- 1.1 5620 SAM Alarm Reference overview 1-2**
- 1.2 NE-specific alarm information 1-3**
- 1.3 Alarm information in other formats 1-5**
- 1.4 OSS alarm monitoring 1-5**

## 1.1 5620 SAM Alarm Reference overview

The *5620 SAM Alarm Reference* describes all the alarms that the 5620 SAM can raise. The alarms are organized into chapters by NE type, and each alarm is presented in tabular format. Alarms that apply to multiple NE types have multiple entries in this guide; the only difference in the tables for these alarms is the applicable major NE release information.

See the *5620 SAM Troubleshooting Guide* for information about using alarms to troubleshoot the managed network. See the *5620 SAM User Guide* for information about alarm support, policies, and management using the 5620 SAM.

Table 1-1 contains a sample alarm entry.

**Table 1-1 EquipmentDegraded**

Alarm	Attributes	Applicable major NE releases
Name: EquipmentDegraded (604) Type: equipmentAlarm (3) Package: equipment Raised on class: equipment.FanTray	Severity: minor Implicitly cleared: true Default probable cause: singleFanFailure (450)	<ul style="list-style-type: none"> <li>• 10.0</li> <li>• 6.0</li> <li>• 7.0</li> <li>• 8.0</li> <li>• 9.0</li> </ul>
<b>Description:</b> The alarm is raised when a single fan fails. The chassis attempts to continue operating within the normal temperature range using only the remaining fans.		
<b>Raising condition:</b> ('Device State' EQUAL 'MinorFailure')		
<b>Clearing condition:</b> ('Device State' NOT EQUAL 'MinorFailure')		
<b>Remedial action:</b> The failed fan unit should be replaced.		

The table title for an alarm entry is the alarm name. When the same alarm name is found in multiple packages, the table title includes the package name in parentheses. Each alarm entry contains the following information:

- Name—the alarm name, and the alarm name ID in parentheses
- Type—the alarm type, and the type ID in parentheses
- Package—the containing package of the alarm, which maps to a package in the *5620 SAM-O XML Reference*
- Raised on class—the package and object class in *package.class* format
- Severity—the alarm default severity level
- Implicitly cleared—whether the alarm automatically clears when the clearing alarm condition is true
- Default probable cause—the typical probable cause of the alarm, and the probable cause ID in parentheses
- Applicable major NE releases—the major device releases against which the alarm can be raised; the releases are applicable to the device specified in the chapter title
- Description—the alarm description

- Raising condition—a logic statement that describes the internal 5620 SAM parameter values that initiate the raising of the alarm
- Clearing condition—a logic statement that describes the internal 5620 SAM parameter values that initiate the clearing of the alarm
- Remedial action—a statement or series of steps recommended by Alcatel-Lucent as the fault clearance procedure for the alarm

## 1.2 NE-specific alarm information

This section describes additional alarm support information for specific NEs.

### Unspecified NE alarms

Unspecified NE alarms are alarms that are not yet directly associated with one or more NE types.

**Note** — Associating alarms with specific NE types is an ongoing Alcatel-Lucent effort. For NE-specific information about an unspecified NE alarm, contact Alcatel-Lucent technical support.

### 5620 SAM platform alarms

5620 SAM platform alarms are alarms that the 5620 SAM raises in response to a condition in the 5620 SAM system that is not associated with an NE, for example, a database fault or the crossing of a disk-capacity threshold.

### 9471 WMM alarms

The 9471 WMM is based on a platform that supports many different applications. Some of the alarms that are described in this document apply to platform functions that the 9471 WMM does not utilize. Therefore, the 5620 SAM does not raise some of the 9471 WMM alarms listed in this document.

Some 9471 WMM alarm attributes are dynamic and are populated at runtime. Due to their dynamic nature, the following 9471 WMM alarm attributes are assigned generic values in this document:

- severity
- probable cause
- alarm type

**Note** — 9471 WMM alarms are provided in this document as a courtesy to assist in alarm identification and mapping. The *Alcatel-Lucent 9471 Wireless Mobility Manager (WMM) Alarm Dictionary 418-111-208* is the primary source for 9471 WMM alarm information.

## eNodeB alarms and events

The eNodeB supports the following notification types:

- Alarms—fault notifications that are assigned one of the standard severity levels. Alarms are displayed in the alarms window and the Faults tab of NE and object properties forms.
- Events—notifications or warnings about specific NE actions. Events are displayed in the Events Log tab of the ENB Equipment properties form on a per-NE basis.

Each alarm that originates from an eNodeB is named with an InfoKey ID. An alarm that the 5620 SAM raises in response to network conditions that involve an eNodeB is named using the standard format.

See the *Alcatel-Lucent 9412 eNodeB Alarms and Events Reference Guide* for more information about eNodeB alarms and events, including impact to network operation.

### Specific problem field for eNodeB alarms

The user-friendly name of eNodeB InfoKey alarms and events is represented by the “specific problem” field in the 5620 SAM alarm schema. In this document, the specific problem is appended to the alarm table title and displayed inside the table along with the specific problem ID number.

### ADAC alarms

eNodeB alarms that are defined with Alarm Nature = ADAC (auto....) are shown in 5620 SAM GUI as Implicitly cleared = “true” and are represented in the 9400 NEM with Alarm Nature = ADAC ().

### eNodeB software upgrade alarms

The 5620 SAM raises the NodeUpgraded info alarm when a managed eNodeB successfully undergoes an upgrade to a major software release, such as from LA6.0 to LR13.1.L. The 5620 SAM does not raise the alarm for software updates to maintenance releases or corrective loads within a major release, such as from LR13.1.L to LR13.1.L CL1.

## 9500 MPR alarms

See *Alcatel-Lucent 9500 MPR Maintenance and Trouble Clearing* for a listing of detailed remedial action procedures for 9500 MPR alarms.

## 1830 PSS alarms

See the *Alcatel-Lucent 1830 PSS Maintenance and Trouble-clearing User Guide* for a listing of detailed remedial action procedures for 1830 PSS alarms.

## External EMS alarms

Alarms that originate from external EMS that the 5620 SAM can manage, such as the 9959 NPO, are often dynamic and can be customized by users. The 5620 SAM has no information about an external EMS alarm until the alarm is sent to the 5620 SAM. Therefore, external EMS alarms are not described in this document. See the documentation of the relevant EMS for more information about the alarms that it can send to the 5620 SAM.

## 1.3 Alarm information in other formats

The alarm information in this document is also available in CSV and XML formats. You can use the `alarmDetails.csv` and `alarmDetails.xml` alarm reference files to tailor the alarm information to your requirements. For example, you can compare the files to determine what alarm information changes between 5620 SAM releases. Contact your Alcatel-Lucent support representative for more information.

## 1.4 OSS alarm monitoring

See the *5620 SAM XML OSS Interface Developer Guide* for information about managing alarms using a 5620 SAM OSS client.

## 1.5 New alarms by 5620 SAM release

This section lists the new alarms for each 5620 SAM release by alarm name and alarm ID. Consider the following statements when reviewing the information in this section:

- The alarm name identifies an alarm in the 5620 SAM GUI. The alarm ID identifies an alarm over OSS.
- Alarm IDs are unique. When an alarm is no longer supported by the 5620 SAM, the alarm ID is not reused by a new alarm.
- If an alarm is renamed, it is typically assigned a new alarm ID. Therefore, renamed alarms can be listed in this section as new. These alarms existed under different alarm names and alarm IDs in previous releases of the 5620 SAM.

For more information about the alarms listed in this section, see the relevant alarm information tables in the NE-specific chapters of this document.

## Maintenance releases

Some maintenance releases may not be listed in this section because no new alarms were added.

## New alarms for 5620 SAM Release 12.0 R5

Table 1-2 lists the new alarms for 5620 SAM Release 12.0 R5.

## 2 — 5620 SAM platform alarms

---

**Note** — Some alarms that the 5620 SAM can raise against the 5620 SAM platform may not be listed in this chapter. Associating alarms with specific domains is an ongoing Alcatel-Lucent effort. If the 5620 SAM raises an alarm against the 5620 SAM platform, and the alarm is not described in this chapter, see chapter 39 for information about the alarm.

**Table 2-1 AccountingPolicyDown**

Alarm	Attributes	Applicable major releases
Name: AccountingPolicyDown (538) Type: AccountingPolicy (54) Package: accounting Raised on class: accounting.Policy	Severity: critical Implicitly cleared: true Default probable cause: accountingPolicyDown (414)	<ul style="list-style-type: none"> <li>12.0 R5</li> </ul>
<b>Description:</b> The alarm is raised when an accounting policy goes operationally Down after a file creation failure at the specified admin and backup locations.		
<b>Raising condition:</b> ('operationalState' EQUAL 'Down')		
<b>Clearing condition:</b> ('operationalState' NOT EQUAL 'Down')		
<b>Remedial action:</b> The file creation error is most likely a result of a flash disk full condition. Please analyse the content of the flash disk and remove redundant files. After this operation is complete please administratively toggle the accounting policy down/up. If the problem persists please contact Alcatel-Lucent support for assistance.

Check for any other alarms (e.g. power adjust required) and follow their corresponding corrective action procedures.5. Wait at least 10 minutes to ensure that no other alarms are raised.6. Remove the unprotected LSP if it was created in a previous step.

Retrieve power level reading on the local port. 2. If input power level is lower or higher than required on the port, identify the associated OCh trail and verify the power levels along the OCh trail. If power levels along the upstream OCh trail are outside of their targeted range, then troubleshoot the port before continuing. If any power deviations raise additional alarms, troubleshoot them first. 3. If all power levels along the OCh trails fall within the target range, locate the fiber connected directly to receiver of the port. 4. Clean the fiber and check it for kinks. 5. If step 3 does not clear the alarm, replace the fiber. 6. Clean the input port of the OT. If the port is pluggable module, replace the module.

<b>Description:</b> The alarm is raised when Receiver Optimization in Progress is detected.		
<b>Remedial action:</b> This procedure details the corrective action for a RCVROPTPROG against the Line port.1. Wait approximately 15 minutes for the LOS or LOF alarm to clear.2. Ensure that the administrative state of the port is Admin Up. When it is Up, then toggle the administrative state from UP > DOWN > UP.3. If a faulty43STX4P pack caused the RCVROPTPROG alarm, replace with it a new 43STX4 pack. After replacement, if the condition persists, fiber loopback the line side of the 43STX4 pack.Remove the fiber from the port where the LOS or LOF was raised and measure the optical power.If the RCVROPTPROG condition is still present more than 15 minutes after the LOS or LOF alarm clears, the problem may be with the card.If the problem is on the Line input signal of the pack, check the signal. After a 40G OT card has initialized successfully, the Tunable Dispersion Compensator (TDC) and Delay Line Interferometer (DLI) on the line-side receive path will automatically tune to optimize transmission performance. During the TDC/DLI optimization, the RCVROPTPROG alarm is raised to notify the user that the pack is tuning, and transmission is not yet stable. When the TDC/DLI tuning process is completed, the alarm clears.4. Perform a warm reset of the card.5. Perform a cold reset of the card.6. Reseat and replace the card.

<b>Description:</b> The alarm is raised when a mediation poll of the SysUpTimeAlarm object on an NE fails, for example, because of network congestion or because the NE is too busy to respond. The probable cause is an unreachable NE Mediation agent on the NE. The polling interval depends on the NE type and is configurable in nms-server.xml. By default, the 5620 SAM polls a managed NE every four minutes. If a poll fails, the alarm is raised. The alarm clears when the 5620 SAM receives a response from the NE, and the 5620 SAM GUI icon that represents the NE turns from red to green.		
<b>Raising condition:</b> ('SNMP Reachability' EQUAL 'Down')		
<b>Remedial action:</b> Informational - if the alarm persists or is occurring frequently then investigation is required to understand a) why the underlying transport network is unreliable or b) why the NE is too busy to respond to 5620 SAM or c) has SNMP been disabled on the NE. Once the issue has been resolved SAM will automatically re-attempt.

<b>Remedial action:</b> This alarm indicates that the OT port has detected an Optical Channel (Och) Server Signal Failure. Please follow the below steps to clear this alarm(At the end of each step wait to see if the fault clears. If not proceed with the next step): 1. Retrieve power level reading on the local OT port. 2. If power level is low on the DWDM facing port, identify the associated OCh trail and verify the power levels along the OCh trail. 3. Identify the farthest upstream point relative to the far end OTUk port at which power level falls within the expected range. 4. Check the alarms/conditions on the node located in step 3 or the node immediately upstream from point identified in step 3. 5. Correct the problem identified in Step 4. 6. If all the power levels along the OCh trails fall within the target range, locate the fiber connected directly to receiver of the port which detects SSF condition. 7. Clean the fiber. 8. Replace the fiber. 9. If the problem is detected on the client port of 11STAR1 OT, and the power level is within the operating range, check for pluggable module alarms. 10. Replace the pluggable module.

<b>Description:</b> The alarm is raised when VTS Open Connection Indication is detected.		
<b>Remedial action:</b> This alarm is raised when the downstream 11DPE12/11DPE12E OT receives an APS/PCC message indicating an OCI from the upstream OT. This alarm is raised at the downstream OT on the Virtual Time Slot[n] which has an established connection. To clear this alarm, check the upstream 11DPE12/11DPE12E OT for any alarms/conditions on any VTS[n] with electrical connections. This will cause the OT to send an OCI message for the relevant VTS[n] to the downstream OT. An electrical connection is a provisioned connection from the VTS[n] to a GbE client port or another line VTS. If such an alarm is present, go to the procedure for clearing OCI alarms to clear the VTSOCI alarm at the downstream 11DPE12/11DPE12E OT.

<b>Description:</b> The alarm is raised when an OSPF interface is operationally down.		
<b>Raising condition:</b> ('operationalState' EQUAL 'Down')		
<b>Clearing condition:</b> ('operationalState' NOT EQUAL 'Down')		
<b>Remedial action:</b> This alarm is raised when the OSPF interface is operationally down. The situation may occur if the underlying physical interface is down either because of administrative disabling or a fault on the far end port or due to a cable connection or cable failure. This alarm will also be raised if the underlying transport network fails or is unreliable. Resolving the underlying instability in the transport network will correct this problem.
