) port, or for the specified DS1 or TMG port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the DS1 or TMG port is provisioned.

The successful response for a RTRV-COND-T1 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified DS1 is embedded within a protection OC3.

A RTRV-COND-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-T1 : [TID] : AID : [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID: { T1-{1-59392} } (T1-DS1#) { T3T1-{1-4800}-{1-28} } (T3T1-DS3#-DS1#) { EC1T1-{1-3840}-{1-28} } (EC1T1-EC1/STS1/DS3#-DS1#) { EC1T1-{1-3840}-{1-7}-{1-4} } (EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#) { OC3T1-{1-2240}-{1-3}-{1-7}-{1-4} } (OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#) { OC3T1-{1-2240}-{1-3}-{1-28} } (OC3T1-OC3#-STS1/DS3#-DS1#) { OC12T1-{1-560}-{1-4}-{1-3}-{1-28} } (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#) { OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4} } (OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#) TMG_AID: { TMG-{0, 1} } ALL_AID: { ALL } Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS1/TMG AID, identifies the DS1 or Timing Reference port. Name-defined values are: ALL All provisioned DS1 and TMG ports in the system. Restrictions: RTRV-COND-T1 is denied if the specified AID does not support the specified CONDTYPE (e.g., DS1 AID and CONDTYPE of SYNCSEC).
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

CONDTYPE	DS1_NEAR-END_CONDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, DS1ISD, EOC, INHPMREPT, LOF, LOS, MAN, RCVCLPBK, ROLLMON, XMTCLPBK}, DS1_FAR-END_CONDTYPE:{RAI, RAI-CI}, TMG_NEAR-END_CONDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the DS1 port is in loop back. (DS1 Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (DS1 or TMG Near-End only.)
AIS-CI	Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near-End)
ALWCBLPBK	Allow C-Bit Loopback. (DS1 Near-End only.)
DS1ISD	DS1 Idle Signal Detected, Incoming. (DS1 Near-End.)
EOC	Embedded Operations Channel, EOC failure detected. (DS1 Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (DS1 Near-End only.)
LOF	Loss Of Frame detected. (DS1 or TMG Near-End only.)
LOS	Loss Of Signal detected. (DS1 or TMG Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (DS1 Near-End only.)
RAI	Remote Alarm Indication detected. (DS1 Far-End only.)
RAI-CI	Remote Alarm Indication for Customer Installation detected. (DS1 Far-End.)
RCVCLPBK	Receive (DS1) C-Bit Loopback. (DS1 Near-End only.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (DS1 Near-End only.)
SLTMSIG	Slipping Timing Reference Signal detected. (TMG Near-End only.)
SYNCPRI	Primary Reference Synchronization failure. (TMG Near-End only.)
SYNCSEC	Secondary Reference Synchronization failure. (TMG Near-End only.)
SYNCSTATQUAL	Synchronization Status Quality. (TMG Near-End only.)
XMTCLPBK	Transmit (DS1) C-Bit Loopback. (DS1 Near-End only.)
Restrictions:	RTRV-COND-T1 is denied if the specified CONDTYPE is not supported for the specified AID (e.g., CONDTYPE of SYNCSEC and DS1 AID). RTRV-COND-T1 is denied if the specified CONDTYPE value is not supported for the specified LOCN value (e.g., CONDTYPE of RAI and LOCN of NEND is entered). RTRV-COND-T1 is denied if the DS1 CI/NI Trouble Sectionalization Premium Feature Option (PFO) is not enabled and an input value of AIS-CI, DS1ISD or RAI-CI is entered.

LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
Restrictions:	RTRV-COND-T1 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-COND-T1 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-COND-T1 command.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

EFON	Equipage, Feature Option Not provided
IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing non-alarmed or not-reported AIS standing condition for DS1 ports T3T1-1309-10 through T3T1-1309-11 is retrieved.

```
RTRV-COND-T1::T3T1-1309-10&&-11::AIS;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
  "T3T1-1309-10,T1:NA,AIS,NSA,07-02,07-30-28,NEND,, "
  /* RTRV-COND-T1::T3T1-1309-10&&-11::AIS [P71061] (1) */
;

```

In the following example, all existing non–alarmed or not–reported standing conditions for DS1 port T3T1–1297–10 are retrieved.

```
RTRV-COND-T1::T3T1-1297-10;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
  "T3T1-1297-10,T1:NA,LOF,SA,07-02,08-44-30,NEND,, "
/* RTRV-COND-T1::T3T1-1297-10 [P71066] (2) */
;

COMMAND CODE: **RTRV-COND-T3**
COMMAND NAME: **RETRIEVE CONDITION T3**

PURPOSE

The RTRV-COND-T3 command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified DS3 port, or for the specified DS3 port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the DS3 port is provisioned.

The successful response for a RTRV-COND-T3 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified DS3 is embedded within a protection OC3.

A RTRV-COND-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-T3 : [TID] : AID : [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

 {EC1T3-{1-3840}} (EC1T3-EC1/STS1/DS3#)
 {OC3T3-{1-2240}-{1-3}} (OC3T3-OC3#-STS1/DS3#)
 {OC12T3-{1-560}-{1-4}-{1-3}} (OC12T3-OC12#-STM1#-STS1/DS3#)
 DS3 AID, identifies the DS3 port.

NTFCNCDE {NA, NR}
 Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:
 NA Not Alarmed
 NR Not Reported

CONDTYPE NEAR-END_CONDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN},
 FAR-END_CONDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI}
 Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
 1TO6LOF One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3.
 7LOF Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3.
 ACTLPBK Active Loopback, the DS3 port is in loop back.
 AICMIS Application Identification Channel Mismatch, AIC mismatch detected.
 AIS Alarm Indication Signal, AIS detected.
 DS2YEL DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3.
 FEACEQPT Far-End Alarm & Control (FEAC) Equipment detected.
 FLTESC Facility Fault Escalation active.
 INHPMREPT Inhibit Performance Monitoring Report, PM report capability inhibited.
 ISD Idle Signal Detected.
 LOF Loss Of Frame detected.
 LOS Loss Of Signal detected.
 MAN Manual removal (logical removal was performed on the facility).
 RAI Remote Alarm Indication detected.

SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are: NSA Non-Service Affecting SA Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> - <SECOND_OF_MINUTE>.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are: TRMT Transmit Direction, value returned for CONDTYPE of FLTESC. <NoVal> No Value (null) returned for all conditions other than FLTESC.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error - <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error - <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing non–alarmed or not–reported standing conditions for DS3 ports T3–1309 through T3–1310 are retrieved.

```
RTRV-COND-T3::T3-1309&&-1310;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
  "T3-1309,T3:NA,AIS,NSA,07-02,07-30-28,FEND,, "
  "T3-1309,T3:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,, "
/* RTRV-COND-T3::T3-1309&&-1310 [P71061] (1) */
;
```

In the following example, all existing non–alarmed or not–reported standing conditions for DS3 port T3–1297 are retrieved.

```
RTRV-COND-T3::T3-1297;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
  "T3-1297,T3:NA,LOF,NSA,07-02,08-44-30,FEND,, "
  "T3-1297,T3:NA,INHMPREPT,NSA,07-02,09-05-12,NEND,, "
/* RTRV-COND-T3::T3-1297 [P71066] (2) */

COMMAND CODE: **RTRV-COND-VT1**
COMMAND NAME: **RETRIEVE CONDITION VT1**

PURPOSE

The RTRV-COND-VT1 command retrieves the current status of any existing non-alarmed or not-reported standing conditions for the specified VT1.5 port, or for the specified VT1.5 port and any matching combination of a specified condition type and location (i.e., the CONDTYPE and LOCN parameters provide a filter for retrieving existing conditions satisfying the specified input parameters). The command is completed regardless of whether the VT1.5 port is provisioned.

The successful response for a RTRV-COND-VT1 command contains one line of parsable output data, in ascending order by port number and ascending order by date and time of occurrence within each port number, for each non-alarmed or not-reported standing condition being reported. If an AID of ALL is entered, all AIDs with an existing non-alarmed or not-reported standing condition are reported.

If there are no existing non-alarmed or not-reported standing conditions with attributes matching the specified (valid) combination of AID, condition type, and location, then the command is completed with no line of parsable output data provided in the response message. In addition, no line of parsable output data is provided if the specified VT1.5 is embedded within a protection OC-3 or OC-12.

A RTRV-COND-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-COND-VT1 : [TID] : AID : [CTAG] : : [CONDTYPE] , [LOCN] , [DIRN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	ALL_AID:		
	{ALL}		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	VT1 AID, identifies the VT1.5 port. Name-defined values are:	
	ALL	All provisioned VT1.5 ports in the system.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the VT1.5 port is in loop back. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
FLTESC	Facility Fault Escalation active. (Near-End only.)
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
IDLE	Idle, incoming idle detected. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
LOP	Loss Of Pointer detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (Near-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SLMF	Signal Label Match Failure detected. (Near-End only.)
Restrictions:	RTRV-COND-VT1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).
LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the location where the condition type is monitored. Values are:
FEND	Far-End, events occurring at a distant network element.
NEND	Near-End, events occurring at the system.
Restrictions:	RTRV-COND-VT1 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).

DIRN	{NA, RCV, TRMT}
Default:	< All applicable directions >
Addressing:	None
Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-COND-VT1 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
Default:	{15-MIN}
Addressing:	None
Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-COND-VT1 command.

OUTPUT PARAMETERS

AID	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	VT1 AID, identifies the VT1.5 port.	
NTFCNCDE	{NA, NR}	
	Notification Code, identifies the notification code generated by the system when the condition occurred. Values are:	
	NA	Not Alarmed
	NR	Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the VT1.5 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	EBER	Excessive Bit Error Rate detected.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	LOP	Loss Of Pointer detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	RFI	Remote Failure Indication detected.
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
	SDBER	Signal Degrade Bit Error Rate detected.
	SLMF	Signal Label Match Failure detected.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting
OCRDAT	{MONTH-DAY:{01-12} - {01-31} } Occurrence Date, identifies the date when the condition occurred. The format of OCRDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.	
OCRTM	{HOUR-MINUTE-SECOND:{00-23} - {00-59} - {00-59} } Occurrence Time, identifies the time when the condition occurred. The format of OCRTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> -<SECOND_OF_MINUTE>.	
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Condition type is not consistent with <FACILITY TYPE STRING>. */ /* Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>. */
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /* Invalid condition type specified: <CONDITION TYPE STRING>. */ /* Invalid parameter specified. */
IIAC	Input, Invalid ACcess identifier /* Invalid Access ID specified. */
SROF	Status, Requested Operation Failed /* Cannot open <FILENAME>. */ /* rpt_file error – <ERRNO>, status = <STATUS>. */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE>. */ /* rpt_print error – <ERRNO>, status = <STATUS>. */

EXAMPLES

In the following example, any existing non-alarmed or not-reported standing conditions for VT1.5 ports EC1VT1-349-3-1 through EC1VT1-349-3-2 are retrieved.

```
RTRV-COND-VT1: :EC1VT1-349-3-1&&-2;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated a CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
  "EC1VT1-349-3-1,VT1:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,,"
  "EC1VT1-349-3-2,VT1:NA,INHMPREPT,NSA,07-02,11-42-18,NEND,,"
  /* RTRV-COND-VT1: :EC1VT1-349-3-1&&-2 [P71061] (1) */
;

```

In the following example, all existing non-alarmed or not-reported standing conditions for VT1.5 port EC1VT1-337-7-4 are retrieved.

```
RTRV-COND-VT1::EC1VT1-337-7-4;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated a CTAG value of P71066. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71066 COMPLD
"EC1VT1-337-7-4,VT1:NA,INHMPREPT,NSA,07-02,09-05-12,NEND,, "
"EC1VT1-337-7-4,VT1:NA,MAN,NSA,07-02,09-25-42,NEND,, "

COMMAND CODE: **RTRV-CONF-T1**
COMMAND NAME: **RETRIEVE CONFERENCE T1**

PURPOSE

The RTRV-CONF-T1 command retrieves the one-way conference cross-connections in which the specified DS1 is involved either as a head (MASTER) or a tail. The conference connections for all conference heads/tails within the specified range of AIDs are retrieved; i.e. this command retrieves conference information as long as the specified DS1 is involved as a head or tail in a conference and regardless of whether the specified AID is connected to a DS1 or a VT1.5. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection. In addition, it is executed with no line of parsable output data provided if the specified DS1 is embedded within a protection OC-3 or OC-12.

The successful response for a RTRV-CONF-T1 contains one line of parsable output data, in ascending order, for each one-way conference cross-connection associated with the specified port either as conference head (MASTER) or conference tail for each conference AID within the specified range of AIDs. Connection types other than conference, including one-way back connections from a conference tail to a conference head, are not reported.

A RTRV-CONF-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-CONF-T1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID: { T1-{1-59392} } (T1-DS1#) { T3T1-{1-4800}-{1-28} } (T3T1-DS3#-DS1#) { EC1T1-{1-3840}-{1-28} } (EC1T1-EC1/STS1/DS3#-DS1#) { OC3T1-{1-2240}-{1-3}-{1-28} } (OC3T1-OC3#-STS1/DS3#-DS1#) { OC12T1-{1-560}-{1-4}-{1-3}-{1-28} } (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#) ALL_AID: { ALL } Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies a DS1 port or the first in a range of ports. A report is generated for each AID that is involved in a conference within the specified range. When ALL is specified, only those conference connections which have a T1 as the conference head will be retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	
	Identifies the tail (transmit side to the network) of a broadcast conference connection which could be a DS1 or VT1.5.	
RDL	{Y}	
	Red Line Status of Cross-Connection. Value:	
	Y	Connection is Redlined.
CKTID	{ "<0-45 VALID CKTID CHARACTERS>" FROM-TO circuit ID previously assigned to cross-connection	

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IIAC      Input, Invalid ACcess identifier
SDBE      Status, internal Data Base Error
/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
/* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
/* CONF Database Error: <ERROR-STRING> for record number <RECORD-NUM-
BER> */

```

SROF Status, Requested Operation Failed

EXAMPLES

In the following example, a conference connection report is generated for all AIDs that are either conference heads (MASTERS) or conference tails within the range of ports T3T1-1-1 through T3T1-3-28.

```
RTRV-CONF-T1::T3T1-1-1&&-28&T3T1-2-1&&-28&T3T1-3-1&&-28;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes there is one conference head within the specified range of ports.

The following example shows that conference head T3T1-1-12 is connected to conference tails T3T1-1-1, T3T1-2-2, and T3T1-3-3. It also shows that conference tail T3T1-3-8 is connected to VT1.5 conference head EC1VT1-10-7-3 and that this connection has been redlined.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "T3T1-1-12,T3T1-1-1"
  "T3T1-1-12,T3T1-2-2"
  "T3T1-1-12,T3T1-3-3"
  "EC1VT1-10-7-3,T3T1-3-8::RDL=Y"
/* RTRV-CONF-T1::T3T1-1-1&&-28&T3T1-2-1&&-28&T3T1-3-1&&-28

RTRV-T1
RTRV-VT1

COMMAND CODE: **RTRV-CONF-VT1**
COMMAND NAME: **RETRIEVE CONFERENCE VT1**

PURPOSE

The RTRV-CONF-VT1 command retrieves the one-way conference cross-connections in which the specified VT1.5 is involved either as a head (MASTER) or a tail. The conference connections for all conference heads/tails within the specified range of AIDs are retrieved; i.e. this command retrieves conference information as long as the specified VT1.5 is involved as a head or tail in a conference with another VT1.5 or DS1 port. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection. In addition, it is executed with no line of parsable output data provided if the specified VT1.5 is embedded within a protection OC3.

The successful response for a RTRV-CONF-VT1 contains one line of parsable output data, in ascending order, for each one-way conference cross-connection associated with the specified port either as conference head (MASTER) or conference tail for each conference AID within the specified range of AIDs. Connection types other than conference, including one-way back connections from a conference tail to a conference head, are not reported.

A RTRV-CONF-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-CONF-VT1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) {ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies a VT1.5 port or a range of ports. A report is generated for each AID that is involved in a conference within the specified range. When ALL is specified, only those conference connections which have a VT1.5 as the conference head will be retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<HEAD>,<TAIL>:: [RDL] [, CKTID] "
  [/* <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

HEAD	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Identifies the head (receive side from the network) of a broadcast conference connection.
TAIL	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Identifies the tail (transmit side to the network) of a broadcast conference connection.
RDL	{Y} Red Line Status of Cross-Connection. Value: Y Connection is Redlined.
CKTID	{"<0-45 VALID CKTID CHARACTERS>"} FROM-TO circuit ID previously assigned to cross-connection

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */ /* CONF Database Error: <ERROR-STRING> for record number <RECORD-NUM- BER> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, a conference connection report is generated for all AIDs that are either conference heads (MASTERS) or conference tails within the range of ports EC1VT1-1-1-1 through EC1VT1-1-3-4.

```
RTRV-CONF-VT1: : EC1VT1-1-1-1&&-4&EC1VT1-1-2-1&&-4&EC1VT1-1-3-1&&-4;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes there is one conference head within the specified range of ports.

Conference head EC1VT1-1-1-3 is connected to conference tails EC1VT1-9-1-1, EC1VT1-2-2-2, and EC1VT1-3-3-3. One conference tail EC1VT1-1-3-4 is connected to VT1 conference head OC3VT1-159-1-1-3. This connection to EC1VT1-1-3-4 has been redlined.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "EC1VT1-1-1-3, EC1VT1-9-1-1"
  "EC1VT1-1-1-3, EC1VT1-2-2-2"
  "EC1VT1-1-1-3, EC1VT1-3-3-3"
  "OC3VT1-159-1-1-3, EC1VT1-1-3-4: :RDL=Y"

COMMAND CODE: **RTRV-CRS**
COMMAND NAME: **RETRIEVE CROSS-CONNECTION**

PURPOSE

The RTRV-CRS command retrieves the connection path, connection type, transmission level, and current PST,SST state for the cross-connection identified by AID from the system database. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection.

The successful response for a RTRV-CRS contains one line of parsable output data, in ascending order (from lowest FROM AID to largest FROM AID), for each cross-connection associated with the specified AID. A line of parsable output data is only displayed if the specified AID is provisioned and cross-connected. A SST value is only displayed when a secondary state is currently applied to the cross-connection. If a specified AID is embedded within a protection OC-3, RTRV-CRS completes successfully with no line of parsable output data displayed.

If the AID specifies a DS1, this command retrieves cross connect information that might exist between the specified AID and another DS1 or VT1.5. If the AID specifies a VT1.5, this command retrieves cross connect information that might exist between the specified AID and another DS1 or VT1.5.

If the AID specifies a DS3, this command retrieves cross connect information that might exist between the specified AID and another DS3 or STS1. If the AID specifies an STS1, this command retrieves cross connect information that might exist between the specified AID and another DS3 or STS-1. If the AID specifies an STS-3C, this command retrieves cross connect information that might exist between the specified AID and another STS-3C.

If the AID specifies an STS-1 or VT1.5 embedded within a ring OC-3/OC-12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12), this command retrieves cross connect information that might exist between the specified AID (displayed in the "FROM" position) and another facility, which would be the drop facility (displayed in the "TO" position). If the AID specifies a drop facility (STS-1/VT1.5) that is not part of an OC-3/OC-12 ring, this command retrieves cross connect information that might exist between the specified AID (displayed in the "FROM" position), and the start-up STS-1/VT1.5 (displayed in the "TO" position) embedded within the ring OC-3/OC-12 facility.

A separate line of parsable output data is provided for each of the following cross-connection situations:

- 1WAY: One line of data for each one-way cross-connection, including the case of a one-way bridge connection, or a connection from a conference tail connected back to the conference head.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connect or as two one-way cross-connects.
- 2WAYPR: One or two lines of data for each two-way path ring cross-connection—one line for the ODD port, another line for the EVEN port. For a drop connection, one line of data is shown. For a ring-to-ring connection, two lines are shown.
- 2WAYDC: One or two lines of data for each two-way drop and continue cross-connection—one line for the ODD port, another line for the EVEN port. For a drop connection, one line of data is shown. For a ring-to-ring connection, two lines are shown.
- BCST: If the FROM AID is a broadcast conference head, one line of data for each one-way cross-connection from the conference head to each conference tail.

A RTRV-CRS command is denied if:

- An invalid parameter value is entered.

T3	DS3 cross connection, displayed for a DS3 to DS3 and DS3 to STS-1 cross connection.	VT1	VT1.5 cross connection, only displayed for a VT1.5 to VT1.5 cross connection.
STS1	STS-1 cross connection, only displayed for an STS-1 to STS-1 cross connection.										
STS3C	STS-3C cross connection, only displayed for an STS-3C to STS-3C cross connection.										
T1	DS1 cross connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross connection.										
T3	DS3 cross connection, displayed for a DS3 to DS3 and DS3 to STS-1 cross connection.										
VT1	VT1.5 cross connection, only displayed for a VT1.5 to VT1.5 cross connection.										
RDL	{Y} Red Line Status of Cross-Connection. Value: <table> <tr> <td>Y</td><td>Connection is Redlined.</td></tr> </table>	Y	Connection is Redlined.								
Y	Connection is Redlined.										
CKTID	{"<0-45 VALID CKTID CHARACTERS>" FROM-TO circuit ID previously assigned to cross-connection										
CKTIDTF	{"<0-45 VALID CKTIDTF CHARACTERS>" TO-FROM circuit ID previously assigned to cross-connection										
PST	{IS, OOS-AU} Primary State, indicates the current primary state of the cross-connection. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: <table> <tr> <td>IS</td><td>In-Service</td></tr> <tr> <td>OOS-AU</td><td>Out-Of-Service-Autonomous</td></tr> </table>	IS	In-Service	OOS-AU	Out-Of-Service-Autonomous						
IS	In-Service										
OOS-AU	Out-Of-Service-Autonomous										

SST	{ROLL, SGEO, STBYH, TERMB, TERMF, TERMT, TS, WRK}
	Secondary State, indicates any secondary states associated with the cross-connection. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the cross-connection at the time of the RTRV-CRS. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:
ROLL	Roll, indicates the ports in the cross connection are under rolling operation.
SGEO	Supporting Entity Outage
STBYH	Stand-by Hot. Applies when CTYPE = 2WAYPR and 2WAYDC. STBYH indicates all the entities required for the cross connection are in-service. But the path is not selected in the RPB module and is ready to be selected if a failure is detected in the working connection.
TERMB	Terminated-Both, indicates both the TO and FROM ports of the cross-connection are terminated.
TERMF	Terminated-From, indicates the FROM port of the cross-connection is terminated.
TERMT	Terminated-To, indicates the TO port of the cross-connection is terminated.
TS	Test, indicates the port is connected to a Test Access port.
WRK	Working. Applies when CTYPE = 2WAYPR and 2WAYDC. WRK indicates all entities required for the cross connection are in-service and the path is selected in the RPB module.

UNSUCCESSFUL RESPONSE FORMAT

SROF	Status, Requested Operation Failed

EXAMPLES

The following example illustrates the command and associated output for port T3T1-1-6 two-way connected to port T3T1-5-3 and one-way bridged to port T3T1-5-4. The two-way connection has been previously re-lined and assigned a circuit ID of TESTCKT3.

```
RTRV-CRS::T3T1-1-6;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"T3T1-1-6,T3T1-5-3:2WAY,T1:RDL=Y,CKTID=TESTCKT3:IS"
"T3T1-1-6,T3T1-5-4:1WAY,T1::IS"
/* RTRV-CRS::T3T1-1-6 [Pad567] (2) */
;
```

The following example illustrates the command and associated output for port T3-1107 two-way path ring connected to port OC3STS1-101-1 and two-way path ring bridged to port OC3STS1-102-1.

```
RTRV-CRS::T3-1107;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P8e373. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"T3-1107,OC3STS1-101-1:2WAYPR,T3::IS,WRK"
"T3-1107,OC3STS1-102-1:2WAYPR,T3::IS,STBYH"
/* RTRV-CRS::T3-1107 [P8e373] (2-5) */
;
```

The following example illustrates the command and associated output for DS1 ports T3T1-1-1 through T3T1-1-7.

```
RTRV-CRS::T3T1-1-1&&-7;
```

The output response, shown below, assumes the X.25 virtual channel 3 of CID 4 was used to enter the command and a system generated CTAG value of Pdb148. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes:

Port T3T1-1-1 is two-way connected to port T3T1-3-5 with a one-way bridge to port T3T1-7-17.

Port T3T1-1-2 is one-way connected to T3T1-2-8 but the T3T1-1-2 port facility is failed (LOF, for example).

Port T3T1-1-3 is two-way connected to port T3T1-3-28 and is also connected to a Test Access port for testing.

Port T3T1-1-4 is two-way connected to port T3T1-12-21 but port T3T1-12-21 is terminated.

Port T3T1-1-5 is not cross-connected.

Port T3T1-1-6 is connected as a broadcast conference head to ports T3T1-7-3, 10-17-3, and T3T1-27-3 with port T3T1-17-3 connected back to the T3T1-1-6 conference head.

Port T3T1-1-7 is connected as a broadcast conference head to ports T3T1-8-4 and T3T1-28-4.

```

COMMAND CODE: **RTRV-CRS-ALL**
COMMAND NAME: **RETRIEVE CROSS-CONNECTION ALL**

PURPOSE

The RTRV-CRS-ALL command retrieves the connection path, connection type, transmission level, and current PST,SST state for the specified cross-connection types (CLEVEL) that exist within the specified Block Size (BLKSIZE) starting at the specified Block Number (BLKNUM) offset in the system cross-connection database. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection.

This command is not efficient for retrieving the cross connect information over a range of ports. This command is most effective when used by an Operations System (OS) to retrieve all the cross connects that exist in the system. In order to do this, the OS should issue a sequence of RTRV-CRS-ALL commands, starting from a block number (BLKNUM) of 1 for a given BLKSIZE and incrementing the BLKNUM successively until an error message with error code IDRG is received. The BLKSIZE should be selected with a recognition that a larger block size will adversely effect the performance of the system and the retrieval will take longer to execute.

The command, for a particular block size, retrieves all the connections FROM another port and not the connection TO another port. For example, in case of BLKSIZE=128 and BLKNUM=1, if all the ports in that range are broadcast heads, they would not be reported unless there is a back-connection. These connections would eventually get reported when the BLKSIZE and BLKNUM is searched where the tail port exist.

The successful response for a RTRV-CRS-ALL contains a line of parsable output data for each cross-connection that currently exists in the cross-connection database area determined by the specified BLKNUM, BLKSIZE, and CLEVEL. A line of parsable output data is only displayed for existing cross-connections. A SST value is only displayed when a secondary state is currently applied to the cross-connection.

The successful response for a RTRV-CRS-ALL that retrieves ring cross-connections displays the drop port in the ring OC-3 or OC-12 (refer to ENT-RNG-OC3 or ENT-RNG-OC12) in the "FROM" position and the start-up STS-1 or VT1.5 embedded with the ring OC-3/OC-12 facility in the "TO" position.

A separate line of parsable output data is provided for each of the following cross-connection situations:

- 1WAY: One line of data for each one-way cross-connection, including the case of a one-way bridge connection, or a connection from a conference tail connected back to the conference head.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connect or as two one-way cross-connections.
- 2WAYPR: One or two lines of data for each two-way path ring cross-connection—one line for the ODD port, another line for the EVEN port. For a drop connection, one line of data is shown. For a ring-to-ring connection, two lines are shown.
- 2WAYDC: One or two lines of data for each two-way drop and continue cross-connection—one line for the ODD port, another line for the EVEN port. For a drop connection, one line of data is shown. For a ring-to-ring connection, two lines are shown.
- BCST: If the TO AID is a broadcast conference tail, one line of data for each one-way cross-connection from the conference tail to each conference head.

A RTRV-CRS-ALL command is denied if:

- The beginning record number of a block, as evaluated from the entered BLKSIZE and BLKNUM, exceeds the number of records in the cross-connection database.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-CRS-ALL: [TID] : [AID] : [CTAG] : : [BLKSIZE] , [BLKNUM] , [CLEVEL] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	{ALL} Default: ALL Addressing: None Description: Access Identifier, specifies all FROM cross-connections within the specified BLKSIZE and BLKNUM range.						
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.						
BLKSIZE	{128, 256, 512, 1024} Default: {128} Addressing: None Description: Block Size, specifies the block size in the cross-connection database for which any existing cross-connections are reported.						
BLKNUM	{1-1610} Default: {1} Addressing: None Description: Block Number, specifies the block number offset within the cross-connection database for which any existing cross-connections are reported. For example, if BLKNUM of 2 and BLKSIZE of 128 are entered, then the cross-connection database entries from 129 to 256 are searched for cross-connections.						
CLEVEL	{T1, T3, STS3C} Default: {T1} Addressing: None Description: Connection Level, specifies the types of connections (T1 and VT1, or T3 and STS1) that are to be reported. Values are: <table> <tr> <td>T1</td><td>T1 Level, specifies any DS1 or VT1.5 cross-connections within the specified BLKSIZE and BLKNUM are reported.</td></tr> <tr> <td>T3</td><td>T3 Level, specifies any DS3 or STS-1 cross-connections within the specified BLKSIZE and BLKNUM are reported.</td></tr> <tr> <td>STS3C</td><td>STS3C Level, specifies any STS3C cross-connections within the specified BLKSIZE and BLKNUM are reported.</td></tr> </table>	T1	T1 Level, specifies any DS1 or VT1.5 cross-connections within the specified BLKSIZE and BLKNUM are reported.	T3	T3 Level, specifies any DS3 or STS-1 cross-connections within the specified BLKSIZE and BLKNUM are reported.	STS3C	STS3C Level, specifies any STS3C cross-connections within the specified BLKSIZE and BLKNUM are reported.
T1	T1 Level, specifies any DS1 or VT1.5 cross-connections within the specified BLKSIZE and BLKNUM are reported.						
T3	T3 Level, specifies any DS3 or STS-1 cross-connections within the specified BLKSIZE and BLKNUM are reported.						
STS3C	STS3C Level, specifies any STS3C cross-connections within the specified BLKSIZE and BLKNUM are reported.

2WAYDC	Two-Way Drop and Continue connection. Not valid for STS-3C.										
BCST	Broadcast conference cross-connection.										
LEVEL	<p>{STS1, STS3C, T1, T3, VT1}</p> <p>Cross-connection Level, indicates the rate of the cross-connected channel. Values are:</p> <table> <tr> <td>STS1</td><td>STS-1 cross-connection, only displayed for an STS-1 to STS-1 cross-connection.</td></tr> <tr> <td>STS3C</td><td>STS-3C cross-connection, only displayed for an STS-3C to STS-3C cross-connection.</td></tr> <tr> <td>T1</td><td>DS1 cross-connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross-connection.</td></tr> <tr> <td>T3</td><td>DS3 cross-connection, displayed for a DS3 to DS3 and DS3 to STS1 cross-connection.</td></tr> <tr> <td>VT1</td><td>VT1.5 cross-connection, only displayed for a VT1.5 to VT1.5 cross-connection.</td></tr> </table>	STS1	STS-1 cross-connection, only displayed for an STS-1 to STS-1 cross-connection.	STS3C	STS-3C cross-connection, only displayed for an STS-3C to STS-3C cross-connection.	T1	DS1 cross-connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross-connection.	T3	DS3 cross-connection, displayed for a DS3 to DS3 and DS3 to STS1 cross-connection.	VT1	VT1.5 cross-connection, only displayed for a VT1.5 to VT1.5 cross-connection.
STS1	STS-1 cross-connection, only displayed for an STS-1 to STS-1 cross-connection.										
STS3C	STS-3C cross-connection, only displayed for an STS-3C to STS-3C cross-connection.										
T1	DS1 cross-connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross-connection.										
T3	DS3 cross-connection, displayed for a DS3 to DS3 and DS3 to STS1 cross-connection.										
VT1	VT1.5 cross-connection, only displayed for a VT1.5 to VT1.5 cross-connection.										
RDL	<p>{Y}</p> <p>Red Line Status of Cross-Connection. Value:</p> <table> <tr> <td>Y</td><td>Connection is Redlined.</td></tr> </table>	Y	Connection is Redlined.								
Y	Connection is Redlined.										
CKTID	<p>{<0-45 VALID CKTID CHARACTERS>}</p> <p>FROM-TO circuit ID previously assigned to cross-connection</p>										

CKTIDTF	{"<0–45 VALID CKTIDTF CHARACTERS>"}	TO–FROM circuit ID previously assigned to cross–connection
PST	{IS, OOS–AU}	Primary State, indicates the current primary state of the cross–connection. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: IS In-Service OOS–AU Out-Of-Service–Autonomous
SST	{ROLL, SGEO, TERMB, TERMF, TERMT, TS, STBYH, WRK}	Secondary State, indicates any secondary states associated with the cross–connection. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the cross–connection at the time of the RTRV–CRS. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: ROLL Roll, indicates the ports in the cross–connection are under rolling operation. SGEO Supporting Entity Outage TERMB Terminated-Both, indicates both the TO and FROM ports of the cross–connection are terminated. TERMF Terminated-From, indicates the FROM port of the cross–connection is terminated. TERMT Terminated-To, indicates the TO port of the cross–connection is terminated. TS Test, indicates the port is connected to a Test Access port. STBYH Stand-by Hot. Applies when CTYPE = 2WAYPR and 2WAYDC. STBYH indicates all the entities required for the cross connection are in–service. But the path is not selected in the RPB module and is ready to be selected if a failure is detected in the working connection. WRK Working. Applies when CTYPE = 2WAYPR and 2WAYDC. WRK indicates all entities required for the cross connection are in–service and the path is selected in the RPB module.

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

```

IDRG      Input, Data RanGe
           /* The value entered for BLKNUM is not valid for the BLKSIZE */
IPNV      Input, Parameter Not Valid
SDBE      Status, internal Data Base Error
           /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
           /* TP Database Error: <ERROR-STRING> for <AID-STRING> */

```

EXAMPLES

The following example illustrates the command and associated output for port T3T1-1-6 two-way connected to port T3T1-6-3 and one-way bridged to port T3T1-6-4.

```
RTRV-CRS-ALL:::::128,1,T1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **RTRV-CRS-ST51**
COMMAND NAME: **RETRIEVE CROSS-CONNECTION ST5-1**

PURPOSE

The RTRV-CRS-ST51 command retrieves the connection path and connection type for a one-way, two-way, two-way path or two-way drop and continue ring cross-connection identified by AID from the system database. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection.

The successful response for a RTRV-CRS-ST51 contains one line of parsable output data, in ascending order (from lowest FROM AID to largest FROM AID), for each one-way or two-way cross-connection associated with the specified AID. A line of parsable output data is only displayed if the specified AID is cross-connected. In addition, no line of parsable output data is displayed if the specified ST5-1 is embedded within a protection OC-3 or OC-12 which is in normal linear mode. In ring mode (refer to ENT-RNG-OC3 or ENT-RNG-OC12), the RTRV-CRS-ST51 command displays output data for ST5-1s embedded within either odd-numbered or even-numbered OC-3 or OC-12 of a ring.

If the AID specifies an ST5-1 embedded within a ring OC3, this command retrieves cross connect information that might exist between the specified AID (displayed in the "FROM" position) and a drop non-terminated ST5-1 (displayed in the "TO" position). If the AID specifies a drop non-terminated ST5-1 that is not part of an OC3 ring, this command retrieves cross connect information that might exist between the specified AID (displayed in the "FROM" position), and the start-up ST5-1 (displayed in the "TO" position) embedded within the ring OC-3/OC-12 facility.

A separate line of parsable output data is provided for each of the following cross-connection situations:

- 1WAY: One line of data for each one-way cross-connection.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connection or as two one-way cross-connections.
- 2WAYPR: One line of data for each two-way path ring cross-connection.
- 2WAYDC: One line of data for each two-way drop and continue ring cross-connection.

The RTRV-CRS-ST51 retrieves information about the cross connect between the specified ST5-1 and another ST5-1 or DS3 port.

A RTRV-CRS-ST51 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-CRS-ST51 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the STS1 port or a range of STS-1 ports. Retrieves cross connection that exists between the specified STS-1 and another STS-1 or DS3.

CTAG < 1–6 VALID CTAG CHARACTERS >
Default: < System assigned CTAG value >
Addressing: None
Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<FROM>,<TO>:<CTYPE>:[RDL=] [,CKTID=] [,CKTIDTF=]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

FROM DS3_AID:
 {T3-{1–4800}} (T3–DS3#)
 STS1_AID:
 {EC1STS1-{1–3840}} (EC1STS1–EC1/STS1#)
 {OC3STS1-{1–2240}–{1–3}} (OC3STS1–OC3#–STS1#)
 {OC12STS1-{1–560}–{1–4}–{1–3}} (OC12STS1–OC12#–STM1#–STS1#)
 DS3 or STS1 AID, indicates the FROM (receive side from the network) port of the cross-connection. If a two-way cross-connection exists, FROM is the specified AID entered in the RTRV–CRS–STS1 command. If a two-way path or a two-way drop and continue ring cross-connection exists, either the FROM or TO AID can be an STS–1 within a ring OC–3 or OC–12.

TO DS3_AID:
 {T3-{1–4800}} (T3–DS3#)
 STS1_AID:
 {EC1STS1-{1–3840}} (EC1STS1–EC1/STS1#)
 {OC3STS1-{1–2240}–{1–3}} (OC3STS1–OC3#–STS1#)
 {OC12STS1-{1–560}–{1–4}–{1–3}} (OC12STS1–OC12#–STM1#–STS1#)
 DS3 or STS1 AID, indicates the TO (transmit side to the network) port of the cross-connection. If a two-way cross-connection exists, TO is the cross-connection AID not specified in the RTRV–CRS–STS1 command. If a two-way path or a two-way drop and continue ring cross-connection exists, either the FROM or TO AID can be an STS–1 within a ring OC–3 or OC–12.

CTYPE {1WAY, 2WAY, 2WAYPR, 2WAYDC}
 Cross-connection Type. Values are:
 1WAY One-way (through matrix) non-ring connection
 2WAY Two-way drop (through matrix) ring or non-ring connection or two-way pass-through ring connection
 2WAYPR Two-Way Path Protected Ring connection
 2WAYDC Two-Way Drop and Continue ring connection

RDL {Y}
 Red Line Status of Cross-Connection. Value:
 Y Connection is Redlined.

CKTID {"<0–45 VALID CKTID CHARACTERS>"}
 FROM–TO circuit ID previously assigned to cross-connection

CKTIDTF {"<0–45 VALID CKTIDTF CHARACTERS>"}
 TO–FROM circuit ID previously assigned to cross-connection

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```
IIAC      Input, Invalid ACcess identifier
SDBE      Status, internal Data Base Error
          /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
          /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
          /* RIP Database Error: <ERROR-STRING> for record number <RECORD-
            NUMBER> */
```

EXAMPLES

The following example illustrates the command and associated output for a one-way connection from STS-1 port embedded within OC-3; OC3STS1-1-3 to STS-1 port EC1STS1-5 an STS-1 embedded within EC1.

```
RTRV-CRS-STs1::OC3STS1-1-3;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The output shows that the connection is redlined and assigned a circuit ID of TESTCKT5.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "OC3STS1-1-3,EC1STS1-5:1WAY:RDL=Y,CKTID=TESTCKTID5"
  /* RTRV-CRS-STs1::OC3STS1-1-3 [Pad567] (2) */
;
```

The following example illustrates the command and associated output for STS-1 ports OC3STS1-9-1 through OC3STS1-9-3.

```
RTRV-CRS::OC3STS1-9-1&&-3;
```

The output response, shown below, assumes the X.25 virtual channel 2 of CID 3 was used to enter the command and a system generated CTAG value of Pdb149. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes:

Port OC3STS1-9-1 is two-way connected to port T3-3.

Port OC3STS1-9-2 is one-way connected to OC3STS1-7-1.

Port OC3STS1-9-3 is one-way connected to OC3STS1-1-3

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pdb149 COMPLD
  "OC3STS1-9-1,T3-3:2WAY"
  "OC3STS1-9-2,OC3STS1-7-1:1WAY"
  "OC3STS1-9-3,OC3STS1-1-3:1WAY"
  /* RTRV-CRS-STs1::OC3STS1-9-1&&-3 [Pdb149] (3-2) */
;
```

COMMAND CODE: **RTRV-CRS-STS3C**
COMMAND NAME: **RETRIEVE CROSS-CONNECTION
STS-3C**

PURPOSE

The RTRV-CRS-STS3C command retrieves the connection path and connection type for a one-way or two-way cross-connection identified by AID from the system database. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection.

The successful response for a RTRV-CRS-STS3C contains one line of parsable output data, in ascending order (from lowest FROM AID to largest FROM AID), for each one-way or two-way cross-connection associated with the specified AID. A line of parsable output data is only displayed if the specified AID is cross-connected. In addition, no line of parsable output data is displayed if the specified STS-3C is embedded within a protection OC-3/OC-12.

A separate line of parsable output data is provided for each of the following cross-connection situations:

- 1WAY: One line of data for each one-way cross-connection.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connection or as two one-way cross-connections.

The RTRV-CRS-STS3C retrieves information about the cross connect between the specified STS-3C and another STS-3C port.

A RTRV-CRS-STS3C command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-CRS-STS3C: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the STS-3C port or a range of STS-3C ports. Retrieves cross connection that exists between the specified STS-3C and another STS-3C.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<FROM>,<TO>:<CTYPE>:[RDL=] [,CKTID=] [,CKTIDTF=] : "
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

FROM	<p>STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) STS3C AID, indicates the FROM (receive side from the network) port of the cross-connection. If a two-way cross-connection exists, FROM is the specified AID entered in the RTRV-CRS-ST3C command.</p>
TO	<p>STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) STS3C AID, indicates the TO (transmit side to the network) port of the cross-connection. If a two-way cross-connection exists, TO is the cross-connection AID not specified in the RTRV-CRS-ST3C command.</p>
CTYPE	<p>{1WAY, 2WAY} Cross-connection Type. Values are: 1WAY One-way cross-connection. 2WAY Two-way cross-connection.</p>
RDL	<p>{Y} Red Line Status of Cross-Connection. Value: Y Connection is Redlined.</p>
CKTID	<p>{"<0-45 VALID CKTID CHARACTERS>"} FROM-TO circuit ID previously assigned to cross-connection</p>
CKTIDTF	<p>{"<0-45 VALID CKTIDTF CHARACTERS>"} TO-FROM circuit ID previously assigned to cross-connection</p>

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IIAC      Input, Invalid ACcess identifier
SDBE      Status, internal Data Base Error
          /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
          /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
          /* RIP Database Error: <ERROR-STRING> for record number <RECORD-
NUMBER> */

```

EXAMPLES

The following example illustrates the command and associated output for a one-way connection from STS-3C port embedded within OC-3; OC3STS3C-1 to STS-3C port OC3STS3C-5, an STS-3C embedded within OC-3. The output shows the connection has been redlined and has a circuit ID of TESTCKT6.

```
RTRV-CRS-ST3C: :OC3STS3C-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"OC3STS3C-1,OC3STS3C-5:1WAY:RDL=Y,CKTID=TESTCKT6"
/* RTRV-CRS-ST3C::OC3STS3C-1 [Pad567] (2) */
;
```

The following example illustrates the command and associated output for STS3C ports OC3STS3C-1 through OC3STS3C-5.

```
RTRV-CRS::OC3STS3C-1&&-5;
```

The output response, shown below, assumes the X.25 virtual channel 2 of CID 3 was used to enter the command and a system generated CTAG value of Pdb149. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes:

Port OC3STS3C-1 is two-way connected to port OC3STS3C-73

Port OC3STS3C-3 is one-way connected to OC3STS3C-57.

Port OC3STS3C-5 is one-way connected to OC3STS3C-41.

COMMAND CODE: **RTRV-CRS-T1**
COMMAND NAME: **RETRIEVE CROSS-CONNECTION T1**

PURPOSE

The RTRV-CRS-T1 command retrieves the connection path and connection type for a one-way, two-way, two-way path or two-way drop and continue ring cross-connection identified by AID from the system database. Other cross-connection types, such as broadcast conference connections, are not reported. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection.

The successful response for a RTRV-CRS-T1 contains one line of parsable output data, in ascending order (from lowest FROM AID to largest FROM AID), for each one-way or two-way cross-connection associated with the specified AID. A line of parsable output data is only displayed if the specified AID is cross-connected. In addition, no line of parsable output data is displayed if the specified DS1 is embedded within a protection OC3/OC12.

If the AID specifies a drop terminated T1 that is not part of an OC3/OC12 ring (refer to ENT-RNG-OC3 or ENT-RNG-OC12), this command retrieves cross connect information that might exist between the specified AID (displayed in the "FROM" position), and the start-up VT1.5 (displayed in the "TO" position) embedded within the ring OC3/OC12 facility.

A separate line of parsable output data is provided for each of the following cross-connection situations:

- 1WAY: One line of data for each one-way cross-connection, including the case of a one-way bridge connection, or a connection from a conference tail connected back to the conference head.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connection or as two one-way cross-connections.
- 2WAYPR: One line of data for each two-way path ring cross-connection.
- 2WAYDC: One line of data for each two-way drop and continue ring cross-connection.

The RTRV-CRS-T1 retrieves information about the cross connect whether the specified DS1 is cross connected to DS1 or VT1.5.

A RTRV-CRS-T1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```
IIAC      Input, Invalid ACcess identifier
SDBE      Status, internal Data Base Error
          /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
          /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
          /* RIP Database Error: <ERROR-STRING> for record number <RECORD-
            NUMBER> */
```

EXAMPLES

The following example illustrates the command and associated output for a redlined one-way connection from DS1 port T3T1-1-6 to DS1 port T3T1-5-3.

```
RTRV-CRS-T1::T3T1-1-6;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"T3T1-1-6,T3T1-5-3:1WAY:RDL=Y"
/* RTRV-CRS-T1::T3T1-1-6 [Pad567] (2) */
;
```

The following example illustrates the command and associated output for DS1 ports T3T1-10-1 through T3T1-10-4.

```
RTRV-CRS::T3T1-10-1&&-4;
```

The output response, shown below, assumes the X.25 virtual channel 2 of CID 3 was used to enter the command and a system generated CTAG value of Pdb149. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes:

Port T3T1-10-1 is two-way connected to port T3T1-3-5 with a one-way bridge to port T3T1-7-17.

Port T3T1-10-2 is one-way connected to EC1T1-2-8.

Port T3T1-10-3 is not cross-connected.

Port T3T1-10-4 is two-way connected to port T3T1-12-21.

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-CRS-T3**
COMMAND NAME: **RETRIEVE CROSS-CONNECTION T3**

PURPOSE

The RTRV-CRS-T3 command retrieves the connection path and connection type for a one-way, two-way, two-way path or two-way drop and continue ring cross-connection identified by AID from the system database. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection.

RTRV-CRS-T3 retrieves information about the cross-connection between the specified T3 and another STS-1 or DS3 port.

The successful response for a RTRV-CRS-T3 contains one line of parsable output data, in ascending order (from lowest FROM AID to largest FROM AID), for each one-way or two-way cross-connection associated with the specified AID. A line of parsable output data is only displayed if the specified AID is cross-connected..

If the AID specifies a drop terminated T3 that is not part of an OC-3/OC-12 ring (refer to ENT-RNG-OC3 or ENT-RNG-OC12), this command retrieves cross connect information that might exist between the specified AID (displayed in the "FROM" position), and the start-up STS-1 (displayed in the "TO" position) embedded within the ring OC-3/OC-12 facility.

A separate line of parsable output data is provided for each of the following cross-connection situations:

- 1WAY: One line of data for each one-way cross-connection.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connection or as two one-way cross-connections.
- 2WAYPR: One line of data for each two-way path ring cross-connection.
- 2WAYDC: One line of data for each two-way drop and continue ring cross-connection.

A RTRV-CRS-T3 command is denied if:

- The specified T3 is an embedded DS3.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-CRS-T3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the DS3 port or a range of DS3 ports. Retrieves cross connection that exists between the specified DS3 and another DS3 or STS-1.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC Input, Invalid ACcess identifier
SDBE Status, internal Data Base Error
 /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
 /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
 /* RIP Database Error: <ERROR-STRING> for record number <RECORD-
 NUMBER> */

EXAMPLES

The following example illustrates the command and associated output for a one-way connection from DS3 port T3-1 to STS-1 port EC1STS1-5, an STS-1 embedded within an EC1.

```
RTRV-CRS-T3::T3-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The connection has been assigned a circuit ID of TESTCKTID6.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pad567 COMPLD  
"T3-1,EC1STS1-5:1WAY:CKTID=TESTCKTID6"  
/* RTRV-CRS-T3::T3-1" [Pad567] (2) */  
;
```

The following example illustrates the command and associated output for DS3 ports T3-11 through T3-13.

```
RTRV-CRS::T3-11&&-13;
```

The output response, shown below, assumes the X.25 virtual channel 2 of CID 3 was used to enter the command and a system generated CTAG value of Pdb149. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes:

Port T3-11 is two-way connected to port T3-3, an electrical DS3 with a one-way bridge to port OC3STS1-7-1, an STS-1 embedded within OC-3.

Port T3-12 is one-way connected to T3-24.

Port T3-13 is not cross-connected.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pdb149 COMPLD  
"T3-11,T3-3:2WAY"  
"T3-11,OC3STS1-7-1:1WAY"  
"T3-12,T3-24:1WAY"  
/* RTRV-CRS-T3::T3-11&&-13 [Pdb149] (3-2) */  
;
```

The following example illustrates the command and associated output for a redlined one-way connection from DS3 port T3-1 to DS3 port T3-5.

```
RTRV-CRS-T3::T3-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pad567 COMPLD  
"T3-1,T3-5:1WAY:RDL=Y"  
/* RTRV-CRS-T3::T3-1 [Pad567] (2) */  
;
```

COMMAND CODE: **RTRV-CRS-VT1**
COMMAND NAME: **RETRIEVE CROSS-CONNECTION VT1**

PURPOSE

The RTRV-CRS-VT1 command retrieves the connection path and connection type for a one-way, two-way, two-way path or two-way drop and continue ring cross-connection identified by AID from the system database. Other cross-connection types, such as broadcast conference connections, are not reported. The command is executed regardless of the provisioning of the specified port or the state of the cross-connection.

The RTRV-CRS-VT1 retrieves information about the cross connect whether the specified VT1.5 is cross connected to DS1 or VT1.5.

The successful response for a RTRV-CRS-VT1 contains one line of parsable output data, in ascending order (from lowest FROM AID to largest FROM AID), for each one-way or two-way cross-connection associated with the specified AID. A line of parsable output data is only displayed if the specified AID is cross-connected. In addition, no line of parsable output data is displayed if the specified VT1.5 is embedded within a protection OC3 which is in normal linear mode. In ring mode (refer to ENT-RNG-OC3 or ENT-RNG-OC12), the RTRV-CRS-VT1 command displays output data for VT1.5s embedded within either odd-numbered or even-numbered ring OC-3s/OC-12s.

If the AID specifies a VT1.5 embedded within a ring OC-3/OC-12, this command retrieves cross connect information that might exist between the specified AID (displayed in the "FROM" position) and a drop non-terminated VT1.5 (displayed in the "TO" position). If the AID specifies a drop non-terminated VT1.5 that is not part of an OC-3/OC-12 ring, this command retrieves cross connect information that might exist between the specified AID (displayed in the "FROM" position), and the start-up VT1.5 (displayed in the "TO" position) embedded within the ring OC-3/OC-12 facility.

A separate line of parsable output data is provided for each of the following cross-connection situations:

- 1WAY: One line of data for each one-way cross-connection, including the case of a one-way bridge connection, or a connection from a conference tail connected back to the conference head.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connection or as two one-way cross-connections.
- 2WAYPR: One line of data for each two-way path ring cross-connection.
- 2WAYDC: One line of data for each two-way drop and continue ring cross-connection.

A RTRV-CRS-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-CRS-VT1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the VT1.5 port or a range of ports. Retrieves cross connection that exists between the specified VT1.5 and another DS1 or VT1.5.

CTAG	< 1–6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

M  <SID> <YY-MM-DD> <HH:MM:SS>
    <CTAG> COMPLD
    "<FROM>,<TO>:<CTYPE>:[RDL=] [,CKTID=] [,CKTIDTF=]"
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

FROM	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	

DS1 or VT1 AID, indicates the FROM (receive side from the network) port of the cross-connection. If a two-way cross-connection exists, FROM is the specified AID entered in the RTRV-CRS-VT1 command. If a two-way path or a two-way drop and continue ring cross-connection exists, either the FROM or TO AID can be a VT1.5 within a ring QC-3/QC-12.

TO	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)	

DS1 or VT1 AID, indicates the TO (transmit side to the network) port of the cross-connection. If a two-way cross-connection exists, TO is the cross-connection AID not specified in the RTRV-CRS-VT1 command. If a two-way path or a two-way drop and continue ring cross-connection exists, either the FROM or TO AID can be a VT1.5 within a ring OC-3/OC-12.

CTYPE	{1WAY, 2WAY, 2WAYPR, 2WAYDC}
	Cross-connection Type. Values are:
1WAY	One-way (through matrix) non-ring connection
2WAY	Two-way drop (through matrix) ring or non-ring connection or two-way pass-through ring connection
2WAYPR	Two-Way Path Protected Ring connection
2WAYDC	Two-Way Drop and Continue ring connection

RDL	{Y} Red Line Status of Cross-Connection. Value: Y Connection is Redlined.
CKTID	{"<0-45 VALID CKTID CHARACTERS>" FROM-TO circuit ID previously assigned to cross-connection
CKTIDTF	{"<0-45 VALID CKTIDTF CHARACTERS>" TO-FROM circuit ID previously assigned to cross-connection

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IIAC      Input, Invalid ACcess identifier
SDBE      Status, internal Data Base Error
          /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
          /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
          /* RIP Database Error: <ERROR-STRING> for record number <RECORD-
            NUMBER> */

```

EXAMPLES

The following example illustrates the command and associated output for a redlined one-way connection from VT1.5 port embedded within EC1 EC1VT1-1-6-4 to DS1 port T3T1-5-3.

```
RTRV-CRS-VT1::EC1VT1-1-6-4;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "EC1VT1-1-6-4,T3T1-5-3:1WAY:RDL=Y"
  /* RTRV-CRS-VT1::EC1VT1-1-6-4 [Pad567] (2) */
;

```

The following example illustrates the command and associated output for VT1.5 ports EC1VT1-10-1-1 through EC1VT1-10-1-4.

```
RTRV-CRS::EC1VT1-10-1-1&&-4;
```

The output response, shown below, assumes the X.25 virtual channel 2 of CID 3 was used to enter the command and a system generated CTAG value of Pdb149. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes:

Port EC1VT1-10-1-1 is two-way connected to port T3T1-3-5 with a one-way bridge to port T3T1-7-17.

Port EC1VT1-10-1-2 is one-way connected to EC1T1-2-8.

Port EC1VT1-10-1-3 is not cross-connected.

Port EC1VT1-10-1-4 is two-way connected to port T3T1-12-21.

```

COMMAND CODE: **RTRV-DA**
COMMAND NAME: **RETRIEVE DELAYED ACTIVATION**

PURPOSE

The RTRV-DA command retrieves information about scheduled delayed activated commands from the delayed activation table.

The commands ACT-DB-BACKUP, DLT-EQPT, ENT-EQPT, and INIT-SYS can be scheduled to be delayed activated at a specified future time, either once, or perpetually, by entering values for the ON (Order Number), DATE, and TIME parameters when the command is entered. When the command is entered with these parameters specified, the command line is entered into the delayed activation table.

Entries in the delayed activation table are retrieved via the RTRV-DA command according to the specified Order Number, and the specified search key parameters TTYPE (Trigger Type), TIMEGE (Time Greater Than or Equal To), or TIMELE (Time Less Than or Equal To).

NOTE: Although the ON parameter value can be an integer from 0 to 999999, the user should limit the number of delayed activation commands at any given time to 500.

A RTRV-DA command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DA: [TID] :ON: [CTAG] : : : [TIMEGE=] [, TIMELE=] [, TTYPE=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
ON	{ON_AID:{0-999999}, ALL} Default: Entry Required Addressing: &&-ranging and &-grouping Description: Order Number AID, specifies the Order Number associated with the command entry in the delayed activation table that is to be retrieved. 0-999999 Order Number value previously assigned to the command. ALL All pending Order Numbers are to be retrieved. Restrictions: RTRV-DA is denied if the specified Order Number does not exist in the delayed activation table.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

TIMEGE=	{YY-MM-DD[-HH-MN]:{ {00-99} - {01-12} - {01-31} [- {00-23} - {00-59}] }, <NoVal> }
Default:	<NoVal>
Addressing:	None
Description:	Time Greater Than or Equal To, specifies commands scheduled for delayed activation whose trigger time is greater than or equal to the designated date and time are to be retrieved. The values for each element of the TIMEGE parameter are:
<YY>	The last two digits of the year. Values are: 70-99 1970 through 1999 00-69 2000 through 2069
<MM>	Month of the year. Values are: 1-12
<DD>	Day of the month. Values are: 1-31
<HH>	Hour of the day. Values are: 0-23
<MN>	Minute of the Hour. Values are: 0-59
	The value for TIMEGE if TIMEGE is not used to sort the delayed activation table is:
<NoVal>	No Value, TIMEGE is not used to sort the delayed activation table.
Restrictions:	RTRV-DA is denied if a TIMEGE value is entered and a TTYPE value of {BOTH, MANUAL} is entered.
TIMELE=	{YY-MM-DD[-HH-MN]:{ {00-99} - {01-12} - {01-31} [- {00-23} - {00-59}] }, <NoVal> }
Default:	<NoVal>
Addressing:	None
Description:	Time Less Than or Equal To, specifies commands scheduled for delayed activation whose trigger time is less than or equal to the designated date and time are to be retrieved. The values for each element of the TIMELE parameter are:
<YY>	The last two digits of the year. Values are: 70-99 1970 through 1999 00-69 2000 through 2069
<MM>	Month of the year. Values are: 1-12
<DD>	Day of the month. Values are: 1-31
<HH>	Hour of the day. Values are: 0-23
<MN>	Minute of the Hour. Values are: 0-59
	The value for TIMELE if TIMELE is not used to sort the delayed activation table is:
<NoVal>	No Value, TIMELE is not used to sort the delayed activation table.
Restrictions:	RTRV-DA is denied if a TIMELE value is entered and a TTYPE value of {BOTH, MANUAL} is entered.

TTYE= {BOTH, MANUAL, TIME}
Default: {BOTH }
Addressing: None
Description: Trigger Type, specifies the delayed activation trigger type of the command to be retrieved. Values are:
 BOTH Specifies both manual and time (automatic) trigger types.
 MANUAL Specifies manual trigger type.
 TIME Specifies time (automatic) trigger type.
Restrictions: RTRV-DA is denied if TTYPE value of {BOTH, MANUAL} is entered and a TIMEGE value or TIMELE value is entered.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* ORDER#   DATE       COMMAND */
/* <ON_AID> <TEVT>     <TL1_CMD> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

ON_AID {ON_AID:{0 – 999999} }
 Order Number Identifier, indicates the Order Number of the scheduled delayed activated command.

TEVT { {<YY> – <MM> – <DD>,<HH> – <MN> – <SS>}, Manual Command}
 Trigger Event, identifies the trigger event (trigger time or manual trigger) for the scheduled delayed activation command that is retrieved. Values for time activated commands are in the form of DATE,TIME. The value “Manual Command” is returned for manually activated (via ACT-DA) commands.
 The values for each element of the DATE,TIME formatted value are:

 <YY> The last two digits of the year. Values are:
 70–99 1970 through 1999
 00–69 2000 through 2069
 ALL All Years

 <MM> Month of the year. Values are:
 01–12
 ALL All Months

 <DD> Day of the month. Values are:
 01–31
 ALL All Days

 <HH> Hour of the day. Values are:
 00–23
 ALL All Hours

 <MN> Minute of the Hour. Values are:
 00–59
 ALL All Minutes

 <SS> Seconds of the Minute. Values are:
 00–59
 ALL All Seconds

 The value for a manually activated command is:
 Manual Command Manual command trigger, indicates that the delayed activated command must be manually triggered by executing an ACT-DA command.

TL1_CMD <TL1_COMMAND>
 TL1 Command, identifies the TL1 command code and its parameter data as entered for delayed activation.

UNSUCCESSFUL RESPONSE FORMAT

```

      <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> DENY
      <ERROR CODE>
      [/* <Informational Error Description Text> */]

;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IPNV      Input, Parameter Not Valid
          /* Invalid order number = [AID] */
          /* Invalid type = <order_type> */
          /* Command with order number = [AID] not found in crontab */
          /* ON=[AID] with ttype=<order_type>, not found in crontab */
          /* ON=[AID] not chronologically within TIMEGE or TIMELE */
          /* TIMEGE (yy-mm-dd) greater than TIMELE(yy-mm-dd) */
          /* TIMEGE & TIMELE can only be entered for TTYPE=TIME */

SDBE      Status, internal Data Base Error
          /* rpt_file=<d>, rpt_name=<s> */
          /* rpt_file=<d>, rpt_name=<s> */
          /* database error reading crontab */

SROF      Status, Requested Operation Failed
          /* command with order number=<order_number> not found in crontab */
          /* database error reading crontab */

```

EXAMPLES

In the following example, RTRV-DA is used to retrieve all scheduled delayed activated commands.

```
RTRV-DA::ALL;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P28006. The response header would contain the provisioned Site ID of the system, and the date and time the commands were executed.

```

      <SID> <YY-MM-DD> <HH:MM:SS>
M  P28006 COMPLD
      /* ORDER #          DATE          COMMAND */
      /* 1001            Manual Command  INIT-SYS:::::1 */
      /* 1010            94-12-31,12-00-00 ACT-DB-BACKUP::OPD-1-3-1 */
      /* RTRV-DA::ALL [P28006] (1) */
;

```

In the following example, RTRV-DA is used to retrieve all scheduled commands that are scheduled for delayed activation on or after 94-11-30 and on or before 95-1-1.

```
RTRV-DA::ALL:::TTYPE=TIME,TIMEGE=94-11-30,TIMELE=95-1-1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P28009. The response header would contain the provisioned Site ID of the system, and the date and time the commands were executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P28009 COMPLD
/* ORDER#      DATE                      COMMAND */
/* 1010        94-12-31,12-00-00        ACT-DB-BACKUP::OPD-1-3-1 */
/* RTRV-DA::ALL:::TTYPE=TIME,TIMEGE=94-11-30,TIMELE=95-1-1 [P28009]
(1) */
;
```

In the following example, RTRV-DA is used to retrieve all scheduled commands with a MANUAL trigger type.

```
RTRV-DA::ALL:::TTYPE=MANUAL;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P28011. The response header would contain the provisioned Site ID of the system, and the date and time the commands were executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P28011 COMPLD
/* ORDER #      DATE                      COMMAND */
/* 1001          Manual Command          INIT-SYS:::::1 */
/* RTRV-DA::ALL:::TTYPE=MANUAL [P28011] (2) */
;
```

ACT-DA
ACT-DB-BACKUP
CANC-DA
DLT-EQPT
ENT-EQPT
INIT-SYS

COMMAND CODE: **RTRV-DB-LABEL**
COMMAND NAME: **RETRIEVE DATABASE LABEL**

PURPOSE

The RTRV-DB-LABEL command reads the database label from the system disk or optical disk media in the specified disk drive. The command is executed regardless of the provisioning or state of the equipment.

If an optical disk (OPD) or hard disk (DSK) is specified and VERIFY is specified for the VER parameter, the 32-bit CRC (Cyclic Redundancy Code) is calculated for the data stored on the specified media and compared to the CRC stored on the media. If the calculated CRC and stored CRC do not match, an unsuccessful response (DENY) message is returned for the RTRV-DB-LABEL command.

The successful output response for a RTRV-DB-LABEL command displays one output line per successful equipment AID. Each output displays its appropriate AID (OPD, DSK) and its associated database label. The unsuccessful output response for a RTRV-DB-LABEL command displays a separate non-parsable line of data for each failed equipment AID.

The RTRV-DB-LABEL command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

The RTRV-DB-LABEL command is denied if:

- The read operation from the disk drive cannot be performed (e.g., the disk drive is not functional, the media is not inserted in the optical disk, the optical disk door is not closed, the optical disk is currently in use, etc.).
- The disk media does not contain a valid database label.
- The AID of an OPD and VER of VERIFY are specified and the CRC validation fails.
- The AID ALL and VER value of VERIFY are specified.
- A database backup is in progress.
- Either hard disk drive (DSK) is not in an in-service state.
- A DSKPTN value of ACT, ALTDB, or INACT and a VER of verify are specified.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DB-LABEL : [TID] : AID : [CTAG] : : [VER] [, DSKPTN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID	<p>EQUIPMENT_AID:</p> <p>{ALL}</p> <p>{DSK-1-3-1, DSK-1-4-2}</p> <p>{OPD-1-3-1, OPD-1-4-2}</p> <p>Default: Entry Required</p> <p>Addressing: None</p> <p>Description: Equipment AID, specifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics. If the AID of ALL is issued, only the currently active generic release and database information labels are displayed for all partitions on all provisioned hard disk drive (DSK) devices and on the currently mounted optical drive (OPD) device. For both DSK and OPD devices, 1-3-1 indicates Copy 0, and 1-4-2 indicates Copy1.</p> <p>Restrictions: RTRV-DB-LABEL is denied if:</p> <ul style="list-style-type: none"> • Any value of DSKPTN is entered and the specified AID is an OPD or ALL. • A DSKPTN value of ISU and AID of an OPD device are specified. • DBBK is specified together with the AID of an OPD device. • No database backup exists on the specified media/device. • No generic file exists on the specified media/device. • The system is in Limited Mode and AID of ALL is selected.
CTAG	<p>< 1-6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
VER	<p>{NOVERIFY, VERIFY}</p> <p>Default: {NOVERIFY}</p> <p>Addressing: None</p> <p>Description: Verify, specifies whether a CRC (Cyclic Redundancy Code) or GCRC (Generic Cyclic Redundancy Code) verification of the data is performed. Values are:</p> <p>NOVERIFY No CRC or GCRC Verification, specifies that no CRC or GCRC verification is to be performed.</p> <p>VERIFY CRC or GCRC Verification, specifies that the CRC or GCRC calculated from the stored data is compared to the CRC or GCRC stored on the media. The RTRV-DB-LABEL command is denied if the CRCs do not match.</p> <p>Restrictions: RTRV-DB-LABEL is denied if VER of VERIFY is entered and the specified AID is for a hard disk drive or ALL.</p>

DSKPTN	{ACT, ALL, ALTDB, DBBK, INACT, ISU}
Default:	{ACT}
Addressing:	None
Description:	Disk Partition, identifies the release generic and/or database backup version on the hard disk. Values are:
ACT	Active, identifies the currently active release generic and database on the hard disk.
ALL	All, identifies all the release generics and/or databases on the hard disk.
ALTDDB	Alternate Database, identifies the alternate database on the hard disk.
DBBK	Database Backup, identifies a database backup file on the hard disk.
INACT	Inactive, identifies the currently inactive release generic and database on the hard disk.
ISU	In service upgrade, identifies the uploaded generic file.
Restrictions:	RTRV-DB-LABEL is denied if <ul style="list-style-type: none"> Any value of DSKPTN is entered and the specified AID is an OPD or ALL. A DSKPTN value of ISU and AID of an OPD device are specified. DBBK is specified together with the AID of an OPD device. No database backup exists on the specified media/device. No generic file exists on the specified media/device.

SUCCESSFUL RESPONSE FORMAT

```

OUTPUT PARAMETERS

AID	EQUIPMENT_AID:
	{ALL}
	{DSK-1-3-1,
	DSK-1-4-2}
	{OPD-1-3-1,
	OPD-1-4-2}
	Equipment AID, identifies the equipment entity.

DSKPTN	{ACT, ALL, ALTDB, DBBK, INACT, ISU} Disk Partition, identifies the release generic and/or database backup version on the hard drive. Values are:												
	<table> <tr> <td>ACT</td><td>Active, identifies the currently active release generic and database on the DSK.</td></tr> <tr> <td>ALL</td><td>All, identifies all the release generics and/or databases on the hard disk</td></tr> <tr> <td>ALTDDB</td><td>Alternate Database, identifies the alternate database on the DSK.</td></tr> <tr> <td>DBBK</td><td>Database Backup, identifies a database backup file.</td></tr> <tr> <td>INACT</td><td>Inactive, identifies the currently inactive release generic and database on the hard drive.</td></tr> <tr> <td>ISU</td><td>In service upgrade, identifies the uploaded generic file.</td></tr> </table>	ACT	Active, identifies the currently active release generic and database on the DSK.	ALL	All, identifies all the release generics and/or databases on the hard disk	ALTDDB	Alternate Database, identifies the alternate database on the DSK.	DBBK	Database Backup, identifies a database backup file.	INACT	Inactive, identifies the currently inactive release generic and database on the hard drive.	ISU	In service upgrade, identifies the uploaded generic file.
ACT	Active, identifies the currently active release generic and database on the DSK.												
ALL	All, identifies all the release generics and/or databases on the hard disk												
ALTDDB	Alternate Database, identifies the alternate database on the DSK.												
DBBK	Database Backup, identifies a database backup file.												
INACT	Inactive, identifies the currently inactive release generic and database on the hard drive.												
ISU	In service upgrade, identifies the uploaded generic file.												
DBSYSTYPE	{1631SX} System Type of the system software for the database on the indicated disk.												
DBSTREAM	{LMC-APS} Release Stream of the system software for the database on the indicated disk. Values are:												
	<table> <tr> <td>LMC-APS</td><td>Large Matrix Configuration-Administration Processing System.</td></tr> </table>	LMC-APS	Large Matrix Configuration-Administration Processing System.										
LMC-APS	Large Matrix Configuration-Administration Processing System.												
DBRLSTYPE	{F, P, R} Software Release Type of the system software for the database on the indicated disk. Refer to the Software Support Agreement for applicable terms and conditions. Values are:												
	<table> <tr> <td>F</td><td>First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints.</td></tr> <tr> <td>P</td><td>Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions.</td></tr> <tr> <td>R</td><td>Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.</td></tr> </table>	F	First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints.	P	Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions.	R	Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.						
F	First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints.												
P	Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions.												
R	Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.												
DBRLSNUM	<Database Release Number> Software Release Number of the system software for the database on the indicated disk.												
DBIREV	{00-99} Intermediate Release Revision of the system software for the database on the indicated disk. Refer to the Software Support Agreement.												
DBMREV	{00-99} Maintenance Release Revision of the system software for the database on the indicated disk. Refer to the Software Support Agreement.												
DBSID	<1-20 CHARACTER SID> Database Site Identification: If the AID of a hard disk is specified, DBSID identifies the provisioned SID of the system. If the AID of an OPD is specified, DBSID identifies the SID from which the database on the optical disk media originated.												
DBDATE	{YY-MM-DD:{00-37,70-99}-{1-12}-{1-31}} Database Backup Date. The format of DBDATE is <YY>-<MM>-<DD> where <YY> is the year, <MM> is the month, <DD> is the day. The values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and the values for <YY> from 00 through 37 are interpreted as the year 2000 through the year 2037. If the AID of a hard disk is specified, DBDATE indicates the date of the last database backup or the backup date of the last restored database (the date stored on the optical disk media used in the last database restoral). If the AID of an OPD is specified, DBDATE indicates the date the data was written to the optical disk media.												

DBTIME	{HH-MN-SS:{00-23}-{00-59}-{00-59}} Database Backup Time. The format of DBTIME is <HH>-<MN>-<SS> where <HH> is the hour, <MN> is the minute, and <SS> is the second. If the AID of a hard disk is specified, DBTIME indicates the time of the last database back-up or the backup time of the last restored database (the time stored on the optical disk media used in the last database restoral). If the AID of an OPD is specified, DBTIME indicates the time the data was written to the optical disk media.
WRCNT	{0-999} Media Write Count, indicates the number of times data has been written to the optical disk media. A value for WRCNT is only returned in a successful response if the AID of an OPD is specified in the command.
CRC	{0X{00000000-FFFFFFFF} } Database Backup Cyclic Redundancy Code, indicates the 8-digit hexadecimal value of the 32-bit Cyclic Redundancy Code stored on the optical disk media. A value for CRC is only returned in a successful response if the AID of an OPD and VER of VERIFY is specified in the command.
GSYSTYP=	{1631SX} Generic System Type, identifies the Generic System Type of the system software for the release generic on the indicated disk and partition.
GSTRM=	{LMC-APS, <NoVal>} Generic Stream, identifies the Generic Release Stream of the system software for the release generic on the indicated disk and partition. Value is: LMC-APS Large Matrix Configuration-Administration Processing System. <NoVal> "No value" is returned if a value for GSTRM is not on the backup media.
GRLSID=	{<GRLSTYPE><GRLSNUM>.<GIREV>.<GMREV>} Generic Release Identification, identifies the Generic Release ID of the system software for the release generic on the indicated disk and partition. The format of GRLSID is <GRLSTYPE><GRLSNUM>.<GIREV>.<GMREV> and the values are: GRLSTYPE Generic Release Type, identifies the software release type {F, P, R}. GRLSNUM Generic Release Number, identifies the software release number {00-99}. GIREV Generic Intermediate Revision, identifies the intermediate release revision {00-99}. GMREV Generic Maintenance Revision, identifies the maintenance release revision {00-99}.
GDATE=	{MM-DD-YY:{1-12}-{1-31}-{00-99}} Generation Date, specifies the Generation Date of the system software for the release generic on the indicated disk and partition. The format of GDATE is <MM>-<DD>-<YY> where <MM> is the month, <DD> is the day, and <YY> is the year.
GTIME=	{HH-MM-SS:{0-23}-{0-59}-{00-59}} Generation Time, specifies the Generation Time of the system software for the release generic on the indicated disk and partition. The format of GTIME is <HH>-<MM>-<SS> where <HH> is the hour, <MM> is the minute, and <SS> is the second.
GCRC=	{0X{00000000-FFFFFFFF} } Generic Cyclic Redundancy Code, indicates the 8-digit hexadecimal value of the 32-bit Cyclic Redundancy Code stored on the optical disk media. A value for CRC is only returned in a successful response if the AID of an OPD and VER of VERIFY is specified in the command.

UNSUCCESSFUL RESPONSE FORMAT

The following unsuccessful response format is generated if an incorrect or invalid command is entered.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Optional Suggested Action Text> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following unsuccessful response format is generated if an incorrect AID is entered.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  ["<AID>[,DSKPTN]:<Unreadable Media or Invalid Label Stream>"]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
SROF	Status, Requested Operation Failed
	/* CRC Mismatch or Read Error */
	/* Creation Date: <DBDATE> <DBTIME> */
	/* Media Write Count: <WRCNT>, CRC: <CRC> */
	/* Media drive already in use */
	/* Can't guarantee exclusive use of media drive */
	/* Media drive open error */
	/* Can't get media label */
	/* Media does not contain a valid DB Backup label */
	/* Unable to open media to verify */
	/* <AID> contains an invalidated label, write count: <WRCNT> */

EXAMPLES

In the following example, the database label is retrieved and the data verified for the media in OPD-0-1.

```
RTRV-DB-LABEL::OPD-0-1:::VERIFY;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P02018. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P02018 COMPLD
  "OPD-0-1:1631SX,LMC-
APS,R06.00.00,ANSDSL672,94-11-18,14-08-33,5,0X8F4B7EA3"
  / * RTRV-DB-LABEL::OPD-0-1:::VERIFY [P02018] (3) */
;
```

RELATED COMMANDS

```

COMMAND CODE: **RTRV-DCC-STATS**
COMMAND NAME: **RETRIEVE DCC STATISTICS**

PURPOSE

The RTRV-DCC-STATS command retrieves the Layer 2 (data link layer) statistic counters of the SONET Data Communication Channel (DCC) network. This command retrieves both the Line and Section DCC data link statistic counters of the specified OC-3 or OC-12.

If the specified OC-3 or OC-12 is not provisioned, i.e., it is in UAS secondary state, or is a protect OC-3, the command completes successfully without producing any output.

If the specified OC-3 or OC-12 is provisioned (i.e., DCC is provisioned), but the DCC is out-of-service, the command completes successfully without producing any output except for the PST value of OOS.

A RTRV-DCC-STATS command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DCC-STATS: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC-3 AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Optical Carrier AID, identifies the OC-3 or OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>, LDCC: IFTX=<value>, BYTEIFTX=<value>, SABMTX=<value>, UIFTX=<value>,
  IFRX=<value>, BYTEIFRX=<value>, SABMRX=<value>, UIFRX=<value>,
  INVFRMRX=<value>, VFRMRX=<value>, FRMRTX=<value>:<PST>"
  "<AID>, SDCC: IFTX=<value>, BYTEIFTX=<value>, SABMTX=<value>, UIFTX=<value>,
  IFRX=<value>, BYTEIFRX=<value>, SABMRX=<value>, UIFRX=<value>,
  INVFRMRX=<value>, VFRMRX=<value>, FRMRTX=<value>:<PST>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

BYTEIFRX= Number of Information Bytes Received

BYTEIFTX=	Number of Information Bytes Transmitted
FRMRTX=	Number of Frames Retransmitted
IFRX=	Number of Information Frames Received
IFTX=	Number of Information Frames Transmitted
INVFRMRX=	Number of Invalid Frames Received
SABMRX=	Number of Set Asynchronous Balanced Mode Frames Received
SABMTX=	Number of Set Asynchronous Balanced Mode Frames Transmitted
UIFRX=	Number of Unnumbered Information Frames Received
UIFTX=	Number of Unnumbered Information Frames Transmitted
VFRMRX=	Number of Valid Frames Received
PST	{IS, OOS} Primary State. Indicates the current primary state of the DCC. IS In-Service OOS Out-Of-Service

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*DCC Database Error: <ERROR-STRING> for <AID-STRING>*/ /*TPidToAidStr(<TP-TYPE>, <RECORD-NUMBER>) Error: <ERROR-STRING>*/
SROF	Status, Requested Operation Failed /*Could not communicate with the SPB. */ /*SPB communication time out*/ /*Bad response code returned from SPB (<RESPONSE-CODE>)*/*
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, both the Line and Section DCC data link statistic counters of the OC-3 are being retrieved.

```
RTRV-DCC-STATS::OC3-16;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pad567 COMPLD  
"OC3-16,LDCC:IFTX=100,BYTEIFTX=0,SABMTX=1,UIFTX=0,IFRX=100,BYTEIFRX=0,

/* RTRV-DCC-STATS::OC3-16 [Pad567] (2) */  
;
```

RELATED COMMANDS

CLR-DCC-STATS

COMMAND CODE: **RTRV-DFLT-EC1**
COMMAND NAME: **RETRIEVE DEFAULT EC1**

PURPOSE

The RTRV-DFLT-EC1 command retrieves the system defaults for EC1 port parameters specified in the SET-DFLT-EC1 command. The response output shows the EC1 parameter system default values that can be changed with the SET-DFLT-EC1 command and are used for provisioning of EC1 ports when a parameter value is not explicitly specified in the ENT-EC1 command.

A RTRV-DFLT-EC1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DFLT-EC1 : [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "AINSTH=<value>:<PST>, [<SST>]"
  [/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

AINSTH=	{HH-MM:{00-48} – {00-59}} Automatic In-Service Threshold, indicates how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. Value is: HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the duration in hours and value MM indicates the duration in minutes.
PST	{IS, OOS} Primary State, indicates the system default provisioning primary state value that will be used when provisioning EC1 ports. Values are: IS In-Service OOS Out-Of-Service
SST	{AINS, <NoVal>} Secondary State, indicates the system default provisioning secondary state value that will be used when provisioning EC1 ports. Values are: AINS Automatic In-Service <NoVal> No Value, the SST default database value is unpopulated. (No SST value is reported in a successful response message.) Note: AINS is automatically off (default=OFF) unless specifically enabled during the provisioning of the facility (via ENT-rr:::SST=AINS or ED-rr:::SST=AINS).

```

OUTPUT PARAMETERS

AINSTH=	{HH-MM:{00-48} – {00-59}} Automatic In-Service Threshold, indicates how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. Value is: HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the duration in hours and value MM indicates the duration in minutes.
S1TRANS=	{ DUS, ACT } S1 byte transmitted, determines if the S1 byte transmitted has the "DUS" message or has the actual traceability of the signal. Values are: DUS Don't USE. The S1 byte is set to "DON'T USE for Synchronization" message. ACT ACTual. The S1 byte is set to the actual traceability of the signal.
SDTHSW=	{5, 6, 7, 8, 9} Signal Degrade Threshold Switching level, indicates the system default provisioning for the signal degrade threshold over which the Signal Degrade protection switching is initiated. Values are: 5 BER threshold of 10E-5. 6 BER threshold of 10E-6. 7 BER threshold of 10E-7. 8 BER threshold of 10E-8. 9 BER threshold of 10E-9.

PST	{IS, OOS}
	Primary State, indicates the system default provisioning primary state value that will be used when provisioning OC-12 ports. Values are:
	IS In-Service
	OOS Out-Of-Service
SST	{AINS, <NoVal>}
	Secondary State. Indicates the system default provisioning secondary state value that will be used when provisioning OC-12 ports. Values are:
	AINS Automatic In-Service
	<NoVal> No Value, the SST default database value is unpopulated. (No SST value is reported in a successful response message.)
	Note: AINS is automatically off (default=OFF) unless specifically enabled during the provisioning of the facility (via ENT-rr:::SST=AINS or ED-rr:::SST=AINS).

COMMAND CODE: **RTRV-DFLT-OC3**
COMMAND NAME: **RETRIEVE DEFAULT OC-3**

PURPOSE

The RTRV-DFLT-OC3 command retrieves the system defaults for OC-3 port parameters specified in the SET-DFLT-OC3 command. The response output shows the OC-3 parameter system default values that can be changed with the SET-DFLT-OC3 command and are used for provisioning of OC-3 ports when a parameter value is not explicitly specified in the ENT-OC3 command.

A RTRV-DFLT-OC3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DFLT-OC3 : [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS >
Default:	< System assigned CTAG value >
Addressing:	None
Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "AINSTH=<value>,S1TRANS=<value>,SDTHSW=<value>:<PST>,<SST>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AINSTH=	{HH-MM:{00-48} - {00-59}}
	Automatic In-Service Threshold, indicates how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. Value is:
	HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the duration in hours and value MM indicates the duration in minutes.
S1TRANS=	{ DUS, ACT }
	S1 byte transmitted, determines if the S1 byte transmitted has the "DUS" message or has the actual traceability of the signal. Values are:
	DUS Don't USE. The S1 byte is set to "DON'T USE for Synchronization" message.
	ACT ACTual. The S1 byte is set to the actual traceability of the signal.
SDTHSW=	{5, 6, 7, 8, 9}
	Signal Degrade Threshold Switching level, indicates the system default provisioning for the signal degrade threshold over which the Signal Degrade protection switching is initiated. Values are:
	5 BER threshold of 10E-5.
	6 BER threshold of 10E-6.
	7 BER threshold of 10E-7.
	8 BER threshold of 10E-8.
	9 BER threshold of 10E-9.

PST	{IS, OOS} Primary State, indicates the system default provisioning primary state value that will be used when provisioning OC-3 ports. Values are: IS In-Service OOS Out-Of-Service
SST	{AINS, <NoVal> Secondary State. Indicates the system default provisioning secondary state value that will be used when provisioning OC-3 ports. Values are: AINS Automatic In-Service <NoVal> No Value, the SST default database value is unpopulated. (No SST value is reported in a successful response message.) Note: AINS is automatically off (default=OFF) unless specifically enabled during the provisioning of the facility (via ENT-rr:::SST=AINS or ED-rr:::SST=AINS).

COMMAND CODE: **RTRV-DFLT-SECU**
COMMAND NAME: **RETRIEVE DEFAULT SECURITY**

PURPOSE

The RTRV-DFLT-SECU command retrieves the provisioned values for the system-wide user security parameters PAGE (password aging), POUT (password deactivation on inactivity), and UOUT (user account deletion on inactivity).

The PAGE parameter is used to enforce periodic changing of user passwords. If PAGE is enabled (a provisioned value greater than zero), the system keeps track of the age of each user's password, except for user's with a UCAL of 31 (system administrator level) or higher. The system resets a user's password-age when the user logs-on (via ACT-USER) the first time as a new account user, and each time the user changes the user's password identifier (PID) via the ED-PID command. A user's password-age is compared to the provisioned PAGE value each time a user logs-on the system. If the user's password-age has reached the PAGE value, the system prompts the user (via the REPT^EVT^SESSION message) to change the existing user password. If a new password is not entered before the user exits the current session, the system deactivates the user's password when the user logs-off the system.

The POUT and UOUT parameters are used to deactivate a password (PID) or user account (UID), respectively, based on user inactivity (the user has not logged-on to the system). A provisioned POUT or UOUT value of zero disables the parameter. The system maintains a user inactivity timer for each user account, except for user's with a UCAL of 31 (system administrator level) or higher. The system resets a user's inactivity timer when the user account is created (via ENT-USER), and each time the user logs-on to the system. If POUT or UOUT is enabled and a user does not log-on to the system for a period of time greater than the provisioned POUT or UOUT values, the system deactivates the user's password (PID) or the user's account (UID), respectively.

If a user password (PID) or user account (UID) is deactivated or removed, then only a system administrator account user or the Alcatel account user can enter a new user password or user account database entry.

A RTRV-DFLT-SECU command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DFLT-SECU: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<SID>:PAGE=<value>,POUT=<value>,UOUT=<value>"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

SID	<1-20 VALID SID CHARACTERS> Site Identifier, indicates the SID of the system as provisioned via the SET-SID command.
-----	---

PAGE=	{ 0–999 }	<p>Password Aging Interval, indicates the number of days that a user's password (PID) is aged before the system prompts the user to change to a new password. Values are:</p> <p>0 Zero, password aging on user accounts is disabled. User passwords are not deactivated by password aging.</p> <p>1–999 Password Aging Interval in days.</p>
POUT=	{ 0–999 }	<p>Password Out (Deactivation on Inactivity) Interval, indicates the number of days that a (non–system administrator or non–Alcatel account) user account can be inactive (the user has not logged–on to the system) before the system deactivates the user password identifier (PID). Values are:</p> <p>0 Zero, Password Out on user accounts is disabled. User passwords are not deactivated due to user log–in inactivity.</p> <p>1–999 Password Out interval in days.</p>
UOUT=	{ 0–999 }	<p>User Identification (UID) Out (Deactivation on Inactivity Interval, indicates the number of days that a (non–system administrator or non–Alcatel account) user account can be inactive (the user has not logged–on to the system) before the system deactivates the user account (UID). Values are:</p> <p>0 Zero, UOUT on user accounts is disabled. User accounts (UIDs) are not deactivated due to user log–in inactivity.</p> <p>1–999 User ID Out interval in days.</p>

COMMAND CODE: **RTRV-DFLT-STS1**
COMMAND NAME: **RETRIEVE DEFAULT STS-1**

PURPOSE

The RTRV-DFLT-STS1 command retrieves the system defaults for STS-1 port parameters specified in the SET-DFLT-STS1 command. The response output shows the STS-1 parameter system default values that can be changed with the SET-DFLT-STS1 command and are used for provisioning of STS-1 ports when a parameter value is not explicitly specified in the ENT-STS1 command.

A RTRV-DFLT-STS1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DFLT-STS1: [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "EXPTRC=\"<value>\",PDIINS=<value>,STSMAP=<value>,STSPTYEL=<value>,
TRC=\"<value>\":<PST>"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

EXPTRC=	<1-62 ASCII printable characters followed by CR and LF > Expected Path Trace message, consists of 1-62 ASCII printable characters followed by a CR and LF.
PDIINS=	{N, Y} Payload Defect Indication INsertion (Transmit/outgoing direction only), indicates whether or not PDI values are inserted into the outgoing signal label (C2) bytes. If Fault Escalation is disabled on the STS1 (default of FLTPRO=N via the ED-FLTPRO-STS1 command), PDI insertion is per GR-253. If Fault Escalation is enabled (FLTPRO=Y), PDI insertion is based on Alcatel's Fault Escalation type payload defects. Values are: N No, PDI values are not inserted into the outgoing signal label when payload defects exist. Y Yes, insertion of appropriate PDI into the outgoing signal label occurs when payload defects exist.

STSMAP=	{ALL, ASYNC, VTFLOAT}						
	STS Map, indicates the system default provisioning expected STS–1 payload type. Value is:						
	<table> <tr> <td>ALL</td><td>Generic STS–1 format. Contains payload of any mapping format (C2 ≠ 000 bin). Since this value matches all signal label values, mismatch alarms can never be generated. The transmitted signal label however depends on how the cross connect has been made.</td></tr> <tr> <td>ASYNC</td><td>Asynchronous mapping for DS3 (i.e. C2=04 hex)</td></tr> <tr> <td>VTFLOAT</td><td>Floating mode VTs (i.e. C2=02 hex).</td></tr> </table>	ALL	Generic STS–1 format. Contains payload of any mapping format (C2 ≠ 000 bin). Since this value matches all signal label values, mismatch alarms can never be generated. The transmitted signal label however depends on how the cross connect has been made.	ASYNC	Asynchronous mapping for DS3 (i.e. C2=04 hex)	VTFLOAT	Floating mode VTs (i.e. C2=02 hex).
ALL	Generic STS–1 format. Contains payload of any mapping format (C2 ≠ 000 bin). Since this value matches all signal label values, mismatch alarms can never be generated. The transmitted signal label however depends on how the cross connect has been made.						
ASYNC	Asynchronous mapping for DS3 (i.e. C2=04 hex)						
VTFLOAT	Floating mode VTs (i.e. C2=02 hex).						
STSPTYEL=	{N}						
	STS Path Yellow, indicates the system default provisioning for the STS–1 Path Yellow behavior. Values are:						
	<table> <tr> <td>N</td><td>No. RDI is transmitted/received on appropriate defect states.</td></tr> </table>	N	No. RDI is transmitted/received on appropriate defect states.				
N	No. RDI is transmitted/received on appropriate defect states.						
TRC=	<1–62 ASCII printable characters followed by CR and LF >						
	STS Path Trace, indicates the system default provisioning transmitted STS–1 Path Trace, consisting of 1–62 ASCII printable characters followed by a CR and LF.						
PST	{IS, OOS}						
	Primary State, indicates the system default provisioning primary state value that is used when provisioning STS–1 ports. Values are:						
	<table> <tr> <td>IS</td><td>In-Service</td></tr> <tr> <td>OOS</td><td>Out-Of-Service</td></tr> </table>	IS	In-Service	OOS	Out-Of-Service		
IS	In-Service						
OOS	Out-Of-Service

```

OUTPUT PARAMETERS

AINSTH=	{HH-MM:{00-48} – {00-59}}
	Automatic In-Service Threshold, indicates how long a customer signal must be present on the facility without a LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. Value is:
HH-MM	Time, specifies the duration of an alarm-free signal where value HH indicates the duration in hours and value MM indicates the duration in minutes.
AISC=	{LOF, LOFLOS, LOS }
	Alarm Indication Signal insertion Criteria, indicates the system default provisioning value for the condition necessary for insertion of AIS into a failed DS1 signal path. Values are:
LOF	Loss Of Frame. Automatic AIS insertion on detection of LOF.
LOFLOS	Loss Of Frame/Loss Of Signal. Automatic AIS insertion on detection of LOF or LOS.
LOS	Loss Of Signal. Automatic AIS insertion on detection of LOS. LOS only applies to a terminated electrical DS1.

AISF=	{N, Y} Alarm Indication Signal Failure substitution, indicates the system default provisioning value for whether a failed upstream signal (as defined by the AISC parameter) should have AIS inserted in the downstream path. Values are: N No. AIS is not inserted in the downstream path of a failed signal, the failed signal passes through the system. Y Yes. AIS is inserted in the downstream path of a failed signal.
FEMETHOD=	{ANSI, ATTPOLL, NONE} Far-End PM collection Method, indicates the system default provisioning value for the PM collection method for far-end PM data. Values are: ANSI Basic ANSI T1.403 PM data collection. ATTPOLL Poll for PM data using AT&T 54016 protocol to poll the data and convert into ANSI format for reporting. (ALCATEL method). NONE None, far-end PM is not collected on the DS1.
FENDNTE=	{ANSI, ANSIATT, ATT, NONE} Far-End Network Terminal performance monitoring terminal type, indicates the system default provisioning value for whether the far end network terminal supports standard ANSI performance monitoring (PM) collection or AT&T TR-54016 polled PM reporting and reporting for ESF DS1 signal formats. Values are: ANSI ANSI, the far-end NTE supports the ANSI T1.403 PM standard. ANSIATT ANSI and AT&T, the far-end NTE supports the ANSI T1.403 PM standard and the AT&T TR-54016 polled PM reporting standard. ATT AT&T TR-54016, the far-end NTE supports the AT&T TR-54016 polled PM reporting standard. (Refer to RTRV-FEDATA-T1) NONE None, the far-end NTE does not support either the ANSI T1.403 PM standard or the AT&T TR-54016 PM standard.
FMT=	{ESF, SF, UNFR} DS1 Format, indicates the system default provisioning value for the DS1 signal format for this port. The DS1 FMT parameter determines the performance monitoring parameter set that is used or the format of the Idle Signal Source port. Values are: ESF Extended SuperFrame. SF SuperFrame. UNFR Unframed.
IDLE=	{AIS, QRSF, QRSU} Idle signal transmit type, indicates the system default provisioning value for the type of Idle signal to be transmitted by this port when it is disconnected, or determines the type of Idle signal of the Idle Signal Source port. Values are: AIS AIS (Alarm Indication Signal). QRSF Framed QRS (Quasi-Random Signal). QRSU Unframed QRS (Quasi-Random Signal).
LINECDE=	{AMI, B8ZS} DS1 Line Code, indicates the system default provisioning value for the type of DS1 line code for a terminated electrical DS1. Values are: AMI Alternate Mark Inversion. B8ZS Bipolar with Eight Zero Substitution.
PST	{IS, OOS} Primary State, indicates the system default provisioning primary state value that will be used when provisioning DS1 ports. Values are: IS In-Service OOS Out-Of-Service

SST {AINS, <NoVal>}
Secondary State, indicates the system default provisioning secondary state value that will be used when provisioning DS1 ports. Values are:
AINS Automatic In-Service
<NoVal> No Value, the SST default database value is unpopulated. (No SST value is reported in a successful response message.)
Note: AINS is automatically off (default=OFF) unless specifically enabled during the provisioning of the facility (via ENT-rr:::SST=AINS or ED-rr:::SST=AINS).

XPOL=<value>:<PST>,[<SST>]"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AINSTH=	{HH-MM:{00-48} – {00-59}}	Automatic In-Service Threshold, indicates how long a customer signal must be present on the facility without a 7LOF, ISD, AICMISM, LOS, LOF, or AIS-L alarm condition before the system puts the facility into the In-Service state. Value is: HH-MM Time, specifies the duration of an alarm-free signal where value HH indicates the duration in hours and value MM indicates the duration in minutes.
AISC=	{LOFLOS, LOS}	Alarm Indication Signal insertion Criteria, indicates the condition at the input of a DS3 intact cross connect necessary for AIS insertion into the output of the DS3 intact cross connect. Values are: LOS Loss of Signal. Automatic AIS insertion upon detection of LOS. LOFLOS Loss of Frame-Loss of Signal. Automatic AIS insertion upon detection of LOFLOS.

AISPASS=	{Y, N }	Alarm Indication Signal Passed, indicates whether the AIS generated by the input port which is connected to the output port is passed through the output port, or whether AIS is generated by the output port itself. Values are: Y Yes, the AIS generated by the input port is passed through the output port. N No, AIS is regenerated by the output port instead of being passed through the output port.
AIST=	{NAS, ONES, OAIS }	Alarm Indication Signal Type, indicates the system default provisioning value for the input AIS signal and generated output AIS signal for the DS3 port should a failure condition exist. Values are: NAS North American Standard. ONES Unframed All Ones (Nonstandard). OAIS Old AIS, the same sequence of information bits as North American Standard but with no regard to how the C-bits are set.
DS3PTYEL=	{N, Y}	DS3 Yellow behavior, indicates whether DS3 path yellow or RDI (remote defect indication) will be sent and detected. Values are: N RDI will be sent/detected by the DS3. Y DS3 path yellow will be sent/detected by the DS3.
FEAC=	{N, Y}	Far End Alarm and Control, indicates the system default provisioning value for the far end alarm and control enable setting for C-bit parity format. Values are: N FEAC inhibited. Y FEAC enabled.
FMT=	{ASYNC, CBIT, FRCC, UNCBIT, UNFR}	DS3 Format, indicates the system default provisioning value for the DS3 signal format for this port. Values are: ASYNC Asynchronous (M13 format). CBIT C-Bit parity format . FRCC Framed Clear Channel. UNCBIT Unchannelized C-Bit parity format UNFR Unframed format
LINECDE=	{B3ZS}	DS3 Line Code, indicates the DS3 line coding type. Only B3ZS code is supported. B3ZS Bipolar with Three Zero Substitution.

PMMETHOD=	<p>{CP, FM, FMA, P, NONE}</p> <p>Performance Monitoring Method, Indicates the system default provisioning value for the type of performance monitoring that is performed on the DS3. Values are:</p> <p>If FMT=ASync (M13 format):</p> <table><tr><td>FM</td><td>F&M bit monitoring.</td></tr><tr><td>FMA</td><td>F&M bit Adjusted monitoring.</td></tr><tr><td>P</td><td>P-bit monitoring.</td></tr></table> <p>If FMT=CBIT (C–Bit parity format):</p> <table><tr><td>CP</td><td>Only CP-bit monitoring.</td></tr><tr><td>FM</td><td>F&M bit and CP-bit monitoring.</td></tr><tr><td>FMA</td><td>F&M bit Adjusted and CP-bit monitoring.</td></tr><tr><td>P</td><td>P-bit and CP-bit monitoring.</td></tr></table> <p>If FMT=FRCC (Framed Clear Channel):</p> <table><tr><td>FM</td><td>F&M bit and CP-bit monitoring</td></tr><tr><td>FMA</td><td>F&M bit Adjusted and CP-bit monitoring</td></tr><tr><td>P</td><td>P-bit and CP-bit monitoring</td></tr></table> <p>If FMT=UNCBIT (Unchannelized C–Bit parity format):</p> <table><tr><td>CP</td><td>Only CP–bit monitoring</td></tr><tr><td>FM</td><td>F&M bit and CP–bit monitoring</td></tr><tr><td>FMA</td><td>F&M bit adjusted and CP–bit monitoring</td></tr><tr><td>P</td><td>P–bit and CP–bit monitoring</td></tr></table> <p>If FMT=UNFR (Unframed):</p> <table><tr><td>NONE</td><td>Null value specified for PMMETHOD</td></tr></table>	FM	F&M bit monitoring.	FMA	F&M bit Adjusted monitoring.	P	P-bit monitoring.	CP	Only CP-bit monitoring.	FM	F&M bit and CP-bit monitoring.	FMA	F&M bit Adjusted and CP-bit monitoring.	P	P-bit and CP-bit monitoring. ```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```
SDBE      Status, internal Data Base Error
          /* DFLT Database Error: <ERROR-STRING> */
```

EXAMPLES

The following example illustrates the command and associated response output.

```
RTRV-DFLT-T3;

The output response, shown below, assumes CID 4 was used to enter the command and a system generated CTAG value of Pac579. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>

```

COMMAND CODE: **RTRV-DFLT-VT1**
COMMAND NAME: **RETRIEVE DEFAULT VT1**

PURPOSE

The RTRV-DFLT-VT1 command retrieves the system defaults for VT1.5 port parameters specified in the SET-DFLT-VT1 command. The response output shows the VT1.5 parameter system default values that can be changed with the SET-DFLT-VT1 command and are used for provisioning of VT1.5 ports when a parameter value is not explicitly specified in the ENT-VT1 command.

A RTRV-DFLT-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DFLT-VT1 : [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RTRV-DFLTATTR-EC1**
COMMAND NAME: **RETRIEVE DEFAULT ATTRIBUTE EC1**

PURPOSE

The RTRV-DFLTATTR-EC1 command retrieves the system provisioning default EC1 condition type attributes. The CONDTYPE, NTFCNCDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving the system default condition type attributes satisfying the specified input parameters. (The system default condition type attributes are set via the SET-DFLTATTR-EC1 command.)

The successful response for a RTRV-DFLTATTR-EC1 command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-DFLTATTR-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTATTR-EC1 : [TID] : [CTAG] : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPEFF] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the system default provisioning notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>.*/ /* Invalid service effect specified: <SERVICE EFFECT STRING>.*/ /* Invalid location specified: <LOCATION STRING>.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>.*/ /* Invalid parameter specified.*/
INUP	Input, Non–Null Unimplemented Parameter /*No matching attributes to update as requested by user.*/
SDBE	Status, internal Data Base Error /*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for the non-service affecting EC1 LOS condition type is retrieved.

RTRV=DFLTATTR=EC1:::,,LOS,,,NSA;

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

      <SID> <YY-MM-DD> <HH:MM:SS>
M  P71080 COMPLD
   ",EC1:MN,LOS,NEND,,NSA"
   /* RTRV-DFLTATTR-EC1::::,LOS,,,NSA [P71080] (1) */
;

```

In the following example, the system default notification code for all EC1 condition types are retrieved.

```
RTRV-DFLTATTR-EC1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-DFLTATTR-F3**
COMMAND NAME: **RETRIEVE DEFAULT ATTRIBUTE F3**

PURPOSE

The RTRV-DFLTATTR-F3 command retrieves the system provisioning default F3 condition type attributes. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving the system default condition type attributes satisfying the specified input parameters. (The system default condition type attributes are set via the SET-DFLTATTR-F3 command.)

The successful response for a RTRV-DFLTATTR-F3 command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-DFLTATTR-F3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

NA	Not Alarmed										
NR	Not Reported										
CONDTYPE	{INHMPREPT} Default: < All applicable condition types listed above > Addressing: None Description: Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are: <table><tr><td>INHMPREPT</td><td>Inhibit Performance Monitoring Report, PM report capability Inhibited.</td></tr></table>	INHMPREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.								
INHMPREPT	Inhibit Performance Monitoring Report, PM report capability Inhibited.										

LOCN	{NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the monitoring location of the condition type to be retrieved. Values are:
	NEND	Near-End, events occurring at the system.
DIRN	{NA, RCV}	
	Default:	{NA}
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-DFLTATTR-F3 command.
	NA	Not Applicable
	RCV	Receive side
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-DFLTATTR-F3 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
	/*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/ STRING>.*/*
IDNV	Input, Data Not Valid
	/* Invalid notification code specified: <NOTIFICATION CODE STRING>.*/ /* Invalid service effect specified: <SERVICE EFFECT STRING>.*/ /* Invalid location specified: <LOCATION STRING>.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>.*/ /* Invalid parameter specified. */
INUP	Input, Non-Null Unimplemented Parameter
	/*No matching attributes to update as requested by user.*/*
SDBE	Status, internal Data Base Error
	/*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for all F3 condition types are retrieved.

```
RTRV-DFLTATTR-F3;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **RTRV-DFLTATTR-OC12**
COMMAND NAME: **RETRIEVE DEFAULT ATTRIBUTE OC-12**

PURPOSE

The RTRV-DFLTATTR-OC12 command retrieves the system provisioning default OC12 condition type attributes. The CONDTYPE, NTFNCNCDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving the system default condition type attributes satisfying the specified input parameters. (The system default condition type attributes are set via the SET-DFLTATTR-OC12 command.)

The successful response for a RTRV-DFLTATTR-OC12 command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-DFLTATTR-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTATTR-OC12 : [TID] : [CTAG] : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPEFF] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the system default provisioning notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported
CR	Critical Alarm										
MJ	Major Alarm										
MN	Minor Alarm										
NA	Not Alarmed										
NR	Not Reported										

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, DUPTARPENRY, EBER, ESW, FRCDWKS WBK, FRCDWKS WPR, INHPMREPT, L2LCONFAIL, L2S CONFAIL, LDCCDLFL, LOCKOUTOFPR, LOF, LOS, MAN, MANWKS WBK, MANWKS WPR, SDBER, SDCCDLFL, WTR}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the OC12 port is in loop back. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
DUPTARPENRY	Duplicate TARP adjacency table. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
ESW	Excessive Switching, lockout of automatic revertive (OC12) switching due to excessive switching. (Near-End only.)
FRCDWKS WBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKS WPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
L2LCONFAIL	Layer 2 Line DCC Connection Failure. (Near-End only.)
L2S CONFAIL	Layer 2 Section DCC Connection Failure. (Near-End only.)
LDCCDLFL	Line DCC Data Link Failure. (Near-End only.)
LOCKOUTOFPR	LockOut Of Protection facility. (Near-End only.)
LOF	Loss Of Frame detected. (Near-End only.)
LOS	Loss Of Signal detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKS WBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKS WPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SDCCDLFL	Section DCC Data Link Failure. (Near-End only.)
WTR	Wait To Restore of protection facility. (Near-End only.)
Restrictions:	RTRV-DFLTATTR-OC12 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RFI and LOCN of NEND is entered).

LOCN	{FEND, NEND}	
	Default:	< All location values applicable to the specified condition type >
	Addressing:	None
	Description:	Location, specifies the monitoring location of the condition type to be retrieved. Values are:
	FEND	Far-End, events occurring at a distant network element.
DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-DFLTATTR-OC12 command.
	NA	Not Applicable
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-DFLTATTR-OC12 command.
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /*Invalid parameter specified.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
INUP	Input, Non-Null Unimplemented Parameter /*No matching attributes to update as requested by user.*/
SDBE	Status, internal Data Base Error /*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for the non-service affecting OC12 RFI condition type is retrieved.

```
RTRV-DFLTATTR-OC12::::,RFI,,,NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71080 COMPLD  
",OC12:NA,RFI,FEND,,,NSA"  
/* RTRV-DFLTATTR-OC12::::,RFI,,,NSA [P71080] (1) */  
;
```

In the following example, the system default notification code for all OC12 condition types are retrieved.

```
RTRV-DFLTATTR-OC12;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /*Invalid parameter specified.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
INUP	Input, Non-Null Unimplemented Parameter /*No matching attributes to update as requested by user.*/
SDBE	Status, internal Data Base Error /*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for the non-service affecting OC3 RFI condition type is retrieved.

```
RTRV-DFLTATTR-OC3::::,RFI,,,NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71080 COMPLD  
",OC3:NA,RFI,FEND,,,NSA"  
/* RTRV-DFLTATTR-OC3::::,RFI,,,NSA [P71080] (1) */  
;
```

In the following example, the system default notification code for all OC3 condition types are retrieved.

```
RTRV-DFLTATTR-OC3 ;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-DFLTATTR-STS1**
COMMAND NAME: **RETRIEVE DEFAULT ATTRIBUTE STS-1**

PURPOSE

The RTRV-DFLTATTR-STS1 command retrieves the system provisioning default STS-1 condition type attributes. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving the system default condition type attributes satisfying the specified input parameters. (The system default condition type attributes are set via the SET-DFLTATTR-STS1 command.)

The successful response for a RTRV-DFLTATTR-STS1 command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-DFLTATTR-STS1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

OUTPUT PARAMETERS

NTFCNCDE	{CR, MJ, MN, NA, NR}	
	Notification Code, identifies the system default notification code of the condition type and service effect being retrieved. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
	NA	Not Alarmed
	NR	Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, PDI, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the STS-1 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	EBER	Excessive Bit Error Rate detected.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	LOP	Loss Of Pointer detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	PDI	Incoming PDI signal detected (STS1)
	RFI	Remote Failure Indication detected.
	SDBER	Signal Degrade Bit Error Rate detected.
	SLMF	Signal Label Match Failure detected.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and system default notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/ STRING>.*/ IDNV
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>.*/ /* Invalid service effect specified: <SERVICE EFFECT STRING>.*/ /* Invalid location specified: <LOCATION STRING>.*/ /* Invalid parameter specified.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>.*/ INUP
INUP	Input, Non-Null Unimplemented Parameter /*No matching attributes to update as requested by user.*/ SDBE
SDBE	Status, internal Data Base Error /*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for the non-service affecting STS-1 IDLE condition type is retrieved.

```
RTRV-DFLTATTR-STS1::::,IDLE,,,NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71080 COMPLD  
",STS1:MN,IDLE,NEND,,,NSA"  
/* RTRV-DFLTATTR-STS1::::,IDLE,,,NSA [P71080] (1) */  
;
```

In the following example, the system default notification code for all STS-1 condition types are retrieved.

```
RTRV-DFLTATTR-STS1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-DFLTATTR-STS3C**
COMMAND NAME: **RETRIEVE DEFAULT ATTRIBUTE
STS-3C**

PURPOSE

The RTRV-DFLTATTR-STS3C command retrieves the system provisioning default STS-3C condition type attributes. The CONDTYPE, NTFCNCDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving the system default condition type attributes satisfying the specified input parameters. (The system default condition type attributes are set via the SET-DFLTATTR-STS3C command.)

The successful response for a RTRV-DFLTATTR-STS3C command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-DFLTATTR-STS3C command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTATTR-STS3C: [TID] :: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,

```

OUTPUT PARAMETERS

NTFCNCDE	{DFLT, MJ, MN, NA, NR} Notification Code, identifies the system default notification code of the condition type and service effect being retrieved. Values are: DFLT Default, the notification code for the specified near-end and/or far-end condition type and service effect combination is set to the system default value (as set via SET-DFLTATTR-STS3C). MJ Major Alarm MN Minor Alarm NA Not Alarmed NR Not Reported
CONDTYPE	NEAR-END_CONDTYPE:{ACTLPBK, AIS, IDLE, INHPMREPT, LOP, MAN, SLMF}, FAR-END_CONDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are: ACTLPBK Active Loopback, the STS-3C port is in loop back. AIS Alarm Indication Signal, AIS detected. IDLE Idle, incoming idle detected. INHPMREPT Inhibit Performance Monitoring Report, PM report capability Inhibited. LOP Loss Of Pointer detected. MAN Manual removal (logical removal was performed on the facility). RFI Remote Failure Indication detected. SLMF Signal Label Match Failure detected.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are: FEND Far-End, events occurring at a distant network element. NEND Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are: TRMT Transmit Direction, value returned for CONDTYPE of FLTESC. <NoVal> No Value (null) returned for all conditions other than FLTESC.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and system default notification code being retrieved. Values are: NSA Non-Service Affecting SA Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /*Invalid parameter specified.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
INUP	Input, Non-Null Unimplemented Parameter /*No matching attributes to update as requested by user.*/
SDBE	Status, internal Data Base Error /*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for the non-service affecting STS-3C IDLE condition type is retrieved.

```
RTRV-DFLTATTR-STS3C: : : : , IDLE , , , NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71080 COMPLD  
", STS3C:MN, IDLE, NEND, , , NSA"  
/* RTRV-DFLTATTR-STS3C: : : : , IDLE , , , NSA [P71080] (1) */  
;
```

In the following example, the system default notification code for all STS-3C condition types are retrieved.

```
RTRV-DFLTATTR-STS3C;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-DFLTATTR-T1**
COMMAND NAME: **RETRIEVE DEFAULT ATTRIBUTE T1**

PURPOSE

The RTRV-DFLTATTR-T1 command retrieves the system provisioning default DS1 condition type attributes. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving the system default condition type attributes satisfying the specified input parameters. (The system default condition type attributes are set via the SET-DFLTATTR-T1 command.)

The successful response for a RTRV-DFLTATTR-T1 command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-DFLTATTR-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTATTR-T1: [TID] :: [CTAG] :: [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPEFF] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the system default provisioning notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported
CR	Critical Alarm										
MJ	Major Alarm										
MN	Minor Alarm										
NA	Not Alarmed										
NR	Not Reported										

CONDTYPE	DS1_NEAR-END_CONDDTYPE:{ACTLPBK, AIS, AIS-CI, ALWCBLPBK, DS1ISD, EOC, INHPMREPT, LOF, LOS, MAN, RCVCLPBK, ROLLMON, XMTCLPBK}, DS1_FAR-END_CONDDTYPE:{RAI, RAI-CI}, TMG_NEAR-END_CONDDTYPE:{AIS, LOF, LOS, SLTMSIG, SYNCPRI, SYNCSEC, SYNCSTATQUAL}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the DS1 port is in loop back. (DS1 Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (DS1 or TMG Near-End only.)
AIS-CI	Alarm Indication Signal for Customer Installation, Incoming AIS detected. (DS1 Near-End)
ALWCBLPBK	Allow C-Bit Loopback. (DS1 Near-End only.)
DS1ISD	DS1 Idle Signal Detected, Incoming. (DS1 Near-End.)
EOC	Embedded Operations Channel, EOC failure detected. (DS1 Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (DS1 Near-End only.)
LOF	Loss Of Frame detected. (DS1 or TMG Near-End only.)
LOS	Loss Of Signal detected. (DS1 or TMG Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (DS1 Near-End only.)
RAI	Remote Alarm Indication detected. (DS1 Far-End only.)
RAI-CI	Remote Alarm Indication for Customer Installation detected. (DS1 Far-End.)
RCVCLPBK	Receive (DS1) C-Bit Loopback. (DS1 Near-End only.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (DS1 Near-End only.)
SLTMSIG	Slipping Timing Reference Signal detected. (TMG Near-End only.)
SYNCPRI	Primary Reference Synchronization failure. (TMG Near-End only.)
SYNCSEC	Secondary Reference Synchronization failure. (TMG Near-End only.)
SYNCSTATQUAL	Synchronization Status Quality. (TMG Near-End only.)
XMTCLPBK	Transmit (DS1) C-Bit Loopback. (DS1 Near-End only.)
Restrictions:	RTRV-DFLTATTR-T1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of RAI and LOCN of NEND is entered). RTRV-DFLTATTR-T1 is denied if the DS1 CI/NI Trouble Sectionalization Premium Feature Option (PFO) is not enabled and an input value of AIS-CI, DS1ISD or RAI-CI is entered.

LOCN	{FEND, NEND}
	Default: < All location values applicable to the specified condition type >
	Addressing: None
	Description: Location, specifies the monitoring location of the condition type to be retrieved. Values are:
	FEND Far-End, events occurring at a distant network element.
	NEND Near-End, events occurring at the system.
	Restrictions: RTRV-DFLTATTR-T1 is denied if the specified LOCN value is not supported for the specified CONDTYPE value (e.g., CONDTYPE of RAI and LOCN of NEND is entered).
DIRN	{NA, RCV, TRMT}
	Default: < All applicable directions >
	Addressing: None
	Description: Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-DFLTATTR-T1 command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-DFLTATTR-T1 command.
SRVEFF	{NSA, SA}
	Default: < Both service effect values >
	Addressing: None
	Description: Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA Non-Service Affecting
	SA Service Affecting

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

EFON	Equipment, Feature Option Not provided
IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /*Invalid parameter specified.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
INUP	Input, Non-Null Unimplemented Parameter /*No matching attributes to update as requested by user.*/
SDBE	Status, internal Data Base Error /*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for the non-service affecting DS1 MAN condition type is retrieved.

RTRV=DFLTATTR-T1:::::,MAN,,,,NSA;

The output responses, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71061. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

      <SID> <YY-MM-DD> <HH:MM:SS>
M   P71061  COMPLD
      ",T1:NA,MAN,NEND,, ,NSA"
      /* RTRV=DFLTATTR-T1::::,MAN,,,NSA [P71061] (1) */
;

```

In the following example, the system default notification code for all DS1 condition types are retrieved.

```
RTRV-DFLTATTR-T1;
```

The output responses, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71068. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-DFLTATTR-T3**
COMMAND NAME: **RETRIEVE DEFAULT ATTRIBUTE T3**

PURPOSE

The RTRV-DFLTATTR-T3 command retrieves the system provisioning default DS3 condition type attributes. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving the system default condition type attributes satisfying the specified input parameters. (The system default condition type attributes are set via the SET-DFLTATTR-T3 command.)

The successful response for a RTRV-DFLTATTR-T3 command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-DFLTATTR-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTATTR-T3 : [TID] : : [CTAG] : : [NTFCNCDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFCNCDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the system default provisioning notification code of the condition type to be retrieved. ```

OUTPUT PARAMETERS

NTFCNCDE	{CR, MJ, MN, NA, NR}
	Notification Code, identifies the system default notification code of the condition type and service effect being retrieved. Values are:
	CR Critical Alarm
	MJ Major Alarm
	MN Minor Alarm
	NA Not Alarmed
	NR Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{1TO6LOF, 7LOF, ACTLPBK, AICMIS, AIS, FLTESC, INHPMREPT, ISD, LOF, LOS, MAN}, FAR-END_CONDDTYPE:{AIS, DS2YEL, FEACEQPT, ISD, LOF, LOS, RAI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	1TO6LOF	One To Six Loss Of Frame, Incoming LOF detected on 1 to 6 DS2s embedded in the DS3.
	7LOF	Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3.
	ACTLPBK	Active Loopback, the DS3 port is in loop back.
	AICMIS	Application Identification Channel Mismatch, AIC mismatch detected.
	AIS	Alarm Indication Signal, AIS detected.
	DS2YEL	DS2 Yellow (Remote Alarm Indication) detected on one of the DS2s embedded in the DS3.
	FEACEQPT	Far-End Alarm & Control (FEAC) Equipment detected.
	FLTESC	Facility Fault Escalation active.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	ISD	Idle Signal Detected.
	LOF	Loss Of Frame detected.
	LOS	Loss Of Signal detected.
	MAN	Manual removal (logical removal was performed on the facility).
	RAI	Remote Alarm Indication detected.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and system default notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /*Invalid parameter specified.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
INUP	Input, Non-Null Unimplemented Parameter /*No matching attributes to update as requested by user.*/
SDBE	Status, internal Data Base Error /*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for the non-service affecting DS3 ISD condition type is retrieved.

```
RTRV-DFLTATTR-T3::::,ISD,,,NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71080 COMPLD
",T3:MN,ISD,NEND,,,NSA"
",T3:NA,ISD,FEND,,,NSA"
/* RTRV-DFLTATTR-T3::::,ISD,,,NSA [P71080] (1) */
;
```

In the following example, the system default notification code for all DS3 condition types are retrieved.

```
RTRV-DFLTATTR-T3;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-DFLTATTR-VT1**
COMMAND NAME: **RETRIEVE DEFAULT ATTRIBUTE VT1**

PURPOSE

The RTRV-DFLTATTR-VT1 command retrieves the system provisioning default VT1.5 condition type attributes. The CONDTYPE, NTFNCNDE, LOCN, and SRVEFF input parameters provide a search-key filter for retrieving the system default condition type attributes satisfying the specified input parameters. (The system default condition type attributes are set via the SET-DFLTATTR-VT1 command.)

The successful response for a RTRV-DFLTATTR-VT1 command contains one line of parsable output data, in alphabetical order, for each condition type being reported. If both service effect attributes are requested, a separate line of output data is provided for service affecting attributes (if any), followed by a line for non-service affecting attributes (if any), per condition type being reported.

If there are no condition type attributes matching the specified (valid) combination of condition type, notification code, location, and service effect, then the command is completed with no line of parsable output data provided in the response message.

A RTRV-DFLTATTR-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTATTR-VT1 : [TID] : : [CTAG] : : [NTFNCNDE] , [CONDTYPE] , [LOCN] , [DIRN] ,
[TMPER] , [SRVEFF] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.										
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.										
NTFNCNDE	{CR, MJ, MN, NA, NR} Default: < All applicable notification codes listed above > Addressing: None Description: Notification Code, specifies the system default provisioning notification code of the condition type to be retrieved. Values are: <table><tr><td>CR</td><td>Critical Alarm</td></tr><tr><td>MJ</td><td>Major Alarm</td></tr><tr><td>MN</td><td>Minor Alarm</td></tr><tr><td>NA</td><td>Not Alarmed</td></tr><tr><td>NR</td><td>Not Reported</td></tr></table>	CR	Critical Alarm	MJ	Major Alarm	MN	Minor Alarm	NA	Not Alarmed	NR	Not Reported
CR	Critical Alarm										
MJ	Major Alarm										
MN	Minor Alarm										
NA	Not Alarmed										
NR	Not Reported										

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI}
Default:	< All applicable condition types listed above >
Addressing:	None
Description:	Condition Type, specifies the condition type to be retrieved. (Refer to Appendix C for a list of all condition types.) Values are:
ACTLPBK	Active Loopback, the VT1.5 port is in loop back. (Near-End only.)
AIS	Alarm Indication Signal, AIS detected. (Near-End only.)
EBER	Excessive Bit Error Rate detected. (Near-End only.)
FLTESC	Facility Fault Escalation active. (Near-End only.)
FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility. (Near-End only.)
FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility. (Near-End only.)
IDLE	Idle, incoming idle detected. (Near-End only.)
INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited. (Near-End only.)
LOP	Loss Of Pointer detected. (Near-End only.)
MAN	Manual removal (logical removal was performed on the facility). (Near-End only.)
MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility. (Near-End only.)
MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility. (Near-End only.)
RFI	Remote Failure Indication detected. (Far-End only.)
ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal. (Near-End only.)
SDBER	Signal Degrade Bit Error Rate detected. (Near-End only.)
SLMF	Signal Label Match Failure detected. (Near-End only.)
Restrictions:	RTRV-DFLTATTR-VT1 is denied if the specified CONDDTYPE value is not supported for the specified LOCN value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).
LOCN	{FEND, NEND}
Default:	< All location values applicable to the specified condition type >
Addressing:	None
Description:	Location, specifies the monitoring location of the condition type to be retrieved. Values are:
FEND	Far-End, events occurring at a distant network element.
NEND	Near-End, events occurring at the system.
Restrictions:	RTRV-DFLTATTR-VT1 is denied if the specified LOCN value is not supported for the specified CONDDTYPE value (e.g., CONDDTYPE of AIS and LOCN of FEND is entered).

DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the condition type being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-DFLTATTR-VT1 command.
	NA	Not Applicable
TMPER	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period. The value for TMPER is verified, but does not affect the function of the RTRV-DFLTATTR-VT1 command.
	RCV	Receive side
SRVEFF	{NSA, SA}	
	Default:	< Both service effect values >
	Addressing:	None
	Description:	Service Effect, specifies the service effect of the condition type to be retrieved. Values are:
	NSA	Non-Service Affecting
	SA	Service Affecting

SUCCESSFUL RESPONSE FORMAT

```

OUTPUT PARAMETERS

NTFCNCDE	{CR, MJ, MN, NA, NR}	
	Notification Code, identifies the system default notification code of the condition type and service effect being retrieved. Values are:	
	CR	Critical Alarm
	MJ	Major Alarm
	MN	Minor Alarm
	NA	Not Alarmed
	NR	Not Reported

CONDTYPE	NEAR-END_CONDDTYPE:{ACTLPBK, AIS, EBER, FLTESC, FRCDWKSWBK, FRCDWKSWPR, IDLE, INHPMREPT, LOP, MAN, MANWKSWBK, MANWKSWPR, ROLLMON, SDBER, SLMF}, FAR-END_CONDDTYPE:{RFI} Condition Type, identifies the condition type being retrieved. (Refer to Appendix C for a list of all condition types.) Values are:	
	ACTLPBK	Active Loopback, the VT1.5 port is in loop back.
	AIS	Alarm Indication Signal, AIS detected.
	EBER	Excessive Bit Error Rate detected.
	FLTESC	Facility Fault Escalation active.
	FRCDWKSWBK	Forced Working Switched Back, working facility was manually force switched from protection to the main facility.
	FRCDWKSWPR	Forced Working Switched to Protection, working facility was manually force switched to the protection facility.
	IDLE	Idle, incoming idle detected.
	INHPMREPT	Inhibit Performance Monitoring Report, PM report capability inhibited.
	LOP	Loss Of Pointer detected.
	MAN	Manual removal (logical removal was performed on the facility).
	MANWKSWBK	Manual Working Switched Back, working facility was manually switched from protection to the main facility.
	MANWKSWPR	Manual Working Switched to Protection, working facility was manually switched to the protection facility.
	RFI	Remote Failure Indication detected.
	ROLLMON	Roll Monitoring, receive-side RTO port being monitored for valid signal.
	SDBER	Signal Degrade Bit Error Rate detected.
	SLMF	Signal Label Match Failure detected.
LOCN	{FEND, NEND} Location, identifies the location where the condition type is monitored. Values are:	
	FEND	Far-End, events occurring at a distant network element.
	NEND	Near-End, events occurring at the system.
DIRN	{TRMT, <NoVal>} Direction, identifies the direction of the condition type being monitored. Values are:	
	TRMT	Transmit Direction, value returned for CONDDTYPE of FLTESC.
	<NoVal>	No Value (null) returned for all conditions other than FLTESC.
SRVEFF	{NSA, SA} Service Effect, identifies the service effect of the condition type and system default notification code being retrieved. Values are:	
	NSA	Non-Service Affecting
	SA	Service Affecting

UNSUCCESSFUL RESPONSE FORMAT

```

M  <SID> <YY-MM-DD> <HH:MM:SS>

    ;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /*Condition type is not consistent with <FACILITY TYPE STRING>.*/ /*Location is not consistent with <FACILITY TYPE STRING> <CONDITION TYPE STRING>.*/
IDNV	Input, Data Not Valid /* Invalid notification code specified: <NOTIFICATION CODE STRING>. */ /* Invalid service effect specified: <SERVICE EFFECT STRING>. */ /* Invalid location specified: <LOCATION STRING>. */ /*Invalid parameter specified.*/ /* Invalid condition type specified: <CONDITION TYPE STRING>. */
INUP	Input, Non-Null Unimplemented Parameter /*No matching attributes to update as requested by user.*/
SDBE	Status, internal Data Base Error /*Unable to read file <FILENAME>, Error <ERROR NUMBER>*/

EXAMPLES

In the following example, the system default notification code for the non-service affecting VT1.5 IDLE condition type is retrieved.

```
RTRV-DFLTATTR-VT1::::,IDLE,,,NSA;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71080. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71080 COMPLD  
",VT1:MN,IDLE,NEND,,,NSA"  
/* RTRV-DFLTATTR-VT1::::,IDLE,,,NSA [P71080] (1) */  
;
```

In the following example, the system default notification code for all VT1.5 condition types are retrieved.

```
RTRV-DFLTATTR-VT1 ;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71085. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-DFLTPMREPT-EC1**
COMMAND NAME: **RETRIEVE DEFAULT PERFORMANCE
MONITORING REPORT EC1**

PURPOSE

The RTRV-DFLTPMREPT-EC1 command retrieves the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of EC1 PM parameters.

A RTRV-DFLTPMREPT-EC1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DFLTPMREPT-EC1 : [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
[ "<AIDTYPE>:<NUMREPT>,<MONLEV>,<TMPER>" ]
. . . .
[ "<AIDTYPE>:<NUMREPT>,<MONLEV>,<TMPER>" ]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AIDTYPE	{EC1} AID Type, identifies the type of AID for the default scheduled PM reporting parameters being retrieved.
NUMREPT	{0–254, <NoVal>} Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1–254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-EC1 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.

MONLEV	<p>{LEVEL-DIRECTION:{0-4294967295} – {DN, UP} }</p> <p>Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:</p> <table> <tr> <td data-bbox="493 310 738 340">{0-4294967295}-DN</td><td data-bbox="781 310 1437 369">Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported.</td></tr> <tr> <td data-bbox="493 373 738 403">{0-4294967295}-UP</td><td data-bbox="781 373 1437 462">Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.</td></tr> </table>	{0-4294967295}-DN	Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported.	{0-4294967295}-UP	Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.
{0-4294967295}-DN	Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported.				
{0-4294967295}-UP	Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.				
TMPER	<p>{15-MIN, 1-DAY}</p> <p>Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:</p> <table> <tr> <td data-bbox="493 583 586 613">15-MIN</td><td data-bbox="688 583 1230 613">15-Minute PM collection registers are reported.</td></tr> <tr> <td data-bbox="493 617 574 646">1-DAY</td><td data-bbox="688 617 1299 646">1-Day (24 hour) PM collection registers are reported.</td></tr> </table>	15-MIN	15-Minute PM collection registers are reported.	1-DAY	1-Day (24 hour) PM collection registers are reported.
15-MIN	15-Minute PM collection registers are reported.				
1-DAY	1-Day (24 hour) PM collection registers are reported.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed
 /* Unable to determine facility type. */

EXAMPLES

In the following example, the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting of OC12 PM parameters is retrieved.

```
RTRV-DFLTPMREPT-OC12;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed
/* Unable to determine facility type. */

EXAMPLES

In the following example, the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting of DS3 PM parameters is retrieved.

```
RTRV-DFLTTPMREPT-T3 ;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **RTRV-DFLTPMREPT-VT1**
COMMAND NAME: **RETRIEVE DEFAULT PERFORMANCE
MONITORING REPORT VT1**

PURPOSE

The RTRV-DFLTPMREPT-VT1 command retrieves the current default provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of VT1.5 PM parameters.

A RTRV-DFLTPMREPT-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DFLTPMREPT-VT1 : [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<AIDTYPE>:<NUMREPT>,<MONLEV>,<TMPER>" ]
. . . .
  ["<AIDTYPE>:<NUMREPT>,<MONLEV>,<TMPER>" ]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AIDTYPE	{VT1} AID Type, identifies the type of AID for the default scheduled PM reporting parameters being retrieved.
NUMREPT	{0–254, <NoVal>} Number of Reports, specifies the number of PM report messages that are generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1–254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMREPT is decremented even if the schedule has been inhibited by the INH-PMREPT-VT1 command. <NoVal> No Value (Null), PM report messages continue to be generated until disabled via a NUMREPT value of 0.

MONLEV	<p>{LEVEL-DIRECTION:{0-4294967295} – {DN, UP} }</p> <p>Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:</p> <table> <tr> <td data-bbox="493 310 738 342">{0-4294967295}–DN</td><td data-bbox="781 310 1443 373">Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported.</td></tr> <tr> <td data-bbox="493 375 738 407">{0-4294967295}–UP</td><td data-bbox="781 375 1443 468">Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.</td></tr> </table>	{0-4294967295}–DN	Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported.	{0-4294967295}–UP	Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.
{0-4294967295}–DN	Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported.				
{0-4294967295}–UP	Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.				
TMPER	<p>{15-MIN, 1-DAY}</p> <p>Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:</p> <table> <tr> <td data-bbox="493 585 586 617">15-MIN</td><td data-bbox="688 585 1230 617">15-Minute PM collection registers are reported.</td></tr> <tr> <td data-bbox="493 619 574 651">1-DAY</td><td data-bbox="688 619 1300 651">1-Day (24 hour) PM collection registers are reported.</td></tr> </table>	15-MIN	15-Minute PM collection registers are reported.	1-DAY	1-Day (24 hour) PM collection registers are reported.
15-MIN	15-Minute PM collection registers are reported.				
1-DAY	1-Day (24 hour) PM collection registers are reported.

COMMAND CODE: **RTRV-DFLTTH-EC1**
COMMAND NAME: **RETRIEVE DEFAULT THRESHOLD EC1**

PURPOSE

The RTRV-DFLTTH-EC1 command retrieves the system provisioning default threshold level (THLEV) for the monitored PM (Performance Monitoring) parameter identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day). (The system default THLEV for each monitored EC1 PM parameter is set via the SET-DFLTTH-EC1 command.)

The successful response for a RTRV-DFLTTH-EC1 command contains one line of parsable output data for each monitored parameter's system default threshold level setting being reported.

A RTRV-DFLTTH-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTTH-EC1 : [TID] :: [CTAG] :: [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}
	NEAR_END_PARAMETERS:{CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, LOSS, LOSS-S, SEFS, SEFS-S, SES-L, SESL, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, ES-L, ESL, FC-L, FCL, SES-L, SESL, UAS-L, UASL} }
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
	ALL All, all monitored parameter PM registers.
	AISS, AISS-L, AISSL Alarm Indication Signal Seconds – Line, AISS register. (Far-end only.)
	CV-L, CVL Coding Violations – Line, CV-L register. (Near-end only.)
	ES-L, ESL Errored Seconds – Line, ES-L register.
	ESA-L, ESAL Errored Seconds type A – Line, ESA-L register. (Near-end only.)
	ESB-L, ESBL Errored Seconds type B – Line, ESB-L register. (Near-end only.)
	FC-L, FCL Failure Counts – Line, FC-L register. (Far-end only.)
	LOSS, LOSS-S Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
	SEFS, SEFS-S Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
	SES-L, SESL Severely Errored Seconds – Line, SES-L register.
	UAS-L, UASL Unavailable Seconds – Line, UAS-L register.
Restrictions:	RTRV-DFLTTH-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
LOCN	{FEND, NEND}
	Default: < All applicable locations for the selected monitored parameters >
Addressing:	None
Description:	Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be retrieved. Values are:
	FEND Far-End
	NEND Near-End
Restrictions:	RTRV-DFLTTH-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
TMPER	{15-MIN, 1-DAY}
	Default: {15-MIN}
Addressing:	None
Description:	Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN 15-Minute PM collection register
	1-DAY 1-Day (24 hour) PM collection register

COMMAND CODE: **RTRV-DFLTTH-OC12**
COMMAND NAME: **RETRIEVE DEFAULT THRESHOLD
OC-12**

PURPOSE

The RTRV-DFLTTH-OC12 command retrieves the system provisioning default threshold level (THLEV) for the monitored PM (Performance Monitoring) parameter identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day). (The system default THLEV for each monitored OC12 PM parameter is set via the SET-DFLTTH-OC12 command.)

The successful response for a RTRV-DFLTTH-OC12 command contains one line of parsable output data for each monitored parameter's system default threshold level setting being reported.

A RTRV-DFLTTH-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTTH-OC12 : [TID] : : [CTAG] : : [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL},
	NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL},
	FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

COMMAND NAME: **RETRIEVE DEFAULT THRESHOLD OC-3**

PURPOSE

The RTRV-DFLTTH-OC3 command retrieves the system provisioning default threshold level (THLEV) for the monitored PM (Performance Monitoring) parameter identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day). (The system default THLEV for each monitored OC3 PM parameter is set via the SET-DFLTTH-OC3 command.)

The successful response for a RTRV-DFLTTH-OC3 command contains one line of parsable output data for each monitored parameter's system default threshold level setting being reported.

A RTRV-DFLTTH-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTTH-OC3 : [TID] :: [CTAG] :: [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All, all monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-S, ESS	Errored Seconds – Section, ES-S register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register.
ESA-S, ESAS	Errored Seconds type A – Section, ESA-S register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register.
ESB-S, ESBS	Errored Seconds type B – Section, ESB-S register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register.
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
PSC, PSC-L, PSCL	Protection Switch Counts – Line, PSC-L register. (Near-end only.)
PSD, PSD-L, PSDL	Protection Switch Duration – Line, PSD-L register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	RTRV-DFLTTH-OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

LOCN	{FEND, NEND}	
	Default:	< All applicable locations for the selected monitored parameters >
	Addressing:	None
	Description:	Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be retrieved. Values are:
	FEND	Far-End
TMPER	NEND	Near-End
	Restrictions:	RTRV-DFLTTH-OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
",OC3:<MONTYPE>,<LOCN>,<THLEV>,<TMPER>"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

```

OUTPUT PARAMETERS

MONTYPE	NEAR_END_PARAMETERS:{AISS, CVL, CVS, ESL, ESS, ESA-L, ESA-S, ESB-L, ESB-S, FC-L, LOSS, PSC-L, PSD-L, SEFS, SESL, SESS, UASL},	
	FAR_END_PARAMETERS:{AISS, CVL, ESL, ESA-L, ESB-L, FC-L, SESL, UASL}	
	Monitored Parameter Type, identifies the monitored parameter. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:	
	AISS	Alarm Indication Signal Seconds – Line, AISS register.
	CVL	Coding Violations – Line, CV-L register.
	CVS	Coding Violations – Section, CV-S register.
	ESL	Errored Seconds – Line, ES-L register.
	ESS	Errored Seconds – Section, ES-S register.
	ESA-L	Errored Seconds type A – Line, ESA-L register.
	ESA-S	Errored Seconds type A – Section, ESA-S register.
	ESB-L	Errored Seconds type B – Line, ESB-L register.
	ESB-S	Errored Seconds type B – Section, ESB-S register.
	FC-L	Failure Counts – Line, FC-L register.
	LOSS	Loss Of Signal Seconds – Section, LOSS register.
	PSC-L	Protection Switch Counts – Line, PSC-L register.
	PSD-L	Protection Switch Duration – Line, PSD-L register.
	SEFS	Severely Errored Frame Seconds – Section, SEFS-S register.
	SESL	Severely Errored Seconds – Line, SES-L register.
	SESS	Severely Errored Seconds – Section, SES-S register.
	UASL	Unavailable Seconds – Line, UAS-L register.
LOCN	{FEND, NEND}	
	Location, indicates whether system default threshold levels for near-end or far-end monitored parameters are being reported. Values are:	
	FEND	Far-End
	NEND	Near-End

THLEV	{0–4294967295}	Threshold Level, indicates the value of the system provisioning default threshold level for the indicated parameter. A value of zero (0) indicates PM threshold crossings are not autonomously reported.
TMPER	{15–MIN, 1–DAY}	Time Period, identifies the accumulation time period for the indicated parameter. Values are:
	15–MIN	15–Minute PM collection register
	1–DAY	1–Day (24 hour) PM collection register

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/* Invalid location in request message. */
	/* Invalid montype in request message. */
	/* Invalid time period in request message. */
IIPG	Input, Invalid Parameter Grouping
	/* Invalid location for requested montype. */
SROF	Status, Requested Operation Failed
	/* Unable to determine facility type. */
	/* Unable to convert montype <MONTYPE> to string. */
	/* Unable to process montype <MONTYPE>. */
	/* Could not write to report file. */

EXAMPLES

In the following example, the system provisioning default threshold level settings for the near–end and far–end 15–Minute coding violations, line (CV–L) registers are retrieved.

```
RTRV-DFLTTH-OC3:::::CVL,,15-MIN;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **RTRV-DFLTTH-T1**
COMMAND NAME: **RETRIEVE DEFAULT THRESHOLD T1**

PURPOSE

The RTRV-DFLTTH-T1 command retrieves the system provisioning default threshold level (THLEV) for the monitored PM (Performance Monitoring) parameter identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day). (The system default THLEV for each monitored DS1 PM parameter is set via the SET-DFLTTH-T1 command.)

The successful response for a RTRV-DFLTTH-T1 command contains one line of parsable output data for each monitored parameter's system default threshold level setting being reported.

A RTRV-DFLTTH-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-DFLTTH-T1 : [TID] :: [CTAG] :: [MONTYPE] , [LOCN] , [TMPER] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL},
	NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, ES-L, ESL, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, LOSS, LOSS-L, LOSSL, QRSSS, QRSSS-P, QRSSSP, SAS-P, SASP, SES-L, SESL, SES-P, SESP, UAS-P, UASP},
	FAR_END_PARAMETERS:{CSS, CSS-P, CSSP, CV-P, CVP, ES-L, ESL, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SEFS, SEFS-P, SEFSP, SES-P, SESP, UAS-P, UASP}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All, all monitored parameter PM registers.
AISS, AISS-P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near-end only.)
CSS, CSS-P, CSSP	Controlled Slip Seconds – Path, CSS register. (Far-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end electrical T1 only.)
CV-P, CVP	Coding Violations – Path, CV-P register.
ES-L, ESL	Errored Seconds – Line, ES-L register. (Near-end electrical T1 or Far-end embedded T1.)
ES-P, ESP	Errored Seconds – Path, ES-P register.
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.
FC-P, FCP	Failure Count – Path, FC-P register.
LOSS, LOSS-L, LOSSL	Loss of Signal Seconds – Line, LOSS register. (Near-end electrical T1 only.)
QRSSS, QRSSS-P, QRSSSP	QRSS Seconds – Path, QRSSS-P register. (Near-end only.)
SAS-P, SASP	Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
SEFS, SEFS-P, SEFSP	Severely Errored Frame Seconds, SEFS register. (Far-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register. (Near-end electrical T1 only.)
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.
Restrictions:	RTRV-DFLTTH-T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

LOCN	{FEND, NEND}	
	Default:	< All applicable locations for the selected monitored parameters >
	Addressing:	None
	Description:	Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be retrieved. Values are:
	FEND	Far-End
TMPER	NEND	Near-End
	Restrictions:	RTRV-DFLTTH-T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).
	{15-MIN, 1-DAY}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register

OUTPUT PARAMETERS

MONTYPE	{NEAR_END_PARAMETERS:{AISS, CVL, CVP, ESA-P, ESB-P, ESL, ESP, FC-P, LOSS, QRSSS-P, SAS-P, SESL, SESP, UASP},	
	FAR_END_PARAMETERS:{CSS, CVP, ESA-P, ESB-P, ESL, ESP, FC-P, SEFS, SESP, UASP} }	
	Monitored Parameter Type, identifies the monitored parameter. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:	
	AISS	AIS Seconds – Path, AISS register.
	CSS	Controlled Slip Seconds – Path, CSS register.
	CVL	Coding Violations – Line, CV-L register.
	CVP	Coding Violations – Path, CV-P register.
	ESP	Errored Seconds – Path, ES-P register.
	ESA-P	Errored Seconds type A – Path, ESA-P register.
	ESB-P	Errored Seconds type B – Path, ESB-P register.
	ESL	Errored Seconds – Line, ES-L register.
	FC-P	Failure Count – Path, FC-P register.
	LOSS	Loss of Signal Seconds – Line, LOSS register.
	QRSSS-P	QRSSS – Path, QRSSS-P register.
	SAS-P	Severe AIS Seconds – Path, SAS-P register.
	SEFS	Severely Errored Frame Seconds, SEFS register.
	SESL	Severely Errored Seconds – Line, SES-L register.
	SESP	Severely Errored Seconds – Path, SES-P register.
	UASP	Unavailable Seconds – Path, UAS-P register.
LOCN	{FEND, NEND}	
	Location, indicates whether system default threshold levels for near-end or far-end monitored parameters are being reported. Values are:	
	FEND	Far-End
	NEND	Near-End

THLEV	{0–4294967295}	Threshold Level, indicates the value of the system provisioning default threshold level for the indicated parameter. A value of zero (0) indicates PM threshold crossings are not autonomously reported.
TMPER	{15–MIN, 1–DAY}	Time Period, identifies the accumulation time period for the indicated parameter. Values are:
	15–MIN	15–Minute PM collection register
	1–DAY	1–Day (24 hour) PM collection register

UNSUCCESSFUL RESPONSE FORMAT

```

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

```

IDNV      Input, Data Not Valid
          /* Invalid location in request message. */
          /* Invalid montype in request message. */
          /* Invalid time period in request message. */
IIPG      Input, Invalid Parameter Grouping
          /* Invalid location for requested montype. */
SROF      Status, Requested Operation Failed
          /* Unable to determine facility type. */
          /* Unable to convert montype <MONTYPE> to string. */
          /* Unable to process montype <MONTYPE>. */
          /* Could not write to report file. */

```

EXAMPLES

In the following example, the system provisioning default threshold level settings for the near–end and far–end 15–Minute coding violations, path (CV–P) registers are retrieved.

```
RTRV-DFLTTH-T1::::CVP,,15-MIN;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

RELATED AUTONOMOUS RESPONSES

REPT^EVT^T1

COMMAND CODE: **RTRV-DFLTTH-T3**
COMMAND NAME: **RETRIEVE DEFAULT THRESHOLD T3**

PURPOSE

The RTRV-DFLTTH-T3 command retrieves the system provisioning default threshold level (THLEV) for the monitored PM (Performance Monitoring) parameter identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day). (The system default THLEV for each monitored DS3 PM parameter is set via the SET-DFLTTH-T3 command.)

The successful response for a RTRV=DFLTTH=T3 command contains one line of parsable output data for each monitored parameter's system default threshold level setting being reported.

A RTRV-DFLTTH-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

```
RTRV=DFLTTH-T3:[TID]::[CTAG]::[MONTYPE],[LOCN],[TMPER];
```

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MONTYPE	{ALL} NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, CVCP-P, CVCPP, ES-L, ESL, ES-P, ESP, ESA-L, ESAL, ESA-P, ESAP, ESACP-P, ESACPP, ESB-L, ESDL, ESB-P, ESBP, EBCP-P, EBCPP, ESCP-P, ESCPP, FC-P, FCP, LOSS, LOSS-L, LOSSL, SAS-P, SASP, SES-L, SEL, SES-P, SESP, SESCP-P, SESCOP, UAS-P, UASP, UASCP-P, UASCOP}, FAR_END_PARAMETERS:{CVCPP, ESACP-P, ESACPP, EBCP-P, EBCPP, ESCP-P, ESCPP, FCCP-P, FCCPP, SASCP-P, SASCPP, SESCO-P, SESCOP, UASCP-P, UASCOP} Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose system default threshold level setting is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are: <div style="margin-left: 40px;"> All All, all monitored parameter PM registers. AISS, AISS-P, AISSP Alarm Indication Signal Seconds – Path, AISS register. (Near-end only.) CV-L, CVL Coding Violations – Line, CV-L register. (Near-end electrical T3 only.) CV-P, CVP Coding Violations – Path, CV-P register. (Near-end only.) </div>

CVCP-P, CVCPP	Code Violations, CP-bit parity – Path, CVCP-P register.
ES-L, ESL	Errored Seconds – Line, ES-L register. (Near-end electrical T3 only.)

ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register. (Near-end electrical T3 only.)
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register. (Near-end only.)
ESACP-P, ESACPP	Errored Seconds type A, CP-bit parity – Path, ESACP-P register.
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register. (Near-end electrical T3 only.)
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register. (Near-end only.)
ESBCP-P, ESBCPP	Errored Seconds type B, CP-bit parity – Path, ESBCP-P register.
ESCP-P, ESCPP	Errored Seconds, CP-bit parity – Path, ESCP-P register.
FC-P, FCP	Failure Counts – Path, FC-P register. (Near-end only.)
FCCP-P, FCCPP	Failure Counts, CP-bit parity – Path, FC-P register. (Far-end only.)
LOSS, LOSS-L, LOSSL	Loss Of Signal Seconds – Line, LOSS register. (Near-end electrical T3 only.)
SAS-P, SASP	Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
SASCP-P, SASCPP	Severe AIS Seconds, CP-bit parity – Path, SASCP-P register. (Far-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register. (Near-end electrical T3 only.)
SES-P, SESP	Severely Errored Seconds – Path, SES-P register. (Near-end only.)
SESCP-P, SESCPP	Severely Errored Seconds, CP-bit parity – Path, SESCP-P register.
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register. (Near-end only.)
UASCP-P, UASCPP	Unavailable Seconds, CP-bit parity – Path, UASCP-P register.
Restrictions:	RTRV-DFLTTH-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).
LOCN	{FEND, NEND}
Default:	< All applicable locations for the selected monitored parameters >
Addressing:	None
Description:	Location, specifies whether system default threshold levels for near-end or far-end monitored parameters are to be retrieved. Values are:
FEND	Far-End
NEND	Near-End
Restrictions:	RTRV-DFLTTH-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).

TMPER {15-MIN, 1-DAY}
Default: {15-MIN}
Addressing: None
Description: Time Period, specifies whether system default threshold levels for the 15-minute or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
 15-MIN 15-Minute PM collection register
 1-DAY 1-Day (24 hour) PM collection register

COMMAND CODE: **RTRV-DFLTTH-VT1**
COMMAND NAME: **RETRIEVE DEFAULT THRESHOLD VT1**

PURPOSE

The RTRV-DFLTTH-VT1 command retrieves the system provisioning default threshold level (THLEV) for the monitored PM (Performance Monitoring) parameter identified by MONTYPE (monitored parameter type), LOCN (near-end or far-end location), and TMPER (15-minute or 1-day). (The system default THLEV for each monitored VT1.5 PM parameter is set via the SET-DFLTTH-VT1 command.)

The successful response for a RTRV-DFLTTH-VT1 command contains one line of parsable output data for each monitored parameter's system default threshold level setting being reported.

A RTRV-DFLTTH-VT1 command is denied if:

- An invalid parameter value is entered.

COMMAND CODE: **RTRV-DGN-STATUS**
COMMAND NAME: **RETRIEVE DIAGNOSTIC STATUS**

PURPOSE

The RTRV-DGN-STATUS command retrieves the diagnostic test results stored on the system disk for the specified equipment entity.

The most recent diagnostic test results are stored on the system disk as a result of:

- A power-up diagnostic test (except the power-up diagnostic test results for a CPU, IPU, or SPB equipment entity).
- A RST-EQPT command (except the diagnostic test results for a CPU, IPU, or SPB equipment entity).
- A DGN-EQPT command.

The successful response to a RTRV-DGN-STATUS command contains a line of non-parsable output data which indicates the time of the last diagnostics (only reported if a diagnostic test has been executed), a line for each test phase executed on the specified equipment entity, and a line for each test phase that failed or had inconclusive test results.

If test results of a test phase for the specified equipment entity are not stored on the system disk (have not been executed), the output response displays "Not Available" as the test results.

Results of RTRV-DGN-STATUS are always inconclusive for any ACL link statistics test phase that is supported on a CIM. The results of any ACL link statistics test phase (e.g., number of link transmissions per unit interval) are reported as non-parsable free-format text in that particular test phase's <Result_Reason> output block.

A RTRV-DGN-STATUS command is denied if:

- The specified equipment entity is not provisioned (via ENT-EQPT).
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-DGN-STATUS : [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {ACM-1-2-{3-7, 10-14}} {CDA-{4, 5, 10, 11, 16, 17, 22, 23, 102, 103 }-3-1} {CDB-{5}-{1, 3}-{1, 2}} CDB-{2-43, 104-111 ,112-135, 136-141 }-{1, 3}-{1, 2} {SI36: CDB-{6-9, 12-15, 18-21, 24-43}-{1, 3}-{1-2}, SI48: CDB-{2-43, 104-111 ,112-135, 136-141 }-{1, 3}-{1, 2} {CIM-1-2-{3-7, 10-14}} {CPU-1-2-{1-2}} {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} {DSI-{44-63}-{1-4}-{1-32}} {DSK-1-3-1, DSK-1-4-2} {EOB-{5}-{1, 3}-{1-5}} {SI48: EOB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}, EOC: EOB-{4-5, 10-11, 16-17, 22-23, 102, 103 }-1-{1-7, 9-15}}

 {SWI-{44-63}-{1-4}-{1-7, 9-15, 17-23, 25-31}}
Default: Entry Required
Addressing: None
Description: Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.

CTAG < 1-6 VALID CTAG CHARACTERS >
Default: < System assigned CTAG value >
Addressing: None
Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* Time of Last Diag: <Diag_Dat_Tm> */]
  [/* <Phase_Number> <Phase_Name> : <Phase_Result> */]
  [/* <Phase_Number> Reason: <Result_Reason> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

Note: The line of text containing the <Result_Reason> is provided for each test phase with a <Test_Result> of either "Failed" or "Inclusive".

OUTPUT PARAMETERS

Diag_Dat_Tm {YY-MM-DD HH:MM:SS{ {00-99}-{1-12}-{1-31} {00-23}:{00-59}:{00-59} } }
 Diagnostic Date and Time, identifies the date and time when the last diagnostic was executed. The format for DIAG_DAT_TM is <YEAR> - <MONTH> - <DAY>^<HOUR>:<MINUTE>:<SECOND> (where ^ indicates a space). This line of output is only reported if a diagnostic test has been executed.

Phase_Number {1-16}
 Test Phase, identifies the diagnostic test phase that was executed. Refer to the DGN-EQPT command for the test phases that can be executed for each circuit pack.

Phase_Name <Name of the test phase that was executed>
 Phase Name, identifies the name of the test phase that was executed. Refer to the DGN-EQPT command for the test phases that can be executed for each circuit pack.

Phase_Result {Failed, Inconclusive, Not Available, Passed}
 Test Result, indicates the results of the diagnostic test. Values are:
 Failed Failed, the equipment entity failed the test phase.
 Inconclusive Inconclusive, the results of this test phase are inconclusive for the reason described by <Result_Reason>.
 Not Available Test results are not available (not stored on the system disk because the test phase was not executed).
 Passed Passed, the equipment entity passed the test phase.

Result_Reason <Reason for a Failed or Inconclusive Test Result>
 Failed/Inconclusive Result Reason, indicates the reason the Test_Result was either "Failed" or "Inconclusive". Note, this information is useful to Alcatel repair personnel and may or may not be useful to a craft person.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```
ENRE     Equipage, Not Recognized Equipage
          /* Invalid or unassigned equipment identifier specified. */
IIAC     Input, Invalid ACcess identifier
          /* Invalid or unassigned equipment identifier specified. */
```

EXAMPLES

In the following example, the latest diagnostic test results for EP3-7-3-1 are retrieved from the system disk.

```
RTRV-DGN-STATUS::EP3-7-3-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
/* Time of Last Diag: <96-07-12> <15:20:13> */
/* 1 Card Presence and Card ID Test           : Passed */
/* 2 Fuse Test                                 : Passed */
/* 3 Load Check                               : Passed */
/* 4 Processor Bus Test                        : Passed */
/* 5 Memory Transfer Link Bus Test           : Passed */
/* 6 EP3 Module Test                           : Passed */
/* 7 Clock and Frame Test                      : Passed */
/* 8 Duplex to Simplex Converter Test         : Passed */
/* 9 STM Signal Process Test                  : Passed */
/* 10 Serial/Parallel Converter Test          : Passed */
/* 11 Multiplexer / Demultiplexer Test       : Passed */
/* RTRV-DGN-STATUS::EP3-7-3-1 [Pad567] (2) */

COMMAND CODE: **RTRV-EC1**
COMMAND NAME: **RETRIEVE EC1**

PURPOSE

The RTRV-EC1 command retrieves the provisioned parameter values, supporting I/O circuit pack AID, near end and far end facility alarm conditions, and current PST,SST state for the specified EC1 port. The EC1 port's current provisioned values and conditions (if provisioned), and state are retrieved from the system database. The command is executed regardless of the state of the EC1.

The successful response for a RTRV-EC1 command contains one line of parsable output data, in ascending order (from lowest specified EC1 AID to largest specified EC1 AID), for each EC1 AID specified. Values for NEN-DALM and FENDALM are only displayed if a condition exists. Only <AID> and <PST,SST> are displayed for a retrieve of an unprovisioned EC1.

A RTRV-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-EC1: [TID]:AID: [CTAG];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the EC1 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>: :AINSTH=<value>, [CARDID=<value>[, FENDALM=<value>]
  [, NENDALM=<value>]] :<PST>, [<SST>]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) EC1 AID indicates the EC1 port to which this line of output data pertains.
-----	---

AINSTH	<p>{HH-MM:{00–48} – {00–59} }</p> <p>Automatic In–Service Threshold. Specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS–L alarm condition before the system puts the facility into the In–Service state. The factory default is 8 hours. The valid value is:</p> <table> <tr> <td>HH-MM</td><td>Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively.</td></tr> </table>	HH-MM	Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively.																
HH-MM	Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IIAC      Input, Invalid ACcess identifier
SDBE      Status, internal Data Base Error
           /* GetAidEntry() Error: <ERROR-STRING> */
           /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
           /* TPidToAidStr() Error: <ERROR-STRING> */
           /* TPidToTbss() Error: <ERROR-STRING> */
SROF      Status, Requested Operation Failed

```

EXAMPLES

In the following example, the provisioning data for EC1 port EC1-12 is retrieved.

```

RTRV-EC1::EC1-12;

The output response, shown below, assumes CID 2 was used to enter the command and a system gener-
ated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system,
and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"EC1-12::AINSTH=05-30,CARDID=EP3-2-1-2:IS"
/* RTRV-EC1::EC1-12 [Pad567] (2) */
;

```

In the following example, the provisioning data for EC1 ports EC1-10 through EC1-14 is retrieved.

```

RTRV-EC1::EC1-10&&-14;

The output response, shown below, assumes CID 6 was used to enter the command and a system gener-
ated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system,
and the date and time the command was executed.

COMMAND CODE: **RTRV-ELF**
COMMAND NAME: **RETRIEVE EVENT LOG FILE**

PURPOSE

The RTRV-ELF command selectively retrieves the output response messages, stored in the system's disk output buffer, that were generated by the system between the specified FRDATM (From Date and Time) and TODATM (To Date and Time) values and/or due to commands entered by the specified UID (User ID).

The system stores all output response messages in the disk output buffer. The types of output response messages consist of:

- Solicited Response Messages, Successful or Unsuccessful (CANCLD, COMPL, DELAY, DENY, or PRTL), caused by the execution of a command input message.
- Acknowledgement Response Messages, IP (In Progress) or OK (Good) messages.
- Autonomous Response Messages (KEEP^ALIVE, REPT^ALM, REPT^DBCHG, REPT^EVT, REPT^HWSW, REPT^INFO, REPT^INITZN, or REPT^PM).

Refer to the Introduction for a description of response messages and message formats. Refer to Section 2 for the output response format and data for each command. Refer to Section 3 for the output response format and data for each autonomous response message.

The successful response for a RTRV-ELF command encloses any retrieved output response messages as non-parsable text (i.e., encloses the retrieved output response messages within the /*...*/ characters). Each retrieved output response message is reported in the same format as when it was generated by the system with the exception that

- all message termination characters (semicolon, greater-than, or less-than characters) are removed from any retrieved output response message,
- any non-parsable text line contained within a retrieved output response message is enclosed within the back-slash (\) escape character, and
- a blank line (cr lf lf) is provided between each retrieved output response message.

In addition, the successful response for a RTRV-ELF command contains one or two lines of non-parsable text, depending on whether any output response messages are retrieved from the disk output buffer.

Note: The size of the output response is limited to the value set in the RSML parameter in ED-PRMTR-SITE. To change the maximum size of a RTRV-ELF successful response, the user must change the RSML value in ED-PRMTR-SITE. If the output is larger than specified in the RSML parameter, it will be truncated and subsequent RTRV-ELF commands will have to be issued to retrieve all data.

A RTRV-ELF command is denied if:

- An invalid parameter value or combination of parameter values is entered.

Note that the RTRV-ELF command can only retrieve output response messages that are "marked" with a date and time prior to the current system date and time. Consequently, if the system date and time is set backwards in time, any output response messages that have a resulting future date/time mark will not be retrieved until the system date/time increments past a response message's date/time mark.

In addition, the RTRV-ELF command only stores output response messages for RTRV-rr commands in the event log buffer for one hour. After that time, a message (e.g., "Report file (/rpt/t1.buc) has been reused") is stored in place of the previously existing output response message.

INPUT FORMAT

RTRV-ELF: [TID] : : [CTAG] : : [FRDATM] , [TODATM] , [UID] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

CTAG	<p>< 1–6 VALID CTAG CHARACTERS ></p> <p>Default: < System assigned CTAG value ></p> <p>Addressing: None</p> <p>Description: Correlation Tag, associates input command with its output responses.</p>
FRDATM	<p>{YY–MM–DD–hh–mm–ss:{ {00–37,70–99}–{01–12}–{01–31}–{00–23}–{00–59}–{00–59} }</p> <p>Default: <Oldest Date & Time in the Disk Output Buffer></p> <p>Addressing: None</p> <p>Description: From Date and Time, specifies the beginning date and time used to filter the response messages from the disk output buffer. The current system date and time is used if a future date and time is specified for FRDATM. The format of FRDATM is <Year> – <Month> – <Day> – <Hour> – <Minutes> – <Seconds>. Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and 00 through 37 are interpreted as the year 2000 through the year 2037.</p> <p>Restrictions: RTRV–ELF is denied if the value for FRDATM is <i>not</i> older than the value for TODATM.</p>

Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and 00 through 37 are interpreted as the year 2000 through the year 2037.</p> <p>Restrictions: RTRV–ELF is denied if the value for TODATM is older than the value for FRDATM.</p>
UID	<p><VALID UID></p> <p>Default: <All UIDs></p> <p>Addressing: None</p> <p>Description: User Identifier, specifies the UID, or all UIDs, used to filter the response messages from the disk output buffer.</p>

SUCCESSFUL RESPONSE FORMAT

The following successful response format is provided when there are response messages in the disk output buffer that satisfy the filtering criteria specified by the command's parameter values.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> <Compl_Code>
    /*
    [<Header Line for the 1st Retrieved Message>]
<Completion Code Line for the 1st Retrieved Message>
    ["<Any Parsable Text Line in the 1st Retrieved Message>"]
    [\/* <Any Non-Parsable Text Line in the 1st Retrieved Message> \*/]
    ...
    ...
    ...
    [<Header Line for the Last Retrieved Message>]
<Completion Code Line for the Last Retrieved Message>
    ["<Any Parsable Text Line in the Last Retrieved Message>"]
    [\/* <Any Non-Parsable Text Line in the Last Retrieved Message> \*/]
    */
    /* First Retrieved Message Date & Time = <FRDATM> */
    /* Last Retrieved Message Date & Time = <TODATM> */
    [\/* <RTRV-ELF Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

The following successful response format is provided if there are *no* response messages in the disk output buffer that satisfy the filtering criteria specified by the command's parameter values.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* No Retrieved Messages */]
    [\/* <RTRV-ELF Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* No Retrieved Messages */]
    [\/* <RTRV-ELF Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

The following successful response format is provided if one hour has passed since the output response of a RTRV-rr command was initially stored in the disk output buffer that satisfied the filtering criteria specified by the command's parameter values.

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* Report file(/rpt/xxxxx.xxx) has been reused */]
    [\/* <RTRV-ELF Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

Compl_Code	{COMPLD, PRTL}
	Completion Code for the RTRV-ELF command. Values are:
	COMPLD Completed, indicates the RTRV-ELF response output contains all of the requested response messages.
	PRTL Partial, indicates the RTRV-ELF response output does not contain all of the requested response messages and a subsequent RTRV-ELF command(s) is required to retrieve the remaining response messages.

FRDATM	<p>{YY-MM-DD-hh-mm-ss:{ {00-37,70-99}-{01-12}-{01-31}-{00-23}-{00-59}-{00-59} } }</p> <p>From Date and Time, identifies the date and time of the first response message retrieved from the disk output buffer. The format of FRDATM is <Year> – <Month> – <Day> – <Hour> – <Minutes> – <Seconds>.Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and 00 through 37 are interpreted as the year 2000 through the year 2037.</p>
TODATM	<p>{YY-MM-DD-hh-mm-ss:{ {00-37,70-99}-{01-12}-{01-31}-{00-23}-{00-59}-{00-59} } }</p> <p>To Date and Time, identifies the date and time of the last response message retrieved from the disk output buffer. The format of TODATM is <Year> – <Month> – <Day> – <Hour> – <Minutes> – <Seconds>.Values for <YY> from 70 through 99 are interpreted as the year 1970 through the year 1999 and 00 through 37 are interpreted as the year 2000 through the year 2037.</p>

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
IDNV	Input, Data Not Valid
SDBE	Status, internal Data Base Error

EXAMPLES

In the following example, the response messages generated by the system on 5/14/95 from 12:10 p.m. to 12:15 p.m. are retrieved from the disk output buffer.

```
RTRV-ELF:::::95-05-14-12-10-00,95-05-14-12-15-00;
```

The output response, shown below, assumes CID 6 was used to enter the command and a system generated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The example output assumes no other response messages were generated by the system during the time frame specified.

RELATED COMMANDS

ED-PRMTR-SITE
RTRV-PRMTR-SITE

COMMAND CODE: **RTRV-EQPT**
COMMAND NAME: **RETRIEVE EQUIPMENT**

PURPOSE

The RTRV-EQPT command retrieves equipment entity provisioning data, status, and state of the specified equipment entity. Parsable output parameters and values are only reported if they pertain to the specified AID. No parsable output data other than the PST,SST values are provided if the specified AID is not provisioned (it has an SST of UAS). The command is executed regardless of the state of the specified equipment AID, unless that AID is an unprovisioned SHELF or is a module residing in an unprovisioned SHELF.

A RTRV-EQPT command is denied if:

- The specified equipment entity is an unprovisioned SHELF or resides in an unprovisioned SHELF.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-EQPT: [TID] :AID: [CTAG] ;

Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.

- ACL1= {ACL-1-2-{9, 13, 17, 21, 25, 37, 41, 45, 49, 53} }
Administration Communication Link Number 1, identifies the ACL AID of the first ACL on the specified ACM or CIM equipment. ACL1=<value> is only reported if the specified AID identifies an ACM or CIM circuit pack.
- ACL2= {ACL-1-2-{10, 14, 18, 22, 26, 38, 42, 46, 50, 54} }
Administration Communication Link Number 2, identifies the ACL AID of the second ACL on the specified ACM or CIM equipment. ACL2=<value> is only reported if the specified AID identifies an ACM or CIM circuit pack.
- ACL3= {ACL-1-2-{11, 15, 19, 23, 27, 39, 43, 47, 51, 55} }
Administration Communication Link Number 3, identifies the ACL AID of the third ACL on the specified ACM or CIM equipment. ACL3=<value> is only reported if the specified AID identifies an ACM or CIM circuit pack.
- ACL4= {ACL-1-2-{12, 16, 20, 24, 28, 40, 44, 48, 52, 56} }
Administration Communication Link Number 4, identifies the ACL AID of the fourth ACL on the specified ACM or CIM equipment. ACL4=<value> is only reported if the specified AID identifies a ACM or CIM circuit pack.
- ACL5= {ACL-1-2-{65, 69, 73, 77, 81, 93, 97, 101, 105, 109} }
Administration Communication Link Number 5, identifies the ACL AID of the fifth ACL on the specified ACM equipment. ACL5=<value> is only reported if the specified AID identifies an ACM circuit pack.

ACL6=	{ACL-1-2-{66, 70, 74, 78, 82, 94, 98, 102, 106, 110} } Administration Communication Link Number 6, identifies the ACL AID of the fifth ACL on the specified ACM equipment. ACL6=<value> is only reported if the specified AID identifies an ACM circuit pack.						
ACL7=	{ACL-1-2-{67, 71, 75, 79, 83, 95, 99, 103, 107, 111} } Administration Communication Link Number 7, identifies the ACL AID of the fifth ACL on the specified ACM equipment. ACL7=<value> is only reported if the specified AID identifies an ACM circuit pack.						
ACL8=	{ACL-1-2-{68, 72, 76, 80, 84, 96, 100, 104, 108, 112} } Administration Communication Link Number 8, identifies the ACL AID of the fifth ACL on the specified ACM equipment. ACL8=<value> is only reported if the specified AID identifies a ACM circuit pack.						
APPN=	{EP3APPS, ES1APPS, MCBAPPS, O1BAPPS, O4MAPPS, OXBAPPS, S3MAPPS} Application Software Name, identifies the name of the application software stored in the Flash EEPROM on the specified circuit pack. APPN=<value> is only reported if the specified AID identifies an EP3, ES1, MCB, O1B, O4M, OXB, or S3M.						
APPV=	<8 HEXADECIMAL DIGIT APPLICATION SOFTWARE VERSION NUMBER> Application Software Version Number, identifies the version number of the application software stored in the Flash EEPROM on the specified circuit pack. APPV=<value> is only reported if the specified AID identifies an EP3, ES1, MCB, O1B, O4M, OXB, or S3M.						
AUTCLK=	{DISABLED, ENABLED} Auto Clock Selection, indicates whether automatic clock copy selection is enabled. AUTCLK=<value> is only reported if the specified AID identifies a SHELF or QUAD. Values are: <table> <tr> <td>DISABLED</td><td>Disabled; auto clock copy selection is disabled.</td></tr> <tr> <td>ENABLED</td><td>Enabled; auto clock copy selection is enabled.</td></tr> </table>	DISABLED	Disabled; auto clock copy selection is disabled.	ENABLED	Enabled; auto clock copy selection is enabled.		
DISABLED	Disabled; auto clock copy selection is disabled.						
ENABLED	Enabled; auto clock copy selection is enabled.						
AUTCLKMD=	{N, Y} Automatic Clock Mode. Indicates whether the MCB CLKMDE is entered automatically or manually. AUTCLKMD=<value> is only reported if the specified AID identifies an MCB and its associated TMG parameter value is EXT1544. Values are: <table> <tr> <td>Y</td><td>Yes. The CLKMDE is entered automatically.</td></tr> <tr> <td>N</td><td>No. The CLKMDE is entered manually.</td></tr> </table>	Y	Yes. The CLKMDE is entered automatically.	N	No. The CLKMDE is entered manually.		
Y	Yes. The CLKMDE is entered automatically.						
N	No. The CLKMDE is entered manually.						
AUTDAT=	{DISABLED, ENABLED} Auto Data Selection, indicates whether automatic matrix data copy selection is enabled for the specified I/O shelf. AUTDAT=<value> is only reported if the specified AID identifies an I/O SHELF or QUAD. Values are: <table> <tr> <td>DISABLED</td><td>Disabled; auto data selection is disabled.</td></tr> <tr> <td>ENABLED</td><td>Enabled; auto data selection is enabled to select the better of the two matrix copies. It does not mean that both matrix sides are good.</td></tr> </table>	DISABLED	Disabled; auto data selection is disabled.	ENABLED	Enabled; auto data selection is enabled to select the better of the two matrix copies. It does not mean that both matrix sides are good.		
DISABLED	Disabled; auto data selection is disabled.						
ENABLED	Enabled; auto data selection is enabled to select the better of the two matrix copies. It does not mean that both matrix sides are good.						
AUTSWTIME=	{YY-MM-DD,HH-MN-SS:{00-99} - {1-12} - {1-31},{00-23} - {00-59} - {00-59} } Auto Clock Switching Time, indicates the date and time of the last automatic MCB copy switch (due to detection of a failure). AUTSWTIME=<value> is only reported if the specified AID identifies an MCB.						
BACKPLANE=	{HIGH, NA, NORM} ES Backplane Type, indicates the type of backplane installed in the specified ES Shelf. BACKPLANE=<value> is only reported if the specified AID identifies an ES Shelf. BACKPLANE=<value> is not valid for 240 port systems. Values are: <table> <tr> <td>HIGH</td><td>High density ES backplane is installed.</td></tr> <tr> <td>NA</td><td>Not Available, the shelf processor is not responding.</td></tr> <tr> <td>NORM</td><td>Normal density ES backplane is installed.</td></tr> </table>	HIGH	High density ES backplane is installed.	NA	Not Available, the shelf processor is not responding.	NORM	Normal density ES backplane is installed.
HIGH	High density ES backplane is installed.						
NA	Not Available, the shelf processor is not responding.						
NORM	Normal density ES backplane is installed.						

CBLENGTH=	<p><Integers in 5 meter increments from 5 through 500 meters> Optical Cable Length (in meters), indicates the cable length (in meters) of the optical cable between a DS1 or DS3 Quad shelf and the EOC shelf or between an SI36 or SI48 shelf and the EOC shelf. CBLENGTH=<value> is only reported if the specified AID identifies a QUAD or identifies a SHELF (with MTXINTF of OPTCL).</p>								
CLEI=	<p>{<UP TO 10 ALPHANUMERIC CLEI CHARACTERS>, NA} Circuit Pack Common Language Equipment Identification code, identifies the CLEI code stored in the Remote Inventory EEPROM for the specified equipment. CLEI=<value> is only reported if the specified AID identifies a CDA, CDB, DSB, EOB, EP3, ES1, IOB, IPB, M16, M32, M40, MCB, O1B, O4M, P39, P56, RPB, S3M, or SPB. Values are:</p> <table> <tr> <td><CLEI CODE></td><td>Common Language Equipment Identification code.</td></tr> <tr> <td>NA</td><td>Not Available, the CLEI code cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).</td></tr> </table>	<CLEI CODE>	Common Language Equipment Identification code.	NA	Not Available, the CLEI code cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).				
<CLEI CODE>	Common Language Equipment Identification code.								
NA	Not Available, the CLEI code cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).								
CLKDEST=	<p>EQPT_AID: {CDA-{4, 5, 10, 11, 16, 17, 22, 23, 102, 103}-3-1} {CDB-{5}-{1, 3}-{1, 2}} CDB-{2-43,104-111,112-135,136-141}-{1, 3}-{1, 2} {SI36: CDB-{6-9, 12-15, 18-21, 24-43}-{1, 3}-{1-2}, {SI48: CDB-{2-43,104-111,112-135,136-141}-{1, 3}-{1, 2}} Clock Destination, identifies the provisioned clock equipment entities receiving the system clock from the specified equipment entity. Multiple equipment AIDs may be shown combined with an ampersand (&). CLKDEST=<value> is only reported if the specified AID identifies a CDA or an MCB.</p>								
CLKMDE=	<p>{FAST, FREE-RUNNING, HOLDOVER, NORMAL} Clock Tracking Mode. Indicates the MCB master clock to external clock reference tracking mode if the specified MCB is the master (as indicated by the CONTSTAT parameter), or indicates the slave clock to master clock reference tracking mode if the specified MCB is the slave (as indicated by the CONTSTAT parameter). CLKMDE=<value> is only reported if the specified AID identifies an MCB. Values are:</p> <table> <tr> <td>FAST</td><td>The slave clock is in fast pull-in of the master clock reference and the master clock is in fast pull-in of the external clock. After achieving the synchronization, CLKMDE automatically changes to NORMAL mode.</td></tr> <tr> <td>FREE-RUNNING</td><td>The master/slave clock is operating such that the output signal is totally internally controlled with no influence of a present or previous external/master reference.</td></tr> <tr> <td>HOLDOVER</td><td>The master/slave clock has lost its previously-connected external reference source and is using data acquired during the Normal mode or using internal data to control its output.</td></tr> <tr> <td>NORMAL</td><td>The slave clock is aligned to and tracking the master clock reference and the master clock is aligned to and tracking the external clock reference source.</td></tr> </table>	FAST	The slave clock is in fast pull-in of the master clock reference and the master clock is in fast pull-in of the external clock. After achieving the synchronization, CLKMDE automatically changes to NORMAL mode.	FREE-RUNNING	The master/slave clock is operating such that the output signal is totally internally controlled with no influence of a present or previous external/master reference.	HOLDOVER	The master/slave clock has lost its previously-connected external reference source and is using data acquired during the Normal mode or using internal data to control its output.	NORMAL	The slave clock is aligned to and tracking the master clock reference and the master clock is aligned to and tracking the external clock reference source.
FAST	The slave clock is in fast pull-in of the master clock reference and the master clock is in fast pull-in of the external clock. After achieving the synchronization, CLKMDE automatically changes to NORMAL mode.								
FREE-RUNNING	The master/slave clock is operating such that the output signal is totally internally controlled with no influence of a present or previous external/master reference.								
HOLDOVER	The master/slave clock has lost its previously-connected external reference source and is using data acquired during the Normal mode or using internal data to control its output.								
NORMAL	The slave clock is aligned to and tracking the master clock reference and the master clock is aligned to and tracking the external clock reference source.								
CLKREF=	<p>{COPY0, COPY1} Clock Reference, identifies the copy of the system clock being provided to the specified Shelf or Quad. CLKREF=<value> is only reported if the specified AID identifies a SHELF or QUAD and selection of system clock is locked to a copy (i.e., AUTCLK of DISABLED). Values are:</p> <table> <tr> <td>COPY0</td><td>Selection of system clock is locked to copy 0 for the specified SHELF or QUAD.</td></tr> <tr> <td>COPY1</td><td>Selection of system clock is locked to copy 1 for the specified SHELF or QUAD.</td></tr> </table>	COPY0	Selection of system clock is locked to copy 0 for the specified SHELF or QUAD.	COPY1	Selection of system clock is locked to copy 1 for the specified SHELF or QUAD.				
COPY0	Selection of system clock is locked to copy 0 for the specified SHELF or QUAD.								
COPY1	Selection of system clock is locked to copy 1 for the specified SHELF or QUAD.								

CLKSRC=	<p>EQPT_AID: {CDA-{4, 5, 10, 11, 16, 17, 22, 23, 102, 103}-3-1} {MCB-{2,3}-3-1} {MCB-{5}-{1,3}-{1}} Clock Source, identifies the provisioned clock equipment entity that provides the system clock to the specified equipment entity. CLKSRC=<value> is only reported if the specified AID identifies a CDA or CDB.</p>
CLKSTAT=	<p>{NOT-READY, READY} Clock Status, indicates whether the clock oscillator on the specified MCB is tracking the master MCB clock oscillator so that a clock copy switch to the specified MCB would be hit-less. CLKSTAT=<value> is only reported if the specified AID identifies an MCB. Values are: NOT-READY The specified MCB is not tracking the master MCB clock and is not ready for a hit-less clock copy switch. READY The specified MCB is tracking the master MCB clock and is ready for a hit-less clock copy switch. (The master MCB is always reported READY.)</p>
CONTSTAT=	<p>{MASTER, SLAVE} Clock Control Status, indicates whether the specified clock entity is the master or slave. CONTSTAT=<value> is only reported if the specified AID identifies a CDB, an MCB or an OXB. Values are: MASTER The circuit pack is the clock master. SLAVE The circuit pack is the clock slave.</p>
CSTYPE=	<p>{M16, M40} Center Stage (Shelf) Type, identifies the type of Center Stage Shelf. CSTYPE=<value> is only reported if the specified AID identifies a Center Stage Shelf. Values are: M16 The Center Stage Shelf type is M16 (not applicable to 240 port LMC systems). M40 The Center Stage Shelf type is M40.</p>
CURPROT=	<p>{AUTO-PROT, MAN-PROT, O-PROT} Current Protection Type, indicates whether the specified I/O circuit pack is switched to protection. CURPROT=<value> is only reported if the specified AID identifies a DSI, EP3, ES1, HMU, or LMU. Values are: AUTO-PROT Automatic-Protection, the system automatically switched the I/O circuit pack to protection (due to a system-detected fault). MAN-PROT Manual-Protection, the I/O circuit pack is switched to protection due to command execution. NO-PROT No-Protection, the I/O circuit pack is not switched to protection. (An I/O protection circuit pack is always reported NO-PROT.)</p>
DATACOPY=	<p>{COPY0, COPY1} Data Copy, indicates the copy of matrix transmission data that is being selected if the I/O shelf is locked to a specific copy. DATACOPY=<value> is only reported if the specified AID identifies an I/O SHELF or QUAD and selection of matrix data is locked to a copy (i.e., AUTDAT of DISABLED). Values are:</p>
DESC=	<p><0-62 ASCII CHARACTERS> Rack Description Text, identifies any text description (e.g., physical location) associated with a specified SHELF/QUAD/RACK AID. DESC= <value> is only reported if the specified AID identifies a SHELF/QUAD/RACK. If the DESC parameter provisioned for a SHELF/QUAD/RACK is ASCII nulls, the DESC parameter is not displayed in the output parameters of the RTRV-EQPT command.</p>

DFLTSIG=	<p>{ASYNC, CBIT, STS1}</p> <p>Default Signal, indicates the type of (default) signal transmitted by an EP3 circuit pack (in a FlexPoint Half-Shelf), after the EP3 has powered-on and database is downloaded, for each of the supported unprovisioned facilities (the signal transmitted for provisioned facilities is based on the facility provisioning). DFLTSIG= <value> is only reported if the specified AID identifies an EP3 and the associated LHSTYPE or UHSTYPE value is EP3F48. Values are:</p> <table><tr><td>ASYNC</td><td>Asynchronous DS3, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is M13 formatted DS3 with DS1 AIS on all embedded DS1s.</td></tr><tr><td>CBIT</td><td>C-Bit DS3, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is C-Bit formatted DS3 with DS1 AIS on all embedded DS1s.</td></tr><tr><td>STS1</td><td>Unequipped STS-1, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is Unequipped STS-1.</td></tr></table>	ASYNC	Asynchronous DS3, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is M13 formatted DS3 with DS1 AIS on all embedded DS1s.	CBIT	C-Bit DS3, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is C-Bit formatted DS3 with DS1 AIS on all embedded DS1s.	STS1	Unequipped STS-1, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is Unequipped STS-1.		
ASYNC	Asynchronous DS3, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is M13 formatted DS3 with DS1 AIS on all embedded DS1s.								
CBIT	C-Bit DS3, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is C-Bit formatted DS3 with DS1 AIS on all embedded DS1s.								
STS1	Unequipped STS-1, the default transmitted signal for unprovisioned ports on the specified EP3 (in a FlexPoint Half-Shelf) is Unequipped STS-1.								
DIST=	<p>{LONG, MAX, MED, SHORT}</p> <p>DS1 Cable Distance, identifies the provisioned cable length of the DS1 cable connected to the specified DSI. DIST=<value> is only reported if the specified AID identifies a DSI. Values are:</p> <table><tr><td>LONG</td><td>440 – 550 feet</td></tr><tr><td>MAX</td><td>> 550 feet</td></tr><tr><td>MED</td><td>220 – 440 feet</td></tr><tr><td>SHORT</td><td>0 – 220 feet</td></tr></table>	LONG	440 – 550 feet	MAX	> 550 feet	MED	220 – 440 feet	SHORT	0 – 220 feet
LONG	440 – 550 feet								
MAX	> 550 feet								
MED	220 – 440 feet								
SHORT	0 – 220 feet								
ESTYPE=	<p>{M16, M32}</p> <p>End Stage (Shelf) Type, identifies the type of End Stage Shelf. ESTYPE=<value> is only reported if the specified AID identifies a End Stage Shelf. Values are:</p> <table><tr><td>M16</td><td>The End Stage Shelf type is M16 (not applicable to 240 port LMC systems).</td></tr><tr><td>M32</td><td>The End Stage Shelf type is M32.</td></tr></table>	M16	The End Stage Shelf type is M16 (not applicable to 240 port LMC systems).	M32	The End Stage Shelf type is M32.				
M16	The End Stage Shelf type is M16 (not applicable to 240 port LMC systems).								
M32	The End Stage Shelf type is M32.								
FIRMN=	<p>{DSBFMWR, EP3FMWR, ES1FMWR, O1BFMWR, O4MFMWR, RPBFMWR, S3MFMWR, SPBFMWR}</p> <p>Firmware Name, identifies the name of the firmware stored in the Flash EEPROM on the specified circuit pack. FIRMN=<value> is only reported if the specified AID identifies a DSB, EP3, ES1, O1B, O4M, RPB, S3M, or SPB.</p>								
FIRMV=	<p><8 HEXADECIMAL DIGIT APPLICATION FIRMWARE VERSION NUMBER></p> <p>Firmware Version Number, identifies the version number of the firmware stored in the Flash EEPROM on the specified circuit pack. FIRMV=<value> is only reported if the specified AID identifies a DSB, EP3, ES1, O1B, O4M, RPB, S3M, or SPB.</p>								
HMUDIST=	<p>{MED, SHORT}</p> <p>HMU Cable Distance, indicates the strap setting for the cable length of the DS3 cable connected to the specified HMU. (Note that HMUDIST is not provisionable.) HMUDIST=<value> is only reported if the specified AID identifies an HMU. Values are:</p> <table><tr><td>MED</td><td>220 – 450 feet</td></tr><tr><td>SHORT</td><td>0 – 225 feet</td></tr></table>	MED	220 – 450 feet	SHORT	0 – 225 feet				
MED	220 – 450 feet								
SHORT	0 – 225 feet								

HWCODE=	{0x0000–0x4000}
	The status of any of 15 hardware locations:
	0x0000 No failures (OK)
	0x0001 Dual-port RAM failure
	0x0002 Sparky ASIC failure
	0x0004 Calvin ASIC failure
	0x0008 A/D converter failure
	0x0010 LOS49M
	0x0020 49M Clock Failure
	0x0040 LOL 3.24M Phase Detector
	0x0080 LOL 2nd pll
	0x0100 slmr52
	0x0200 int52
	0x0400 Clock activity
	0x0800 Comm error
	0x1000 s166
	0x2000 Not ready
	0x4000 MCB card interlink problem
HWMODE=	{NORMAL, FREE–RUNNING, FAST, HOLDOVER}
	Hardware Mode. Indicates the MCB master clock to external clock reference tracking mode if the specified MCB is the master, or indicates the slave clock to master clock reference tracking mode if the specified MCB is the slave. HWMODE=<value> is only reported if the specified AID identifies an MCB. Values are:
	FAST The slave clock is in fast pull–in of the master clock reference, and the master clock is in fast pull–in of the external clock. After achieving the synchronization, HWMODE automatically changes to NORMAL mode.
	FREE–RUNNING The master/slave clock is operating such that the output signal is totally internally controlled with no influence of a present or previous external/master reference.
	HOLDOVER The master/slave clock has lost its previously–connected external reference source and is using data acquired during the Normal mode or using internal data to control its output.
	NORMAL The slave clock is aligned to and tracking the master clock reference and the master clock is aligned to and tracking the external clock reference source.
HWSTATE=	{MASTER, SLAVE}
	Hardware Status Information. Values are:
	MASTER The circuit pack is the clock master.
	SLAVE The circuit pack is the clock slave.

L2PTYPE= {CS, DS1IO, DS3IO, EOC, ES, SI48, SI36, CM}
Level 2 Processor Type, identifies the type of level two processor load pertaining to the specified circuit pack. L2PTYPE=<value> is only reported if the specified AID identifies an IPU or SPB. Values are:

CS	Center-Stage Matrix SPB
DS1IO	DS1 I/O IPU
DS3IO	DS3 I/O IPU
EOC	Electrical Optical Convertor SPB
ES	End-Stage Matrix SPB
SI48	SONET I/O 48 DS3/STS SPB
SI36	SONET I/O 36 DS3/STS SPB
CM	Compact Matrix (240 port LMC matrix) shelf SPB

LBO1= {LONG, SHORT}
Line Build Out 1, identifies the provisioned line build out for the lowest numbered DS3 on the specified circuit pack. LBO1=<value> is only reported if the specified AID identifies an EP3 or ES1. Values are:

LONG	LBO configured for 226 – 450 feet of cable
SHORT	LBO configured for 0 – 225 feet of cable

LBO2= {LONG, SHORT}
Line Build Out 2, identifies the provisioned line build out for the middle numbered DS3 on the specified circuit pack. LBO2=<value> is only reported if the specified AID identifies an EP3 or ES1. Values are:

LONG	LBO configured for 226 – 450 feet of cable
SHORT	LBO configured for 0 – 225 feet of cable

LBO3= {LONG, SHORT}
Line Build Out 3, identifies the provisioned line build out for the highest numbered DS3 on the specified circuit pack. LBO3=<value> only is reported if the specified AID identifies an EP3 or ES1. Values are:

LONG	LBO configured for 226 – 450 feet of cable
SHORT	LBO configured for 0 – 225 feet of cable

LHSTYPE= {EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48, ES1S36, ES148, O1BFH48, O1BSH48, O1BSH48, O4MSH48, O4MFH48}

Lower Half Shelf Type, identifies the type of lower half I/O shelf. LHSTYPE=<value> is only reported if the specified AID identifies an I/O SHELF. Valid values are:

EP3E36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Enhanced capability.
EP3E48	High Density DS3 I/O Shelf with 48 DS3s per shelf containing EP3s that have Enhanced capability.
EP3F36	High Density DS3/STS Shelf with 36 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.
EP3F48	High Density DS3/STS1 I/O Shelf with 48 DS3/STS1s per shelf containing EP3s that have FlexPoint (DS3/STS1) capability.
EP3S36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Standard capability.
EP3S48	High Density DS3 I/O Shelf with 48 DS3s per shelf containing EP3s that have Standard capability.
ES136	High Density STS Shelf with 36 STSs per shelf containing ES1 circuit packs.
ES148	High Density STS1 I/O Shelf with 48 STS1s per shelf containing ES1 circuit packs.
O1BFH48	O1B (OC-3) Shelf with 48 DS3/STS1s per shelf, FlexPoint capability, and Half-bandwidth to the matrix.
O1BSH48	O1B (OC-3) Shelf with 48 STS1s per shelf, SONET capability, and Half-bandwidth to the matrix.
O4MSH48	O4M (OC-12) Standard module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.
O4MFH48	O4M (OC-12) FlexPoint module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.

Mate AID, identifies the equipment AID of the redundant equipment corresponding to the specified AID. MATEAID=<value> is only reported for the AIDs shown above.

MEMCAP= {16M, 32M, 128M}

Memory Capacity, identifies the accessible DRAM memory capacity on the specified CPU. MEMCAP=<value> is only reported if the specified AID identifies the active or standby copy of a CPU. Values are:

16M	16 Megabytes
32M	32 Megabytes
128M	128 Megabytes
1G	1024 Megabytes

MNEMONIC=	<p>{<UP TO 8 ALPHANUMERIC CHARACTER MNEMONIC>, NA}</p> <p>Circuit Pack Mnemonic, identifies the Alcatel mnemonic stored in the Remote Inventory EEPROM for the specified equipment. MNEMONIC=<value> is only reported if the specified AID identifies a CDA, CDB, DSB, EOB, EP3, ES1, IOB, IPB, M16, M32, M40, MCB, O1B, O4M, P39, P56, RPB, S3M, or SPB. Values are:</p> <table> <tr> <td><MNEMONIC></td><td>Mnemonic identifier.</td></tr> <tr> <td>NA</td><td>Not Available, the Mnemonic identifier cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).</td></tr> </table>	<MNEMONIC>	Mnemonic identifier.	NA	Not Available, the Mnemonic identifier cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).		
<MNEMONIC>	Mnemonic identifier.						
NA	Not Available, the Mnemonic identifier cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).						
MODEL=	<p><0–16 ASCII CHARACTERS></p> <p>Model, identifies the model of the disk drive associated with a specified DSK or OPD AID. MODEL= <value> is only reported if the specified AID identifies a DSK or OPD.</p>						
MTPGPL=	<p>{MAXIMUM, MINIMUM, OUT}</p> <p>Mate Power Group Power Level, indicates the available power status of the power supply group that corresponds to the opposite copy (mate) of the specified power supply. MTPGPL=<value> is only reported if the specified AID identifies a P39, P56, or PSF. Values are:</p> <table> <tr> <td>MAXIMUM</td><td>All power supplies in the opposite copy power supply group are in-service and functional.</td></tr> <tr> <td>MINIMUM</td><td>A minimum number of the required power supplies in the opposite copy power supply group are in-service and functional.</td></tr> <tr> <td>OUT</td><td>There is an insufficient number of in-service and functional power supplies in the opposite copy power supply group.</td></tr> </table>	MAXIMUM	All power supplies in the opposite copy power supply group are in-service and functional.	MINIMUM	A minimum number of the required power supplies in the opposite copy power supply group are in-service and functional.	OUT	There is an insufficient number of in-service and functional power supplies in the opposite copy power supply group.
MAXIMUM	All power supplies in the opposite copy power supply group are in-service and functional.						
MINIMUM	A minimum number of the required power supplies in the opposite copy power supply group are in-service and functional.						
OUT	There is an insufficient number of in-service and functional power supplies in the opposite copy power supply group.						
MTXINTF=	<p>{ELECT, OPTCL}</p> <p>Matrix Interface, identifies the type of interface used between the I/O Shelf or Quad and the End Stage matrix shelf. MTXINF=<value> is only reported if the specified AID identifies an I/O SHELF or QUAD. Values are:</p> <table> <tr> <td>ELECT</td><td>Electrical interface between I/O Shelf and End Stage matrix.</td></tr> <tr> <td>OPTCL</td><td>Optical interface between the SI36/SI48 SHELF or the DS3/DS1 QUAD and the End Stage Matrix.</td></tr> </table>	ELECT	Electrical interface between I/O Shelf and End Stage matrix.	OPTCL	Optical interface between the SI36/SI48 SHELF or the DS3/DS1 QUAD and the End Stage Matrix.		
ELECT	Electrical interface between I/O Shelf and End Stage matrix.						
OPTCL	Optical interface between the SI36/SI48 SHELF or the DS3/DS1 QUAD and the End Stage Matrix.						
OPTMATE=	<p>EQUIPMENT_AID:</p> <p>{EOB–{5}–{1, 3}–{1–5}}</p> <p>{SI48: EOB–{6–9, 12–15, 18–21, 24–43, 104–111, 112–135, 136–141}–{1, 3}–{1–2}, EOC: EOB–{4–5, 10–11, 16–17, 22–23, 102, 103}–1–{1–7, 9–15}}</p> <p>{IOB–{6–8, 12–14}–{1, 3}–{1, 3, 5, 7}, IOB–9–3–{1, 3, 5, 7}, IOB–15–1–{1, 3, 5, 7}}</p> <p>{OXB–{44–63}–{1–4}–{1–2}}</p> <p>Optical Mate AID, identifies the EOB, IOB, or OXB circuit pack connected at the other end of the inter-rack optical cable corresponding to the specified equipment. If an AID for an EOC:EOB is specified which is optically connected to a QUAD, only the first of the four associated OXB circuit packs is reported. If an AID for an EOC:EOB is specified which is optically connected to an SI48 shelf, the AID of the EOB in the SI48 shelf, to which the specified EOB is optically connected, is reported. If an AID for an EOC:EOB is specified which is optically connected to an SI36 shelf, the first of the two IOBs, to which the specified EOB is optically connected, is reported. If an AID for a SI48:EOB is specified which is optically connected to an EOC:EOB, the AID of the EOB in the EOC shelf, to which the specified EOB is optically connected in the SI48 shelf, is reported. similarly, parsable output parameters and values are reported for the SI36:EOB and ASYNC:OXB AIDs. The OPTMATE=<value> is only reported if the specified AID identifies an EOB, IOB, or OXB.</p>						

OPTTYPE=	{IR, LR} Optical Transmitter Type, identifies the optical transmitter type on the specified equipment. OPTTYPE=<value> is only reported if the specified AID identifies an O1B or O4M. Values are:	
	IR	Intermediate Reach optical transmitter
	LR	Long Reach optical transmitter
PARTNUM=	{<UP TO 14 ALPHANUMERIC CHARACTER PART NUMBER>, NA} Circuit Pack Part Number, identifies the Alcatel part number stored in the Remote Inventory EEPROM for the specified equipment. PARTNUM=<value> is only reported if the specified AID identifies a CDA, CDB, DSB, EOB, EP3, ES1, IPB, M16, M32, M40, MCB, O1B, O4M, P39, P56, RPB, S3M, or SPB. Values are:	
	<PART NUMBER>	Part Number identifier.
	NA	Not Available, the Part Number identifier cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).
PBTYPE=	{IPB, RPB} Protection Board Type, specifies the type of protection board the SHELF supports. Values are:	
	IPB	Internal Protection Board circuit pack
	RPB	Ring Protection Board circuit pack
PGPL=	{MAXIMUM, MINIMUM, OUT} Power Group Power Level, indicates the available power status of the power supply group that is associated with the specified AID. PGPL=<value> is only reported if the specified AID identifies a CDA, CDB, DSB, DSI, EOB, EP3, ES1, HMU, IOB, IPB, IPU, LMU, M16, M32, M40, MCB, O1B, O4M, OXB, P39, P56, PRT, PSF, RPB, S3M, SPB, or SWI. Values are:	
	MAXIMUM	All power supplies in the associated power supply group are in-service and functional.
	MINIMUM	A minimum number of the required power supplies in the associated power supply group are in-service and functional.
	OUT	There is an insufficient number of in-service and functional power supplies in the associated power supply group.
PORT=	DS1_AID: {T1-{1-59392}} (T1-DS1#) DS3_AID: {T3-{1-4800}} (T3-DS3#) EC1_AID: {EC1-{1-3840}} (EC1-EC1/STS1#) OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC12_AID: {OC12-{1-560}} (OC12-OC12#) Port AID, identifies the highest hierarchical facility that is (would be) supported by the specified circuit packs. Multiple facility AIDs may be shown combined with a double-ampersand (&&- range) or ampersand (&-group) if the specified circuit pack supports more than one facility. Both EC1 and DS3 AIDs are shown, separated by the word "or", if an EP3 is specified. PORT=<value> is only reported if the specified AID identifies a DSI, EP3, ES1, HMU, LMU, O1B, O4M, or S3M.	
PRI=	{NONE, TMG-0, TMG-1} Primary Clock Reference, identifies the primary clock reference source. PRI=<value> is only reported if the specified AID identifies an MCB. Values are:	
	NONE	Neither TMG-0 or TMG-1 is the primary clock reference source.
	TMG-0	TMG-0 is the primary clock reference source.
	TMG-1	TMG-1 is the primary clock reference source.

PROCTYPE=	{L3PE2, OBPE}										
	Processor Type, specifies the type of processor used on the address module. PROC- TYPE=<value> is only reported if the specified AID identifies an EP3, ES1, O1B. Values are:										
	<table> <tr> <td>L3PE2</td><td>The module contains an L3PE2 processor.</td></tr> <tr> <td>OBPE</td><td>The module contains an OBPE processor.</td></tr> </table>	L3PE2	The module contains an L3PE2 processor.	OBPE	The module contains an OBPE processor.						
L3PE2	The module contains an L3PE2 processor.										
OBPE	The module contains an OBPE processor.										
PROTSTAT=	{MAIN-NEEDS-PROT, MAIN-OK, MAIN-SWITCHED, PROT-NOT-IN-USE, PROTECTING-<EQPT_AID>}										
	Protection Status, identifies the current I/O protection status of the specified I/O circuit pack. PROTSTAT=<value> is only reported if the specified AID identifies an DSI, EP3, ES1, HMU, or LMU. Values are:										
	<table> <tr> <td>MAIN-NEEDS-PROT</td><td>Main Circuit Pack Needs Protection, reported if the speci- fied AID is for a main I/O circuit pack that needs protection.</td></tr> <tr> <td>MAIN-OK</td><td>Main OK, reported if the specified AID is for a main I/O cir- cuit pack that does not need protection.</td></tr> <tr> <td>MAIN-SWITCHED</td><td>Main Circuit Pack Switched to Protection, reported if the specified AID is for a main I/O circuit pack that is switched to protection.</td></tr> <tr> <td>PROT-NOT-IN-USE</td><td>Protection Circuit Pack is Not In Use, reported if the speci- fied AID is for a protection circuit pack that is not providing protection.</td></tr> <tr> <td>PROTECTING-<EQPT_AID></td><td>Protecting - <Equipment AID>, reported if the specified AID is for a protection circuit pack. <EQPT_AID> is the AID of the I/O circuit pack being protected.</td></tr> </table>	MAIN-NEEDS-PROT	Main Circuit Pack Needs Protection, reported if the speci- fied AID is for a main I/O circuit pack that needs protection.	MAIN-OK	Main OK, reported if the specified AID is for a main I/O cir- cuit pack that does not need protection.	MAIN-SWITCHED	Main Circuit Pack Switched to Protection, reported if the specified AID is for a main I/O circuit pack that is switched to protection.	PROT-NOT-IN-USE	Protection Circuit Pack is Not In Use, reported if the speci- fied AID is for a protection circuit pack that is not providing protection.	PROTECTING-<EQPT_AID>	Protecting - <Equipment AID>, reported if the specified AID is for a protection circuit pack. <EQPT_AID> is the AID of the I/O circuit pack being protected.
MAIN-NEEDS-PROT	Main Circuit Pack Needs Protection, reported if the speci- fied AID is for a main I/O circuit pack that needs protection.										
MAIN-OK	Main OK, reported if the specified AID is for a main I/O cir- cuit pack that does not need protection.										
MAIN-SWITCHED	Main Circuit Pack Switched to Protection, reported if the specified AID is for a main I/O circuit pack that is switched to protection.										
PROT-NOT-IN-USE	Protection Circuit Pack is Not In Use, reported if the speci- fied AID is for a protection circuit pack that is not providing protection.										
PROTECTING-<EQPT_AID>	Protecting - <Equipment AID>, reported if the specified AID is for a protection circuit pack. <EQPT_AID> is the AID of the I/O circuit pack being protected.										
QTYPE=	{DS1,DS3}										
	QUAD Type, indicates the quadrant type for the specified I/O Quad. QTYPE=<value> is only reported if the specified AID identifies a QUAD. Values are:										
	<table> <tr> <td>DS1</td><td>QTYPE configured for DS1 QUAD.</td></tr> <tr> <td>DS3</td><td>QTYPE configured for DS3 QUAD</td></tr> </table>	DS1	QTYPE configured for DS1 QUAD.	DS3	QTYPE configured for DS3 QUAD						
DS1	QTYPE configured for DS1 QUAD.										
DS3	QTYPE configured for DS3 QUAD										
REFSWMODE=	{MANSWTOPRI, MANSWTOSEC, SWTOPRI, SWTOSEC}										
	Reference Switch Mode, indicates whether the specified MCB is manually or automatical- ly switched to either the Primary or Secondary Clock Reference Source. REFSWMODE=<value> is only reported if the specified AID identifies an MCB. Values are:										
	<table> <tr> <td>MANSWTOPRI</td><td>Manually switched to Primary Clock Reference Source.</td></tr> <tr> <td>MANSWTOSEC</td><td>Manually switched to Secondary Clock Reference Source.</td></tr> <tr> <td>SWTOPRI</td><td>Automatically switched to Primary Clock Reference Source.</td></tr> <tr> <td>SWTOSEC</td><td>Automatically switched to Secondary Clock Reference Source.</td></tr> </table>	MANSWTOPRI	Manually switched to Primary Clock Reference Source.	MANSWTOSEC	Manually switched to Secondary Clock Reference Source.	SWTOPRI	Automatically switched to Primary Clock Reference Source.	SWTOSEC	Automatically switched to Secondary Clock Reference Source.		
MANSWTOPRI	Manually switched to Primary Clock Reference Source.										
MANSWTOSEC	Manually switched to Secondary Clock Reference Source.										
SWTOPRI	Automatically switched to Primary Clock Reference Source.										
SWTOSEC	Automatically switched to Secondary Clock Reference Source.										
REFSWTIME=	{YY-MM-DD,HH-MN-SS:{00-99} - {1-12} - {1-31},{00-23} - {00-59} - {00-59} }										
	Clock Reference Switch Time, indicates the date and time of the last automatic or manual TMG-{0, 1} clock reference switch. REFSWTIME=<value> is only reported if the speci- fied AID identifies an MCB and its associated TMG parameter value is EXT1544.										
REVISION=	<0-4 ASCII CHARACTERS>										
	Revision, identifies the revision number of the disk drive associated with a specified DSK or OPD AID. REVISION= <value> is only reported if the specified AID identifies a DSK or OPD.										

RPLSHELF=	<p>SHELF/QUAD_AID: {QUAD-{44-63}-{1-4}-{1-4}} {SHELF-{6-8, 12-14, 18-20, 24-26, 28-30, 32-34, 36-38, 40-42, 104-106, 108-110, 136-141}-{1, 3}-1, SHELF-{9, 21, 35, 43}-3-1, SHELF-{15, 27, 31, 39, 107, 111}-1-1}}</p> <p>Replacement Shelf, identifies the SI48 Shelf that is replaced by the specified QUAD, or the DS1 Quad that is replacing the specified disabled (SST of DSBLD) SI48 Shelf. RPLSHELF=<value> is only reported if the specified AID identifies a QUAD or an I/O SHELF (with an SST of DSBLD).</p>								
RSPLKSTAT=	<p>{OFF, ON} RSP Lock Status, indicates the status of the 48 volt power switch in the RSP. RSPLKSTAT=<value> is only reported if the specified AID identifies an RSP. Values are:</p> <table> <tr> <td>OFF</td><td>Off, the RSP 48 volt power switch is off.</td></tr> <tr> <td>ON</td><td>On, the RSP 48 volt power switch is on.</td></tr> </table>	OFF	Off, the RSP 48 volt power switch is off.	ON	On, the RSP 48 volt power switch is on.				
OFF	Off, the RSP 48 volt power switch is off.								
ON	On, the RSP 48 volt power switch is on.								
RVRTV=	<p>{N, Y} Clock Reference Revertive Mode, indicates whether clock reference switching of TMG-{0, 1} is revertive or non-revertive. RVRTV=<value> is only reported if the specified AID identifies an MCB module. Values are:</p> <table> <tr> <td>N</td><td>No, the clock reference source does not revert to the original reference source upon restoration of a failed reference source.</td></tr> <tr> <td>Y</td><td>Yes, the clock reference source does revert to the original reference source upon restoration of a failed reference source.</td></tr> </table>	N	No, the clock reference source does not revert to the original reference source upon restoration of a failed reference source.	Y	Yes, the clock reference source does revert to the original reference source upon restoration of a failed reference source.				
N	No, the clock reference source does not revert to the original reference source upon restoration of a failed reference source.								
Y	Yes, the clock reference source does revert to the original reference source upon restoration of a failed reference source.								
RX1550=	<p>{ON, OFF, NA} Receiving cross coupled clock from the mate MCB module.</p>								
RX155CPO=	<p>{LOF, LOS, FO, NOERR} State of the clock incoming to the copy 0 CDB modules.</p> <table> <tr> <td>LOF</td><td>Loss of frame detected</td></tr> <tr> <td>LOS</td><td>Loss of signal detected</td></tr> <tr> <td>FO</td><td>Frame offset</td></tr> <tr> <td>NOERR</td><td>No error</td></tr> </table>	LOF	Loss of frame detected	LOS	Loss of signal detected	FO	Frame offset	NOERR	No error
LOF	Loss of frame detected								
LOS	Loss of signal detected								
FO	Frame offset								
NOERR	No error								
RX155CP1=	<p>{LOF, LOS, FO, NOERR} State of the clock incoming to the copy 1 CDB modules.</p> <table> <tr> <td>LOF</td><td>Loss of frame</td></tr> <tr> <td>LOS</td><td>Loss of signal</td></tr> <tr> <td>FO</td><td>Frame offset</td></tr> <tr> <td>NOERR</td><td>No error</td></tr> </table>	LOF	Loss of frame	LOS	Loss of signal	FO	Frame offset	NOERR	No error
LOF	Loss of frame								
LOS	Loss of signal								
FO	Frame offset								
NOERR	No error								
SEC=	<p>{NONE, TMG-0, TMG-1} Secondary Clock Reference, identifies the secondary clock reference source. SEC=<value> is only reported if the specified AID identifies an MCB. Values are:</p> <table> <tr> <td>NONE</td><td>Neither TMG-0 or TMG-1 is the secondary clock reference source.</td></tr> <tr> <td>TMG-0</td><td>TMG-0 is the secondary clock reference source.</td></tr> <tr> <td>TMG-1</td><td>TMG-1 is the secondary clock reference source.</td></tr> </table>	NONE	Neither TMG-0 or TMG-1 is the secondary clock reference source.	TMG-0	TMG-0 is the secondary clock reference source.	TMG-1	TMG-1 is the secondary clock reference source.		
NONE	Neither TMG-0 or TMG-1 is the secondary clock reference source.								
TMG-0	TMG-0 is the secondary clock reference source.								
TMG-1	TMG-1 is the secondary clock reference source.								
SERIAL=	<p>{<UP TO 16 ALPHANUMERIC CHARACTER SERIAL NUMBER>, NA} Circuit Pack Serial Number, identifies the Alcatel serial number stored in the Remote Inventory EEPROM for the specified equipment. SERIAL=<value> is only reported if the specified AID identifies a CDA, CDB, DSB, EOB, EP3, ES1, IPB, M16, M32, M40, MCB, IOB, O1B, O4M, P39, P56, RPB, S3M, or SPB. Values are:</p> <table> <tr> <td><SERIAL NUMBER></td><td>Serial Number identifier.</td></tr> <tr> <td>NA</td><td>Not Available, the Serial Number identifier cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).</td></tr> </table>	<SERIAL NUMBER>	Serial Number identifier.	NA	Not Available, the Serial Number identifier cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).				
<SERIAL NUMBER>	Serial Number identifier.								
NA	Not Available, the Serial Number identifier cannot be read from the Remote Inventory EEPROM (e.g., the circuit pack is not equipped).								

SIZE=	<0–7 ASCII CHARACTERS> Size, identifies the size of the disk (in megabytes) associated with a specified DSK or OPD AID. SIZE= <value> is only reported if the specified AID identifies a DSK or OPD.
SW=	{0x00 – 0x0F} Switch bit signals
TMG=	{EXT1544, INT} Internal/External Timing Mode, indicates the timing mode of the specified MCB. TMG=<value> is only reported if the specified AID identifies an MCB. Values are: EXT1544 External 1544 Kbps (DS1) clock reference timing INT Internal clock reference timing
TMG0=	{AIS, LOF, LOS, OK, PLLEOR, SLTMSIG, SYNCSTATQUAL, UNPROV} Timing Reference Source 0 Status, indicates the failure/provisioning status of the TMG–0 Timing Reference Source. TMG0=<value> is only reported if the specified AID identifies an MCB. Values are: AIS AIS detected. LOF Loss of Frame detected. LOS Loss of Signal detected. OK No problems detected. PLLEOR Phase Lock Loop End (out) Of Range detected. (This value is suppressed if AIS, LOF, or LOS is detected.) SLTMSIG Slipping Timing Reference Signal detected. SYNCSTATQUAL Synchronization Status Quality. UNPROV The timing source is not provisioned.
TMG1=	{AIS, LOF, LOS, OK, PLLEOR, SLTMSIG, SYNCSTATQUAL, UNPROV} Timing Reference Source 1 Status, indicates the failure/provisioning status of the TMG–1 Timing Reference Source. TMG1=<value> is only reported if the specified AID identifies an MCB. Values are: AIS AIS detected. LOF Loss of Frame detected. LOS Loss of Signal detected. OK No problems detected. PLLEOR Phase Lock Loop End (out) Of Range detected. (This value is suppressed if AIS, LOF, or LOS is detected.) SLTMSIG Slipping Timing Reference Signal detected. SYNCSTATQUAL Synchronization Status Quality. UNPROV The timing source is not provisioned.
TX155=	{ON, OFF, NA} This MCB module sending distribution clock to the CDB modules.
TX1550=	{ON, OFF, NA} Transmit state of the cross coupled clock to the mate MCB module.
UHSTYPE=	{EP3E36, EP3E48, EP3F36, EP3F48, EP3S36, EP3S48, ES136, ES148, O1BFH48, O1BSH48, O4MSH48, O4MFH48} Upper Half Shelf Type, identifies the type of upper half I/O shelf. UHSTYPE=<value> is only reported if the specified AID identifies an I/O SHELF. Valid values are: EP3E36 High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Enhanced capability. EP3E48 High Density DS3 I/O Shelf with 48 DS3s per shelf containing EP3s that have Enhanced capability.

EP3F36	High Density DS3/STS Shelf with 36 DS3s/STS1s per shelf containing EP3s that have FlexPoint (STS1/DS3) capability.																								
EP3F48	High Density DS3/STS1 I/O Shelf with 48 DS3/STS1s per shelf containing EP3s that have FlexPoint (DS3/STS1) capability.																								
EP3S36	High Density DS3 Shelf with 36 DS3s per shelf containing EP3s that have Standard capability.																								
EP3S48	High Density DS3 I/O Shelf with 48 DS3s per shelf containing EP3s that have Standard capability.																								
ES136	High Density STS Shelf with 36 STSs per shelf containing ES1 circuit packs.																								
ES148	High Density STS1 I/O Shelf with 48 STS1s per shelf containing ES1 circuit packs.																								
O1BFH48	O1B (OC-3) Shelf with 48 DS3/STS1s per shelf, FlexPoint capability, and Half-bandwidth to the matrix.																								
O1BSH48	O1B (OC-3) Shelf with 48 STS1s per shelf, SONET capability, and Half-bandwidth to the matrix.																								
O4MSH48	O4M (OC-12) Standard module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.																								
O4MFH48	O4M (OC-12) FlexPoint module in Half Density SI48-O4M shelf, and Half-bandwidth to the matrix.																								
VENDOR=	<0-8 ASCII CHARACTERS> Vendor, identifies the name of the manufacturer of the disk drive associated with a specified DSK or OPD AID. VENDOR= <value> is only reported if the specified AID identifies a DSK or OPD.																								
PST	{IS, IS-ANR, OOS-AU, OOS-AUMA, OOS-MA} Primary State, indicates the current primary state of the specified equipment entity. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: <table> <tr> <td>IS</td><td>In-Service</td></tr> <tr> <td>IS-ANR</td><td>In-Service-Abnormal</td></tr> <tr> <td>OOS-AU</td><td>Out-Of-Service-Autonomous</td></tr> <tr> <td>OOS-AUMA</td><td>Out-Of-Service-Autonomous and Management</td></tr> <tr> <td>OOS-MA</td><td>Out-Of-Service-Management</td></tr> </table>	IS	In-Service	IS-ANR	In-Service-Abnormal	OOS-AU	Out-Of-Service-Autonomous	OOS-AUMA	Out-Of-Service-Autonomous and Management	OOS-MA	Out-Of-Service-Management

COMMAND CODE: **RTRV-F3**
COMMAND NAME: **RETRIEVE F3**

PURPOSE

The RTRV-F3 command retrieves the provisioned parameter values, all assigned DS1s, and the state for the specified fractional DS3 (F3). The command is executed regardless of the state of the F3.

The successful response for a RTRV-F3 command contains one line of parsable output data, in ascending order (from lowest specified F3 AID to largest specified F3 AID) for each F3 AID specified. Values for the T1N1 to T1N7 parameters are only displayed if a DS1 has been assigned in that respective slot. Only <AID> and <PST,SST> are displayed for a retrieve on an unprovisioned F3.

A RTRV-F3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-F3: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS1 AID, identifies the DS1 port. Restrictions: The AID must indicate an F3 AID that is located in an electrical DS3 located on a SI48 shelf or the command will be denied.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>:: [FMT=<value> [ ,T1N1=<value>] [ ,T1N2=<value>] [ ,T1N3=<value>]
  [ ,T1N4=<value>] [ ,T1N5=<value>] [ ,T1N6=<value>] [ ,T1N7=<value>]] :
  <PST>, [SST>]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) F3 AID. Indicates the F3 to which this line of output data pertains.
FMT=	{ESF, SF} Framing Format, identifies the framing format of the F3 and all the DS1s assigned to the it. Values are: ESF Extended SuperFrame. DS1s all are ESF formatted. SF SuperFrame. DS1s all are normal SuperFrame formatted.

T1N1=	DS1_AID: {T3T1-{1-4800}-{1-28}} DS1 Number 1's AID, identifies a DS1 assigned to the F3	(T3T1-DS3#-DS1#)
T1N2=	DS1_AID: {T3T1-{1-4800}-{1-28}} DS1 Number 2's AID, identifies a DS1 assigned to the F3	(T3T1-DS3#-DS1#)
T1N3=	DS1_AID: {T3T1-{1-4800}-{1-28}} DS1 Number 3's AID, identifies a DS1 assigned to the F3	(T3T1-DS3#-DS1#)
T1N4=	DS1_AID: {T3T1-{1-4800}-{1-28}} DS1 Number 4's AID, identifies a DS1 assigned to the F3	(T3T1-DS3#-DS1#)
T1N5=	DS1_AID: {T3T1-{1-4800}-{1-28}} DS1 Number 5's AID, identifies a DS1 assigned to the F3	(T3T1-DS3#-DS1#)
T1N6=	DS1_AID: {T3T1-{1-4800}-{1-28}} DS1 Number 6's AID, identifies a DS1 assigned to the F3	(T3T1-DS3#-DS1#)
T1N7=	DS1_AID: {T3T1-{1-4800}-{1-28}} DS1 Number 7's AID, identifies a DS1 assigned to the F3	(T3T1-DS3#-DS1#)
PST	{IS, OOS-AU, OOS-AUMA, OOS-MA} Primary State. Indicates the current primary state of the F3. Refer to Appendix G, State Transitions. Values are:	
	IS	In-Service
	OOS-AU	Out-Of-Service-Autonomous
	OOS-AUMA	Out-Of-Service-Autonomous and Management
	OOS-MA	Out-Of-Service-Management
SST	{DSBLD, PMI, SGEO, UAS} Secondary State. Indicates any secondary states associated with the F3. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the F3 at the time of the RTRV-F3. Values are:	
	DSBLD	Disabled
	PMI	Performance Monitoring Inhibited
	SGEO	Supporting Entity Outage
	UAS	Unassigned

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* GetAidEntry() Error: <ERROR-STRING> */
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* TPidToAidStr() Error: <ERROR-STRING> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the first four F3s in the electrical DS3 T3-7 are retrieved:

```
RTRV-F3::T3F3-7-1&&-4;
```

The output response, shown below, assumes CID 6 was used to enter the command and a system generated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pab124 COMPLD
"T3F3-7-1::FMT=SF,T1N1=T3T1-7-4,T1N2=T3T1-7-8,T1N3=T3T1-7-9:IS"
"T3F3-7-2::FMT=SF,T1N5=T3T1-7-5,T1N6=T3T1-7-6:IS,PMI"
"T3F3-7-3::OOS-MA,UAS"
"T3F3-7-4::OOS-MA,UAS"
/* RTRV-F3::T3F3-7-1&&-4 [Pab124] (6) */
;
```

The output shows that the first F3 (T3F3-7-1) has three DS1s associated to it, all using SuperFrame format. The F3 is in service and summarized PM data can be retrieved from the F3. The second F3 only has two DS1s associated with it but it has a secondary state of PMI indicating that the PM data collecting has been turned off for the F3 via the SET-PMODE-F3 command. The last two F3s have not yet been provisioned.

```

COMMAND CODE: **RTRV-FAC-SUM**
COMMAND NAME: **RETRIEVE FACILITY SUMMARY**

PURPOSE

The RTRV-FAC-SUM command retrieves a summary of all provisioned and unprovisioned facilities within the 1631 SX LMC.

The successful response for a RTRV-FAC-SUM command contains a list of all facilities grouped by type (T1, T3, OC3, etc.) and status (available, provisioned, cross connected, etc.). Individual lines within these listings show how many of each type and group of facilities exist within the system. Where applicable, each of these groupings also contains a line indicating the AID of the next available port of the same type.

A RTRV-FAC-SUM command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-FAC-SUM: [TID] :: [CTAG] :: [FACTYPE=] [, NEXTAVAIL=] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
FACTYPE=	{ALL, EC1, OC3, OC12, STS1, STS3C, T1, T3, VT1, F3} Default: {ALL} Addressing: None Description: Facility Type, for displaying ports of all or selected facility types. No entry or FACTYPE=ALL causes display of all system facilities. FACTYPE= <facility type> displays ports of that facility type only.
NEXTAVAIL=	{Y, N} Default: {N} Addressing: None Description: Next port available for provisioning. Y = Display next port available for provisioning N = Do not display next port available for provisioning.

OUTPUT PARAMETERS

FACTYPE	FACility TYPE for which number of ports are displayed. Values are:	
	T3	Asynchronous 44.736 Mbps facility
	EC1	Electrical Carrier level 1, 51.84 Mbps facility
	OC3	SONET Optical Carrier level 3, 155.52 Mbps facility
	OC12	SONET Optical Carrier level 12, 622.08 Mbps facility
	STS1	Synchronous Transport Signal level 1, 51.84 Mbps facility
	STS3C	Synchronous Transport Signal level 2 – Concatenated, 155.52 Mbps facility
	T1	Asynchronous 1.544 Mbps facility
	VT1	SONET Virtual Tributary (VT1.5), 1.544 Mbps facility
	F3	Asynchronous Fractional DS3, up to seven DS1 facilities

Note: Paired FACTYPEs, T3/EC1 and STS3C/STS1, displayed in Successful Response Format as “Flexpoint pairs” represent one type (eg, T3 or EC1) of FACTYPE. Ports on Flexpoint modules may be configured for either indicated FACTYPE but not a mix of both.

NEXTAVAIL Access identifier of NEXT AVAILable port of the facility type. Values are:

DS1_AID:
 {T1-{1-59392}} (T1-DS1#)
 {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)

DS3_AID:

COMMAND CODE: **RTRV-FEDATA-T1**
COMMAND NAME: **RETRIEVE FAR END DATA T1**

PURPOSE

The RTRV-FEDATA-T1 command polls the far-end network element connected to the specified DS1 port and returns the polled response information from the far-end network element in the command's successful response message.

The poll of the far-end network element uses TR-54016 specified messages transmitted and received over the Facility Data Link (FDL) of the specified Extended SuperFrame Format (ESF) DS1 port. The system converts the hexadecimal values entered for the command's parameter values to binary format for transmission in the appropriate message fields to the far-end network element. The binary information received in the FDL response message from the far-end network element is converted to hexadecimal values for return in the command's successful response message.

From the time a poll request message is sent, the system waits for the time specified by WAITTIME for a FDL response message from the far-end network element.

NOTE: The RTRV-FEDATA-T1 command inserts a 54016 protocol message onto the DS1's facility data link. When issued, this message can mask data link messages coming from upstream on the link and prevent them from being seen at the local Network Element or at any place downstream from it (including at the customer's installation and their DS1 termination equipment). This may impact such activity as remote PM data collection (PFE, NP, NPFE, etc.) and customer site-to-site data link and PM messages.

A RTRV-FEDATA-T1 command is denied if:

- The specified DS1 port is not provisioned (via ENT-T1) with a FMT value of ESF and a FENDNTE value of ATT or ANSIATT and a FEMETHOD value of ATPOLL or ANSI.
- There are three RTRV-FEDATA-T1 commands in progress on DS1 ports supported by the same SI48 I/O (EP3) circuit pack.
- There are three RTRV-FEDATA-T1 commands in progress on DS1 ports within the same Quad.
- The specified DS1 port is in a loop back (a DS1 SST of LPBK).
- Any port that contains the specified DS1 port is in a loop back (e.g. DS3, STS1, EC1, OC3).
- Any port that contains the specified DS1 port is intact connected to another port.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-FEDATA-T1: [TID]:AID:[CTAG]:::[ADDR1R=][,ADDR2R=][,ADDR1T=][,ADDR2T=]
[,CONTROLT=][,MTEXT1=][,MTEXT2=][,WAITTIME=];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T1-{1-59392}}		(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}		(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}		(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}		(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}		(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	Default:	Entry Required	
	Addressing:	None	
	Description:	DS1 AID, identifies the DS1 port whose far-end data is to be retrieved.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

ADDR1R=	< Two hexadecimal digits > Default: {81} Addressing: None Description: Address 1 Response, specifies the first address byte to be compared against the LAP-B or LAP-D address field in messages received from the far-end network element over the ESF FDL channel. The system reads and processes received FDL message when the ADDR1R and ADDR2R values matches the address field in the received FDL message.
ADDR2R=	< Either no value or two hexadecimal digits > Default: <NoVal> Addressing: None Description: Address 2 Response, specifies the second address byte to be compared against the LAP-D address field in messages received from the far-end network element over the ESF FDL channel. The system reads and processes received FDL message when the ADDR1R and ADDR2R values matches the address field in the received FDL message.
ADDR1T=	< Two hexadecimal digits > Default: {C3} Addressing: None Description: Address 1 Transmit, specifies the contents of the first address byte of the LAP-B or LAP-D address field in the message transmitted to the far-end network element over the ESF FDL channel.
ADDR2T=	< Either no value or two hexadecimal digits > Default: <NoVal> Addressing: None Description: Address 2 Transmit, specifies the contents of the second address byte of the LAP-D address field in the message transmitted to the far-end network element over the ESF FDL channel.
CONTROLT=	< Two hexadecimal digits > Default: {08} Addressing: None Description: Control Field Transmit, specifies the contents of the control field in the message transmitted to the far-end network element over the ESF FDL channel.
MTEXT1=	< 0 (no value) to 60 hexadecimal digits > Default: <NoVal> Addressing: None Description: Message Text 1 Transmit, specifies the contents of the first part of the information field in the message transmitted to the far-end network element over the ESF FDL channel. The values for MTEXT1 and MTEXT2 are concatenated together to form the entire information field in the transmitted FDL message. Restrictions: RTRV-FEDATA-T1 is denied if no value is entered for MTEXT1 and a value is entered for MTEXT2.

MTEXT2=	< 0 (no value) to 60 hexadecimal digits >
Default:	<NoVal>
Addressing:	None
Description:	Message Text 2 Transmit, specifies the contents of the second part of the information field in the message transmitted to the far-end network element over the ESF FDL channel. The values for MTEXT1 and MTEXT2 are concatenated together to form the entire information field in the transmitted FDL message.
Restrictions:	RTRV-FEDATA-T1 is denied if a value for MTEXT2 is entered and no value is entered for MTEXT1.
WAITTIME=	{1-10}
Default:	{5}
Addressing:	None
Description:	Wait Time, specifies the number of seconds the system waits, from the time the system transmits the FDL message, to receive a FDL response message from the far-end network element.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID>, T1:<TIMEOUT> [, <ADDR1R>, <ADDR2R>, <CONTROLR>, <MTEXTR>] "
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

AID	DS1_AID: { T1-{1-59392} } (T1-DS1#) { T3T1-{1-4800}-{1-28} } (T3T1-DS3#-DS1#) { EC1T1-{1-3840}-{1-28} } (EC1T1-EC1/STS1/DS3#-DS1#) { OC3T1-{1-2240}-{1-3}-{1-28} } (OC3T1-OC3#-STS1/DS3#-DS1#) { OC12T1-{1-560}-{1-4}-{1-3}-{1-28} } (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#) DS1 AID, identifies the DS1 port whose far-end PM data is being retrieved.
TIMEOUT	{NOTIMEOUT, TIMEOUT} Time Out, indicates whether a valid FDL response message from the far-end network element was received within the time specified by WAITTIME. Values are: NOTIMEOUT A valid FDL response message was received within the time specified by WAITTIME. TIMEOUT A valid FDL response message was not received within the time specified by WAITTIME.
ADDR1R	< Two hexadecimal digits > Address 1 Received, identifies the contents of the first byte in the address field in the received ESF FDL message. A value for ADDR1R is only returned when the TIMEOUT value is NOTIMEOUT.
ADDR2R	< Either no value or two hexadecimal digits > Address 2 Received, identifies the contents of the second byte (if any) in the address field in the received ESF FDL message. A value for ADDR2R is only returned when the TIMEOUT value is NOTIMEOUT.
CONTROLR	< Two hexadecimal digits > Control Field Received, identifies the contents of the control field in the received ESF FDL message. A value for CONTROLR is only returned when the TIMEOUT value is NOTIMEOUT.

MTEXTR < 0 (no value) to 500 hexadecimal digits >
Message Text Received, identifies the contents of the data field in the received ESF FDL message. A value for MTEXTR is only returned when the TIMEOUT value is NOTIME-OUT.

UNSUCCESSFUL RESPONSE FORMAT

```

  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Error retrieving CONTROLT. */ /* Error retrieving MTEXT1. */ /* Error retrieving MTEXT2. */ /* Error retrieving WAITTIME. */ /* Invalid field name entered. */ /* Invalid number of ASCII characters entered as input for <fieldname>. */ /* Invalid ASCII characters entered as input for <fieldname>. */ /* Too many ASCII characters have been entered as <fieldname>. */ /* Only an even number of ASCII characters is valid for <fieldname>. */ /* Error retrieving ADDR1R. */ /* Error retrieving ADDR1T. */ /* Error retrieving ADDR2R. */ /* Error retrieving ADDR2T. */ /* ADDR2R expected. */ /* ADDR2T expected. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IPMS	Input, Parameter MiSsing /* MTEXT1 must be specified. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM <TP_Type> record <tp_num>. */
SNVS	Status, Not in Valid State /* This DS1 channel is unassigned. */ /* This DS1 is executing a loopback. */ /* The <TP_Type> which contains this DS1 is executing a loopback. */
SROF	Status, Requested Operation Failed /* Failed to convert TPid <tp_num> to an AID string. */ /* This DS1 channel is not provisioned for ESF format. */ /* The FENDNTE parameter has not been provisioned for FDL data polling. */ /* Could not get controlling level 2 processor id for <AID>. */ /* Unable to allocate memory for user data. */ /* Unable to determine supporting facility entity. */

EXAMPLES

In the following example, RTRV-FEDATA-T1 is used to retrieve the PM data from the far-end network element on DS1 port T3T1-1307-5. In the example, default values are used for the ADDR1T, ADDR2T, ADDR1R, and ADDR2R values, MTEXT1 is set to 05414264, and WAITTIME is set to 10 seconds.

```
RTRV-FEDATA-T1::T3T1-1307-5:::MTEXT1=05414264,WAITTIME=10;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"T3T1-1307-5,T1:NOTIMEOUT,81,,04,0500414264C2"
/* RTRV-FEDATA-T1::T3T1-1307-5:::MTEXT1=05414264,WAITTIME=10
[P71042] (1) */
;
```

In the following example, RTRV-FEDATA-T1 is used to retrieve the PM data from the far-end network element on DS1 port T3T1-1307-5, but the WAITTIME timer expires before receiving a valid FDL response message

```
RTRV-FEDATA-T1::T3T1-1307-5:::MTEXT1=05414264,WAITTIME=10;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71046. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71046 COMPLD
"T3T1-1307-5,T1:TIMEOUT"
/* RTRV-FEDATA-T1::T3T1-1307-5:::MTEXT1=05414264,WAITTIME=10
[P71046] (1) */
;
```

COMMAND CODE: **RTRV-FFP-OC12**
COMMAND NAME: **RETRIEVE FAST FACILITY
PROTECTION OC-12**

PURPOSE

The RTRV-FFP-OC12 command retrieves the provisioned parameter values pertaining to the OC-12 facility protection group.

The successful response for a RTRV-FFP-OC12 command contains one line of parsable output data, in ascending order (from lowest specified OC-12 AID to largest specified OC-12 AID), for each OC-12 AID specified.

A RTRV-FFP-OC12 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-FFP-OC12 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the OC-12 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID1>,<AID2>:BDCST=<value>,K2GEN=<value>,PROTSTAT=<value>,
    PSDIRN=<value>,RVRTV=<value>[,WTRTIME=<value>]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID1	OC12_AID: {OC12-{1-560}} (OC12-OC12#) OC12 AID, indicates the protected OC-12 port to which this line of output data pertains.
AID2	OC12_AID: {OC12-{1-560}} (OC12-OC12#) OC12 AID, indicates the protecting OC-12 which is mate to the OC-12 specified in AID1.

BDCST=	{Y}	Broadcast, indicates whether the OC-12 payload is transmitted over the working and protection channels simultaneously. Values are: Y Yes. (Note, only applies to 1+1 protection switching).
K2GEN=	{PROP, STAN}	K2 bits 1-4 Generation. Defines how the K2 bits 1 through 4 are generated. Values are: STAN Standard way. The K2 bits 1-4 will be generated according to Bell-core standards. PROP Proprietary non-standard way. This value is only valid if PSDIRN=UNI and RTRV=N. In this case, the outgoing K2 bits 1-4 are set to equal the outgoing K1 bits 5 through 8.
PROTSTAT=	{MAIN-ESW-LOCKOUT, MAIN-NEEDS-PROT, MAIN-OK, MAIN-SWITCHED, PROTECTING-<OC12_AID>, PROT-LOCKOUT, PROT-NOT-IN-USE, PROT-SWITCHED, WTR-<OC12_AID>}	Protection Status, identifies the current protection status of the OC-12 line. Values are: MAIN-ESW-LOCKOUT Main OC-12 Excessive Switching Lockout, value only reported if the specified AID is for a main OC-12 line that is locked out from using Protection due to excessive switching. MAIN-NEEDS-PROT Main Needs Protection, value reported if the specified AID is for a main OC-12 line that requires protection (i.e., Signal Fail (SF) detected on both Main and Protect OC-12 lines, or Signal Fail or Signal Degrade (SD) detected on the Main OC-12 line and protection switching is locked out, either manually or due to excessive switching. MAIN-OK Main OK, value reported if the specified AID is for a main OC-12 line that does not require protection. MAIN-SWITCHED Main Switched to Protection, value reported if the specified AID is for a main OC-12 line that is switched to protection. PROTECTING-<OC12_AID> Protecting - <OC12_AID>, value reported if the specified AID is for a protection OC-12 line. <OC12_AID> is the AID of the OC-12 line being protected. PROT-LOCKOUT Protection Locked Out, value reported if the specified AID is for a protection OC-12 line that is locked out from being used as protection line. PROT-NOT-IN-USE Protection Not In Use, value reported if the specified AID is for a protection OC-12 line that is not providing protection. PROT-SWITCHED Protection Switched to Main, value reported if the specified AID is for a protection OC-12 line that is switched to Main. WTR-<OC12_AID> Wait To Restore - <OC12_AID>, value reported if the specified AID is for a protection OC-12 line. <OC12_AID> is the AID of the OC-12 line being protected due to wait to restore time.
PSDIRN=	{UNI}	Protection Switching Direction, identifies the type of protection switching operation. Values are: UNI Unidirectional protection switching.

RVRTV= {N, Y}
Revertive, indicates whether a protection switch is revertive. Values are:
N No, protection switching is non-revertive.
Y Yes. Protection switching is revertive.

WTRTIME= {5–12}
Wait to Restore Time. Determines the wait to restore time that is used by the revertive line protection switching group. This parameter is valid only when revertive switching is selected. Values are:
5–12 An integer value in minutes between 5 and 12.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID1>, <AID2>:EBER=<value>, PDIDET=<value>, PROTSTAT=<value>,
  PSDIRN=<value>, RVRTV=<value>, SDTHSW=<value>, [WTRTIME=<value>]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC Input, Invalid ACcess identifier
SDBE Status, internal Data Base Error
/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
/* FFP Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>
*/
/* TPidToAidStr() Error: <ERROR-STRING> */

EXAMPLES

In the following example, the provisioning data for OC-12 port OC12-1 is retrieved.

```
RTRV-FFP-OC12::OC12-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "OC12-1, 2-2:BDCST=Y, K2GEN=PROP, PSDIRN=UNI, RVRTV=N, PROTSTAT=MAIN-OK,
  WTRTIME=5"
  /* RTRV-FFP-OC12::OC12-1 [Pad567] (2) */
;

  PSDIRN=<value>, RVRTV=<value> [, WTRTIME=<value>] "
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID1	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC3 AID, indicates the protected OC-3 port to which this line of output data pertains.
AID2	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC3 AID, indicates the protecting OC-3 which is mate to the OC-3 specified in AID1.
BDCST=	{Y} Broadcast, indicates whether the OC-3 payload is transmitted over the working and protection channels simultaneously. Values are: Y Yes. (Note, only applies to 1+1 protection switching).

K2GEN=	{PROP, STAN}	K2 bits 1–4 Generation. Defines how the K2 bits 1 through 4 are generated. Values are:
	STAN	Standard way. The K2 bits 1–4 will be generated according to Bell-core standards.
	PROP	Proprietary non-standard way. This value is only valid if PSDIRN=UNI and RTRV=N. In this case, the outgoing K2 bits 1–4 are set to equal the outgoing K1 bits 5 through 8.
PROTSTAT=	{MAIN-ESW-LOCKOUT, MAIN-NEEDS-PROT, MAIN-OK, MAIN-SWITCHED, PROTECTING-<OC3_AID>, PROT-LOCKOUT, PROT-NOT-IN-USE, PROT-SWITCHED, WTR-<OC3_AID>}	Protection Status, identifies the current protection status of the OC-3 line. Values are:
	MAIN-ESW-LOCKOUT	Main OC-3 Excessive Switching Lockout, value only reported if the specified AID is for a main OC-3 line that is locked out from using Protection due to excessive switching.
	MAIN-NEEDS-PROT	Main Needs Protection, value reported if the specified AID is for a main OC-3 line that requires protection (i.e., Signal Fail (SF) detected on both Main and Protect OC-3 lines, or Signal Fail or Signal Degrade (SD) detected on the Main OC-3 line and protection switching is locked out, either manually or due to excessive switching.
	MAIN-OK	Main OK, value reported if the specified AID is for a main OC-3 line that does not require protection.
	MAIN-SWITCHED	Main Switched to Protection, value reported if the specified AID is for a main OC-3 line that is switched to protection.
	PROTECTING-<OC3_AID>	Protecting – <OC3_AID>, value reported if the specified AID is for a protection OC-3 line. <OC3_AID> is the AID of the OC-3 line being protected.
	PROT-LOCKOUT	Protection Locked Out, value reported if the specified AID is for a protection OC-3 line that is locked out from being used as protection line.
	PROT-NOT-IN-USE	Protection Not In Use, value reported if the specified AID is for a protection OC-3 line that is not providing protection.
	PROT-SWITCHED	Protection Switched to Main, value reported if the specified AID is for a protection OC-3 line that is switched to Main.
	WTR-<OC3_AID>	Wait To Restore – <OC3_AID>, value reported if the specified AID is for a protection OC3 line. <OC3_AID> is the AID of the OC3 line being protected due to wait to restore time.
PSDIRN=	{UNI}	Protection Switching Direction, identifies the type of protection switching operation. Values are:
	UNI	Unidirectional protection switching.
RVRTV=	{N, Y}	Revertive, indicates whether a protection switch is revertive. Values are:
	N	No, protection switching is non-revertive.
	Y	Yes. Protection switching is revertive.

WTRTIME= {5-12}
Wait to Restore Time. Determines the wait to restore time that is used by the revertive line protection switching group. This parameter is valid only when revertive switching is selected. Values are:
5-12 An integer value in minutes between 5 and 12.

ED-OC3
ENT-OC3
ENT-FFP-OC3

COMMAND CODE: **RTRV-FFP-STs1**
COMMAND NAME: **RETRIEVE FAST FACILITY
PROTECTION STs-1**

PURPOSE

The RTRV-FFP-STs1 command retrieves the switching parameter values of a ring STs-1 FFP pair. The specified AID identifies a ring FFP that was created (implicitly) via an ENT-CRS-STs1 or ENT-CRS-T3 command. This command is only applicable to the ring configuration (refer to ENT-RNG-OC3 or ENT-RNG-OC12).

The successful response for a RTRV-FFP-STs1 command contains one line of parsable output data, in ascending order (from lowest specified STs-1 AID to largest specified STs-1 AID), for each STs-1 AID specified. If no FFP entity is found, no error is returned. If the specified STs-1 AID is unassigned (an SST of UAS), no output is returned.

A RTRV-FFP-STs1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-FFP-STs1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {OC3STs1-{1-2240}-{1-3}} (OC3STs1-OC3#-STs1#) {OC12STs1-{1-560}-{1-4}-{1-3}} (OC12STs1-OC12#-STM1#-STs1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the preferred (protected) or alternate (protecting) STs-1 path or range of paths.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID1>,<AID2>:EBER=<value>,PDIDET=<value>,PROTSTAT=<value>,
PSDIRN=<value>,RVRTV=<value>,SDTHSW=<value>,[WTRTIME=<value>]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID1	STS1_AID: {OC3STs1-{1-2240}-{1-3}} (OC3STs1-OC3#-STs1#) {OC12STs1-{1-560}-{1-4}-{1-3}} (OC12STs1-OC12#-STM1#-STs1#) STs1 AID, indicates the preferred (protected) STs-1 port to which this line of output data pertains.
------	---

AID2	<p>STS1_AID:</p> <p>{OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#)</p> <p>{OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#)</p> <p>STS1 AID, indicates the alternate (protecting) STS-1 which is mate to the STS-1 specified in AID1.</p>																								
EBER=	<p>{3, 4}</p> <p>STS-1 Excessive BER switching threshold. Determines the value corresponding to an Excessive BER condition. Values are:</p> <table> <tr> <td>3</td><td>BER threshold of 10E-3.</td></tr> <tr> <td>4</td><td>BER threshold of 10E-4.</td></tr> </table>	3	BER threshold of 10E-3.	4	BER threshold of 10E-4.																				
3	BER threshold of 10E-3.																								
4	BER threshold of 10E-4.																								
PDIDET=	<p>{N, Y}</p> <p>Path Defect Indication Detection. Determines whether PDI is detected and processed. Values are:</p> <table> <tr> <td>N</td><td>PDI is not detected.</td></tr> <tr> <td>Y</td><td>PDI is detected and used for ring path protection switching.</td></tr> </table>	N	PDI is not detected.	Y	PDI is detected and used for ring path protection switching.																				
N	PDI is not detected.

PREFERRED-MAN	Preferred Manual, value reported if a manual switch is requested on Preferred path (i.e., Manual Switch of Working to Protection Path).	ALTERNATE-MAN	Alternate Manual, value reported if a manual switch requested on Alternate path (i.e., Manual Switch of Protection to Working Path).	PREFERRED-STBY	Preferred Standby, value reported if the preferred path is standby.	ALTERNATE-STBY	Alternate Standby, value reported if the alternate path is standby.	PREFERRED-WTR	Preferred path is in Wait-to-Restore state. This value is applicable in Revertive switching mode only.
PREFERRED-ACT	Preferred Active, value reported if the preferred path is active.																								
ALTERNATE-ACT	Alternate Active, value reported if the alternate path is active.																								
PREFERRED-ESW-LOCKOUT	Preferred path is in Excessive Switching Lock-out state.																								
PREFERRED-FAIL	Preferred Failed, value reported if the preferred path has failed.																								
ALTERNATE-FAIL	Alternate Failed, value reported if the alternate path has failed.																								
PREFERRED-FRCD	Preferred Forced, value reported if a forced switch is requested on Preferred path (i.e., Forced Switch of Working to Protection Path).																								
ALTERNATE-FRCD	Alternate Forced, value reported if a forced switch is requested on Alternate path (i.e., Forced Switch of Protection to Working Path).																								
PREFERRED-MAN	Preferred Manual, value reported if a manual switch is requested on Preferred path (i.e., Manual Switch of Working to Protection Path).																								
ALTERNATE-MAN	Alternate Manual, value reported if a manual switch requested on Alternate path (i.e., Manual Switch of Protection to Working Path).																								
PREFERRED-STBY	Preferred Standby, value reported if the preferred path is standby.																								
ALTERNATE-STBY	Alternate Standby, value reported if the alternate path is standby.																								
PREFERRED-WTR	Preferred path is in Wait-to-Restore state. This value is applicable in Revertive switching mode only.																								
PSDIRN=	<p>{UNI}</p> <p>Protection Switching Direction, identifies the type of protection switching operation. Values are:</p> <table> <tr> <td>UNI</td><td>Unidirectional path switched ring protection switching.</td></tr> </table>	UNI	Unidirectional path switched ring protection switching.																						
UNI	Unidirectional path switched ring protection switching.																								

RVRTV= {Y, N}
Revertive, indicates the revertive switch mode of the FFP selector. Values are:
Y Yes, revertive protection switching.
N No, non-revertive protection switching.

SDTHSW= {5, 6, 7, 8, 9}
STS-1 Signal Degrade Threshold Switching level. Indicates the signal degrade threshold over which Signal Degrade protection switching is initiated. Values are:
5 BER threshold of 10E-5.
6 BER threshold of 10E-6.
7 BER threshold of 10E-7.
8 BER threshold of 10E-8.
9 BER threshold of 10E-9.

WTRTIME= {5-12}
Wait to Restore Time. Indicates the wait to restore time that is used by the revertive path level protection switching group. This parameter is only valid when revertive switching is selected. Values are:
5-12 An integer value in minutes between 5 and 12.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC Input, Invalid ACcess identifier
SDBE Status, internal Data Base Error
/* TPidToAidStr() Error: <ERROR-STRING> */

EXAMPLES

In the following example, the provisioning data for STS-1 port OC3STS1-5-1 is retrieved.

```
RTRV-FFP-STs1:OC3STS1-5-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"OC3STS1-5-1,OC3STS1-6-1:EBER=3,PDIDET=N,PSDIRN=UNI,RVRTV=N,
SDTHSW=5,PROTSTAT=PREFERRED-ACT"
/* RTRV-FFP-STs1:OC3STS1-5-1 [Pad567] (2) */
;
```

RELATED COMMANDS

DLT-STs1
ED-FFP-STs1

3AL45392AJ
Issue 01, February 2005

ED-STS1
ENT-STS1

COMMAND CODE: **RTRV-FFP-VT1**
COMMAND NAME: **RETRIEVE FAST FACILITY
PROTECTION VT1**

PURPOSE

The RTRV-FFP-VT1 command retrieves the switching parameter values of a ring VT1.5 FFP pair. The specified AID identifies a ring FFP that was created (implicitly) via an ENT-CRS-VT1 or ENT-CRS-T1 command. This command is only applicable to the ring configuration (refer to ENT-RNG-OC3 or ENT-RNG-OC12).

The successful response for a RTRV-FFP-VT1 command contains one line of parsable output data, in ascending order (from lowest specified VT1.5 AID to largest specified VT1.5 AID), for each VT1.5 AID specified. If no FFP entity is found, no error is returned. If the specified VT1.5 AID is unassigned (an SST of UAS), no output is returned.

A RTRV-FFP-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-FFP-VT1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the preferred (protected) or alternate (protecting) VT1.5 path or range of paths.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<AID1>,<AID2>:EBER=<value>,PROTSTAT=<value>,PSDIRN=<value>,

COMMAND CODE: **RTRV-FL-EQPT**
COMMAND NAME: **RETRIEVE FAULT LOCATE EQUIPMENT**

PURPOSE

The RTRV-FL-EQPT command reads and analyzes the system's fault location database and displays fault isolation data pertaining to the specified equipment entity.

The successful response to a RTRV-FL-EQPT command contains several lines of non-parsable output data. If FLTTYPE of DATA is specified, the first output line indicates whether updating the fault location database is inhibited (refer to ALW-FL-EQPT and INH-FL-EQPT) and an output line for fault location information pertaining to the specified equipment entity. Regardless of whether FLTTYPE of DATA is specified, a line of data is provided for any "suspected" equipment entities that could be causing the detected fault.

A RTRV-FL-EQPT command is executed regardless of whether updates to the fault location database is automatically or manually disabled/inhibited. However, the information retrieved and analyzed by the command may not reflect the current status of the system if updating the fault location database is inhibited. Updating the fault location database is automatically inhibited during an APS control system restart or a CIM circuit pack copy switch, or manually inhibited by an INH-FL-EQPT command. Upon completion of an APS system restart or a CIM copy switch, the fault location database is automatically updated with the current status of the system, unless updates have been manually inhibited by an INH-FL-EQPT command. If updating the fault location database has been manually inhibited by an INH-FL-EQPT command, the fault location database is automatically updated with the current status of the system when updating is enabled by the ALW-FL-EQPT command.

A RTRV-FL-EQPT command is denied if:

- The specified equipment entity has not previously been provisioned with the ENT-EQPT command.
- An invalid parameter value is entered.

INPUT FORMAT

------	---

FLTYPE	{DATA, STNE}
Default:	{STNE}
Addressing:	None
Description:	Fault Location Report Type, specifies the type of fault location information to be provided. Values are:
DATA	Data, the output report indicates whether updating the fault location database is inhibited, provides additional fault location data for the specified (detecting) equipment AID, and provides a list of any "suspect" equipment entities along with additional fault location data for the suspect equipment AID.
STNE	Sectionalize Trouble to an entity within the Network Element, the output report provides a list of any "suspect" equipment entities without any additional fault location data for the suspect equipment AID.

SUCCESSFUL RESPONSE FORMAT

```

[/* Fault isolation status: <FISTAT> */]
[/* <DETAID>:<FLTYPE>,<DATA> */]
[/* <DETAID>:<FLTYPE>,<SUSAID>[:<DATA>] */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

FISTAT	{Allowed, Inhibited}
	Fault Isolation STATus, indicates whether updating the fault location database is allowed or inhibited (via ALW-FL-EQPT and INH-FL-EQPT). Values are:
Allowed	Allowed, fault location database updates are enabled.
Inhibited	Inhibited, fault location database updates are disabled.

```

Detecting Equipment AID, the equipment entity for which fault isolation data is analyzed.

FLTYPE {DATA, STNE}

Fault Location Report Type, identifies the type of fault location information retrieved. Values are:

DATA	Data, FLTTYPER of DATA was entered. (Additional fault location data for the specified (detecting) equipment entity and any "suspect" equipment entity is provided.)
STNE	Sectionalize Trouble to an entity within Network Element, FLTTYPER of STNE was entered. (Additional fault location data for any "suspect" equipment entity is not provided.)

DATA	{ALM, CLKSEL0, CLKSEL1, CLKSELOPP, CLKSELREC, CLKSELSAM, CULPRIT, DEO, DIO, DMX, DS, DUEO, DUIO, DUMX, FEO, FIO, FMX, FS, FUEO, FUIO, FUMX, HW, MT, OOS, TEO, TIO, TMX, TS, TUEO, TUIO, TUMX}
	Fault Location Data, indicates pertinent fault location information concerning the detecting or suspected AID. Zero or more of the following values, separated by a comma, are displayed if FLTYPE of DATA is entered:
ALM	Alarmed, the indicated equipment entity is alarmed.
CLKSEL0	Copy 0 Clock Selected, the indicated circuit pack is selecting the copy 0 clock.
CLKSEL1	Copy 1 Clock Selected, the indicated circuit pack is selecting the copy 1 clock.
CLKSELOPP	Opposite copy of Clock Selected, the indicated circuit pack is selecting the opposite copy of clock.
CLKSELREC	Recovered Clock Selected, the indicated circuit pack is selecting the recovered clock.
CLKSELSAM	Same copy of Clock Selected, the indicated circuit pack is selecting the same copy of clock.
CULPRIT	Culprit, the indicated equipment entity is the source of the fault.
DEO	Data Electrical/Optical, a data error at the electrical-to-optical side of the indicated equipment entity is detected.
DIO	Data Input/Output, a data error at the I/O side of the indicated equipment entity is detected.
DMX	Data Matrix, a data error at the matrix side of the indicated equipment entity is detected.
DS	Data Suspect, the indicated equipment entity may be the source of the data errors.
DUEO	Data Upstream Electrical/Optical, a data error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
DUIO	Data Upstream Input/Output, a data error upstream from the I/O side of the indicated equipment entity is detected.
DUMX	Data Upstream Matrix, a data error upstream from the matrix side of the indicated equipment entity is detected.
FEO	Facility Electrical/Optical, a facility failure at the electrical-to-optical side of the indicated equipment entity is detected.
FIO	Facility Input/Output, a facility failure at the I/O side of the indicated equipment entity is detected.
FMX	Facility Matrix, a facility failure at the matrix side of the indicated equipment entity is detected.
FS	Facility Suspect, the indicated equipment entity may be the source of the facility failures.
FUEO	Facility Upstream Electrical/Optical, a facility failure upstream from the electrical-to-optical side of the indicated equipment entity is detected.
FUIO	Facility Upstream Input/Output, a facility failure upstream from the I/O side of the indicated equipment entity is detected.
FUMX	Facility Upstream Matrix, a facility failure upstream from the matrix side of the indicated equipment entity is detected.
HW	Hardware, a hardware fault on the indicated equipment entity is detected.
MT	Maintenance, the indicated equipment entity has a SST of MT.
OOS	Out-of-Service, the indicated equipment entity is OOS.
TEO	Timing Electrical/Optical, a timing error at the electrical-to-optical side of the indicated equipment entity is detected.

TIO	Timing Input/Output, a timing error at the I/O side of the indicated equipment entity is detected.
TMX	Timing Matrix, a timing error at the matrix side of the indicated equipment entity is detected.
TS	Timing Suspect, the indicated equipment entity may be the source of the timing errors.
TUEO	Timing Upstream Electrical/Optical, a timing error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
TUIO	Timing Upstream Input/Output, a timing error upstream from the I/O side of the indicated equipment entity is detected.
TUMX	Timing Upstream Matrix, a timing error upstream from the matrix side of the indicated equipment entity is detected.

Suspected Equipment/Facility AID, identifies a suspected contributor (if any) to a fault which has been detected on the detecting AID (DETAID value) and the associated DS1 or DS3 facility AID if the fault is associated with DS1/DS3 Quad equipment.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENRE	Equipage, Not Recognized Equipage /* The command was rejected. */ /* Invalid or unassigned equipment identifier specified. */
ICNV	Input, Command Not Valid /* Invalid command requested on equipment. */
IDNV	Input, Data Not Valid /* The RTRV-FL-EQPT was rejected. */ /* Unable to retrieve FLTYPE parameter. */
IIAC	Input, Invalid ACcess identifier /* The RTRV-FL-EQPT was rejected. */ /* Invalid or unassigned equipment identifier specified. */
IPNV	Input, Parameter Not Valid /* The RTRV-FL-EQPT was rejected. */ /* Invalid parameter or option specified in command. */
SDBE	Status, internal Data Base Error /* The RTRV-FL-EQPT aborted due to system error. */ /* Unable to create RTRV-FL-EQPT report file. */ /* Unable to open RTRV-FL-EQPT report file. */ /* Unable to print RTRV-FL-EQPT report file. */
SNVS	Status, Not in Valid State /* The RTRV-FL-EQPT was rejected. */ /* Command not valid for current state of equipment. */
SROF	Status, Requested Operation Failed /* The RTRV-FL-EQPT aborted due to system error. */ /* Unable to get data base type for <AID>. */ /* Unable to get data base index for <AID>. */

EXAMPLES

In the following example, retrieval and analysis of fault isolation data for CDA-4-3-1 is provided along with any additional pertinent fault isolation data.

```
RTRV-FL-EQPT : : CDA-4-3-1 : : : DATA ;
```

The output response assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc517. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The output response shown indicates that fault isolation is currently allowed, that CDA-4-3-1 is out-of-service, and that CDA-4-3-1 is the only suspect in the suspect list.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc517 COMPLD
/* Fault isolation inhibit status: Allowed */
/* CDA-4-3-1:DATA,:OOS */
/* CDA-4-3-1:DATA,CDA-4-3-1:OOS */
/* RTRV-FL-EQPT::CDA-4-3-1::DATA [Pfc517] (1) */
;
```

In the following example, retrieval and analysis of fault isolation data for CDA-5-3-1 is provided, but without any additional pertinent fault isolation data.

```
RTRV-FL-EQPT::CDA-5-3-1::STNE;
```

The output response assumes CID 2 was used to enter the command and a system generated CTAG value of Pfc519. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The output response shown indicates that MCB-3-3-1 is the first suspect, MCB-2-3-1 is the second suspect, and CDA-5-3-1 is the third suspect.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc519 COMPLD
/* CDA-5-3-1:STNE,MCB-3-3-1 */
/* CDA-5-3-1:STNE,MCB-2-3-1 */
/* CDA-5-3-1:STNE,CDA-5-3-1 */
/* RTRV-FL-EQPT::CDA-5-3-1::STNE [Pfc519] (2) */
;
```

In the following example, retrieval and analysis of fault isolation data for CDA-10-3-1 is provided, along with any additional pertinent fault isolation data.

```
RTRV-FL-EQPT::CDA-10-3-1::DATA;
```

The output response assumes CID 4 was used to enter the command and a system generated CTAG value of Pfc521. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The output response shown indicates that fault isolation is currently allowed and that CDA-10-3-1 has no additional data to report. In addition, the output response indicates that there are no suspects to report for CDA-10-3-1.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc521 COMPLD
/* Fault isolation inhibit status: Allowed */
/* CDA-10-3-1:DATA,: */
/* RTRV-FL-EQPT::CDA-10-3-1::DATA [Pfc521] (4) */
;
```

In the following example, retrieval and analysis of fault isolation data for CDB-3-3-1 is provided, but without any additional pertinent fault isolation data.

```
RTRV-FL-EQPT::CDB-3-3-1::STNE;
```

The output response assumes CID 4 was used to enter the command and a system generated CTAG value of Pfc522. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The output response shown indicates that there are no suspects to report for CDB-3-3-1.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc522 COMPLD
/* RTRV-FL-EQPT::CDB-3-3-1::STNE [Pfc522] (4) */
;
```

In the following example, retrieval and analysis of fault isolation data for MCB-2-3-1 is provided along with any additional pertinent fault isolation data.

```
RTRV-FL-EQPT::MCB-2-3-1:::DATA;
```

The output response assumes CID 1 was used to enter the command and a system generated CTAG value of Pfc518. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The output response shown indicates that fault isolation is currently allowed and that MCB-2-3-1 has detected a matrix timing fault and an upstream matrix timing fault, and MCB-2-3-1 is considered a timing suspect. In addition, MCB-3-3-1 is the first suspect, has a hardware fault detected, and is alarmed. MCB-2-3-1 is the second suspect, and as previously indicated has detected a matrix timing fault, an upstream matrix timing fault, and is considered a timing suspect.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pfc518 COMPLD
/* Fault isolation inhibit status: Allowed */
/* MCB-2-3-1:DATA,:TMX,TUMX,TS */
/* MCB-2-3-1:DATA,MCB-3-3-1:HW,ALM */
/* MCB-2-3-1:DATA,MCB-2-3-1:TMX,TUMX,TS */
/* RTRV-FL-EQPT::MCB-2-3-1:::DATA [Pfc518] (1) */
;
```

COMMAND CODE: **RTRV-FLTPRO-STS1**
COMMAND NAME: **RETRIEVE FAULT PROPAGATION STS-1**

PURPOSE

The RTRV-FLTPRO-STS1 command retrieves the provisioned fault escalation parameter values from the system database for the specified STS-1 port. The command is executed regardless of the state of the STS-1.

The successful response for a RTRV-FLTPRO-STS1 command contains one line of parsable output data for each STS-1 AID specified, in ascending order (from lowest specified STS-1 AID to highest specified STS-1 AID). Only <AID> is displayed for a retrieve of an unprovisioned STS-1.

A RTRV-FLTPRO-STS1 command is denied if:

- The "Fault Escalation" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-FLTPRO-STS1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies the STS-1 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<AID>.: [FAILDET=<value>, FLTPRO=<value>]"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) STS1 AID, identifies the STS-1 port to which this line of output data pertains.
-----	--

FAILDET= {NONE, SL, SLP}
Failure Detection (receive direction only), indicates the type of incoming STS-1 or OC-3 failures which will result in an *Escalation Request* being issued to all outgoing ports receiving any bandwidth from this STS-1 (i.e., are cross-connected to it). Values are:

NONE	None, no detection of STS-1 level failure conditions.
SL	Section/Line, specifies section and line level failure detection (LOS, LOF, AIS-L, EBER, or LOP-P) is enabled.
SLP	Section/Line/Path, specifies section, line, and path level failure detection (LOS, LOF, AIS-L, EBER, LOP-P, or AIS-P) is enabled.

FLTPRO= {N, Y}
Fault Propagation (transmit direction only), indicates whether any *Escalation Request* that is present for any incoming (i.e., from the matrix) constituent of the outgoing STS-1 is escalated up to the STS-1 Path level (i.e., AIS-P or PDI-P inserted in the output signal, depending on the STS-1 parameter PDIINS). Values are:

N	No, Fault Escalation to the STS-1 Path level is disabled.
Y	Yes, Fault Escalation to the STS-1 Path level is enabled.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier /* Error in GetFacIds() */
IPNV	Input, Parameter Not Valid
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* TPidToAidStr() Error: <ERROR-STRING> */

EXAMPLES

In following example, the fault escalation parameter values for STS-1 ports EC1STS1-10 through EC1STS1-12 are retrieved where port EC1STS1-11 has not yet been provisioned.

```
RTRV-FLTPRO-STs1::EC1STS1-10&&-12;

The output response, shown below, assumes CID 6 was used to enter the command and a system generated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-FLTPRO-T1**
COMMAND NAME: **RETRIEVE FAULT PROPAGATION T1**

PURPOSE

The RTRV-FLTPRO-T1 command retrieves the provisioned fault escalation parameter value from the system database for the specified DS1 port. The command is executed regardless of the state of the DS1.

The successful response for a RTRV-FLTPRO-T1 command contains one line of parsable output data for each DS1 AID specified, in ascending order (from lowest specified DS1 AID to highest specified DS1 AID). Only <AID> is displayed for a retrieve of an unprovisioned, electrical DS1. No output data is provided for non-electrical DS1 ports.

A RTRV-FLTPRO-T1 command is denied if:

- The specified non-ranging AID is not an electrical DS1.
- The "Fault Escalation" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-FLTPRO-T1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID: {T1-{1-59392}} (T1-DS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the electrical DS1 port or a range or ports. Restrictions: RTRV-FLTPRO-T1 is denied if the AID of a non-electrical DS1 is specified. In the case of ranging, the incorrect types will be skipped.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<AID>.: [FAILDET=<value>]"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	{DS1_AID} {T1-{1-59392}} (T1-DS1#) DS1 AID, identifies the electrical DS1 port to which this line of output data pertains.
-----	--

FAILDET= {NONE, SL, SLP}
Failure Detection (receive direction only), indicates the type of incoming DS1 failures which will result in an *Escalation Request* being issued to all outgoing ports receiving any bandwidth from this DS1 (i.e., are cross-connected to it). Values are:

NONE	None, no detection of DS1 level failure conditions.
SL	Section/Line, specifies section and line level failure detection (LOS or LOF) is enabled.
SLP	Section/Line/Path, specifies section, line, and path level failure detection (LOS, LOF, or AIS) is enabled.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier /* Error in GetFaclds() */
IPNV	Input, Parameter Not Valid
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* TPidToAidStr() Error: <ERROR-STRING> */

EXAMPLES

In the following example, the fault escalation parameter values for electrical DS1 ports T1-71 through T1-73 are retrieved where port T1-72 has not yet been provisioned.

```
RTRV-FLTPRO-T1::T1-71&&-73;
```

The output response, shown below, assumes CID 6 was used to enter the command and a system generated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pab124 COMPLD

COMMAND CODE: **RTRV-FLTPRO-T3**
COMMAND NAME: **RETRIEVE FAULT PROPAGATION T3**

PURPOSE

The RTRV-FLTPRO-T3 command retrieves the provisioned fault escalation parameter values from the system database for the specified DS3 port. The command is executed regardless of the state of the DS3.

The successful response for a RTRV-FLTPRO-T3 command contains one line of parsable output data for each DS3 AID specified, in ascending order (from lowest specified DS3 AID to highest specified DS3 AID). Only <AID> is displayed for a retrieve of an unprovisioned DS3.

A RTRV-FLTPRO-T3 command is denied if:

- The "Fault Escalation" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-FLTPRO-T3 : [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) {EC1T3-{1-3840}} (EC1T3-EC1/STS1/DS3#) {OC3T3-{1-2240}-{1-3}} (OC3T3-OC3#-STS1/DS3#) {OC12T3-{1-560}-{1-4}-{1-3}} (OC12T3-OC12#-STM1#-STS1/DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS3 AID, identifies the DS3 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<AID>.: [FAILDET=<value>, FLTPRO=<value>]"
[/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) {EC1T3-{1-3840}} (EC1T3-EC1/STS1/DS3#) {OC3T3-{1-2240}-{1-3}} (OC3T3-OC3#-STS1/DS3#) {OC12T3-{1-560}-{1-4}-{1-3}} (OC12T3-OC12#-STM1#-STS1/DS3#) DS3 AID, identifies the DS3 port to which this line of output data pertains.
-----	---

FAILDET=	{NONE, SL, SLP}
	Failure Detection (receive direction and on electrical T3s only), indicates the type of incoming DS3 failures which will result in an <i>Escalation Request</i> being issued to all outgoing ports receiving any bandwidth from this DS3 (i.e., are cross-connected to it). Values are:
	NONE None, no detection of DS3 level failure conditions.
	SL Section/Line, specifies section and line level failure detection (LOS or LOF) is enabled.
	SLP Section/Line/Path, specifies section, line, and path level failure detection (LOS, LOF, or AIS) is enabled.
FLTPRO=	{N, Y}
	Fault Propagation (transmit direction only), indicates whether any <i>Escalation Requests</i> that are present for incoming (i.e., from the matrix) constituents of the outgoing DS3 is escalated up to the:
	DS3 Section level (i.e., output signal removed) for electrical DS3 ports terminated on a DS3 Quad shelf, or
	DS3 Path level (i.e. DS3-AIS inserted on output signal) for DS3s not terminated on a DS3 Quad shelf.
	Values are:
	N No, fault escalation to the DS3 Path or Section level is disabled.
	Y Yes, fault escalation to the DS3 Path or Section level is enabled.

COMMAND CODE: **RTRV-FLTPRO-VT1**
COMMAND NAME: **RETRIEVE FAULT PROPAGATION VT1**

PURPOSE

The RTRV-FLTPRO-VT1 command retrieves the provisioned fault escalation parameter value from the system database for the specified VT1.5 port. The command is executed regardless of the state of the VT1.5.

The successful response for a RTRV-FLTPRO-VT1 command contains one line of parsable output data for each VT1.5 AID specified, in ascending order (from lowest specified VT1.5 AID to highest specified VT1.5 AID). Only <AID> is displayed for a retrieve of an unprovisioned VT1.5.

A RTRV-FLTPRO-VT1 command is denied if:

- The "Fault Escalation" PFO is not enabled.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-FLTPRO-VT1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies the VT1.5 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<AID>.: [FLTPRO=<value>]"
[/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) VT1 AID, identifies the VT1.5 port to which this line of output data pertains.
-----	--

FLTPRO= {N, Y}
Fault Propagation (transmit direction only), indicates whether or not any *Escalation Request* that is present for any incoming (i.e., from the matrix) constituent of the outgoing VT1.5 is escalated up to the VT1.5 Path level (i.e., AIS-V inserted in the output signal).
Values are:
N No, Fault Escalation to the VT1.5 Path level is disabled.
Y Yes, Fault Escalation to the VT1.5 Path level is enabled

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

COMMAND CODE: **RTRV-FTP-USER**
COMMAND NAME: **RETRIEVE FTP USER**

PURPOSE

The RTRV-FTP-USER command retrieves the user profile entry in the FTP (File Transfer Protocol) User Security Database.

The RTRV-FTP-USER command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An RTRV-FTP-USER command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-FTP-USER: [TID] :: [CTAG] :: [FTPUID] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
FTPUID	<5-12 VALID FTPUID CHARACTERS> or {ALL} Default: {ALL} Addressing: None Description: FTP User Identifier, specifies a unique user ID. Valid values for FTPUID are 5 to 12, case-sensitive alphanumeric characters where the first character must always be an alphabetic character. The following special characters are also accepted as valid characters and will be part of the FTPUID: % (percent sign), + (plus sign), # (pound sign), and _ (under score). (Note that the dash (-) character is also accepted by the system, but only characters prior to the dash become part of the FTPUID. The dash (-) and characters after that are ignored by the system.) Named-defined values are: <div>ALL, all All FTP User Identifiers are retrieved.</div>

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <FTPUID>,<ACCTYPE> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

FTPUID	<5–12 VALID FTPUID CHARACTERS> FTP User Identifier, identifies the provisioned UID value.	
ACCTYPE	{BPM, DB, ISU} Access Type, identifies the type of access the FTP user has.	
	BPM	User has access to binary PM data.
	DB	User has access to database backup files
	ISU	User has access to in-service upgrade generic files

UNSUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RTRV-GOS-EC1**
COMMAND NAME: **RETRIEVE GRADE-OF-SERVICE EC1**

PURPOSE

The RTRV-GOS-EC1 command retrieves the current system-level Grade-Of-Service-EC1 threshold level setting which determines the number of service affecting EC1 facility alarms required to generate a (system-level) common Grade-Of-Service-EC1 (GOS-EC1) condition.

The GOS-EC1 condition type attributes are set by the SET-ATTR-COM command.

A RTRV-GOS-EC1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-GOS-EC1: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* EC1 grade-of-service threshold is <THRESHOLD>. */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

THRESHOLD	{0-3072} Threshold, identifies the number of service affecting EC1 facility alarms required to generate a (system-level) common GOS-EC1 condition. A value of zero (0) indicates no GOS-EC1 condition is generated.
-----------	--

COMMAND CODE: **RTRV-GOS-STS1**
COMMAND NAME: **RETRIEVE GRADE-OF-SERVICE STS-1**

PURPOSE

The RTRV-GOS-STS1 command retrieves the current system-level Grade-Of-Service-STS1 threshold level setting which determines the number of service affecting STS-1 facility alarms required to generate a (system-level) common Grade-Of-Service-STS1 (GOS-STS1) condition.

The GOS-STS1 condition type attributes are set by the SET-ATTR-COM command.

A RTRV-GOS-STS1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-GOS-STS1 : [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* STS1 grade-of-service threshold is <THRESHOLD>. */
/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

OUTPUT PARAMETERS

THRESHOLD	{0-3072} Threshold, identifies the number of service affecting STS-1 facility alarms required to generate a (system-level) common GOS-STS1 condition. A value of zero (0) indicates no GOS-STS1 condition is generated.
-----------	--

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
/* <Informational Error Description Text> */
/* <Expanded Error Code Description> */
/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SDBE Status, internal Data Base Error
 /* Error reading the GOS thresholds database. */

EXAMPLES

In the following example, the current system-level GOS-STS1 alarm threshold level is retrieved.

```
RTRV-GOS-STS1;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71012. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-GOS-STS3C**
COMMAND NAME: **RETRIEVE GRADE-OF-SERVICE STS-3C**

PURPOSE

The RTRV-GOS-STS3C command retrieves the current system-level Grade-Of-Service-STS3C threshold level setting which determines the number of service affecting STS-3C facility alarms required to generate a (system-level) common Grade-Of-Service-STS3C (GOS-STS3C) condition.

The GOS-STS3C condition type attributes are set by the SET-ATTR-COM command.

A RTRV-GOS-STS3C command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-GOS-STS3C: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **RTRV-GTI-STATUS**
COMMAND NAME: **RETRIEVE GTI (FAULT) STATUS**

PURPOSE

The RTRV-GTI-STATUS command retrieves the equipment AIDs, any associated fault location data or error information, and the GTI cable AIDs, if any, related to the specified GTI AID.

When a GTI condition is set on a GT1 or GT4 equipment entity, the RTRV-GTI-STATUS command is used to identify the equipment AIDs, and any associated fault location data or error information, pertaining to the indicated GTI signal path. Subsequent to obtaining the associated equipment AIDs, a RTRV-FL-EQPT command may provide additional fault isolation information pertaining to the cause of the GTI condition.

The successful response to a RTRV-GTI-STATUS command contains several lines of non-parsable output data, with each line of output identifying:

- the equipment AID (and any associated fault location data pertaining to the indicated equipment) associated with the specified GTI signal path,
- the GTI cable AID, if any, for each end of the specified GTI signal path,
- zero, one, or more lines of error information for each identified equipment AID.

Refer to the Successful Response Format, below.

A RTRV-GTI-STATUS command is denied if:

- Either of the circuit packs associated with the specified GTI cable AID is not provisioned.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-GTI-STATUS : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >
Default:	<SID>
Addressing:	None
Description:	Target Identifier, specifies the network node TID for the command.

AID

GTI_CABLE_AID:

Equipment AID, identifies a circuit pack associated with the indicated GTI Cable AID.

DATA {ALM, CLKSEL0, CLKSEL1, CLKSELOPP, CLKSELREC, CLKSELSAM, CULPRIT,
 DEO, DIO, DMX, DS, DUEO, DUIO, DUMX, FEO, FIO, FMX, FS, FUEO, FUIO, FUMX,
 HW, MT, OOS, TEO, TIO, TMX, TS, TUEO, TUIO, TUMX, fault data not received from
 <L2P EQPT AID>, not responding}

Fault Location Data, indicates pertinent fault location information, if any, concerning the identified equipment entity. If a fault condition exists, one or more of the following values, separated by a comma, are displayed:

ALM	Alarmed, the indicated equipment entity is alarmed.
CLKSEL0	Copy 0 Clock Selected, the indicated circuit pack is selecting the copy 0 clock.
CLKSEL1	Copy 1 Clock Selected, the indicated circuit pack is selecting the copy 1 clock.
CLKSELOPP	Opposite copy of Clock Selected, the indicated circuit pack is selecting the opposite copy of clock.
CLKSELREC	Recovered Clock Selected, the indicated circuit pack is selecting the recovered clock.
CLKSELSAM	Same copy of Clock Selected, the indicated circuit pack is selecting the same copy of clock.
CULPRIT	Culprit, the indicated equipment entity is the source of the fault.
DEO	Data Electrical/Optical, a data error at the electrical-to-

DIO	optical side of the indicated equipment entity is detected. Data Input/Output, a data error at the I/O side of the indicated equipment entity is detected.
DMX	Data Matrix, a data error at the matrix side of the indicated equipment entity is detected.
DS	Data Suspect, the indicated equipment entity may be the source of the data errors.
DUEO	Data Upstream Electrical/Optical, a data error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
DUIO	Data Upstream Input/Output, a data error upstream from the I/O side of the indicated equipment entity is detected.
DUMX	Data Upstream Matrix, a data error upstream from the matrix side of the indicated equipment entity is detected.
FEO	Facility Electrical/Optical, a facility failure at the electrical-to-optical side of the indicated equipment entity is detected.
FIO	Facility Input/Output, a facility failure at the I/O side of the indicated equipment entity is detected.
FMX	Facility Matrix, a facility failure at the matrix side of the indicated equipment entity is detected.
FS	Facility Suspect, the indicated equipment entity may be the source of the facility failures.
FUEO	Facility Upstream Electrical/Optical, a facility failure upstream from the electrical-to-optical side of the indicated equipment entity is detected.
FUIO	Facility Upstream Input/Output, a facility failure upstream from the I/O side of the indicated equipment entity is detected.
FUMX	Facility Upstream Matrix, a facility failure upstream from the matrix side of the indicated equipment entity is detected.
HW	Hardware, a hardware fault on the indicated equipment entity is detected.
MT	Maintenance, the indicated equipment entity has a SST of MT.
OOS	Out-of-Service, the indicated equipment entity is OOS.
TEO	Timing Electrical/Optical, a timing error at the electrical-to-optical side of the indicated equipment entity is detected.
TIO	Timing Input/Output, a timing error at the I/O side of the indicated equipment entity is detected.
TMX	Timing Matrix, a timing error at the matrix side of the indicated equipment entity is detected.
TS	Timing Suspect, the indicated equipment entity may be the source of the timing errors.
TUEO	Timing Upstream Electrical/Optical, a timing error upstream from the electrical-to-optical side of the indicated equipment entity is detected.
TUIO	Timing Upstream Input/Output, a timing error upstream from the I/O side of the indicated equipment entity is detected.
TUMX	Timing Upstream Matrix, a timing error upstream from the matrix side of the indicated equipment entity is detected.

fault data not received from <L2P EQPT AID> not responding	The supporting Level 2 Processor did not respond. The indicated equipment entity is not OOS and no re- sponse from the entity was received.
--	---

ERROR_INFO {CID, CONN RAM, COPY0 ASYMAIS, COPY0 CID, COPY0 FPE, COPY0 PBIT, COPY0 STM1 LOF, COPY0 STM1 LOSSYNC, COPY0 STM1 RAIL, COPY0 WPE, COPY1 ASYMAIS, COPY1 CID, COPY1 FPE, COPY1 PBIT, COPY1 STM1 LOF, COPY1 STM1 LOSSYNC, COPY1 STM1 RAIL, COPY1 WPE, STM1 LOF, STM1 LOSSYNC, STM1 OF, STM1 RAIL, STM1 SPILL, STM1 UF, STM4 1, STM4 2, STM4 3, STM4 4, STM4 B1, STM4 CABLE DELAY, STM4 DXCLK, STM4 DXSPILL, STM4 LOF, STM4 LOS, STM4 MXCLK, STM4 MXSPILL, XMIT LASER OFF}

Equipment Error Information, indicates additional error information, if any, detected by the system pertaining to the equipment AID identified in the output line above this line. Multiple lines of <ERROR_INFO> may be displayed, with multiple values of <ERROR_INFO>, separated by a comma, per line. Values are:

CID	Connect IDentification error detected.
CONN RAM	Connection RAM error detected.
COPY0 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 0 signal and not on Copy1
COPY0 CID	Connect IDentification error detected on Copy 0 signal.
COPY0 FPE	Frame Parity Error detected on Copy 0 signal.
COPY0 PBIT	Parity Bit Error detected on Copy 0 signal.
COPY0 STM1 LOF	Loss of Frame detected on STM1 Copy 0 signal.
COPY0 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 0 signal.
COPY0 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 0 signal.
COPY0 WPE	Word Parity Error detected on Copy 0 signal.
COPY1 ASYMAIS	Asymmetrical AIS. AIS detected on Copy 1 signal and not on Copy1
COPY1 CID	Connect IDentification error detected on Copy 1 signal.
COPY1 FPE	Frame Parity Error detected on Copy 1 signal.
COPY1 PBIT	Parity Bit Error detected on Copy 1 signal.
COPY1 STM1 LOF	Loss of Frame detected on STM1 Copy 1 signal.
COPY1 STM1 LOSSYNC	Loss of Synchronization pulse detected on STM1 Copy 1 signal.
COPY1 STM1 RAIL	Lower or upper limit delay Rail detected on STM1 Copy 1 signal.
COPY1 WPE	Word Parity Error detected on Copy 1 signal.
STM1 LOF	Loss of Frame detected on STM1 signal.
STM1 LOSSYNC	Loss of Sync pulse detected on STM1 signal.
STM1 OF	Over-Flow buffer spill detected on STM1 signal.
STM1 RAIL	Lower or upper limit delay Rail detected on STM1 signal.
STM1 SPILL	Buffer Spill detected on STM1 signal.
STM1 UF	Under-Flow buffer spill detected on STM1 signal.
STM4 1	Error detected on STM4 signal number one.
STM4 2	Error detected on STM4 signal number two.
STM4 3	Error detected on STM4 signal number three.
STM4 4	Error detected on STM4 signal number four.
STM4 B1	B1 error detected on STM4 signal.
STM4 CABLE DELAY	Cable Delay error detected on STM4 signal.
STM4 DXCLK	Demux Clock error detected on STM4 signal.
STM4 DXSPILL	Demux Clock Spill detected on STM4 signal.
STM4 LOF	Loss of Frame detected on STM4 signal.
STM4 LOS	Loss of Signal detected on STM4 signal.
STM4 MXCLK	Mux Clock error detected on STM4 signal.
STM4 MXSPILL	Mux Clock Spill detected on STM4 signal.
XMIT LASER OFF	EOB, IOB, or OXB Transmit Laser has been turned off.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* Invalid GTI card type <card type number> specified. */ /* Invalid AID specified – cbl # (cable number) out of range. */ /* Invalid AID specified – slot # (slot number) out of range. */
SARB	Status, All Resources Busy /* Too many RTRV-GTI-STATUS commands already in progress. */
SDBE	Status, internal Data Base Error /* Invalid matrix stage number <matrix stage number> encountered. */ /* Error reading matrix cable input database for bay <bay number> shelf <shelf number>. */ /* Error reading eoc to es1 cable database for cable <cable number>. */ /* Error reading es1 to cs cable database for cable <cable number>. */ /* Error reading cs to es3 cable database for cable <cable number>. */ /* Error reading matrix cable output database for cable <cable number>. */ /* Error reading eoc to io cable database for cable <cable number>. */ /* Invalid subrack type (<subrack type number>) in FROM equipment shelf (<shelf id>) database. */ /* Invalid FROM card type <card type number> encountered. */ /* Failed to read EM DB for shelf equipment (<shelf id>), status=<error number>. */ /* Failed to get OC3 TP DB record <record number> error <error number>. */ /* Unable to create RTRV-GTI-STATUS report file. */ /* Unable to open RTRV-GTI-STATUS report file. */ /* Unable to print RTRV-GTI-STATUS report file. */
SNVS	Status, Not in Valid State /* <EQPT AID> is not in a provisioned state. */ /* <EQPT AID> is not use. */ /* Command not valid for current state of equipment. */

SROF Status, Requested Operation Failed

```
/* Unable to access memory for FI auxiliary data. */
/* Unable to retrieve TO equipment (<equipment id>) database. */
/* Unable to retrieve TO equipment shelf (<shelf id>) database. */
/* Unable to retrieve FROM equipment (<equipment id>) database. */
/* Specified AID cbl # (<cable number>) may be invalid for current configuration.*/
/* Unable to retrieve FROM equipment shelf (<shelf id>) database. */
/* Unable to queue FI auxiliary buffer for retrieve gti status request. */
/* Unable to send retrieve gti status message to ACL for <SPB AID>. */
/* Unable to send retrieve gti status message to ACL for <IPU AID>. */
/* Unable to determine I/O card slot for subrack type (<subrack type number>) GTI offset
   (<gti offset number>). */
/* Unable to determine matrix card type for bay <bay number> shelf <shelf number> slot
   <slot number>.*
/* Unable to compute matrix input cable number for <EQPT AID>. */
/* Invalid SI protect board type (<card type>) for bay <bay number> shelf <shelf number>
   slot <slot number>.*
/* Unable to get TP type and TP number for I/O equipment (<equipment id>). */
/* Unexpected response received from <SPB AID>. */
/* Unexpected response received from <IPU AID>. */
/* Unable to re-queue FI auxiliary buffer for retrieve gti status request. */
/* The RTRV-GTI-STATUS was aborted. */
/* Invalid FROM I/O card type (<card type number>) encountered. */
/* Invalid FROM matrix card type (<card type number>) encountered. */
/* Invalid FROM gti location (<gti location number>) encountered. */
/* Invalid SI protect board card type (<card type number>) encountered.*/
/* Invalid TO I/O card type (<card type number>) encountered. */
/* Invalid TO matrix card type (<card type number>) encountered. */
/* Invalid TO gti location (<gti location number>) encountered. */
```

EXAMPLES

In the following example, fault isolation data pertaining to GTI AID G1M16-4-3-1-1 is retrieved.

```
RTRV-GTI-STATUS::RTRV-GTI-STATUS::G1M16-4-3-1-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
/* From Eqpt AID: EP3-6-1-2:TMX,TUMX,TS,CLKSEL0 */
/* COPY1 STM1 LOSSYNC, COPY1 STM1 LOF, COPY1 CID */
/* IPB Eqpt AID: IPB-6-1-2:HW,ALM,CLKSEL0 */
/* From Cable AID: CBL-6-1-XA250H */
/* To Cable AID: CBL-4-3-UX031B */
/* To Eqpt AID: M16-4-3-1:OOS */
/* RTRV-GTI-STATUS::G1M16-4-3-1-1 [Pad567] (2) */
;
```

COMMAND CODE: **RTRV-HDR**
COMMAND NAME: **RETRIEVE HEADER**

PURPOSE

The RTRV-HDR command is used to retrieve the system's output response (site) header. The output response header consists of the site identifier (SID) and the current date and time.

The RTRV-HDR command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-HDR: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed
 /* ERROR, Could not Access Site Header Information */

EXAMPLES

In the following example, RTRV-HDR is used to retrieve the site header information.

```
RTRV-HDR;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P13001. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P13001 COMPLD  
/* RTRV-HDR [P13001] (1) */  
;

COMMAND CODE: **RTRV-IP-FILTER**
COMMAND NAME: **RETRIEVE IP PACKET FILTER TABLE ENTRY**

PURPOSE

The RTRV-IP-FILTER command retrieves an entry or all entries in the packet filter table used by the Internet Protocol (IP) router of the stack running on the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command retrieves entries in the network layer (Layer 3) parameters pertaining to the packet filter table.

If the IPADDR is specified, the packet filter table entry corresponding to the IP address is retrieved. If the IPADDR is specified as ALL or null, all the packet filter table entries are retrieved. If the IPADDR is specified and no entry is present in the table, the command completes successfully without producing any output.

The successful response for a RTRV-IP-FILTER contains one line of parsable output data for each specified CPORT that is provisioned as a LAN port.

The RTRV-IP-FILTER command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An RTRV-IP-FILTER command is denied if:

- The specified CID is not configured as the LAN on the ICM.
- The specified CID is not configured with the IP packet filter table entry being retrieved.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-IP-FILTER: [TID] : CPORT: [CTAG] :: [IPADDR] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
IPADDR	{{(0-255)-(0-255)-(0-255)-(0-255)}, ALL} Default: <All Entries> Addressing: None Description: Internet Protocol Address, specifies the IP Address of the NE to which the packet filter table entry is retrieved. Name-defined values are: ALL All the packet filter table entries are retrieved.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<CPORT>::IPADDR=<value>,NETMASK=<value>"]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

CPORT	{3, 5, 7, 9, 11} Control Port, identifies the CID which is configured as the LAN on the ICM module.
IPADDR=	{{(0-255)-(0-255)-(0-255)-(0-255)}, ALL} Internet Protocol Address, specifies the IP Address of the NE to which the packet filter table entry is added. Name-defined values are: ALL All the packet filter table entries are added.
NETMASK=	{{(0-255)-(0-255)-(0-255)-(0-255)} Subnet Mask, specifies the subnet mask of the network to which the NE with IPADDR is connected to.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
IPNV	Input, Parameter Not Valid

EXAMPLES

In the following example, the entries in the packet filter table for CPORT 3 are being retrieved and IPADDR is set to ALL.

```
RTRV-IP-FILTER::3::ALL;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "3::IPADDR=0-0-0-0,NETMASK=255-255-255-0"
  [/ * RTRV-IP-FILTER::3::ALL [Pad567] (2) */]
;
```

RELATED COMMANDS

DLT-IP-FILTER
ENT-IP-FILTER

COMMAND CODE: **RTRV-IP-PRMTR**
COMMAND NAME: **RETRIEVE IP PARAMETERS**

PURPOSE

The RTRV-IP-PRMTR command retrieves the Internet Protocol (IP) Layer parameters of the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command retrieves the network layer (Layer 3) parameters pertaining to the IP layer stack.

The successful response for a RTRV-IP-PRMTR contains one line of parsable output data for each specified CPORT that is provisioned as a LAN port.

The RTRV-IP-PRMTR command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

A RTRV-IP-PRMTR command is denied if:

- The specified CID is not configured as the LAN on the ICM.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-IP-PRMTR: [TID] : CPORT: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<CPORT>.:BRDCSTADR=<value>,GATEWAYADR=<value>,
IPADDR=<value>,NETMASK=<value>,NODENAME=<value>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

CPORT	{3, 5, 7, 9, 11} Control Port, identifies the CID which is configured as the LAN on the ICM module. N No, specifies all parameters are not set to the factory default. Y Yes, specifies all parameters are set to the factory default.
BRDCSTADR=	{(0-255)-(0-255)-(0-255)-(0-255)} Broadcast Address, specifies the Network Layer Broadcast Address for the specified IP Address. The Broadcast Address is the IP Address with all the host bits set to one (NOTE: the host bits are the bits in the NETMASK that are set to zero).

GATEWAYADR= {(0-255)-(0-255)-(0-255)-(0-255)}
Gateway Address, specifies the Network Layer's Default Gateway router's IP address.

IPADDR= {(0-223)-(0-255)-(0-255)-(0-255)}
Internet Protocol Address, specifies the IP Address of the Network Interface.

NETMASK= {(0-255)-(0-255)-(0-255)-(0-255)}
Subnet Mask, specifies the subnet mask of the network to which the NE is connected to.

NODENAME= <1-15 ASCII printable characters>
TCP/IP Network Name, specifies the TCP/IP network name of the NE. This value is not used by the NE at this time, but is set so the verification of the IP address is made at a later time.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
IPNV	Input, Parameter Not Valid

EXAMPLES

In the following example, the IP layer parameters pertaining to the LAN for CPORT 11 are being retrieved and all parameters are set to the factory default.

```
RTRV-IP-PRMTR::11;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "11::BRDCSTADR=192-0-2-255,GATEWAYADR=0-0-0-0,
  IPADDR=192-0-2-1,NETMASK=255-255-255-0,NODENAME=NULL"
  /* RTRV-IP-PRMTR::11 [Pad567] (2) */
;
```

RELATED COMMANDS

ED-IP-PRMTR

COMMAND CODE: **RTRV-IP-STATICRT**
COMMAND NAME: **RETRIEVE IP STATIC ROUTE**

PURPOSE

The RTRV-IP-STATICRT command retrieves the entries in the static routing table used by the Internet Protocol (IP) router running on the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command retrieves entries in the network layer (Layer 3) parameters pertaining to the static routing table.

If the IPADDR is specified, the static router table entry corresponding to the IP address is retrieved. If the IPADDR is specified as ALL or null, all the static router table entries are retrieved.

The successful response for a RTRV-IP-STATICRT contains one line of parsable output data for each specified CPORT that is provisioned as a LAN port.

The RTRV-IP-STATICRT command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

A RTRV-IP-STATICRT command is denied if:

- The specified CID is not configured as the LAN on the ICM.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-IP-STATICRT: [TID] : CPORT: [CTAG] :: [IPADDR] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
IPADDR	{{(0-223)-(0-255)-(0-255)-(0-255)}, ALL} Default: <All Entries> Addressing: None Description: Internet Protocol Address, specifies the IP Address of the NE to which the static route entry is retrieved. Name-defined values are: ALL All the static router table entries are retrieved.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<CPORT>::DESTTYPE=value>, GATEWAYADR=<value>, IPADDR=<value>,
NETMASK=<value>"]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

CPORT	{3, 5, 7, 9, 11} Control Port, identifies the CID which is configured as the LAN on the ICM module.
DESTTYPE=	{HOST, NET} Destination Type, determines the type of the IP Address specified in the IPADDR parameter. Values are: HOST Specifies the IP Address type is a Host. NET Specifies the IP Address type is a Network.
GATEWAYADR=	{{(0-255)-(0-255)-(0-255)-(0-255}} Gateway Address, specifies the gateway address of the gateway to which the packets are sent in order to reach the NE whose IP address is as given in the IPADDR parameter.
IPADDR=	{{(0-223)-(0-255)-(0-255)-(0-255}} Internet Protocol Address, specifies the IP Address of the NE to which the static route entry is made.
NETMASK=	{{(0-255)-(0-255)-(0-255)-(0-255}} Subnet Mask, specifies the subnet mask of the network to which the NE with IPADDR is connected to.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]

COMMAND CODE: **RTRV-ISGLP-ALL**
COMMAND NAME: **RETRIEVE IN-SERVICE LOOPBACK ALL**

PURPOSE

The RTRV-ISGLP-ALL command retrieves STS-1 and DS3 ports in the system that are supporting an In-Service-Growth Loopback (ISGLP) and all VT1.5 and DS1 ports in the system that are in an In-Service-Growth Loopback (ISGLP).

The successful output response will generate a separate parsable line of data for each STS1 or T3 AID that is currently supporting an ISGLP because an OPR-ISGLP-STs1|T3 was executed (i.e., has a SST of UAS&MT&LPBK), and each T1 or VT1 AID that is currently in an ISGLP because an OPR-ISGLP-T1|VT1 was executed (i.e., has a SST of UAS&MT&LPBK) and is not being reported via a line for a T3 or STS1 AID. No line of output data shall be provided if no ISGLPs currently exist in the system.

A RTRV-ISGLP-ALL command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ISGLP-ALL: [TID] : [AID] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	{ALL} Default: <ALL> Addressing: None Description: Access Identifier, identifies the ports involved in or supporting In-Service-Growth Loopbacks.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<AID>, <AIDTYPE>:CS0=<value>,CS1=<value>,MODE=<value>"]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	DS1_AID:	
	{T1-{1-59392}}	(T1-DS1#)
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	VT1_AID:	
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)
	AID of the port that is in In-service growth loopback. One line for each port that is under such loopback is output.	
AIDTYPE	{STS1, T1, T3, VT1}	
	Indicates the type of the AID specified by the AID output parameter. Value is:	
	STS1	Indicates that the AID corresponds to STS-1 AID
	T1	Indicates that the AID corresponds to DS1 AID
	T3	Indicates that the AID corresponds to DS3 AID
CS0=	VT1	
	Indicates that the AID corresponds to VT1.5 AID	
	CS0_AID:	
	{M16 - 2 - 3 - {1-16} }	
	{M40 - 2 - 3 - {1-16} }	
CS1=	{M40 - 5 - 3 - {4,5,9,10} }	
	The equipment AID of the center stage copy 0 matrix module that is being used in the test.	
	CS1_AID:	
	{M16 - 3 - 3 - {1-16} }	
	{M40 - 3 - 3 - {1-16} }	
	{M40 - 5 - 1 - {4,5,9,10} }	
	The equipment AID of the center stage copy 1 matrix module that is being used in the test.	

MODE= {BOTH, INV1, INV3, NORM}
Loop-back Test Mode, specifies how the embedded DS1s within the specified DS3 are assigned matrix time slots for the loop back test. Values are:

BOTH	Inverted time slot assignments in Both the first-stage and third-stage matrix, specifies that time slot assignments for the loop back test are to be inverted in both the first-stage and third-stage matrix. DS1 #1 is assigned time slot #28, DS1 #2 is assigned time slot #27, ..., DS1 #28 is assigned time slot #1 in the first-stage and third-stage matrix. Time-slot assignments inverted in both the first-stage and third-stage matrix return to the I/O module with normal (non-inverted) time slot assignments. This is valid only when the AID is that of T3 or STS1.
INV1	Inverted time slot assignments in the First-stage matrix, specifies that time slot assignments for the loop back test are to be inverted in the first-stage matrix. DS1 #1 is assigned time slot #28, DS1 #2 is assigned time slot #27, ..., DS1 #28 is assigned time slot #1 in the first-stage matrix. Time-slot assignments in the third-stage matrix are not inverted. This is valid only when the AID is that of T3 or STS1.
INV3	Inverted time slot assignments in the Third-Stage matrix, specifies that time slot assignments for the loop back test are to be inverted in the third-stage matrix. DS1 #1 is assigned time slot #28, DS1 #2 is assigned time slot #27, ..., DS1 #28 is assigned time slot #1 in the third-stage matrix. Time-slot assignments in the third-stage matrix are not inverted. This is valid only when the AID is that of T3 or STS1.
NORM	Normal time slot assignments in the first and third-stage matrix, specifies no change in the time slot assignments for the loop back test are to be made in the first-stage and third-stage matrix. DS1 #1 is assigned time slot #1, DS1 #2 is assigned time slot #2, ..., DS1 #28 is assigned time slot #28. This is valid for all the AIDs listed.

COMMAND CODE: RTRV-ISID-T1
COMMAND NAME: RETRIEVE IDLE SIGNAL IDENTIFIER FOR DS1

PURPOSE

This command retrieves the contents of Idle Signal Identification (ISID) messages that may be coming in on the Facility Data Link for a single given DS1. If DS1 Idle Signal Identification messages are present, they arrive at the rate of once per second. This command watches for an ISID message on the given DS1 for a maximum of 3.5 to 4.0 seconds (approximately 3 message periods). If no ISID messages (or no good ISID messages) have been received in that time, the command will timeout and return a message unavailable indication. If a message is received, the message content shall be returned in the response to this command.

Within the ISID messages received from a facility data link, special control characters, reserved characters, 8 bit binaries, etc. (ASCII string values) from the in-use portion of the EIC, LIC, FIC, Unit, and Port number fields are converted by the 1631 SX LMC system. Specifically, the system replaces the following with a question mark (?) character (3F hex) in displaying corresponding output parameters:

- All control characters (i.e., 01 hex to 1F hex and the value 7F hex)
- All double quote (") and back slash (\) characters (22 hex and 5C hex respectively)
- All 8 bit characters (i.e., 80 hex to FF hex)

All other characters are left unchanged. Note that the normal conversion of NULLs to "." characters are not necessary, since a NULL is considered a terminator in this case and would not be included in the output string.

A RTRV-ISID-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.
- The DS1 CI/NI Trouble Sectionalization Premium Feature Option is not enabled.
- The AID of a DS1 that is not in extended superframe (ESF) format is specified.
- A range or more than one DS1 is specified in the AID entry.
- The DS1 specified is not supported by EP3, O1B, O4M, or S3M modules compatible with the DS1 CI/NI Trouble Sectionalization Premium Feature Option.
- The AID of a DS1 is located on an Async shelf.

INPUT FORMAT

RTRV-ISID-T1: [TID]:AID: [CTAG];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS1_AID:	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
	Default:	Entry Required
	Addressing:	None
	Description:	Identifies the DS1 port or a range of ports. This may also identify an external reference timing source. Name-defined values are:
	Restrictions:	RTRV-ISID-T1 is denied if _____
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD

```

OUTPUT PARAMETERS

AID	DS1_AID: {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#) {EC1T1-{1-3840}-{1-28}} (EC1T1-EC1/STS1/DS3#-DS1#) {OC3T1-{1-2240}-{1-3}-{1-28}} (OC3T1-OC3#-STS1/DS3#-DS1#) {OC12T1-{1-560}-{1-4}-{1-3}-{1-28}} (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
CR=	{Y,N} CaRrier's network flag. Indicates whether equipment generating the DS1 IDLE is within the carrier's network or at a customer installation. This is taken directly from the C/R bit in the ISID message. Values are: Y Yes. DS1 Idle Signal is being generated within the carrier's network. N No. DS1 Idle Signal is being generated external to carrier's network.
EIC=	< 0 to 10 Printable ASCII Characters > Equipment Identification Code of equipment originating the DS1 Idle Signal.
LIC=	< 0 to 11 Printable ASCII Characters > Location Identification Code of equipment originating the DS1 Idle Signal.
FIC=	< 0 to 10 Printable ASCII Characters > Frame Identification Code of equipment originating the DS Idle Signal. Identifies where in a building the equipment is located.
UNIT=	< 0 to 6 Printable ASCII Characters > A code that identifies the UNITs location within a bay of equipment originating the DS Idle Signal.
PORT=	< 0 to 4 Printable ASCII Characters > The number of the PORT originating the DS Idle Signal.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENRI	Equipage, Not equipped for Retrieving specified Information /* I/O module does not support ISID */
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* TPidToAidStr (<TP-TYPE>. <RECORD-NUMBER>) : <ERROR-STRING> */
SNVS	Status, Not in Valid State
SROF	Status, Requested Operation Failed /* Could not communicate with the SPB. */ /* SPB communication time out */ /* Bad response code returned from SPB (<RESPONSE-CODE>) */
SRQN	Status, invalid ReQuest
SSRE	Status, System Resources Exceeded /* DS1 channel is busy */

EXAMPLES

In the following example, Idle Signal Identification (ISID) messages coming in on the Facility Data Link for a DS1 are retrieved.

```
RTRV-ISID-T1::T3T1-1-4;
```

The output response, shown below, shows idle signal being generated at a customer (CaRrier=No) installation. The customer's assigned ID for this installation location is EAST01, and the port number on the customer's equipment generating the signal is 2311.

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-ISU-STATUS**
COMMAND NAME: **RETRIEVE IN-SERVICE UPGRADE
STATUS**

PURPOSE

The RTRV-ISU-STATUS command retrieves the status of the generic upgrade procedure. This command determines the current status of the upgrade procedure (i.e. No upgrade in progress, the STA-ISU command is issued, the STA-ISU command failed, the STP-ISU command is issued, awaiting the INIT-SYS-NEW command, etc.).

A RTRV-ISU-STATUS command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-ISU-STATUS: [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
M    <SID> <YY-MM-DD> <HH:MM:SS>
    <CTAG> COMPLD
    ": ISUSTAT=<ISUSTAT>[, ISUKEY=<ISUKEY>]"
    [ / * <Upgrade Description Text Line> */ ]+
    [ / * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */ ]
;
```

OUTPUT PARAMETERS

ISUSTAT=	{INITNC, INITNIP, INITOC, INITOIP, NOSTAIP, RMVD, RMVIP, STAC, STAF, STAIPnn, STPC}
	In-Service Upgrade Status, indicates the current status of the system with respect to the Generic In-Service Upgrade process. Values are:
INITNC	Initialize New Completed, indicates the INIT-SYS-NEW command completed successfully and the system is restarted on the new release.
INITNIP	Initialize New In Progress, indicates the INIT-SYS-NEW command is in progress.
INITOC	Initialize Old Completed, indicates the INIT-SYS-OLD command completed successfully and the system is restarted on the previous release.
INITOIP	Initialize Old In Progress, indicates the INIT-SYS-OLD command is in progress.
NOSTAIP	No Status In Progress, indicates that no Generic In-Service Upgrade procedure is in progress or has been attempted.
RMVIP	Removal In Progress, indicates the removal of the previous release partition (i.e. inactive generic) in in progress.
RMVD	Removed, indicates the removal of the previous release partition is completed and the system is permanently set on the active release.
STAC	Status Completed, indicates that the STA-ISU command completed successfully and is awaiting the issuance of the INIT-SYS-NEW command.
STAF	Status Failed, indicates that the STA-ISU command failed and must be restarted.
STAIPnn	Status In Progress, indicates that a Generic In-Service Upgrade procedure is in progress. The "STAIP" indicates the STA-ISU command is in progress and "nn" is a step number {1-99} within the STA-ISU process.
STPC	Stop Completed, indicates that the STP-ISU command completed successfully.
ISUKEY=	<1-5 ALPHANUMERIC CHARACTERS>
	In-Service Upgrade Key, specifies the logical in-service upgrade reversion key. Valid values for ISUKEY are a string of 1 through 5 ASCII alphanumeric characters from the set {0-9, A-Z}. Note that spaces and special characters are not included. The ISUKEY is only returned when the value of ISUSTAT is STAIP, STAC, INITNIP, or INITNC.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV Input, Parameter Not Valid

EXAMPLES

In the following example, the status of the generic upgrade procedure is retrieved.

```
RTRV-ISU-STATUS;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
      <SID> <YY-MM-DD> <HH:MM:SS>
M   Pad567 COMPLD
      ": ISUSTAT=STAC,ISUKEY=A6b1F"
      " TYPE=UPGRD Completed <MM-DD-YY> <HH:MM:SS>
/* RTRV-ISU-STATUS [Pad567] (2) */
;
```

COMMAND CODE: **RTRV-ITMRSLT**
COMMAND NAME: **RETRIEVE INSTALLATION TEST AND
MAINTENANCE RESULT**

PURPOSE

The RTRV-ITMRSLT command retrieves the result of the Installation Test and Maintenance (ITM) test specified currently in progress. The ITM test supports the testing of the GTI matrix cables.

If RTRV-ITMRSLT is executed and the specified test is currently in progress, the partial results of the current test is sent and the test continues.

If the response of the RTRV-ITMRSLT or the IP messages of the START-ITMTEST command show errors, then the RTRV-GTI-STATUS should be used to diagnose the problem.

A RTRV-ITMRSLT command is denied if:

- The specified test is currently not in progress.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-ITMRSLT: [TID] : : [CTAG] : : TESTTYPE;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
TESTTYPE	{MTXCBL} Default: Entry Required Addressing: None Description: Test Type, specifies the type of test. Values are: MTXCBL Matrix Cable Test

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD/PRTL
  "<MTXCOPY>,<TESTTYPE>"
["<ES1AID>,<ES1RSLT>,<GT2AID>,<GT2RSLT>,<GT3AID>,<GT3RSLT>,<IDRSLT>,<BERSLT>" ] *
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;]
```

OUTPUT PARAMETERS

MTXCOPY	{COPY0, COPY1} Matrix Copy. Values are: COPY0 Matrix Copy 0 COPY1 Matrix Copy 1
TESTTYPE	{MTXCBL} Test Type, specifies the type of test. Values are: MTXCBL Matrix Cable Test

ES1AID	ES1_AID: {M16-{4-5, 10, 11, 16, 17, 22, 23}-3-{1-16}} {M32-{{4-5, 10-11, 16-17, 22-23, 102, 103 }-3-{1-16}}} Identifies the AID of a provisioned first stage ES module.
ES1RSLT	{EQP, OK} ES1 Result, identifies the result of the equipment test on the ES1 module. Values are: EQP The module is faulty or unequipped. OK The module is okay.
GT2AID	GT2_AID: {G1M16-{2-3}-3-{1-16}-{1-16}} {G1M40-{2-3}-{1, 3}-{1-16}-{1-32}} Identifies the AID of the GTI cable between the first stage ES and a CS.
GT2RSLT	{EQP, CON, OK} GT2 Result, identifies the result of the GTI test on the connection between the first stage ES and the CS. Values are: EQP The module is faulty or unequipped. CON The connection is faulty. OK The connection is okay.
GT3AID	GT3_AID: {G1M16-{4-5, 10, 11, 16, 17, 22, 23}-3-{1-16}-{1-16}} {G1M32-{4-5, 10-11, 16-17, 22-23, 102, 103}-3-{1-16}-{1-32}} Identifies the AID of the GTI cable between a CS and the third stage ES.
GT3RSLT	{EQP, CON, OK} GT3 Result, identifies the result of the GTI test on the connection between the CS and the third stage ES. Values are: EQP The module is faulty or unequipped. CON The connection is faulty. OK The connection is okay.
IDRSLT	{MM, OK} Identification Result, identifies the result of the Identification test. Values are: MM ID Mismatch. OK The connection is okay.
BERSLT	Bit Error (BE) Test Result. Identifies the number of bit errors detected. OK The connection is OK. NOK The connection is Not OK. NAV Test result is Not Available.

UNSUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RTRV-LAN-STATS**
COMMAND NAME: **RETRIEVE LAN STATISTICS**

PURPOSE

The RTRV-LAN-STATS command retrieves the data link statistic counters of the SONET Data Communication Channel (DCC) network. This command retrieves the data link statistic counters of the LAN residing on a DSB.

If the specified DSB is not provisioned, i.e. it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-LAN-STATS command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-LAN-STATS : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6–9, 12–15, 18–21, 24–43, 104–111 , 112–135, 136–141 }-{1, 3}-{1–2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB on which the LAN resides and whose data-link counters are being cleared.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD

/* Invalid error response was received from L2P. */
```

EXAMPLES

In the following example, the data link statistic counters of DSB-6-1-1 is retrieved.

```
RTRV-LAN-STATS::DSB-6-1-1;  
  <SID> <YY-MM-DD> <HH:MM:SS>  
M   Pad567 COMPLD  
  "DSB-6-1-1::BYTERX=10000,BYTETX=10000,EXCOL=0,FRMRX=10,FRMTX=10"  
  /* RTRV-LAN-STATS::DSB-6-1-1 [Pad567] (2) */  
;
```

RELATED COMMANDS

CLR-LAN-STATS

COMMAND CODE: **RTRV-LLLAN**
COMMAND NAME: **RETRIEVE LOWER LAYER LAN
PARAMETERS**

PURPOSE

The RTRV-LLLAN command retrieves the Layer 1 (physical layer) and Layer 2 (data link layer) parameters of the SONET Data Communication Channel (DCC) network. This command retrieves the OSI lower layer stack (Layer 1 and Layer 2) parameters pertaining to the LAN.

If the specified DSB is not provisioned, i.e. it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-LLLAN command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-LLLAN: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB on the LAN whose lower layer parameters are being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "<AID>: :L2INFO=<value>"  
  [/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]  
;
```

On successful completion of RTRV-LLLAN if the DSB is not in an OOS-MA state, the system will compare the Lower Layer LAN parameters in the database with those on the hardware and if any of the parameters are different, the system will print the parameters on the hardware in the second line, shown as optional above. If the DSB is in an OOS-MA state, only the parameters in the database will be displayed.

OUTPUT PARAMETERS

L2INFO= {512, 1024, 1497}
Layer 2 Information Field, specifies the maximum size of the OSI Layer 2 information field.

UNSUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **RTRV-LLLDCC**
COMMAND NAME: **RETRIEVE LOWER LAYER LINE DCC**

PURPOSE

The RTRV-LLLDCC command retrieves all the provisioned parameter values supporting Layer 1 (physical layer) and Layer 2 (data link layer) of the SONET Data Communication Channel (DCC) network. This command retrieves all the provisioned lower layer stack (Layer 1 and Layer 2) parameters of the Line DCC.

If the specified OC-3/OC-12 is not provisioned, i.e., it is in UAS secondary state, or if the protection OC-3/OC-12 is specified, the command completes successfully without producing any output.

A RTRV-LLLDCC command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-LLLDCC: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	OC3_AID:	{OC3–{1–2240}}	(OC3–OC3#)
	OC12_AID:	{OC12–{1–560}}	(OC12–OC12#)
	Default:	Entry Required	
	Addressing:	None	
	Description:	Optical Carrier AID, identifies the generic address of an OC–3/OC–12 whose lower layer parameters specific to the Line DCC are being retrieved.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

SUCCESSFUL RESPONSE FORMAT

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    "<AID>:: ,L2IF=<value>,L2INFO=<value>,
L2MAXCALLS=<value>,L2NOA=<value>,L2RCALLTMR=<value>,L2REX=<value>,
L2SIDE=<value>,L2WAIT=<value>:<PST>"
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    ["<AID>:: ,L2IF=<value>,L2INFO=<value>,

L2SIDE=<value>,L2WAIT=<value>:<PST>"]
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

On successful completion of RTRV-LLLDCC if the Line DCC is enabled, the system will compare the Lower Layer Line DCC parameters in the database with those on the hardware and if any of the parameters are different, the system will print the parameters on the hardware in the second line, shown as optional above. If the Line DCC is disabled, only the parameters in the database will be displayed.

OUTPUT PARAMETERS

AID	<p>OC3_AID: {OC3-{1-2240}} (OC3-OC3#)</p> <p>OC12_AID: {OC12-{1-560}} (OC12-OC12#)</p> <p>Optical Carrier AID, identifies the OC-3/OC-12 port.</p>				
L2IF=	<p>{1-127}</p> <p>Layer 2 Outstanding I Frame, specifies the Outstanding I Frame count for Layer 2.</p>				
L2INFO=	<p>{512, 1024, 1497}</p> <p>Layer 2 Information Field, specifies the maximum size of the information field for Layer 2.</p>				
L2MAXCALLS=	<p>{1-32}</p> <p>Maximum Number of Layer 2 Retries, determines the maximum number of the Layer 2 retries connecting to the other end before it reports a connection failure to the application layer.</p>				
L2NOA=	<p>{4-120}</p> <p>Layer 2 No Activity Timer, specifies the Layer 2 No Activity Timer (T203) in seconds.</p>				
L2RCALLTMR=	<p>{1-65535}</p> <p>Layer 2 LAPD Controller, determines how long the Layer 2 LAPD controller waits (in seconds) after L2MAXCALLS are exhausted and before the Layer 2 LAPD makes another set of attempts to connect.</p>				
L2REX=	<p>{2-16}</p> <p>Layer 2 Retransmission Count, specifies the Layer 2 retransmissions count.</p>				
L2SIDE=	<p>{NETWORK, USER}</p> <p>Layer 2 User Side/Network Side, defines the assignment of Layer 2 user side/network side roles. Values are:</p> <table border="0" style="margin-left: 40px;"> <tbody> <tr> <td>NETWORK</td> <td>Indicates the Layer 2 role is assigned on the network side.</td> </tr> <tr> <td>USER</td> <td>Indicates the Layer 2 role is assigned on the user side.</td> </tr> </tbody> </table>	NETWORK	Indicates the Layer 2 role is assigned on the network side.	USER	Indicates the Layer 2 role is assigned on the user side.
NETWORK	Indicates the Layer 2 role is assigned on the network side.				
USER	Indicates the Layer 2 role is assigned on the user side.				

L2WAIT= {2–200,}
Layer 2 Waiting Acknowledge Timer, specifies the Layer 2 Waiting Acknowledge timer in tenths of seconds.

PST {IS, OOS}
Primary State, determines the primary state in which the lower layer Section DCC is put into. Values are:

IS	In-Service
OOS	Out-Of-Service

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/ * <Informational Error Description Text> */]
  [/ * <Expanded Error Code Description> */]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/*TP Database Error: <ERROR-STRING> for <AID-STRING>*/
	/*DCC Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/
	/*TPidToAidStr() Error: <ERROR-STRING>*/
SROF	Status, Requested Operation Failed
	/*Could not communicate with the SPB*/
	/*Bad response code returned from SPB (<RESPONSE_CODE>)*/*
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the provisioned data of the Line DCC for port OC3-3 port OC3-1 is being retrieved.

```
RTRV-LLLDCC::OC3-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "OC3-1::L2IF=7,L2INFO=512,L2MAXCALLS=1,L2NOA=10,
  L2RCALLTMR=60,L2REX=10,L2SIDE=NETWORK,L2WAIT=5:OOS"
  /* RTRV-LLLDCC::OC3-1 [Pad567] (2) */
;
```

RELATED COMMANDS

	{OC3-{1-2240}}	(OC3-OC3#)
	OC12_AID:	
	{OC12-{1-560}}	(OC12-OC12#)
	Default:	Entry Required
	Addressing:	None
	Description:	Optical Carrier AID, identifies the generic address of an OC-3/OC-12 whose lower layer parameters specific to the Section DCC are being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
    "<AID>:: L2IF=<value>,L2INFO=<value>,
L2MAXCALLS=<value>,L2NOA=<value>,L2RCALLTMR=<value>,L2REX=<value>,
L2SIDE=<value>,L2WAIT=<value>:PST"
    /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
    ["<AID>::L2IF=<value>,L2INFO=<value>,
L2MAXCALLS=<value>,L2NOA=<value>,L2RCALLTMR=<value>,L2REX=<value>,
L2SIDE=<value>,L2WAIT=<value>:PST"]
    /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

On successful completion of RTRV-LLSDCC if the Section DCC is enabled, the system will compare the Lower Layer Section DCC parameters in the database with those on the hardware and if any of the parameters are different, the system will print the parameters on the hardware in the second line, shown as optional above. If the Section DCC is disabled, only the parameters in the database will be displayed.

OUTPUT PARAMETERS

AID	OC3_AID: {OC3-{1-2240}}	(OC3-OC3#)
	OC12_AID: {OC12-{1-560}}	(OC12-OC12#)
	Optical Carrier AID, identifies the OC-3/OC-12 port.	
L2IF=	{1-127}	
	Layer 2 Outstanding I Frame, specifies the Outstanding I Frame count for Layer 2.	
L2INFO=	{512, 1024, 1497}	
	Layer 2 Information Field, specifies the maximum size of the information field for Layer 2.	
L2MAXCALLS=	{1-32}	
	Maximum Number of Layer 2 Retries, determines the maximum number of the Layer 2 retries connecting to the other end before it reports a connection failure to the application layer.	
L2NOA=	{4-120}	
	Layer 2 No Activity Timer, specifies the Layer 2 No Activity Timer (T203) in seconds.	
L2RCALLTMR=	{1-65535}	
	Layer 2 LAPD Controller, determines how long the Layer 2 LAPD controller waits (in seconds) after L2MAXCALLS are exhausted and before the Layer 2 LAPD makes another set of attempts to connect.	
L2REX=	{2-16}	
	Layer 2 Retransmission Count, specifies the Layer 2 retransmissions count.	
L2SIDE=	{NETWORK, USER}	
	Layer 2 User Side/Network Side, defines the assignment of Layer 2 user side/network side roles. Values are:	
	NETWORK	Indicates the Layer 2 role is assigned on the network side.
	USER	Indicates the Layer 2 role is assigned on the user side.
L2WAIT=	{2-200}	
	Layer 2 Waiting Acknowledge Timer, specifies the Layer 2 Waiting Acknowledge timer in tenths of seconds.	

PST {IS, OOS}
Primary State, determines the primary state in which the lower layer Section DCC is put into. Values are:
IS In-Service
OOS Out-Of-Service

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*DCC Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/ /*TPidToAidStr() Error: <ERROR-STRING>*/
SROF	Status, Requested Operation Failed /*Could not communicate with the SPB*/ /*Bad response code returned from SPB (<RESPONSE_CODE>)*/*
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the provisioned data of the Section DCC for OC-3 port OC3-1 is being retrieved.

```
RTRV-LLSDCC::OC3-1;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "OC3-1::L2IF=7,L2INFO=512,L2MAXCALLS=1,L2NOA=10,
  L2RCALLTMR=60,L2REX=10,L2SIDE=NETWORK,L2WAIT=5:OOS"
  [/* RTRV-LLSDCC::OC3-1 [Pad567] (2) */]
;
```

RELATED COMMANDS

ED-LLSDCC

COMMAND CODE: **RTRV-LPBK-EC1**
COMMAND NAME: **RETRIEVE LOOPBACK EC1**

PURPOSE

The RTRV-LPBK-EC1 command retrieves the EC1 ports that are in a loopback within the specified range of EC1 AIDs. The command is executed regardless of the provisioning of the specified ports.

The successful response for a RTRV-LPBK-EC1 contains one line of parsable data, in ascending order, for each EC1 port that is in a loopback within the specified range of AIDs. No output data is returned for an AID that is not in a loopback.

A RTRV-LPBK-EC1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-LPBK-EC1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies a EC1 port or a range of EC1 ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
["<AID>:LOCN=<value>,LPBKTYPE=<value>"]  
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

OUTPUT PARAMETERS

AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) EC1 AID, identifies a EC1 port that is in a loopback.
LOCN=	{NEND} Location, indicates the location (near-end) of the loopback. Value is: NEND Near-End, indicates the loopback is in the system.
LPBKTYPE=	{FACILITY} Loopback Type, indicates the type of loopback. Value is: FACILITY Facility, indicates a EC1 loopback at the receive-side (from the network) of the specified EC1 port.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, all EC1 ports between EC1 ports EC1-49 and EC1-96 that are in a loopback are reported.

```
RTRV-LPBK-EC1::EC1-49&&-96;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes there are three EC1 ports in a loopback within the specified range of ports.

COMMAND CODE: **RTRV-LPBK-STs1**
COMMAND NAME: **RETRIEVE LOOPBACK STs-1**

PURPOSE

The RTRV-LPBK-STs1 command retrieves the STs-1 ports that are in a loopback within the specified range of STs-1 AIDs. The command is executed regardless of the provisioning of the specified ports.

The successful response for a RTRV-LPBK-STs1 contains one line of parsable data, in ascending order, for each STs-1 port that is in a loopback within the specified range of AIDs. No output data is returned for an AID that is not in a loopback. In addition, no line of parsable output data is returned if the specified STs-1 is embedded within a protection OC3 or OC12.

A RTRV-LPBK-STs1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-LPBK-STs1: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: STS1 AID, identifies an STs-1 port or a range of STs-1 ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
["<AID>:LOCN=<value>,LPBKTYPE=<value>,SUPPORTING=<value>"]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	STS1_AID: {EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#) {OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#) {OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#) STS1 AID, identifies an STs-1 port that is in a loopback.
LOCN=	{NEND} Location, indicates the location (near-end) of the loopback. Value is: NEND Near-End, indicates the loopback is in the system.

LPBKTYPE= {MATRIX, PAYLOAD}
Loopback Type, indicates the type of loopback. Value is:
MATRIX Matrix, indicates an STS-1 loopback in the system matrix.
PAYLOAD Payload, indicates an STS-1 loopback in the RPB module.

SUPPORTING={N, Y}
Supporting entity's Loopback Status, indicates whether the supporting OC12, OC3 or EC1 of the specified STS-1 is in loopback. Values are:
Y Yes, the supporting entity is in a loopback.
N No, the supporting entity is not in a loopback.

UNSUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RTRV-LPBK-T1**
COMMAND NAME: **RETRIEVE LOOPBACK T1**

PURPOSE

The RTRV-LPBK-T1 command retrieves the DS1 ports that are in a loopback within the specified range of DS1 AIDs. If a DS1 port is in a loopback, parsable output data indicates the location of the loopback, the type of loopback, whether a C-bit loopback request is being received or transmitted, and whether any supporting DS3 is in a loopback. The command is executed regardless of the provisioning of the specified ports.

The successful response for a RTRV-LPBK-T1 contains one line of parsable data, in ascending order, for each DS1 port that is in a loopback within the specified range of AIDs. No output data is returned for an AID that is not in a loopback. In addition, no line of parsable output data is returned if the specified DS1 is embedded within a protection OC3.

A RTRV-LPBK-T1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-LPBK-T1 : [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID: { T1-{1-59392} } (T1-DS1#) { T3T1-{1-4800}-{1-28} } (T3T1-DS3#-DS1#) { EC1T1-{1-3840}-{1-28} } (EC1T1-EC1/STS1/DS3#-DS1#) { OC3T1-{1-2240}-{1-3}-{1-28} } (OC3T1-OC3#-STS1/DS3#-DS1#) { OC12T1-{1-560}-{1-4}-{1-3}-{1-28} } (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS1 AID, identifies a DS1 port or a range of DS1 ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD

```

OUTPUT PARAMETERS

AID	DS1_AID: { T1-{1-59392} } (T1-DS1#) { T3T1-{1-4800}-{1-28} } (T3T1-DS3#-DS1#) { EC1T1-{1-3840}-{1-28} } (EC1T1-EC1/STS1/DS3#-DS1#) { OC3T1-{1-2240}-{1-3}-{1-28} } (OC3T1-OC3#-STS1/DS3#-DS1#) { OC12T1-{1-560}-{1-4}-{1-3}-{1-28} } (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#) DS1 AID, identifies a DS1 port that is in a loopback.
-----	--

LOCN=	{FEND, NEND, NONE}	Location, indicates the location (near-end or far-end) where the loopback is established. Values are:
	FEND	Far-End, indicates that a C-bit loopback request is being transmitted in the supporting DS2 signal to loopback the specified DS1 at the far-end of the facility.
	NEND	Near-End, indicates that the system has established a loopback via an OPR-LPBK-T1.
	NONE	None, indicates that a C-bit loopback request is not being transmitted and the system has not established a loopback via an OPR-LPBK-T1.
LPBKTYPE=	{FACILITY, MATRIX, NONE}	Loopback Type; indicates the type of loopback. Values are:
	FACILITY	Facility, if LOCN of NEND, indicates a DS1 loopback at the receive-side (from the network) of the specified DS1 port, or if LOCN of FEND, indicates a C-bit loopback request is being transmitted.
	MATRIX	Matrix, indicates a DS1 loopback in the system matrix.
	NONE	None, indicates that a C-bit loopback request is not being transmitted and the system has not established a loopback via an OPR-LPBK-T1.
SUPPORTING=	{N, Y}	Supporting entity's Loopback Status, indicates whether the supporting DS3, OC-3, EC1, STS-1, or VT1.5 of an embedded DS1 is in loopback. Values are:
	Y	Yes, the supporting entity is in a loopback.
	N	No, the supporting entity is not in a loopback, or the specified DS1 port is not an embedded DS1.
CBIT=	{N, R, T, T&R}	C-Bit Loopback Status, indicates the transmit and receive C-bit loopback request status for the DS1. Values are:
	N	No, a C-bit loopback request is not being transmitted or received.
	R	Receiving, a C-bit loopback request is being received and the receive-side of the DS1 port is looped back.
	T	Transmitting, a C-bit loopback request is being transmitted.
	T&R	Transmitting and Receiving, a C-bit loopback request is being transmitted and a C-bit loopback request is being received and the receive-side of the DS1 port is looped back.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```

IIAC      Input, Invalid ACcess identifier
SDBE      Status, internal Data Base Error
          /* TP Database Error: <ERROR-STRING> for <AID-STRING> */
          /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */

```

SROF Status, Requested Operation Failed

EXAMPLES

In the following example, all DS1 ports between DS1 ports T3T1-1175-1 and T3T1-1175-28 that are in a loopback are reported.

```
RTRV-LPBK-T1::T3T1-1175-1&&-28;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes there are four DS1 ports in a loopback within the specified range of ports.

COMMAND CODE: **RTRV-LPBK-T3**
COMMAND NAME: **RETRIEVE LOOPBACK T3**

PURPOSE

The RTRV-LPBK-T3 command retrieves the DS3 ports that are in a loopback within the specified range of DS3 AIDs. The command is executed regardless of the provisioning of the specified ports.

The successful response for a RTRV-LPBK-T3 contains one line of parsable data, in ascending order, for each DS3 port that is in a loopback within the specified range of AIDs. No output data is returned for an AID that is not in a loopback. In addition, no line of parsable output data is returned if the specified DS3 is embedded within a protection OC3.

A RTRV-LPBK-T3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-LPBK-T3 : [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS3 AID, identifies a DS3 port or a range of DS3 ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
["<AID>:LOCN=<value>,LPBKTYPE=<value>"]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	DS3_AID: {T3-{1-4800}} (T3-DS3#) DS3 AID, identifies a DS3 port that is in a loopback.
LOCN=	{NEND} Location, indicates the location (near-end) of the loopback. Value is: NEND Near-End, indicates the loopback is in the system.
LPBKTYPE=	{FACILITY,MATRIX} Loopback Type, indicates the type of loopback. Value is: FACILITY Facility, indicates a DS3 loopback at the receive-side (from the network) of the specified DS3 port. MATRIX Matrix, specifies a DS3 loopback in the system matrix.

UNSUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **RTRV-LPBK-VT1**
COMMAND NAME: **RETRIEVE LOOPBACK VT1**

PURPOSE

The RTRV-LPBK-VT1 command retrieves the VT1.5 ports that are in a loopback within the specified range of VT1.5 AIDs. If a VT1.5 port is in a loopback, parsable output data indicates the location of the loopback, the type of loopback, and whether any supporting EC1, OC-3, or OC-12 port is in a loopback. The command is executed regardless of the provisioning of the specified ports.

The successful response for a RTRV-LPBK-VT1 contains one line of parsable data, in ascending order, for each VT1.5 port that is in a loopback within the specified range of AIDs. No output data is returned for an AID that is not in a loopback. In addition, no line of parsable output data is returned if the specified VT1.5 is embedded within a protection OC-3 or OC-12.

A RTRV-LPBK-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-LPBK-VT1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: VT1 AID, identifies a VT1.5 port or a range of VT1.5 ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
["<AID>:LOCN=<value>,LPBKTYPE=<value>,SUPPORTING=<value>"]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) VT1 AID, identifies a VT1.5 port that is in a loopback.
-----	---

LOCN= {NEND}
Location, indicates the location (near-end or far-end) where the loopback is established.
Values are:
NEND Near-End, indicates that the loopback is in the system.

LPBKTYPE= {MATRIX, PAYLOAD}
Loopback Type; indicates the type of loopback. Values are:
MATRIX Matrix, indicates a VT1.5 loopback in the system matrix.
PAYLOAD Payload, indicates a VT1.5 loopback in the RPB module.

SUPPORTING={N, Y}
Supporting entity's Loopback Status, indicates whether the supporting OC-12, OC-3, EC1, or STS-1 of an embedded VT1.5 is in loopback. Values are:
Y Yes, the supporting entity is in a loopback.
N No, the supporting entity is not in a loopback.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
/* <Informational Error Description Text> */
/* <Expanded Error Code Description> */

SDBE Status, internal Data Base Error
/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
/* CONN Database Error: <ERROR-STRING> for <AID-STRING> */
SROF Status, Requested Operation Failed

EXAMPLES

In the following example, all VT1.5 ports between VT1.5 ports OC3VT1-3-3-1-1 and OC3VT1-3-3-1-4 that are in a loopback are reported.

```
RTRV-LPBK-VT1 : OC3VT1-3-3-1-1&&-4 ;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. The example assumes there are five VT1.5 ports in a loopback within the specified range of ports.

COMMAND CODE: **RTRV-MAADDR**
COMMAND NAME: **RETRIEVE MANUAL AREA ADDRESS**

PURPOSE

The RTRV-MAADDR command retrieves the Manual Area Address of Layer 3 (network layer) of the SONET Data Communication Channel (DCC) network.

If the specified DSB is not provisioned, i.e., it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-MAADDR command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-MAADDR: [TID] :AID: [CTAG] : : [MANADNRNUM] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB on which the manual area addresses are being retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MANADNRNUM	{1, 2, 3, ALL} Default: {1} Addressing: None Description: Manual Address Number, identifies the manual area address being retrieved. Name-defined values are: ALL All of the 3 Manual Area Addresses are retrieved.

SUCCESSFUL RESPONSE FORMAT

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    "<AID>.:L3IDP1=<value>,L3DFI1=<value>,L3ORG1=<value>,L3RES1=<value>,
L3ROU1=<value>,L3IDP2=<value>,L3DFI2=<value>,L3ORG2=<value>,
L3RES2=<value>,L3ROU2=<value>,L3IDP3=<value>,L3DFI3=<value>,
L3ORG3=<value>,L3RES3=<value>,L3ROU3=<value>"
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    ["<AID>.:L3IDP1=<value>,L3DFI1=<value>,L3ORG1=<value>,L3RES1=<value>,
L3ROU1=<value>,L3IDP2=<value>,L3DFI2=<value>,L3ORG2=<value>,
L3RES2=<value>,L3ROU2=<value>,L3IDP3=<value>,L3DFI3=<value>,
L3ORG3=<value>,L3RES3=<value>,L3ROU3=<value>"]
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

On successful completion of RTRV-MAADDR if the DSB is not in an OOS-MA state, the system will compare the Manual Area Address parameters in the database with those on the hardware and if any of the parameters are different, the system will print the parameters on the hardware in the second line, shown as optional above. If the DSB is in an OOS-MA state, only the parameters in the database will be displayed.

OUTPUT PARAMETERS

L3IDP1=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Layer 3 Initial Domain Part 1, identifies the Initial Domain Part of the NSAP pertaining to the 1st Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3DFI1=	<p><2 ASCII HEXADECIMAL VALUES></p> <p>Layer 3 Domain Format Identifier 1, identifies the Domain Format Identifier Field of the NSAP pertaining to the 1st Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3ORG1=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Layer 3 Organization Identifier 1, specifies the Organization Identifier within the NSAP pertaining to the 1st Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3RES1=	<p><4 ASCII HEXADECIMAL VALUES></p> <p>Layer 3 Reserved Space 1, specifies the Reserved Space within the NSAP pertaining to the 1st Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3ROU1=	<p><8 ASCII HEXADECIMAL VALUES></p> <p>Layer 3 Routing Domain 1, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 1st Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>
L3IDP2=	<p><6 ASCII HEXADECIMAL VALUES></p> <p>Layer 3 Initial Domain Part 2, identifies the Initial Domain Part of the NSAP pertaining to the 2nd Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.</p>

L3DFI2=	<2 ASCII HEXADECIMAL VALUES> Layer 3 Domain Format Identifier 2, identifies the Domain Format Identifier Field of the NSAP pertaining to the 2nd Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3ORG2=	<6 ASCII HEXADECIMAL VALUES> Layer 3 Organization Identifier 2, specifies the Organization Identifier within the NSAP pertaining to the 2nd Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3RES2=	<4 ASCII HEXADECIMAL VALUES> Layer 3 Reserved Space 2, specifies the Reserved Space within the NSAP pertaining to the 2nd Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3ROU2=	<8 ASCII HEXADECIMAL VALUES> Layer 3 Routing Domain 2, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 2nd Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3IDP3=	<6 ASCII HEXADECIMAL VALUES> Layer 3 Initial Domain Part 3, identifies the Initial Domain Part of the NSAP pertaining to the 3rd Manual Area Address. The value is two fields including the Authority and Format Identifier (AFI) which is 1 octet long concatenating with the Initial Domain Identifier (IDI) which is 2 octets long for a total of 3 octets. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3DFI3=	<2 ASCII HEXADECIMAL VALUES> Layer 3 Domain Format Identifier 3, identifies the Domain Format Identifier Field of the NSAP pertaining to the 3rd Manual Area Address. The value is 1 octet long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3ORG3=	<6 ASCII HEXADECIMAL VALUES> Layer 3 Organization Identifier 3, specifies the Organization Identifier within the NSAP pertaining to the 3rd Manual Area Address. The value is 3 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3RES3=	<4 ASCII HEXADECIMAL VALUES> Layer 3 Reserved Space 3, specifies the Reserved Space within the NSAP pertaining to the 3rd Manual Area Address. The value is 2 octets long and each is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.
L3ROU3=	<8 ASCII HEXADECIMAL VALUES> Layer 3 Routing Domain 3, specifies both the Routing Domain of the NSAP (2 octets) and the area within the Routing Domain (2 octets) for a total of 4 octets pertaining to the 3rd Manual Area Address. Each octet is specified in the form of pq, where p and q are the ASCII encoded hexadecimal.

PORT**

PURPOSE

The RTRV-MON-CPORT command retrieves the list of CPORTs (Control Ports) being monitored for CPORT activity by the specified UID.

A user can only retrieve the user's own list of CPORTs being monitored for CPORT activity. The system administrator (UID of "system" or "SYSTEM") or Alcatel account user can retrieve the list of CPORTs being monitored for CPORT activity for all users.

The successful response for a RTRV-MON-CPORT command contains one or more lines of non-parsable output data indicating whether the identified UID is monitoring CPORT activity and the list of CPORTs being monitored for CPORT activity (established for the user by the START-MON-CPORT and STOP-MON-CPORT commands). If a user is provisioned to monitor CPORT activity, a separate line of output data is provided for each CPORT being monitored for CPORT activity. If the system administrator or Alcatel account user specifies a UID of ALL, a separate line of output data is provided for each CPORT being monitored for CPORT activity for each user provisioned for CPORT monitoring.

A RTRV-MON-CPORT command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-MON-CPORT: [TID] :: [CTAG] :: [UID] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
UID	{ALL, <5-12 VALID UID CHARACTERS>, <NoVal>} Default: <NoVal> Addressing: None Description: User Identifier, specifies the UID for which the report is to be generated. Values are: ALL All UIDs monitoring CPORT activity. (Only the "system", "SYSTEM", or Alcatel account user can specify ALL.) <VALID UID> UID of a user. (Only the "system", "SYSTEM", or Alcatel account user can specify another user's UID.) <NoVal> No Value, specifies the UID of the user executing the command. Restrictions: RTRV-MON-CPORT is denied if UID of {ALL, <Another User's UID>} is entered and the user's UCAL is {1-30} (refer to ENT-USER or ED-PRVG-USER).

SUCCESSFUL RESPONSE FORMAT

The following successful response format is used if a CPORT monitoring activity is being retrieved for a single user (either by specifying a UID value for a specific user or a UID value of <NoVal>).

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* User <UID> is not monitoring any CPORTs */]
  [/* user <UID>: CPORT Monitoring <MONACT> list is set to */]
  [/* <CPORT> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

The following successful response format is used if a CPORT monitoring activity is being retrieved for all users (by specifying a UID value of ALL).

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* No User is monitoring any CPORTs */]
  [/* user <UID>: CPORT Monitoring <MONACT> list is set to */]
  [/* <CPORT> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

UID	<User_ID> User Identifier, identifies the UID of the user monitoring the CPORT activity.
MONACT	{ACTIVE, INACTIVE} CPORT Monitoring Active Indicator, indicates whether monitoring of CPORT activity is active (the user is not subscribed to an OSL of W – refer to ENT-USER or ED-PRVG-USER). Values are: ACTIVE CPORT Monitoring Active, the indicated UID is provisioned for CPORT activity monitoring and the user is not subscribed to an OSL of W. INACTIVE CPORT Monitoring Inactive, the indicated UID is provisioned for CPORT activity monitoring but the user is subscribed to an OSL of W.
CPORT	{1-12} Control Port, identifies the physical control port that is being CPORT monitored.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Illegal Input: UID length */ /* Illegal Input: UID */
IPNV	Input, Parameter Not Valid /* Please use your own user ID or omit the UID parameter */
SDBE	Status, internal Data Base Error /* USDB read error – status = <status number> */
SROF	Status, Requested Operation Failed /* UID not found */ /* User not found in USDB */

EXAMPLES

In the following example, USER15 retrieves the list of CPORTs and X.25 virtual channels the user is monitoring for CPORT activity.

```
RTRV-MON-CPORT:::::USER15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71061. The response headers would contain the provisioned Site ID of the system, and the date and time the commands were executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71061 COMPLD
/* user USER15: CPORT Monitoring ACTIVE list is set to */
/* 2 */
/* 4 */
/* RTRV-MON-CPORT:::::USER15 [P71061] (1) */
;
```

In the following example, list of CPORTs being monitored for CPORT activity by all users is retrieved. The example assumes the command is executed by the system administrator (UID of "system").

```
RTRV-MON-CPORT:::::ALL;
```

The output response, shown below, assumes CID 5 was used to enter the command and a system generated CTAG value of P71065. The response headers would contain the provisioned Site ID of the system, and the date and time the commands were executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71065 COMPLD
/* user USER4: CPORT Monitoring ACTIVE list is set to */
/* 1 */
/* user USER15: CPORT Monitoring ACTIVE list is set to */
/* 2 */
/* 4 */
/* user USER20: CPORT Monitoring INACTIVE list is set to */
/* 2 */
/* 3 */
/* RTRV-MON-CPORT:::::ALL [P71065] (1) */
;
```

START-MON-CPORT

STOP-MON-CPORT

COMMAND CODE: **RTRV-MTX**
COMMAND NAME: **RETRIEVE MATRIX COPY**

PURPOSE

The RTRV-MTX command retrieves all the parameters that pertain to both matrix copies, as to the type of the modules used in the end stages and center stages.

This command is very useful during an upgrade of the matrix from one size to another.

A RTRV-MTX command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-MTX: [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"COPY0:<MTXTYPE>,<ES1TYPE>,[<ES2TYPE>],[<ES3TYPE>],[<ES4TYPE>],
[<ES5TYPE>]<CS1TYPE>,<CS2TYPE>"
"COPY1:<MTXTYPE>,<ES1TYPE>,[<ES2TYPE>],[<ES3TYPE>],[<ES4TYPE>],
[<ES5TYPE>]<CS1TYPE>,<CS2TYPE>"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

COPY0	Matrix related values for Copy 0.
COPY1	Matrix related values for Copy 1.
CS1TYPE	{M16, M40} Center Stage 1 Type. For 240–port LMC systems, indicates the type of CS modules in bay 5. For other LMC systems, indicates the type of CS modules in bay 2 shelf 3 and bay 3 shelf 3. For 240–port LMC systems, the only valid CS1TYPE value is M40; otherwise, valid values are: M16 The center stage shelves are provisioned for M16 circuit packs. M40 The center stage shelves are provisioned for M40 circuit packs.
CS2TYPE	{M40} Center Stage 2 Type. Indicates the type of CS modules in bay 2, shelf 1 and bay 3, shelf 1. Values are: M40 The center stage shelves are provisioned for M40 circuit packs.

ES1TYPE	{M16,M32}	End Stage 1 Type. For 240-port LMC systems, indicates the type of ES modules in bay 5. For other LMC systems, indicates the type of ES modules in bays 4 and 5. For 240-port LMC systems, the only valid ES1TYPE value is M32; otherwise, valid values are:
	M16	The end stage shelves are provisioned for M16 circuit packs. No value is reported if the end stage is not provisioned.
	M32	The end stage shelves are provisioned for M32 circuit packs. No value is reported if the end stage is not provisioned.
ES2TYPE	{M16,M32}	End Stage 2 Type. Indicates the type of ES modules in bays 10 and 11. Values are:
	M16	The end stage shelves are provisioned for M16 circuit packs. No value is reported if the end stage is not provisioned.
	M32	The end stage shelves are provisioned for M32 circuit packs. No value is reported if the end stage is not provisioned.
ES3TYPE	{M16,M32}	End Stage 3 Type. Indicates the type of ES modules in bays 16 and 17. An ES3TYPE value is only reported when the system contains at least four clovers. Values are:
	M16	The end stage shelves are provisioned for M16 circuit packs. No value is reported if the end stage is not provisioned.
	M32	The end stage shelves are provisioned for M32 circuit packs. No value is reported if the end stage is not provisioned.
ES4TYPE	{M16,M32}	End Stage 4 Type. Indicates the type of ES modules in bays 22 and 23. An ES4TYPE value is only reported when the system contains at least four clovers. Values are:
	M16	The end stage shelves are provisioned for M16 circuit packs. No value is reported if the end stage is not provisioned.
	M32	The end stage shelves are provisioned for M32 circuit packs. No value is reported if the end stage is not provisioned.
ES5TYPE	{M32}	End Stage 4 Type. Indicates the type of ES modules in bays 102 and 103. An ES5TYPE value is only reported when the system contains four clovers. Values are:
	M32	The end stage shelves are provisioned for M32 circuit packs. No value is reported if the end stage is not provisioned.
MTXTYPE	{240,672,1344,2688,3360}	Matrix Type, indicates the maximum matrix size in DS3 equivalent ports. Values are:
	240	Maximum matrix size is 240 DS3 equivalent ports.
	672	Maximum matrix size is 672 DS3 equivalent ports.
	1344	Maximum matrix size is 1344 DS3 equivalent ports.
	2688	Maximum matrix size is 2688 DS3 equivalent ports.
	3360	Maximum matrix size is 3360 DS3 equivalent ports.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  /* <Informational Error Description Text> */
  /* <Expanded Error Code Description> */
  /* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed
 /* Error reading database for card <AID> */

EXAMPLES

In the following example, retrieval of the status of the copy0 and copy1 of the matrix, is provided .

RTRV-MTX;

The output response shown indicates that the first two end stages have M16 modules and the center stage has M40 modules and the matrix is a 672 DS3 equivalent port system.

```

COMMAND CODE: **RTRV-NODEID**
COMMAND NAME: **RETRIEVE (BPM) NODE IDENTIFIER**

PURPOSE

The RTRV-NODEID command retrieves the provisioned value of the Node Identifier transmitted in any Binary Performance Monitoring (BPM) report message.

A RTRV-NODEID command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-NODEID: [TID] :: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

COMMAND CODE: **RTRV-NSAP**
COMMAND NAME: **RETRIEVE NETWORK SERVICE ACCESS POINT**

PURPOSE

The RTRV-NSAP command instructs the 1631 SX to provide Network Service Access Point (NSAP) information which is supported by Layer 3 (network layer) of the SONET Data Communication Channel (DCC) network. This command retrieves the list of neighboring network elements (NEs) including the paths and all the NE addresses in the Level 1 and/or Level 2 Intermediate System (IS) area.

If the specified DSB is not provisioned, i.e., it is in UAS secondary state, the command completes successfully without producing any output.

A RTRV-NSAP command is denied if:

- The specified DSB is in UEQ or MEA secondary state or OOS-MA primary state.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-NSAP: [TID] :AID: [CTAG] : : [ISTYPE] , [NSAP] ;

INPUT PARAMETERS

TID	<1-20 VALID TID CHARACTERS> Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.				
AID	EQUIPMENT_AID: {DSB-{6-9, 12-15, 18-21, 24-43, 104-111 , 112-135, 136-141 }-{1, 3}-{1-2}} Default: Entry Required Addressing: None Description: DSB AID, identifies the DSB of the circuit router to retrieve the NSAPs of the Level 1 or Level 1 and Level 2 neighboring systems.				
CTAG	<1-6 VALID CTAG CHARACTERS> Default: <System Assigned CTAG Value> Addressing: None Description: Correlation Tag, associates input command with its output responses.				
ISTYPE	{DRCT, L1ROU} Default: {DRCT} Addressing: None Description: Intermediate System Type, specifies the type of Intermediate System (IS). <table> <tr> <td>DRCT</td><td>Direct, Specifies directly reachable Level 1 and Level 2 Intermediate Systems (IS).</td></tr> <tr> <td>L1ROU</td><td>Level 1 Router, specifies all reachable Level 1 Intermediate Systems (IS). The specified L1ROU retrieves the NSAPs of all the reachable Level 1 Intermediate Systems which includes NEs, Gateway NEs or Mediation Devices.</td></tr> </table>	DRCT	Direct, Specifies directly reachable Level 1 and Level 2 Intermediate Systems (IS).	L1ROU	Level 1 Router, specifies all reachable Level 1 Intermediate Systems (IS). The specified L1ROU retrieves the NSAPs of all the reachable Level 1 Intermediate Systems which includes NEs, Gateway NEs or Mediation Devices.
DRCT	Direct, Specifies directly reachable Level 1 and Level 2 Intermediate Systems (IS).				
L1ROU	Level 1 Router, specifies all reachable Level 1 Intermediate Systems (IS). The specified L1ROU retrieves the NSAPs of all the reachable Level 1 Intermediate Systems which includes NEs, Gateway NEs or Mediation Devices.				

NSAP	<40 ASCII HEXADECIMAL VALUES>
Default:	None
Addressing:	None
Description:	Network Service Access Point, specifies the Network Service Access Point (NSAP) address of the neighboring NE to be searched in the automatic adjacency table. Values are 20 octets long encoded as 40 ASCII hexadecimal. The user enters the values in either upper case or lower case (i.e. case sensitive). If NSAP is not specified, all the NSAPs in the Level 1 or both Level 1 and Level 2 routing areas depending on the ISTYPE are retrieved.
Restrictions:	RTRV-NSAP is denied if the specified NSAP is less than 40 ASCII characters.

SUCCESSFUL RESPONSE FORMAT

The specified AID in the output response will match the entered AID. The NSAP value is 20 octets long and is specified in the form of pq, where p and q are the ASCII encoded hexadecimal. Each NSAP will occupy 40 characters on each output response line.

Note: The first format line of output data is the NSAP of the DSB of the local NSAP being reported for L1ROU. The remaining format lines of output data is the remaining list of neighboring NSAPs being reported.

The following successful response format is one response line for each NSAP when ISTYPE is L1ROU.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "1,<AID>:<NSAP>"
  "2,<AID>:<NSAP>"
  "3,<AID>:<NSAP>"
  ...
  "N,<AID>:<NSAP>"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

The following successful response format is one response line for each NSAP when ISTYPE is ALL.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "1,<AID>: [<SDCC>|<LDCC>|<LAN>,<ISLEVEL>,<ENABLE>,<NSAP>]"
  "2,<AID>: [<SDCC>|<LDCC>|<LAN>,<ISLEVEL>,<ENABLE>,<NSAP>]"
  "3,<AID>: [<SDCC>|<LDCC>|<LAN>,<ISLEVEL>,<ENABLE>,<NSAP>]"
  ...
  "N,<AID>: [<SDCC>|<LDCC>|<LAN>,<ISLEVEL>,<ENABLE>,<NSAP>]"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

AID	<0-40 ASCII HEXADECIMAL VALUES> Equipment AID, identifies the equipment entity.				
LDCC	Line DCC, specifies the LDCC type is retrieved in the adjacency table.				
SDCC	Section DCC, specifies the SDCC type is retrieved in the adjacency table.				
LAN	Local Area Network, specifies the LAN is retrieved in the adjacency table.				
ENABLE	{N, Y} Enable, determines if the TARP propagation to the NE specified by the NSAP parameter is enabled or disabled. Values are: <table> <tr> <td>N</td><td>No, specifies the TARP propagation to the NE in the NSAP parameter is disabled.</td></tr> <tr> <td>Y</td><td>Yes, specifies the TARP propagation to the NE in the NSAP parameter is enabled.</td></tr> </table>	N	No, specifies the TARP propagation to the NE in the NSAP parameter is disabled.	Y	Yes, specifies the TARP propagation to the NE in the NSAP parameter is enabled.
N	No, specifies the TARP propagation to the NE in the NSAP parameter is disabled.				
Y	Yes, specifies the TARP propagation to the NE in the NSAP parameter is enabled.				

ISLEVEL	{1, 2, BOTH} Intermediate System Level, determines the IS Level for which the TARP adjacency table is being modified. 1 NSAP is a level 1 adjacency. 2 NSAP is a level 2 adjacency. BOTH NSAP is both level 1 and level 2 adjacency.
NSAP	<40 ASCII HEXADECIMAL VALUES> Network Service Access Point, specifies the Network Service Access Point (NSAP) address. Values are 20 octets long encoded as 40 ASCII hexadecimals.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

RTRV-TARPADJ

COMMAND CODE: **RTRV-OC12**
COMMAND NAME: **RETRIEVE OC-12**

PURPOSE

The RTRV-OC12 command retrieves the provisioned parameter values, supporting I/O circuit pack AID, near end and far end facility alarm conditions, and current PST,SST state for the specified OC-12 port. The OC-12 port's current provisioned values and conditions (if provisioned), and state are retrieved from the system database. The command is executed regardless of the state of the OC-12.

The successful response for a RTRV-OC12 command contains one line of parsable output data, in ascending order (from lowest specified OC-12 AID to largest specified OC-12 AID), for each OC-12 AID specified. Values for NENDALM and FENDALM are only displayed if a condition exists. Only <AID> and <PST,SST> are displayed for a retrieve of an unprovisioned OC-12.

A RTRV-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-OC12: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the OC-12 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<AID>: :AINSTH=<value>,CARDID=<value>[ ,FENDALM=<value>]
[ ,NENDALM=<value>] ,S1TRANS=<value>,SDTHSW=<value> ,:PST,SST"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) OC12 AID indicates the OC-12 port to which this line of output data pertains.
-----	---

AINSTH	{HH-MM:{00–48} – {00–59} } Automatic In–Service Threshold. Specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS–L alarm condition before the system puts the facility into the In–Service state. The factory default is 8 hours. The valid value is: HH–MM Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively.
CARDID=	EQPT_AID: {04M–{6–9, 12–15, 18–21, 24–43, 104–111 , 112–135, 135–141 }–{1, 3}–{2–3, 11–12}} I/O Equipment Card ID, identifies the OC–12 port’s supporting I/O equipment AID using the equipment AID format.
FENDALM=	{RFI} Far End OC–12 Alarm Condition, identifies any far end OC–12 alarm conditions that exist on the OC–12. A FENDALM value is only reported if a FENDALM condition exists. Value is: RFI Far End Remote Failure Indication detected
NENDALM=	{AIS, EBER, LOF, LOS, SDBER} Near End OC–12 Alarm Condition, identifies any near end OC–12 alarm conditions that exist on the OC–12. A NENDALM value is reported only when a NENDALM condition exists. Values are: AIS Alarm Indication Signal detected EBER Excessive Bit Error Rate detected LOF Loss of Frame detected LOS Loss of Signal detected SDBER Signal Degrade Bit Error Rate detected
S1TRANS=	{ DUS, ACT } S1 byte transmitted, determines if the S1 byte transmitted has the “DUS” message or has the actual traceability of the signal. Values are: DUS Don’t USE. The S1 byte is set to “DON’T USE for Synchronization” message. ACT ACTual. The S1 byte is set to the actual traceability of the signal.
SDTHSW=	{5, 6, 7, 8, 9} Signal Degrade Threshold Switching level, indicates the signal degrade threshold over which Signal Degrade protection switching is initiated. Values are: 5 BER threshold of 10E–5 6 BER threshold of 10E–6 7 BER threshold of 10E–7 8 BER threshold of 10E–8 9 BER threshold of 10E–9
PST	{IS, OOS–AU, OOS–AUMA, OOS–MA} Primary State, indicates the current primary state of the OC–12. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: IS In–Service OOS–AU Out–Of–Service–Autonomous OOS–AUMA Out–Of–Service–Autonomous and Management OOS–MA Out–Of–Service–Management

SST {AINS, DSBLD, FAF, LPBK, MT, PMI, PSI, STBYH, TRM, UAS, WRK}
Secondary State, indicates any secondary states associated with the OC-12. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the OC-12 at the time of the RTRV-OC12. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:

AINS	Automatic In-Service
DSBLD	Disabled
FAF	Facility Failure
LPBK	Loopback
MT	Maintenance
PMI	Performance Monitoring Inhibited
PSI	Protection Switching Inhibited
SDEE	Supported Entity Exists
STBYH	Standby-Hot. If set on Working line, the working line is ready to carry service (no FAF). If set on Protection line, the Protection line is ready to carry service (no FAF).
TRM	Terminated
UAS	Unassigned
WRK	Working. If set on Working line, the Working line is carrying service. If set on Protection line, the Protection line is carrying service.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* GetAidEntry() Error: <ERROR-STRING> */
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
	/* TPidToAidStr(<TP-TYPE>, <RECORD-NUMBER>) Error: <ERROR-STRING> */
	/* TPidToTbss(<TP-TYPE>, <RECORD-NUMBER>) Error: <ERROR-STRING> */
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the provisioning data for OC–12 port OC12–12 is retrieved.

```
RTRV-OC12::OC12-12;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"OC12-12::CARDID= 04M-2-1-2,SDTHSW=6,S1TRANS=ACT:IS,STBYH"
/* RTRV-OC12::OC12-12 [Pad567] (2) */
;
```

In the following example, the provisioning data for OC–12 ports OC12–21 through OC12–25 is retrieved.

```
RTRV-OC12::OC12-21&&-25;
```

The output response, shown below, assumes CID 6 was used to enter the command and a system generated CTAG value of Pab124. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pab124 COMPLD
"OC12-21::AINSTH=05-30,CARDID= 04M-5-1-12,SDTHSW=6,S1TRANS=ACT:IS"
"OC12-22::CARDID=04M-5-1-13,SDTHSW=6,NENDALM=LOF,S1TRANS=ACT:OOS-
AU,FAF"
"OC12-23::CARDID=04M-5-1-14,SDTHSW=6,NENDALM=LOS,S1TRANS=ACT:IS,AINS"
"OC12-24::OOS-MA,UAS"
"OC12-25::CARDID=04M-5-1-16,SDTHSW=6,S1TRANS=ACT:IS"

COMMAND CODE: **RTRV-OC3**
COMMAND NAME: **RETRIEVE OC-3**

PURPOSE

The RTRV-OC3 command retrieves the provisioned parameter values, supporting I/O circuit pack AID, near end and far end facility alarm conditions, and current PST,SST state for the specified OC-3 port. The OC-3 port's current provisioned values and conditions (if provisioned), and state are retrieved from the system database. The command is executed regardless of the state of the OC-3.

The successful response for a RTRV-OC3 command contains one line of parsable output data, in ascending order (from lowest specified OC-3 AID to largest specified OC-3 AID), for each OC-3 AID specified. Values for NENDALM and FENDALM are only displayed if a condition exists. Only <AID> and <PST,SST> are displayed for a retrieve of an unprovisioned OC-3.

A RTRV-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-OC3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: Identifies the OC-3 port or a range of ports.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

The output response will be as follows:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<AID>: :AINSTH=<value>,CARDID=<value>[,FENDALM=<value>]
[,NENDALM=<value>],S1TRANS=<value>,SDTHSW=<value>,:PST,SST"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) OC3 AID indicates the OC-3 port to which this line of output data pertains.
-----	--

AINSTH	{HH-MM:{00–48} – {00–59} } Automatic In–Service Threshold. Specifies how long a customer signal must be present on the facility without a LOS, LOF, or AIS–L alarm condition before the system puts the facility into the In–Service state. The factory default is 8 hours. The valid value is: HH–MM Time, specifies the duration of an alarm–free signal where value HH indicates the time duration in hours and value MM indicates the time duration in minutes. The valid range of values is 00–48 and 00–59 (in increments of 1 minute), respectively.
CARDID=	EQPT_AID: {01B–{6–9, 12–15, 18–21, 24–43, 104–111 , 112–135, 136–141 }–{1, 3}–{2–9, 11–18}} I/O Equipment Card ID, identifies the OC–3 port’s supporting I/O equipment AID using the equipment AID format.
FENDALM=	{RFI} Far End OC–3 Alarm Condition, identifies any far end OC–3 alarm conditions that exist on the OC–3. A FENDALM value is only reported if a FENDALM condition exists. Value is: RFI Far End Remote Failure Indication detected
NENDALM=	{AIS, EBER, LOF, LOS, SDBER} Near End OC–3 Alarm Condition, identifies any near end OC–3 alarm conditions that exist on the OC–3. A NENDALM value is reported only when a NENDALM condition exists. Values are: AIS Alarm Indication Signal detected EBER Excessive Bit Error Rate detected LOF Loss of Frame detected LOS Loss of Signal detected SDBER Signal Degrade Bit Error Rate detected
S1TRANS=	{ DUS, ACT } S1 byte transmitted, determines if the S1 byte transmitted has the “DUS” message or has the actual traceability of the signal. Values are: DUS Don’t USE. The S1 byte is set to “DON’T USE for Synchronization” message. ACT ACTual. The S1 byte is set to the actual traceability of the signal.
SDTHSW=	{5, 6, 7, 8, 9} Signal Degrade Threshold Switching level, indicates the signal degrade threshold over which Signal Degrade protection switching is initiated. Values are: 5 BER threshold of 10E–5 6 BER threshold of 10E–6 7 BER threshold of 10E–7 8 BER threshold of 10E–8 9 BER threshold of 10E–9
PST	{IS, OOS–AU, OOS–AUMA, OOS–MA} Primary State, indicates the current primary state of the OC–3. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: IS In–Service OOS–AU Out–Of–Service–Autonomous OOS–AUMA Out–Of–Service–Autonomous and Management OOS–MA Out–Of–Service–Management

SST {AINS, DSBLD, FAF, LPBK, MT, PMI, PSI, STBYH, TRM, UAS, WRK}
Secondary State, indicates any secondary states associated with the OC-3. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the OC-3 at the time of the RTRV-OC3. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:

AINS	Automatic In-Service
DSBLD	Disabled
FAF	Facility Failure
LPBK	Loopback
MT	Maintenance
PMI	Performance Monitoring Inhibited

COMMAND CODE: **RTRV-OSADDR-SITE**
COMMAND NAME: **RETRIEVE OPERATIONS SYSTEM
ADDRESS – SITE**

PURPOSE

The RTRV-OSADDR-SITE command retrieves the contents (X.25 incoming SVC calling addresses and associated UID auto-login provisioning) of the system's X.25 Incoming SVC Calling Address database.

The successful response for a RTRV-OSADDR-SITE command contains either a non-parsable data header line followed by a non-parsable line of output data for each entry in the system's X.25 Incoming SVC Calling Address database, or a single non-parsable line of output if there are no entries in the database.

A RTRV-OSADDR-SITE command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-OSADDR-SITE: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* ADDR          AUTOIN */
  /* <ADDR>          <AUTOIN> */]
  [/* OSADDR is empty */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

ADDR	<1-15 INTEGER X.25_CALLING_ADDRESS> X.25 Incoming SVC Calling Address, indicates the X.25 Incoming SVC Calling Address (the X.25 address for the system calling the 1631 SX) entry in the X.25 Incoming SVC Calling Address database.
AUTOIN	{%, <UID>} Automatic Login, identifies the User ID that is automatically logged-in to the system when an X.25 incoming SVC call request packet is received with a calling address matching the associated ADDR value. Values are: % No Automatic Login, a normal log-in sequence (via ACT-USER) is required to access the system. <UID> UID Automatically Logged-in, the User ID (UID) is automatically logged-in when an X.25 incoming SVC call request packet is received with an incoming SVC calling address matching the entered ADDR value.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

```
SDBE      Status, internal Data Base Error
          /* Unable to read OSADDR – status = <status number> */
```

EXAMPLES

In the following example, the entries in the system's X.25 Incoming SVC Calling Address database are retrieved.

```
RTRV-OSADDR-SITE;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P1e015. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-OVRHD-OC12**
COMMAND NAME: **RETRIEVE OVERHEAD OC-12**

PURPOSE

The RTRV-OVRHD-OC12 command retrieves selected overhead bytes of an OC-12.

A RTRV-OVRHD-OC12 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-OVRHD-OC12 : [TID] : AID : [CTAG] : : [OVRHDTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: None Description: Identifies OC-12 port whose overhead byte(s) are to be retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
OVRHDTYPE	{K1, K2} Default: <All applicable overhead types listed above> Addressing: None Description: Overhead Type. Identifies the type of overhead to be retrieved. Values are: K1 K1, displays the incoming K1 byte as a binary value. K2 K2, displays the incoming K2 byte as a binary value.

SUCCESSFUL RESPONSE FORMAT

If the specified OVRHDTYPE is K1 or K2, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "AID: [K1=<value> <REQ> <CH1>] [,K2=<value> <CH2><ARCH><MODE>]  
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

If the specified OVRHDTYPE is K1 or K2 while there is a LOS/LOF defect on the OC-12, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "AID:OVRHDUNREADBLE"  
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

If the specified AID is unassigned (i.e. in a UAS secondary state), the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

If the OC12 is part of a UPSR ring, and the values for mode are AIS-L, RDI-L, or UA, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "AID: [K1=<value> NA NA [,K2=<value> NA UPSR <MODE>]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

- AID** OC12_AID:
{OC12-{1-560}} (OC12-OC12#)
OC12 AID, identifies a OC-12 port whose overhead byte(s) are to be retrieved.
- K1=** <00000000-11111111 byte in binary format>
K1, displays the incoming K1 byte as a binary value.
- REQ** {LP, FS, SF-HP, SF-LP, SD-HP, SD-LP, UNASGN, WTR, EX, RR, DNR, NR, NA}
APS Request. Displays the APS request indicated on the first four bits of the K1 byte.
The following values can be displayed:

K1 Bits 1-4	REQ
1111	LP
1110	FS
1101	SF-HP
1100	SF-LP
1011	SD-HP
1010	SD-LP
1001	UNASGN
1000	MS
0111	UNASGN
0110	WTR
0101	UNASGN
0100	EX
0011	UNASGN
0010	RR
0001	DNR
0000	NR
Not Applicable	NA

CH1	{0–15, NA} APS Channel on the K1 byte, displays the number of the channel for which the APS request is issued. Values are: 0–15 Decimal value corresponding to the last four bits of the K1 byte when ARCH = 1:N or 1+1 NA Not applicable when ARCH = UPSR
K2=	<00000000–11111111 byte in binary format> K2, displays the incoming K2 byte as a binary value.
CH2	{0–15, NA} APS Channel on the K2 byte. Displays the number of the channel bridged onto protection. Values are: 0–15 Decimal value corresponding to the first four bits of the K2 byte when ARCH = 1:N or 1+1 NA Not applicable when ARCH = UPSR
ARCH	{1+1, 1:N, UPSR} APS Architecture. Displays the APS architecture. Values are: 1:N 1:N Architecture 1+1 1+1 Architecture UPSR UPSR Ring Architecture
MODE	{UNI, BI, AIS–L, RDI–L, UA} APS Mode. Displays the APS switching mode. Values are: UNI Unidirectional when ARCH = 1:N or 1+1 BI Bidirectional when ARCH = 1:N or 1+1 AIS–L AIS–L detected RDI–L RDI–L detected UA Unassigned Values

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
SROF	Status, Requested Operation Failed
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the K1 byte is retrieved.

```
RTRV-OVRHD-OC12: :OC12-16;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"OC12-16:K1=0000 0000 NR 0,K2=0000 0 000 0 1+1 UA"
/* RTRV-OVRHD-OC12::OC12-16 [Pad567] (2) */
;

```

COMMAND CODE: **RTRV-OVRHD-OC3**
COMMAND NAME: **RETRIEVE OVERHEAD OC-3**

PURPOSE

The RTRV-OVRHD-OC3 command retrieves selected overhead bytes of an OC-3.

A RTRV-OVRHD-OC3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-OVRHD-OC3 : [TID] : AID : [CTAG] : : [OVRHDTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: None Description: Identifies OC-3 port whose overhead byte(s) are to be retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
OVRHDTYPE	{K1, K2} Default: <All applicable overhead types listed above> Addressing: None Description: Overhead Type. Identifies the type of overhead to be retrieved. Values are: K1 K1, displays the incoming K1 byte as a binary value and APS code. K2 K2, displays the incoming K2 byte as a binary value and APS code.

SUCCESSFUL RESPONSE FORMAT

If the specified OVRHDTYPE is K1 or K2, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "AID: [K1=<value> <REQ> <CH1>] [,K2=<value> <CH2><ARCH><MODE>]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

If the specified OVRHDTYPE is K1 or K2 while there is a LOS/LOF defect on the OC-3, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "AID: OVRHDUNREADBLE"
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

If the specified AID is unassigned (i.e. in a UAS secondary state), the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

If the OC3 is part of a UPSR ring, and the values for mode are AIS-L, RDI-L, or UA, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "AID: [K1=<value> NA NA [,K2=<value> NA UPSR <MODE>]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID OC3_AID:
{OC3-{1-2240}} (OC3-OC3#)
OC3 AID, identifies a OC-3 port whose overhead byte(s) are to be retrieved.

K1= <0000-1111 byte in binary format>
K1, displays the incoming K1 byte as a binary value and APS code.

REQ {LP, FS, SF-HP, SF-LP, SD-HP, SD-LP, UNASGN, WTR, EX, RR, DNR, NR}
APS Request. Displays the APS request indicated on the first four bits of the K1 byte.
The following values can be displayed:

K1 Bits 1-4	REQ
1111	LP
1110	FS
1101	SF-HP
1100	SF-LP
1011	SD-HP
1010	SD-LP
1001	UNASGN
1000	MS
0111	UNASGN
0110	WTR
0101	UNASGN
0100	EX
0011	UNASGN
0010	RR
0001	DNR
0000	NR

CH1 {0-15}
APS Channel on the K1 byte, displays the number of the channel for which the APS request is issued (last four bits of the K1 byte).

K2=	<0000–1111 byte in binary format> K2, displays the incoming K2 byte as a binary value and APS code.
CH2	{0–15} APS Channel on the K2 byte. Displays the number of the channel bridged onto protection (first four bits of the K2 byte).
ARCH	{1+1, 1:N, UPSR} APS Architecture. Displays the APS architecture. Values are: 1:N 1:n Architecture. 1+1 1+1 Architecture. UPSR UPSR Ring Architecture
MODE	{UNI, BI, AIS–L, RDI–L, UA} APS Mode. Displays the APS switching mode. Values are: UNI unidirectional. BI bidirectional. AIS–L AIS–L detected. RDI–L RDI–L detected. UA Unassigned Values.

UNSUCCESSFUL RESPONSE FORMAT

```

M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
SROF	Status, Requested Operation Failed
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the K1 byte is retrieved.

```
RTRV-OVRHD-OC3::OC3-16;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

RTRV-OVRHD-STS1

RTRV-OVRHD-STS3C

COMMAND CODE: **RTRV-OVRHD-ST51**
COMMAND NAME: **RETRIEVE OVERHEAD ST5-1**

PURPOSE

The RTRV-OVRHD-ST51 command retrieves selected overhead bytes of an ST5-1.

A RTRV-OVRHD-ST51 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-OVRHD-ST51: [TID]:AID:[CTAG]::[OVRHDTYPE];

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	Identifies STS-1 port whose overhead byte(s) are to be retrieved.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	
OVRHDTYPE	{C2}		
	Default:	<All applicable overhead types listed above>	
	Addressing:	None	
	Description:	Overhead Type. Identifies the type of overhead to be retrieved. Values are:	
	C2	C2 byte in the Hex format to be retrieved.	

SUCCESSFUL RESPONSE FORMAT

If the specified OVRHDTYPE is C2, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "AID: [C2=<value>]"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

If the specified OVRHDTYPE is C2 while there is a LOF/LOP/AIS-P defect on the ST5-1, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "AID:OVRHDUNREADBLE"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

If the specified AID is unassigned (i.e. in a UAS secondary state), the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

C2= Displays C2 byte in the Hex format with range of 00_H to FF_H. For purposes of SLMF defect detection, any C2 byte received that contains a PDI value of E1_H to FB_H (1 to 27 contained VT defects) shall be treated as though it were a value of 02_H (i.e., VT structured payload); a C2 byte received that contains the PDI value of FC_H (28 contained VT defects or DS3 payload defects) shall be treated as though it were a value of 02_H for VT structured payload or 04_H for non-VT structured payload.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
SROF	Status, Requested Operation Failed
SSRE	Status, System Resources Exceeded

EXAMPLES

In the following example, the C2 byte is retrieved.

```
RTRV-OVRHD-STs1: :OC3STS1-1-3;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
  "OC3STS1-1-3:C2=0x1"

RTRV-OVRHD-STs3C
```

COMMAND CODE: **RTRV-OVRHD-STS3C**
COMMAND NAME: **RETRIEVE OVERHEAD STS-3C**

PURPOSE

The RTRV-OVRHD-STS3C command retrieves selected overhead bytes of an STS-3C.

A RTRV-OVRHD-STS3C command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-OVRHD-STS3C: [TID] :AID: [CTAG] : : [OVRHDTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: None Description: Identifies STS-3C port whose overhead byte(s) are to be retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
OVRHDTYPE	{C2} Default: <All applicable overhead types listed above> Addressing: None Description: Overhead Type. Identifies the type of overhead to be retrieved. Values are: C2 C2 byte in the Hex format to be retrieved.

SUCCESSFUL RESPONSE FORMAT

If the specified OVRHDTYPE is C2, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "AID: [C2=<value>]  
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

If the specified OVRHDTYPE is C2 while there is a LOF/LOP/AIS-P defect on the STS-3C, the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "AID:OVRHDUNREADBLE"  
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

If the specified AID is unassigned (i.e. in a UAS secondary state), the successful response format is:

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

C2= Displays C2 byte in the Hex format with range of 00_H to FF_H.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC Input, Invalid ACcess identifier

EXAMPLES

In the following example, the C2 byte is retrieved.

```
RTRV-OVRHD-ST3C: :OC3ST3C-16;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

```

COMMAND CODE: **RTRV-PARTITN**
COMMAND NAME: **RETRIEVE PARTITION**

PURPOSE

The RTRV-PARTITN command retrieves the user facility partition names (PMODE of PNAME), the facility partition port AIDs (PMODE of PPORT), or the partitioned user UIDs associated with the facility partition name (PMODE of PUSER) specified by PARTNAM.

A partitioned user can only retrieve partitioning information pertaining to the partitioned user's facility partition. A non-partitioned user can retrieve facility partitioning information pertaining to any facility partition.

The successful response for a RTRV-PARTITN command contains one or more lines of non-parsable output data for each facility partition name retrieved if PMODE of PNAME is entered, or for each partition port AID assigned to each partition name retrieved if PMODE of PPORT is entered, or for each partitioned user UID for each partition name retrieved if PMODE of PUSER is entered. No line of output data is provided if the requested data associated with the specified PARTNAM does not exist (e.g., no facility ports have been assigned to the partition).

A RTRV-PARTITN command is denied if:

- A partitioned user enters a partition name (PARTNAM) associated with another user.
- The "User Partitioning" PFO is not enabled.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PARTITN: [TID] : : [CTAG] : : [PMODE] , [PARTNAM] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.						
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.						
PMODE	{PNAME, PPORT, PUSER} Default: {PPORT} Addressing: None Description: Partition Display Mode, specifies the type of user facility partitioning information to be retrieved. Values are: <table><tr><td>PNAME</td><td>Partition Names, specifies that partition names are retrieved.<ul style="list-style-type: none">• If the user is a partitioned user, the partitioned user's partition name is displayed.• If the user is a non-partitioned user, the partition name(s) of the specified facility partition(s) are retrieved.</td></tr><tr><td>PPORT</td><td>Partition Ports, specifies that the facility ports assigned to the specified facility partition(s) are retrieved.<ul style="list-style-type: none">• If the user is a partitioned user, only ports assigned to the user's facility partition are retrieved.• If the user is a non-partitioned user, all ports assigned to the specified facility partition(s) are retrieved.</td></tr><tr><td>PUSER</td><td>Partition Users, specifies that the UIDs associated with the specified facility partition are retrieved.</td></tr></table>	PNAME	Partition Names, specifies that partition names are retrieved. <ul style="list-style-type: none">• If the user is a partitioned user, the partitioned user's partition name is displayed.• If the user is a non-partitioned user, the partition name(s) of the specified facility partition(s) are retrieved.	PPORT	Partition Ports, specifies that the facility ports assigned to the specified facility partition(s) are retrieved. <ul style="list-style-type: none">• If the user is a partitioned user, only ports assigned to the user's facility partition are retrieved.• If the user is a non-partitioned user, all ports assigned to the specified facility partition(s) are retrieved.	PUSER	Partition Users, specifies that the UIDs associated with the specified facility partition are retrieved.
PNAME	Partition Names, specifies that partition names are retrieved. <ul style="list-style-type: none">• If the user is a partitioned user, the partitioned user's partition name is displayed.• If the user is a non-partitioned user, the partition name(s) of the specified facility partition(s) are retrieved.						
PPORT	Partition Ports, specifies that the facility ports assigned to the specified facility partition(s) are retrieved. <ul style="list-style-type: none">• If the user is a partitioned user, only ports assigned to the user's facility partition are retrieved.• If the user is a non-partitioned user, all ports assigned to the specified facility partition(s) are retrieved.						
PUSER	Partition Users, specifies that the UIDs associated with the specified facility partition are retrieved.						

- If the user is a partitioned user, the UIDs associated with the partitioned user's facility partition are retrieved.
- If the user is a non-partitioned user, the UIDs associated with the specified facility partition(s) are retrieved.

PARTNAM	{<1–20 CHARACTER VALID PARTITION NAME>, ALL}
Default:	{ALL}
Addressing:	None
Description:	Partition Name, specifies the name of the user facility partition. Values are:
	<p><VALID PARTITION NAME> A specific user facility partition.</p> <p>ALL All specified user facility partitioning data.</p> <ul style="list-style-type: none"> • If PMODE of PNAME is specified and the user is a partitioned user, the partitioned user's partition name is displayed. • If PMODE of PNAME is specified and the user is a non-partitioned user, all facility partition names in the system are retrieved. • If PMODE of PPORT is specified and the user is a partitioned user, only ports assigned to the partitioned user's facility partition are retrieved. • If PMODE of PPORT is specified and the user is a non-partitioned user, all ports assigned to all facility partitions are retrieved. • If PMODE of PUSER is specified and the user is a partitioned user, the UIDs associated with the partitioned user's facility partition are retrieved. • If PMODE of PUSER is specified and the user is a non-partitioned user, the UIDs associated with all facility partitions are retrieved.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
[/ * <PARTNAM> */]
[/ * <PARTNAM> (<PORTTYPE>) <AID> */]
[/ * <PARTNAM> <UID> */]
[/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;

```

Note: The first format line of output data is used if PMODE of PNAME is entered. The second format line of output data is used if PMODE of PPORT is entered. The third format line of output data is used if PMODE of PUSER is entered.

OUTPUT PARAMETERS

PARTNAM	<1–20 CHARACTER PARTITION NAME> Partition Name, indicates the name assigned to the user facility partition.
PORTTYPE	{DS1, DS3, EC1, F3, OC3, OC12, STS1, STS3C, VT1} Port Type, identifies the type of facility.
	DS3 DS3 port, electrical or embedded
	DS1 DS1 port, electrical or embedded
	EC1 Electrical STS–1
	F3 Fractional T3
	OC3 Optical Carrier level 3

	OC12	Optical Carrier level 12	
	STS1	STS-1 port

	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	EC1, F3, OC3, OC12, STS1, STS3C, VT1.5, DS3, or DS1 AID, identifies the EC1, F3, OC3, OC12, STS1, STS3C, VT1.5, DS3, or DS1 port in a user partition.		
UID	< 5-12 CHARACTER UID >		
	User Identifier, identifies the UID of a user associated to the user facility partition.		

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

ENFE	Equipage, FEature Not provided
IDNV	Input, Data Not Valid /* Invalid Partition Name */ /* Illegal input */
IIFM	Input, Invalid data ForMat /* PARTNAM length */ /* PMODE length */
IPNV	Input, Parameter Not Valid /* PARTNAM */ /* PMODE */
SDBE	Status, internal Data Base Error /* Error accessing the PARTITION DB – status = <status number> */
SROF	Status, Requested Operation Failed /* User not found in USDB */ /* Privilege: UNAUTHORIZED TO REQUEST THIS COMMAND */

EXAMPLES

In the following example, all facility partition names are retrieved.

```
RTRV-PARTITN: : : : PNAME, ALL;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P27011. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P27011 COMPLD  
/* PARTITION1 */  
/* PARTITION2 */  
/* PARTITION3 */  
/* RTRV-PARTITN: : : : PNAME, ALL [P27011] (1) */  
;
```

In the following example, all partitioned user UIDs associated with all facility partitions are retrieved.

```
RTRV-PARTITN: : : : PUSER, ALL;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P27030. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P27030 COMPLD  
/* PARTITION1 USER20 */  
/* USER23 */  
/* USER25 */  
/* PARTITION2 USER20 */  
/* USER01 */  
/* PARTITION3 USER05 */  
/* USER33 */  
/* RTRV-PARTITN: : : : PUSER, ALL [P27030] (1) */  
;
```

In the following example, all DS3 or DS1 ports assigned to all facility partitions are retrieved.

RTRV-PARTITN is used to retrieve all ports in all partitions:

```
RTRV-PARTITN: : : : PPORT;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P27031. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P27031 COMPLD
/* PARTITION1 (DS3) T3-5 */
/*           (DS3) T3-6 */
/*           (DS3) T3-7 */
/* PARTITION2 (DS1) T1-1 */
/*           (DS1) T1-2 */
/*           (DS1) T1-3 */
/*           (DS1) T1-4 */
/* PARTITION3 (DS3) EC1T3-11 */
/*           (DS3) EC1T3-12 */
/* RTRV-PARTITN:::::PPORT [P27031] (1) */
;
```

COMMAND CODE: **RTRV-PATH-STS1**
COMMAND NAME: **RETRIEVE CONNECTION PATH STS1**

PURPOSE

The RTRV-PATH-STS1 command retrieves the redundant internal paths of the specified pair of STS1 ports through the system. The command is executed regardless of the provisioning or cross-connection status of the specified ports.

The redundant internal paths through the system that are reported are the paths from the specified FROM STS1 AID to the specified TO STS1 AID. RTRV-PATH-STS1 does not report on the paths through the system from the specified TO STS1 AID to the specified FROM STS1 AID.

The successful response to a RTRV-PATH-STS1 command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 and copy 1 data paths through the system. Refer to the Successful Response Format, below.

If a cross-connection does not exist between the specified FROM and TO ports, the center-stage cable identifiers and center-stage circuit packs cannot be determined and are therefore not reported. In this case, a line of output indicates that no cross-connection exists for the specified ports.

A RTRV-PATH-STS1 command is denied if:

- Either of the AIDs specified by FROM or TO is not provisioned or is not in OOS-AUMA, UAS, MT state.
- The specified STS1 is embedded within a protection OC3 or OC12.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PATH-STS1 : [TID] : FROM, TO : [CTAG] : : [PATH] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
FROM	STS1_AID:		
	{EC1STS1-{1-3840}}		(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}		(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}		(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required	
	Addressing:	None	
	Description:	STS1 AID, specifies the FROM STS1 port.	
TO	STS1_AID:		
	{EC1STS1-{1-3840}}		(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}		(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}		(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required	
	Addressing:	None	
	Description:	STS1 AID, specifies the TO STS1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

PATH	{0, 1–28}	
	Default:	{ 0 }
	Addressing:	None
	Description:	Path. Indicates which of the 29 paths, that the intact STS1 is divided into, is to be analyzed. Values are:
	0	The path over which the overhead is being transmitted.
	1–28	The path over which the 1–28 VT1.5 equivalent components are being transmitted..

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* From STS1: <FROM>, PATH=<value> */
/* Copy 0: <EQPT_AID> Copy 1: <EQPT_AID> */
....
/* Copy 0: <EQPT_AID> Copy 1: <EQPT_AID> */
/* To STS1: <TO>, PATH=<value> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

FROM	STS1_AID:	
	{EC1STS1-{1–3840}}	(EC1STS1–EC1/STS1#)
	{OC3STS1-{1–2240}–{1–3}}	(OC3STS1–OC3#–STS1#)
	{OC12STS1-{1–560}–{1–4}–{1–3}}	(OC12STS1–OC12#–STM1#–STS1#)
	STS1 AID, identifies the FROM STS–1 port.	
PATH=	{0–28}	
	Path, identifies which of the paths, that the intact STS1 is divided into, is being reported.	
	Values are:	
	0	The path over which the overhead is being transmitted is being reported.
	1–28	The path over which the 1–28 VT1.5 equivalent components are being transmitted is being reported.

{No connection.}
{Path not found.}

Equipment AID, identifies the equipment and cable entities that form the internal system path from the FROM STS-1 port to the TO STS-1 port. Non-AID values are:

No connection. The value {No connection.} is displayed in place of the center-stage circuit pack AID if a connection does not exist between the specified FROM and TO ports.

Path not found. The value {Path not found.} is displayed in place of the center-stage circuit pack AID if a connection in the cross-connection database does not exist in the matrix hardware. (This may be due to a hardware failure or slowed system performance under heavy load conditions. Consequently, the RTRV-PATH-STS1 should be executed again if this value is returned in the output response.)

TO	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	STS1 AID, identifies the TO STS-1 port.

  slot <slot number>.*/
/*Unable to get TP type and TP number for I/O equipment (<equipment id>).*/
```

EXAMPLES

In the following example, the internal system path from STS-1 port EC1STS1-195 to STS-1 port EC1STS1-207 is retrieved. The example shown assumes there is no cross-connection between the two STS-1 ports.

```
RTRV-PATH-STSt: :EC1STS1-195,EC1STS1-207;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
/* FROM STSt: EC1STS1-195,PATH=0 */
/* COPY 0: EP3-8-1-2 COPY 1: EP3-8-1-2 */
/* COPY 0: IPB-8-1-1 COPY 1: IPB-8-1-2 */
/* COPY 0: CBL-8-1-XA150F COPY 1: CBL-8-1-XA250H */
/* COPY 0: CBL-5-3-LX031H COPY 1: CBL-4-3-LX031H */
/* COPY 0: M16-5-3-9 COPY 1: M16-4-3-9 */
/* COPY 0: No connection COPY 1: No connection */
/* COPY 0: M16-5-3-13 COPY 1: M16-4-3-13 */
/* COPY 0: CBL-5-3-LX101E COPY 1: CBL-4-3-LX101E */
/* COPY 0: CBL-8-1-XA150C COPY 1: CBL-8-1-XA250E */
/* COPY 0: IPB-8-1-1 COPY 1: IPB-8-1-2 */
/* COPY 0: EP3-8-1-6 COPY 1: EP3-8-1-6 */
/* TO STSt: EC1STS1-207,PATH=0 */
/* RTRV-PATH-STSt: :EC1STS1-195,EC1STS1-207 [Pad567] (2) */
;
```

In the following example, the internal system path from STS-1 port EC1STS1-195 to STS-1 port EC1STS1-207 is retrieved. The example shown assumes that there is a cross-connection between the two STS-1 ports.

```
RTRV-PATH-STSt: :EC1STS1-195,EC1STS1-207;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

/* COPY 0: IPB-8-1-1 COPY 1: IPB-8-1-2 */
/* COPY 0: EP3-8-1-6 COPY 1: EP3-8-1-6 */
/* TO STSt: EC1STS1-207,PATH=0 */
/* RTRV-PATH-STSt: :EC1STS1-195,EC1STS1-207 [Pad569] (3) */
;
```

In the following example, the pass through connection path between STS-1 port OC3STS1-65-1 and STS-1 port OC3STS1-66-1 is retrieved.

```
RTRV-PATH-STS1::OC3STS1-65-1,OC3STS1-66-1;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad569 COMPLD

COMMAND CODE: **RTRV-PATH-STS3C**
COMMAND NAME: **RETRIEVE CONNECTION PATH STS-3C**

PURPOSE

The RTRV-PATH-STS3C command retrieves the redundant internal paths of the specified pair of STS3C ports through the system. The command is executed regardless of the provisioning or cross-connection status of the specified ports.

The redundant internal paths through the system that are reported are the paths from the specified FROM STS3C AID to the specified TO STS3C AID. RTRV-PATH-STS3C does not report on the paths through the system from the specified TO STS3C AID to the specified FROM STS3C AID.

The successful response to a RTRV-PATH-STS3C command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 and copy 1 data paths through the system. Refer to the Successful Response Format, below.

If a cross-connection does not exist between the specified FROM and TO ports, the AIDs of the I/O circuit packs and the end-state circuit packs to which the I/O circuit packs are connected, as well as the connecting cable identifiers, are reported.

A RTRV-PATH-STS3C command is denied if:

- Either the AID specified by FROM or TO is not in a provisioned state (no UAS secondary state).
- Both of the AIDs specified by FROM and TO are not STS3C.
- The specified STS3C is embedded within a protection OC3 or OC12.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PATH-STS3C : [TID] : FROM, TO : [CTAG] : : [PATH] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
FROM	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: None Description: STS3C AID, specifies the FROM STS-3C port.
TO	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: None Description: STS3C AID, specifies the TO STS-3C port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

PATH	{0–86}	
	Default:	{ 0 }
	Addressing:	None
	Description:	Path. Indicates which of the 87 paths, that the intact STS3C is divided into, is to be analyzed. Values are:
	0, 1, 2	The path over which the overhead is being transmitted.
	3 – 86	The path over which the 3–86 VT1.5 equivalent components are being transmitted.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* From STS3C: <FROM>,PATH=<value> */
/* Copy 0: <EQPT_AID> Copy 1: <EQPT_AID> */
....
/* Copy 0: <EQPT_AID> Copy 1: <EQPT_AID> */
/* To STS3C: <TO>,PATH=<value> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

FROM	STS3C_AID:	
	{OC3STS3C–{1–2240}}	(OC3STS3C–OC3#/STS3C#)
	{OC12STS3C–{1–560}–{1–4}}	(OC12STS3C–OC12#–STM1/STS3C#)
	STS3C AID, identifies the FROM STS–3C port.	
PATH=	{0–86}	
	Path, identifies which of the 87 paths, that the intact STS3C is divided into, is being reported. Values are:	
	0, 1, 2	The path over which the overhead is being transmitted is being reported.
	3 – 86	The path over which the 3–86 VT1.5 equivalent components are being transmitted is being reported.

{No connection.}
{Path not found.}
```

Equipment AID, identifies the equipment and cable entities that form the internal system path from the FROM STS3C port to the TO STS3C port. Non-AID values are:

No connection. The value {No connection.} is displayed in place of the center-stage circuit pack AID if a connection does not exist between the specified FROM and TO ports.

Path not found. The value {Path not found.} is displayed in place of the center-stage circuit pack AID if a connection in the cross-connection database does not exist in the matrix hardware. (This may be due to a hardware failure or slowed system performance under heavy load conditions. Consequently, the RTRV-PATH-ST3C should be executed again if this value is returned in the output response.)

TO	STS3C_AID:	
	{OC3STS3C-{1-2240}}	(OC3STS3C-OC3#/STS3C#)
	{OC12STS3C-{1-560}-{1-4}}	(OC12STS3C-OC12#-STM1/STS3C#)
	STS3C AID, identifies the TO STS-3C port.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
	/* Unable to retrieve PATH NUMBER parameter. */
	/* Invalid PATH NUMBER <path number> specified. */
	/* Both FROM and TO facility must be STS3C AID. */
IIAC	Input, Invalid ACcess identifier
	/* Invalid FROM AID entered. */
	/* Invalid TO AID entered. */

EXAMPLES

In the following example, the internal system path from STS3C port OC3STS3C-3 to STS3C port OC3STS3C-15 is retrieved. The example shown assumes there is no cross-connection between the two STS3C ports.

```
RTRV-PATH-ST3C: :OC3STS3C-3,OC3STS3C-15;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
/* FROM STS3C: OC3STS3C-3,PATH=0 */
/* COPY 0: O1B-6-1-4 COPY 1: O1B-6-1-4 */
/* COPY 0: RPB-6-1-1 COPY 1: RPB-6-1-2 */
/* COPY 0: CBL-8-1-XA150F COPY 1: CBL-8-1-XA250H */
/* COPY 0: CBL-5-3-UX031B COPY 1: CBL-4-3-UX031B */
/* COPY 0: M16-5-3-1 COPY 1: M16-4-3-1 */

COMMAND CODE: **RTRV-PATH-T1**
COMMAND NAME: **RETRIEVE CONNECTION PATH T1**

PURPOSE

The RTRV-PATH-T1 command retrieves the redundant internal paths of the specified pair of DS1 or VT1.5 ports through the system. The command is executed regardless of the provisioning or cross-connection status of the specified ports.

The redundant internal paths through the system that are reported are the paths from the specified FROM DS1 or VT1.5 AID to the specified TO DS1 or VT1.5 AID. RTRV-PATH-T1 does not report on the paths through the system from the specified TO DS1 or VT1.5 AID to the specified FROM DS1 or VT1.5 AID.

The successful response to a RTRV-PATH-T1 command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 and copy 1 data paths through the system. Refer to the Successful Response Format, below.

If a cross-connection does not exist between the specified FROM and TO ports, the center-stage cable identifiers and center-stage circuit packs can not be determined and are therefore not reported. In this case, a line of output indicates that no cross-connection exists for the specified ports.

A RTRV-PATH-T1 command is denied if:

- If both the FROM and TO values identify a VT1.5 port.
- Either the AID specified by FROM or TO is not provisioned or is not in OOS-AUMA, UAS, MT state
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PATH-T1 : [TID] : FROM, TO : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
FROM	DS1_AID:

 {No connection.}
 {Path not found.}

Equipment AID, identifies the equipment and cable entities that form the internal system path from the FROM DS1 or VT1.5 port to the TO DS1 or VT1.5 port. Non-AID values are:

- No connection. The value {No connection.} is displayed in place of the center-stage circuit pack AID if a connection does not exist between the specified FROM and TO ports.
- Path not found. The value {Path not found.} is displayed in place of the center-stage circuit pack AID if a connection in the cross-connection database does not exist in the matrix hardware. (This may be due to a hardware failure or slowed system performance under heavy load conditions. Consequently, the RTRV-PATH-T1 should be executed again if this value is returned in the output response.)

TO DS1_AID:
 {T1-{1-59392}} (T1-DS1#)
 {T3T1-{1-4800}-{1-28}} (T3T1-DS3#-DS1#)
 {EC1T1-{1-3840}-{1-28}} (EC1T1-EC1/STS1/DS3#-DS1#)
 {OC3T1-{1-2240}-{1-3}-{1-28}} (OC3T1-OC3#-STS1/DS3#-DS1#)
 {OC12T1-{1-560}-{1-4}-{1-3}-{1-28}} (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)
 VT1_AID:
 {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
 {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
 {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)
 DS1 or VT1 AID, identifies the TO DS1 or VT1.5 port.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV Input, Data Not Valid
 /* FROM and/or TO facility must be T1 AID. */

IIAC Input, Invalid ACcess identifier
 /* Invalid FROM AID entered. */
 /* Invalid TO AID entered. */

SDBE Status, internal Data Base Error
 /* Failed to get FROM TP DB record <TP record number> error <errnum>. */
 /* Failed to get TO TP DB record <TP record number> error <errnum>. */
 /* Error reading <AID> database record. */
 /* Error reading <AID type> id:<parent ipu> database record */
 /* Failed to read EM DB for shelf equipment (<shelf id>), status=<errnum>. */
 /* Failed to get OC3 TP DB record <TP record number> error <errnum>. */
 /* Error reading matrix cable input database for bay <bay number> shelf <shelf number>
 */
 /* Error reading eoc to es1 cable database for cable <cable num>. */
 /* TPid to first stage Tmsl conversion error <errnum>. */
 /* TPid to third stage Tmsl conversion error <errnum>. */
 /* Unable to get connection pointer for TP type <tp type>, TP num <tp record number>,
 error <errnum>. */
 /* Unable to get QRS pointer for TP type <tp type>, TP num <tp num>, error <errnum>.
 */
 /* Invalid from_cid <connect id num> in connection database for TP type <tp type>, TP
 num <tp num>. */
 /* Tmsl Path Retrieve error <errnum>. */
 /* Error reading es1 to cs cable database for cable <cable number>. */
 /* Error reading cs to es3 cable database for cable <cable number>. */
 /* Error reading matrix cable output database for cable <cable number>. */
 /* Error reading eoc to io cable database for cable <cable number>. */

SNVS Status, Not in Valid State
 /* FROM AID not as provisioned. */
 /* TO AID not as provisioned. */
 /* FROM AID must be in a provisioned or maintenance state. */
 /* TO AID must be in a provisioned or maintenance state. */

SROF Status, Requested Operation Failed
 /* FROM AID to string error <errnum>. */
 /* FROM TPid to Tbss conversion error <errnum>. */
 /* FROM Physical TPid to Tbss conversion error <errnum>. */
 /* Invalid or unsupported card type, <card type>, encountered for <AID>. */
 /* Invalid physical TP type <tp type> encountered for <AID>. */
 /* TO TPid to Tbss conversion error <errnum>. */
 /* TO Physical to Tbss conversion error <errnum>. */
 /* TO AID to string error <errnum>. */
 /* Unable to convert the FROM TP type to a string error <errnum>. */
 /* Unable to convert the TO TP type to a string error <errnum>. */
 /*Unable to determine first stage card type for bay <bay number> shelf <shelf number>
 slot <slot number>.*/
 /*Unable to determine center stage card type for bay <bay number> shelf <shelf number>
 slot <slot number>.*/
 /*Unable to determine third stage card type for bay <bay number> shelf <shelf number>
 slot <slot number>.*/
 /* Invalid matrix interface (<matrix interface type number>) encountered for <AID>. */
 /* Unable to compute matrix input cable number for <AID>. */
 /* Invalid SI protect board type (<card type>) for bay <bay number> shelf <shelf number>
 slot <slot number>.*/
 /* Unable to get physical termination point identifier for <AID>. */
 /* Unable to get TP type and TP number for I/O equipment (<equipment id>). */

EXAMPLES

In the following example, the internal system path from DS1 port T3T1-1155-2 to DS1 port T3T1-1177-6 is retrieved. The example shown assumes there is no cross-connection between the two DS1 ports.

```
RTRV-PATH-T1: :T3T1-1155-2, T3T1-1177-6;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
/* FROM T1/VT1: T3T1-1155-2 */
/* COPY 0: EP3-8-1-2 COPY 1: EP3-8-1-2 */
/* COPY 0: IPB-8-1-1 COPY 1: IPB-8-1-2 */
/* COPY 0: CBL-8-1-XA150F COPY 1: CBL-8-1-XA250H */
/* COPY 0: CBL-5-3-LX031H COPY 1: CBL-4-3-LX031H */
/* COPY 0: M16-5-3-9 COPY 1: M16-4-3-9 */
/* COPY 0: No connection COPY 1: No connection */
/* COPY 0: M16-5-3-14 COPY 1: M16-4-3-14 */
/* COPY 0: CBL-5-3-LX111G COPY 1: CBL-4-3-LX111G */
/* COPY 0: CBL-3-XA150B COPY 1: CBL-3-XA250D */
/* COPY 0: IPB-8-1-1 COPY 1: IPB-8-1-2 */
/* COPY 0: EP3-8-1-11 COPY 1: EP3-8-1-11 */
/* TO T1/VT1: T3T1-1177-6 */
/* RTRV-PATH-T1: :T3T1-1155-2, T3T1-1177-6 [Pad567] (2) */
;
```

In the following example, the internal system path from DS1 port T3T1-1155-2 to DS1 port T3T1-1177-6 is retrieved. The example shown assumes that there is a cross-connection between the two DS1 ports.

```
RTRV-PATH-T1: :T3T1-1155-2, T3T1-1177-6;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of Pad569. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

COMMAND CODE: **RTRV-PATH-T3**
COMMAND NAME: **RETRIEVE CONNECTION PATH T3**

PURPOSE

The RTRV-PATH-T3 command retrieves the redundant internal paths of the specified pair of DS3 or STS-1 ports through the system. The command is executed regardless of the provisioning or cross-connection status of the specified ports.

The redundant internal paths through the system that are reported are the paths from the specified FROM DS3 or STS-1 AID to the specified TO DS3 or STS-1 AID. RTRV-PATH-T3 does not report on the paths through the system from the specified TO DS3 or STS-1 AID to the specified FROM DS3 or STS-1 AID.

The successful response to a RTRV-PATH-T3 command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 and copy 1 data paths through the system. Refer to the Successful Response Format, below.

If a cross-connection does not exist between the specified FROM and TO ports, the center-stage cable identifiers and center-stage circuit packs can not be determined and are therefore not reported. In this case, a line of output indicates that no cross-connection exists for the specified ports.

A RTRV-PATH-T3 command is denied if:

- If both the FROM and TO values identify an STS-1 port.
- Either the AID specified by FROM or TO is not provisioned or is not in OOS-AUMA, UAS, MT state
- The specified STS-1 is embedded within a protection OC-3 or OC-12.
- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PATH-T3 : [TID] : FROM, TO : [CTAG] : : [PATH] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
FROM	DS3_AID:		
	{T3-{1-4800}}	(T3-DS3#)	
	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	DS3 or STS1 AID, specifies the FROM DS3 or STS-1 port.	
	Restrictions:	RTRV-PATH-T3 command is denied if both the specified FROM and TO values are an STS-1 AID.	
TO	DS3_AID:		
	{T3-{1-4800}}	(T3-DS3#)	
	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	None	
	Description:	DS3 or STS1 AID, specifies the TO DS3 or STS-1 port.	
	Restrictions:	RTRV-PATH-T3 command is denied if both the specified TO and FROM values are an STS-1 AID.	

CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
PATH	{0, 1–28} Default: { 0 } Addressing: None Description: Path. Indicates which of the 29 paths, that the intact STS1 is divided into, is to be analyzed. Values are: 0 The path over which the overhead is being transmitted. 1–28 The path over which the 1–28 VT1.5 equivalent components are being transmitted..

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* From T3/STS1: <FROM>, PATH=<value> */
/* Copy 0: <EQPT_AID> Copy 1: <EQPT_AID> */
....
/* Copy 0: <EQPT_AID> Copy 1: <EQPT_AID> */
/* To T3/STS1: <TO>, PATH=<value> */
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

FROM	DS3_AID: {T3-{1–4800}} (T3–DS3#) STS1_AID: {EC1STS1-{1–3840}} (EC1STS1–EC1/STS1#) {OC3STS1-{1–2240}-{1–3}} (OC3STS1–OC3#–STS1#) {OC12STS1-{1–560}-{1–4}-{1–3}} (OC12STS1–OC12#–STM1#–STS1#) DS3 or STS1 AID, identifies the FROM DS3 or STS–1 port.
PATH=	{0–28} Path, identifies which of the paths, that the intact T3 is divided into, is being reported. Values are: 0 The path over which the overhead is being transmitted is being reported. 1–28 The path over which the 1–28 T1 equivalent components are being transmitted is being reported.

{No connection.}
{Path not found.}

Equipment AID, identifies the equipment and cable entities that form the internal system path from the FROM DS3 or STS-1 port to the TO DS3 or STS-1 port. Non-AID values are:

- No connection. The value {No connection.} is displayed in place of the center-stage circuit pack AID if a connection does not exist between the specified FROM and TO ports.
- Path not found. The value {Path not found.} is displayed in place of the center-stage circuit pack AID if a connection in the cross-connection database does not exist in the matrix hardware. (This may be due to a hardware failure or slowed system performance under heavy load conditions. Consequently, the RTRV-PATH-T3 should be executed again if this value is returned in the output response.)

TO

DS3_AID:

{T3-{1-4800}} (T3-DS3#)

STS1_AID:

{EC1STS1-{1-3840}} (EC1STS1-EC1/STS1#)

{OC3STS1-{1-2240}-{1-3}} (OC3STS1-OC3#-STS1#)

{OC12STS1-{1-560}-{1-4}-{1-3}} (OC12STS1-OC12#-STM1#-STS1#)

DS3 or STS1 AID, identifies the TO DS3 or STS-1 port.

UNSUCCESSFUL RESPONSE FORMAT

```

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Unable to retrieve PATH NUMBER parameter */ /* Invalid PATH NUMBER <path number> specified. */ /* FROM and/or TO facility must be T3 AID. */
IIAC	Input, Invalid ACcess identifier /* Invalid FROM AID entered. */ /* Invalid TO AID entered. */
SDBE	Status, internal Data Base Error /* FROM TPid to supported TPid conversion error <errnum>. */ /* TO TPid to supported TPid conversion error <errnum>. */ /* Failed to get FROM TP DB record <TP record number> error <errnum>. */ /* Failed to get TO TP DB record <TP record number> error <errnum>. */ /* Error reading <AID> database record. */ /* Error reading <AID type> id:<parent ipu> database record */ /* Failed to read EM DB for shelf equipment (<shelf id>), status=<errnum>. */ /* Failed to get OC3 TP DB record <TP record number> error <errnum>. */ /* Error reading matrix cable input database for bay <bay number> shelf <shelf number> */ /* Error reading eoc to es1 cable database for cable <cablenum>. */ /* TPid to first stage Tmsl conversion error <errnum>. */ /* TPid to third stage Tmsl conversion error <errnum>. */ /* Unable to get connection pointer for TP type <tp type>, TP num <tp record number>, error <errnum>. */ /* Tmsl Path Retrieve error <errnum>. */ /* Error reading es1 to cs cable database for cable <cablenumber>. */ /* Error reading cs to es3 cable database for cable <cablenumber> .*/ /* Error reading matrix cable output database for cable <cablenumber>. */ /* Error reading eoc to io cable database for cable <cablenumber>. */
SNVS	Status, Not in Valid State /* FROM AID not as provisioned. */ /* TO AID not as provisioned. */ /* FROM AID must be in a provisioned or maintenance state. */ /* TO AID must be in a provisioned or maintenance state. */

SROF Status, Requested Operation Failed

- /* FROM AID to string error <errnum>. */
- /* FROM TPid to T3 TPid conversion error <errnum>. */
- /* FROM TPid to Tbss conversion error <errnum>. */
- /* Invalid or unsupported card type, <card type>, encountered for <AID>. */
- /* TO TPid to T3 TPid conversion error <errnum>. */
- /* TO TPid to Tbss conversion error <errnum>. */
- /* TO AID to string error <errnum>. */
- /* Unable to convert the FROM TP type to a string error <errnum>. */
- /* Unable to convert the TO TP type to a string error <errnum>. */
- /*Unable to determine first stage card type for bay <bay number> shelf <shelf number>
slot <slot number>.*/*
- /*Unable to determine center stage card type for bay <bay number> shelf <shelf number>
slot <slot number>.*/*
- /*Unable to determine third stage card type for bay <bay number> shelf <shelf number>
slot <slot number>.*/*
- /* Invalid matrix interface (<matrix interface type number>) encountered for <AID>. */
- /* Unable to compute matrix input cable number for <AID>. */
- /* Invalid SI protect board type (<card type>) for bay <bay number> shelf <shelf number>
slot <slot number>.*/*
- /* Unable to get TP type and TP number for I/O equipment (<equipment id>). */

EXAMPLES

In the following example, the internal system path from DS3 port T3-961 to DS3 port T3-1000 is retrieved. The example shown assumes there is no cross-connection between the two DS3 ports.

```
RTRV-PATH-T3::T3-961,T3-1000;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P49525. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P49525 COMPLD
/* FROM T3: T3-961,PATH=0 */
/* COPY 0: EP3-6-1-2 COPY 1: EP3-6-1-2 */
/* COPY 0: IPB-6-1-1 COPY 1: IPB-6-1-2 */
/* COPY 0: CBL-6-1-XA150F COPY 1: CBL-6-1-XA250H */
/* COPY 0: CBL-5-3-UX031B COPY 1: CBL-4-3-UX031B */
/* COPY 0: M16-5-3-1 COPY 1: M16-4-3-1 */
/* COPY 0: No connection. COPY 1: No connection. */
/* COPY 0: M16-5-3-5 COPY 1: M16-4-3-5 */
/* COPY 0: CBL-5-3-UX101E COPY 1: CBL-4-3-UX101E */
/* COPY 0: CBL-6-1-XA150E COPY 1: CBL-6-1-XA250C */
/* COPY 0: IPB-6-1-1 COPY 1: IPB-6-1-2 */
/* COPY 0: EP3-6-1-16 COPY 1: EP3-6-1-16 */
/* TO T3: T3-1000,PATH=0 */
/* RTRV-PATH-T3::T3-961,T3-1000 [P49525] (3-2) */
```

;

In the following example, the internal system path from DS3 port T3-981 to DS3 port T3-1548 is retrieved. The example shown assumes that there is a cross-connection between the two DS3 ports.

```
RTRV-PATH-T3::T3-981,T3-1548;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P49552. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-PATH-VT1**
COMMAND NAME: **RETRIEVE CONNECTION PATH VT1**

PURPOSE

The RTRV-PATH-VT1 command retrieves the redundant internal paths of the specified pair of VT1.5 ports through the system. The command is executed regardless of the provisioning or cross-connection status of the specified ports.

The redundant internal paths through the system that are reported are the paths from the specified FROM VT1.5 AID to the specified TO VT1.5 AID. RTRV-PATH-VT1 does not report on the paths through the system from the specified TO VT1.5 AID to the specified FROM VT1.5 AID.

The successful response to a RTRV-PATH-VT1 command contains several lines of non-parsable output data, with each line of output identifying an element of the copy 0 and copy 1 data paths through the system. Refer to the Successful Response Format, below.

If a cross-connection does not exist between the specified FROM and TO ports, the center-stage cable identifiers and center-stage circuit packs can not be determined and are therefore not reported. In this case, a line of output indicates that no cross-connection exists for the specified ports.

A RTRV-PATH-VT1 command is denied if:

- Either the AID specified by FROM or TO is not provisioned or is not in OOS-AUMA, UAS, MT state
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PATH-VT1 : [TID] : FROM, TO : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
FROM	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID, specifies the FROM VT1.5 port.
TO	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) Default: Entry Required Addressing: None Description: VT1 AID, specifies the TO VT1.5 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

{No connection.}
{Path not found.}

```

Equipment AID, identifies the equipment and cable entities that form the internal system path from the FROM VT1.5 port to the TO VT1.5 port. Non-AID values are:

No connection. The value {No connection.} is displayed in place of the center-stage circuit pack AID if a connection does not exist between the specified FROM and TO ports.

Path not found. The value {Path not found.} is displayed in place of the center-stage circuit pack AID if a connection in the cross-connection

database does not exist in the matrix hardware. (This may be due to a hardware failure or slowed system performance under heavy load conditions. Consequently, the RTRV-PATH-VT1 should be executed again if this value is returned in the output response.)

TO VT1_AID:
 {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)
 {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)
 {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}
 (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)
VT1 AID, identifies the TO VT1.5 port.

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Both FROM and TO facility must be VT1 AID. */
IIAC	Input, Invalid ACcess identifier /* Invalid FROM AID entered. */ /* Invalid TO AID entered. */
SDBE	Status, internal Data Base Error /* Failed to get FROM TP DB record <TP record number> error <errnum>. */ /* Failed to get TO TP DB record <TP record number> error <errnum>. */ /* Error reading <AID> database record. */ /* Error reading <AID type> id:<parent ipu> database record */ /* Failed to read EM DB for shelf equipment (<shelf id>), status=<errnum>. */ /* Failed to get OC3 TP DB record <TP record number> error <errnum>. */ /* Error reading matrix cable input database for bay <bay number> shelf <shelf number> */ /* Error reading eoc to es1 cable database for cable <cable num>. */ /* TPid to first stage Tmsl conversion error <errnum>. */ /* TPid to third stage Tmsl conversion error <errnum>. */ /* Unable to get connection pointer for TP type <tp type>, TP num <tp record number>, error <errnum>. */ /* Tmsl Path Retrieve error <errnum>. */ /* Error reading es1 to cs cable database for cable <cable number>. */ /* Error reading cs to es3 cable database for cable <cable number> .*/ /* Error reading matrix cable output database for cable <cable number>. */ /* Error reading eoc to io cable database for cable <cable number>. */
SNVS	Status, Not in Valid State /* FROM AID not as provisioned. */ /* TO AID not as provisioned. */ /* FROM AID must be in a provisioned or maintenance state. */ /* TO AID must be in a provisioned or maintenance state. */

SROF Status, Requested Operation Failed

```

/* FROM AID to string error <errnum>. */
/*FROM TPid to T1 TPid conversion error <errnum>.*/
/*FROM TPid to VT1 TPid conversion error <errnum>.*/
/* FROM TPid to Tbss conversion error <errnum>. */
/* FROM Physical TPid to Tbss conversion error <errnum>. */
/* Invalid or unsupported card type, <card type>, encountered for <AID>. */
/* Invalid physical TP type <tp type> encountered for <AID>. */
/* TO TPid to Tbss conversion error <errnum>. */
/* TO Physical to Tbss conversion error <errnum>. */
/* TO AID to string error <errnum>. */
/* Unable to convert the FROM TP type to a string error <errnum>. */
/* Unable to convert the TO TP type to a string error <errnum>. */
/*Unable to determine first stage card type for bay <bay number> shelf <shelf number>
slot <slot number>.*/
/*Unable to determine center stage card type for bay <bay number> shelf <shelf number>
slot <slot number>.*/
/*Unable to determine third stage card type for bay <bay number> shelf <shelf number>
slot <slot number>.*/
/* Invalid matrix interface (<matrix interface type number>) encountered for <AID>. */
/* Unable to compute matrix input cable number for <AID>. */
/* Invalid SI protect board type (<card type>) for bay <bay number> shelf <shelf number>
slot <slot number>. */
/* Unable to get physical termination point identifier for <AID>. */
/* Unable to get TP type and TP number for I/O equipment (<equipment id>). */

```

EXAMPLES

In the following example, the internal system path from VT1.5 port EC1VT1-195-1-2 to VT1.5 port EC1VT1-217-2-2 is retrieved. The example shown assumes there is no cross-connection between the two VT1.5 ports.

```
RTRV-PATH-VT1: : EC1VT1-195-1-2, EC1VT1-217-2-2;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
/* FROM VT1: EC1VT1-195-1-2 */
/* COPY 0: EP3-8-1-2 COPY 1: EP3-8-1-2 */

COMMAND CODE: **RTRV-PFO**
COMMAND NAME: **RETRIEVE PREMIUM FEATURE OPTION**

PURPOSE

The RTRV-PFO command provides a list of the available Premium Feature Options (PFOs) by Alcatel part number, along with the associated PFO Administrative and Operational state.

The successful response to a RTRV-PFO command contains a line of parsable output data in ascending order by PFO part number, for each PFO being reported. No parsable output data is provided if no PFOs exist in the system.

A RTRV-PFO command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PFO: [TID] : : [CTAG] : : [IPNEXT] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
IPNEXT	{N, Y} Default: {N} Addressing: None Description: Include Part Number Extension, specifies whether any part number extensions are included in the output response message. Values are: N No, Alcatel part number extensions are not included in the output. Y Yes, Alcatel part number extensions are included in the output.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [" :<PRTNUM> [<PNEXT>] , <ADMSTATE> , <OPRSTATE>" ]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

PRTNUM	{<NAANNNNNAA>, <NNNNNNNNNN>} Alcatel Part Number for the Premium Feature Option. Values for PRTNUM are 10 ASCII characters in length, consisting of either all numerical (N) characters or a combination of numerical (N) and upper-case alphabetic (A) characters. A ASCII upper-case Alphabetic character (A-Z). N ASCII Numerical character (0-9).
--------	--

PNEXT	{<AANN>, <AA**>, <**NN>, <****>}
	Alcatel Part Number Extension for the associated PRTNUM. A value for PNEXT is only returned if IPNEXT of Y is entered in the command. Note that no additional characters are in an output line between the PRTNUM and PNEXT values (PRTNUM and PNEXT are concatenated together in an extended form part number). Values for PNEXT are 4 ASCII characters consisting of either
	. Two upper-case alphabetic (A) and two numerical (N) characters, or
	. Two upper-case alphabetic (A) and two asterisk (*) characters, or
	. Two asterisk (*) and two numerical (N) characters, or
	. Four asterisk (*) characters.
	A ASCII upper-case Alphabetic character (A–Z).
	N ASCII Numerical character (0–9).
	* ASCII asterisk character (*).
ADMSTATE	{ALLOWED, INHIBITED}
	PFO Administrative State, indicates the currently configured state of the PFO. Values are:
	ALLOWED Allowed, the indicated PFO is enabled.
	INHIBITED Inhibited, the indicated PFO is disabled.
OPRSTATE	{OFF, ON}
	PFO Operational State, indicates the current operating state of the PFO. Values are:
	ON On, the indicated PFO is operational and active.
	OFF Off, the indicated PFO is inactive. (An additional operation is necessary, e.g., an INIT–SYS command, if the value for ADMSTATE is ALLOWED.)

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

SDBE Status, internal Data Base Error

EXAMPLES

In the following example, the state of all Premium Feature Options are retrieved.

```
RTRV-PFO;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P27011. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-PM-EC1**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING EC1**

PURPOSE

The RTRV-PM-EC1 command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified EC1 port(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMMODE-EC1 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-EC1) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-EC1 command contains the following lines of parsable output data for each EC1 AID specified, in ascending order by EC1 AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying any existing alarms and the current state of the EC1,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the port is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).

A RTRV-PM-EC1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-EC1 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}
	NEAR_END_PARAMETERS:{CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, LOSS, LOSS-S, SEFS, SEFS-S, SES-L, SESL, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, ES-L, ESL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM data is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
	ALL All monitored parameter PM registers.
	AISS, AISS-L, AISSL Alarm Indication Signal Seconds – Line, AISS register. (Far-end only.)
	CV-L, CVL Coding Violations – Line, CV-L register. (Near-end only.)
	ES-L, ESL Errored Seconds – Line, ES-L register.
	ESA-L, ESAL Errored Seconds type A – Line, ESA-L register. (Near-end only.)
	ESB-L, ESBL Errored Seconds type B – Line, ESB-L register. (Near-end only.)
	FC-L, FCL Failure Counts – Line, FC-L register. (Far-end only.)
	LOSS, LOSS-S Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
	SEFS, SEFS-S Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
	SES-L, SESL Severely Errored Seconds – Line, SES-L register.
	UAS-L, UASL Unavailable Seconds – Line, UAS-L register.
Restrictions:	RTRV-PM-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
MONLEV	{LEVEL-DIRECTION:{0-4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} }
	Default: {1-UP}
Addressing:	None
Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0-4294967295} – DN <LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.
	{0-4294967295} – DNORNCMPL <LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.
	{0-4294967295} – UP <LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.
	{0-4294967295} – UPORNCMPL <LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.

LOCN	{FEND, NEND}	
	Default:	< All applicable locations for the selected monitored parameters >
	Addressing:	None
	Description:	Location, specifies whether PM registers for near-end or far-end PM monitoring are to be retrieved. Values are:
	FEND	Far-End
DIRN	NEND	Near-End
	Restrictions:	RTRV-PM-EC1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of NEND is entered).
	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
TMPER	Addressing:	None
	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-PM-EC1 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
MONDAT	{15-MIN, 1-DAY, BOTH}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register
	BOTH	Both 15-Minute and 1-Day PM collection registers
	Restrictions:	RTRV-PM-EC1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
		RTRV-PM-EC1 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.
		RTRV-PM-EC1 is denied if TMPER of 1-DAY and NUM15MIN of {1-32, ALL} (i.e., any value) is entered.
		RTRV-PM-EC1 is denied if TMPER of 15-MIN and NUM1DAY of {1-7, ALL} (i.e., any value) is entered.
	{MONTH-DAY:{01-12} – {01-31} }	
	Default:	< Current date >
	Addressing:	None
	Description:	Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
	Restrictions:	RTRV-PM-EC1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
		RTRV-PM-EC1 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.

MONTM	{ HOUR – MINUTE :{00–23} – {00–59} }
	Default: < Current time > Addressing: None Description: Monitor Time, if TMPER of {15–MIN, BOTH} is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TMPER of 1–DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is < HOUR_OF_DAY > – < MINUTE_OF_HOUR >, where: < HOUR_OF_DAY > is in 24 hour time. < MINUTE_OF_HOUR > set to {0–14} specifies the first 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {15–29} specifies the second 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {30–44} specifies the third 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {45–59} specifies the fourth 15–minute period within the < HOUR_OF_DAY > value. Restrictions: RTRV–PM–EC1 is denied if TMPER of 15–MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
NUM15MIN	{1–32, ALL, <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 15–Minute Historical Registers, specifies the number of 15–Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM . Values are: 1–32 1–32 additional historical 15–Minute PM data registers. ALL All additional historical 15–Minute PM data registers. <NoVal> No Value, no additional historical 15–Minute PM data registers. Restrictions: RTRV–PM–EC1 is denied if NUM15MIN of {1–32, ALL} (i.e., any value) and TMPER of 1–DAY is entered.
NUM1DAY	{1–7, ALL, <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 1–Day Historical Registers, specifies the number of 1–Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM . Values are: 1–7 1–7 additional historical 1–Day PM data registers. ALL All additional historical 1–Day PM data registers. <NoVal> No Value, no additional historical 1–Day PM data registers. Restrictions: RTRV–PM–EC1 is denied if NUM1DAY of {1–7, ALL} (i.e., any value) and TMPER of 15–MIN is entered.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
[ "<AID>, EC1 : [<NENDALM>] , [<FENDALM>] , <PST>, <SST>" ]

<MONDAT>, <MONTM>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

Note: The first line of parsable output is provided only when a value for NUM15MIN is entered. The second line of parsable output is provided for each PM data register reported.

OUTPUT PARAMETERS

AID	<p>EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) EC1 AID, identifies the EC1 port.</p>
FENDALM	<p>{RFI} Far End EC1 Alarm Condition, identifies any far-end EC1 alarm conditions that exist on the EC1. A FENDALM value is only reported if a FENDALM condition exists. Value is: RFI Remote Failure Indication detected</p>
NENDALM	<p>{AIS, LOF, LOS} Near End EC1 Alarm Condition, identifies any near-end EC1 alarm conditions that exist on the EC1. A NENDALM value is reported only if a NENDALM condition exists. Values are: AIS Alarm Indication Signal, AIS detected LOF Loss Of Frame detected LOS Loss Of Signal detected</p>
PST	<p>{IS, OOS-AU, OOS-AUMA, OOS-MA} Primary State, indicates the current primary state of the EC1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: IS In Service OOS-AU Out Of Service-Autonomous OOS-AUMA Out Of Service-Autonomous and Management OOS-MA Out Of Service-Management</p>
SST	<p>{DSBLD, FAF, LPBK, MT, UAS, AINS} Secondary State, indicates any secondary states associated with the EC1. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the EC1 at the time of the RTRV-PM-EC1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: AINS The EC1 is under Automatic IN-Service state. DSBLD Disabled FAF Facility failure LPBK Loopback MT Maintenance PMI Performance Monitoring Inhibited UAS Unassigned</p>
MONTYPE	<p>NEAR_END_PARAMETERS:{CVL, ESL, ESA-L, ESB-L, LOSS, SEFS, SESL, UASL}, FAR_END_PARAMETERS:{AISS, ESL, FC-L, SESL, UASL} Monitored Parameter Type, identifies the monitored parameter. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are: AISS Alarm Indication Signal Seconds – Line, AISS register. CVL Coding Violations – Line, CV-L register. ESL Errored Seconds – Line, ES-L register. ESA-L Errored Seconds type A – Line, ESA-L register. ESB-L Errored Seconds type B – Line, ESB-L register. FC-L Failure Counts – Line, FC-L register. LOSS Loss Of Signal Seconds – Section, LOSS register. SEFS Severely Errored Frame Seconds – Section, SEFS-S register. SESL Severely Errored Seconds – Line, SES-L register. UASL Unavailable Seconds – Line, UAS-L register.</p>

MONVAL	{0–4294967295, NA} Monitored Parameter Value, indicates the measured value of the indicated MONTYPE being reported. Values are: 0–4294967295 Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}. NA Not Available, value reported if VLDTY is {NA}.
VLDTY	{ADJ, COMPL, LONG, NA, OFF, PRTL} Validity, indicates whether the PM data being retrieved for the specified time period was accumulated over the entire time period or some portion thereof. Values are: ADJ Adjusted, the data was manually adjusted or initialized (via INIT–REG–EC1). COMPL Complete, the data was accumulated over the entire time period. LONG Longer, the data was accumulated over a greater period of time than the indicated time period. NA Not Available, the data is not available. OFF Off, PM data collection for the entire time period was disabled (via SET–PMMODE–EC1). PRTL Partial, the data was accumulated over some portion of the time period, but not the entire time period.
LOCN	{FEND, NEND} Location, indicates whether a near–end or far–end monitored parameter is being reported. Values are: FEND Far–End NEND Near–End
DIRN	{NA, RCV} Direction, identifies the direction of the signal being monitored. Values are: NA Not Applicable, value reported for LOCN value of FEND. RCV Receive side, value reported for LOCN value of NEND.
TMPER	{15–MIN, 1–DAY} Time Period, identifies the accumulation time period for the indicated monitored parameter. Values are: 15–MIN 15–Minute PM collection period 1–DAY 1–Day (24 hour) PM collection period
MONDAT	{MONTH–DAY:{01–12} – {01–31} } Monitor Date, identifies the date when the PM collection period began. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
MONTM	{HOUR–MINUTE:{00–23} – {00–59} } Monitor Time, identifies the time of day when the PM collection period began. The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Value for num15min is not consistent with value for time period */ /* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monlev in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid date in request message. */ /* Invalid num15min value in request message. */ /* Invalid num1day value in request message. */ /* Invalid day for the requested month. */ /* Invalid time in request message. */ /* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Error in reading TP database record. */
SROF	Status, Requested Operation Failed /* Timeout waiting for response from <AID>. */ /* Invalid time period is detected, TMPER = <TIME PERIOD>. */ /* Unable to determine the global TP number, TPTYPE=<TP TYPE>, TPNum=<TP NUMBER>. */ /* Unable to allocate memory for user data. */ /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Unable to determine the history file name, TPTYPE=<TP TYPE>, TMPER=<TIME PERIOD>, FileIdx=<FILE INDEX>. */ /* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */ /* Failed to retrieve PM historical data. */ /* Unable to determine supporting facility entity. */ /* Error occurred while provisioning equipment. */ /* Unexpected response message received from <CARDNAME>. */ /* Failed to convert tp num to AID string. */ /* Unable to determine facility type. */ /* Unable to determine alarms. */ /* Failed to get PST and SST State. */

EXAMPLES

In the following example, the 1-Day historical PM data that was accumulated for EC1 port EC1-57 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-EC1::EC1-57:::ALL,12-UP,,1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"EC1-57,EC1:CVL,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"
"EC1-57,EC1:ESL,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"
/* RTRV-PM-EC1::EC1-57:::ALL,12-UP,,1-DAY,1-15 [P71042] (1) */
;
```

In the following example, the current far-end 15-Minute AIS seconds (AISS) PM data for EC1 port EC1-97 is retrieved.

```
RTRV-PM-EC1::EC1-97:::AISS;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
"EC1-97,EC1:AISS,1,PRTL,FEND,RCV,15-MIN,01-18,10-30"
/* RTRV-PM-EC1::EC1-97:::AISS [P71048] (2) */
;
```

In the following example, the 15-minute historical near-end errored seconds, line (ES-L) PM data that was accumulated for EC1 port EC1-383 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-EC1::EC1-383:::ES-L,0-UP,NEND,,15-MIN,01-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
"EC1-383,EC1:ESL,0,CMPL,NEND,RCV,15-MIN,01-18,08-15"
/* RTRV-PM-EC1::EC1-383:::ES-L,0-UP,NEND,,15-MIN,1-18,8-20
[P71049] (2) */
;
```

COMMAND CODE: RTRV-PM-F3
COMMAND NAME: RETRIEVE PERFORMANCE
MONITORING F3

PURPOSE

The RTRV-PM-F3 command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified Fractional-T3(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMMODE-F3 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-F3) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-F3 command contains the following lines of parsable output data for each provisioned Fractional-T3 AID specified, in ascending order by Fractional-T3 AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying the current state of the Fractional-T3,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the F3 is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).

A RTRV-PM-F3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-F3 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the Fractional-T3.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL, CV–N, CVN, ES–N, ESN, ESA–N, ESAN, ESB–N, ESBN, FC–N, FCN, SAS–N, SASN, SES–N, SESN, UAS–N, UASN}	
	Default:	{ALL}
	Addressing:	None
	Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM data is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (–). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
	ALL	All monitored parameter PM registers.
	CV–N, CVN	Coding Violations – N, CV–N register contains a summary of CV–P counts for all DS1s assigned to the F3.
	ES–N, ESN	Errored Seconds – N, ES–N register contains a summary of ES–P counts for all DS1s assigned to the F3.
	ESA–N, ESAN	Errored Seconds type A – N, ESA–N register contains a summary of ESA–P counts for all DS1s assigned to the F3.
	ESB–N, ESBN	Errored Seconds type B – N, ESB–N register contains a summary of ESB–P counts for all DS1s assigned to the F3.
	FC–N, FCN	Failure Count – N, FC–N register contains a summary of FC–P counts for all DS1s assigned to the F3.
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} }	
	Default:	{1–UP}
	Addressing:	None
	Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295} – DN	<LEVEL> – Down, Only PM data for the specified MONTYPE that is less–than or equal–to (<) the value of <LEVEL> is reported.
	{0–4294967295} – DNORNCMPL	<LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.
	{0–4294967295} – UP	<LEVEL> – Up, Only PM data for the specified MONTYPE that is greater–than or equal–to (>) the value of <LEVEL> is reported.
	{0–4294967295} – UPORNCMPL	<LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.

LOCN	{NEND} Default: <All applicable locations for the selected monitored parameters> Addressing: None Description: Location, specifies PM registers for near-end PM monitoring are to be retrieved. Value is: NEND Near-End
DIRN	{NA, RCV, TRMT} Default: < All applicable directions > Addressing: None Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-PM-F3 command. NA Not Applicable RCV Receive side TRMT Transmit direction
TMPER	{15-MIN, 1-DAY, BOTH} Default: {15-MIN} Addressing: None Description: Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are: 15-MIN 15-Minute PM collection register. 1-DAY 1-Day (24 hour) PM collection register. BOTH Both 15-Minute and 1-Day PM collection registers Restrictions: RTRV-PM-F3 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-F3 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time. RTRV-PM-F3 is denied if TMPER of 1-DAY and NUM15MIN of {1-32, ALL} (i.e., any value) is entered. RTRV-PM-F3 is denied if TMPER of 15-MIN and NUM1DAY of {1-7, ALL} (i.e., any value) is entered.
MONDAT	{MONTH-DAY:{01-12} – {01-31}} Default: < Current date > Addressing: None Description: Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>. Restrictions: RTRV-PM-F3 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-F3 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.

MONTM	{ HOUR – MINUTE :{00–23} – {00–59} }
	Default: < Current time > Addressing: None Description: Monitor Time. If TMPER of {15–MIN, BOTH} is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TMPER of 1–DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is < HOUR_OF_DAY > – < MINUTE_OF_HOUR >, where: < HOUR_OF_DAY > is in 24 hour time. < MINUTE_OF_HOUR > set to {0–14} specifies the first 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {15–29} specifies the second 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {30–44} specifies the third 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {45–59} specifies the fourth 15–minute period within the < HOUR_OF_DAY > value. Restrictions: RTRV–PM–F3 is denied if TMPER of 15–MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
NUM15MIN	{1–32, ALL, <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 15–Minute Historical Registers, specifies the number of 15–Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM . Values are: 1–32 1–32 additional historical 15–Minute PM data registers. ALL All additional historical 15–Minute PM data registers. <NoVal> No Value, no additional historical 15–Minute PM data registers. Restrictions: RTRV–PM–F3 is denied if NUM15MIN of {1–32, ALL} (i.e., any value) and TMPER of 1–DAY is entered.
NUM1DAY	{1–7, ALL, <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 1–Day Historical Registers, specifies the number of 1–Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM . Values are: 1–7 1–7 additional historical 1–Day PM data registers. ALL All additional historical 1–Day PM data registers. <NoVal> No Value, no additional historical 1–Day PM data registers. Restrictions: RTRV–PM–F3 is denied if NUM1DAY of {1–7, ALL} (i.e., any value) and TMPER of 15–MIN is entered.

UASN	Unavailable Seconds - N, UAS-N register contains a summary of UAS-P counts for all DS1s assigned to the F3.
CVN	Coding Violations - N, CV-N register contains a summary of CV-P counts for all DS1s assigned to the F3.																
ESN	Errored Seconds - N, ES-N register contains a summary of ES-P counts for all DS1s assigned to the F3.																
ESA-N	Errored Seconds type A - N, ESA-N register contains a summary of ESA-P counts for all DS1s assigned to the F3.																
ESB-N	Errored Seconds type B - N, ESB-N register contains a summary of ESB-P counts for all DS1s assigned to the F3.																
FC-N	Failure Count - N, FC-N register contains a summary of FC-P counts for all DS1s assigned to the F3.																
SAS-N	Severe AIS Seconds - N, SAS-N register contains a summary of SAS-P counts for all DS1s assigned to the F3.																
SESN	Severely Errored Seconds - N, SES-N register contains a summary of SES-P counts for all DS1s assigned to the F3.																
UASN	Unavailable Seconds - N, UAS-N register contains a summary of UAS-P counts for all DS1s assigned to the F3.																
MONVAL	<p>{0-4294967295, NA}</p> <p>Monitored Parameter Value, indicates the measured value of the indicated MONTYPE being reported. Values are:</p> <table> <tr> <td>0-4294967295</td><td>Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}.</td></tr> <tr> <td>NA</td><td>Not Available, value reported if VLDTY is {NA}.</td></tr> </table>	0-4294967295	Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}.	NA	Not Available, value reported if VLDTY is {NA}.												
0-4294967295	Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}.																
NA	Not Available, value reported if VLDTY is {NA}.																

VLDTY	{ADJ, COMPL, LONG, NA, OFF, PRTL} Validity, indicates whether the PM data being retrieved for the specified time period was accumulated over the entire time period or some portion thereof. Values are: ADJ Adjusted, the data was manually adjusted or initialized (via INIT-REG-F3). COMPL Complete, the data was accumulated over the entire time period. LONG Longer, the data was accumulated over a greater period of time than the indicated time period. NA Not Available, the data is not available. OFF Off, PM data collection for the entire time period was disabled (via SET-PMMODE-F3). PRTL Partial, the data was accumulated over some portion of the time period, but not the entire time period.
LOCN	{NEND} Location, indicates a near-end monitored parameter is being reported. Value is: NEND Near-End
DIRN	{RCV} Direction, identifies the direction of the signal being monitored. Value is: RCV Receive side, value reported for LOCN value of NEND.
TMPER	{15-MIN, 1-DAY} Time Period, identifies the accumulation time period for the indicated monitored parameter. Values are: 15-MIN 15-Minute PM collection period 1-DAY 1-Day (24 hour) PM collection period
MONDAT	{MONTH-DAY:{01-12} - {01-31} } Monitor Date, identifies the date when the PM collection period began. The format of MONDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
MONTM	{HOUR-MINUTE:{00-23} - {00-59} } Monitor Time, identifies the time of day when the PM collection period began. The format of MONTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR>.
NUMT1S	{0-7} Number of DS1s, identifies the number of DS1s assigned to the indicated F3 at the end of the PM collection period.
NT1CHG	{Y, <NoVal>} Number of DS1s Changed, indicates the number of DS1s assigned to the indicated F3 changed during the PM collection period. Values are: Y Yes, the number of DS1s assigned to the indicated F3 changed during the PM collection period. <NoVal> No Value (unpopulated) is displayed in the output if the number of DS1s assigned to the indicated F3 did not change during the PM collection period.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Value for num15min is not consistent with value for time period */ /* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monlev in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid date in request message. */ /* Invalid num15min value in request message. */ /* Invalid num1day value in request message. */ /* Invalid day for the requested month. */ /* Invalid time in request message. */ /* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Error in reading TP database record. */
SROF	Status, Requested Operation Failed /* Timeout waiting for response from <AID>. */ /* Invalid time period is detected, TMPER = <TIME PERIOD>. */ /* Unable to determine the global TP number, TPTYPE=<TP TYPE>, TPNum=<TP NUMBER>. */ /* Unable to allocate memory for user data. */ /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Unable to determine the history file name, TPType=<TP TYPE>, TMPER=<TIME PERIOD>, FileIdx=<FILE INDEX>. */ /* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */ /* Failed to retrieve PM historical data. */ /* Unable to determine supporting facility entity. */ /* Error occurred while provisioning equipment. */ /* Unexpected response message received from <CARDNAME>. */

EXAMPLES

In the following example, the 1-Day historical PM data that was accumulated for Fractional-T3 T3F3-1012-15 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-F3::T3F3-1012-15:::ALL,12-UP,,1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"T3F3-1012-15,F3:CVN,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"
"T3F3-1012-15,F3:FC-N,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"
/* RTRV-PM-F3::T3F3-1012-15:::ALL,12-UP,,1-DAY,1-15 [P71042] (1) */
;
```

In the following example, the 15-minute historical errored seconds (ES-N) PM data that was accumulated for Fractional-T3 T3F3-1343-2 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-F3::T3F3-1343-2:::ES-N,0-UP,,15-MIN,1-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
"T3F3-1343-2,F3:ESN,5,CMPL,NEND,RCV,15-MIN,01-18,08-15"
/* RTRV-PM-F3::T3F3-1343-2:::ES-P,0-UP,,15-MIN,1-18,8-20 [P71049] (2) */
;
```

COMMAND CODE: **RTRV-PM-OC12**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING OC-12**

PURPOSE

The RTRV-PM-OC12 command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified OC-12 port(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMODE-OC12 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-OC12) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-OC12 command contains the following lines of parsable output data for each provisioned OC12 AID specified, in ascending order by OC12 AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying any existing alarms and the current state of the OC-12,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the port is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).

A RTRV-PM-OC12 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-OC12 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies the OC-12 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM data is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-S, ESS	Errored Seconds – Section, ES-S register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register.
ESA-S, ESAS	Errored Seconds type A – Section, ESA-S register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register.
ESB-S, ESBS	Errored Seconds type B – Section, ESB-S register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register.
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
PSC, PSC-L, PSCL	Protection Switch Counts – Line, PSC-L register. (Near-end only.)
PSD, PSD-L, PSDL	Protection Switch Duration – Line, PSD-L register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	RTRV-PM-OC12 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

MONLEV	<p>{LEVEL–DIRECTION:{0–4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} }</p> <p>Default: {1–UP}</p> <p>Addressing: None</p> <p>Description: Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:</p> <p>{0–4294967295} – DN <LEVEL> – Down, Only PM data for the specified MONTYPE that is less–than or equal–to (<) the value of <LEVEL> is reported.</p> <p>{0–4294967295} – DNORNCMPL <LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</p> <p>{0–4294967295} – UP <LEVEL> – Up, Only PM data for the specified MONTYPE that is greater–than or equal–to (>) the value of <LEVEL> is reported.</p> <p>{0–4294967295} – UPORNCMPL <LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</p>						
LOCN	<p>{FEND, NEND}</p> <p>Default: < All applicable locations for the selected monitored parameters ></p> <p>Addressing: None</p> <p>Description: Location, specifies whether PM registers for near–end or far–end PM monitoring are to be retrieved. Values are:</p> <table data-bbox="493 1089 805 1152"> <tr> <td>FEND</td><td>Far–End</td></tr> <tr> <td>NEND</td><td>Near–End</td></tr> </table> <p>Restrictions: RTRV–PM–OC12 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV–S and LOCN of FEND is entered).</p>	FEND	Far–End	NEND	Near–End		
FEND	Far–End						
NEND	Near–End						
DIRN	<p>{NA, RCV, TRMT}</p> <p>Default: < All applicable directions ></p> <p>Addressing: None</p> <p>Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV–PM–OC12 command.</p> <table data-bbox="493 1467 894 1551"> <tr> <td>NA</td><td>Not Applicable</td></tr> <tr> <td>RCV</td><td>Receive side</td></tr> <tr> <td>TRMT</td><td>Transmit direction</td></tr> </table>	NA	Not Applicable	RCV	Receive side	TRMT	Transmit direction
NA	Not Applicable						
RCV	Receive side						
TRMT	Transmit direction						

TMPER	{15-MIN, 1-DAY, BOTH}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	<div> <div>15-MIN</div> <div>15-Minute PM collection register</div> </div> <div> <div>1-DAY</div> <div>1-Day (24 hour) PM collection register</div> </div> <div> <div>BOTH</div> <div>Both 15-Minute and 1-Day PM collection registers</div> </div>
MONDAT	Restrictions: RTRV-PM-OC12 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
	RTRV-PM-OC12 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.
	RTRV-PM-OC12 is denied if TMPER of 1-DAY and NUM15MIN of {1-32, ALL} (i.e., any value) is entered.
	RTRV-PM-OC12 is denied if TMPER of 15-MIN and NUM1DAY of {1-7, ALL} (i.e., any value) is entered.
MONDAT	{MONTH-DAY:{01-12} – {01-31} }
	Default: < Current date >
	Addressing: None
	Description: Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
Restrictions:	RTRV-PM-OC12 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
	RTRV-PM-OC12 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.
MONTM	{HOUR-MINUTE:{00-23} – {00-59} }
	Default: < Current time >
	Addressing: None
	Description: Monitor Time, if TMPER of {15-MIN, BOTH} is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TMPER of 1-DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>, where:
Restrictions:	<HOUR_OF_DAY> is in 24 hour time.
	<MINUTE_OF_HOUR> set to {0-14} specifies the first 15-minute period within the <HOUR_OF_DAY> value.
	<MINUTE_OF_HOUR> set to {15-29} specifies the second 15-minute period within the <HOUR_OF_DAY> value.
	<MINUTE_OF_HOUR> set to {30-44} specifies the third 15-minute period within the <HOUR_OF_DAY> value.
	<MINUTE_OF_HOUR> set to {45-59} specifies the fourth 15-minute period within the <HOUR_OF_DAY> value.
Restrictions:	RTRV-PM-OC12 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.

NUM15MIN	{1–32, ALL, <NoVal> Default: <NoVal> Addressing: None Description: Number of 15–Minute Historical Registers, specifies the number of 15–Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are: 1–32 1–32 additional historical 15–Minute PM data registers. ALL All additional historical 15–Minute PM data registers. <NoVal> No Value, no additional historical 15–Minute PM data registers. Restrictions: RTRV–PM–OC12 is denied if NUM15MIN of {1–32, ALL} (i.e., any value) and TMPER of 1–DAY is entered.
NUM1DAY	{1–7, ALL, <NoVal> Default: <NoVal> Addressing: None Description: Number of 1–Day Historical Registers, specifies the number of 1–Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are: 1–7 1–7 additional historical 1–Day PM data registers. ALL All additional historical 1–Day PM data registers. <NoVal> No Value, no additional historical 1–Day PM data registers. Restrictions: RTRV–PM–OC12 is denied if NUM1DAY of {1–7, ALL} (i.e., any value) and TMPER of 15–MIN is entered.

["<AID>,OC12:[<NENDALM>],[<FENDALM>],<PST>,<SST>"]
"<AID>,OC12:<MONTYPE>,<MONVAL>,<VLDTY>,<LOCN>,<DIRN>,<TMPER>,<MONDAT>,<MONTM>"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

Note: The first line of parsable output is provided only when a value for NUM15MIN is entered. The second line of parsable output is provided for each PM data register reported.

OUTPUT PARAMETERS

AID	OC12_AID: {OC12–{1–560}} OC12 AID, identifies the OC–12 port.	(OC12–OC12#)
FENDALM	{RFI} Far End OC–12 Alarm Condition, identifies any far–end OC–12 alarm conditions that exist on the OC–12. A FENDALM value is only reported if a FENDALM condition exists. Value is: RFI Remote Failure Indication detected	
NENDALM	{AIS, LOF, LOS} Near End OC–12 Alarm Condition, identifies any near–end OC–12 alarm conditions that exist on the OC–12. A NENDALM value is reported only if a NENDALM condition exists. Values are: AIS Alarm Indication Signal, AIS detected LOF Loss Of Frame detected LOS Loss Of Signal detected	

PST	{IS, OOS–AU, OOS–AUMA, OOS–MA}
	Primary State, indicates the current primary state of the OC–12. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:
	IS In Service
	OOS–AU Out Of Service–Autonomous
	OOS–AUMA Out Of Service–Autonomous and Management
	OOS–MA Out Of Service–Management
SST	{AINS, DSBLD, FAF, LPBK, MT, PMI, PSI, STBYH, UAS, WRK}
	Secondary State, indicates any secondary states associated with the OC–12. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the OC–12 at the time of the RTRV–PM–OC12. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:
	AINS The OC–12 is under Automatic IN–Service state.
	DSBLD Disabled
	FAF Facility failure
	LPBK Loopback
	MT Maintenance
	PMI Performance Monitoring Inhibited
	PSI Protection Switching Inhibited
	STBYH If set on Working line, the working line is ready to carry service (no FAF). If set on Protection line, the Protection line is ready to carry service (no FAF).
	UAS Unassigned
	WRK If set on Working line, the Working line is carrying service. If set on Protection line, the Protection line is carrying service.
MONTYPE	NEAR_END_PARAMETERS:{AISS, CVL, CVS, ESL, ESS, ESA–L, ESA–S, ESB–L, ESB–S, FC–L, LOSS, PSC–L, PSD–L, SEFS, SESL, SESS, UASL},
	FAR_END_PARAMETERS:{AISS, CVL, ESL, ESA–L, ESB–L, FC–L, SESL, UASL}
	Monitored Parameter Type, identifies the monitored parameter. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
	AISS Alarm Indication Signal Seconds – Line, AISS register.
	CVL Coding Violations – Line, CV–L register.
	CVS Coding Violations – Section, CV–S register.
	ESL Errored Seconds – Line, ES–L register.
	ESS Errored Seconds – Section, ES–S register.
	ESA–L Errored Seconds type A – Line, ESA–L register.
	ESA–S Errored Seconds type A – Section, ESA–S register.
	ESB–L Errored Seconds type B – Line, ESB–L register.
	ESB–S Errored Seconds type B – Section, ESB–S register.
	FC–L Failure Counts – Line, FC–L register.
	LOSS Loss Of Signal Seconds – Section, LOSS register.
	PSC–L Protection Switch Counts – Line, PSC–L register.
	PSD–L Protection Switch Duration – Line, PSD–L register.
	SEFS Severely Errored Frame Seconds – Section, SEFS–S register.
	SESL Severely Errored Seconds – Line, SES–L register.
	SESS Severely Errored Seconds – Section, SES–S register.
	UASL Unavailable Seconds – Line, UAS–L register.

MONVAL	{0–4294967295, NA} Monitored Parameter Value, indicates the measured value of the indicated MONTYPE being reported. Values are: 0–4294967295 Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}. NA Not Available, value reported if VLDTY is {NA}.
VLDTY	{ADJ, COMPL, LONG, NA, OFF, PRTL} Validity, indicates whether the PM data being retrieved for the specified time period was accumulated over the entire time period or some portion thereof. Values are: ADJ Adjusted, the data was manually adjusted or initialized (via INIT–REG–OC12). COMPL Complete, the data was accumulated over the entire time period. LONG Longer, the data was accumulated over a greater period of time than the indicated time period. NA Not Available, the data is not available. OFF Off, PM data collection for the entire time period was disabled (via SET–PMMODE–OC12). PRTL Partial, the data was accumulated over some portion of the time period, but not the entire time period.
LOCN	{FEND, NEND} Location, indicates whether a near–end or far–end monitored parameter is being reported. Values are: FEND Far–End NEND Near–End
DIRN	{NA, RCV} Direction, identifies the direction of the signal being monitored. Values are: NA Not Applicable, value reported for LOCN value of FEND. RCV Receive side, value reported for LOCN value of NEND.
TMPER	{15–MIN, 1–DAY} Time Period, identifies the accumulation time period for the indicated monitored parameter. Values are: 15–MIN 15–Minute PM collection period 1–DAY 1–Day (24 hour) PM collection period
MONDAT	{MONTH–DAY:{01–12} – {01–31} } Monitor Date, identifies the date when the PM collection period began. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
MONTM	{HOUR–MINUTE:{00–23} – {00–59} } Monitor Time, identifies the time of day when the PM collection period began. The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Value for num15min is not consistent with value for time period */ /* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monlev in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid date in request message. */ /* Invalid num15min value in request message. */ /* Invalid num1day value in request message. */ /* Invalid day for the requested month. */ /* Invalid time in request message. */ /* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Error in reading TP database record. */
SROF	Status, Requested Operation Failed /* Timeout waiting for response from <AID>. */ /* Invalid time period is detected, TMPER = <TIME PERIOD>. */ /* Unable to determine the global TP number, TPType=<TP TYPE>, TPNum=<TP NUMBER>. */ /* Unable to allocate memory for user data. */ /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Unable to determine the history file name, TPType=<TP TYPE>, TMPER=<TIME PERIOD>, FileIdx=<FILE INDEX>. */ /* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */ /* Failed to retrieve PM historical data. */ /* Unable to determine supporting facility entity. */ /* Error occurred while provisioning equipment. */ /* Unexpected response message received from <CARDNAME>. */ /* Failed to convert tp num to AID string. */ /* Unable to determine facility type. */ /* Unable to determine alarms. */ /* Failed to get PST and SST State. */

EXAMPLES

In the following example, the 1-Day historical PM data that was accumulated for OC12 port OC12-105 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-OC12::OC12-105:::ALL,12-UP,,1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"OC12-105,OC12:CVL,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"
"OC12-105,OC12:ESL,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"
/* RTRV-PM-OC12::OC12-105:::ALL,12-UP,,1-DAY,1-15 [P71042] (1) */
;
```

In the following example, the current near-end and far-end 15-Minute AIS seconds (AISS) PM data for OC12 port OC12-113 is retrieved.

```
RTRV-PM-OC12::OC12-113:::AISS;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
"OC12-113,OC12:AISS,1,PRTL,NEND,RCV,15-MIN,01-18,10-30"
"OC12-113,OC12:AISS,0,PRTL,FEND,RCV,15-MIN,01-18,10-30"
/* RTRV-PM-OC12::OC12-113:::AISS [P71048] (2) */
;
```

In the following example, the 15-minute historical near-end errored seconds, line (ES-L) PM data that was accumulated for OC12 port OC12-113 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-OC12::OC12-113:::ES-L,0-UP,NEND,,15-MIN,1-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
"OC12-113,OC12:ESL,0,CMPL,NEND,RCV,15-MIN,01-18,08-15"
/* RTRV-PM-OC12::OC12-113:::ES-L,0-UP,NEND,,15-MIN,1-18,8-20
[P71049] (2) */
;
```

COMMAND CODE: RTRV-PM-OC3
COMMAND NAME: RETRIEVE PERFORMANCE
MONITORING OC-3

PURPOSE

The RTRV-PM-OC3 command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified OC3 port(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMODE-OC3 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-OC3) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-OC3 command contains the following lines of parsable output data for each provisioned OC3 AID specified, in ascending order by OC3 AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying any existing alarms and the current state of the OC3,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the port is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).

A RTRV-PM-OC3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-OC3 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID: {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, CV-S, CVS, ES-L, ESL, ES-S, ESS, ESA-L, ESAL, ESA-S, ESAS, ESB-L, ESBL, ESB-S, ESBS, FC-L, FCL, LOSS, LOSS-S, PSC, PSC-L, PSCL, PSD, PSD-L, PSDL, SEFS, SEFS-S, SES-L, SESL, SES-S, SESS, UAS-L, UASL}, FAR_END_PARAMETERS:{AISS, AISS-L, AISSL, CV-L, CVL, ES-L, ESL, ESA-L, ESAL, ESB-L, ESBL, FC-L, FCL, SES-L, SESL, UAS-L, UASL}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM data is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-L, AISSL	Alarm Indication Signal Seconds – Line, AISS register.
CV-L, CVL	Coding Violations – Line, CV-L register.
CV-S, CVS	Coding Violations – Section, CV-S register. (Near-end only.)
ES-L, ESL	Errored Seconds – Line, ES-L register.
ES-S, ESS	Errored Seconds – Section, ES-S register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register.
ESA-S, ESAS	Errored Seconds type A – Section, ESA-S register. (Near-end only.)
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register.
ESB-S, ESBS	Errored Seconds type B – Section, ESB-S register. (Near-end only.)
FC-L, FCL	Failure Counts – Line, FC-L register.
LOSS, LOSS-S	Loss Of Signal Seconds – Section, LOSS register. (Near-end only.)
PSC, PSC-L, PSCL	Protection Switch Counts – Line, PSC-L register. (Near-end only.)
PSD, PSD-L, PSDL	Protection Switch Duration – Line, PSD-L register. (Near-end only.)
SEFS, SEFS-S	Severely Errored Frame Seconds – Section, SEFS-S register. (Near-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register.
SES-S, SESS	Severely Errored Seconds – Section, SES-S register. (Near-end only.)
UAS-L, UASL	Unavailable Seconds – Line, UAS-L register.
Restrictions:	RTRV-PM-OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV-S and LOCN of FEND is entered).

MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} }	
	Default:	{1–UP}
	Addressing:	None
	Description:	Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295} – DN <LEVEL> – Down, Only PM data for the specified MONTYPE that is less–than or equal–to (<) the value of <LEVEL> is reported. {0–4294967295} – DNORNCMPL <LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported. {0–4294967295} – UP <LEVEL> – Up, Only PM data for the specified MONTYPE that is greater–than or equal–to (>) the value of <LEVEL> is reported. {0–4294967295} – UPORNCMPL <LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.	
LOCN	{FEND, NEND}	
	Default:	< All applicable locations for the selected monitored parameters >
	Addressing:	None
	Description:	Location, specifies whether PM registers for near–end or far–end PM monitoring are to be retrieved. Values are:
	FEND Far–End NEND Near–End Restrictions: RTRV–PM–OC3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of CV–S and LOCN of FEND is entered).	
DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV–PM–OC3 command.
	NA Not Applicable RCV Receive side TRMT Transmit direction	

TMPER	{15-MIN, 1-DAY, BOTH}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN 15-Minute PM collection register
	1-DAY 1-Day (24 hour) PM collection register
	BOTH Both 15-Minute and 1-Day PM collection registers
	Restrictions: RTRV-PM-OC3 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-OC3 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time. RTRV-PM-OC3 is denied if TMPER of 1-DAY and NUM15MIN of {1-32, ALL} (i.e., any value) is entered. RTRV-PM-OC3 is denied if TMPER of 15-MIN and NUM1DAY of {1-7, ALL} (i.e., any value) is entered.
MONDAT	{MONTH-DAY:{01-12} – {01-31} }
	Default: < Current date >
	Addressing: None
	Description: Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
	Restrictions: RTRV-PM-OC3 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-OC3 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.
MONTM	{HOUR-MINUTE:{00-23} – {00-59} }
	Default: < Current time >
	Addressing: None
	Description: Monitor Time, if TMPER of {15-MIN, BOTH} is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TMPER of 1-DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>, where: <HOUR_OF_DAY> is in 24 hour time. <MINUTE_OF_HOUR> set to {0-14} specifies the first 15-minute period within the <HOUR_OF_DAY> value. <MINUTE_OF_HOUR> set to {15-29} specifies the second 15-minute period within the <HOUR_OF_DAY> value. <MINUTE_OF_HOUR> set to {30-44} specifies the third 15-minute period within the <HOUR_OF_DAY> value. <MINUTE_OF_HOUR> set to {45-59} specifies the fourth 15-minute period within the <HOUR_OF_DAY> value.
	Restrictions: RTRV-PM-OC3 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.

NUM15MIN	{1–32, ALL, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	Number of 15–Minute Historical Registers, specifies the number of 15–Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are:
	1–32 1–32 additional historical 15–Minute PM data registers.
	ALL All additional historical 15–Minute PM data registers.
	<NoVal> No Value, no additional historical 15–Minute PM data registers.
Restrictions:	RTRV–PM–OC3 is denied if NUM15MIN of {1–32, ALL} (i.e., any value) and TMPER of 1–DAY is entered.
NUM1DAY	{1–7, ALL, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	Number of 1–Day Historical Registers, specifies the number of 1–Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are:
	1–7 1–7 additional historical 1–Day PM data registers.
	ALL All additional historical 1–Day PM data registers.
	<NoVal> No Value, no additional historical 1–Day PM data registers.
Restrictions:	RTRV–PM–OC3 is denied if NUM1DAY of {1–7, ALL} (i.e., any value) and TMPER of 15–MIN is entered.

SUCCESSFUL RESPONSE FORMAT

```

```

Note: The first line of parsable output is provided only when a value for NUM15MIN is entered. The second line of parsable output is provided for each PM data register reported.

OUTPUT PARAMETERS

AID	OC3_AID: {OC3–{1–2240}} OC3 AID, identifies the OC–3 port.	(OC3–OC3#)
FENDALM	{RFI} Far End OC–3 Alarm Condition, identifies any far–end OC–3 alarm conditions that exist on the OC–3. A FENDALM value is only reported if a FENDALM condition exists. Value is: RFI Remote Failure Indication detected	
NENDALM	{AIS, LOF, LOS} Near End OC–3 Alarm Condition, identifies any near–end OC–3 alarm conditions that exist on the OC–3. A NENDALM value is reported only if a NENDALM condition exists. Values are: AIS Alarm Indication Signal, AIS detected LOF Loss Of Frame detected LOS Loss Of Signal detected	

PST	<p>{IS, OOS–AU, OOS–AUMA, OOS–MA}</p> <p>Primary State, indicates the current primary state of the OC–3. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:</p> <table> <tr> <td>IS</td><td>In Service</td></tr> <tr> <td>OOS–AU</td><td>Out Of Service–Autonomous</td></tr> <tr> <td>OOS–AUMA</td><td>Out Of Service–Autonomous and Management</td></tr> <tr> <td>OOS–MA</td><td>Out Of Service–Management</td></tr> </table>	IS	In Service	OOS–AU	Out Of Service–Autonomous	OOS–AUMA	Out Of Service–Autonomous and Management	OOS–MA	Out Of Service–Management																										
IS	In Service																																		
OOS–AU	Out Of Service–Autonomous																																		
OOS–AUMA	Out Of Service–Autonomous and Management																																		
OOS–MA	Out Of Service–Management																																		
SST	<p>{AINS, DSBLD, FAF, LPBK, MT, PMI, PSI, STBYH, UAS, WRK}</p> <p>Secondary State, indicates any secondary states associated with the OC–3. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the OC–3 at the time of the RTRV–PM–OC3. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:</p> <table> <tr> <td>AINS</td><td>The OC–3 is under Automatic IN–Service state.</td></tr> <tr> <td>DSBLD</td><td>Disabled</td></tr> <tr> <td>FAF</td><td>Facility failure</td></tr> <tr> <td>LPBK</td><td>Loopback</td></tr> <tr> <td>MT</td><td>Maintenance</td></tr> <tr> <td>PMI</td><td>Performance Monitoring Inhibited</td></tr> <tr> <td>PSI</td><td>Protection Switching Inhibited</td></tr> <tr> <td>STBYH</td><td>If set on Working line, the working line is ready to carry service (no FAF). MONVAL	{0–4294967295, NA} Monitored Parameter Value, indicates the measured value of the indicated MONTYPE being reported. Values are: 0–4294967295 Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}. NA Not Available, value reported if VLDTY is {NA}.
VLDTY	{ADJ, COMPL, LONG, NA, OFF, PRTL} Validity, indicates whether the PM data being retrieved for the specified time period was accumulated over the entire time period or some portion thereof. Values are: ADJ Adjusted, the data was manually adjusted or initialized (via INIT–REG–OC3). COMPL Complete, the data was accumulated over the entire time period. LONG Longer, the data was accumulated over a greater period of time than the indicated time period. NA Not Available, the data is not available. OFF Off, PM data collection for the entire time period was disabled (via SET–PMMODE–OC3). PRTL Partial, the data was accumulated over some portion of the time period, but not the entire time period.
LOCN	{FEND, NEND} Location, indicates whether a near–end or far–end monitored parameter is being reported. Values are: FEND Far–End NEND Near–End
DIRN	{NA, RCV} Direction, identifies the direction of the signal being monitored. Values are: NA Not Applicable, value reported for LOCN value of FEND. RCV Receive side, value reported for LOCN value of NEND.
TMPER	{15–MIN, 1–DAY} Time Period, identifies the accumulation time period for the indicated monitored parameter. Values are: 15–MIN 15–Minute PM collection period 1–DAY 1–Day (24 hour) PM collection period
MONDAT	{MONTH–DAY:{01–12} – {01–31} } Monitor Date, identifies the date when the PM collection period began. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
MONTM	{HOUR–MINUTE:{00–23} – {00–59} } Monitor Time, identifies the time of day when the PM collection period began. The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Value for num15min is not consistent with value for time period */ /* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monlev in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid date in request message. */ /* Invalid num15min value in request message. */ /* Invalid num1day value in request message. */ /* Invalid day for the requested month. */ /* Invalid time in request message. */ /* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Error in reading TP database record. */
SROF	Status, Requested Operation Failed /* Timeout waiting for response from <AID>. */ /* Invalid time period is detected, TMPER = <TIME PERIOD>. */ /* Unable to determine the global TP number, TPType=<TP TYPE>, TPNuM=<TP NUM- BER>. */ /* Unable to allocate memory for user data. */ /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Unable to determine the history file name, TPType=<TP TYPE>, TMPER=<TIME PE- RIOD>, FileIdx=<FILE INDEX>. */ /* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */ /* Failed to retrieve PM historical data. */ /* Unable to determine supporting facility entity. */ /* Error occurred while provisioning equipment. */ /* Unexpected response message received from <CARDNAME>. */ /* Failed to convert tp num to AID string. */ /* Unable to determine facility type. */ /* Unable to determine alarms. */ /* Failed to get PST and SST State. */

EXAMPLES

In the following example, the 1-Day historical PM data that was accumulated for OC3 port OC3-105 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-OC3::OC3-105:::ALL,12-UP,,1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"OC3-105,OC3:CVL,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"
"OC3-105,OC3:ESL,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"
/* RTRV-PM-OC3::OC3-105:::ALL,12-UP,,1-DAY,1-15 [P71042] (1) */
;
```

In the following example, the current near-end and far-end 15-Minute AIS seconds (AISS) PM data for OC3 port OC3-113 is retrieved.

```
RTRV-PM-OC3::OC3-113:::AISS;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
"OC3-113,OC3:AISS,1,PRTL,NEND,RCV,15-MIN,01-18,10-30"
"OC3-113,OC3:AISS,0,PRTL,FEND,RCV,15-MIN,01-18,10-30"
/* RTRV-PM-OC3::OC3-113:::AISS [P71048] (2) */
;
```

In the following example, the 15-minute historical near-end errored seconds, line (ES-L) PM data that was accumulated for OC3 port OC3-113 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-OC3::OC3-113:::ES-L,0-UP,NEND,,15-MIN,1-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
"OC3-113,OC3:ESL,0,CMPL,NEND,RCV,15-MIN,01-18,08-15"
/* RTRV-PM-OC3::OC3-113:::ES-L,0-UP,NEND,,15-MIN,1-18,8-20
[P71049] (2) */
;

COMMAND CODE: **RTRV-PM-STS1**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING STS-1**

PURPOSE

The RTRV-PM-STS1 command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified STS1 port(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMMODE-STS1 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-STS1) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-STS1 command contains the following lines of parsable output data for each STS-1 AID specified, in ascending order by STS1 AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying any existing alarms and the current state of the STS1,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the port is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).
- No line of parsable output data is provided if the specified STS1 is embedded within a protection OC3 or OC12.

A RTRV-PM-STS1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-STS1: [TID] :AID: [CTAG] :: [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS1 AID, identifies the STS-1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}, FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}																		
	Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM data is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:																		
	<table> <tr> <td>ALL</td><td>All monitored parameter PM registers.</td></tr> <tr> <td>ALS-P, ALSP</td><td>Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.</td></tr> <tr> <td>CV-P, CVP</td><td>Coding Violations – Path, CV-P register.</td></tr> <tr> <td>ES-P, ESP</td><td>Errored Seconds – Path, ES-P register.</td></tr> <tr> <td>ESA-P, ESAP</td><td>Errored Seconds type A – Path, ESA-P register.</td></tr> <tr> <td>ESB-P, ESBP</td><td>Errored Seconds type B – Path, ESB-P register.</td></tr> <tr> <td>FC-P, FCP</td><td>Failure Counts – Path, FC-P register.</td></tr> <tr> <td>SES-P, SESP</td><td>Severely Errored Seconds – Path, SES-P register.</td></tr> <tr> <td>UAS-P, UASP</td><td>Unavailable Seconds – Path, UAS-P register.</td></tr> </table>	ALL	All monitored parameter PM registers.	ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.	CV-P, CVP	Coding Violations – Path, CV-P register.	ES-P, ESP	Errored Seconds – Path, ES-P register.	ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.	ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.	FC-P, FCP	Failure Counts – Path, FC-P register.	SES-P, SESP	Severely Errored Seconds – Path, SES-P register.	UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.
ALL	All monitored parameter PM registers.																		
ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.																		
CV-P, CVP	Coding Violations – Path, CV-P register.																		
ES-P, ESP	Errored Seconds – Path, ES-P register.																		
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.																		
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.																		
FC-P, FCP	Failure Counts – Path, FC-P register.																		
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.																		
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.																		
MONLEV	{LEVEL-DIRECTION:{0-4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} }																		
	Default: {1-UP} Addressing: None Description: Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:																		
	<table> <tr> <td>{0-4294967295} – DN</td><td><LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.</td></tr> <tr> <td>{0-4294967295} – DNORNCMPL</td><td><LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</td></tr> <tr> <td>{0-4294967295} – UP</td><td><LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.</td></tr> <tr> <td>{0-4294967295} – UPORNCMPL</td><td><LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</td></tr> </table>	{0-4294967295} – DN	<LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.	{0-4294967295} – DNORNCMPL	<LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.	{0-4294967295} – UP	<LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.	{0-4294967295} – UPORNCMPL	<LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.										
{0-4294967295} – DN	<LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.																		
{0-4294967295} – DNORNCMPL	<LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.																		
{0-4294967295} – UP	<LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.																		
{0-4294967295} – UPORNCMPL	<LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.																		
LOCN	{FEND, NEND}																		
	Default: < All applicable locations for the selected monitored parameters > Addressing: None Description: Location, specifies whether PM registers for near-end or far-end PM monitoring are to be retrieved. Values are:																		
	<table> <tr> <td>FEND</td><td>Far-End</td></tr> <tr> <td>NEND</td><td>Near-End</td></tr> </table>	FEND	Far-End	NEND	Near-End														
FEND	Far-End																		
NEND	Near-End																		

DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-PM-STs1 command.
	NA	Not Applicable
	RCV	Receive side
	TRMT	Transmit direction
TMPER	{15-MIN, 1-DAY, BOTH}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register
	BOTH	Both 15-Minute and 1-Day PM collection registers
	Restrictions:	RTRV-PM-STs1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-STs1 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time. RTRV-PM-STs1 is denied if TMPER of 1-DAY and NUM15MIN of {1-32, ALL} (i.e., any value) is entered. RTRV-PM-STs1 is denied if TMPER of 15-MIN and NUM1DAY of {1-7, ALL} (i.e., any value) is entered.
MONDAT	{MONTH-DAY:{01-12} - {01-31} }	
	Default:	< Current date >
	Addressing:	None
	Description:	Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
	Restrictions:	RTRV-PM-STs1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-STs1 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.

MONTM	{ HOUR – MINUTE :{00–23} – {00–59} }
	Default: < Current time > Addressing: None Description: Monitor Time, if TMPER of {15–MIN, BOTH} is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TMPER of 1–DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is < HOUR_OF_DAY > – < MINUTE_OF_HOUR >, where: < HOUR_OF_DAY > is in 24 hour time. < MINUTE_OF_HOUR > set to {0–14} specifies the first 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {15–29} specifies the second 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {30–44} specifies the third 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {45–59} specifies the fourth 15–minute period within the < HOUR_OF_DAY > value. Restrictions: RTRV–PM–STS1 is denied if TMPER of 15–MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
NUM15MIN	{1–32, ALL, <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 15–Minute Historical Registers, specifies the number of 15–Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are: 1–32 1–32 additional historical 15–Minute PM data registers. ALL All additional historical 15–Minute PM data registers. <NoVal> No Value, no additional historical 15–Minute PM data registers. Restrictions: RTRV–PM–STS1 is denied if NUM15MIN of {1–32, ALL} (i.e., any value) and TMPER of 1–DAY is entered.
NUM1DAY	{1–7, ALL, <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 1–Day Historical Registers, specifies the number of 1–Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are: 1–7 1–7 additional historical 1–Day PM data registers. ALL All additional historical 1–Day PM data registers. <NoVal> No Value, no additional historical 1–Day PM data registers. Restrictions: RTRV–PM–STS1 is denied if NUM1DAY of {1–7, ALL} (i.e., any value) and TMPER of 15–MIN is entered.

Note: The first line of parsable output is provided only when a value for NUM15MIN is entered. The second line of parsable output is provided for each PM data register reported.

OUTPUT PARAMETERS

AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	STS1 AID, identifies the STS-1 port.	
FENDALM	{RFI}	
	Far End STS-1 Alarm Condition, identifies any far-end STS-1 alarm conditions that exist on the STS-1. A FENDALM value is only reported if a FENDALM condition exists. Value is:	
	RFI	Remote Failure Indication detected
NENDALM	{AIS, IDLE, IDMISMATCH LOP, SLMF}	
	Near End STS-1 Alarm Condition, identifies any near-end STS-1 alarm conditions that exist on the STS-1. A NENDALM value is reported only if a NENDALM condition exists. Values are:	
	AIS	Alarm Indication Signal, AIS detected
	IDLE	Idle, incoming idle detected
	IDMISMATCH	Path ID (PID) Mismatch detected
	LOP	Loss Of Pointer detected
	SLMF	Signal Label Match Failure detected
PST	{IS, OOS-AU, OOS-AUMA, OOS-MA}	
	Primary State, indicates the current primary state of the STS-1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:	
	IS	In Service
	OOS-AU	Out Of Service-Autonomous
	OOS-AUMA	Out Of Service-Autonomous and Management
	OOS-MA	Out Of Service-Management
SST	{ACT, BUSY, DSBLD, FAF, LPBK, MT, TRM, UAS}	
	Secondary State, indicates any secondary states associated with the STS-1. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the STS-1 at the time of the RTRV-PM-STS1. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:	
	ACT	Active, i.e., Cross-connected.
	BUSY	Busy, i.e., 2-way cross-connected.
	DSBLD	Disabled
	FAF	Facility failure
	LPBK	Loopback
	MT	Maintenance
	PMI	Performance Monitoring Inhibited
	TRM	Terminated.
	UAS	Unassigned

MONTYPE	<p>NEAR_END_PARAMETERS:{ALS-P, CVP, ESP, ESA-P, ESB-P, FC-P, SESP, UASP},</p> <p>FAR_END_PARAMETERS:{ALS-P, CVP, ESP, ESA-P, ESB-P, FC-P, SESP, UASP}</p> <p>Monitored Parameter Type, identifies the monitored parameter. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:</p> <table> <tr> <td>ALS-P</td><td>Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.</td></tr> <tr> <td>CVP</td><td>Coding Violations – Path, CV-P register.</td></tr> <tr> <td>ESP</td><td>Errored Seconds – Path, ES-P register.</td></tr> <tr> <td>ESA-P</td><td>Errored Seconds type A – Path, ESA-P register.</td></tr> <tr> <td>ESB-P</td><td>Errored Seconds type B – Path, ESB-P register.</td></tr> <tr> <td>FC-P</td><td>Failure Counts – Path, FC-P register.</td></tr> <tr> <td>SESP</td><td>Severely Errored Seconds – Path, SES-P register.</td></tr> <tr> <td>UASP</td><td>Unavailable Seconds – Path, UAS-P register.</td></tr> </table>	ALS-P	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.	CVP	Coding Violations – Path, CV-P register.	ESP	Errored Seconds – Path, ES-P register.	ESA-P	Errored Seconds type A – Path, ESA-P register.	ESB-P	Errored Seconds type B – Path, ESB-P register.	FC-P	Failure Counts – Path, FC-P register.	SESP	Severely Errored Seconds – Path, SES-P register.	UASP	Unavailable Seconds – Path, UAS-P register.
ALS-P	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.																
CVP	Coding Violations – Path, CV-P register.																
ESP	Errored Seconds – Path, ES-P register.																
ESA-P	Errored Seconds type A – Path, ESA-P register.																
ESB-P	Errored Seconds type B – Path, ESB-P register.																
FC-P	Failure Counts – Path, FC-P register.																
SESP	Severely Errored Seconds – Path, SES-P register.																
UASP	Unavailable Seconds – Path, UAS-P register.																
MONVAL	<p>{0-4294967295, NA}</p> <p>Monitored Parameter Value, indicates the measured value of the indicated MONTYPE being reported. Values are:</p> <table> <tr> <td>0-4294967295</td><td>Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}.</td></tr> <tr> <td>NA</td><td>Not Available, value reported if VLDTY is {NA}.</td></tr> </table>	0-4294967295	Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}.	NA	Not Available, value reported if VLDTY is {NA}.												
0-4294967295	Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}.																
NA	Not Available, value reported if VLDTY is {NA}.																
VLDTY	<p>{ADJ, COMPL, LONG, NA, OFF, PRTL}</p> <p>Validity, indicates whether the PM data being retrieved for the specified time period was accumulated over the entire time period or some portion thereof. Values are:</p> <table> <tr> <td>ADJ</td><td>Adjusted, the data was manually adjusted or initialized (via INIT-REG-STS1).</td></tr> <tr> <td>COMPL</td><td>Complete, the data was accumulated over the entire time period.</td></tr> <tr> <td>LONG</td><td>Longer, the data was accumulated over a greater period of time than the indicated time period.</td></tr> <tr> <td>NA</td><td>Not Available, the data is not available.</td></tr> <tr> <td>OFF</td><td>Off, PM data collection for the entire time period was disabled (via SET-PMODE-STS1).</td></tr> <tr> <td>PRTL</td><td>Partial, the data was accumulated over some portion of the time period, but not the entire time period.</td></tr> </table>	ADJ	Adjusted, the data was manually adjusted or initialized (via INIT-REG-STS1).	COMPL	Complete, the data was accumulated over the entire time period.	LONG	Longer, the data was accumulated over a greater period of time than the indicated time period.	NA	Not Available, the data is not available.	OFF	Off, PM data collection for the entire time period was disabled (via SET-PMODE-STS1).	PRTL	Partial, the data was accumulated over some portion of the time period, but not the entire time period.				
ADJ	Adjusted, the data was manually adjusted or initialized (via INIT-REG-STS1).																
COMPL	Complete, the data was accumulated over the entire time period.																
LONG	Longer, the data was accumulated over a greater period of time than the indicated time period.																
NA	Not Available, the data is not available.																
OFF	Off, PM data collection for the entire time period was disabled (via SET-PMODE-STS1).																
PRTL	Partial, the data was accumulated over some portion of the time period, but not the entire time period.																
LOCN	<p>{FEND, NEND}</p> <p>Location, indicates whether a near-end or far-end monitored parameter is being reported. Values are:</p> <table> <tr> <td>FEND</td><td>Far-End</td></tr> <tr> <td>NEND</td><td>Near-End</td></tr> </table>	FEND	Far-End	NEND	Near-End												
FEND	Far-End																
NEND	Near-End																
DIRN	<p>{NA, RCV}</p> <p>Direction, identifies the direction of the signal being monitored. Values are:</p> <table> <tr> <td>NA</td><td>Not Applicable, value reported for LOCN value of FEND.</td></tr> <tr> <td>RCV</td><td>Receive side, value reported for LOCN value of NEND.</td></tr> </table>	NA	Not Applicable, value reported for LOCN value of FEND.	RCV	Receive side, value reported for LOCN value of NEND.												
NA	Not Applicable, value reported for LOCN value of FEND.																
RCV	Receive side, value reported for LOCN value of NEND.																
TMPER	<p>{15-MIN, 1-DAY}</p> <p>Time Period, identifies the accumulation time period for the indicated monitored parameter. Values are:</p> <table> <tr> <td>15-MIN</td><td>15-Minute PM collection period</td></tr> <tr> <td>1-DAY</td><td>1-Day (24 hour) PM collection period</td></tr> </table>	15-MIN	15-Minute PM collection period	1-DAY	1-Day (24 hour) PM collection period												
15-MIN	15-Minute PM collection period																
1-DAY	1-Day (24 hour) PM collection period																
MONDAT	<p>{MONTH-DAY:{01-12} – {01-31} }</p> <p>Monitor Date, identifies the date when the PM collection period began. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.</p>																
MONTM	<p>{HOUR-MINUTE:{00-23} – {00-59} }</p> <p>Monitor Time, identifies the time of day when the PM collection period began. The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>.</p>

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent
	/* Value for num15min is not consistent with value for time period */
	/* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid
	/* Invalid location in request message. */
	/* Invalid montype in request message. */
	/* Invalid monlev in request message. */
	/* Invalid direction in request message. */
	/* Invalid time period in request message. */
	/* Invalid date in request message. */
	/* Invalid num15min value in request message. */
	/* Invalid num1day value in request message. */
	/* Invalid day for the requested month. */
	/* Invalid time in request message. */
	/* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier
	/* AID not in Partition. */
	/* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping
	/* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error
	/* Error in reading TP database record. */

SROF Status, Requested Operation Failed

```
/* Timeout waiting for response from <AID>. */
/* Invalid time period is detected, TMPER = <TIME PERIOD>. */
/* Unable to determine the global TP number, TPTYPE=<TP TYPE>, TPNum=<TP
NUMBER>. */
/* Unable to allocate memory for user data. */
/* rpt_file error – <ERRNO>, status = <STATUS> */
/* Cannot open <FILENAME> */
/* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */
/* rpt_print error – <ERRNO>, status = <STATUS> */
/* Unable to determine the history file name, TPType=<TP TYPE>, TMPER=<TIME PE-
RIOD>, FileIdx=<FILE INDEX>. */
/* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */
/* Failed to retrieve PM historical data. */
/* Unable to determine supporting facility entity. */
/* Error occurred while provisioning equipment. */
/* Unexpected response message received from <CARDNAME>. */
/* Failed to convert tp num to AID string. */
/* Unable to determine facility type. */
/* Unable to determine alarms. */
/* Failed to get PST and SST State. */
```

EXAMPLES

In the following example, the 1-Day historical PM data that was accumulated for STS-1 port EC1STS1-57 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-STS1::EC1STS1-57::ALL,12-UP,,1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"EC1STS1-57,STS1:FC-P,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"
"EC1STS1-57,STS1:UASP,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"
/* RTRV-PM-STS1::EC1STS1-57::ALL,12-UP,,1-DAY,1-15 [P71042] (1) */
;
```

In the following example, the current 15-Minute AIS/LOP (ALS-P) PM data for STS-1 port EC1STS1-97 is retrieved.

```
RTRV-PM-STS1::EC1STS1-97::ALSP;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
"EC1STS1-97,STS1:ALS-P,1,PRTL,NEND,RCV,15-MIN,01-18,10-30"
"EC1STS1-97,STS1:ALS-P,0,PRTL,FEND,RCV,15-MIN,01-18,10-30"
/* RTRV-PM-STS1::EC1STS1-97::ALSP [P71048] (2) */
;
```

In the following example, the 15-minute historical near-end errored seconds, path (ES-P) PM data that was accumulated for STS-1 port EC1STS1-383 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-STs1::EC1STS1-383:::ESP,0-UP,NEND,,15-MIN,1-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71049 COMPLD  
"EC1STS1-383,STS1:ESP,0,CMPL,NEND,RCV,15-MIN,01-18,08-15"  
/* RTRV-PM-STs1::EC1STS1-383:::ESP,0-UP,NEND,,15-MIN,1-18,8-20  
[P71049] (2) */  
;

COMMAND CODE: **RTRV-PM-STS3C**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING STS-3C**

PURPOSE

The RTRV-PM-STS3C command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified STS-3C port(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMODE-STS3C command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-STS3C) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-STS3C command contains the following lines of parsable output data for each STS3C AID specified, in ascending order by STS3C AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying any existing alarms and the current state of the STS3C,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the port is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).
- No line of parsable output data is provided if the specified STS3C is embedded within a protection OC3 or OC12.

A RTRV-PM-STS3C command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-STS3C: [TID] :AID: [CTAG] :: [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS3C_AID:		
	{OC3STS3C–{1–2240}}	(OC3STS3C–OC3#/STS3C#)	
	{OC12STS3C–{1–560}–{1–4}}	(OC12STS3C–OC12#–STM1/STS3C#)	
	Default:	Entry Required	
	Addressing:	&&–ranging and &–grouping	
	Description:	STS3C AID, identifies the STS–3C port.	
CTAG	< 1–6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}, FAR_END_PARAMETERS:{ALS-P, ALSP, CV-P, CVP, ES-P, ESP, ESA-P, ESAP, ESB-P, ESBP, FC-P, FCP, SES-P, SESP, UAS-P, UASP}																	
	Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM register is to be initialized. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are: <table> <tr><td>ALL</td><td>All, all monitored parameter PM registers.</td></tr> <tr><td>ALS-P, ALSP</td><td>Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.</td></tr> <tr><td>CV-P, CVP</td><td>Coding Violations – Path, CV-P register.</td></tr> <tr><td>ES-P, ESP</td><td>Errored Seconds – Path, ES-P register.</td></tr> <tr><td>ESA-P, ESAP</td><td>Errored Seconds type A – Path, ESA-P register.</td></tr> <tr><td>ESB-P, ESBP</td><td>Errored Seconds type B – Path, ESB-P register.</td></tr> <tr><td>FC-P, FCP</td><td>Failure Counts – Path, FC-P register.</td></tr> <tr><td>SES-P, SESP</td><td>Severely Errored Seconds – Path, SES-P register.</td></tr> <tr><td>UAS-P, UASP</td><td>Unavailable Seconds – Path, UAS-P register.</td></tr> </table>	ALL	All, all monitored parameter PM registers.	ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.	CV-P, CVP	Coding Violations – Path, CV-P register.	ES-P, ESP	Errored Seconds – Path, ES-P register.	ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.	ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.	FC-P, FCP	Failure Counts – Path, FC-P register.	SES-P, SESP	Severely Errored Seconds – Path, SES-P register.	UAS-P, UASP
ALL	All, all monitored parameter PM registers.																	
ALS-P, ALSP	Alarm Indication Signal/Loss of Pointer – Path, ALS-P register.																	
CV-P, CVP	Coding Violations – Path, CV-P register.																	
ES-P, ESP	Errored Seconds – Path, ES-P register.																	
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register.																	
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register.																	
FC-P, FCP	Failure Counts – Path, FC-P register.																	
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.																	
UAS-P, UASP	Unavailable Seconds – Path, UAS-P register.																	
MONLEV	{LEVEL-DIRECTION:{0-4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} }																	
	Default: {1-UP} Addressing: None Description: Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are: <table> <tr> <td>{0-4294967295} – DN</td> <td><LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.</td> </tr> <tr> <td>{0-4294967295} – DNORNCMPL</td> <td><LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</td> </tr> <tr> <td>{0-4294967295} – UP</td> <td><LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.</td> </tr> <tr> <td>{0-4294967295} – UPORNCMPL</td> <td><LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</td> </tr> </table>	{0-4294967295} – DN	<LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.	{0-4294967295} – DNORNCMPL	<LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.	{0-4294967295} – UP	<LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.	{0-4294967295} – UPORNCMPL	<LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.									
{0-4294967295} – DN	<LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.																	
{0-4294967295} – DNORNCMPL	<LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.																	
{0-4294967295} – UP	<LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.																	
{0-4294967295} – UPORNCMPL	<LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.																	
LOCN	{FEND, NEND}																	
	Default: < All applicable locations for the selected monitored parameters > Addressing: None Description: Location, specifies whether PM registers for near-end or far-end PM monitoring are to be retrieved. Values are: <table> <tr><td>FEND</td><td>Far-End</td></tr> <tr><td>NEND</td><td>Near-End</td></tr> </table>	FEND	Far-End	NEND	Near-End													
FEND	Far-End																	
NEND	Near-End																	

DIRN	{NA, RCV, TRMT}
	Default: {NA}
	Addressing: None
	Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-PM-STS3C command.
	NA Not Applicable
	RCV Receive side
	TRMT Transmit direction
TMPER	{15-MIN, 1-DAY, BOTH}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN 15-Minute PM collection register
	1-DAY 1-Day (24 hour) PM collection register
	BOTH Both 15-Minute and 1-Day PM collection registers
	Restrictions: RTRV-PM-STS3C is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-STS3C is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time. RTRV-PM-STS3C is denied if TMPER of 1-DAY and NUM15MIN of {1-32, ALL} (i.e., any value) is entered. RTRV-PM-STS3C is denied if TMPER of 15-MIN and NUM1DAY of {1-7, ALL} (i.e., any value) is entered.
MONDAT	{MONTH-DAY:{01-12} – {01-31} }
	Default: < Current date >
	Addressing: None
	Description: Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
	Restrictions: RTRV-PM-STS3C is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-STS3C is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.

MONTM	{ HO UR- MIN UTE:{00-23} – {00-59} }
	Default: < Current time > Addressing: None Description: Monitor Time, if TM PER of {15- MIN , BOTH } is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TM PER of 1- DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is < HO UR_ OF _ DAY > – < MIN UTE_ OF _ HO UR>, where: < HO UR_ OF _ DAY > is in 24 hour time. < MIN UTE_ OF _ HO UR> set to {0-14} specifies the first 15-minute period within the < HO UR_ OF _ DAY > value. < MIN UTE_ OF _ HO UR> set to {15-29} specifies the second 15-minute period within the < HO UR_ OF _ DAY > value. < MIN UTE_ OF _ HO UR> set to {30-44} specifies the third 15-minute period within the < HO UR_ OF _ DAY > value. < MIN UTE_ OF _ HO UR> set to {45-59} specifies the fourth 15-minute period within the < HO UR_ OF _ DAY > value.
	Restrictions: RTRV-PM-STS3C is denied if TM PER of 15- MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
NUM15MIN	{1-32, ALL , <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 15-Minute Historical Registers, specifies the number of 15-Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM . Values are: 1-32 1-32 additional historical 15-Minute PM data registers. ALL All additional historical 15-Minute PM data registers. <NoVal> No Value, no additional historical 15-Minute PM data registers.
	Restrictions: RTRV-PM-STS3C is denied if NUM15MIN of {1-32, ALL } (i.e., any value) and TM PER of 1- DAY is entered.
NUM1DAY	{1-7, ALL , <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 1-Day Historical Registers, specifies the number of 1-Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM . Values are: 1-7 1-7 additional historical 1-Day PM data registers. ALL All additional historical 1-Day PM data registers. <NoVal> No Value, no additional historical 1-Day PM data registers.
	Restrictions: RTRV-PM-STS3C is denied if NUM1DAY of {1-7, ALL } (i.e., any value) and TM PER of 15- MIN is entered.

SUCCESSFUL RESPONSE FORMAT

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
[  "<AID>,STS3C:[<NENDALM>],[<FENDALM>],<PST>,<SST>" ]

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Value for num15min is not consistent with value for time period */ /* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monlev in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid date in request message. */ /* Invalid num15min value in request message. */ /* Invalid num1day value in request message. */ /* Invalid day for the requested month. */ /* Invalid time in request message. */ /* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Error in reading TP database record. */

SROF Status, Requested Operation Failed

```
/* Timeout waiting for response from <AID>. */
/* Invalid time period is detected, TMPEr = <TIME PERIOD>. */
/* Unable to determine the global TP number, TPType=<TP TYPE>, TPNum=<TP
NUMBER>. */
/* Unable to allocate memory for user data. */
/* rpt_file error – <ERRNO>, status = <STATUS> */
/* Cannot open <FILENAME> */
/* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */
/* rpt_print error – <ERRNO>, status = <STATUS> */
/* Unable to determine the history file name, TPType=<TP TYPE>, TMPEr=<TIME PE-
RIOD>, FileIdx=<FILE INDEX>. */
/* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */
/* Failed to retrieve PM historical data. */
/* Unable to determine supporting facility entity. */
/* Error occurred while provisioning equipment. */
/* Unexpected response message received from <CARDNAME>. */
/* Failed to convert tp num to AID string. */
/* Unable to determine facility type. */
/* Unable to determine alarms. */
/* Failed to get PST and SST State. */
```

EXAMPLES

In the following example, the 1-Day historical PM data that was accumulated for STS3C port OC3STS3C-9 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-STS3C: :OC3STS3C-9: :ALL,12-UP, , , 1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"OC3STS3C-9,STS3C:FC-P,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"
"OC3STS3C-9,STS3C:UASP,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"
/* RTRV-PM-STS3C: :OC3STS3C-9: :ALL,12-UP, , , 1-DAY,1-15 [P71042] (1) */
;
```

In the following example, the current 15-Minute AIS/LOP (ALS-P) PM data for STS3C port OC3STS3C-1 is retrieved.

```
RTRV-PM-STS3C: :OC3STS3C-1: :ALSP;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
"OC3STS3C-1,STS3C:ALS-P,1,PRTL,NEND,RCV,15-MIN,01-18,10-30"
"OC3STS3C-1,STS3C:ALS-P,0,PRTL,FEND,RCV,15-MIN,01-18,10-30"
/* RTRV-PM-STS3C: :OC3STS3C-1: :ALSP [P71048] (2) */
;
```

In the following example, the 15-minute historical near-end errored seconds, path (ES-P) PM data that was accumulated for STS3C port OC3STS3C-47 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-ST3C::OC3STS3C-47:::ESP,0-UP,NEND,,15-MIN,1-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71049 COMPLD  
"OC3STS3C-47,STS3C:ESP,0,CMPL,NEND,RCV,15-MIN,01-18,08-15"  
/* RTRV-PM-ST3C::OC3STS3C-47:::ESP,0-UP,NEND,,15-MIN,1-18,8-20 [P71049]  
(2) */  
;

COMMAND CODE: **RTRV-PM-T1**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING T1**

PURPOSE

The RTRV-PM-T1 command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified DS1 port(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMMODE-T1 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-T1) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-T1 command contains the following lines of parsable output data for each DS1 AID specified, in ascending order by DS1 AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying any existing alarms and the current state of the DS1,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the port is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).
- No line of parsable output data is provided if the specified DS1 is embedded within a protection OC3 or OC12.

If the specified AID refers to an embedded DS1 supported by O4M/S3M, O1B, EP3, or ES1 modules and MON-TYPE=QRSSP, RTRV-PM-T1 completes successfully without producing any output.

A RTRV-PM-T1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-T1 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS1_AID:		
	{T1-{1-59392}}	(T1-DS1#)	
	{T3T1-{1-4800}-{1-28}}	(T3T1-DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-28}}	(EC1T1-EC1/STS1/DS3#-DS1#)	
	{EC1T1-{1-3840}-{1-7}-{1-4}}	(EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-28}}	(OC3T1-OC3#-STS1/DS3#-DS1#)	
	{OC3T1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-28}}	(OC12T1-OC12#-STM1#-STS1/DS3#-DS1#)	
	{OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}	(OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	

	Description:	DS1 AID, identifies the DS1 port.
CTAG	<1–6 VALID CTAG CHARACTERS>	
	Default:	<System Assigned CTAG Value>
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
MONTYPE	{ALL}, {GROUP1}, NEAR_END_PARAMETERS:{AISS, AISS–P, AISSP, CV–L, CVL, CV–P, CVP, ES–L, ESL, ES–NP, ESNP, ES–P, ESP, ESA–P, ESAP, ESB–P, ESBP, FC–P, FCP, LOSS, LOSS–L, LOSSL, QRSSS, QRSSS–P, QRSSSP, SAS–P, SASP, SES–L, SESL, SES–NP, SESNP, SES–P, SESP, UAS–P, UASP}, FAR_END_PARAMETERS:{CSS, CSS–P, CSSP, CV–P, CVP, ES–L, ESL, ES–P, ESP, ESA–P, ESAP, ESB–P, ESBP, FC–P, FCP, SEFS, SEFS–P, SEFSP, SES–P, SESP, UAS–NP, UASNP, UAS–P, UASP}	
	Default:	{ALL}
	Addressing:	None
	Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM data is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (–). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
	ALL	All monitored parameter PM registers.
	GROUP1	All applicable monitored PM registers from the group consisting of CSS–P, ES–P, ESB–P, FC–P, SES–P, UAS–P. (Note. Only parameters that apply are reported, e.g., ESF parameters are not reported for a SF DS1, FEND parameters are not reported if LOCN of NEND is specified.)
	AISS, AISS–P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near–end only.)
	CSS, CSS–P, CSSP	Controlled Slip Seconds – Path, CSS register. (Far–end only.)
	CV–L, CVL	Coding Violations – Line, CV–L register. (Near–end electrical T1 only.)
	CV–P, CVP	Coding Violations – Path, CV–P register.
	ES–L, ESL	Errored Seconds – Line, ES–L register. (Near–end electrical T1 or Far–end embedded T1.)
	ES–NP, ESNP	Errored Seconds – Network Path, ES–NP register. (Near–end or Far–end.)
	ES–P, ESP	Errored Seconds – Path, ES–P register.
	ESA–P, ESAP	Errored Seconds type A – Path, ESA–P register.
	ESB–P, ESBP	Errored Seconds type B – Path, ESB–P register.
	FC–P, FCP	Failure Count – Path, FC–P register.
	LOSS, LOSS–L, LOSSL	Loss of Signal Seconds – Line, LOSS register. (Near–end electrical T1 only.)
	QRSSS, QRSSS–P, QRSSSP	QRSS Seconds – Path, QRSSS–P register. (Near–end only.)
	SAS–P, SASP	Severe AIS Seconds – Path, SAS–P register. (Near–end only.)
	SEFS, SEFS–P, SEFSP	Severely Errored Frame Seconds, SEFS register. (Far–end only.)
	SES–L, SESL	Severely Errored Seconds – Line, SES–L register. (Near–end electrical T1 only.)
	SES–NP, SESNP	Severely Errored Seconds – Network Path, SES–NP register. (Near–end or Far–end.)

	SES–P, SESP UAS–P, UASP	Severely Errored Seconds – Path, SES–P register. Unavailable Seconds – Path, UAS–P register.
	Restrictions:	RTRV–PM–T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered). RTRV–PM–T1 is denied if the DS1 CI/NI Trouble Sectionalization Premium Feature Option (PFO) is not enabled and an input value of ES–NP, ESNP, SES–NP, SESNP, UAS–NP or UASNP is entered.
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} } Default: {1–UP} Addressing: None Description: Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are: {0–4294967295} – DN <LEVEL> – Down, Only PM data for the specified MONTYPE that is less–than or equal–to (<) the value of <LEVEL> is reported. {0–4294967295} – DNORNCMPL <LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported. {0–4294967295} – UP <LEVEL> – Up, Only PM data for the specified MONTYPE that is greater–than or equal–to (>) the value of <LEVEL> is reported. {0–4294967295} – UPORNCMPL <LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.	
LOCN	{FEND, NEND} Default: < All applicable locations for the selected monitored parameters > Addressing: None Description: Location, specifies whether PM registers for near–end or far–end PM monitoring are to be retrieved. Values are: FEND Far–End NEND Near–End Restrictions: RTRV–PM–T1 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).	
DIRN	{NA, RCV, TRMT} Default: < All applicable directions > Addressing: None Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV–PM–T1 command. NA Not Applicable, value reported for LOCN value of FEND. RCV Receive side, value reported for LOCN value of NEND. TRMT Transmit direction, value reported for LOCN value of FEND.	

TMPER	{15-MIN, 1-DAY, BOTH}
	Default: {15-MIN}
	Addressing: None
	Description: Description: Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN 15-Minute PM collection register.
	1-DAY 1-Day (24 hour) PM collection register.
	BOTH Both 15-Minute and 1-Day PM collection registers
	Restrictions: RTRV-PM-T1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-T1 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time. RTRV-PM-T1 is denied if TMPER of 1-DAY and NUM15MIN of {1-32, ALL} (i.e., any value) is entered. RTRV-PM-T1 is denied if TMPER of 15-MIN and NUM1DAY of {1-7, ALL} (i.e., any value) is entered.
MONDAT	{MONTH-DAY:{01-12} – {01-31} }
	Default: < Current date >
	Addressing: None
	Description: Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
	Restrictions: RTRV-PM-T1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-T1 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.
MONTM	{HOUR-MINUTE:{00-23} – {00-59} }
	Default: < Current time >
	Addressing: None
	Description: Monitor Time, if TMPER of {15-MIN, BOTH} is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TMPER of 1-DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>, where: <HOUR_OF_DAY> is in 24 hour time. <MINUTE_OF_HOUR> set to {0-14} specifies the first 15-minute period within the <HOUR_OF_DAY> value. <MINUTE_OF_HOUR> set to {15-29} specifies the second 15-minute period within the <HOUR_OF_DAY> value. <MINUTE_OF_HOUR> set to {30-44} specifies the third 15-minute period within the <HOUR_OF_DAY> value. <MINUTE_OF_HOUR> set to {45-59} specifies the fourth 15-minute period within the <HOUR_OF_DAY> value.
	Restrictions: RTRV-PM-T1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.

NUM15MIN	{1–32, ALL, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	Number of 15–Minute Historical Registers, specifies the number of 15–Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are:
	1–32 1–32 additional historical 15–Minute PM data registers.
	ALL All additional historical 15–Minute PM data registers.
	<NoVal> No Value, no additional historical 15–Minute PM data registers.
Restrictions:	RTRV–PM–T1 is denied if NUM15MIN of {1–32, ALL} (i.e., any value) and TMPPER of 1–DAY is entered.
NUM1DAY	{1–7, ALL, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	Number of 1–Day Historical Registers, specifies the number of 1–Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are:
	1–7 1–7 additional historical 1–Day PM data registers.
	ALL All additional historical 1–Day PM data registers.
	<NoVal> No Value, no additional historical 1–Day PM data registers.
Restrictions:	RTRV–PM–T1 is denied if NUM1DAY of {1–7, ALL} (i.e., any value) and TMPPER of 15–MIN is entered.

	UASNP	Unavailable Seconds – Path, UAS–NP register.
	UASP	Unavailable Seconds – Path, UAS–P register.
MONVAL	{0–4294967295, NA}	Monitored Parameter Value, indicates the measured value of the indicated MONTYPE being reported. Values are:
	0–4294967295	Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}.
	NA	Not Available, value reported if VLDTY is {NA}.
VLDTY	{ADJ, COMPL, LONG, NA, OFF, PRTL}	Validity, indicates whether the PM data being retrieved for the specified time period was accumulated over the entire time period or some portion thereof. Values are:
	ADJ	Adjusted, the data was manually adjusted or initialized (via INIT–REG–T1).
	COMPL	Complete, the data was accumulated over the entire time period.
	LONG	Longer, the data was accumulated over a greater period of time than the indicated time period.
	NA	Not Available, the data is not available.
	OFF	Off, PM data collection for the entire time period was disabled (via SET–PMMODE–T1).
	PRTL	Partial, the data was accumulated over some portion of the time period, but not the entire time period.
LOCN	{FEND, NEND}	Location, indicates whether a near–end or far–end monitored parameter is being reported. Values are:
	FEND	Far–End
	NEND	Near–End
DIRN	{NA, RCV}	Direction, identifies the direction of the signal being monitored. Values are:
	NA	Not Applicable, value reported for LOCN value of FEND.
	RCV	Receive side, value reported for LOCN value of NEND.
TMPER	{15–MIN, 1–DAY}	Time Period, identifies the accumulation time period for the indicated monitored parameter. Values are:
	15–MIN	15–Minute PM collection period
	1–DAY	1–Day (24 hour) PM collection period
MONDAT	{MONTH–DAY:{01–12} – {01–31} }	Monitor Date, identifies the date when the PM collection period began. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
MONTM	{HOUR–MINUTE:{00–23} – {00–59} }	Monitor Time, identifies the time of day when the PM collection period began. The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

EFON	Equipage, Feature Option Not provided
IDNC	Input, Data Not Consistent
	/* Value for num15min is not consistent with value for time period */
	/* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid
	/* Invalid location in request message. */
	/* Invalid montype in request message. */
	/* Invalid monlev in request message. */
	/* Invalid direction in request message. */
	/* Invalid time period in request message. */
	/* Invalid date in request message. */
	/* Invalid num15min value in request message. */
	/* Invalid num1day value in request message. */
	/* Invalid day for the requested month. */
	/* Invalid time in request message. */
	/* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier
	/* AID not in Partition. */
	/* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping
	/* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error
	/* Error in reading TP database record. */

SROF Status, Requested Operation Failed

```
/* Timeout waiting for response from <AID>. */  
/* Invalid time period is detected, TMPEP = <TIME PERIOD>. */  
/* Unable to determine the global TP number, TPTYPE=<TP TYPE>, TPNum=<TP  
NUMBER>. */  
/* Unable to allocate memory for user data. */  
/* rpt_file error – <ERRNO>, status = <STATUS> */  
/* Cannot open <FILENAME> */  
/* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */  
/* rpt_print error – <ERRNO>, status = <STATUS> */

RIOD>, FileIdx=<FILE INDEX>. */  
/* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */  
/* Failed to retrieve PM historical data. */  
/* Unable to determine supporting facility entity. */  
/* Error occurred while provisioning equipment. */  
/* Unexpected response message received from <CARDNAME>. */  
/* Failed to convert tp num to AID string. */  
/* Unable to determine facility type. */  
/* Unable to determine alarms. */  
/* Failed to get PST and SST State. */
```

EXAMPLES

In the following example, the 1-Day historical PM data that was accumulated for DS1 port T3T1-1017-15 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-T1::T3T1-1017-15::ALL,12-UP,,1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71042 COMPLD  
"T3T1-1017-15,T1:CVP,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"  
"T3T1-1017-15,T1:FC-P,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"  
/* RTRV-PM-T1::T3T1-1017-15::ALL,12-UP,,1-DAY,1-15 [P71042] (1) */  
;
```

In the following example, the current 15-Minute AIS seconds (AISS) PM data for DS1 port T1-8 is retrieved.

```
RTRV-PM-T1::T1-8::AISS;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71048 COMPLD  
"T1-8,T1:AISS,1,PRTL,NEND,RCV,15-MIN,01-18,10-30"  
/* RTRV-PM-T1::T1-8::AISS [P71048] (2) */  
;
```

In the following example, the 15-minute historical near-end and far-end errored seconds, path (ES-P) PM data that was accumulated for DS1 port T3T1-1343-20 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-T1::T3T1-1343-20:::ES-P,0-UP,,15-MIN,1-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
"T3T1-1343-20,T1:ESP,5,CMPL,NEND,RCV,15-MIN,01-18,08-15"
"T3T1-1343-20,T1:ESP,0,CMPL,FEND,NA,15-MIN,01-18,08-15"
/* RTRV-PM-T1::T3T1-1343-20:::ES-P,0-UP,,15-MIN,1-18,8-20
[P71049] (2) */
;

COMMAND CODE: RTRV-PM-T3
COMMAND NAME: RETRIEVE PERFORMANCE
MONITORING T3

PURPOSE

The RTRV-PM-T3 command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified DS3 port(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMMODE-T3 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-T3) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-T3 command contains the following lines of parsable output data for each DS3 AID specified, in ascending order by DS3 AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying any existing alarms and the current state of the DS3,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the port is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).
- No line of parsable output data is provided if the specified DS3 is embedded within a protection OC3 or OC12.

A RTRV-PM-T3 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-T3 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	DS3_AID:		
	{T3-{1-4800}}	(T3-DS3#)	
	{EC1T3-{1-3840}}	(EC1T3-EC1/STS1/DS3#)	
	{OC3T3-{1-2240}-{1-3}}	(OC3T3-OC3#-STS1/DS3#)	
	{OC12T3-{1-560}-{1-4}-{1-3}}	(OC12T3-OC12#-STM1#-STS1/DS3#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	DS3 AID, identifies the DS3 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{AISS, AISS-P, AISSP, CV-L, CVL, CV-P, CVP, CVCP-P, CVCPP, ES-L, ESL, ES-P, ESP, ESA-L, ESAL, ESA-P, ESAP, ESACP-P, ESACPP, ESB-L, ESBL, ESB-P, ESBP, ESBCP-P, ESBCPP, ESCP-P, ESCPP, FC-P, FCP, LOSS, LOSS-L, LOSSL, SAS-P, SASP, SES-L, SESL, SES-P, SESP, SESCO-P, SESCO, UAS-P, UASP, UASCP-P, UASCPP}, FAR_END_PARAMETERS:{CVCP-P, CVCPP, ESACP-P, ESACPP, ESBCP-P, ESBCPP, ESCP-P, ESCPP, FCCP-P, FCCPP, SASCP-P, SASCPP, SESCO-P, SESCPP, UASCP-P, UASCPP}
Default:	{ALL}
Addressing:	None
Description:	Monitored Parameter Type, identifies the type of monitored parameter whose PM data is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:
ALL	All monitored parameter PM registers.
AISS, AISS-P, AISSP	Alarm Indication Signal Seconds – Path, AISS register. (Near-end only.)
CV-L, CVL	Coding Violations – Line, CV-L register. (Near-end electrical T3 only.)
CV-P, CVP	Coding Violations – Path, CV-P register. (Near-end only.)
CVCP-P, CVCPP	Code Violations, CP-bit parity – Path, CVCP-P register.
ES-L, ESL	Errored Seconds – Line, ES-L register. (Near-end electrical T3 only.)
ES-P, ESP	Errored Seconds – Path, ES-P register. (Near-end only.)
ESA-L, ESAL	Errored Seconds type A – Line, ESA-L register. (Near-end electrical T3 only.)
ESA-P, ESAP	Errored Seconds type A – Path, ESA-P register. (Near-end only.)
ESACP-P, ESACPP	Errored Seconds type A, CP-bit parity – Path, ESACP-P register.
ESB-L, ESBL	Errored Seconds type B – Line, ESB-L register. (Near-end electrical T3 only.)
ESB-P, ESBP	Errored Seconds type B – Path, ESB-P register. (Near-end only.)
ESBCP-P, ESBCPP	Errored Seconds type B, CP-bit parity – Path, ESBCP-P register.
ESCP-P, ESCPP	Errored Seconds, CP-bit parity – Path, ESCP-P register.
FC-P, FCP	Failure Counts – Path, FC-P register. (Near-end only.)
FCCP-P, FCCPP	Failure Counts, CP-bit parity – Path, FC-P register. (Far-end only.)
LOSS, LOSS-L, LOSSL	Loss Of Signal Seconds – Line, LOSS register. (Near-end electrical T3 only.)
SAS-P, SASP	Severe AIS Seconds – Path, SAS-P register. (Near-end only.)
SASCP-P, SASCPP	Severe AIS Seconds, CP-bit parity – Path, SASCP-P register. (Far-end only.)
SES-L, SESL	Severely Errored Seconds – Line, SES-L register. (Near-end electrical T3 only.)
SES-P, SESP	Severely Errored Seconds – Path, SES-P register.

	<p>(Near-end only.)</p> <p>SESCP-P, SESCPCP Severely Errored Seconds, CP-bit parity – Path, SESCO-P register.</p> <p>UAS-P, UASPCP Unavailable Seconds – Path, UAS-P register. (Near-end only.)</p> <p>UASCP-P, UASCPP Unavailable Seconds, CP-bit parity – Path, UASCP-P register.</p> <p>Restrictions: RTRV-PM-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).</p>
MONLEV	<p>{LEVEL-DIRECTION:{0-4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} }</p> <p>Default: {1-UP}</p> <p>Addressing: None</p> <p>Description: Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:</p> <p>{0-4294967295} – DN <LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.</p> <p>{0-4294967295} – DNORNCMPL <LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</p> <p>{0-4294967295} – UP <LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.</p> <p>{0-4294967295} – UPORNCMPL <LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</p>
LOCN	<p>{FEND, NEND}</p> <p>Default: < All applicable locations for the selected monitored parameters ></p> <p>Addressing: None</p> <p>Description: Location, specifies whether PM registers for near-end or far-end PM monitoring are to be retrieved. Values are:</p> <p>FEND Far-End</p> <p>NEND Near-End</p> <p>Restrictions: RTRV-PM-T3 is denied if the specified MONTYPE value is not supported for the specified LOCN value (e.g., MONTYPE of AISS and LOCN of FEND is entered).</p>
DIRN	<p>{NA, RCV, TRMT}</p> <p>Default: < All applicable directions ></p> <p>Addressing: None</p> <p>Description: Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-PM-T3 command.</p> <p>NA Not Applicable</p> <p>RCV Receive side</p> <p>TRMT Transmit direction</p>

TMPER	{15-MIN, 1-DAY, BOTH}
	Default: {15-MIN}
	Addressing: None
	Description: Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	<div> <div>15-MIN</div> <div>15-Minute PM collection register</div> </div> <div> <div>1-DAY</div> <div>1-Day (24 hour) PM collection register</div> </div> <div> <div>BOTH</div> <div>Both 15-Minute and 1-Day PM collection registers</div> </div>
	Restrictions: RTRV-PM-T3 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-T3 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.
MONDAT	{MONTH-DAY:{01-12} - {01-31} }
	Default: < Current date >
	Addressing: None
	Description: Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> - <DAY_OF_MONTH>.
	Restrictions: RTRV-PM-T3 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-T3 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.
MONTM	{HOUR-MINUTE:{00-23} - {00-59} }
	Default: < Current time >
	Addressing: None
	Description: Monitor Time, if TMPER of {15-MIN, BOTH} is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TMPER of 1-DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is <HOUR_OF_DAY> - <MINUTE_OF_HOUR>, where: <div> <div><HOUR_OF_DAY> is in 24 hour time.</div> <div><MINUTE_OF_HOUR> set to {0-14} specifies the first 15-minute period within the <HOUR_OF_DAY> value.</div> <div><MINUTE_OF_HOUR> set to {15-29} specifies the second 15-minute period within the <HOUR_OF_DAY> value.</div> <div><MINUTE_OF_HOUR> set to {30-44} specifies the third 15-minute period within the <HOUR_OF_DAY> value.</div> <div><MINUTE_OF_HOUR> set to {45-59} specifies the fourth 15-minute period within the <HOUR_OF_DAY> value.</div> </div>
	Restrictions: RTRV-PM-T3 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.

NUM15MIN	{1–32, ALL, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	Number of 15–Minute Historical Registers, specifies the number of 15–Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are:
1–32	1–32 additional historical 15–Minute PM data registers.
ALL	All additional historical 15–Minute PM data registers.
<NoVal>	No Value, no additional historical 15–Minute PM data registers.
Restrictions:	RTRV–PM–T3 is denied if NUM15MIN of {1–32, ALL} (i.e., any value) and TMPPER of 1–DAY is entered.
NUM1DAY	{1–7, ALL, <NoVal>}
Default:	<NoVal>
Addressing:	None
Description:	Number of 1–Day Historical Registers, specifies the number of 1–Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are:
1–7	1–7 additional historical 1–Day PM data registers.
ALL	All additional historical 1–Day PM data registers.
<NoVal>	No Value, no additional historical 1–Day PM data registers.
Restrictions:	RTRV–PM–T3 is denied if NUM1DAY of {1–7, ALL} (i.e., any value) and TMPPER of 15–MIN is entered.

SUCCESSFUL RESPONSE FORMAT

```

```

Note: The first line of parsable output is provided only when a value for NUM15MIN is entered. The second line of parsable output is provided for each PM data register reported.

OUTPUT PARAMETERS

AID	DS3_AID:	
	{T3–{1–4800}}	(T3–DS3#)
	{EC1T3–{1–3840}}	(EC1T3–EC1/STS1/DS3#)
	{OC3T3–{1–2240}–{1–3}}	(OC3T3–OC3#–STS1/DS3#)
	{OC12T3–{1–560}–{1–4}–{1–3}}	(OC12T3–OC12#–STM1#–STS1/DS3#)
	DS3 AID, identifies the DS3 port.	
FENDALM	{AIS, FEACEQPT, ISD, LOF, LOS, RAI}	
	Far End Alarm. Identifies any far–end DS3 alarm conditions that exist on the DS3. A FENDALM value is reported only if a FENDALM condition exists. Values are:	
	AIS	Alarm Indication Signal, AIS detected
	FEACEQPT	Far–End Alarm & Control (FEAC) Equipment detected
	ISD	Idle Signal Detected
	LOF	Loss Of Frame detected
	LOS	Loss Of Signal detected
	RAI	Remote Alarm Indicated detected

NENDALM	{7LOF, AICMIS, AIS, ISD, LOF, LOS}
	Near End Alarm. Identifies any near-end DS3 alarm conditions that exist on the DS3. A NENDALM value is reported only if a NENDALM condition exists. Values are:
	7LOF Seven Loss Of Frame, Incoming LOF detected on all 7 DS2s embedded in the DS3
	AICMIS Application Identification Channel Mismatch, AIC mismatch detected
	AIS Alarm Indication Signal, AIS detected
	ISD Idle Signal Detected
	LOF Loss Of Frame detected
	LOS Loss Of Signal detected
PST	{IS, OOS-AU, OOS-AUMA, OOS-MA}
	Primary State. Indicates the current primary state of the DS3. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are:
	IS In-Service
	OOS-AU Out Of Service-Autonomous
	OOS-AUMA Out Of Service-Autonomous and Management
	OOS-MA Out Of Service-Management
SST	{ACT, AINS, BUSY, DSBLD, FAF, LPBK, MT, PMI, SDEE, SGEO, TRM, TS, UAS}
	Secondary State. Indicates any secondary states associated with the DS3. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the DS3 at the time of the RTRV-PM-T3. Values are:
	ACT Active
	AINS Automatic In-Service
	BUSY Busy
	DSBLD Disabled
	FAF Facility failure
	LPBK Loopback
	MT Maintenance
	PMI Performance Monitoring Inhibited
	SDEE Supported Entity Exists
	SGEO Supporting Entity Outage
	TRM Terminated, supported entity is cross-connected
	TS Test
	UAS Unassigned

MONTYPE	NEAR_END_PARAMETERS:{AISS, CVCP-P, CVL, CVP, ESA-L, ESA-P, ESACP-P, ESB-L, ESB-P, ESBCP-P, ESCP-P, ESL, ESP, FC-P, LOSS, SAS-P, SESP, SESL, SESP, UASCP-P, UASP},	
	FAR_END_PARAMETERS:{CVCP-P, ESACP-P, ESBCP-P, ESCP-P, FCCP-P, SASCP-P, SESP-P, UASCP-P}	
	Monitored Parameter Type, identifies the monitored parameter. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:	
	AISS	AIS Seconds – Path, AISS register.
	CVCP-P	Coding Violations, CP-bit parity – Path, CVCP-P register.
	CVL	Coding Violations – Line, CV-L register.
	CVP	Coding Violations – Path, CV-P register.
	ESA-L	Errored Seconds type A – Line, ESA-L register.
	ESA-P	Errored Seconds type A – Path, ESA-P register.
	ESACP-P	Errored Seconds type A, CP-bit parity – Path, ESACP-P register.
	ESB-L	Errored Seconds type B – Line, ESB-L register.
	ESB-P	Errored Seconds type B – Path, ESB-P register.
	ESBCP-P	Errored Seconds type B, CP-bit parity – Path, ESBCP-P register.
	ESCP-P	Errored Seconds, CP-bit parity – Path, ESCP-P register.
	ESL	Errored Seconds – Line, ES-L register.
	ESP	Errored Seconds – Path, ES-P register.
	FC-P	Failure Counts – Path, FC-P register.
	FCCP-P	Failure Counts, CP-bit parity – Path, FC-P register.
	LOSS	Loss Of Signal Seconds – Line, LOSS register.
	SAS-P	Severe AIS Seconds – Path, SAS-P register.
	SASCP-P	Severe AIS Seconds, CP-bit parity – Path, SASCP-P register.
	SESCP-P	Severely Errored Seconds, CP-bit parity – Path, SESP-P register.
	SESL	Severely Errored Seconds – Line, SES-L register.
	SESP	Severely Errored Seconds – Path, SES-P register.
	UASCP-P	Unavailable Seconds, CP-bit parity – Path, UASCP-P register.
	UASP	Unavailable Seconds – Path, UAS-P register.
MONVAL	{0-4294967295, NA}	
	Monitored Parameter Value, indicates the measured value of the indicated MONTYPE being reported. Values are:	
	0-4294967295	Measured Value of the Monitored Parameter, value reported if VLDTY is not {NA}.
	NA	Not Available, value reported if VLDTY is {NA}.
VLDTY	{ADJ, COMPL, LONG, NA, OFF, PRTL}	
	Validity, indicates whether the PM data being retrieved for the specified time period was accumulated over the entire time period or some portion thereof. Values are:	
	ADJ	Adjusted, the data was manually adjusted or initialized (via INIT-REG-T3).
	COMPL	Complete, the data was accumulated over the entire time period.
	LONG	Longer, the data was accumulated over a greater period of time than the indicated time period.
	NA	Not Available, the data is not available.
	OFF	Off, PM data collection for the entire time period was disabled (via SET-PMODE-T3).
	PRTL	Partial, the data was accumulated over some portion of the time period, but not the entire time period.

LOCN	{FEND, NEND} Location, indicates whether a near-end or far-end monitored parameter is being reported. Values are: FEND Far-End NEND Near-End
DIRN	{NA, RCV} Direction, identifies the direction of the signal being monitored. Values are: NA Not Applicable, value reported for LOCN value of FEND. RCV Receive side, value reported for LOCN value of NEND.
TMPER	{15-MIN, 1-DAY} Time Period, identifies the accumulation time period for the indicated monitored parameter. Values are: 15-MIN 15-Minute PM collection period 1-DAY 1-Day (24 hour) PM collection period
MONDAT	{MONTH-DAY:{01-12} – {01-31} } Monitor Date, identifies the date when the PM collection period began. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
MONTM	{HOUR-MINUTE:{00-23} – {00-59} } Monitor Time, identifies the time of day when the PM collection period began. The format of MONTM is <HOUR_OF_DAY> – <MINUTE_OF_HOUR>.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Value for num15min is not consistent with value for time period */ /* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monlev in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid date in request message. */ /* Invalid num15min value in request message. */ /* Invalid num1day value in request message. */ /* Invalid day for the requested month. */ /* Invalid time in request message. */ /* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */

IIPG Input, Invalid Parameter Grouping
 /* Invalid location for requested montype. */

SDBE Status, internal Data Base Error
 /* Error in reading TP database record. */

SROF Status, Requested Operation Failed
 /* Timeout waiting for response from <AID>. */
 /* Invalid time period is detected, TMPEP = <TIME PERIOD>. */
 /* Unable to determine the global TP number, TPTYPE=<TP TYPE>, TPNum=<TP
 NUMBER>. */
 /* Unable to allocate memory for user data. */
 /* rpt_file error – <ERRNO>, status = <STATUS> */
 /* Cannot open <FILENAME> */
 /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */
 /* rpt_print error – <ERRNO>, status = <STATUS> */
 /* Unable to determine the history file name, TPTYPE=<TP TYPE>, TMPEP=<TIME PE-
 RIOD>, FileIdx=<FILE INDEX>. */
 /* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */
 /* Failed to retrieve PM historical data. */
 /* Unable to determine supporting facility entity. */
 /* Error occurred while provisioning equipment. */
 /* Unexpected response message received from <CARDNAME>. */
 /* Failed to convert tp num to AID string. */
 /* Unable to determine facility type. */
 /* Unable to determine alarms. */
 /* Failed to get PST and SST State. */

EXAMPLES

In the following example, the 1–Day historical PM data that was accumulated for DS3 port T3–1017 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-T3::T3-1017::ALL,12-UP,,1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"T3-1017,T3:FC-P,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"
"T3-1017,T3:UASP,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"
/* RTRV-PM-T3::T3-1017::ALL,12-UP,,1-DAY,1-15 [P71042] (1) */
;
```

In the following example, the current 15–Minute AIS seconds (AISS) PM data for DS3 port T3–1057 is retrieved.

```
RTRV-PM-T3::T3-1057::AISS;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
"T3-1057,T3:AISS,1,PRTL,NEND,RCV,15-MIN,01-18,10-30"
/* RTRV-PM-T3::T3-1057::AISS [P71048] (2) */
;
```

In the following example, the 15–minute historical near–end errored seconds, path (ES–P) PM data that was accumulated for DS3 port T3–1333 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-T3::T3-1333::ESP,0-UP,,15-MIN,1-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
"T3-1333,T3:ESP,0,CMPL,NEND,RCV,15-MIN,01-18,08-15"
/* RTRV-PM-T3::T3-1333:::ESP,0-UP,,,15-MIN,1-18,8-20 [P71049] (2) */
;
```

COMMAND CODE: RTRV-PM-VT1
COMMAND NAME: RETRIEVE PERFORMANCE
MONITORING VT1

PURPOSE

The RTRV-PM-VT1 command retrieves the current and/or historical 15-Minute and/or 1-Day PM data corresponding to the specified PM data collection register(s) for the specified VT1.5 port(s).

For each monitored parameter, the current and/or up to thirty-two (32) 15-Minute historical (up to the most recent previous 8 hours of 15-Minute PM data) PM registers, or the current and/or up to seven (7) 1-Day historical PM registers, or a combination of both 15-Minute and 1-Day PM registers can be retrieved.

If the SET-PMMODE-VT1 command is set to PMSTATE=OFF for an entire 15-minute period and no PM occurs on that port, and if the PMSTATE is set to ON within several minutes after the 15-minute period, then the retrieved VLDTY value (via RTRV-PM-VT1) for the previous 15-minute period *may not* be displayed as OFF.

The successful response for a RTRV-PM-VT1 command contains the following lines of parsable output data for each VT1.5 AID specified, in ascending order by VT1.5 AID:

- If a value for NUM15MIN is entered, one line of parsable output data identifying any existing alarms and the current state of the VT1.5,
- A line of parsable output data for each PM parameter for each PM collection period being reported, in ascending order by PM collection period. No output PM data is provided if the port is not provisioned. No output PM data is provided if the date and time specified exceed the available collection periods (i.e., exceeds 8 hours for 15-Minute PM registers or 7 days for 1-Day PM registers).
- No line of parsable output data is provided if the specified VT1.5 is embedded within a protection OC3 or OC12.

A RTRV-PM-VT1 command is denied if:

- An invalid parameter value or combination of parameter values is entered.

INPUT FORMAT

RTRV-PM-VT1 : [TID] : AID : [CTAG] : : [MONTYPE] , [MONLEV] , [LOCN] , [DIRN] , [TMPER] ,
[MONDAT] , [MONTM] , [NUM15MIN] , [NUM1DAY] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	VT1 AID, identifies the VT1.5 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	

MONTYPE	{ALL}, NEAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV, ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV}, FAR_END_PARAMETERS:{ALS-V, ALSV, CV-V, CVV, ES-V, ESV, ESA-V, ESAV, ESB-V, ESBV, FC-V, FCV, SES-V, SESV, UAS-V, UASV}																		
	Default: {ALL} Addressing: None Description: Monitored Parameter Type, identifies the type of monitored parameter whose PM data is being retrieved. A parameter may be specified by more than one value, e.g., parameter values may be entered with or without the dash (-). Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:																		
	<table> <tr> <td>ALL</td><td>All monitored parameter PM registers.</td></tr> <tr> <td>ALS-V, ALSV</td><td>Alarm Indication Signal/Loss of Pointer – VT Path, ALS-V register.</td></tr> <tr> <td>CV-V, CVV</td><td>Coding Violations – VT Path, CV-V register.</td></tr> <tr> <td>ES-V, ESV</td><td>Errored Seconds – VT Path, ES-V register.</td></tr> <tr> <td>ESA-V, ESAV</td><td>Errored Seconds type A – VT Path, ESA-V register.</td></tr> <tr> <td>ESB-V, ESBV</td><td>Errored Seconds type B – VT Path, ESB-V register.</td></tr> <tr> <td>FC-V, FCV</td><td>Failure Counts – VT Path, FC-V register.</td></tr> <tr> <td>SES-V, SESV</td><td>Severely Errored Seconds – VT Path, SES-V register.</td></tr> <tr> <td>UAS-V, UASV</td><td>Unavailable Seconds – VT Path, UAS-V register.</td></tr> </table>	ALL	All monitored parameter PM registers. MONLEV	{LEVEL-DIRECTION:{0-4294967295} – {DN, DNORNCMPL, UP, UPORNCMPL} }																		
	Default: {1-UP} Addressing: None Description: Monitoring Level, specifies the discriminating level of PM parameter event counts to be reported for the specified monitored parameter (MONTYPE). The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:																		
	<table> <tr> <td>{0-4294967295} – DN</td><td><LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.</td></tr> <tr> <td>{0-4294967295} – DNORNCMPL</td><td><LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</td></tr> <tr> <td>{0-4294967295} – UP</td><td><LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.</td></tr> <tr> <td>{0-4294967295} – UPORNCMPL</td><td><LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.</td></tr> </table>	{0-4294967295} – DN	<LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.	{0-4294967295} – DNORNCMPL	<LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.	{0-4294967295} – UP	<LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.	{0-4294967295} – UPORNCMPL	<LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.										
{0-4294967295} – DN	<LEVEL> – Down, Only PM data for the specified MONTYPE that is less-than or equal-to (<) the value of <LEVEL> is reported.																		
{0-4294967295} – DNORNCMPL	<LEVEL> – Down Or Not Complete, Only PM data for the specified MONTYPE that is < the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is > the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.																		
{0-4294967295} – UP	<LEVEL> – Up, Only PM data for the specified MONTYPE that is greater-than or equal-to (>) the value of <LEVEL> is reported.																		
{0-4294967295} – UPORNCMPL	<LEVEL> – Up Or Not Complete, Only PM data for the specified MONTYPE that is > the value of <LEVEL> or that does not have a VLDTY flag of CMPL (i.e., the PM data is < the value of <LEVEL> and has a VLDTY flag of {ADJ, LONG, NA, OFF, PRTL}) is reported.																		
LOCN	{FEND, NEND}																		
	Default: < All applicable locations for the selected monitored parameters > Addressing: None Description: Location, specifies whether PM registers for near-end or far-end PM monitoring are to be retrieved. Values are:																		
	<table> <tr> <td>FEND</td><td>Far-End</td></tr> <tr> <td>NEND</td><td>Near-End</td></tr> </table>	FEND	Far-End	NEND	Near-End														
FEND	Far-End																		
NEND	Near-End																		

DIRN	{NA, RCV, TRMT}	
	Default:	< All applicable directions >
	Addressing:	None
	Description:	Direction, specifies the direction of the signal being monitored. The value for DIRN is verified, but does not affect the function of the RTRV-PM-VT1 command.
	NA	Not Applicable
TMPER	RCV	Receive side
	TRMT	Transmit direction
	{15-MIN, 1-DAY, BOTH}	
	Default:	{15-MIN}
	Addressing:	None
	Description:	Time Period, specifies whether PM data for the 15-minute and/or the daily (24 hour) PM collection register for the specified parameter is to be retrieved. Values are:
	15-MIN	15-Minute PM collection register
	1-DAY	1-Day (24 hour) PM collection register
	BOTH	Both 15-Minute and 1-Day PM collection registers
	Restrictions:	RTRV-PM-VT1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-VT1 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.
MONDAT	{MONTH-DAY:{01-12} – {01-31} }	
	Default:	< Current date >
	Addressing:	None
	Description:	Monitor Date, specifies the (starting) date of the PM collection period for which PM data is to be retrieved. The format of MONDAT is <MONTH_OF_YEAR> – <DAY_OF_MONTH>.
	Restrictions:	RTRV-PM-VT1 is denied if TMPER of 15-MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time. RTRV-PM-VT1 is denied if TMPER of {1-DAY, BOTH} is entered and the date specified by MONDAT is not within the previous seven (7) days of the current time.

MONTM	{ HOUR – MINUTE :{00–23} – {00–59} }
	Default: < Current time > Addressing: None Description: Monitor Time, if TMPER of {15–MIN, BOTH} is entered, specifies the (starting) time of the PM collection period for which PM data is to be retrieved. If TMPER of 1–DAY is entered, the value of MONTM is ignored (i.e., an entered value is validated, but does not affect the command execution). The format of MONTM is < HOUR_OF_DAY > – < MINUTE_OF_HOUR >, where: < HOUR_OF_DAY > is in 24 hour time. < MINUTE_OF_HOUR > set to {0–14} specifies the first 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {15–29} specifies the second 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {30–44} specifies the third 15–minute period within the < HOUR_OF_DAY > value. < MINUTE_OF_HOUR > set to {45–59} specifies the fourth 15–minute period within the < HOUR_OF_DAY > value. Restrictions: RTRV–PM–VT1 is denied if TMPER of 15–MIN is entered and the date and time specified by MONDAT and MONTM is not within the previous eight (8) hours of the current time.
NUM15MIN	{1–32, ALL, <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 15–Minute Historical Registers, specifies the number of 15–Minute historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are: 1–32 1–32 additional historical 15–Minute PM data registers. ALL All additional historical 15–Minute PM data registers. <NoVal> No Value, no additional historical 15–Minute PM data registers. Restrictions: RTRV–PM–VT1 is denied if NUM15MIN of {1–32, ALL} (i.e., any value) and TMPER of 1–DAY is entered.
NUM1DAY	{1–7, ALL, <NoVal>}
	Default: <NoVal> Addressing: None Description: Number of 1–Day Historical Registers, specifies the number of 1–Day historical PM data registers to retrieve in addition to that specified by MONDAT and MONTM. Values are: 1–7 1–7 additional historical 1–Day PM data registers. ALL All additional historical 1–Day PM data registers. <NoVal> No Value, no additional historical 1–Day PM data registers. Restrictions: RTRV–PM–VT1 is denied if NUM1DAY of {1–7, ALL} (i.e., any value) and TMPER of 15–MIN is entered.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNC	Input, Data Not Consistent /* Value for num15min is not consistent with value for time period */ /* Value for num1day is not consistent with value for time period */
IDNV	Input, Data Not Valid /* Invalid location in request message. */ /* Invalid montype in request message. */ /* Invalid monlev in request message. */ /* Invalid direction in request message. */ /* Invalid time period in request message. */ /* Invalid date in request message. */ /* Invalid num15min value in request message. */ /* Invalid num1day value in request message. */ /* Invalid day for the requested month. */ /* Invalid time in request message. */ /* Input date/time is not within the valid range. */
IIAC	Input, Invalid ACcess identifier /* AID not in Partition. */ /* Invalid AID entered. */
IIPG	Input, Invalid Parameter Grouping /* Invalid location for requested montype. */
SDBE	Status, internal Data Base Error /* Error in reading TP database record. */

SROF Status, Requested Operation Failed

- /* Timeout waiting for response from <AID>. */
- /* Invalid time period is detected, TMPER = <TIME PERIOD>. */
- /* Unable to determine the global TP number, TPTYPE=<TP TYPE>, TPNum=<TP NUMBER>. */
- /* Unable to allocate memory for user data. */
- /* rpt_file error – <ERRNO>, status = <STATUS> */
- /* Cannot open <FILENAME> */
- /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */
- /* rpt_print error – <ERRNO>, status = <STATUS> */
- /* Unable to determine the history file name, TPType=<TP TYPE>, TMPER=<TIME PERIOD>, FileIdx=<FILE INDEX>. */
- /* Failed to send rtrv pm msg to SPB/IPU=<SPB/IPU ADDRESS>. */
- /* Failed to retrieve PM historical data. */
- /* Unable to determine supporting facility entity. */
- /* Error occurred while provisioning equipment. */
- /* Unexpected response message received from <CARDNAME>. */
- /* Failed to convert tp num to AID string. */
- /* Unable to determine facility type. */
- /* Unable to determine alarms. */
- /* Failed to get PST and SST State. */

EXAMPLES

In the following example, the 1-Day historical PM data that was accumulated for VT1.5 port EC1VT1-57-2-1 on January 15th for all monitored parameters with a value greater than or equal to a count of 12 is retrieved.

```
RTRV-PM-VT1::EC1VT1-57-2-1::ALL,12-UP,,1-DAY,1-15;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71042 COMPLD
"EC1VT1-57-2-1,VT1:FC-V,14,CMPL,NEND,RCV,1-DAY,01-15,00-00"
"EC1VT1-57-2-1,VT1:UASV,15,CMPL,NEND,RCV,1-DAY,01-15,00-00"
/* RTRV-PM-VT1::EC1VT1-57-2-1::ALL,12-UP,,1-DAY,1-15 [P71042] (1) */
;
```

In the following example, the current 15-Minute AIS/LOP (ALS-V) PM data for VT1.5 port EC1VT1-97-7-4 is retrieved.

```
RTRV-PM-VT1::EC1VT1-97-7-4::ALSV;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
"EC1VT1-97-7-4,VT1:ALS-V,1,PRTL,NEND,RCV,15-MIN,01-18,10-30"
"EC1VT1-97-7-4,VT1:ALS-V,0,PRTL,FEND,RCV,15-MIN,01-18,10-30"
/* RTRV-PM-VT1::EC1VT1-97-7-4::ALSV [P71048] (2) */
;
```

In the following example, the 15-minute historical near-end errored seconds, VT path (ES-V) PM data that was accumulated for VT1.5 port EC1VT1-383-5-3 on January 18th for the collection period beginning at 8:15 am is retrieved.

```
RTRV-PM-VT1::EC1VT1-383-5-3::ESV,0-UP,NEND,,15-MIN,1-18,8-20;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
"EC1VT1-383-5-3,VT1:ESV,0,CMPL,NEND,RCV,15-MIN,01-18,08-15"
/* RTRV-PM-VT1::EC1VT1-383-5-3::ESV,0-UP,NEND,,15-MIN,1-18,8-20
[P71049] (2) */
;

COMMAND CODE: **RTRV-PMATTR-ALL**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING ATTRIBUTES ALL**

PURPOSE

The RTRV-PMATTR-ALL command retrieves the system-wide PM attributes. Threshold Crossing Alert (TCA) attributes and the REPTPMFILERDY attribute are supported. (Also refer to SET-PMATTR-ALL.)

A RTRV-PMATTR-ALL command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMATTR-ALL: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
"TCA=<value>,REPTPMFILERDY=<value>"  
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

OUTPUT PARAMETERS

TCA=	{A, R} Threshold Crossing Alert, indicates whether autonomous messages for the indicated threshold crossing alerts (TCA) are allowed or restricted during the remainder of a 15-minute monitor period for which a corresponding facility failure is detected. The following TCAs are affected:
------	---

Facility Type	Facility Failure	Threshold Crossing Alerts (TCAs) Affected
OC12	LOS or LOF	T-CVS, T-ESS, T-ESA-S, T-ESB-S, T-LOSS, T-SEFS, T-SESS
	AIS-L	T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-FC-L, T-SESL, T-UASL
	RFI-L	(Far-End):T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-FC-L, T-SESL, T-UASL
OC3	LOS or LOF	T-CVS, T-ESS, T-ESA-S, T-ESB-S, T-LOSS, T-SEFS, T-SESS
	AIS-L	T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-FC-L, T-SESL, T-UASL
	RFI-L	(Far-End):T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-FC-L, T-SESL, T-UASL
EC1	LOS or LOF	T-LOSS, T-SEFS
	AIS-L	T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-SESL, T-UASL
	RFI-L	(Far-End):T-ESL, T-FC-L, T-SESL, T-UASL
STS-1	AIS-P or LOP-P	T-ALS-P, T-CVP T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SESP, T-UASP
	RFI-P	(Far-End):T-ALS-P, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SESP, T-UASP
STS-3C	AIS-P or LOP-P	T-ALS-P, T-CVP T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SESP, T-UASP
	RFI-P	(Far-End):T-ALS-P, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SESP, T-UASP
VT1.5	AIS-V or LOP-V	T-ALS-V, T-CVV T-ESV, T-ESA-V, T-ESB-V, T-FC-V, T-SESV, T-UASV
	RFI-V	(Far-End):T-ALS-V, T-CVV, T-ESV, T-ESA-V, T-ESB-V, T-FC-V, T-SESV, T-UASV
DS3	LOS	T-CVL, T-ESL, T-ESA-L, T-ESB-L, T-LOSS, T-SESL
	LOF or AIS	T-AISS, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SAS-P, T-SESP, T-UASP, T-CVCP-P, T-ESCP-P, T-ESACP-P, T-ESBCP-P, T-SESCP-P, T-UASCP-P
	RAI	(Far-End):T-CVCP-P, T-ESCP-P, T-ESACP-P, T-ESBCP-P, T-FCCP-P, T-SASCP-P, T-SESCP-P, T-UASCP-P

Facility Type	Facility Failure	Threshold Crossing Alerts (TCAs) Affected
DS1	LOS	T-CVL, T-ESL, T-LOSS, T-SESL
	LOF, AIS, or AIS-CI	T-AISS, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SAS-P, T-SESP, T-UASP, T-ESNP, T-SESNP, T-UASNP
	RAI or RAI-CI	(Far-End):T-CSS, T-CVP, T-ESP, T-ESA-P, T-ESB-P, T-FC-P, T-SEFS, T-SESP, T-UASP, T-ESNP, T-SESNP, T-UASNP

Other TCAs for other PM parameters are not affected. Refer to Appendix F, Monitored PM Parameters for a list of all monitored PM parameters. Values are:

- A Allowed, indicates that threshold crossing alerts are generated regardless of whether the associated facility has failed.
- R Restricted, indicates that threshold crossing alerts for the affected PM parameters (see above) are not generated for the remainder of any 15-minute monitor period for which the associated facility has failed.

REPTPMFILERDY REPORT PM FILE READY

{Y, N}

Report PM File Ready is a flag that indicates if the event message of PMFILERDY needs to be generated and displayed to the customer. Values are:

- Y Yes, the transient event PMFILERDY message needs to be generated and displayed.
- N No, the transient event PMFILERDY message does not need to be generated and displayed.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/ * <Informational Error Description Text> */]
[/ * <Expanded Error Code Description> */]
[/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SDBE Status, internal Data Base Error
/* Error reading pm attribute database file. */

EXAMPLES

In the following example, the system-wide PM attribute settings are retrieved.

```
RTRV-PMATTR-ALL;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P18005. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P18005 COMPLD  
"TCA=A,REPTPMFILERDY=Y"  
/* RTRV-PMATTR-ALL [P18005] (2) */  
;

COMMAND CODE: **RTRV-PMODE-EC1**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING MODE EC1**

PURPOSE

The RTRV-PMODE-EC1 command retrieves the PM mode type setting (whether near-end section or line PM data collection or far-end line PM data collection is enabled) for the specified EC1 port. (Refer to the SET-PMODE-EC1 command for additional information.)

The successful response for a RTRV-PMODE-EC1 command contains one line of parsable output data for each near-end or far-end PM mode type setting being reported, in ascending order (from the lowest specified EC1 AID to the highest specified EC1 AID) for each EC1 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-EC1).

A RTRV-PMODE-EC1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMODE-EC1 : [TID] : AID : [CTAG] : : [LOCN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{FEND, NEND} Default: < All applicable locations > Addressing: None Description: Location. specifies whether the PM mode for near-end or far-end PM monitoring is to be retrieved. Values are: FEND Far-End NEND Near-End

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
"<AID> : <LOCN> , <MODETYPE>"  
[/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]  
;
```

OUTPUT PARAMETERS

AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) EC1 AID, identifies the EC1 port.
-----	--

LOCN	{FEND, NEND}	Location, indicates whether the report line pertains to near-end or far-end monitored parameters. Values are:
	FEND	Far-End
	NEND	Near-End
MODETYPE	{L, L&S, NONE, S}	Mode Type, indicates the type of PM parameters that are being monitored. Values are:
	L	Line PM parameters are being monitored.
	L&S	Line and Section PM parameters are being monitored.
	NONE	None, no PM parameters are being monitored.
	S	Section PM parameters are being monitored.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in partition. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM EC1 record. */ /* Failed to set file ptr to EC1 pmmode database. */
SROF	Status, Requested Operation Failed /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* rpt_file error - <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE> */ /* rpt_print error - <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */

EXAMPLES

In the following example, the PM mode setting for near-end and far-end PM parameters for EC1 port EC1-105 is retrieved.

```
RTRV-PMODE-EC1::EC1-105;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of all near-end and far-end parameters is enabled for EC1 port EC1-105.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
  "EC1-105:NEND,L&S"
  "EC1-105:FEND,L"
/* RTRV-PMODE-EC1::EC1-105 [P71048] (2) */
;
```

In the following example, the PM mode setting for near-end PM parameters for EC1 port EC1-2 is retrieved.

```
RTRV-PMODE-EC1::EC1-2::NEND;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end parameters is disabled for EC1 port EC1-2.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
  "EC1-2:NEND,NONE"
/* RTRV-PMODE-EC1::EC1-2::NEND [P71049] (3) */
;

COMMAND CODE: RTRV-PMMODE-F3
COMMAND NAME: RETRIEVE PERFORMANCE
MONITORING MODE F3

PURPOSE

The RTRV-PMMODE-F3 command retrieves the PM mode type setting (whether path PM data collection is enabled) for the specified Fractional-T3. (Refer to the SET-PMMODE-F3 command for additional information.)

The successful response for a RTRV-PMMODE-F3 command contains one line of parsable output data for each PM mode type setting being reported, in ascending order (from the lowest specified F3 AID to the highest specified F3 AID) for each F3 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-F3).

A RTRV-PMMODE-F3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMMODE-F3 : [TID] : AID : [CTAG] : : [LOCN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the Fractional-T3.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{NEND} Default: <All applicable locations> Addressing: None Description: Location. specifies whether the PM mode for near-end or far-end PM monitoring is to be retrieved. Value is: NEND Near-End.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<AID>: <LOCN>, <MODETYPE>"
[/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

AID	F3_AID: {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) F3 AID, identifies the Fractional-T3.
-----	--

LOCN	{NEND}	Location, indicates whether the report line pertains to near-end or far-end monitored parameters. Value is:
	NEND	Near-End
MODETYPE	{N, NONE}	Mode Type, indicates the type of PM parameters that are being monitored. Values are:
	N	N T1 Path, Path PM parameters are to be monitored and summarized for all DS1s assigned to the F3.
	NONE	None, no PM parameters are being monitored.

UNSUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in partition. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM F3 record. */ /* Failed to set file ptr to F3 pmmode database. */
SROF	Status, Requested Operation Failed /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* rpt_file error – <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */ /* rpt_print error – <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */

EXAMPLES

In the following example, the PM mode setting for the PM parameters for Fractional-T3 T3F3-1057-8 is retrieved.

```
RTRV-PMODE-F3::T3F3-1057-8;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P71048 COMPLD  
"T3F3-1057-8:NEND,N"  
/* RTRV-PMODE-F3::T3F3-1057-8 [P71048] (2) */

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in partition. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM OC3 record. */ /* Failed to set file ptr to OC3 pmmode database. */
SROF	Status, Requested Operation Failed /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* rpt_file error - <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE> */ /* rpt_print error - <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */

EXAMPLES

In the following example, the PM mode setting for near-end and far-end PM parameters for OC3 port OC3-115 is retrieved.

```
RTRV-PMODE-OC3::OC3-115;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of all near-end and far-end parameters is enabled for OC3 port OC3-115.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
  "OC3-115:NEND,L&S"
  "OC3-115:FEND,L"
/* RTRV-PMODE-OC3::OC3-115 [P71048] (2) */
;
```

In the following example, the PM mode setting for near-end PM parameters for OC3 port OC3-118 is retrieved.

```
RTRV-PMODE-OC3::OC3-118::NEND;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end parameters is disabled for OC3 port OC3-118.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
  "OC3-118:NEND,NONE"
/* RTRV-PMODE-OC3::OC3-118::NEND [P71049] (3) */
;

COMMAND CODE: **RTRV-PMODE-STS1**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING MODE STS-1**

PURPOSE

The RTRV-PMODE-STS1 command retrieves the PM mode type setting (whether near-end or far-end path PM data collection is enabled) for the specified STS-1 port. (Refer to the SET-PMODE-STS1 command for additional information.)

The successful response for a RTRV-PMODE-STS1 command contains one line of parsable output data for each near-end or far-end PM mode type setting being reported, in ascending order (from the lowest specified STS-1 AID to the highest specified STS-1 AID) for each STS-1 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-STS1). In addition, no line of parsable output data is displayed if the specified STS-1 is embedded within a protection OC-3 or OC-12.

A RTRV-PMODE-STS1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMODE-STS1: [TID] :AID: [CTAG] :: [LOCN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	STS1_AID:		
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)	
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)	
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)	
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	STS1 AID, identifies the STS-1 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	
LOCN	{FEND, NEND}		
	Default:	< All applicable locations >	
	Addressing:	None	
	Description:	Location. specifies whether the PM mode for near-end or far-end PM monitoring is to be retrieved. Values are:	
	FEND	Far-End	
	NEND	Near-End	

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in partition. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM STS1 record. */ /* Failed to set file ptr to STS1 pmmode database. */
SROF	Status, Requested Operation Failed /*Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* rpt_file error - <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE> */ /* rpt_print error - <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */

EXAMPLES

In the following example, the PM mode setting for near-end and far-end PM parameters for STS-1 port EC1STS1-115 is retrieved.

```
RTRV-PMODE-STS1::EC1STS1-115;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end path and far-end path parameters is enabled for STS-1 port EC1STS1-115.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M  P71048  COMPLD
    "EC1STS1-115:NEND,P"
    "EC1STS1-115:FEND,P"
/*  RTRV-PMODE-STS1::EC1STS1-115  [P71048]  (2)  */
;
```

In the following example, the PM mode setting for near-end PM parameters for STS-1 port EC1STS1-2 is retrieved.

```
RTRV-PMODE-STS1::EC1STS1-2::NEND;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end parameters is disabled for STS-1 port EC1STS1-2.

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in partition. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM STS3C record. */ /* Failed to set file ptr to STS3C pmmode database. */
SROF	Status, Requested Operation Failed /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* rpt_file error - <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE> */ /* rpt_print error - <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */

EXAMPLES

In the following example, the PM mode setting for near-end and far-end PM parameters for STS-3C port OC3STS3C-8 is retrieved.

```
RTRV-PMODE-STS3C : OC3STS3C-8 ;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end path and far-end path parameters is enabled for STS-3C port OC3STS3C-8.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "OC3STS3C-8:NEND,P"  
  "OC3STS3C-8:FEND,P"  
/* RTRV-PMODE-STS3C:OC3STS3C-8 [P71048] (2) */  
;
```

In the following example, the PM mode setting for near-end PM parameters for STS-3C port OC3STS3C-2 is retrieved.

```
RTRV-PMODE-STS3C : OC3STS3C-2::NEND ;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end parameters is disabled for STS-3C port OC3STS3C-2.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "OC3STS3C-2:NEND,NONE"

COMMAND CODE: RTRV-PMMODE-T1
COMMAND NAME: RETRIEVE PERFORMANCE
MONITORING MODE T1

PURPOSE

The RTRV-PMMODE-T1 command retrieves the PM mode type setting (whether near-end line or path PM data collection or far-end line or path PM data collection is enabled) for the specified DS1 port. (Refer to the SET-PMMODE-T1 command for additional information.)

The successful response for a RTRV-PMMODE-T1 command contains one line of parsable output data for each near-end or far-end PM mode type setting being reported, in ascending order (from the lowest specified DS1 AID to the highest specified DS1 AID) for each DS1 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-T1). In addition, no line of parsable output data is displayed if the specified DS1 is embedded within a protection OC-3 or OC-12.

A RTRV-PMMODE-T1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMMODE-T1 : [TID] : AID : [CTAG] : : [LOCN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	DS1_AID: { T1-{1-59392} } (T1-DS1#) { T3T1-{1-4800}-{1-28} } (T3T1-DS3#-DS1#) { EC1T1-{1-3840}-{1-28} } (EC1T1-EC1/STS1/DS3#-DS1#) { EC1T1-{1-3840}-{1-7}-{1-4} } (EC1T1-EC1/STS1#-VTGrp#-VT1/DS1#) { OC3T1-{1-2240}-{1-3}-{1-28} } (OC3T1-OC3#-STS1/DS3#-DS1#) { OC3T1-{1-2240}-{1-3}-{1-7}-{1-4} } (OC3T1-OC3#-STS1#-VTGrp#-VT1/DS1#) { OC12T1-{1-560}-{1-4}-{1-3}-{1-28} } (OC12T1-OC12#-STM1#-STS1/DS3#-DS1#) { OC12T1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4} } (OC12T1-OC12#-STM1#-STS1#-VTGrp#-VT1/DS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: DS1 AID, identifies the DS1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
LOCN	{FEND, NEND} Default: < All applicable locations > Addressing: None Description: Location. specifies whether the PM mode for near-end or far-end PM monitoring is to be retrieved. Values are: FEND Far-End NEND Near-End Restrictions: RTRV-PMMODE-T1 is denied if a value of LOCN=FEND is used and the "FDL based Far End Performance Monitoring" PFO is not enabled.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD

 /* nrl_rpt_print error – no transaction, msgtype = <MSGTYPE> */
 /* rpt_print error – <ERRNO>, status = <STATUS> */
 /* Failed to convert TPid to an AID string. */

EXAMPLES

In the following example, the PM mode setting for near-end and far-end PM parameters for DS1 port T3T1-1057-8 is retrieved.

```
RTRV-PMODE-T1::T3T1-1057-8;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end path and far-end line and path parameters is enabled for DS1 port T3T1-1057-8.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "T3T1-1057-8:NEND,P"  
  "T3T1-1057-8:FEND,L&P"  
/* RTRV-PMODE-T1::T3T1-1057-8 [P71048] (2) */  
;
```

In the following example, the PM mode setting for near-end PM parameters for DS1 port T3T1-961-2 is retrieved.

```
RTRV-PMODE-T1::T3T1-961-2::NEND;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end parameters is disabled for DS1 port T3T1-961-2.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  "T3T1-961-2:NEND,NONE"

COMMAND CODE: **RTRV-PMMODE-T3**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING MODE T3**

PURPOSE

The RTRV-PMMODE-T3 command retrieves the PM mode type setting (whether near-end line or path PM data collection or far-end path PM data collection is enabled) for the specified DS3 port. (Refer to the SET-PMMODE-T3 command for additional information.)

The successful response for a RTRV-PMMODE-T3 command contains one line of parsable output data for each near-end or far-end PM mode type setting being reported, in ascending order (from the lowest specified DS3 AID to the highest specified DS3 AID) for each DS3 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-T3). In addition, no line of parsable output data is displayed if the specified DS3 is embedded within a protection OC3.

A RTRV-PMMODE-T3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMMODE-T3 : [TID] : AID : [CTAG] : : [LOCN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	DS3_AID:	
	{T3-{1-4800}}	(T3-DS3#)
	{EC1T3-{1-3840}}	(EC1T3-EC1/STS1/DS3#)

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in partition. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM T3 record. */ /* Failed to set file ptr to T3 pmmode database. */
SROF	Status, Requested Operation Failed /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* rpt_file error - <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE> */ /* rpt_print error - <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */

EXAMPLES

In the following example, the PM mode setting for near-end and far-end PM parameters for DS3 port T3-1057 is retrieved.

```
RTRV-PMODE-T3::T3-1057;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end line and path and far-end path parameters is enabled for DS3 port T3-1057.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
  "T3-1057:NEND,L&P"
  "T3-1057:FEND,P"
/* RTRV-PMODE-T3::T3-1057 [P71048] (2) */
;
```

In the following example, the PM mode setting for near-end PM parameters for DS3 port T3-961 is retrieved.

```
RTRV-PMODE-T3::T3-961::NEND;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end parameters is disabled for DS3 port T3-961.

```

COMMAND CODE: RTRV-PMMODE-VT1
COMMAND NAME: RETRIEVE PERFORMANCE
MONITORING MODE VT1

PURPOSE

The RTRV-PMMODE-VT1 command retrieves the PM mode type setting (whether near-end or far-end path PM data collection is enabled) for the specified VT1.5 port. (Refer to the SET-PMMODE-VT1 command for additional information.)

The successful response for a RTRV-PMMODE-VT1 command contains one line of parsable output data for each near-end or far-end PM mode type setting being reported, in ascending order (from the lowest specified VT1.5 AID to the highest specified VT1.5 AID) for each VT1.5 AID specified. A line of parsable output data is only displayed if the specified AID is provisioned (via ENT-VT1). In addition, no line of parsable output data is displayed if the specified VT1.5 is embedded within a protection OC3.

A RTRV-PMMODE-VT1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMMODE-VT1 : [TID] : AID : [CTAG] : : [LOCN] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >		
	Default:	<SID>	
	Addressing:	None	
	Description:	Target Identifier, specifies the network node TID for the command.	
AID	VT1_AID:		
	{EC1VT1-{1-3840}-{1-7}-{1-4}}	(EC1VT1-EC1/STS1#-VTGrp#-VT1.5#)	
	{OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}}	(OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#)	
	{OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}}		
	(OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#)		
	Default:	Entry Required	
	Addressing:	&&-ranging and &-grouping	
	Description:	VT1 AID, identifies the VT1.5 port.	
CTAG	< 1-6 VALID CTAG CHARACTERS >		
	Default:	< System assigned CTAG value >	
	Addressing:	None	
	Description:	Correlation Tag, associates input command with its output responses.	
LOCN	{FEND, NEND}		
	Default:	< All applicable locations >	
	Addressing:	None	
	Description:	Location. specifies whether the PM mode for near-end or far-end PM monitoring is to be retrieved. Values are:	
	FEND	Far-End	
	NEND	Near-End	

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
"<AID>:<LOCN>,<MODETYPE>"
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	VT1_AID: {EC1VT1-{1-3840}-{1-7}-{1-4}} (EC1VT1-EC1/STS1#-VTGrp#-VT1.5#) {OC3VT1-{1-2240}-{1-3}-{1-7}-{1-4}} (OC3VT1-OC3#-STS1#-VTGrp#-VT1.5#) {OC12VT1-{1-560}-{1-4}-{1-3}-{1-7}-{1-4}} (OC12VT1-OC12#-STM1#-STS1#-VTGrp#-VT1.5#) VT1 AID, identifies the VT1.5 port.
LOCN	{FEND, NEND} Location, indicates whether the report line pertains to near-end or far-end monitored parameters. Values are: FEND Far-End NEND Near-End
MODETYPE	{NONE, P} Mode Type, indicates the type of PM parameters that are being monitored. Values are: NONE None, no PM parameters are being monitored. P Path PM parameters are being monitored.

UNSUCCESSFUL RESPONSE FORMAT

```

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Invalid location in request message. */
IIAC	Input, Invalid ACcess identifier /* Invalid AID entered. */ /* AID not in partition. */
SDBE	Status, internal Data Base Error /* Failed to set pointer to FM VT1 record. */ /* Failed to set file ptr to VT1 pmmode database. */
SROF	Status, Requested Operation Failed /* Unable to determine supporting facility entity. */ /* Unable to determine facility type. */ /* rpt_file error - <ERRNO>, status = <STATUS> */ /* Cannot open <FILENAME> */ /* nrl_rpt_print error - no transaction, msgtype = <MSGTYPE> */ /* rpt_print error - <ERRNO>, status = <STATUS> */ /* Failed to convert TPid to an AID string. */

EXAMPLES

In the following example, the PM mode setting for near-end and far-end PM parameters for VT1.5 port EC1VT1-105-7-3 is retrieved.

```
RTRV-PMODE-VT1::EC1VT1-105-7-3;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P71048. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end path and far-end path parameters is enabled for VT1.5 port EC1VT1-105-7-3.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71048 COMPLD
  "EC1VT1-105-7-3:NEND,P"
  "EC1VT1-105-7-3:FEND,P"
/* RTRV-PMODE-VT1::EC1VT1-105-7-3 [P71048] (2) */
;
```

In the following example, the PM mode setting for near-end PM parameters for VT1.5 port EC1VT1-2-2-6 is retrieved.

```
RTRV-PMODE-VT1::EC1VT1-2-2-6::NEND;
```

The output response, shown below, assumes CID 3 was used to enter the command and a system generated CTAG value of P71049. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

The response shown assumes PM monitoring of near-end parameters is disabled for VT1.5 port EC1VT1-2-2-6.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M P71049 COMPLD
  "EC1VT1-2-2-6:NEND,NONE"

COMMAND CODE: **RTRV-PMSCHED-ALL**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING SCHEDULE ALL**

PURPOSE

The RTRV-PMSCHED-ALL command retrieves

- whether 1-DAY PM reporting is enabled,
- the scheduled time-of-day of the autonomous REPT^PM^rr messages containing the 1-DAY PM report (if enabled),

A RTRV-PMSCHED-ALL command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMSCHED-ALL: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
/* <PMMODE>, <RPTIME> */
[/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

PMMODE	{OFF, ON} PM Mode, identifies whether a 1-DAY PM report is created and reported in a REPT^PM^rr autonomous message. Values are: OFF Off, indicates that the 1-DAY PM report is not generated. ON On, indicates that a 1-DAY PM report is to be created and reported in a REPT^PM^rr autonomous message at the time specified by the RPTIME parameter.
RPTIME	{HOUR-MINUTE:{00-23} - {00-59} } Report Time, identifies the time of day the autonomous REPT^PM^rr messages containing the scheduled PM report is generated. The format of RPTIME is <HOUR_OF_DAY> - <MINUTE_OF_HOUR> where {00-00} represents midnight.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed
 /* Cannot read crontab, status = <STATUS> */

EXAMPLES

In the following example, the on/off status and scheduled time of the daily report is retrieved.

```
RTRV-PMSCHED-ALL;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-PMSCHED-EC1**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING SCHEDULE EC1**

PURPOSE

The RTRV-PMSCHED-EC1 command retrieves the current provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of EC1 PM parameters.

A RTRV-PMSCHED-EC1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMSCHED-EC1 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EC1_AID: {EC1-{1-3840} } (EC1-EC1/STS1#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: EC1 AID, identifies the EC1 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<AID>,<AIDTYPE>:<REPTINVL>,,, [<NUMINVL>] ,,<MONLEV>,,,<TMPER>,,

<INHMODE>"]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	EC1_AID {EC1-{1-3840} } (EC1-EC1/STS1#) EC1 AID, identifies the EC1 port.
AIDTYPE	{EC1} AID Type, identifies the type of AID for the PM schedule being retrieved.
REPTINVL	{15-MIN, 1-DAY} Report Interval, identifies the reporting interval of the PM report messages. Values are: 15-MIN 15 Minute Intervals, indicates EC1 PM reports are generated every 15 minutes. 1-DAY 1-Day (24 hour) Intervals, indicates EC1 PM reports are generated daily.

NUMINVL	{0–254, <NoVal>}	Number of Intervals, identifies the number of PM reporting intervals remaining to be generated. Values are:
	0	Zero, scheduled PM reporting is disabled.
	1–254	1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMINVL is decremented even if the schedule has been inhibited by the INH–PMREPT–EC1 command.
	<NoVal>	No Value (Null), PM report messages continue to be generated every REPTINVL until disabled (via SCHED–PMREPT–EC1).
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, UP} }	Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295}–DN	Only PM data for monitored PM parameters that are less–than or equal–to (<) the value of <LEVEL> are reported.
	{0–4294967295}–UP	Only PM data for monitored PM parameters that are greater–than or equal–to (>) the value of <LEVEL> are reported.
TMPER	{15–MIN, 1–DAY}	Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15–MIN	15–Minute PM collection registers are reported.
	1–DAY	1–Day (24 hour) PM collection registers are reported.
INHMODE	{ALW, INH}	Inhibit Mode, identifies if the reporting of the PM data is inhibited (via INH–PMREPT–EC1 command). Values are:
	ALW	Allowed, the reporting of the PM data is allowed.
	INH	Inhibited, the reporting of the PM data is inhibited.

UNSUCCESSFUL RESPONSE FORMAT

COMMAND CODE: **RTRV-PMSCHED-F3**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING SCHEDULE F3**

PURPOSE

The RTRV-PMSCHED-F3 command retrieves the current provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of F3 PM parameters.

A RTRV-PMSCHED-F3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMSCHED-F3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	F3_AID {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: F3 AID, identifies the F3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<AID>,<AIDTYPE>:<REPTINVL>,,, [<NUMINVL>] ,,<MONLEV>,,,<TMPER>,,,
<INHMODE>"]

<INHMODE>"]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	F3_AID {T3F3-{1-4800}-{1-14}} (T3F3-DS3#-Fractional_DS3#) F3 AID, identifies the F3 port.
AIDTYPE	{F3} AID Type, identifies the type of AID for the PM schedule being retrieved.
REPTINVL	{15-MIN, 1-DAY} Report Interval, identifies the reporting interval of the PM report messages. Values are: 15-MIN 15 Minute Intervals, indicates F3 PM reports are generated every 15 minutes. 1-DAY 1-Day (24 hour) Intervals, indicates F3 PM reports are generated daily.

NUMINVL	{0–254, <NoVal>}	Number of Intervals, identifies the number of PM reporting intervals remaining to be generated. Values are:
	0	Zero, scheduled PM reporting is disabled.
	1–254	1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMINVL is decremented even if the schedule has been inhibited by the INH–PMREPT–F3 command.
	<NoVal>	No Value (Null), PM report messages continue to be generated every REPTINVL until disabled (via SCHED–PMREPT–F3).
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, UP} }	Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295}–DN	Only PM data for monitored PM parameters that are less–than or equal–to (<) the value of <LEVEL> are reported.
	{0–4294967295}–UP	Only PM data for monitored PM parameters that are greater–than or equal–to (>) the value of <LEVEL> are reported.
TMPER	{15–MIN, 1–DAY}	Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15–MIN	15–Minute PM collection registers are reported.
	1–DAY	1–Day (24 hour) PM collection registers are reported.
INHMODE	{ALW, INH}	Inhibit Mode, identifies if the reporting of the PM data is inhibited (via INH–PMREPT–F3 command). Values are:
	ALW	Allowed, the reporting of the PM data is allowed.
	INH	Inhibited, the reporting of the PM data is inhibited.

UNSUCCESSFUL RESPONSE FORMAT

  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

AID	OC12_AID {OC12-{1-560}} (OC12-OC12#) OC12 AID, identifies the OC-12 port.
AIDTYPE	{OC12} AID Type, identifies the type of AID for the PM schedule being retrieved.
REPTINVL	{15-MIN, 1-DAY} Report Interval, identifies the reporting interval of the PM report messages. Values are: 15-MIN 15 Minute Intervals, indicates OC12 PM reports are generated every 15 minutes. 1-DAY 1-Day (24 hour) Intervals, indicates OC12 PM reports are generated daily.

NUMINV	{0–254, <NoVal>}	Number of Intervals, identifies the number of PM reporting intervals remaining to be generated. Values are:
	0	Zero, scheduled PM reporting is disabled.
	1–254	1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMINV is decremented even if the schedule has been inhibited by the INH–PMREPT–OC12 command.
	<NoVal>	No Value (Null), PM report messages continue to be generated every REPTINV until disabled (via SCHED–PMREPT–OC12).
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, UP} }	Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295}–DN	Only PM data for monitored PM parameters that are less–than or equal–to (<) the value of <LEVEL> are reported.
	{0–4294967295}–UP	Only PM data for monitored PM parameters that are greater–than or equal–to (>) the value of <LEVEL> are reported.
TMPER	{15–MIN, 1–DAY}	Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15–MIN	15–Minute PM collection registers are reported.
	1–DAY	1–Day (24 hour) PM collection registers are reported.
INHMODE	{ALW, INH}	Inhibit Mode, identifies if the reporting of the PM data is inhibited (via INH–PMREPT–OC12 command). Values are:
	ALW	Allowed, the reporting of the PM data is allowed.
	INH	Inhibited, the reporting of the PM data is inhibited.

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

```

SROF      Status, Requested Operation Failed
          /* Unable to determine facility type. */

```

EXAMPLES

In the following example, the current provisioning pertaining to scheduled Performance Monitoring (PM) reporting of OC12 PM parameters is retrieved.

```
RTRV-PMSCHED-OC12::OC12-8;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-PMSCHED-OC3**
COMMAND NAME: **RETRIEVE PERFORMANCE
MONITORING SCHEDULE OC3**

PURPOSE

The RTRV-PMSCHED-OC3 command retrieves the current provisioning pertaining to scheduled Performance Monitoring (PM) reporting (e.g., reporting enabled, the discriminating threshold level of reported PM parameters, etc.) of OC3 PM parameters.

A RTRV-PMSCHED-OC3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PMSCHED-OC3 : [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC3_AID {OC3-{1-2240}} (OC3-OC3#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC3 AID, identifies the OC-3 port.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

<INHMODE>"]
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	OC3_AID {OC3-{1-2240}} (OC3-OC3#) OC3 AID, identifies the OC-3 port.
AIDTYPE	{OC3} AID Type, identifies the type of AID for the PM schedule being retrieved.
REPTINVL	{15-MIN, 1-DAY} Report Interval, identifies the reporting interval of the PM report messages. Values are: 15-MIN 15 Minute Intervals, indicates OC3 PM reports are generated every 15 minutes. 1-DAY 1-Day (24 hour) Intervals, indicates OC3 PM reports are generated daily.

NUMINVL	{0–254, <NoVal>}	Number of Intervals, identifies the number of PM reporting intervals remaining to be generated. Values are:
	0	Zero, scheduled PM reporting is disabled.
	1–254	1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMINVL is decremented even if the schedule has been inhibited by the INH–PMREPT–OC3 command.
	<NoVal>	No Value (Null), PM report messages continue to be generated every REPTINVL until disabled (via SCHED–PMREPT–OC3).
MONLEV	{LEVEL–DIRECTION:{0–4294967295} – {DN, UP} }	Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> – <DIRECTION>. Values are:
	{0–4294967295}–DN	Only PM data for monitored PM parameters that are less–than or equal–to (<) the value of <LEVEL> are reported.
	{0–4294967295}–UP	Only PM data for monitored PM parameters that are greater–than or equal–to (>) the value of <LEVEL> are reported.
TMPER	{15–MIN, 1–DAY}	Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are:
	15–MIN	15–Minute PM collection registers are reported.
	1–DAY	1–Day (24 hour) PM collection registers are reported.
INHMODE	{ALW, INH}	Inhibit Mode, identifies if the reporting of the PM data is inhibited (via INH–PMREPT–OC3 command). Values are:
	ALW	Allowed, the reporting of the PM data is allowed.
	INH	Inhibited, the reporting of the PM data is inhibited.

<INHMODE>"]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

AID	STS3C_AID {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) STS3C AID, identifies the STS-3C port.
AIDTYPE	{STS3C} AID Type, identifies the type of AID for the PM schedule being retrieved.

REPTINVL	{15-MIN, 1-DAY}	Report Interval, identifies the reporting interval of the PM report messages. Values are: 15-MIN 15 Minute Intervals, indicates STS-3C PM reports are generated every 15 minutes. 1-DAY 1-Day (24 hour) Intervals, indicates STS-3C PM reports are generated daily.
NUMINVL	{0-254, <NoVal>}	Number of Intervals, identifies the number of PM reporting intervals remaining to be generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMINVL is decremented even if the schedule has been inhibited by the INH-PMREPT-ST33C command. <NoVal> No Value (Null), PM report messages continue to be generated every REPTINVL until disabled (via SCHED-PMREPT-ST33C).
MONLEV	{LEVEL-DIRECTION:{0-4294967295} - {DN, UP} }	Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.
TMPER	{15-MIN, 1-DAY}	Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are: 15-MIN 15-Minute PM collection registers are reported. 1-DAY 1-Day (24 hour) PM collection registers are reported.
INHMODE	{ALW, INH}	Inhibit Mode, identifies if the reporting of the PM data is inhibited (via INH-PMREPT-ST33C command). Values are: ALW Allowed, the reporting of the PM data is allowed. INH Inhibited, the reporting of the PM data is inhibited.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed
 /* Unable to determine facility type. */

EXAMPLES

In the following example, the current provisioning pertaining to scheduled Performance Monitoring (PM) reporting of DS1 PM parameters is retrieved.

```
RTRV-PMSCHED-T1::T1-1;

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P71042. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

	{OC12T3-{1-560}-{1-4}-{1-3}}		(OC12T3-OC12#-STM1#-STS1/DS3#)
	DS3 AID, identifies the DS3 port.		

AIDTYPE	{T3}	AID Type, identifies the type of AID for the PM schedule being retrieved.
REPTINVL	{15-MIN, 1-DAY}	Report Interval, identifies the reporting interval of the PM report messages. Values are: 15-MIN 15 Minute Intervals, indicates DS3 PM reports are generated every 15 minutes. 1-DAY 1-Day (24 hour) Intervals, indicates DS3 PM reports are generated daily.
NUMINVL	{0-254, <NoVal>}	Number of Intervals, identifies the number of PM reporting intervals remaining to be generated. Values are: 0 Zero, scheduled PM reporting is disabled. 1-254 1 to 254 reports are to be generated. When the CPU is in an IS state and the system has successfully completed a restart, NUMINVL is decremented even if the schedule has been inhibited by the INH-PMREPT-T3 command. <NoVal> No Value (Null), PM report messages continue to be generated every REPTINVL until disabled (via SCHED-PMREPT-T3).
MONLEV	{LEVEL-DIRECTION:{0-4294967295} - {DN, UP} }	Monitoring Level, identifies the discriminating level of PM parameter event counts that are reported in PM messages for monitored PM parameters. The format of MONLEV is <LEVEL> - <DIRECTION>. Values are: {0-4294967295}-DN Only PM data for monitored PM parameters that are less-than or equal-to (<) the value of <LEVEL> are reported. {0-4294967295}-UP Only PM data for monitored PM parameters that are greater-than or equal-to (>) the value of <LEVEL> are reported.
TMPER	{15-MIN, 1-DAY}	Time Period, identifies the accumulation time period of the PM parameters reported in the PM report messages. Values are: 15-MIN 15-Minute PM collection registers are reported. 1-DAY 1-Day (24 hour) PM collection registers are reported.
INHMODE	{ALW, INH}	Inhibit Mode, identifies if the reporting of the PM data is inhibited (via INH-PMREPT-T3 command). Values are: ALW Allowed, the reporting of the PM data is allowed. INH Inhibited, the reporting of the PM data is inhibited.

COMMAND CODE: **RTRV-POOL**
COMMAND NAME: **RETRIEVE POOL**

PURPOSE

The RTRV-POOL command retrieves the number of VT1.5 matrix time slots available for DS1/VT1.5 cross-connections requiring a broadcast connection in the indicated first-stage of the matrix. Types of cross-connections that may require a broadcast connection in a first-stage matrix unit are a one-way bridge connection, a conference connection, and a test access connection.

The broadcast cross-connection for any DS1/VT1.5 port that is (one-way) cross-connected to more than one other DS1/VT1.5 port is made in either the first-stage or the third-stage of the matrix. Since first-stage matrix bandwidth can be exhausted by broadcast connections, the system reserves either 112 or 280 first-stage matrix time slots depending upon the configured system size (i.e., 112 for 672/1344 port systems and 280 for 240/2688/3360 port systems) for broadcast connections to guarantee bandwidth is available when required for non-broadcast connections.

The third-stage matrix is used for any broadcast cross-connection between two ports connected to the same third-stage matrix unit. One of the available first-stage matrix time slots is only used for a broadcast cross-connection when the connection can not be made in a third-stage matrix unit.

The successful response for a RTRV-POOL contains separate lines of parsable output data for each possible (first-stage) end-stage matrix unit in the system (one for each end-stage being reported) if the ESNUM parameter is ALL or one line if the ESNUM specifies a specific (first-stage) end-stage matrix unit.

A RTRV-POOL command is denied if:

- An ESNUM of {17-40} is entered and the system is not configured as a 1340, 2688 or 3360 port system (i.e., the system is configured as a 672 port system).
- An ESNUM greater than 3 is entered and the system is configured as a 240 port system.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-POOL: [TID] :: [CTAG] :: [ESNUM] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

ESNUM	{1–40, ALL}	
	Default:	<ALL>
	Addressing:	None
	Description:	End Stage Number, specifies the (first–stage) end–stage matrix unit whose available pool is displayed. Values are:
	1 to 3	Displays the available pool of the specified (first–stage) end–stage matrix unit. An ESNUM of {1–3} is valid if the system is configured as a 240 port system.
	1 to 16	Displays the available pool of the specified (first–stage) end–stage matrix unit. An ESNUM of {1–16} is valid if the system is configured as a 672 port system.
	1 to 32	Displays the available pool of the specified (first–stage) end–stage matrix unit. An ESNUM of {1–32} is valid if the system is configured as a 1344 or 2688 port system.
	1 to 40	Displays the available pool of the specified (first–stage) end–stage matrix unit. An ESNUM of {1–40} is valid if the system is configured as a 3360 port system.
	ALL	All, display the available pool of all (first–stage) end–stage matrix units (e.g., only three lines of output shall be displayed for a 240 port system).

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>

  ["ES=<value>,AVAILPOOL=<value>"]
  ["ES=<value>,AVAILPOOL=<value>"]
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;

```

OUTPUT PARAMETERS

ES=	{1–40}	
		End–Stage Number, identifies the first–stage end–stage matrix associated with the lines of output data being displayed. Separate lines of output data are provided for each first–stage end–stage in the system (one for each end–stage being reported). Values are:
	1 to 3	Displays an ES of {1–3} if the system is configured as a 240 port system.
	1 to 16	Displays an ES of {1–16} if the system is configured as a 672 port system.
	1 to 32	Displays an ES of {1–32} if the system is configured as a 1344 or 2688 port system.
	1 to 40	Displays an ES of {1–40} if the system is configured as a 3360 port system.
AVAILPOOL=	{0–280}	
		Available VT1.5 Pool, indicates the number of VT1.5 matrix time slots available in each first–stage end–stage matrix for DS1/VT1.5 broadcast connections. Values are:
	0 to 112	Displays an AVAILPOOL of {0–112} if the system is configured as a 672 or 1344 port system.
	0 to 280	Displays an AVAILPOOL of {0–280} if the system is configured as a 240, 2688 or 3360 port system.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid
SDBE	Status, internal Data Base Error /* Error printing report file */
SROF	Status, Requested Operation Failed /* Error getting ptr to report file */ /* Error opening report file */

EXAMPLES

In the following example, the available pool of VT1.5 time slots for each first–stage end–stage matrix is retrieved. Note that the output is shown for a case where the I/O shelves using only the first 16 end stages are provisioned.

```
RTRV-POOL;
```

The output response, shown below, assumes CID port 3 was used to enter the command and a system generated CTAG value of Pad568. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

COMMAND CODE: **RTRV-PRMTR-NE**
COMMAND NAME: **RETRIEVE PARAMETER NETWORK
ELEMENT**

PURPOSE

The RTRV-PRMTR-NE command retrieves general system level configuration information consisting of

- the system type, software release number, and software release date,
- the provisioned center stage matrix type,
- the system restart status.

A RTRV-PRMTR-NE command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PRMTR-NE: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ":<SYSTYPE>,<STREAM>,<RLSTYPE><RLSNUM>.<IREV>.<MREV>,<RLSDATE>,,
<MTXTYPE>::<STATUS>"
  [/ * <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

SYSTYPE	{1631SX} System Type.
STREAM	{LMC-APS} Release Stream. Value is: LMC-APS Large Matrix Configuration – Administration Processing System.
RLSTYPE	{F, P, R} Software Release Type. Refer to the Software Support Agreement for applicable terms and conditions. Values are: F First Office Application, the software load is intended for FOA evaluation and testing and is qualified to carry traffic under specified conditions or constraints. P Preliminary, the software load is only intended for evaluation and testing under controlled, non-traffic bearing conditions. R Released, the software load is fully qualified to carry traffic per applicable Alcatel specifications.

RLSNUM	{05, 06, 07, 08, 09, 10} Software Release Number.										
IREV	{00–99} Intermediate Release Revision. Refer to the Software Support Agreement.										
MREV	{00–99} Maintenance Release Revision. Refer to the Software Support Agreement.										
RLSDATE	{YY–MM–DD:{00–99} – {1–12} – {1–31} } Release Date, indicates the date of the system software release. The format of RLSDATE is <YEAR> – <MONTH_OF_YEAR> – <DAY_OF_MONTH>.										
MTXTYPE	{240, 672, 1344, 2688, 3360} Matrix Type, indicates the maximum matrix size in DS3 equivalent ports. Values are: <table> <tr> <td>240</td><td>Maximum matrix size is 240 DS3 equivalent ports.</td></tr> <tr> <td>672</td><td>Maximum matrix size is 672 DS3 equivalent ports.</td></tr> <tr> <td>1344</td><td>Maximum matrix size is 1344 DS3 equivalent ports.</td></tr> <tr> <td>2688</td><td>Maximum matrix size is 2688 DS3 equivalent ports.</td></tr> <tr> <td>3360</td><td>Maximum matrix size is 3360 DS3 equivalent ports.</td></tr> </table>	240	Maximum matrix size is 240 DS3 equivalent ports.	672	Maximum matrix size is 672 DS3 equivalent ports.	1344	Maximum matrix size is 1344 DS3 equivalent ports.	2688	Maximum matrix size is 2688 DS3 equivalent ports.	3360	Maximum matrix size is 3360 DS3 equivalent ports.
240	Maximum matrix size is 240 DS3 equivalent ports.										
672	Maximum matrix size is 672 DS3 equivalent ports.										
1344	Maximum matrix size is 1344 DS3 equivalent ports.										
2688	Maximum matrix size is 2688 DS3 equivalent ports.										
3360	Maximum matrix size is 3360 DS3 equivalent ports.										
STATUS	{COMPLETE, IN–PROGRESS} Status, indicates the status of any system restart process.										

UNSUCCESSFUL RESPONSE FORMAT

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

SROF Status, Requested Operation Failed
 /* Database access failure. */

EXAMPLES

In the following example, RTRV-PRMTR-NE is used to retrieve general system information:

```
RTRV-PRMTR-NE;
```

The output responses, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P27031. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M P27031 COMPLD
  ":1631SX,LMC-APS,R08.00.00,02-05-99,,672::COMPLETE"
  /* RTRV-PRMTR-NE [P27031] (1) */
;

```

RELATED COMMANDS

ED-PRMTR-NE
INIT-SYS

COMMAND CODE: **RTRV-PRMTR-SITE**
COMMAND NAME: **RETRIEVE PARAMETER SITE**

PURPOSE

The RTRV-PRMTR-SITE command retrieves the provisioned values for the global system parameters pertaining to:

- unsuccessful login attempts (ATTCNT, LKOT parameters),
- global X.25 provisioning parameters (T1, T4, N2 parameters),
- validation of X.25 SVC calling address (VALIDATE parameter),
- disk synchronization (SYNCTIME, SYNCCNT parameters),
- the Event Log File provisioning parameters (MAXFSIZE, MAXFNBR, RSML parameters),
- reporting of the software release number in the ACT-USER response (ENRELNUM parameter),
- the "alcatel" user login access (ALCATEL parameter).

The RTRV-PRMTR-SITE command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

A RTRV-PRMTR-SITE command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PRMTR-SITE: [TID] : : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ":<ATTCNT>,<LKOT>,<ALCATEL>:ENRELNUM=<value>,FTP=<value>,
  MAXFNBR=<value>,MAXFSIZE=<value>,N2=<value>,RSML=<value>,
  T1=<value>,T4=<value>,SYNCCNT=<value>,SYNCTIME=<value>,
  VALIDATE=<value>,TIMEOUT=<value>,<TCPSESS=<value>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

ATTCNT	{0-15} Invalid Login Attempt Count, indicates the number of invalid login attempts allowed before login is disabled on a CPORT for the duration of LKOT. A value of 0 (zero) indicates this function is disabled. The ATTCNT value applies to all CPORTs and X.25 virtual channels on the system.
LKOT	{0-15} Login Lockout Time, indicates the number of minutes CPORT login access is disabled following the specified ATTCNT. A value of 0 (zero) indicates this function is disabled. The LKOT value applies to all CPORTs and X.25 virtual channels on the system.

ALCATEL	{OFF, ON} Alcatel, indicates whether the “alcatel” user is allowed login access. Values are: OFF Login by the “alcatel” UID is disabled. ON Login by the “alcatel” UID is enabled.
FTP=	{DISABLE, ENABLE} File Transfer Protocol, specifies if FTP file transfers will be supported by the system. DISABLE FTP login and any file transfers are disabled and not allowed by the system. This affects any further FTP logins but does not affect the FTP user already logged in. ENABLE FTP login and any file transfers are enabled and are allowed by the system.
ENRELNUM=	{N, Y} Enable Release Number, indicates whether the software release number is returned as parsable data in the successful response message of the ACT–USER command. N No, the software release number is not returned as parsable data in the successful response message of the ACT–USER command. Y Yes, the software release number is returned as parsable data in the successful response message of the ACT–USER command.
MAXFNBR=	{5–100} Event Log File Maximum File Number, indicates the number of disk buffer files to be used for the Event Log File.
MAXFSIZE=	{16–1024} Event Log File Maximum Size, indicates the size, in 1024 byte blocks, of each Event Log File disk buffer. (e.g., If MAXFSIZE is set to 1024, 1 megabyte of disk space is allocated for each disk buffer file.)
N2=	{2–16} X.25 N2 Number of Retries, indicates the maximum number of retries for the X.25 N2 Number of Retries parameter.
RSML=	{1–25000} Event Log File maximum Response Message Length, indicates the maximum size, in 1024 byte blocks, of the output response message for a RTRV–ELF command. Any output response message for a RTRV–ELF command greater–than the RSML value is truncated.
SYNCCNT=	{0–100} Disk Sync Count, indicates the maximum number of disk write cycles before a disk synchronization is performed. A value of 0 (zero) indicates no disk syncs are performed based on disk write counts.
SYNCTIME=	{0–60} Disk Sync Time, indicates the maximum number of seconds between disk memory synchronization. A value of 0 (zero) indicates no disk syncs are performed based on time.
T1=	{1–200} X.25 T1 Retry Timer, indicates the amount of time, in tenths of seconds for the X.25 T1 Retry Timer parameter.
T4=	{1–1200} X.25 T4 No–Activity Timer, indicates the amount of time, in tenths of seconds, for the X.25 T4 No–Activity Timer parameter.

VALIDATE=	{ALL, NONE} Validate X.25 SVC Calling Addresses, indicates whether X.25 SVC calling addresses received in an X.25 call request packet are validated against the X.25 Calling Address database. Validation of X.25 SVC calling addresses applies to all provisioned SVC channels in the system. (Refer to ENT-OSADDR-SITE.) Values are: ALL Validate All, the system only accepts X.25 SVC calling addresses that have been provisioned in its X.25 Calling Address database. NONE Validate None, the system accepts any incoming X.25 SVC calling address.
TIMEOUT	{5-7200} Telnet activity time out in seconds. This is the maximum time that a telnet session can be inactive (without any input or output on the connection).
TCPSESS	{1-24} Maximum number of Telnet sessions allowed per physical LAN port. Applies to all LAN ports in system.

COMMAND CODE: **RTRV-PROCSTAT-EQPT**
COMMAND NAME: **RETRIEVE PROCESS STATUS
EQUIPMENT**

PURPOSE

The RTRV-PROCSTAT-EQPT retrieves the current process status specified ACL link or the process status of the active CPU's task and/or queues. The process status available consists of the ACL link re-transmissions (per unit interval) or active CPU task utilization level and/or queue-fill level. The AID of either copy of the CPU can be specified to retrieve the status of the active CPU copy.

The successful response for a RTRV-PROCSTAT-EQPT if the AID is specified as CPU, contains a separate line of output data for the aggregate CPU utilization level and a separate line of output data for each of the five most full queues. No line of output data is displayed for empty queues (e.g., if all queues are empty, no lines of output data are reported).

The successful response for a RTRV-PROCSTAT-EQPT if the AID of the active CIM or ACM is specified, contains a separate line of output data reporting the number of ACL retransmissions that have occurred since the last CIM or ACM restart for each ACL supported by the CIM. If the AID specifies the inactive CIM or ACM, the command completes successfully with no line of output data displayed.

The successful response for a RTRV-PROCSTAT-EQPT if the AID of the active ACL is specified, contains a separate line of output data reporting the number of ACL retransmissions that have occurred since the last CIM restart for each Level 2 Processor (SPB, IPU) that is supported by the ACL. If the AID specifies the inactive ACL, the command completes successfully with no line of output data displayed.

A RTRV-PROCSTAT-EQPT command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PROCSTAT-EQPT: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	EQUIPMENT_AID: {ACL-1-2-{9-28, 37-56, 65-84, 93-112}} {ACM-1-2-{3-7, 10-14}} {CIM-1-2-{3-7, 10-14}} {CPU-1-2-{1-2}} Default: Entry Required Addressing: None Description: Equipment AID, identifies the equipment entity. Refer to Appendix B, Access Identifiers (AIDs) for a definition of equipment mnemonics.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```

    <SID> <YY-MM-DD> <HH:MM:SS>
M  <CTAG> COMPLD
    /* <AID1>[, <AID2>] : [<PROCID>] , , , <PROCSTAT> */
    . . . .
    /* <AID1>[, <AID2>] : [<PROCID>] , , , <PROCSTAT> */
    [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

AID1	<p>EQUIPMENT_AID1:</p> <p>{ACL-1-2-{9-28, 37-56, 65-84, 93-112}}</p> <p>{ACM-1-2-{3-7, 10-14}}</p> <p>{CIM-1-2-{3-7, 10-14}}</p> <p>{CPU-1-2-{1-2}}</p> <p>Equipment AID1, identifies the AID of the CPU, CIM, ACM or ACL as applicable from the specified input parameter AID.</p>
AID2	<p>EQUIPMENT_AID2:</p> <p>{ACL-1-2-{9-28, 37-56, 65-84, 93-112}}</p> <p>{IPU-{44-63}-{1-4}-{1-8}}</p> <p>{SPB-{2-43, 102-111, 112-135, 136-141}-{1, 3}-{1-2}}</p> <p>Equipment AID2, identifies the AID of the ACL when a CIM or ACM AID is entered and ACL retransmissions are reported for the ACL, or identifies the AID of the L2P (SPB, IPU) when an ACL AID is entered and ACL retransmissions are reported for a L2P.</p>
PROCID	<p>{ ACLRETRAN, Q-<Q_Key>-<Q_ID>, UTIL }</p> <p>Process Identifier keyword, identifies the type of information being reported. Values are:</p> <p>ACLRETRAN ACL Retransmission, indicates that the line of output is reporting the ACL Retransmissions counter corresponding to the identified AID2. This keyword is reported with ACL, IPU, or SPB AID2s.</p> <p>Q-<Q_Key>-<Q_ID> Q-Queue_Key-Queue_Identifier, identifies the CPU's Queue Key and Queue Identifier to which the line of output pertains and reports the percentage queue-fill level for each of the five most-full CPU queues. The Q_Key and Q_ID each consist of up to 8 hex characters preceded by "0x", i.e., the value set is {Q-{0x0-0xFFFFFFFF}-{0x0-0xFFFFFFFF}. This keyword is reported with CPU AID1.</p> <p>UTIL Utilization, indicates the line of output is reporting the aggregate processor utilization level. This keyword is reported with CPU AID1.</p>
PROCSTAT	<p>{ {0x0-0xFFFFFFFF}, {1-100} }</p> <p>Process Status, identifies the status of the link retransmissions or process levels. Values are:</p> <p>{0x0-0xFFFFFFFF} Link Retransmissions corresponding to the identified AID. Reports the number of ACL Retransmissions that have occurred on the identified ACL AID2 or to the L2P (IPU, SPB) AID2 since the last associated CIM restart. The value consists of up to 8 Hex characters preceded by "0x". A CIM restart resets the associated ACL Retransmissions count to zero.</p> <p>{1-100} Numeric Percent (rounded to nearest integer value). Reported with CPU AID1 when the aggregate processor utilization level or when a queue-fill level is being reported.</p>

UNSUCCESSFUL RESPONSE FORMAT

  /* CPU-1-2-1, :Q-0x8-0x8,,,55 */]
  /* RTRV-PROCSTAT-EQPT: :CPU-1-2-1 [Pad567] (2) */]
;
```

RELATED COMMANDS

DGN-EQPT
RTRV-DGN-STATUS

COMMAND CODE: **RTRV-PRVG-CMD**
COMMAND NAME: **RETRIEVE PRIVILEGE COMMAND**

PURPOSE

The RTRV-PRVG-CMD command retrieves the existing command access CCAL (Command Code Authorization Level) security level and CCFC (Command Code Functional Category) security group(s) for the specified command code (either for a specific command code or all command codes) or the specified CCFC security group.

The successful response for a RTRV-PRVG-CMD contains one or more lines of parsable output data for each command code satisfying the specified CMD and CCFC search filters. If a command code satisfying the specified CMD and CCFC search filters is not found, then no parsable output data is provided and a line of non-parsable informational text is provided.

A RTRV-PRVG-CMD command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PRVG-CMD: [TID] :: [CTAG] :: [CMD] , [CCFC] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.				
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.				
CMD	{<TL1 Command Code>, ALL, all} Default: {ALL} Addressing: None Description: TL1 Command Code, specifies the TL1 command code for which the security group and security level is retrieved. The value for the CMD parameter can be any one of the TL1 command codes, in upper or lower case. Values are: <table><tr><td><TL1 Command Code></td><td>Any of the TL1 command codes, in upper or lower case.</td></tr><tr><td>ALL, all</td><td>All TL1 command codes.</td></tr></table>	<TL1 Command Code>	Any of the TL1 command codes, in upper or lower case.	ALL, all	All TL1 command codes.
<TL1 Command Code>	Any of the TL1 command codes, in upper or lower case.				
ALL, all	All TL1 command codes.				
CCFC	<1 -26 VALID CCFC CHARACTERS> Default: {ABCDEFGHIJKLMNOPQRSTUVWXYZ} Addressing: None Description: Command Code Functional Category, specifies the security group(s) to be retrieved. CCFC is specified as a string of 1 to 26 non-case sensitive, order independent, alphabetic characters. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC).				

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  ["<CMD>:<CCFC>,<CCAL>"]
  [/* No Command Subscribed To Specified Group */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

OUTPUT PARAMETERS

CMD	<TL1 COMMAND CODE> Command, identifies the TL1 command code.
CCFC	<1 –26 VALID (A–Z) CCFC CHARACTERS> Command Community Functional Category, indicates the security groups the command is assigned to.
CCAL	{1–32} Command Community Authorization Level, indicates the security level for the command. Commands that can only be executed by the system administrator (UID of “system” or “SYSTEM”) have the security level of 31. Commands that can only be executed by the Alcatel account user have the security level of 32.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
  <ERROR CODE>
  [/* <Informational Error Description Text> */]
  [/* <Expanded Error Code Description> */]
  [/* <Optional Suggested Action Text> */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]

```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IPNV	Input, Parameter Not Valid
	/* Invalid Command */
	/* Entry in CCFC group not valid, <group> */
	/* Illegal Input: CCFC */
	/* Illegal Input: COMMAND, CCFC */
	/* Illegal Input: COMMAND */
	/* Illegal Input: CCFC length */

EXAMPLES

In the following example, the CCFC and CCAL settings for the STOP-CID command are retrieved.

```
RTRV-PRVG-CMD:::::STOP-CID;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P0d033. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P0d033 COMPLD  
"STOP-CID:ABCZ,12"  
/* RTRV-PRVG-CMD:::::STOP-CID [P0d033] (1) */  
;
```

In the following example, the CCFC and CCAL settings for all commands with a CCFC of F are retrieved.

```
RTRV-PRVG-CMD:::::,F;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P0d039. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

```

RELATED COMMANDS

```
ED-GROUP-CMD  
ED-PRVG-CMD  
ED-PRVG-USER  
ENT-USER  
RTRV-PRVG-USER
```

COMMAND CODE: **RTRV-PRVG-USER**
COMMAND NAME: **RETRIEVE PRIVILEGE USER**

PURPOSE

The RTRV-PRVG-USER command retrieves the user profile entry, identified by the specified UID, UCFCI, and UCFCO “search keys”, in the User Security Database.

The system administrator (UID of “system” or “SYSTEM”) or Alcatel account user can retrieve any or all user profile entries. Any other user can only retrieve their own user profile entry.

The successful response for a RTRV-PRVG-USER command contains one line of parsable output data for each user security database entry retrieved. If a database entry matching the specified UID, UCFCI, and UCFCO values is not found, then no parsable output data is provided and a line of non-parsable output informational text is provided.

The RTRV-PRVG-USER command is denied if:

- The specified UID is not the UID of the user executing the command, unless the UID is “system” or “SYSTEM”.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PRVG-USER: [TID] : : [CTAG] : : [UID] , [UCFCI] , [UCFCO] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
UID	{<5-12 VALID UID CHARACTERS>, ALL, all} Default: <UID of the user entering the command> (If the user entering the command is not the system administrator or the Alcatel account user) {ALL} (If the user entering the command is the system administrator or the Alcatel account user) Addressing: None Description: User Identifier, specifies the user ID whose user security database entry is to be retrieved. (Refer to the UID parameter in ENT-USER for a description of valid UID values.) Values are: <Valid UID> User security database entry for the specified UID is retrieved. ALL, all User security database entry for all UIDs are retrieved. Restrictions: RTRV-PRVG-USER is denied if UID of {ALL, all} is entered and the user entering the command is not the system administrator or the Alcatel account user.

UCFCI	<p><1–26 VALID (A–Z) UCFCI CHARACTERS> Default: {ABCDEFGHIJKLMNOPQRSTUVWXYZ} Addressing: None Description: User Command Functional Category, Input, specifies the command access input security CCFC group(s) for the user (defines the set of TL1 commands the user can execute). Each input security group contains one or more TL1 command. Up to 26 input security groups A–Z can be specified for the user. To execute a command, a user must belong to at least one input security group assigned to the TL1 command to be executed. UCFCI is specified as a string of up to 26 order-independent, non-case sensitive characters A–Z. If a character is entered more than once in the string the system accepts the string as if the character was only entered once. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC), for the default security groups.</p>
UCFCO	<p><1–26 VALID (A–Z) UCFCO CHARACTERS> Default: {ABCDEFGHIJKLMNOPQRSTUVWXYZ} Addressing: None Description: User Command Functional Category, Output, specifies the command access output security group(s) for the user (defines the TL1 command output responses a user receives because of commands executed by another user). UCFCO does not filter output responses for commands executed by the user, UCFCO only filters output responses for commands executed by another user. Each output security group contains one or more TL1 commands. Up to 26 output security groups A–Z can be specified for the user. To receive output responses from a command executed by another user, a user must belong to at least one output security group assigned to the TL1 command. If a user is assigned UCFCO of Z, the user receives output results from all TL1 commands executed by another user. UCFCO is specified as a string of up to 26 order-independent, non-case sensitive characters A–Z. If a character is entered more than once in the string the system accepts the string as if the character was only entered once. Refer to Appendix H, User Command Privilege Defaults (CCAL & CCFC), for the default security groups.</p>

SUCCESSFUL RESPONSE FORMAT

The following successful response format is used if a database entry satisfying the specified search key values for UID, UCFCI, and UCFCO is found.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "<UID>:<UCFCI>,<UCFCO>,<UCAL>,<OMODE>,[<OSL>],[<UNAM>],<RUSURE>,<DSKBFIND>,<TYPE>,<DM>,[<PARTNAM>],<OSTYPE>,<LNKTMR>,<LOTO>,<KAMINTVL>,<MIPINTVL>"
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

The following successful response format is used if a database entry satisfying the specified search key values for UID, UCFCI, and UCFCO is not found.

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  [/* No match found for user input group, <UCFCI> */]
  [/* No match found for user output group, <UCFCO> */]
  [/* No user(s) found within specified group */]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;

```

OUTPUT PARAMETERS

UID	<5–12 VALID UID CHARACTERS> User Identifier, identifies the UID for the database entry being retrieved.																				
UCFCI	<1–26 VALID UCFCI CHARACTERS> User Command Functional Category, Input, identifies the provisioned UCFCI value assigned to the user. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)																				
UCFCO	<1–26 VALID UCFCI CHARACTERS> User Command Functional Category, Output, identifies the provisioned UCFCO value assigned to the user. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)																				
UCAL	{1–32} User Command Authorization Level, identifies the provisioned UCAL value assigned to the user. UCAL values of 31 and 32 are reserved for the system administrator and Alcatel account, respectively. (Also refer to the Introduction for a description of User Security and to Appendix H, User Command Privilege Defaults (CCAL & CCFC).)																				
OMODE	{C} Command Input Operational Mode, indicates the system initializes to the Direct Command Input mode.																				
OSL	{<String of characters composed of {B, C, D, E, H, I, M, m, O, P, R, S, W}>, <NoVal>} Output Subscription Level, identifies the unsolicited output response messages a user receives. The OSL value reported is a case-sensitive, order-independent character string composed of any or all of the characters in the OSL value set of {B, C, D, E, H, I, M, m, O, P, R, S, W} (e.g., CMmEDPSOWR) or no value. If an OSL value of A was provisioned, the reported OSL value is BCDEHIMmOSW. If an OSL value of Z was provisioned, no value is reported for OSL. Values are: <table> <tr> <td>B</td><td>Report Data(B)ase Change messages (via REPT^DBCHG).</td></tr> <tr> <td>C</td><td>Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>D</td><td>Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)</td></tr> <tr> <td>E</td><td>Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).</td></tr> <tr> <td>H</td><td>Reserved for future use. This OSL value (currently) has no affect.</td></tr> <tr> <td>I</td><td>Report (I)nitilization messages (via REPT^INITZN).</td></tr> <tr> <td>M</td><td>Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>m</td><td>Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.</td></tr> <tr> <td>O</td><td>Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.</td></tr> <tr> <td>P</td><td>Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)</td></tr> </table>	B	Report Data(B)ase Change messages (via REPT^DBCHG).	C	Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.	D	Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)	E	Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).	H	Reserved for future use. This OSL value (currently) has no affect.	I	Report (I)nitilization messages (via REPT^INITZN).	M	Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.	m	Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.	O	Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.	P	Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)
B	Report Data(B)ase Change messages (via REPT^DBCHG).																				
C	Report setting/clearing of (C)ritical alarms (via REPT^ALM) for equipment alarms and facility alarms.																				
D	Report Con(D)ition messages. (Note. The REPT^COND autonomous message type is not currently implemented in the system.)																				
E	Report (E)vent messages (via REPT^EVT^EQPT, REPT^EVT^T1, or REPT^EVT^T3). The E option does not disable the warning message generated at user login (via REPT^EVT^SESSION).																				
H	Reserved for future use. This OSL value (currently) has no affect.																				
I	Report (I)nitilization messages (via REPT^INITZN).																				
M	Report setting/clearing of (M)ajor alarms (via REPT^ALM) for equipment alarms and facility alarms.																				
m	Report setting/clearing of (m)inor alarms (via REPT^ALM) for equipment alarms and facility alarms.																				
O	Provide Command ech(O) output response line for all responses. Refer to the Introduction for a description of other non-parsable text lines in successful, unsuccessful, and acknowledgement response messages controlled by the O option.																				
P	Report scheduled daily (P)erformance monitoring (PM) (via REPT^PM). (Note. The P filter does not affect PM threshold crossing alert messages. These are REPT^EVT messages.)																				

R	Report erro(R) messages (via REPT^HWSW). (These are Alcatel autonomous informational messages.)
S	Report (S)tatus messages (via REPT^INFORMATION or REPT^STAT). (These are Alcatel autonomous informational messages.)
W	Report (W)orld responses from all TL1 commands executed by any other user. A user subscribing to the W option receives all autonomous responses and the output responses for commands executed by another user according to the user's UCFCO value.
<NoVal>	No value is reported if no OSL values were provisioned (all OSL filters are off and the user will not receive unsolicited messages).
UNAM	<p>{1–18 VALID UNAM CHARACTERS, <NoVal>}</p> <p>User Name, identifies the provisioned UNAM value. Values are:</p> <p><Provisioned UNAM value></p> <p><NoVal> No value is reported if a UNAM value was not provisioned via ENT–USER or ED–PRVG–USER.</p>
RUSURE	<p>{NO, YES}</p> <p>Are You Sure Prompt, indicates whether the user is to receive an additional RUSURE prompt for the RESTORE–DB and DLT–PARTITN commands. The RUSURE prompt allows the user to cancel the execution of the command before any changes in the system are made. Values are:</p> <p>NO No, the user will not receive an RUSURE prompt.</p> <p>YES Yes, the user will receive an RUSURE prompt when the user enters a RESTORE–DB or DLT–PARTITN command.</p>
DSKBFIND	<p>{ALWAYS, NEVER}</p> <p>Disk Buffer Find Indicator, indicates whether a user receives all output messages the user is subscribed to receive (via the user's OSL and UCFCO values), that were generated while the user was logged off the system, when the user re–logs in to the system. Values are:</p> <p>ALWAYS Always, when the user logs in, the user receives all output messages the user is subscribed to receive that were generated while the user was logged off the system.</p> <p>NEVER Never, when the user logs in, the user does not receive disk buffered response messages. The user only receives current response messages.</p>
TYPE	<p>{PRN, TTY, VDT}</p> <p>Terminal Type, indicates the terminal CPORT configuration for the user. Values are:</p> <p>PRN Printer (output only) CPORT.</p> <p>TTY Teletype Terminal, non–cursor addressable input/output terminal.</p> <p>VDT Video Display Terminal, cursor addressable video display terminal.</p>
DM	<p>{ECHO, NA, NOECHO}</p> <p>TTY Display Mode, indicates the display mode for a TTY terminal. Values are:</p> <p>ECHO Character Echo, input characters are echoed.</p> <p>NA Not Applicable, value used for DM when TYPE is not TTY.</p> <p>NOECHO Character Not Echo, input characters are not echoed.</p>
PARTNAM	<p>{<1–20 VALID PARTITION NAME CHARACTERS>, <NoVal>}</p> <p>Partition Name, indicates the provisioned value for PARTNAM.</p> <p><Provisioned PARTNAM value></p> <p><NoVal> No value is reported if a PARTNAM value was not provisioned.</p>

OSTYPE	<p>{ITS, NMA, OPSINE, OTHER, TSC}</p> <p>Operations System Type, identifies the provisioned OSTYPE value. Values are:</p> <table> <tr> <td>ITS</td><td>Integrated Test Systems. Allows the user to enter non-universal AIDs for commands while the system is in universal AID mode. Inputs that are not in the universal AID format will have the universal AID structures appended on the input and extracted on the output.</td></tr> <tr> <td>NMA</td><td>Network Monitoring and Analysis OS.</td></tr> <tr> <td>OPSINE</td><td>Operations System for Intelligent Network Elements OS.</td></tr> <tr> <td>OTHER</td><td>Any OS type other than NMA, OPSINE, and TSC.</td></tr> <tr> <td>TSC</td><td>Test Session Controller OS.</td></tr> </table>	ITS	Integrated Test Systems. Allows the user to enter non-universal AIDs for commands while the system is in universal AID mode. Inputs that are not in the universal AID format will have the universal AID structures appended on the input and extracted on the output.	NMA	Network Monitoring and Analysis OS.	OPSINE	Operations System for Intelligent Network Elements OS.	OTHER	Any OS type other than NMA, OPSINE, and TSC.	TSC	Test Session Controller OS.
ITS	Integrated Test Systems. Allows the user to enter non-universal AIDs for commands while the system is in universal AID mode. Inputs that are not in the universal AID format will have the universal AID structures appended on the input and extracted on the output.										
NMA	Network Monitoring and Analysis OS.										
OPSINE	Operations System for Intelligent Network Elements OS.										
OTHER	Any OS type other than NMA, OPSINE, and TSC.										
TSC	Test Session Controller OS.										
LNKTMR	<p>{0–3600}</p> <p>CPORT Activity Link Timer, identifies the amount of time (in seconds) that the CPORT link is inactive before a link time-out event occurs. LNKTMR is not triggered by a user login, but by CPORT link communication activity after the login occurs. The LOTO parameter determines whether the user is automatically logged out if a link time-out occurs. Values are:</p> <table> <tr> <td>0</td><td>Disabled, no link time-out will occur.</td></tr> <tr> <td>1–3600</td><td>Time in seconds, indicates the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, indicated.</td></tr> </table>	0	Disabled, no link time-out will occur.	1–3600	Time in seconds, indicates the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, indicated.						
0	Disabled, no link time-out will occur.										
1–3600	Time in seconds, indicates the LNKTMR time interval. A link time-out occurs if the link is inactive for the time, in seconds, indicated.										
LOTO	<p>{LOGOUT, NOLOGOUT}</p> <p>Logout On Link Timer Time-out, indicates whether the user is logged off when the CPORT activity link timer (LNKTMR) times out.</p> <table> <tr> <td>LOGOUT</td><td>The user is logged off when the link timer expires.</td></tr> <tr> <td>NOLOGOUT</td><td>The user is not logged off when the link timer expires.</td></tr> </table>	LOGOUT	The user is logged off when the link timer expires.	NOLOGOUT	The user is not logged off when the link timer expires.						
LOGOUT	The user is logged off when the link timer expires.										
NOLOGOUT	The user is not logged off when the link timer expires.										
KAMINTVL	<p>{0, 20–300}</p> <p>Keep Alive Message Interval, indicates the amount of time (in seconds) that the user must be inactive before a Keep Alive Message (KAM) is automatically sent to the user. The user is inactive if there is no TL1 input or output (command responses, acknowledgement responses, or autonomous responses) between the user and the system. When a user logs in, the user's KAM timer is started and increments until CPORT link activity occurs. The KAM timer is reset when link activity is detected. KAM timers are not incremented when the system is in Limited Command Entry mode. Values are:</p> <table> <tr> <td>0</td><td>Disabled, a KAM timer is not active and the user does not automatically receive any KAM autonomous messages.</td></tr> <tr> <td>20–300</td><td>Time in seconds, specifies the KAM time interval. A KAM message is generated if the user's CPORT link is inactive for the time, in seconds, specified.</td></tr> </table>	0	Disabled, a KAM timer is not active and the user does not automatically receive any KAM autonomous messages.	20–300	Time in seconds, specifies the KAM time interval. A KAM message is generated if the user's CPORT link is inactive for the time, in seconds, specified.						
0	Disabled, a KAM timer is not active and the user does not automatically receive any KAM autonomous messages.										
20–300	Time in seconds, specifies the KAM time interval. A KAM message is generated if the user's CPORT link is inactive for the time, in seconds, specified.										
MIPINTVL	<p>{0, 20–3500}</p> <p>Multiple In Progress Message Interval, indicates the amount of time (in seconds) before an additional In Progress (IP) messages is generated. Any additional IP messages occur after the initial two second IP message is generated. An additional IP message for the ACT-USER, CANC-USER, ED-PID, STOP-OPS, START-OPS, or INIT-SYS commands is not generated, regardless of the MIPINTVL value. MIPINTVL timers are deactivated when the system is in Limited Command Entry mode. Values are:</p> <table> <tr> <td>0</td><td>Disabled, the user will not receive any additional IP messages after the initial two-second IP message.</td></tr> <tr> <td>20–3500</td><td>Time in seconds, indicates that an additional IP message is generated every n seconds (n=20 to 300) until the entered command completes execution.</td></tr> </table>	0	Disabled, the user will not receive any additional IP messages after the initial two-second IP message.	20–3500	Time in seconds, indicates that an additional IP message is generated every n seconds (n=20 to 300) until the entered command completes execution.						
0	Disabled, the user will not receive any additional IP messages after the initial two-second IP message.										
20–3500	Time in seconds, indicates that an additional IP message is generated every n seconds (n=20 to 300) until the entered command completes execution.										

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid /* Privilege: UNAUTHORIZED TO REQUEST THIS COMMAND */
IPNV	Input, Parameter Not Valid /* Illegal Input: UID length */ /* Illegal Input: UID */ /* Illegal Input: UCFCI length */ /* Illegal Input: UCFCI */ /* Illegal Input: UCFCO length */ /* Illegal Input: UCFCO */ /* Entry in UCFCI group not valid, <UCFCI> */ /* Entry in UCFCO group not valid, <UCFCO> */ /* UID not found */
SDBE	Status, internal Data Base Error /* Unable to read USDB – status = <status number> */ /* User not found in USDB */
SROF	Status, Requested Operation Failed /* User not found in USDB, status= <status number> */

EXAMPLES

In the following example, RTRV-PRVG-USER is used by the system administrator to retrieve all user database entries with a UCFCI and UCFCO of F.

```
RTRV-PRVG-USER: : : : ALL, F, F;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of P0b052. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P0b052 COMPLD  
"vdt02:F,F,30,C,CMmEDPOSW,,YES,ALWAYS,VDT,NA,,OTHER,0,NOLOGOUT,0,0"  
/* RTRV-PRVG-USER: : : : ALL, , F [P0b052] (2) */  
;
```

In the following example, RTRV-PRVG-USER is used by the the system administrator to retrieve all user database entries with a UCFCO of E.

```
RTRV-PRVG-USER: : : : ALL, , E;
```

The output response, shown below, assumes CID 1 was used to enter the command and a system generated CTAG value of P0b043. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed. was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M P0b043 COMPLD  
/* No User(s) Found Within Specified Group */  
/* RTRV-PRVG-USER: : : : ALL, , E [P0b043] (1) */  
;
```

COMMAND CODE: **RTRV-PTHTRC-STS1**
COMMAND NAME: **RETRIEVE PATH TRACE STS-1**

PURPOSE

The RTRV-PTHTRC-STS1 command retrieves the contents of the STS-1 path trace message, a 64-character ASCII message. This command may be used to retrieve the “incoming” path trace message, “expected” path trace message or the “outgoing” path trace message (which is inserted into the Path overhead of the outgoing STS-1. The “expected” and “outgoing” path trace message can be entered with ENT/ED-STS1 command.

In ring mode (refer to ENT-RNG-OC3), the RTRV-PTHTRC-STS1 command displays the path trace message(s) for STS-1s that are part of an odd-numbered or even-numbered ring OC-3 or OC-12.

A RTRV-PTHTRC-STS1 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PTHTRC-STS1 : [TID] : AID : [CTAG] : : [MSGTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS >	
	Default:	<SID>
	Addressing:	None
	Description:	Target Identifier, specifies the network node TID for the command.
AID	STS1_AID:	
	{EC1STS1-{1-3840}}	(EC1STS1-EC1/STS1#)
	{OC3STS1-{1-2240}-{1-3}}	(OC3STS1-OC3#-STS1#)
	{OC12STS1-{1-560}-{1-4}-{1-3}}	(OC12STS1-OC12#-STM1#-STS1#)
	Default:	Entry Required
	Addressing:	None
	Description:	Identifies STS-1 port whose path trace is to be retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS >	
	Default:	< System assigned CTAG value >
	Addressing:	None
	Description:	Correlation Tag, associates input command with its output responses.
MSGTYPE	{ALL, EXPTRC, INCTRC, TRC}	
	Default:	{INCTRC}
	Addressing:	None
	Description:	Message type. Identifies the type of message to be retrieved. The valid values are:
	ALL	All the types of the path trace to be retrieved.
	EXPTRC	Expected path trace message to be retrieved.
	INCTRC	Incoming path trace message to be retrieved.
	TRC	Transmitted path trace message to be retrieved.

SUCCESSFUL RESPONSE FORMAT

```

<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
  "\"<TRC1>\\" [
  "\"<TRC2>\\"
  "\"<TRC3>\\" ]
  [/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
i

```

OUTPUT PARAMETERS

- <TRC1> What is displayed in this field depends on the MSGTYPE parameter. If the MSGTYPE is ALL, then INCTRC is displayed and if the MSGTYPE is not ALL, then the selected path trace message is displayed. This consists of 0–62 ASCII printable characters followed by a CR and LF. If the path trace to be displayed is all ASCII NULLs (00 Hex), then only “.” will be displayed. If the path trace to be displayed is all other non–printable ASCII type characters, then only “?” will be displayed.
- <TRC2> This field is displayed only if the MSGTYPE is ALL and it displays the “outgoing” (transmitted) path trace (TRC). This consists of 0–62 ASCII printable characters followed by a CR and LF. If the path trace to be displayed is all ASCII NULLs (00 Hex), then only “.” will be displayed. If the path trace to be displayed is all other non–printable ASCII type characters, then only “?” will be displayed.
- <TRC3> This field is displayed only if the MSGTYPE is ALL and it displays the “expected” path trace (EXPTRC). This consists of 0–62 ASCII printable characters followed by a CR and LF. If the path trace to be displayed is all ASCII NULLs (00 Hex), then only “.” will be displayed. If the path trace to be displayed is all other non–printable ASCII type characters, then only “?” will be displayed.

UNSUCCESSFUL RESPONSE FORMAT

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non–Parser Error Codes used with this command are:

IDNV	Input, Data Not Valid
IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error
	/* TP Database Error: <ERROR-STRING> for <AID-STRING> */
SROF	Status, Requested Operation Failed
	/* Could not communicate with the SPB.*/
	/* Bad response code returned from SPB (<RESPONSE_CODE>) */
SSRE	Status, System Resources Exceeded

EXAMPLES

The following example illustrates the command and associated response output.

```
RTRV-PTHTRC-STs1: :EC1STs1-42;
```

The output response, shown below, assumes CID 4 was used to enter the command and a system generated CTAG value of Pac579. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pac579 COMPLD
  "\INCOMING PATH TRACE GOES HERE\"
  /* RTRV-PTHTRC-STs1: :EC1STs1-42 [Pac579] (4) */
;
```

The following example illustrates the command and associated response output.

```
RTRV-PTHTRC-STs1::EC1STs1-41:::ALL;
```

The output response, shown below, assumes CID 4 was used to enter the command and a system generated CTAG value of Pac579. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>

```

COMMAND CODE: **RTRV-PTHTRC-STS3C**
COMMAND NAME: **RETRIEVE PATH TRACE STS-3C**

PURPOSE

The RTRV-PTHTRC-STS3C command retrieves the contents of the STS3C path trace message, a 64-character ASCII message. This command may be used to retrieve the "incoming" path trace message or "expected" path trace message. The "expected" path trace message can be entered with ENT/ED-STS3C command. If RTRV-PTHTRC-STS3C is issued successfully and the incoming path trace message does not contain CR, LF characters, then the system displays the incoming path trace message without the CR, LF characters.

If RTRV-PTHTRC-STS3C is issued with MSGTYPE of ALL or INCTRC and either the STS-3C is in a LOP condition or its containing OC-3/OC-12 is in LOS/LOF/AIS-L condition(s), then the command is completed and a null string (i.e., "\") for the incoming path trace is displayed. If RTRV-PTHTRC-STS3C is issued on an STS-3C which is not provisioned, then the command is completed with no line of parsable output data provided.

A RTRV-PTHTRC-STS3C command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-PTHTRC-STS3C: [TID] :AID: [CTAG] :: [MSGTYPE] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	STS3C_AID: {OC3STS3C-{1-2240}} (OC3STS3C-OC3#/STS3C#) {OC12STS3C-{1-560}-{1-4}} (OC12STS3C-OC12#-STM1/STS3C#) Default: Entry Required Addressing: None Description: Identifies STS-3C port whose path trace is to be retrieved.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.
MSGTYPE	{ALL, EXPTRC, INCTRC, TRC} Default: {INCTRC} Addressing: None Description: Message type. Identifies the type of path trace message to be retrieved. The valid values are: ALL All the types of the path trace messages, whichever exist, to be retrieved. EXPTRC Expected incoming path trace message to be retrieved. INCTRC Incoming path trace message to be retrieved. TRC Transmitted path trace message to be retrieved.

```

The following example illustrates the command and associated response output.

```
RTRV-PTHTRC-STS3C: :OC3STS3C-11:::ALL;
```

The output response, shown below, assumes CID 4 was used to enter the command and a system generated CTAG value of Pac579. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M Pac579 COMPLD  
  "\"INCOMING PATH TRACE GOES HERE\""  
  "\"TRANSMITTED PATH TRACE GOES HERE\""  
  "\"EXPECTED PATH TRACE GOES HERE\""  
/* RTRV-PTHTRC-STS3C: :OC3STS3C-11:::ALL [Pac579] (4) */  
;

COMMAND CODE: **RTRV-RDL-ALL**
COMMAND NAME: **RETRIEVE RED LINED ALL**

PURPOSE

The RTRV-RDL-ALL command retrieves a listing of cross-connections which have previously been designated as Red Lined. The command is executed regardless of the state of the cross-connections.

The successful response for a RTRV-RDL-ALL contains one line of parsable output data for each red lined cross-connection. An SST value is only displayed when a secondary state is currently applied to the cross-connection.

A separate line of parsable output data is provided for each of the following red lined cross-connect situations:

- 1WAY: One line of data for each one-way cross-connection, including the case of a one-way bridge connection, or a connection from a conference tail connected back to the conference head.
- 2WAY: One line of data for each two-way cross-connection, whether the two-way cross-connection was established as a single two-way cross-connect or as two one-way cross-connects.
- 2WAYPR: One line of data for each two-way path ring cross-connection. (Only preferred side is shown.)
- 2WAYDC: One line of data for each two-way drop and continue cross-connection. (Only preferred side is shown.)
- BCST: One line of data for each one-way cross-connection from the conference head to each conference tail.

A RTRV-RDL-ALL command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-RDL-ALL: [TID] : [AID] : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	<ALL> Default: <ALL> cross-connections (No entry necessary) Addressing: None Description: ALL may be entered or omitted. No other entry will be accepted.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>

	DS1, VT1, DS3, STS1, or STS3C AID, indicates the TO (transmit side to the network) port of the cross-connection.	
CTYPE	{1WAY, 2WAY, 2WAYPR, 2WAYDC, BCST}	
	Cross-connection Type. Values are:	
	1WAY	One-way cross-connection
	2WAY	Two-way cross-connection
	2WAYPR	Two-Way Path Protected connection
	2WAYDC	Two-Way Drop and Continue connection
	BCST	Broadcast conference cross-connection.

LEVEL	{STS1, STS3C, T1, T3, VT1} Rate of the cross-connected channel. Valid values are: <table> <tr> <td>STS1</td><td>STS-1 cross connection, only displayed for an STS-1 to STS-1 cross connection.</td></tr> <tr> <td>STS3C</td><td>STS-3C cross connection, only displayed for an STS-3C to STS-3C cross connection.</td></tr> <tr> <td>T1</td><td>DS1 cross connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross connection.</td></tr> <tr> <td>T3</td><td>DS3 cross connection, displayed for a DS3 to DS3 and DS3 to STS-1 cross connection.</td></tr> <tr> <td>VT1</td><td>VT1.5 cross connection, only displayed for a VT1.5 to VT1.5 cross connection.</td></tr> </table>	STS1	STS-1 cross connection, only displayed for an STS-1 to STS-1 cross connection.	STS3C	STS-3C cross connection, only displayed for an STS-3C to STS-3C cross connection.	T1	DS1 cross connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross connection.	T3	DS3 cross connection, displayed for a DS3 to DS3 and DS3 to STS-1 cross connection.	VT1	VT1.5 cross connection, only displayed for a VT1.5 to VT1.5 cross connection.
STS1	STS-1 cross connection, only displayed for an STS-1 to STS-1 cross connection.										
STS3C	STS-3C cross connection, only displayed for an STS-3C to STS-3C cross connection.										
T1	DS1 cross connection, displayed for a DS1 to DS1 and DS1 to VT1.5 cross connection.										
T3	DS3 cross connection, displayed for a DS3 to DS3 and DS3 to STS-1 cross connection.										
VT1	VT1.5 cross connection, only displayed for a VT1.5 to VT1.5 cross connection.										
RDL	{Y} Red Line Status of Cross-Connection. Value: <table> <tr> <td>Y</td><td>Connection is Redlined.</td></tr> </table>	Y	Connection is Redlined.								
Y	Connection is Redlined.										
CKTID	{<0-45 VALID CKTID CHARACTERS>} FROM-TO circuit ID previously assigned to cross-connection (only displayed for non-NULL values)										
CKTIDTF	{<0-45 VALID CKTIDTF CHARACTERS>} TO-FROM circuit ID previously assigned to cross-connection (only displayed for non-NULL values)										
PST	{IS, OOS-AU} Primary State, indicates the current primary state of the cross-connection. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: <table> <tr> <td>IS</td><td>In-Service</td></tr> <tr> <td>OOS-AU</td><td>Out-Of-Service-Autonomous</td></tr> </table>	IS	In-Service	OOS-AU	Out-Of-Service-Autonomous						
IS	In-Service										
OOS-AU	Out-Of-Service-Autonomous										
SST	{SGEO, STBYH, TS, WRK} Secondary State, indicates any secondary states associated with the cross-connection. SST values may be shown in the output combined with an ampersand (&) if more than one value applies to the cross-connection at the time of the RTRV-RDL-ALL. Refer to Appendix G, State Transitions for a definition of state names and description of state transitions. Values are: <table> <tr> <td>SGEO</td><td>Supporting Entity Outage</td></tr> <tr> <td>STBYH</td><td>Stand-by Hot. Applies when CTYPE = 2WAYPR and 2WAYDC. STBYH indicates all the entities required for the cross connection are in-service. But the path is not selected in the RPB module and is ready to be selected if a failure is detected in the working connection.</td></tr> <tr> <td>TS</td><td>Test, indicates the port is connected to a Test Access port.</td></tr> <tr> <td>WRK</td><td>Working. Applies when CTYPE = 2WAYPR and 2WAYDC. WRK indicates all entities required for the cross connection are in-service and the path is selected in the RPB module.</td></tr> </table>	SGEO	Supporting Entity Outage	STBYH	Stand-by Hot. Applies when CTYPE = 2WAYPR and 2WAYDC. STBYH indicates all the entities required for the cross connection are in-service. But the path is not selected in the RPB module and is ready to be selected if a failure is detected in the working connection.	TS	Test, indicates the port is connected to a Test Access port.	WRK	Working. Applies when CTYPE = 2WAYPR and 2WAYDC. WRK indicates all entities required for the cross connection are in-service and the path is selected in the RPB module.		
SGEO	Supporting Entity Outage										
STBYH	Stand-by Hot. Applies when CTYPE = 2WAYPR and 2WAYDC. STBYH indicates all the entities required for the cross connection are in-service. But the path is not selected in the RPB module and is ready to be selected if a failure is detected in the working connection.										
TS	Test, indicates the port is connected to a Test Access port.										
WRK	Working. Applies when CTYPE = 2WAYPR and 2WAYDC. WRK indicates all entities required for the cross connection are in-service and the path is selected in the RPB module.

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /* TP Database Error: <ERROR-STRING> for <AID-STRING> */ /* CONN Database Error: <ERROR-STRING> for <AID-STRING> */ /* CONF Database Error: <ERROR-STRING> for record number <RECORD-NUMBER> */ /* RIP Database Error: <ERROR-STRING> for record number <RECORD-NUMBER> */
SROF	Status, Requested Operation Failed

EXAMPLES

The following example illustrates the RTRV-RDL-ALL command and associated output.

```
RTRV-RDL-ALL;
```

The output response below shows a system-generated CTAG value of Pad568 and all red lined connections in the system.

```
<SID> <YY-MM-DD> <HH:MM:SS>

COMMAND CODE: **RTRV-RIP-PRMTR**
COMMAND NAME: **RETRIEVE RIP PARAMETERS**

PURPOSE

The RTRV-RIP-PRMTR command retrieves the Routing Information Protocol (RIP) parameters of the Local Area Network (LAN) interface on the Intelligent Communication Module (ICM). This command retrieves the network layer (Layer 3) parameters for RIP.

The successful response for a RTRV-RIP-PRMTR contains one line of parsable output data for each specified CPORT that is provisioned as a LAN port.

The RTRV-RIP-PRMTR command can be executed while in the Limited Command Execution mode (i.e., after execution of a STOP-OPS command) or the Normal Command Execution mode.

An RTRV-RIP-PRMTR command is denied if:

- The specified CID is not configured as the LAN on the ICM.
- The specified CID is not configured with the RIP parameters being retrieved.
- An invalid parameter value is entered.

INPUT FORMAT

RTRV-RIP-PRMTR : [TID] : CPORT : [CTAG] ;

INPUT PARAMETERS

TID	< 1–20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
CPORT	{3, 5, 7, 9, 11} Default: Entry Required Addressing: None Description: Control Port, identifies the CID which is configured as the LAN on the ICM module.
CTAG	< 1–6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>  
M <CTAG> COMPLD  
  ["<CPORT>.:RIPMODE=<value>,RIPSTAT=<value>"]  
  [/ * <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]  
;
```

OUTPUT PARAMETERS

RIPMODE=	{V1, V2, V1V2} Routing Information Protocol (RIP) Mode, determines which RIP version the router supports in the receive direction. Values are: V1 Version 1, specifies only Version 1 of the RIP is supported in the receive direction. V2 Version 2, specifies only Version 2 of the RIP is supported in the receive direction. V1V2 Version 1 and Version 2, specifies both Version 1 and Version 2 of the RIP are supported in the received direction.
----------	--

RIPSTAT= {DISABLE, ENABLE}
Routing Information Protocol (RIP) Status, determines whether or not the RIP protocol is enabled on the router. Values are:
DISABLE Specifies the RIP protocol is not enabled on the router.
ENABLE Specifies the RIP protocol is enabled on the router.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC Input, Invalid ACcess identifier

EXAMPLES

In the following example, the RIP parameters pertaining to the LAN on the ICM are being retrieved.

```
RTRV-RIP-PRMTR::5;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD
"5::RIPMODE=V1V2,RIPSTAT=DISABLE"
/* RTRV-RIP-PRMTR::5 [Pad567] (2) */
;
```

RELATED COMMANDS

ED-RIP-PRMTR

COMMAND CODE: **RTRV-RNG-OC12**
COMMAND NAME: **RETRIEVE RING OC-12**

PURPOSE

The RTRV-RNG-OC12 command retrieves ring protection group pairs for OC-12 facilities (that were established with the ENT-RNG-OC-12 command). It retrieves the preferred (protected) OC-12 and its associated alternate (protecting) OC-12 (i.e., odd-numbered and even-numbered OC-12s, respectively).

The successful response for a RTRV-RNG-OC12 command contains one line of parsable output data, in ascending order (from lowest FROM AID to largest FROM AID), for each ring protection group pair of OC-12 facilities. Regardless of which OC-12 is specified by AID (i.e., preferred or alternate), AID1 displays the preferred facility and the AID2 displays the alternate facility. If no OC-12 ring is found, the command completes successfully with no line of parsable output data displayed. In addition, no line of parsable output data is displayed if the specified port is unassigned (an SST of UAS).

A RTRV-RNG-OC12 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-RNG-OC12: [TID] :AID: [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
AID	OC12_AID: {OC12-{1-560}} (OC12-OC12#) Default: Entry Required Addressing: &&-ranging and &-grouping Description: OC12 AID, identifies either the preferred (protected) or the alternate (protecting) OC-12 port) which together constitutes the ring node.
CTAG	< 1-6 VALID CTAG CHARACTERS > Default: < System assigned CTAG value > Addressing: None Description: Correlation Tag, associates input command with its output responses.

SUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> COMPLD
["<AID1>,<AID2>::WTSDEL=<value>"]
[/* <Command Echo> [<CTAG>] (<CID [-VCNUM] >) */]
;
```

OUTPUT PARAMETERS

AID1	OC12_AID: {OC12-{1-560}} (OC12-OC12#) OC12 AID, identifies the preferred (protected) OC-12 port.
AID2	OC12_AID: {OC12-{1-560}} (OC12-OC12#) OC12 AID, identifies the alternate (protecting) OC-12 port.

WTSDEL= {DELAY, IMMED}
Wait to Switch Delay. Determines if the path switching on the paths within the OC-12 is being delayed by a set amount determined by the hardware or if it is immediate. Values are:

DELAY	The path switching is being delayed by approximately 25 milliseconds after the fault is detected.
IMMED	The path switching is occurring immediately upon detection of the fault.

UNSUCCESSFUL RESPONSE FORMAT

```
<SID> <YY-MM-DD> <HH:MM:SS>
M <CTAG> DENY
<ERROR CODE>
[/* <Informational Error Description Text> */]
[/* <Expanded Error Code Description> */]
[/* <Command Echo> [<CTAG>] (<CID[-VCNUM]>) */]
;
```

ERROR CODES

Refer to Appendix D, Error Codes, for a complete list of Error Codes. Appendix D also contains a list of Error Codes that are used if the command cannot be correctly parsed by the Command Parser. Parser generated Error Codes are not duplicated below. Other non-Parser Error Codes used with this command are:

IIAC	Input, Invalid ACcess identifier
SDBE	Status, internal Data Base Error /*TP Database Error: <ERROR-STRING> for <AID-STRING>*/ /*RNG Database Error: <ERROR-STRING> for record number <RECORD-NUMBER>*/ /*TPidToAidStr() Error: <ERROR-STRING>*/
SROF	Status, Requested Operation Failed

EXAMPLES

In the following example, the ring protection pair is retrieved for OC-12 port OC12-13 (preferred line).

```
RTRV-RNG-OC12::OC12-13;
```

The output response, shown below, assumes CID 2 was used to enter the command and a system generated CTAG value of Pad567. The response header would contain the provisioned Site ID of the system, and the date and time the command was executed.

```
<SID> <YY-MM-DD> <HH:MM:SS>
M Pad567 COMPLD

COMMAND CODE: **RTRV-RNG-OC3**
COMMAND NAME: **RETRIEVE RING OC-3**

PURPOSE

The RTRV-RNG-OC3 command retrieves ring protection group pairs for OC-3 facilities (that were established with the ENT-RNG-OC-3 command). It retrieves the preferred (protected) OC-3 and its associated alternate (protecting) OC-3 (i.e., odd-numbered and even-numbered OC-3s, respectively).

The successful response for a RTRV-RNG-OC3 command contains one line of parsable output data, in ascending order (from lowest FROM AID to largest FROM AID), for each ring protection group pair of OC-3 facilities. Regardless of which OC-3 is specified by AID (i.e., preferred or alternate), AID1 displays the preferred facility and the AID2 displays the alternate facility. If no OC-3 ring is found, the command completes successfully with no line of parsable output data displayed. In addition, no line of parsable output data is displayed if the specified port is unassigned (an SST of UAS).

A RTRV-RNG-OC3 command is denied if:

- An invalid parameter value is entered.

INPUT FORMAT

RTRV-RNG-OC3 : [TID] : AID : [CTAG] ;

INPUT PARAMETERS

TID	< 1-20 VALID TID CHARACTERS > Default: <SID> Addressing: None Description: Target Identifier, specifies the network node TID for the command.
