<b>Description:</b> The SFMInterconnectPortDegraded alarm is generated by 7950 XRS-40 when the system has detected a reduction in switch fabric capacity because of degrade in a particular SFM interconnect port associated to the switch fabric. This is indicated through the field SfmIcPortDegradeState, the value of the field would not be None in this condition. The value degraded indicates switch fabric capacity on this port is reduced, but SFM interconnect port can still carry some traffic but not all the full capacity of the interconnect port.		
<b>Raising condition:</b> ('Fabric Degrade State' NOT EQUAL 'None')		

(1 of 2)

Alarm	Attributes	Applicable major releases
<b>Clearing condition:</b> ('Fabric Degrade State' EQUAL 'None')		
<b>Remedial action:</b> Switch fabric capacity is reduced due to the degradation in associated SFM interconnect port, this may not cause any impact to service because of redundancy in the fabric. Although it may not be possible to maintain full service, the SFM interconnection port and attached cable may be the cause for the degradation, replacing the affected components may restore some fabric capacity.

<b>Clearing condition:</b> NOT (((('Configured Alarms'anyBit'Encoder Degrade') AND ('Reported Alarms'anyBit'Encoder Degrade'))		
<b>Remedial action:</b> The OT or SVAC card has detected a DSP failure and this means that the wavelength tracker encode power control is compromised. If this occurs during steady state operation, there is a high probability that the services carried by this OT or SVAC are unaffected. To clear this alarm, replace the card. The card replacement procedure is service affecting and should be conducted during a maintenance window.

<b>Clearing condition:</b> NOT (((('Configured Alarms'anyBit'Encoder Failure') AND ('Reported Alarms'anyBit'Encoder Failure'))		
<b>Remedial action:</b> A cold reset, reseal, or replacement of a card is service impacting if the card is currently carrying services. If there are services currently carried over the card, it may be best to wait for a maintenance window before resetting, replacing, or resealing the card. Confirm that replacement OT or SVAC card supports the same band as the alarmed OT or SVAC card and connect all fibers to the replacement OT or SVAC card.

<b>Clearing condition:</b> NOT (((('Configured Alarms'anyBit'Power Control Degrade') AND ('Reported Alarms'anyBit'Power Control Degrade'))))		
<b>Remedial action:</b> check to see that the fiber for that card is correct. Remove the fiber from the Tx port on the transponder card. If the condition clears after 20 seconds, then this is a misfiber problem.

<b>Clearing condition:</b> NOT (((('Configured Alarms'anyBit'Power Control Failure') AND ('Reported Alarms'anyBit'Power Control Failure'))))		
<b>Remedial action:</b> Either alarmed card has detected equipment problem or there is misfiber problem such that a light-emitting fiber has been plugged into the Tx port of aWavelength Tracker encoder-equipped transponder card.If the card is a transponder card that is equipped with aWavelength Tracker encoder, check to see that the fiber for that card is correct. Remove the fiber from the Tx port on the transponder card. If the condition clears after 20 seconds, then this is a misfiber problem.the card is an SVAC, or if there is no fiber problem on the transponder card.Disconnect all fibers on the alarmed card and Replace the card. connect all fibers to the replacement card

Alarm	Attributes	Applicable major releases
Name: WmmATCA_ShelfFRUs (4196) Type: mmeAlarm (77) Package: Itemme Raised on class: Itemme.MmeAlarmEntry	Severity: variable Implicitly cleared: true Default probable cause: mmeUnspecifiedReason (607)	<ul style="list-style-type: none"> <li>• 6.0.0</li> <li>• 7.0.0</li> <li>• 7.1.0</li> <li>• 8.0.0</li> <li>• 8.1.0</li> </ul>
<b>Description:</b> This alarm indicates a problem with the shelf FRU information stored in the EEPROMs (located on the NFATCAV2 back panel and accessed via the I2C local bus). The EEPROMS contents are validated when a shelf manager is initialized as the active shelf manager, and periodically by the active shelf manager.		
<b>Remedial action:</b> A firmware upgrade may be needed, contact Alcatel-Lucent Customer Support.

<b>Remedial action:</b> Look at sensor alarms to see why the card was deactivated and resolve underlying problems.		

Table 22-67 WmmLSS\_cardConnectionLost

Alarm	Attributes	Applicable major releases
Name: WmmLSS_cardConnectionLost (4199) Type: mmeAlarm (77) Package: Itemme Raised on class: Itemme.MmeAlarmEntry	Severity: variable Implicitly cleared: true Default probable cause: mmeUnspecifiedReason (607)	<ul style="list-style-type: none"> <li>• 6.0.0</li> <li>• 7.0.0</li> <li>• 7.1.0</li> <li>• 8.0.0</li> <li>• 8.1.0</li> </ul>
<b>Description:</b> REM detected a problem with its connectivity to a service member under its control, or a service member has missed a heartbeat to REM.		
<b>Remedial action:</b> Verify the status on the service on the MI GUI. It should be 'Out of Service'. If it is active, or standby hot, with its mate being active, or manually out-of-service (unlocked/disabled/idle) then the alarm condition is not valid. If communication to the service does not come back within several minutes (e.g. the cardConnectionLost alarm does not clear), it may be necessary to connect to the card's console-port to get the status of the service. Consult card specific documentation about the console commands to obtain the card service state. If you are not successful in connecting to the console, this could be due to either a networking problem, or a fault in the card. If the card is inaccessible via console, it can be recovered via the reset button, or by power cycling. Continued trouble may mean the card is having some hardware difficulty; and Alcatel-Lucent Customer Support should be contacted to determine the next step(s). Try to ping the internal fixed service ip address of the service member from the host which is running the active CNFG service. If pinging the service member from the CNFG host succeeds, then go to Step 4; else go to Step 5. Determine if REM has a connection to the service member via the use of the netstat command on the host which has the active CNFG service. The following command will give a list of IP addresses that REM has connected to via well-known port 20000: netstat -a   grep 20000. Look for an 'Established' connection to the service's IP address in the output of the above command. If the service's IP address is not found in the output and this is the first time you have visited this step, then go to Step 6. If the service's IP address is not found in the output and this is the second time you have visited this step, then go to Step 7. Check the IP connections from the host that has the active CNFG service member to the switches and the routers. Check the connection to the card. If connection problems are found, they must be fixed. One can also verify that the appropriate service IP addresses have been plumbed and the appropriate service image has been downloaded to the card. Try switching the CNFG service to its currently standby hot member via MI GUI. Stop and start the CNFG service via the stopCNFG and startCNFG commands, respectively. This will stop the REM process and restart it, among others within the CNFG service. Once the CNFG service is active, the virtual cluster can be switched back. Note that error recovery and provisioning ability will be affected if the CNFG service is not operational. Restart/reload the service. This may be done via the MI GUI.

<b>Description:</b> This alarm indicates that a hardware diagnostic failure has been detected. Depending on the criticality of the checks, alarms with various severities are generated.		
<b>Remedial action:</b> For the Critical Alarm, the card should be taken OOS and replaced. For the Major Alarm, the card should be taken OOS and rebooted to see if the alarm clears. If it does not clear or there are other reports from the card (such as Asserts) reporting problems, the card should be left OOS and Alcatel-Lucent Customer Support should be contacted. For the Minor Alarm, contact Alcatel-Lucent Customer Support for the correction procedure.

<b>Remedial action:</b> This alarm will clear automatically if the rate of escalating assert generation drops below the threshold. An automatic escalation would result in a switch over and should also drop the rate of assert generation. Determine if any other alarms have been recently raised on the resource reported and address them. Examine the recent Performance (PM) counts on the resource reported; they may suggest more regarding this issue. If a provisioning or configuration change was executed just before the alarm was raised, consider that the change is causing the problem. If a Software Update (SU) or Patch is being soaked, then this could indicate a problem with the software delivered; immediately contact Alcatel-Lucent Customer Support. If the PM counts indicates degradation of service and a switch over has not occurred, switch the service to its redundant mate. If the situation persists after a switch-over, be sure that the prior active host of the service was removed from service and restored completely. Attempt another switch over to the original active host for the service. In all cases, contact customer support regarding this alarm.

<b>Description:</b> The raised alarm LSS_cpiAudErrCount indicates the value of the VS.audErrCount measurement monitored by the Audit Errors CPI exceeded a threshold in the last 15 minute interval. Audits run at low priority to recover lost or stuck resources. Audits generate error reports describing any problems they find. The VS.audErrCnt measurement reports the number of individual errors found by audits during the interval.		
<b>Remedial action:</b> Although audits take recovery for each error they find, use the Maintenance Interface to examine the set of audit errors reported. If this alarm recurs or is ongoing due to the same set of audits, contact Alcatel-Lucent Customer Support. If this alarm is new and coincides with the introduction of a software update, contact Alcatel-Lucent Customer Support immediately. This alarm will clear automatically if the rate of audit detected errors drops below the threshold.

<b>Description:</b> The raised alarm, LSS_cpiAudManAct, indicates the value of the VS.audManAct measurement monitored by the Audit Errors Requiring Manual Action CPI exceeded a threshold in the last 15 minute interval. Audits run at low priority to recover lost or stuck resources. Audits generate error reports describing any problems they find.. The VS.audManAct measurement reports the number of individual errors found by audits during the interval that require manual action for recovery.		
<b>Remedial action:</b> Using the Maintenance Interface, examine the set of audit errors reported and address them. Audit error reports requiring manual action should specify the actions needed to perform recovery. If this alarm is new and coincides with the introduction of a software update, contact Alcatel-Lucent Customer Support immediately. This alarm will clear automatically if the rate of audit detected errors requiring manual action drops below the threshold. However, this will not happen until the required manual recovery steps have been taken.

<b>Description:</b> The raised alarm LSS_cpiAudNewEvent indicates the value of the VS.audNewEvent measurement monitored by the Audit Initiated Events CPI exceeded a threshold in the last 15 minute interval. Audits run at low priority to recover lost or stuck resources. Audits generate error reports describing any problems they find..The VS.audNewEvent measurement reports the number of times during the interval that an audit that ran without being part of an escalated recovery and found at least one error.		
<b>Remedial action:</b> Although audits take recovery for each error they find, use the Maintenance Interface to examine the set of audit errors reported. If this alarm recurs or is ongoing due to the same set of audits, contact Alcatel-Lucent Customer Support. If this alarm is new and coincides with the introduction of a software update, contact Alcatel-Lucent Customer Support immediately. This alarm will clear automatically if the rate of audit invocations that detect errors drops below the threshold.

<b>Description:</b> The raised alarm LSS_cpiExceptionService indicates the value of the VS.exceptionService measurement monitored by the Service Exceptions CPI exceeded a threshold in the last 15 minute interval.		
<b>Remedial action:</b> The value of the VS.exceptionService measurement monitored by the Service Exceptions CPI exceeded a threshold in the last 15 minute interval. This alarm will clear automatically if the rate of exceptions drops below the threshold. Determine if any other alarms have been recently raised on the resource reported and address them. Examine the recent Performance (PM) counts on the resource reported; they may suggest more regarding this issue. If a provisioning or configuration change was executed just before the alarm was raised, consider that the change is causing the problem. If a Software Update (SU) or Patch is being soaked, then this could indicate a problem with the software delivered; immediately contact Alcatel-Lucent Customer Support. If the PM counts indicates degradation of service and a switch-over has not already occurred, switch the service to its redundant mate. If the situation persists after a switch-over, be sure that the prior active host of the service was removed from service and restored completely. Attempt another switch over to the original active host for the service. If the situation persists after two or more switch-overs of the pair within the service, then attempt to duplex fail the service. In all cases, contact customer support regarding this alarm.

<b>Description:</b> The raised alarm LSS_cpiFileSysUsage indicates the value of resource usage count VS.fileSysUsage monitored by the File System Usage CPI exceeded a threshold in the last 5-minute interval.		
<b>Remedial action:</b> Remove outdated and obsolete files to free the file system space. Move the important data files to other disks to free the file system space. When CPI alarm LSS_cpiFileSysUsage is fired for CDR host, don't remove CDR record files (under /app1/data0/cdrdata) and PCMD record files (under /app1/data0/pcmddata). Furthermore, double check timestamp of CDR records files under /app1/data0/cdrdata/app2/charging/stream1/primary. If many files are older than two PULL/PUSH intervals, then there might be CDR records file transfer issue, which should be fixed firstly. For non-CDR record or non-PCMD record files, follow step 1 or step 2.

<b>Description:</b> The raised alarm LSS_cpiReinitServiceSelf indicates the value of the VS.reinitServiceSelf measurement monitored by the Automatic Service Re-initialization CPI exceeded a threshold in the last 15 minute interval.		
<b>Remedial action:</b> This alarm will clear automatically if the rate of re-initializations drops below the threshold. Check that a switch over has successfully occurred. Determine if any other alarms have been recently raised on the resource reported and address them. As this is likely the result of recovery escalation, one or more of these alarms may also be raised: LSS_cpiAsrtEsc, LSS_cpiExceptionService, LSS_cpiRestartTask. If a provisioning or configuration change was executed just before the alarm was raised, consider that the change is causing the problem. If a Software Update (SU) or Patch is being soaked, then this could indicate a problem with the software delivered; immediately contact Alcatel-Lucent Customer Support. If the situation persists after a switch-over, be sure that the prior active host of the service was removed from service and restored completely. Attempt another switch over to the original active host for the service if that has not already occurred. If the situation persists after two or more switch-overs of the pair within the service, then attempt to duplex fail the service. Attempt to power down the card providing the service and then restore it. If the problem clears, this suggests faulty hardware. In all cases, contact customer support regarding this alarm.

## 22 — Alcatel-Lucent 9471 WMM alarms

Alarm	Attributes	Applicable major releases
<b>Remedial action:</b> Verify that no running debug or testing tool is running that uses a lot of CPU. <b>Description:</b> A Critical Application Resource (CAR) has reached a degraded condition that indicates some aspect of the switch is not performing as expected. The affected service member is indicated in the alarm by the PoolType, PoolId, and PoolMemberId.		
<b>Remedial action:</b> The root cause depends on the specific resource that is degraded. From the alarm, determine the service member that is degraded, as shown by the PoolType, PoolId, and PoolMemberId. On the MI GUI, go to the Management Interface window. Under the appropriate shelf, click Service Members. In the Service Members window, right click the appropriate service member, and choose Display Degraded Critical Resources. A pop-up window will display the 'Resource name' for each resource that is causing the service member to be degraded. In most cases, when a resource is degraded, the associated alarm will be firing. See the entry for this alarm in the '9471 Mobility Management Entity Alarm Dictionary 418-111-208' for a list of resources and the associated alarms.

Table 22-172 WmmLSS\_ethernetError

Alarm	Attributes	Applicable major releases
Name: WmmLSS_ethernetError (4268) Type: mmeAlarm (77) Package: Itemme Raised on class: Itemme.MmeAlarmEntry	Severity: variable Implicitly cleared: true Default probable cause: mmeUnspecifiedReason (607)	<ul style="list-style-type: none"> <li>• 6.0.0</li> <li>• 7.0.0</li> <li>• 7.1.0</li> <li>• 8.0.0</li> <li>• 8.1.0</li> </ul>
<b>Description:</b> One of the two Ethernet Links on a Service Host has failed.		
<b>Remedial action:</b> Regardless of the cause of the Ethernet Link alarm, integrity software running on the affected Service Host should automatically initiate a switch to redundant hardware to ensure that the effects of the failure are minimized. The following recovery actions may, in fact, be automatically initiated: Service Host switch, if multiple Ethernet Links are affected Ethernet Link switch, if a single Active Ethernet Link is affected None, if the hardware failure affects a Standby Ethernet Link The reason for the failure needs to be understood and corrected. It is possible that the Service Host Ethernet Port failed, the cabling that interconnects the Ethernet Port to the network is cut, the Routers and/or Ethernet Switches that make up the Alcatel-Lucent SoftSwitch Network failed. Investigate each of these reasons and discount or correct. Once corrected, the alarm will be cleared.

<b>Description:</b> The redundant Ethernet link has gone down on one of the diskless hosts. A link switchover may have occurred to move communication for that host to the remaining link, which is now simplex.		
<b>Remedial action:</b> Determine if any related alarms are also present, such as on the ESC, chassis, or board itself. Correct those alarms first and see if this alarm clears as a result. On Alcatel-Lucent CP 1000: Verify that the cable from the corresponding faceplate port to the external Ethernet router is connected and is good. Replace as necessary. On other Alcatel-Lucent Products: Verify that the ESC corresponding to this link is operational by viewing its status at MI, and by telnet to the ESC card. Correct or replace ESC as necessary. On Alcatel-Lucent 5400 LCP: Verify that the hub corresponding to this link is operational by viewing its status at MI, and by telnet to the Hub. Correct or replace Hub as necessary. On Alcatel-Lucent CP 1000: Verify that the external Ethernet router is operational. Correct or replace as necessary. On other Alcatel-Lucent Products: On the ESC verify that the Ethernet port corresponding to the card for this host is operational. Re-enable port as necessary. On Alcatel-Lucent 5400 LCP: On the hub verify that the Ethernet port corresponding to the card for this host is operational. Re-enable port as necessary. Replace the card used for this host using the appropriate FRU procedure as necessary. On Alcatel-Lucent CP 1000: Replace the card used for this host using the appropriate FRU procedure. If the above steps do not clear the alarm, contact Alcatel-Lucent Customer Support.

<b>Description:</b> An excessive number of links of a given type (e.g. s1mme, s11, etc.) are down. This is usually due to a network connectivity problem and not the individual links between the WMM and the external entity. Once this alarm is triggered the WMM will stop reporting alarms and status for links of the given type. Once the network problem is resolved and the number of links down is no longer excessive, this alarm will clear and the status of all links of the given type will be updated. This alarm is raised when at least 100 links of a given type are down. This alarm clears when 95 or fewer links are down.		
<b>Remedial action:</b> Determine that there are no errors within the IP network. If the network entity data is provisioned on MME, verify the data is correct. Verify the network entity that MME fails to communicate with is in service.

## 22 – Alcatel-Lucent 9471 WMM alarms

Alarm	Attributes	Applicable major releases
<b>Description:</b> The system detected a problem or a state change to external connectivity.		
<b>Remedial action:</b> For INFO alarm, there is no action needed. For MAJOR and CRITICAL alarm, verify the cable connections from both HUB cards to customer layer 2 switches, check if the cables are plugged properly. For MAJOR and CRITICAL alarm, verify the port status on HUB cards, the port connect to the customer network should be in service. For MAJOR and CRITICAL alarm, verify the individual Ethernet port status on the HUB card for the given host with the alarm. For the CRITICAL alarm, verify connectivity to/from each of the IPs listed in the ARP list from the given host with the alarm. Check the next hop reported as failing. Contact Alcatel-Lucent Customer Support for the correction procedure if previous steps do not correct it.

<b>Description:</b> A Service Host abnormally transitioned to an out-of-service state. (Note, this alarm will only be generated if the mate Service Host is in-service.)		
<b>Remedial action:</b> In general, the first few occurrences of the abnormal termination is automatically recovered by integrity software on the Service Host, in which case no manual action is necessary. When automatic recovery occurs the alarm clears automatically as well. However, if the unexpected event causing the abnormal termination occurs at a frequent enough rate, the Service Host can be left in a permanent Unavailable state. If in this state the alarm will not be cleared automatically and manual action is necessary to restore the Service Host. Bringing a Service Host software back to an In-Service state can be initiated from the MI. Ultimately, the reason for the abnormal termination needs to be determined and a fix provided. Fortunately, debugging output is sent to the MI Log File and core files are typically generated when these conditions occur. To aid Alcatel-Lucent Customer Support in providing a fix, the storage of the MI Log File and the collection of any core files at the time the error occurred should be done and made available. The location of generated core files is /var/core on the Service host that experienced the abnormal termination.

<b>Description:</b> This alarm is raised when SCTP path becomes unavailable. The local and remote provisioned addresses need to be checked for use of the correct 2 sub-networks provided. If the provisioned addresses match the 2 physical subnets, and if all address provisioned are also correct, then the physical network that carries the subnet used in the path 'unavailable' alarm needs to be investigated for trouble. The specifics of the path are documented in the 'additionalText' field of the alarm. These alarms may need to be cleared manually: as alarms are reported when path connectivity is established, however their contents are a function of provisioned addresses (paths) that may be wrong and changed when the connection is down, and may no longer match with the path that was originally alarmed.		
<b>Remedial action:</b> Verify that the endpoints IP addresses on the MME are the remote entity are provisioned correctly. Verify that the network between the MME and the remote entity is functioning correctly.

<b>Description:</b> Number of activated PDP context threshold reached.		
<b>Remedial action:</b> Analyze the operation context of the alarm. Determine if this alarm is structural or conjectural. Analyze the observation counters values to evaluate how quick the number of activated PDP contexts has increased. Depending on the result of the investigations: If the activated PDP contexts overload corresponds to a specific peak, you don't need to perform any upgrade of the SGSN. If alarm LSS_pdpThreshold is present as major, the activated PDP contexts overload is constant. There is a gap between the demand of PS services and the SGSN processing capacity. You need to upgrade the SGSN configuration. Please contact Alcatel-Lucent Customer Support.

<b>Description:</b> The LANCHECK audit has identified corrupted packets being transmitted through the network.		
<b>Remedial action:</b> The reason for the data corruption needs to be understood and corrected. It is possible that the Service Host Ethernet Port failed, the cabling that interconnects the Ethernet Port to the network is damaged, the Routers and/or Ethernet Switches that make up the Alcatel-Lucent SoftSwitch Network failed. Investigate each of these reasons and discount or correct. Once corrected, the alarm will be cleared.

The types of messages/calls that are shed is specific to the application and there tends to be additional types of messages impacted by the shedding as the severity increases. Currently the default thresholds between Major and Critical is 70.		
<b>Remedial action:</b> Verify that there is no running debug or testing tool that uses a lot of CPU/memory. If CPU or memory utilization regularly exceeds thresholds, investigate how the call traffic load can be reduced: Reengineer so less traffic is directed to this office or card. <b>Description:</b> Software that is executing on the Service Host has terminated abnormally.		
<b>Remedial action:</b> Generally, no manual action is necessary. Integrity software on the Service Host takes care of automatic recovery from the abnormal termination. When automatic recovery occurs the alarm will be cleared automatically as well. The affected software gets in a permanent unavailable state after frequent abnormal terminations. In this state, the alarm will not be cleared automatically and manual action will be necessary to restore the software. Bringing Service Host software back to an in-service state can be initiated from the MI. Use the MI GUI virtual host screen, initialization control option. If the problem reoccurs, contact Alcatel-Lucent Customer Support.

<b>Description:</b> The SNMP trap rate threshold for a particular SNE to the MI-Agent has been exceeded.		
<b>Remedial action:</b> Verify the sanity of the SNE to determine what is causing it to send excessive SNMP traps to the MI-Agent. As the cause for excessive traps can vary by instance, use standard fault detection techniques such as viewing alarms and/or network events at the MI-Agent, visual inspection of the SNE for external alarms and/or loose cables, and running diagnostic test to assist in determining the cause.

<b>Description:</b> Signifies that an SNE managed by the MI is the addressee of an improperly authenticated network protocol message. SNMP community name and client authentication failures cause the Element Manager to generate this trap.		
<b>Remedial action:</b> Verify that the individual trying to access the system is a legitimate user, and that the SNMP community strings are set correctly. This alarm may be disabled by turning off the SNMP authentication traps on the SNE (providing the SNE supports this capability).

<b>Description:</b> The MI was unable to communicate to a host via its SNMP interface.		
<b>Remedial action:</b> Verify that the ethernet cable is connected and in working order. Verify that the SNE may be ICMP-pinged over the same interface to determine whether it is an SNMP problem or a more general IP problem. If the problem is an IP problem, verify that the routers/switches are configured correctly. If the problem is only an SNMP problem and persists over several polling cycles, contact Alcatel-Lucent Customer Support.

<b>Remedial action:</b> This Alarm should be cleared manually. Need to find out where the user is trying to log in from to further verify whether this is a legitimate user. Need to check the user's CLI shell history to investigate for possible suspicious activity. Check the /var/log/auth.log for detailed access information. Check the /var/log/bash.log to investigate the user's cli activity. You may also use the Security and Audit Trail Log Viewer on the MI-agent GUI to view these logs.

<b>Description:</b> The SNMP trap rate threshold for a collection of SNEs to the MI-Agent has been exceeded.		
<b>Remedial action:</b> Verify the sanity of all SNEs in the system to determine which ones are sending excessive SNMP traps to the MI-Agent. As the cause for excessive traps can vary by instance, use standard fault detection techniques such as viewing alarms and/or network events at the MI-Agent, visual inspection of the SNE for external alarms and/or loose cables, and running diagnostic test to assist in determining the cause.

<b>Description:</b> The alarm is raised when a mediation poll of the SysUpTimeAlarm object on an NE fails, for example, because of network congestion or because the NE is too busy to respond. The probable cause is an unreachable NE Mediation agent on the NE. The polling interval depends on the NE type and is configurable in nms-server.xml. By default, the 5620 SAM polls a managed NE every four minutes. If a poll fails, the alarm is raised. The alarm clears when the 5620 SAM receives a response from the NE, and the 5620 SAM GUI icon that represents the NE turns from red to green.		
<b>Raising condition:</b> ('SNMP Reachability' EQUAL 'Down')		
<b>Remedial action:</b> Informational - if the alarm persists or is occurring frequently then investigation is required to understand a) why the underlying transport network is unreliable or b) why the NE is too busy to respond to 5620 SAM or c) has SNMP been disabled on the NE. Once the issue has been resolved SAM will automatically re-attempt.

<b>Description:</b> The alarm is raised when a mediation poll of the SysUpTimeAlarm object on an NE fails, for example, because of network congestion or because the NE is too busy to respond. The probable cause is an unreachable NE Mediation agent on the NE. The polling interval depends on the NE type and is configurable in nms-server.xml. By default, the 5620 SAM polls a managed NE every four minutes. If a poll fails, the alarm is raised. The alarm clears when the 5620 SAM receives a response from the NE, and the 5620 SAM GUI icon that represents the NE turns from red to green.		
<b>Raising condition:</b> ('SNMP Reachability' EQUAL 'Down')		
<b>Remedial action:</b> Informational - if the alarm persists or is occurring frequently then investigation is required to understand a) why the underlying transport network is unreliable or b) why the NE is too busy to respond to 5620 SAM or c) has SNMP been disabled on the NE. Once the issue has been resolved SAM will automatically re-attempt.

The used buffer cache memory should be low. To drop the cache memory use the command echo 3 >/proc/sys/vm/drop_caches. Terminate some calls to check whether memory utilization comes down, clearing the alarm. If the memory utilization does not reduce and the alarm persists, de-register the Small Cells and check for reduction in memory utilization. <b>Description:</b> This alarm indicates this eNB is potentially a victim of PCI confusion, it has multiple potential neighbor cells that have the same PCI as each other.		
<b>Impact:</b> Mobility procedure triggered in the cell may be directed to a wrong neighboring cell, leading to further call drops.		
<b>Remedial action:</b> The maintenance action has to be done in one of the neighbor eNBs. Note that here only a potential confusion is raised, meaning that there may be no impact. In case HO KPIs show an issue, this may be the cause. Then a manual intervention, is needed in one of the distant eNBs to solve the problem, by changing the PCI. If the Neighbours are confirmed to be real, then the confusion is detected as real and AutoPCI will try to solve the conflict on the actor side. In case it is not enabled or it cannot solve the conflict, major alarms are raised on both actor and victim sides.

## 26 – Alcatel-Lucent 9xxx eNodeB alarms

Alarm	Attributes	Applicable major releases
<b>Remedial action:</b> Depending on the reason found different actions can be taken: (1) packet loss or delay between the eNB and the BM-SC: fix network issue; (2) estimated network delay in the BM-SC is not correct: Check the network delay at the BM-SC; (3) time reference is different in eNB and BM-SC: check the synchronization period and the synchronization sequence provisioned in the BM-SC and the eNB parameters Mbms::m1SyncSequenceDuration and m1SyncPeriodDuration. The Mbms::m1SyncPeriodOffset can also be set on the eNB side to make a correction on the time-stamps received from the BM-SC. This value is subtracted to the BM-SC time-stamp (modulus m1SyncPeriodDuration). The same value shall be set on all eNBs of a MBSFN area. When possible, it is preferred to adjust the delay directly in the BM-SC rather than setting the syncPeriodOffset. (4) mismatch between the service bit rate and the resources allocated in the eNB: check MCE and content provider provisioning: the effective bit rate on the M1 interface seems to exceed the bit rate announced in M3 session start. (5) check isMbmsTrafficAllowed and the status of the synchronization clock source.

<b>Description:</b> This alarm indicates the RFM in Macro eNB or RFME in Metro has detected that transmit power on this port is too high so transmission for the port has been turned off. The turn off may also be caused by High reflected power: if the antenna cable is disconnected or damaged, or the antenna is damaged there may be high RF power levels reflected back into the RFM antenna port. RFMs can absorb a certain amount of this but newer high power units may not be able to absorb high return levels and so need to shut down. The power off may be also be due to High input IQ slew rates- internal slew detectors shut down the transmit path if the IQ levels swing too much for too long (5 seconds)		
<b>Impact:</b> The RFM port in Macro or RFME port in Metro is no longer transmitting, but the cell may still be partially supported on another port. The associated cell is degraded.		
<b>Remedial action:</b> Check for proper downlink power settings of the cells assigned to this port. Check also if the antenna cable is disconnected or damaged, or if the antenna is damaged, this may be the cause of High Reflected Power. Check also the CPRI cable connection, that may be the cause of High Input slew detectors
