Remedial action: The maintenance action has to be done in one of the neighbor eNBs. Note that here only a potential confusion is raised, meaning that there may be no impact. In case HO KPIs show an issue, this may be the cause. Then a manual intervention, is needed in one of the distant eNBs to solve the problem, by changing the PCI. If the Neighbours are confirmed to be real, then the confusion is detected as real and AutoPCI will try to solve the conflict on the actor side. In case it is not enabled or it cannot solve the conflict, major alarms are raised on both actor and victim sides.

<p>Impact: Mobility procedure triggered in the neighbour cell may be directed to a wrong neighboring cell, leading to further call drops. The list of potentially victim eNBs is displayed.</p>		
<p>Remedial action: If the automatic PCI allocation is activated: Increase the list of allowed PCI values, either for the local or for the distant eNodeB; If the automatic PCI allocation is not activated: Change the PCI value, either for the local or the distant cell.</p>

(1 of 2)

Alarm	Attributes	Applicable major releases
<p>Remedial action: Depending on the reason found different actions can be taken: (1) packet loss or delay between the eNB and the BM-SC: fix network issue; (2) estimated network delay in the BM-SC is not correct: Check the network delay at the BM-SC; (3) time reference is different in eNB and BM-SC: check the synchronization period and the synchronization sequence provisionned in the BM-SC and the eNB parameters Mbms::m1SyncSequenceDuration and m1SyncPeriodDuration. The Mbms::m1SyncPeriodOffset can also be set on the eNB side to make a correction on the time-stamps received from the BM-SC. This value is subtracted to the BM-SC time-stamp (modulus m1SyncPeriodDuration). The same value shall be set on all eNBs of a MBSFN area. When possible, it is preferred to adjust the delay directly in the BM-SC rather than setting the syncPeriodOffset. (4) mismatch between the service bit rate and the resources allocated in the eNB: check MCE and content provider provisioning: the effective bit rate on the M1 interface seems to exceed the bit rate announced in M3 session start. (5) check isMbmsTrafficAllowed and the status of the synchronization clock source.</p>

This can happen in the following cases: (1)The conflict could not be solved autonomously by the eNB; (2)The automatic PCI allocation is not activated.		
Impact: Mobility procedure triggered in the neighbour cell may be directed to a wrong neighboring cell, leading to further call drops. The list of potentially victim eNBs is displayed.		
Remedial action: If the automatic PCI allocation is activated: Increase the list of allowed PCI values, either for the local or for the distant eNodeB; If the automatic PCI allocation is not activated:Change the PCI value, either for the local or the distant cell.

Impact: Mobility procedure triggered in the cell may be directed to a wrong neighboring cell, leading to further call drops.		
Remedial action: The maintenance action has to be done in one of the neighbour eNBs. The issue is also reported by Alarms in these eNBs. If the automatic PCI allocation is activated in these eNBs: (1) If a Warning Alarm is raised, the issue will be automatically solved in the next maintenance window; (2) If a Major Alarm is raised, the issue cannot be automatically solved. It is necessary to increase the list of allowed PCI values, and the issue will be automatically solved in the next maintenance window. If the automatic PCI allocation is not activated in these eNBs: A Major Alarm is raised. It is necessary to change the PCI value of one of the actor cell of the issue.

Description: This alarm indicates the RFM in Macro eNB or RFME in Metro has detected that transmit power on this port is too high so transmission for the port has been turned off. The turn off may also be caused by High reflected power: if the antenna cable is disconnected or damaged, or the antenna is damaged there may be high RF power levels reflected back into the RFM antenna port. RFMs can absorb a certain amount of this but newer high power units may not be able to absorb high return levels and so need to shut down. The power off may be also be due to High input IQ slew rates- internal slew detectors shut down the transmit path if the IQ levels swing too much for too long (5 seconds)		
Impact: The RFM port in Macro or RFME port in Metro is no longer transmitting, but the cell may still be partially supported on another port. The associated cell is degraded.		
Remedial action: Check for proper downlink power settings of the cells assigned to this port. Check also if the antenna cable is disconnected or damaged, or if the antenna is damaged, this may be the cause of High Reflected Power. Check also the CPRI cable connection, that may be the cause of High Input slew detectors

Description: The alarm is raised when a mediation poll of the SysUpTimeAlarm object on an NE fails, for example, because of network congestion or because the NE is too busy to respond. The probable cause is an unreachable NE Mediation agent on the NE. The polling interval depends on the NE type and is configurable in nms-server.xml. By default, the 5620 SAM polls a managed NE every four minutes. If a poll fails, the alarm is raised. The alarm clears when the 5620 SAM receives a response from the NE, and the 5620 SAM GUI icon that represents the NE turns from red to green.		
Raising condition: ('SNMP Reachability' EQUAL 'Down')		
Remedial action: Informational - if the alarm persists or is occurring frequently then investigation is required to understand a) why the underlying transport network is unreliable or b) why the NE is too busy to respond to 5620 SAM or c) has SNMP been disabled on the NE. Once the issue has been resolved SAM will automatically re-attempt.

Description: The alarm is raised when a mediation poll of the SysUpTimeAlarm object on an NE fails, for example, because of network congestion or because the NE is too busy to respond. The probable cause is an unreachable NE Mediation agent on the NE. The polling interval depends on the NE type and is configurable in nms-server.xml. By default, the 5620 SAM polls a managed NE every four minutes. If a poll fails, the alarm is raised. The alarm clears when the 5620 SAM receives a response from the NE, and the 5620 SAM GUI icon that represents the NE turns from red to green.		
Raising condition: ('SNMP Reachability' EQUAL 'Down')		
Remedial action: Informational - if the alarm persists or is occurring frequently then investigation is required to understand a) why the underlying transport network is unreliable or b) why the NE is too busy to respond to 5620 SAM or c) has SNMP been disabled on the NE. Once the issue has been resolved SAM will automatically re-attempt.
