## 12 — Alcatel-Lucent 7450 ESS alarms

Alarm	Attributes	Applicable major releases
<b>Description:</b> The alarm is raised when the protocol on a particular network interface has been detected as non-conformant to the associated distributed CPU protection policy parameters (on receiving vRtrIfDcpDynamicExcd trap) and the alarm status is set as non-conformant. When the network interface starts hold-down period for an exceeding protocol (on receiving vRtrIfDcpDynamicHoldDownStart trap), the alarm status will change into non-conformant(Hold Down Start). When the network interface completes hold-down period for an exceeding protocol (on receiving vRtrIfDcpDynamicHoldDownEnd trap), the alarm status will be changed into non-conformant(Hold Down End). When the protocol for the network interface has been detected as conformant for a period of the configured detection-time after having been previously detected as exceeding and completed any hold-down period (on receiving vRtrIfDcpDynamicConform trap), the alarm will be cleared.		
<b>Remedial action:</b> Appropriate configuration changes to the distributed CPU protection policy or to the affected network interface may be required.

<b>Description:</b> The alarm is raised when the local-monitoring-policer for a particular network interface has transitioned from a conformant state to a non-conformant state and the system will attempt to allocate dynamic enforcement policers (on receiving sapDcpLocMonExcd trap), and the alarm status is set as non-conformant. When all dynamic enforcement policers associated with a non-conformant local-monitoring-policer have been successfully allocated for the network interface (on receiving sapDcpLocMonExcdAllDynAlloc trap), the alarm status will be changed into non-conformant(Located All). When the local-monitoring-policer for a particular network interface has transitioned from a conformant state to a non-conformant state and the system cannot allocate all the dynamic enforcement policers associated with the distributed CPU protection policy (on receiving sapDcpLocMonExcdDynResource trap), the alarm status will be changed into non-conformant(Cannot Allocate All). When all the previously allocated dynamic enforcement policers for a particular local-monitoring-policer on the associated distributed CPU protection policy have been freed up and all the protocols are once again being monitored by local-monitor (on receiving sapDcpLocMonExcdAllDynFreed trap), the alarm will be cleared.		
<b>Remedial action:</b> Appropriate configuration changes to the distributed CPU protection policy or to the affected network interface may be required.

<b>Description:</b> The alarm is raised when a device reports an encoder degradation on a wavelength tracker interface.		
<b>Raising condition:</b> (('Configured Alarms'anyBit'Encoder Degrade') AND ('Reported Alarms'anyBit'Encoder Degrade'))		
<b>Clearing condition:</b> NOT (((('Configured Alarms'anyBit'Encoder Degrade') AND ('Reported Alarms'anyBit'Encoder Degrade'))))		
<b>Remedial action:</b> The OT or SVAC card has detected a DSP failure and this means that the wavelength tracker encode power control is compromised. If this occurs during steady state operation, there is a high probability that the services carried by this OT or SVAC are unaffected. To clear this alarm, replace the card. The card replacement procedure is service affecting and should be conducted during a maintenance window.

## 14 – Alcatel-Lucent 7705 SAR alarms

Alarm	Attributes	Applicable major releases
<b>Remedial action:</b> This alarm indicates that all physical Ethernet links associated with a LAG are operationally down. The reasons for the links to be down may vary from link to link. The following possible causes of this alarm should be investigated. The physical port (near end or far end) may have failed - this can be remedied by replacing the interface card in question. ## 16 – Alcatel-Lucent 7710 SR alarms

Alarm	Attributes	Applicable major releases
<b>Remedial action:</b> This alarm is raised when the OSPF interface neighbor is operationally down. The situation may occur if the underlying physical interface is down either because of administrative disabling or a fault on the far end port or due to a cable connection or cable failure. This alarm will also be raised if the underlying transport network fails or is unreliable. Resolving the underlying instability in the transport network will correct this problem.

<b>Description:</b> The alarm is raised when the link-specific packet arrival rate limit at the SAP is violated.		
<b>Raising condition:</b> ('Number of Rate Violations' NOT EQUAL '0L')		
<b>Remedial action:</b> A device in the network is sending traffic to the NE at a rate which is higher than expected. The source of the traffic must be identified and if the behavior is undesired then the device should be disabled. It is also possible that the threshold has been configured at a level which is lower than acceptable in which case the configuration should be align with the traffic levels expected.

## 17 – Alcatel-Lucent 7750 SR alarms

Alarm	Attributes	Applicable major releases
<b>Description:</b> The alarm is raised when the value of the object tmnxMcOmcStatFailed changes from 'notAct' to any of the other values. The alarm is cleared when the value of the object tmnxMcOmcStatFailed changes to 'notAct' from any of the other values. A transition from 'notAct' or 'no' to 'yes' means that the traffic of some or all associated client application entries is being dropped. For example, all traffic from some or all of the IPOE subscriber hosts protected by a failed SRRP instance is dropped by this system. A transition to 'no' means that the system has successfully allocated resources for the traffic of all associated client application entries. A transition to 'notAct' means that this system is not performing the active role anymore for this access protection instance. For example, the value of the object tmnxSrrpOperState has become different from 'master' for the corresponding instance.		
<b>Raising condition:</b> ('Instance Failed' NOT EQUAL 'Not Act')		
<b>Clearing condition:</b> ('Instance Failed' EQUAL 'Not Act')		
<b>Remedial action:</b> There are three recovery actions possible, depending on the reason of the transition of the access protection instance. If it is caused by a problem in the access network, fix that problem, or make additional resources available for this access protection instance. If it is caused by a misconfiguration of this system, correct that, or make additional resources available for this access protection instance.

Ensure that the interface is administratively up. Check for a poor cable connection to the port or for a faulty cable/fiber. If neither appears to be the problem run diagnostics on the port to determine if it is faulty.
