Description: This alarm indicates that eMBMS service is experiencing packet loss (greater than LteCell::mbmsPacketLossThrHigh) or excessive delay (packets are detected in excess in eMBMS buffers).		
Remedial action: Depending on the reason found different actions can be taken: (1)packet loss or delay between the eNB and the BM-SC: fix network issue; (2) estimated network delay in the BM-SC is not correct: Check the network delay at the BM-SC; (3) time reference is different in eNB and BM-SC: check the synchronization period and the synchronization sequence provisionned in the BM-SC and the eNB parameters Mbms::m1SyncSequenceDuration and m1SyncPeriodDuration. The Mbms::m1SyncPeriodOffset can also be set on the eNB side to make a correction on the time-stamps received from the BM-SC. This value is subtracted to the BM-SC time-stamp (modulus m1SyncPeriodDuration). The same value shall be set on all eNBs of a MBSFN area. When possible, it is preffered to adjust the delay directly in the BM-SC rather than setting the syncPeriodOffset. (4) mismatch between the service bit rate and the resources allocated in the eNB: check MCE and content provider provisionning: the effective bit rate on the M1 interface seems to exceed the bit rate announced in M3 session start. (5) the status of the synchronization clock source.

Description: This alarm indicates the RFM in Macro eNB or RFME in Metro has detected that transmit power on this port is too high so transmission for the port has been turned off. The turn off may also be caused by High reflected power: if the antenna cable is disconnected or damaged, or the antenna is damaged there may be high RF power levels reflected back into the RFM antenna port. RFMs can absorb a certain amount of this but newer high power units may not be able to absorb high return levels and so need to shut down. The power off may be also be due to High input IQ slew rates- internal slew detectors shut down the transmit path if the IQ levels swing too much for too long (5 seconds)		
Remedial action: Check for proper downlink power settings of the cells assigned to this port. Check also if the antenna cable is disconnected or damaged, or if the antenna is damaged, this may be the cause of High Reflected Power. Check also the CPRI cable connection, that may be the cause of High Input slew detectors

Description: This event indicates that the control board suffered from an unexpected, unplanned reset.\nMore detailed information on the cause of this event is included in the Additional Information section of the event. This section provides detailed failure information intended for Nokia support and R&D experts to allow them to identify unique fault signatures of eNodeB hardware and software problems. \nThe information provided here is generally called a Fault Signature. The fault signature provides the raw material that can be used to diagnose a root cause for the event. It does not directly provide the root cause, but rather portions of a signature of a fault that can be compared to other faults. Each fault is different, but a unique fault signature can be constructed using combinations of data in the events.\n\nFor a description of eNodeB Fault Signatures included in failure events, see 'Fault Signatures for bCEM, eCCM and Cell failure Events' (p. 1-9). Contact Nokia support for further assistance.

Description: This event indicates that the control board suffered from an unexpected, unplanned reset. \nMore detailed information on the cause of this event is included in the Additional Information section of the event. This section provides detailed failure information intended for Nokia support and R&D experts to allow them to identify unique fault signatures of eNodeB hardware and software problems. \nThe information provided here is generally called a Fault Signature. The fault signature provides the raw material that can be used to diagnose a root cause for the event. It does not directly provide the root cause, but rather portions of a signature of a fault that can be compared to other faults. Each fault is different, but a unique fault signature can be constructed using combinations of data in the events.\n\nFor a description of eNodeB Fault Signatures included in failure events, see 'Fault Signatures for bCEM, eCCM and Cell failure Events' (p. 1-9). Contact Nokia support for further assistance.

Remedial action: Nothing can be done specific to the NGSS / SIP DS card itself. DNS server connectivity paths and provisioning must be checked and verified to ensure proper response linkage between intra-LSS and extra-LSS DNS entities.Intra-LSS DNS connectivity should be first verified through procedural verification followed by Extra-LSS to network-level DNS server connectivity confirmation. Check the data at the DNS server to ensure that valid data is available.After 15 seconds where extended cache is not used this alarm alarm will clear itself automatically. If none of the steps above succeed in clearing the alarm, contact Customer Support.

Table 30-15 CmmLSS_cardConnectionLost

Alarm	Attributes	Applicable major release
Name: CmmLSS_cardConnectionLost (11331) Type: equipmentAlarm Package: ltecmm.CmmLSS_cardConnectionLost Raised on class: ltecmm.CmmAlarmEntry	Severity: indeterminate Specific problem: Not Applicable Implicitly cleared: true Default probable cause: linkFailure	Release: • 17.0.0
Description: REM detected a problem with its connectivity to a service member under its control, or a service member has missed a heartbeat to REM.		
Remedial action: Verify the status on the service using REMcli. It should be "Out of Service". If it is active, or standby hot, with its mate being active, or manually out-of-service (unlocked/disabled/idle) then the alarm condition is not valid.If communication to the service does not come back within several minutes (e.g. the cardConnectionLost alarm does not clear), it may be necessary to connect to the card's console-port to get the status of the service. Consult card specific documentation about the console commands to obtain the card service state.If you are not successful in connecting to the console, this could be due to either a networking problem, or a fault in the card. If the the card is inaccessible via console, it can be recovered via the reset button, or by powercycling. Continued trouble may mean the card is having some hardware difficulty; and Customer Support should be contacted to determine the next step(s).Try to ping the internal fixed service ip address of the serivce member from the host which is running the active REM process. If pinging the service member from the VM succeeds, then go to Step 4; else go to Step 5.Determine if REM has a connection to the service member via the use of the netstat command on the host which has the active REM process The following command will give a list of IP addresses that REM has connected to via well-known port 20000:netstat -a | grep 20000Look for an "Established" connection to the service's IP address in the output of the above command. If the service's IP address is not found in the output and this is the first time you have visited this step, then go to Step 6. If the service's IP address is not found in the output and this is the second time you have visited this step, then go to Step 7.Check the IP connections from the host that has the active REM service member to the switches and the routers. Check the connection to the card. If connection problems are found, they must be fixed. One can also verify that the appropriate service IP addresses have been plumbed and the appropriate service image has been downloaded to the card.Try switching over the REM process.Restart/reload the service.

Table 30-23 CmmLSS_cpiAsrtEsc

Alarm	Attributes	Applicable major release
Name: CmmLSS_cpiAsrtEsc (11339) Type: qualityOfServiceAlarm Package: ltecmm.CmmLSS_cpiAsrtEsc Raised on class: ltecmm.CmmAlarmEntry	Severity: indeterminate Specific problem: Not Applicable Implicitly cleared: true Default probable cause: thresholdCrossed	Release: • 17.0.0
Description: The raised alarm LSS_cpiAsrtEsc indicates the value of the VS.asrtESC measurement monitored by the Escalating Asserts CPI exceeded a threshold in the last 15 minute interval.In software, defensive checks are placed to ensure expected inputs or boundary conditions within routines are met. If such a check fails, an assert report is logged containing information for the code author to debug the problem. The assert messages themselves are not of much value to the operator.When the problem is serious enough, such as being associated with a critical resource, an assert that can result in escalation is used. Such asserts are tied to a leaky bucket mechanism that measures the rate of these events. If the specified thresholds are reached, a task restart is attempted. If that level of escalation continues to fail, then a process initialization is done which leads to a switch-over of the service. Immediate escalation is possible.Notes:The thresholds are configurable via CLI.An alarm with the same severity will be raised only once for the same CPI and component.The alarm will be cleared if no threshold is met in one of the following intervals.		
Remedial action: This alarm will clear automatically if the rate of escalating assert generation drops below the threshold. An automatic escalation would result in a switch over and should also drop the rate of assert generation.Determine if any other alarms have been recently raised on the resource reported and address them.Examine the recent Performance (PM) counts on the resource reported; they may suggest more regarding this issue.If a provisioning or configuration change was executed just before the alarm was raised, consider that the change is causing the problem.If an Software Update (SU) or Patch is being soaked, then this could indicate a problem with the software delivered; immediately contact Customer Support.If the PM counts indicates degradation of service and a switch over has not occurred, switch the service to its redundant mate.If the situation persists after a switch-over, be sure that the prior active host of the service was removed from service and restored completely. Attempt another switch over to the original active host for the service.In all cases, contact customer support regarding this alarm.

Description: The raised alarm LSS_cpiAsrtNonEscCritical indicates the value of the VS.asrtNonESCCritical measurement monitored by the Critical Non-Escalating Asserts CPI exceeded a threshold in the last 15 minute interval.In software, defensive checks are placed to ensure expected inputs or boundary conditions within routines are met. If such a check fails, an assert report is logged containing information for the code author to debug the problem. The assert messages themselves are not of much value to the operator. Most of the time asserts are isolated events; however, they can begin to accumulate in which case a more serious failure may be occurring for which this alarm is bringing attention to.Defensive checks are performed to prevent more serious outages if possible.Asserts, which do not invoke any automatic recovery through escalation, are tagged with levels of severity, in this case critical, to provide guidance to Customer Support on the seriousness of the problem.Notes:The thresholds are configurable via CLI.An alarm with the same severity will be raised only once for the same CPI and component.The alarm will be cleared if no threshold is met in one of the following intervals.

Table 30-71 CmmLSS_cpiReinitServiceSelf (continued)

Alarm	Attributes	Applicable major release
Remedial action: This alarm will clear automatically if the rate of re-initializations drops below the threshold.Check that a switch over has successfully occurred.Determine if any other alarms have been recently raised on the resource reported and address them. As this is likely the result of recovery escalation, one or more of these alarms may also be raised: LSS_cpiAsrtEsc, LSS_cpiExceptionService, LSS_cpiRestartTaskIf a provisioning or configuration change was executed just before the alarm was raised, consider that the change is causing the problem.If an Software Update (SU) or Patch is being soaked, then this could indicate a problem with the software delivered; immediately contact Customer Support.If the situation persists after a switch-over, be sure that the prior active host of the service was removed from service and restored completely. Attempt another switch over to the original active host for the service if that has not already occurred.If the situation persists after two or more switch-overs of the pair within the service, then attempt to duplex fail the service.Attempt to power down the card providing the service and then restore it. If the problem clears, this suggests faulty hardware.In all cases, contact customer support regarding this alarm.		

Table 30-72 CmmLSS_cpiRestartTask

Alarm	Attributes	Applicable major release
Name: CmmLSS_cpiRestartTask (11388) Type: processingErrorAlarm Package: ltecmm.CmmLSS_cpiRestartTask Raised on class: ltecmm.CmmAlarmEntry	Severity: indeterminate Specific problem: Not Applicable Implicitly cleared: true Default probable cause: unspecifiedReason	Release: • 17.0.0
Description: The raised alarm LSS_cpiRestartTask indicates the value of the VS.restartTask measurement monitored by the Task Re-starts CPI exceeded a threshold in the last 15 minute interval.A restart is a fault recovery that is taken when a task (a.k.a. thread) within a resource (i.e., process in this case) performs an illegal operation (e.g., accessing an invalid address) or directly by the task when it enters an error leg that cannot recover the problem (the restart is directed by an assert call). The task's execution is halted at the point of the operation and resumed at its entry function.The intent is for one task restart to occur for a fault. However, if this fails, a leaky-bucket mechanism is also monitoring the rate of task restarts and an escalation to an initialization of the resource will occur if excessive. The initialization will also cause a switch over to the redundant mate.It is possible for more than one task to be undergoing restarts. These events are tied into this same PM count and the same leaky-bucket mechanism.Notes:The thresholds are configurable via CLI.An alarm with the same severity will be raised only once for the same CPI and component.The alarm will be cleared if no threshold is met in one of the following intervals.		
Remedial action: This alarm will clear automatically if the rate of task restart occurrences drops below the threshold.Determine if any other alarms have been recently raised on the resource reported and address them.Examine the recent Performance (PM) counts on the resource reported; they may suggest more regarding this issue.If a provisioning or configuration change was executed just before the alarm was raised, consider that the change is causing the problem.If an Software Update (SU) or Patch is being soaked, then this could indicate a problem with the software delivered; immediately contact Customer Support.If the PM counts indicates degradation of service and a switch-over has not already occurred, switch the service to its redundant mate.If the situation persists after a switch-over, be sure that the prior active host of the service was removed from service and restored completely. Attempt another switch over to the original active host for the service.If the situation persists after two or more switch-overs of the pair within the service, then attempt to duplex fail the service.In all cases, contact customer support regarding this alarm.

The 'Additional Info' field of the alarm report will list the contributing causes. When thread level CPU overload level changes, a corresponding profile report is also generated.		
Remedial action: Verify that no running debug or testing tool is running that uses a lot of CPU.If CPU utilization regularly exceeds thresholds, investigate how the call traffic load can be reduced:Reengineer so less traffic is directed to this office or card.If CPU utilization regularly exceeds thresholds, investigate how to re-engineer the system so less traffic is directed to this service. Table 30-91 CmmLSS_dataMismatch (continued)

Alarm	Attributes	Applicable major release
Description: A data mismatch has been detected, which indicates that there has been an error in provisioning. The additionalText field of the event provides the details of the data mismatch. Currently supported data mismatches are listed in the table below: IdentifierResourceExplanationMH_SH_PROVISIONINGCMM link(S1mme, S6a, S13, SGs)An interface profile has been associated with an SCTP profile that indicates either single-homed or multi-homed, but the network interface types (ni-types) associated with a network interface do not match that configuration. For example for SGs, the singled-homed ni-type is SGS, and the multi-homed ni-types are SGS_1 and SGS_2, so if the SCTP profile indicates single-homed, an SGs network interface must have an ni-type type of SGS, and if the SCTP profile indicates multi-homed, an SGs interface must have ni-types of SGS_1 and SGS_2. The additionalText field indicates the type of homing provisioned and the inconsistency found.MH_PROVISIONED_IPSLinkAn SCTP multi-homed link has been provisioned with remote adrresses that do not match the addresses that were learned from the remote end in the INIT-ACK message. There is either a provisioning mistake on the CMM, or on the remote end of the connection. The additionalText field of the event will indicate the provisioned (LCL) IP addresses and the remote (RMT) learned addresses which caused the descrepancy. The state of each IP address will be indicated after the IP address , e.g. 1.2.3.4(STATE), where STATE is one of; R - reachable, U - unreachable, C - unconfirmed.This alarm must be manually cleared after the provisioned data is corrected.		
Remedial action: The following table indicates the recovery procedure for the events referred to by their identifier in the previous table:IdentifierRecovery ProcedureMH_SH_PROVISIONINGCorrect the SCTP profile for this link type to indicate the correct homing type (SH or MH), or configure the correct ni-types for the link, so that they match the SCTP profile.MH_PROVISIONED_IPSCorrect the provisioning of the locally provisioned remote IPs to match the learned remote IPs, or change the provisioning on the remote end to match the locally provisioned remote IPs.

Remedial action: Regardless of the cause of the Ethernet Link alarm, integrity software running on the affected Service Host should automatically initiate a switch to redundant hardware to ensure that the effects of the failure are minimized. The following recovery actions may, in fact, be automatically initiated:Service Host switch, if multiple Ethernet Links are affectedEthernet Link switch, if a single Active Ethernet Link is affectedNone, if the hardware failure affects a Standby Ethernet LinkThe reason for the failure needs to be understood and corrected. It is possible that the Service Host Ethernet Port failed, the cabling that interconnects the Ethernet Port to the network is cut, the Routers and/or Ethernet Switches that make up theSoftSwitch Network failed. Each of these possible reasons needs to be investigated and discounted or corrected by maintenance personnel. Once corrected, the alarm will be cleared.

Description: The CMM uses the MariaDB database engine to store the 2G-3G-4G configuration data. This database is set up to run as a Master-Master configuration, with a replication link between the two nodes. This link will ensure the data updates on one node are propogated to the other node. It is possible that separate transactions can update the same data on both node simultaneously, causing failures to apply the data. In the event this occurs, the MariaDB replication link alarm is fired. Normally, the system will recover from most errors. However, if the corruption is severe, the alarm will persist, and service personal should be called to isolate the issue and possibly recover the database.		
Remedial action: CMM will recover itself, and clear the alarm for limited database failures. If the database failures are significant, the alarm will persist and support should be contacted to isolate the issue and recover the MariaDB database if required.Manually clear the alarm.

Remedial action: noSystemResourceAvailableMemory usage will fluctuate, and this problem may resolve itself quickly. However, if this is seen frequently, the processor may have experienced a problem because memory is not being freed properly; in this case, more drastic action may be required.For H248:Initialization of the cardKeep in mind that these actions may result in the loss of some calls. Switching over to standby process prior to this is advised. If this problem is seen repeatedly, Field support should be contacted.For CDR services:Initialization of the cardKeep in mind that these actions may result in the loss of some files. If this problem is seen repeatedly, field support should be contacted.utilizationReachedThresholdRe-establish the connection to CCF.

Table 30-123 CmmLSS_mmeTAIeNBMapping (continued)

Alarm	Attributes	Applicable major release
Description: The MME uses a target TAI to route S1AP messages to a HeNB that is indirectly connected to the MME via a HeNB GW. In order for the MME to route a message to the correct HeNB GW, only one eNB that is directly connected to the MME can send the given TAI to the MME in an S1AP S1 Setup Request message. This alarm indicates that while routing an S1AP message via TAI, the MME detected that the TAI maps to more than one eNB. In this situation, the MME will attempt to route the message to one of the these eNBs. If that eNB cannot route the message further to a HeNB, the corresponding S1AP procedure is expected fail (e.g., S1 handover is rejected by that eNB). In order to remedy this situation, the service provider must modify eNB TAI configuration (using whatever configuration system is used by the eNB) so that only one eNB sends a given TAI to the MME. This alarm must be manually cleared after the service provider has made corrections to eNB configuration.		
Remedial action: The E-UTRAN service provider must modify eNB TAI configuration (using whatever configuration system is used by the eNB) so that only one eNB sends a given TAI to the MME.Manually clear the alarm.

Description: The MME receives an eNB's supported TAIs in the S1AP S1 Setup Request and eNB Configuration Update messages. This alarm indicates that a TAI received from the eNB is not provisioned on the MME. In order to remedy this situation, the service provider must modify eNB TAI configuration (using whatever configuration system is used by the MME) or update the MME's configuration data to support the TAI indicated in the alarm. This alarm must be manually cleared after the service provider has made corrections to configuration data.		
Remedial action: The service provider must make corrections to either eNB or MME TAI configuration data.Manually clear the alarm.

Table 30-129 CmmLSS_numberOfTuplesInUse (continued)

Alarm	Attributes	Applicable major release
Description: The raised alarm LSS_numberOfTuplesInUse indicates that the number of tuples currently in use in a DA (data access) table used to store dynamic database information, has reached a threshold. The DA table in question is specified in the 'Resource'. The threshold is indicated in the 'Additional Information'.Notes:A DA table can have the following thresholds:Minor Alarm OnsetMinor Alarm AbatementMajor Alarm OnsetMajor Alarm AbatementCritical Alarm OnsetCritical Alarm AbatementThe alarm will be raised (or will transition to a higher severity if already raised) if the number of tuples in use is greater than or equal to the onset threshold for that severity (specific to that table).The alarm will transition to a lower severity (or will be cleared if the current severity is minor) if the number of tuples in use is less than or equal to the abatement threshold for that severity (specific to that table).

Table 30-130 CmmLSS_pathAvailability

Alarm	Attributes	Applicable major release
Name: CmmLSS_pathAvailability (11439) Type: communicationsAlarm Package: ltecmm.CmmLSS_pathAvailability Raised on class: ltecmm.CmmAlarmEntry	Severity: indeterminate Specific problem: Not Applicable Implicitly cleared: true Default probable cause: linkFailure	Release: • 17.0.0
Description: This alarm is raised when SCTP path becomes unavailable. The local and remote provisioned addresses need to be checked for use of the correct 2 sub-networks provided. If the provisioned addresses match the 2 physical subnets, and if all address provisioned are also correct, then the physical network that carries the subnet used in the path 'unavailable' alarm needs to be investigated for trouble. The 'additionalText' field of the alarm indicates the type(s1mme, s11, etc.) of link that has a path down. To retrive which paths are down use the appropriate CLI command to retrieve path status. These alarms may need to be cleared manually: as alarms are reported when path connectivity is established, however their contents are a function of provisioned addresses (paths) that may be wrong and changed when the connection is down, and may no longer match with the path that was originally alarmed.Note: this alarm is cleared when the path's SCTP association changes operational state, either from 'Enabled' to 'Disabled' or from 'Disabled' to 'Enabled'. This change could result from an administrative lock or unlock action, or a change in the collective availability of the association's paths. Any path unreachable alarms will be cleared. If the new association state is 'Disabled', a single link/association alarm (LSS_externalLinkDown) will be raised.		
Remedial action: Verify that the endpoints IP addresses on the CMM are the remote entity are provisioned correctly.Verify that the network between the CMM and the remote entity is functioning correctly.

Clearing condition: ('operationalState' EQUAL 'Enabled')		
Remedial action: Check the status of the site power supply.		

Table 34-8 AuxiliaryServerStatus

Alarm	Attributes	Applicable major release
Name: AuxiliaryServerStatus (311) Type: communicationsAlarm Package: server.AuxiliaryServerStatus Raised on class: server.AuxiliaryServer	Severity: critical Specific problem: Not Applicable Implicitly cleared: true Default probable cause: systemFailed	Release: • 6.0 • 7.0 • 8.0 • 9.0
Description: The alarm is raised when a 5620 SAM main server cannot communicate with an auxiliary server. The alarm clears when communication is restored.		
Raising condition: ('Server Status' EQUAL 'Down')		
Clearing condition: ('Server Status' EQUAL 'Up')		
Remedial action: Informational - if the alarm persists or is occurring frequently then investigation is required to understand why the connectivity between the AUX and SAM servers is unreliable.		

Table 34-9 BareMetalReachabilityDown

Alarm	Attributes	Applicable major release
Name: BareMetalReachabilityDown (10273) Type: virtualPortAlarm Package: dctr.BareMetalReachabilityDown Raised on class: dctr.BMDevice	Severity: major Specific problem: Not Applicable Implicitly cleared: true Default probable cause: BareMetalReachability-DownOrDeleted	Release: • 6.0 • 7.0 • 8.0 • 9.0
Description: The alarm is raised when Bare Metal server is reachability down.		
Raising condition: (('bgpReachabilityState' NOT EQUAL '0'))		
Clearing condition: (('bgpReachabilityState' EQUAL '0'))		
Remedial action: This alarm can be cleared when bare metal device BGP prefix is up. Check for virtual switch controller down or virtual switch down or interface/port down in underlay network (hence the BGP prefix not advertised).

Alarm	Attributes	Applicable major release
Name: BootParametersMisconfigured (35) Type: configurationAlarm Package: netw.BootParametersMisconfigured Raised on class: netw.NetworkElement	Severity: critical Specific problem: Not Applicable Implicitly cleared: true Default probable cause: persistentIndexFailure Applicable probable causes: • persistentIndexFailure • configFileBootFailure	Release: • 6.0 • 7.0 • 8.0 • 9.0

Table 34-10 BootParametersMisconfigured (continued)

Alarm	Attributes	Applicable major release
Description: The alarm is raised when the SNMP Index Boot Status on an NE is not set to Persistent.		
Raising condition: (('isGenericNode' EQUAL 'false') AND ('State' NOT EQUAL 'Pre-provisioned') AND ((('Config File Status' NOT EQUAL 'Executed Successfully') AND ('Config File Status' NOT EQUAL 'configFileStatus_unspecified')) OR (('Persistent Index Status' NOT EQUAL 'Rebuild Succeeded') AND ('Persistent Index Status' NOT EQUAL 'persistentIndexStatus_unspecified'))))		
Clearing condition: (('Config File Status' EQUAL 'Executed Successfully') AND ('Persistent Index Status' EQUAL 'Rebuild Succeeded'))		
Remedial action: Ensure that "SNMP Index Boot Status" is persistent (using cli command "show system information" on the NE). If not, unmanage the network element from SAM, ensure that "persist on" is set in the bof file, save the bof, save a config file, verify that an index file (.ndx) is saved as well, reboot the router, verify that SNMP Index Boot Status is persistent and finally remanage the router from SAM.

Alarm	Attributes	Applicable major release
Name: ClientDelegateServerStatus (731) Type: communicationsAlarm Package: server.ClientDelegateServerStatus Raised on class: server.ClientDelegateServer	Severity: critical Specific problem: Not Applicable Implicitly cleared: true Default probable cause: systemFailed	Release: • 6.0 • 7.0 • 8.0 • 9.0
Description: The alarm is raised when a client delegate server is unreachable.		
Raising condition: ('Server Status' EQUAL 'Down')		
Clearing condition: ('Server Status' EQUAL 'Up')		
Remedial action: Informational - if the alarm persists or is occurring frequently then investigation is required to understand why the connectivity between the client delegate platform and SAM servers is unreliable or the client delegate server itself is unreliable.

Description: The alarm is raised when SAM fails to manage a 9430 Compact Mobility Unit due to an FTP failure.		
Raising condition: ('Management State' EQUAL 'FTP Failed')		
Clearing condition: ('Management State' EQUAL 'Managed')		

Table 34-12 CmuManagementFailed (continued)

Alarm	Attributes	Applicable major release
Remedial action: Verify FTP connectivity between the 5620 SAM and the 9430 Compact Mobility Unit, then re-attempt to manage.
