About this document

Purpose

The *5620 SAM Alarm Reference* describes the alarms that the 5620 SAM can raise against managed NEs, network objects, and platform components. The alarms are organized into chapters by NE type, and each alarm is presented in tabular format. Alarms that apply to multiple NE types have multiple entries in this document; the only difference in the tables for these alarms is the applicable major NE release information.

See the *5620 SAM Troubleshooting Guide* for information about using alarms to troubleshoot the managed network. See the *5620 SAM User Guide* for information about alarm support, policies, and management using the 5620 SAM.

1 Overview

1.1 Alarm information

Alarm entry structure

Table 1-1, “EquipmentDegraded” (p. 11) contains a sample alarm entry.

Table 1-1 EquipmentDegraded

Alarm	Attributes	Applicable major release
Name: EquipmentDegraded (604) Type: equipmentAlarm (3) Package: equipment.EquipmentDegraded Raised on class: equipment.FanTray	Severity: minor Specific problem: Not Applicable Implicitly cleared: true Default probable cause: singleFanFailure (450)	Release: • 5.0.0 • 6.0.0 • 7.0.0
Description: The alarm is raised when a single fan fails. The chassis attempts to continue operating within the normal temperature range using only the remaining fans.		
Raising condition: ('Device State' EQUAL 'MinorFailure')		
Clearing condition: ('Device State' NOT EQUAL 'MinorFailure')		
Remedial action: The failed fan unit should be replaced.		

The table title for an alarm entry is the alarm name. When the same alarm name is found in multiple packages, the table title includes the package name in parentheses. Each alarm entry contains the following information:

Alarm fields

- Name—the alarm name, and the alarm name ID in parentheses
- Type—the alarm type, and the type ID in parentheses
- Package—the containing package of the alarm, which maps to a package in the *5620 SAM-O XML Reference*
- Raised on class—the package and object class in package.class format
- Severity—the alarm default severity level
- Specific problem—the user-friendly alarm name (applicable to RAN NEs only)
- Implicitly cleared—whether the alarm automatically clears when the clearing alarm condition is true
- Default probable cause—the typical probable cause of the alarm, and the probable cause ID in parentheses
- Applicable major NE releases—the major device releases against which the alarm can be raised; the releases are applicable to the device specified in the chapter title
- Description—the alarm description

- Raising condition—a logic statement that describes the internal 5620 SAM parameter values that initiate the raising of the alarm
- Clearing condition—a logic statement that describes the internal 5620 SAM parameter values that initiate the clearing of the alarm
- Remedial action—a statement or series of steps recommended as the fault clearance procedure for the alarm

1.2 NE-specific alarm information

Unspecified NE alarms

Unspecified NE alarms are alarms that are not yet directly associated with one or more NE types.

Note: Associating alarms with specific NE types is an ongoing effort. For NE-specific information about an unspecified NE alarm, contact technical support.

5620 SAM platform alarms

5620 SAM platform alarms are alarms that the 5620 SAM raises in response to a condition in the 5620 SAM system that is not associated with an NE, for example, a database fault or the crossing of a disk-capacity threshold.

9471 WMM alarms

The 9471 WMM is based on a platform that supports many different applications. Some of the alarms that are described in this document apply to platform functions that the 9471 WMM does not utilize. Therefore, the 5620 SAM does not raise some of the 9471 WMM alarms listed in this document.

Some 9471 WMM alarm attributes are dynamic and are populated at runtime. Due to their dynamic nature, the following 9471 WMM alarm attributes are assigned generic values in this document:

- severity
- probable cause
- alarm type

Note: 9471 WMM alarms are provided in this document as a courtesy to assist in alarm identification and mapping. The *9471 Wireless Mobility Manager (MME) Alarm Dictionary 418-111-208* is the primary source for 9471 WMM alarm information.

eNodeB alarms and events

The eNodeB supports the following notification types:

- Alarms-fault notifications that are assigned one of the standard severity levels. Alarms are displayed in the alarms window and the Faults tab of NE and object properties forms.
- Events-notifications or warnings about specific NE actions. Events are displayed in the Events Log tab of the ENB Equipment properties form on a per-NE basis.

Each alarm that originates from an eNodeB is named with an InfoKey ID. An alarm that the 5620 SAM raises in response to network conditions that involve an eNodeB is named using the standard format.

See the *9412 eNodeB Alarms and Events Reference Guide* for more information about eNodeB alarms and events, including impact to network operation.

Specific problem for eNodeB and 9774 LMG alarms

The user-friendly name of eNodeB and 9774 LMG InfoKey alarms and events is represented by the "specific problem" field in the 5620 SAM alarm schema.

ADAC alarms

eNodeB alarms that are defined with Alarm Nature = ADAC (auto.) are shown in 5620 SAM GUI as Implicitly cleared = "true" and are represented in the 9400 NEM with Alarm Nature = ADAC ().

eNodeB software upgrade alarms

The 5620 SAM raises the NodeUpgraded info alarm when a managed eNodeB successfully undergoes an upgrade to a major software release, such as from LA6.0 to LR13.1.L. The 5620 SAM does not raise the alarm for software updates to maintenance releases or corrective loads within a major release, such as from LR13.1.L to LR13.1.L CL1.

Applicable classes for eNodeB releases

The “Raised on classes” information for an eNodeB alarm can vary between the applicable major NE releases. Alarm class applicability in this document is presented generically without specifying variations per release.

9500 MPR alarms

See *9500 MPR Maintenance and Trouble Clearing* for a listing of detailed remedial action procedures for 9500 MPR alarms.

1830 PSS alarms

See the *1830 PSS Maintenance and Trouble-clearing User Guide* for a listing of detailed remedial action procedures for 1830 PSS alarms.

External EMS alarms

Alarms that originate from external EMS that the 5620 SAM can manage, such as the 9959 NPO, are often dynamic and can be customized by users. The 5620 SAM has no information about an external EMS alarm until the alarm is sent to the 5620 SAM. Therefore, external EMS alarms are not described in this document. See the documentation of the relevant EMS for more information about the alarms that it can send to the 5620 SAM.

1.3 Alarm information in other formats

Alarm information in other formats

The alarm information in this document is also available in CSV and XML formats. You can use the alarmDetails.csv and alarmDetails.xml alarm reference files to tailor the alarm information to your requirements. For example, you can compare the files to determine what alarm information changes between 5620 SAM releases. Contact your support representative for more information.

See the *5620 SAM XML OSS Interface Developer Guide* for information about managing alarms using a 5620 SAM OSS client.

1.5 New alarms by 5620 SAM release

Introduction

This section lists the new alarms for each 5620 SAM release by alarm name and alarm ID. Consider the following statements when reviewing the information in this section:

- The alarm name identifies an alarm in the 5620 SAM GUI. The alarm ID identifies an alarm over OSSI.
- Alarm IDs are unique. When an alarm is no longer supported by the 5620 SAM, the alarm ID is not reused by a new alarm.
- If an alarm is renamed, it is typically assigned a new alarm ID. Therefore, renamed alarms can be listed in this section as new. These alarms existed under different alarm names and alarm IDs in previous releases of the 5620 SAM.

For more information about the alarms listed in this section, see the relevant alarm information tables in the NE-specific chapters of this document.

Maintenance releases

Some maintenance releases may not be listed in this section because no new alarms were added.

2.1 Alarms

Alarms

Note: Some alarms that the 5620 SAM can raise against this device may not be listed in this chapter. Associating alarms with specific NE types is an ongoing Alcatel-Lucent effort. If the 5620 SAM raises an alarm against this device type, and the alarm is not described in this chapter, see Chapter 39, “Unspecified NE”.

Table 2-1 ActiveAbnormalCondition

Alarm	Attributes	Applicable major release
Name: ActiveAbnormalCondition (3938) Type: activeAbnormalConditionAlarm Package: netw.ActiveAbnormalCondition Raised on class: netw.NetworkElement	Severity: major Specific problem: Not Applicable Implicitly cleared: true Default probable cause: ActiveAbnormalConditionState	Release: • 6.0 • 7.0 • 8.0 • 9.0
Description: The alarm is an indication for abnormal condition on NE.		
Raising condition: ('abnormalCondition' EQUAL 'true')		
Clearing condition: ('abnormalCondition' EQUAL 'false')		
Remedial action: This alarm is raised when there is a abnormal state indication on NE.		

Table 2-2 ActiveFailedCrossConnectionProblem

Alarm	Attributes	Applicable major release
Name: ActiveFailedCrossConnectionProblem (8213) Type: communicationsAlarm Package: gmpls.ActiveFailedCrossConnectionProblem Raised on class: gmpls.OpticalGLSP	Severity: warning Specific problem: Not Applicable Implicitly cleared: true Default probable cause: ActiveFailedCrossConnection-Problem	Release: • 6.0 • 7.0 • 8.0 • 9.0
Description: The alarm is raised when the active route of a control plane service (with a protection type of SBR, GR, or PRC) has failed due to a cross-connection problem. As a result, the system tries to establish a backup path in order to reroute the traffic.		
Remedial action: Not Available.		

Table 2-3 ActiveFailedEndpointFailure

In the case of a loopback IP address change, the condition resolves itself after one hour.This situation can also happen if one of the following situations occur:if the control network was segmented when the OCH trails were created. If the control network is rejoined then any duplicates are discovered and this alarm is raised. The control network is segmented if the one or more ALPHG CN links are down such that a number of NEs cannot communicate to the remainder of the NEs in the network. if a database with a duplicate Och-trail is restored on a NE.if two Och Trails with the identical name are created at the same time within the network

If power levels along the upstream OCh trail are outside of their targeted range, then troubleshoot the port before continuing. If any power deviations raise additional alarms, troubleshoot them first.\n 3. If all power levels along the OCh trails fall within the target range, locate the fiber connected directly to receiver of the port.\n 4. Clean the fiber and check it for kinks.\n 5. If step 3 does not clear the alarm, replace the fiber.\n 6. Clean the input port of the OT. If the port is pluggable module, replace the module.

Description: The alarm is raised when Receiver Optimization in Progress is detected.		
Remedial action: This procedure details the corrective action for a RCVROPTPROG against the Line port.1. Wait approximately 15 minutes for the LOS or LOF alarm to clear.2. Ensure that the administrative state of the port is Admin Up. When it is Up, then toggle the administrative state from UP > DOWN > UP.3. If a faulty43STX4P pack caused the RCVROPTPROG alarm, replace with it a new 43STX4 pack. After replacement, if the condition persists, fiber loopback the line side of the 43STX4 pack.Remove the fiber from the port where the LOS or LOF was raised and measure the optical power.If the RCVROPTPROG condition is still present more than 15 minutes after the LOS or LOF alarm clears, the problem may be with the card.If the problem is on the Line input signal of the pack, check the signal. After a 40G OT card has initialized successfully, the Tunable Dispersion Compensator (TDC) and Delay Line Interferometer (DLI) on the line-side receive path will automatically tune to optimize transmission performance. During the TDC/DLI optimization, the RCVROPTPROG alarm is raised to notify the user that the pack is tuning, and transmission is not yet stable. When the TDC/DLI tuning process is completed, the alarm clears.4. Perform a warm reset of the card.5. Perform a cold reset of the card.6. Reseat and replace the card.

Remedial action: This alarm indicates that the OT port has detected an Optical Channel (Och) Server Signal Failure. Please follow the below steps to clear this alarm(At the end of each step wait to see if the fault clears. If not proceed with the next step):\n 1. Retrieve power level reading on the local OT port.\n 2. If power level is low on the DWDM facing port, identify the associated OCh trail and verify the power levels along the OCh trail.\n 3. Identify the farthest upstream point relative to the far end OTUk port at which power level falls within the expected range.\n 4. Check the alarms/conditions on the node located in step 3 or the node immediately upstream from point identified in step 3.\n 5. Correct the problem identified in Step 4.\n 6. If all the power levels along the OCh trails fall within the target range, locate the fiber connected directly to receiver of the port which detects SSF condition.\n 7. Clean the fiber.\n 8. Replace the fiber.\n 9. If the problem is detected on the client port of 11STAR1 OT, and the power level is within the operating range, check for pluggable module alarms.\n 10. Replace the pluggable module.
