The 5620 SAM validates a device software file set before it imports the file set and distributes it to an NE. Ensure that the file set downloads properly to the NE and is not tampered with before you re-attempt the upgrade. The alarm clears when a valid file set is on the NE and the 5620 SAM activates the software image in the file set.		
Raising condition: ('isImageValid' EQUAL 'false')		
Clearing condition: ('isImageValid' EQUAL 'true')		
Remedial action: The existing SW image in the SAM database should be replaced with an image that is known to be complete and valid.

Description: The SFMInterconnectPortDegraded alarm is generated by 7950 XRS-40 when the system has detected a reduction in switch fabric capacity because of degrade in a particular SFM interconnect port associated to the switch fabric. This is indicated through the field SfmIcPortDegradeState, the value of the field would not be None in this condition. The value degraded indicates switch fabric capacity on this port is reduced, but SFM interconnect port can still carry some traffic but not all the full capacity of the interconnect port.		
Raising condition: ('Fabric Degrade State' NOT EQUAL 'None')		

(1 of 2)

Alarm	Attributes	Applicable major releases
Clearing condition: ('Fabric Degrade State' EQUAL 'None')		
Remedial action: Switch fabric capacity is reduced due to the degradation in associated SFM interconnect port, this may not cause any impact to service because of redundancy in the fabric. Although it may not be possible to maintain full service, the SFM interconnection port and attached cable may be the cause for the degradation, replacing the affected components may restore some fabric capacity.
