statePacketsReceived [State Packets Received] (tmnxMcLagPeerStatsPktsRxState)	long	The value of tmnxMcLagPeerStatsPktsRxState indicates how many valid MC-Lag control packets of type lag state were received on this system from the peer.
tooShortPacketsDropped [Too Short Packets Dropped] (tmnxMcLagPeerStatsDropPktTooShrt)	long	The value of tmnxMcLagPeerStatsDropPktTooShrt indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was too short.
unknownTlvPacketsDropped [Unknown Tlv Packets Dropped] (tmnxMcLagPeerStatsDropUnknownTlv)	long	The value of tmnxMcLagPeerStatsDropUnknownTlv indicates how many MC-Lag control packets were dropped on this system from the peer because the packet contained an unknown TLV.

Table 656 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerSynchronizationProtocolStats</p> <p>MIB entry name: tmnxMcPeerSyncStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a multi-chassis synchronization protocol entry. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcPeerSyncStatsTable): The tmnxMcPeerSyncStatsTable has an entry for each multi-chassis peer synchronization protocol entry.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: multichassis.PeerSynchronizationProtocol</p>		
bodyDecodeErrorPacketsReceived [Body Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrBody)	long	The value of tmnxMcPeerSyncPktsRxErrBody indicates the number of packets with body decode errors received from the multi-chassis peer.
dataPacketsReceived [Data Packets Received] (tmnxMcPeerSyncPktsRxData)	long	The value of tmnxMcPeerSyncPktsRxData indicates the number of hello packets received from the multi-chassis peer.
dataPacketsTransmitted [Data Packets Transmitted] (tmnxMcPeerSyncPktsTxData)	long	The value of tmnxMcPeerSyncPktsTxData indicates the number of data packets transmitted to the multi-chassis peer.
erroneousPacketsReceived [Erroneous Packets Received] (tmnxMcPeerSyncPktsRxErr)	long	The value of tmnxMcPeerSyncPktsRxErr indicates the number of erroneous packets received from the multi-chassis peer.
headerDecodeErrorPacketsReceived [Header Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrHeader)	long	The value of tmnxMcPeerSyncPktsRxErrHeader indicates the number of packets with header decode errors received from the multi-chassis peer.
helloPacketsReceived [Hello Packets Received] (tmnxMcPeerSyncPktsRxHello)	long	The value of tmnxMcPeerSyncPktsRxHello indicates the number of hello packets received from the multi-chassis peer.

Table 656 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
helloPacketsTransmitted [Hello Packets Transmitted] (tmnxMcPeerSyncPktsTxHello)	long	The value of tmnxMcPeerSyncPktsTxHello indicates the number of hello packets transmitted to the multi-chassis peer.
otherPacketsReceived [Other Packets Received] (tmnxMcPeerSyncPktsRxOther)	long	The value of tmnxMcPeerSyncPktsRxOther indicates the number of all other packet types received from the multi-chassis peer.
otherPacketsTransmitted [Other Packets Transmitted] (tmnxMcPeerSyncPktsTxOther)	long	The value of tmnxMcPeerSyncPktsTxOther indicates the number of all other packet types transmitted to the multi-chassis peer.
packetTransmissionErrors [Packet Transmission Errors] (tmnxMcPeerSyncPktsTxErr)	long	The value of tmnxMcPeerSyncPktsTxErr indicates the number of packet transmission errors.
sequenceNumberErrorPacketsReceived [Sequence Number Error Packets Received] (tmnxMcPeerSyncPktsRxErrSeqNum)	long	The value of tmnxMcPeerSyncPktsRxErrSeqNum indicates the number of packets with sequence number errors received from the multi-chassis peer.
totalPacketsReceived [Total Packets Received] (tmnxMcPeerSyncPktsRxAll)	long	The value of tmnxMcPeerSyncPktsRxAll indicates the total number of packets received from the multi-chassis peer.
totalPacketsTransmitted [Total Packets Transmitted] (tmnxMcPeerSyncPktsTxAll)	long	The value of tmnxMcPeerSyncPktsTxAll indicates the total number of packets transmitted to the multi-chassis peer.

Table 657 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
NEBgpAutoRdStats MIB entry name: svcBgpAutoRDType1Group Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
svcBgpAutoRDType1InUse [Svc Bgp Auto RDType 1 In Use] (svcBgpAutoRDType1InUse)	long	The value of svcBgpAutoRDType1InUse indicates number of community values in use for this entry.
SnmpAgentStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
sgiSnmplnGetBulks [Sgi Snmp In Get Bulks] (sgiSnmplnGetBulks)	long	The value of sgiSnmplnGetBulks indicates the total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmplnASNParseErrs [Snmp In ASNParse Errs] (snmplnASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.

Table 657 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.

Table 657 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 658 openflow statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>OFChannelStats</p> <p>MIB entry name: tmnxOFChannelStatsEntry</p> <p>Entry description: The value of tmnxOFChannelStatsEntry specifies statistics information for the various packets exchanged between an open-flow switch and the controller.</p> <p>Table description (for tmnxOFChannelStatsTable): The tmnxOFChannelStatsTable contains channel statistics information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: openflow.OFChannelTable</p>		
pktsErr [Pkts Err] (tmnxOFChannelPacketErr)	java. math. BigInteger	The value of tmnxOFChannelPacketErr indicates the total number of error packets exchanged by open-flow switch specified by tmnxOFSwitchName with the controller.
pktsRx [Pkts Rx] (tmnxOFChannelPacketRx)	java. math. BigInteger	The value of tmnxOFChannelPacketRx indicates the total number of packets received by an open-flow switch specified by tmnxOFSwitchName.
pktsTx [Pkts Tx] (tmnxOFChannelPacketTx)	java. math. BigInteger	The value of tmnxOFChannelPacketTx indicates the total number of packets transmitted by an open-flow switch specified by tmnxOFSwitchName.
pktsType [Pkts Type] (tmnxOFChannelPacketType)	int	The value of tmnxOFChannelPacketType specifies the packet type exchanged between an open-flow switch and the controller.

Table 658 openflow statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>OFPortStats</p> <p>MIB entry name: tmnxOFPortStatsEntry</p> <p>Entry description: The value of tmnxOFPortStatsEntry specifies statistics information related to port associated with an open-flow switch.</p> <p>Table description (for tmnxOFPortStatsTable): The tmnxOFPortStatsTable contains port statistics information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: openflow.OFPortDescription</p>		
portId [Port Id] (tmnxOFPortID)	long	The value of tmnxOFPortID specifies the port identifier for uniquely identifying a port within an open-flow switch instance specified by tmnxOFSwitchName.
portName [Port Name] (tmnxOFPortName)	String	The value of tmnxOFPortName indicates the textual name of the interface. The value of this object should be the name of the interface as assigned by the open-flow switch.
portTxBytes [Port Tx Bytes] (tmnxOFPortTxBytes)	java. math. BigInteger	The value of tmnxOFPortTxBytes indicates the total number of bytes transmitted by this open-flow port.
portTxPkts [Port Tx Pkts] (tmnxOFPortTxPackets)	java. math. BigInteger	The value of tmnxOFPortTxPackets indicates the total number of packets transmitted by this open-flow port.

Table 658 openflow statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portType [Port Type] (tmnxOFPortType)	int	The value of tmnxOFPortType indicates the port-type for port identifier specified by tmnxOFPortID. openFlowPhysicalPort (1) - corresponds to hardware interface of an open-flow switch. openFlowLogicalPort (2) - corresponds to higher level abstractions defined by an open-flow switch (e.g. link aggregation groups, tunnels, loopback interfaces). openFlowReservedPort (3) - specifies generic forwarding actions such as sending to the controller, flooding, or forwarding using non open-flow methods, such as 'normal' switch processing.

Table 659 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: tmnxOspfAreaEntry</p> <p>Entry description: The tmnxOspfAreaEntry contains information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for tmnxOspfAreaTable): The tmnxOspfAreaTable contains information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
nssaTranslatorEvents [Nssa Translator Events] (tmnxOspfAreaNssaTranslatorEvents)	long	The value of tmnxOspfAreaNssaTranslatorEvents indicates the number of Translator State changes that have occurred since the last boot-up.
totalLSACount [Total LSACount] (tmnxOspfAreaScopeLsaCount)	long	The value of tmnxOspfAreaScopeLsaCount indicates the total number of Area-Scope link state advertisements in this area's link-state database.
totalSpfRuns [Total Spf Runs] (tmnxOspfAreaSpfRuns)	long	The value of tmnxOspfAreaSpfRuns indicates the number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
totalUnknownLSACount [Total Unknown LSACount] (tmnxOspfAreaScopeUnkLsaCount)	long	The value of tmnxOspfAreaScopeUnkLsaCount indicates the total number of unknown Area-Scope link-state advertisements in this area's link-state database.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaSiteLfaStats</p> <p>MIB entry name: tmnxOspfLfaStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfLfaStatsTable represents information on LFA coverage for a given OSPF area</p> <p>Table description (for tmnxOspfLfaStatsTable): The tmnxOspfLfaStatsTable maintains information on loopfree-alternate (LFA) coverage for each instance of OSPF protocol.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
ospfLfaCoverage [Ospf Lfa Coverage] (tmnxOspfLfaCoverage)	long	The value of tmnxOspfLfaCoverage indicates how much LFA coverage is being obtained for the set of available LFA eligible nodes.
ospfLfaNodesCovered [Ospf Lfa Nodes Covered] (tmnxOspfLfaNodesCovered)	long	The value of tmnxOspfLfaNodesCovered indicates in absolute numbers the number of nodes for which an LFA is found.
ospfLfaPrefixCoverage [Ospf Lfa Prefix Coverage] (tmnxOspfLfaPfxCoverage)	long	The value of tmnxOspfLfaPfxCoverage indicates how much LFA prefix coverage is being obtained for the set of available LFA eligible prefixes.
ospfLfaPrefixCovered [Ospf Lfa Prefix Covered] (tmnxOspfLfaPfxCovered)	long	The value of tmnxOspfLfaPfxCovered indicates in absolute numbers the number of prefixes for which an LFA is found.
ospfLfaTotalNodes [Ospf Lfa Total Nodes] (tmnxOspfLfaTotalNodes)	long	The value of tmnxOspfLfaTotalNodes indicates in absolute numbers the number of nodes eligible for LFA calculation.
ospfLfaTotalPrefix [Ospf Lfa Total Prefix] (tmnxOspfLfaTotalPfx)	long	The value of tmnxOspfLfaTotalPfx indicates in absolute numbers the number of prefixes eligible for LFA calculation.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceGeneralStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (tmnxOspfNgIfEvents)	long	The value of tmnxOspfNgIfEvents indicates the number of times this OSPF interface has changed its state, or an error has occurred.
<p>InterfaceReceiveStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfNgIfRxBadChecksums)	long	The value of tmnxOspfNgIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
InterfaceStatusStats MIB entry name: tmnxOspfNgIfStatsEntry Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface. Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface. Supports realtime plotting Supports scheduled collection Monitored class: ospf.Interface		
authorizationFailures [Authorization Failures] (tmnxOspfNgIfAuthFailures)	long	The value of tmnxOspfNgIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfNglfBadAreas)	long	The value of tmnxOspfNglfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfNglfBadAuthTypes)	long	The value of tmnxOspfNglfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfNglfBadDeadIntervals)	long	The value of tmnxOspfNglfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfNglfBadDstAddrs)	long	The value of tmnxOspfNglfBadDstAddrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfNglfBadHelloIntervals)	long	The value of tmnxOspfNglfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfNglfBadLengths)	long	The value of tmnxOspfNglfBadLengths indicates the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfNglfBadNeighbors)	long	The value of tmnxOspfNglfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNetworks [Bad Networks] (tmnxOspfNgIfBadNetworks)	long	The value of tmnxOspfNgIfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfNgIfBadOptions)	long	The value of tmnxOspfNgIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this interface or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfNgIfBadPacketTypes)	long	The value of tmnxOspfNgIfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfNgIfBadVersions)	long	The value of tmnxOspfNgIfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
badVirtualLinks [Bad Virtual Links] (tmnxOspfNgIfBadVirtualLinks)	long	The value of tmnxOspfNgIfBadVirtualLinks indicates the total number of OSPF packets received on this interface that are destined to a virtual link that does not exist since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfNgIfDiscardPackets)	long	The value of tmnxOspfNgIfDiscardPackets indicates the total number of OSPF packets discarded on this interface since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfNgIfRetransmitOuts)	long	The value of tmnxOspfNgIfRetransmitOuts indicates the total number of OSPF Retransmits sent on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceTransmitStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

events [Events] (tmnxOspfNgNbrEvents)	long	The value of tmnxOspfNgNbrEvents indicates the number of times this neighbor relationship has changed state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfNgNbrLsRetransQLen)	long	The value of tmnxOspfNgNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>NeighborStatusStats</p> <p>MIB entry name: tmnxOspfNgNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgNbrStatsTable represents additional columns for statistics for an OSPF neighbor.</p> <p>Table description (for tmnxOspfNgNbrStatsTable): The tmnxOspfNgNbrStatsTable provides an extension of the tmnxOspfNgNbrTable for statistics for an OSPF neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Neighbor</p>		

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badMtus [Bad Mtus] (tmnxOspfNgNbrBadMTUs)	long	The value of tmnxOspfNgNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badNeighborStates [Bad Neighbor States] (tmnxOspfNgNbrBadNbrStates)	long	The value of tmnxOspfNgNbrBadNbrStates indicates the total number of OSPF packets received when the neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfNgNbrBadPackets)	long	The value of tmnxOspfNgNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfNgNbrBadSeqNums)	long	The value of tmnxOspfNgNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfNgNbrDuplicates)	long	The value of tmnxOspfNgNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfNgNbrLsaInstallFailed)	long	The value of tmnxOspfNgNbrLsaInstallFailed indicates the total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfNgNbrLsaNotInLsdb)	long	The value of tmnxOspfNgNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfNgNbrNumRestarts)	long	The value of tmnxOspfNgNbrNumRestarts indicates the number of times the neighbor has attempted restart.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
optionMismatches [Option Mismatches] (tmnxOspfNgNbrOptionMismatches)	long	The value of tmnxOspfNgNbrOptionMismatches indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
<p>ShamLinkGeneralStats MIB entry name: tmnxOspfShamLfStatsEntry Entry description: Each row entry in the tmnxOspfShamLfStatsTable represents additional columns for statistics for an OSPF sham link. Table description (for tmnxOspfShamLfStatsTable): The tmnxOspfShamLfStatsTable provides an extension of the tmnxOspfShamLfTable for statistics for an OSPF sham link. Supports realtime plotting Supports scheduled collection Monitored class: ospf.ShamLink</p>		
events [Events] (tmnxOspfShamLfEvents)	long	The value of tmnxOspfShamLfEvents indicates the number of state changes or error events on this sham link.
<p>ShamLinkNeighborGeneralStats MIB entry name: tmnxOspfShamNbrStatsEntry Entry description: Each row entry in the tmnxOspfShamNbrStatsTable represents additional columns for statistics for an OSPF sham link neighbor. Table description (for tmnxOspfShamNbrStatsTable): The tmnxOspfShamNbrStatsTable provides an extension of the tmnxOspfShamNbrTable for statistics for an OSPF sham link neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.ShamLinkNeighbor</p>		
events [Events] (tmnxOspfShamNbrEvents)	long	The value of tmnxOspfShamNbrEvents indicates the number of times this sham link has changed its state, or an error has occurred.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfShamNbrLsRetransQLen)	long	The value of tmnxOspfShamNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>ShamLinkNeighborStatusStats</p> <p>MIB entry name: tmnxOspfShamNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamNbrStatsTable represents additional columns for statistics for an OSPF sham link neighbor.</p> <p>Table description (for tmnxOspfShamNbrStatsTable): The tmnxOspfShamNbrStatsTable provides an extension of the tmnxOspfShamNbrTable for statistics for an OSPF sham link neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLinkNeighbor</p>		
badMtus [Bad Mtus] (tmnxOspfShamNbrBadMTUs)	long	The value of tmnxOspfShamNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfShamNbrBadPackets)	long	The value of tmnxOspfShamNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfShamNbrBadSeqNums)	long	The value of tmnxOspfShamNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.
badVirtualNeighborStates [Bad Virtual Neighbor States] (tmnxOspfShamNbrBadNbrStates)	long	The value of tmnxOspfShamNbrBadNbrStates indicates the total number of OSPF packets received when the sham link neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplicates [Duplicates] (tmnxOspfShamNbrDuplicates)	long	The value of tmnxOspfShamNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfShamNbrLsaInstallFail)	long	The value of tmnxOspfShamNbrLsaInstallFail indicates the total number of times when an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfShamNbrLsaNotInLsdb)	long	The value of tmnxOspfShamNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfShamNbrNumRestarts)	long	The value of tmnxOspfShamNbrNumRestarts indicates the number of times the sham link neighbor has attempted restart since tmnxOspfAdminState was last set to 'enabled'.
optionMismatches [Option Mismatches] (tmnxOspfShamNbrOptionMismatch)	long	The value of tmnxOspfShamNbrOptionMismatch indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
<p>ShamLinkReceiveStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamIfRxDBDs)	long	The value of tmnxOspfShamIfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfShamIfRxBadChecksums)	long	The value of tmnxOspfShamIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>ShamLinkStatusStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
authorizationFailures [Authorization Failures] (tmnxOspfShamIfAuthFailures)	long	The value of tmnxOspfShamIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.
badAreas [Bad Areas] (tmnxOspfShamIfBadAreas)	long	The value of tmnxOspfShamIfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfShamIfBadAuthTypes)	long	The value of tmnxOspfShamIfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfShamIfBadDeadIntervals)	long	The value of tmnxOspfShamIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfShamIfBadDstAddrs)	long	The value of tmnxOspfShamIfBadDstAddrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badHelloIntervals [Bad Hello Intervals] (tmnxOspfShamIfBadHelloIntervals)	long	The value of tmnxOspfShamIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfShamIfBadLengths)	long	The value of tmnxOspfShamIfBadLengths indicates the total number of OSPF packets received on this sham link with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfShamIfBadNeighbors)	long	The value of tmnxOspfShamIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.
badNetworks [Bad Networks] (tmnxOspfShamIfBadNetworks)	long	The value of tmnxOspfShamIfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfShamIfBadOptions)	long	The value of tmnxOspfShamIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this sham link or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfShamIfBadPacketTypes)	long	The value of tmnxOspfShamIfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfShamIfBadVersions)	long	The value of tmnxOspfShamIfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
discardPackets [Discard Packets] (tmnxOspfShamIfDiscardPackets)	long	The value of tmnxOspfShamIfDiscardPackets indicates the total number of OSPF packets discarded on this sham link since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfShamIfRetransmitOuts)	long	The value of tmnxOspfShamIfRetransmitOuts indicates the total number of OSPF Retransmits sent on this sham link since tmnxOspfAdminState was last set to 'enabled'.
<p>ShamLinkTransmitStats MIB entry name: tmnxOspfShamIfStatsEntry Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link. Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link. Supports realtime plotting Supports scheduled collection Monitored class: ospf.ShamLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamIfRxDBDs)	long	The value of tmnxOspfShamIfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
<p>SiteStats</p> <p>MIB entry name: tmnxOspfStatisticsEntry</p> <p>Entry description: Each row entry in the tmnxOspfStatisticsTable represents additional columns for statistics for an OSPF instance.</p> <p>Table description (for tmnxOspfStatisticsTable): The tmnxOspfStatisticsTable provides an extension of the tmnxOspfGeneralTable for statistics for an OSPF instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Site</p>		
addRouteFailed [Add Route Failed] (tmnxOspfRoutesAddsFailed)	long	The value of tmnxOspfRoutesAddsFailed indicates the number of times an attempt to add a route to the Route Table Manager (RTM) failed for this OSPF instance.
cspfDroppedRequests [Cspf Dropped Requests] (tmnxOspfCSPFDroppedRequests)	long	The value of tmnxOspfCSPFDroppedRequests indicates the number of dropped CSPF requests made by the OSPF protocol.
cspfPathsFound [Cspf Paths Found] (tmnxOspfCSPFPathsFound)	long	The value of tmnxOspfCSPFPathsFound indicates the number of of paths found for the requests made to OSPF protocol.
cspfPathsNotFound [Cspf Paths Not Found] (tmnxOspfCSPFPathsNotFound)	long	The value of tmnxOspfCSPFPathsNotFound indicates the number of of paths not found for the requests made to OSPF protocol.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cspfRequests [Cspf Requests] (tmnxOspfCSPFRequests)	long	The value of tmnxOspfCSPFRequests indicates the number of CSPF requests made to the OSPF protocol.
deleteRouteFailed [Delete Route Failed] (tmnxOspfRoutesDelsFailed)	long	The value of tmnxOspfRoutesDelsFailed indicates the number of times an attempt to delete a route from the Route Table Manager (RTM) failed for this instance of OSPF.
inOverflowCount [In Overflow Count] (tmnxOspfNumTimesInOverflow)	long	The value of tmnxOspfNumTimesInOverflow indicates the count of the number of times the system was in the overflow state.
inOverloadCount [In Overload Count] (tmnxOspfNumTimesInOverload)	long	The value of tmnxOspfNumTimesInOverload indicates the count of the number of times the system was overloaded.
modifyRouteFailed [Modify Route Failed] (tmnxOspfRoutesModsFailed)	long	The value of tmnxOspfRoutesModsFailed indicates the number of times an attempt to modify a route in the Route Table Manager (RTM) failed for this instance of OSPF.
newLsasOriginated [New Lsas Originated] (tmnxOspfOriginateNewLsas)	long	The value of tmnxOspfOriginateNewLsas indicates the number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
newLsasReceived [New Lsas Received] (tmnxOspfRxNewLsas)	long	The value of tmnxOspfRxNewLsas indicates the number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
spfAttemptsFailed [Spf Attempts Failed] (tmnxOspfSpfAttemptsFailed)	long	The value of tmnxOspfSpfAttemptsFailed indicates the number of times an attempt to run SPF has failed because SPF runs have been stopped as a result of insufficient memory resources.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualLinkGeneralStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
events [Events] (tmnxOspfVirtIfEvents)	long	The value of tmnxOspfVirtIfEvents indicates the number of state changes or error events on this Virtual Link
<p>VirtualLinkReceiveStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfVirtIfRxBadChecksums)	long	The value of tmnxOspfVirtIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
VirtualLinkStatusStats MIB entry name: tmnxOspfVirtIfStatsEntry Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface. Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualLink		
authorizationFailures [Authorization Failures] (tmnxOspfVirtIfAuthFailures)	long	The value of tmnxOspfVirtIfAuthFailures indicates the total number of OSPF packets received on this virtual interface with invalid authentication keys.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfVirtIfBadAreas)	long	The value of tmnxOspfVirtIfBadAreas indicates the total number of OSPF packets received on this virtual interface with area mismatches.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfVirtIfBadAuthTypes)	long	The value of tmnxOspfVirtIfBadAuthTypes indicates the total number of OSPF packets received on this virtual interface with invalid authentication types.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfVirtIfBadDeadIntervals)	long	The value of tmnxOspfVirtIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfVirtIfBadDstAdrs)	long	The value of tmnxOspfVirtIfBadDstAdrs indicates the total number of OSPF packets received on this virtual interface with invalid destination IP address.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfVirtIfBadHelloIntervals)	long	The value of tmnxOspfVirtIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfVirtIfBadLengths)	long	The value of tmnxOspfVirtIfBadLengths indicates the total number of OSPF packets received on this virtual interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfVirtIfBadNeighbors)	long	The value of tmnxOspfVirtIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the configuration this router has for the neighbor.
badNetworks [Bad Networks] (tmnxOspfVirtIfBadNetworks)	long	The value of tmnxOspfVirtIfBadNetworks indicates the total number of OSPF packets received on this virtual interface with invalid network or mask fields.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badOptions [Bad Options] (tmnxOspfVirtIfBadOptions)	long	The value of tmnxOspfVirtIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this virtual interface or transit-area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfVirtIfBadPacketTypes)	long	The value of tmnxOspfVirtIfBadPacketTypes indicates the total number of OSPF packets received on this virtual interface with invalid OSPF packet types.
badVersions [Bad Versions] (tmnxOspfVirtIfBadVersions)	long	The value of tmnxOspfVirtIfBadVersions indicates the total number of OSPF packets received on this virtual interface with invalid OSPF version numbers.
discardPackets [Discard Packets] (tmnxOspfVirtIfDiscardPackets)	long	The value of tmnxOspfVirtIfDiscardPackets indicates the total number of OSPF packets discarded on this virtual interface.
retransmitOuts [Retransmit Outs] (tmnxOspfVirtIfRetransmitOuts)	long	The value of tmnxOspfVirtIfRetransmitOuts indicates the total number of OSPF packets retransmitted on this virtual interface.
<p>VirtualLinkTransmitStats MIB entry name: tmnxOspfVirtIfStatsEntry Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface. Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualLink</p>		

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
<p>VirtualNeighborGeneralStats</p> <p>MIB entry name: tmnxOspfVirtNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor.</p> <p>Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualNeighbor</p>		

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
events [Events] (tmnxOspfVirtNbrEvents)	long	The value of tmnxOspfVirtNbrEvents indicates the number of times this virtual link has changed its state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfVirtNbrLsRetransQLen)	long	The value of tmnxOspfVirtNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>VirtualNeighborStatusStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
badMtus [Bad Mtus] (tmnxOspfVirtNbrBadMTUs)	long	The value of tmnxOspfVirtNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfVirtNbrBadPackets)	long	The value of tmnxOspfVirtNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfVirtNbrBadSeqNums)	long	The value of tmnxOspfVirtNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 659 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badVirtualNeighborStates [Bad Virtual Neighbor States] (tmnxOspfVirtNbrBadNbrStates)	long	The value of tmnxOspfVirtNbrBadNbrStates indicates the total number of OSPF packets received when the virtual neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfVirtNbrDuplicates)	long	The value of tmnxOspfVirtNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfVirtNbrLsaInstallFail)	long	The value of tmnxOspfVirtNbrLsaInstallFail indicates the total number of times when an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfVirtNbrLsaNotInLsdb)	long	The value of tmnxOspfVirtNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfVirtNbrNumRestarts)	long	The value of tmnxOspfVirtNbrNumRestarts indicates the number of times the virtual neighbor has attempted restart since tmnxOspfAdminState was last set to 'enabled'.
optionMismatches [Option Mismatches] (tmnxOspfVirtNbrOptionMismatch)	long	The value of tmnxOspfVirtNbrOptionMismatch indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 660 pae802_1x statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PaePortAuthenticatorDiagStats</p> <p>MIB entry name: dot1xAuthDiagEntry</p> <p>Entry description: The diagnostics information for an Authenticator PAE.</p> <p>Table description (for dot1xAuthDiagTable): A table that contains the diagnostics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort 		
dot1xAuthAuthEapLogoffWhileAuthenticated [Dot 1 x Auth Auth Eap Logoff While Authenticated] (dot1xAuthAuthEapLogoffWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to DISCONNECTED, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapLogoffWhileAuthenticating [Dot 1 x Auth Auth Eap Logoff While Authenticating] (dot1xAuthAuthEapLogoffWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticated [Dot 1 x Auth Auth Eap Starts While Authenticated] (dot1xAuthAuthEapStartsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of an EAPOL-Start message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticating [Dot 1 x Auth Auth Eap Starts While Authenticating] (dot1xAuthAuthEapStartsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Start message being received from the Supplicant.

Table 660 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthAuthFailWhileAuthenticating [Dot 1 x Auth Auth Fail While Authenticating] (dot1xAuthAuthFailWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to HELD, as a result of the Backend Authentication state machine indicating authentication failure (authFail = TRUE).
dot1xAuthAuthReauthsWhileAuthenticated [Dot 1 x Auth Auth Reauths While Authenticated] (dot1xAuthAuthReauthsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthReauthsWhileAuthenticating [Dot 1 x Auth Auth Reauths While Authenticating] (dot1xAuthAuthReauthsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthSuccessWhileAuthenticating [Dot 1 x Auth Auth Success While Authenticating] (dot1xAuthAuthSuccessWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to AUTHENTICATED, as a result of the Backend Authentication state machine indicating successful authentication of the Supplicant (authSuccess = TRUE).
dot1xAuthAuthTimeoutsWhileAuthenticating [Dot 1 x Auth Auth Timeouts While Authenticating] (dot1xAuthAuthTimeoutsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of the Backend Authentication state machine indicating authentication timeout (authTimeout = TRUE).
dot1xAuthBackendAccessChallenges [Dot 1 x Auth Backend Access Challenges] (dot1xAuthBackendAccessChallenges)	long	Counts the number of times that the state machine receives an initial Access-Challenge packet from the Authentication server (i.e., aReq becomes TRUE, causing exit from the RESPONSE state). Indicates that the Authentication Server has communication with the Authenticator.
dot1xAuthBackendAuthFails [Dot 1 x Auth Backend Auth Fails] (dot1xAuthBackendAuthFails)	long	Counts the number of times that the state machine receives an EAP-Failure message from the Authentication Server (i.e., aFail becomes TRUE, causing a transition from RESPONSE to FAIL). Indicates that the Supplicant has not authenticated to the Authentication Server.

Table 660 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthBackendAuthSuccesses [Dot 1 x Auth Backend Auth Successes] (dot1xAuthBackendAuthSuccesses)	long	Counts the number of times that the state machine receives an EAP-Success message from the Authentication Server (i.e., aSuccess becomes TRUE, causing a transition from RESPONSE to SUCCESS). Indicates that the Supplicant has successfully authenticated to the Authentication Server.
dot1xAuthBackendNonNakResponsesFromSupplicant [Dot 1 x Auth Backend Non Nak Responses From Supplicant] (dot1xAuthBackendNonNakResponsesFromSupplicant)	long	Counts the number of times that the state machine receives a response from the Supplicant to an initial EAP-Request, and the response is something other than EAP-NAK (i.e., rxResp becomes TRUE, causing the state machine to transition from REQUEST to RESPONSE, and the response is not an EAP-NAK). Indicates that the Supplicant can respond to the Authenticator's chosen EAP-method.
dot1xAuthBackendOtherRequestsToSupplicant [Dot 1 x Auth Backend Other Requests To Supplicant] (dot1xAuthBackendOtherRequestsToSupplicant)	long	Counts the number of times that the state machine sends an EAP-Request packet (other than an Identity, Notification, Failure or Success message) to the Supplicant (i.e., executes txReq on entry to the REQUEST state). Indicates that the Authenticator chose an EAP-method.
dot1xAuthBackendResponses [Dot 1 x Auth Backend Responses] (dot1xAuthBackendResponses)	long	Counts the number of times that the state machine sends an initial Access-Request packet to the Authentication server (i.e., executes sendRespToServer on entry to the RESPONSE state). Indicates that the Authenticator attempted communication with the Authentication Server.
dot1xAuthEapLogoffsWhileConnecting [Dot 1 x Auth Eap Logoffs While Connecting] (dot1xAuthEapLogoffsWhileConnecting)	long	Counts the number of times that the state machine transitions from CONNECTING to DISCONNECTED as a result of receiving an EAPOL-Logoff message.
dot1xAuthEntersAuthenticating [Dot 1 x Auth Enters Authenticating] (dot1xAuthEntersAuthenticating)	long	Counts the number of times that the state machine transitions from CONNECTING to AUTHENTICATING, as a result of an EAP-Response/Identity message being received from the Supplicant.

Table 660 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEntersConnecting [Dot 1 x Auth Enters Connecting] (dot1xAuthEntersConnecting)	long	Counts the number of times that the state machine transitions to the CONNECTING state from any other state.
<p>PaePortAuthenticatorSessionStats MIB entry name: dot1xAuthSessionStatsEntry Entry description: The session statistics information for an Authenticator PAE. This shows the current values being collected for each session that is still in progress, or the final values for the last valid session on each port where there is no session currently active. Table description (for dot1xAuthSessionStatsTable): A table that contains the session statistics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself. Supports realtime plotting Supports scheduled collection Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort 		
dot1xAuthSessionAuthenticMethod [Dot 1 x Auth Session Authentic Method] (dot1xAuthSessionAuthenticMethod)	int	The authentication method used to establish the session.
dot1xAuthSessionFramesRx [Dot 1 x Auth Session Frames Rx] (dot1xAuthSessionFramesRx)	long	The number of user data frames received on this Port during the session.
dot1xAuthSessionFramesTx [Dot 1 x Auth Session Frames Tx] (dot1xAuthSessionFramesTx)	long	The number of user data frames transmitted on this Port during the session.
dot1xAuthSessionOctetsRx [Dot 1 x Auth Session Octets Rx] (dot1xAuthSessionOctetsRx)	java. math. BigInteger	The number of octets received in user data frames on this Port during the session.

Table 660 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthSessionOctetsTx [Dot 1 x Auth Session Octets Tx] (dot1xAuthSessionOctetsTx)	java. math. BigInteger	The number of octets transmitted in user data frames on this Port during the session.
dot1xAuthSessionTerminateCause [Dot 1 x Auth Session Terminate Cause] (dot1xAuthSessionTerminateCause)	int	The reason for the session termination.
dot1xAuthSessionTime [Dot 1 x Auth Session Time] (dot1xAuthSessionTime)	long	The duration of the session in seconds.
<p>PaePortAuthenticatorStats</p> <p>MIB entry name: dot1xAuthStatsEntry</p> <p>Entry description: The statistics information for an Authenticator PAE.</p> <p>Table description (for dot1xAuthStatsTable): A table that contains the statistics objects for the Authenticator PAE associated with each Port. dot1xAuthEapLengthErrorFramesRx [Dot 1 x Auth Eap Length Error Frames Rx] (dot1xAuthEapLengthErrorFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the Packet Body Length field is invalid.
dot1xAuthEapolFramesRx [Dot 1 x Auth Eapol Frames Rx] (dot1xAuthEapolFramesRx)	long	The number of valid EAPOL frames of any type that have been received by this Authenticator.

Table 660 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEapolFramesTx [Dot 1 x Auth Eapol Frames Tx] (dot1xAuthEapolFramesTx)	long	The number of EAPOL frames of any type that have been transmitted by this Authenticator.
dot1xAuthEapolLogoffFramesRx [Dot 1 x Auth Eapol Logoff Frames Rx] (dot1xAuthEapolLogoffFramesRx)	long	The number of EAPOL Logoff frames that have been received by this Authenticator.
dot1xAuthEapolReqFramesTx [Dot 1 x Auth Eapol Req Frames Tx] (dot1xAuthEapolReqFramesTx)	long	The number of EAP Request frames (other than Rq/Id frames) that have been transmitted by this Authenticator.
dot1xAuthEapolReqIdFramesTx [Dot 1 x Auth Eapol Req Id Frames Tx] (dot1xAuthEapolReqIdFramesTx)	long	The number of EAP Req/Id frames that have been transmitted by this Authenticator.
dot1xAuthEapolRespFramesRx [Dot 1 x Auth Eapol Resp Frames Rx] (dot1xAuthEapolRespFramesRx)	long	The number of valid EAP Response frames (other than Resp/Id frames) that have been received by this Authenticator.
dot1xAuthEapolRespIdFramesRx [Dot 1 x Auth Eapol Resp Id Frames Rx] (dot1xAuthEapolRespIdFramesRx)	long	The number of EAP Resp/Id frames that have been received by this Authenticator.
dot1xAuthEapolStartFramesRx [Dot 1 x Auth Eapol Start Frames Rx] (dot1xAuthEapolStartFramesRx)	long	The number of EAPOL Start frames that have been received by this Authenticator.
dot1xAuthInvalidEapolFramesRx [Dot 1 x Auth Invalid Eapol Frames Rx] (dot1xAuthInvalidEapolFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the frame type is not recognized.
dot1xAuthLastEapolFrameVersion [Dot 1 x Auth Last Eapol Frame Version] (dot1xAuthLastEapolFrameVersion)	long	The protocol version number carried in the most recently received EAPOL frame.

Table 661 pcep statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PcepPeerAdditionalStats</p> <p>MIB entry name: tmnxPcepPeerStatsEntry</p> <p>Entry description: The value of tmnxPcepPeerStatsEntry represents statistics information about a single peer which spans all PCEP sessions to that peer.</p> <p>Table description (for tmnxPcepPeerStatsTable): The tmnxPcepPeerStatsTable contains statistics information about peers known by the PCEP entity.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: pcep.PcepPccPeer</p>		
numberPCRptReceived [Number PCRpt Received] (tmnxPcepPeerNumPCRptRcvd)	long	The value of tmnxPcepPeerNumPCRptRcvd indicates the number of PCRpt messages received from this peer.
numberPCRptSent [Number PCRpt Sent] (tmnxPcepPeerNumPCRptSent)	long	The value of tmnxPcepPeerNumPCRptSent indicates the number of PCRpt messages sent to this peer.
numberPCUpdReceived [Number PCUpd Received] (tmnxPcepPeerNumPCUpdRcvd)	long	The value of tmnxPcepPeerNumPCUpdRcvd indicates the number of PCUpd messages received from this peer.
numberPCUpdSent [Number PCUpd Sent] (tmnxPcepPeerNumPCUpdSent)	long	The value of tmnxPcepPeerNumPCUpdSent indicates the number of PCUpd messages sent to this peer.
numberRptReceived [Number Rpt Received] (tmnxPcepPeerNumRptRcvd)	long	The value of tmnxPcepPeerNumRptRcvd indicates the number of report messages received from this peer. This might be greater than tmnxPcepPeerNumPCRptRcvd because multiple requests can be batched into a single PCRpt message.

Table 661 pcep statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
numberRptSent [Number Rpt Sent] (tmnxPcepPeerNumRptSent)	long	The value of tmnxPcepPeerNumRptSent indicates the number of report messages sent to this peer. This might be greater than tmnxPcepPeerNumPCRptSent because multiple requests can be batched into a single PCRpt message.
peerAddress [Peer Address] (tmnxPcepPeerAddr)	String	The value of tmnxPcepPeerAddr specifies the Internet address of the peer.
<p>PcepPeerStats MIB entry name: pcePcepPeerEntry Entry description: Information about a single peer that spans all PCEP sessions to that peer. Table description (for pcePcepPeerTable): This table contains information about peers known by the local PCEP entity. The entries in this table are read-only. This table gives peer information that spans PCEP sessions. Information about current PCEP sessions can be found in the pcePcepSessTable table. Supports realtime plotting Supports scheduled collection Monitored class: pcep.PcepPccPeer</p>		
numberKeepAliveReceived [Number Keep Alive Received] (pcePcepPeerNumKeepaliveRcvd)	long	The number of Keepalive messages received from this peer.
numberKeepAliveSent [Number Keep Alive Sent] (pcePcepPeerNumKeepaliveSent)	long	The number of Keepalive messages sent to this peer.
numberPCErrorReceived [Number PCError Received] (pcePcepPeerNumPCErrRcvd)	long	The number of PCErr messages received from this peer.
numberPCErrorSent [Number PCError Sent] (pcePcepPeerNumPCErrSent)	long	The number of PCErr messages sent to this peer.

Table 661 pcep statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
numberPCNotificationSent [Number PCNotification Sent] (pcePcepPeerNumPCNtfSent)	long	The number of PCNtf messages sent to this peer.
numberPCNotificionReceived [Number PCNotificion Received] (pcePcepPeerNumPCNtfRcvd)	long	The number of PCNtf messages received from this peer.
numberPCReplyReceived [Number PCReply Received] (pcePcepPeerNumPCRepRcvd)	long	The number of PCRep messages received from this peer.
numberPCReplySent [Number PCReply Sent] (pcePcepPeerNumPCRepSent)	long	The number of PCRep messages sent to this peer.
numberPCRequestReceived [Number PCRequest Received] (pcePcepPeerNumPCReqRcvd)	long	The number of PCReq messages received from this peer.
numberPCRequestSent [Number PCRequest Sent] (pcePcepPeerNumPCReqSent)	long	The number of PCReq messages sent to this peer.
numberRequestReceived [Number Request Received] (pcePcepPeerNumReqRcvd)	long	The number of requests received from this peer. A request corresponds 1:1 with an RP object in a PCReq message. This might be greater than pcePcepPeerNumPCReqRcvd because multiple requests can be batched into a single PCReq message.
numberRequestSent [Number Request Sent] (pcePcepPeerNumReqSent)	long	The number of requests sent to this peer. A request corresponds 1:1 with an RP object in a PCReq message. This might be greater than pcePcepPeerNumPCReqSent because multiple requests can be batched into a single PCReq message.

Table 661 pcep statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
numberSessionSetupFail [Number Session Setup Fail] (pcePcepPeerNumSessSetupFail)	long	The number of PCEP sessions with the peer that have been attempted but failed before being fully established. This counter is incremented each time a session retry to this peer fails.
numberSessionSetupSuccess [Number Session Setup Success] (pcePcepPeerNumSessSetupOK)	long	The number of PCEP sessions successfully established with the peer, including any current session. This counter is incremented each time a session with this peer is successfully established.
peerAddress [Peer Address] (pcePcepPeerAddr)	String	The Internet address of the peer. The type is given by pcePcepPeerAddrType.

Table 662 pim statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceAdditionalStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface</p>		
bootstrapExpPolicyDrops [Bootstrap Exp Policy Drops] (vRtrPimNgIfBtrExpPolicyDrops)	long	The value of vRtrPimNgIfBtrExpPolicyDrops indicates the number of Bootstrap Messages that were not transmitted on this interface because of Bootstrap export policy. PIM Bootstrap export policies are configured using bootstrap export policy objects in vRtrPimNgGenPolicyTable.
bootstrapImpPolicyDrops [Bootstrap Imp Policy Drops] (vRtrPimNgIfBtrImpPolicyDrops)	long	The value of vRtrPimNgIfBtrImpPolicyDrops indicates the number of Bootstrap Messages received on this interface but were dropped because of Bootstrap import policy. PIM Bootstrap import policies are configured using bootstrap import policy objects in vRtrPimNgGenPolicyTable.
joinPolicyDrops [Join Policy Drops] (vRtrPimNgIfJoinPolicyDrops)	long	The value of vRtrPimNgIfJoinPolicyDrops indicates the number of times the join policy match resulted in dropping PIM Join-Prune Message or one of the source group contained in the message. PIM Join policies are configured using join policy objects in vRtrPimNgGenPolicyTable.
registerPolicyDrops [Register Policy Drops] (vRtrPimNgIfRegisterPolicyDrops)	long	The value of vRtrPimNgIfRegisterPolicyDrops indicates the number of times the register policy match resulted in dropping PIM Register Message. PIM Register policies are configured using the register policy objects in vRtrPimNgGenPolicyTable.
rxBSMNoRouterAlertDrops [Rx BSMNo Router Alert Drops] (vRtrPimNgIfRxBSMNoRouterAlertDrops)	long	The value of vRtrPimNgIfRxBSMNoRouterAlertDrops indicates the number of BSM messages that were dropped because router alert option was not present.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBSMWrongIfDrops [Rx BSMWrong If Drops] (vRtrPimNgIfRxBSMWrongIfDrops)	long	The value of vRtrPimNgIfRxBSMWrongIfDrops indicates the number of BSM messages that were dropped either because they were not sent by the correct RPF neighbor or because they arrived on the wrong interface.
rxInvalidJoinPrunes [Rx Invalid Join Prunes] (vRtrPimNgIfRxInvalidJoinPrunes)	long	The value of vRtrPimNgIfRxInvalidJoinPrunes indicates the number of invalid PIM Join Prune messages received on this interface. A Join Prune message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidJoinPrune notification is sent.
rxInvalidRegisters [Rx Invalid Registers] (vRtrPimNgIfRxInvalidRegisters)	long	The value of vRtrPimNgIfRxInvalidRegisters indicates the number of invalid PIM Register messages received on this interface. A Register message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidRegister notification is sent.
rxJoinPruneErrs [Rx Join Prune Errs] (vRtrPimNgIfRxJoinPruneErrs)	long	The value of vRtrPimNgIfRxJoinPruneErrs indicates the number of errors while processing Join-Prune messages received on this interface.
rxJoinPrunes [Rx Join Prunes] (vRtrPimNgIfRxJoinPrunes)	long	The value of vRtrPimNgIfRxJoinPrunes indicates the number of PIM Join Prune messages received on this interface.
txJoinPrunes [Tx Join Prunes] (vRtrPimNgIfTxJoinPrunes)	long	The value of vRtrPimNgIfTxJoinPrunes indicates the number of PIM Join Prune messages transmitted on this interface.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
InterfaceStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface		
bsmErrs [Bsm Errs] (vRtrPimNgIfTxBsmErrs)	long	The value of vRtrPimNgIfTxBsmErrs indicates the number of errors while transmitting PIM Bootstrap Messages (BSM) on this interface.
bsmPdus [Bsm Pdus] (vRtrPimNgIfTxBsmPdus)	long	The value of vRtrPimNgIfTxBsmPdus indicates the number of PIM Bootstrap Messages (BSM) transmitted on this interface.
mcacPolicyDrops [Mcac Policy Drops] (vRtrPimNgIfMcacPolicyDrops)	long	The value of the object vRtrPimNgIfMcacPolicyDrops indicates the number times a PIM Group is dropped because of applying a multicast CAC policy on this interface.
registerStopErrs [Register Stop Errs] (vRtrPimNgIfTxRegisterStopErrs)	long	The value of vRtrPimNgIfTxRegisterStopErrs indicates the number of PIM errors while trasmitting PIM Register Stop messages on this interface.
registerStops [Register Stops] (vRtrPimNgIfTxRegisterStops)	long	The value of vRtrPimNgIfTxRegisterStops indicates the number of PIM Register Stop messages transmitted on this interface.
rxAssertErrs [Rx Assert Errs] (vRtrPimNgIfRxAssertErrs)	long	The value of vRtrPimNgIfRxAssertErrs indicates the number of errors while processing Assert messages received on this interface.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxAsserts [Rx Asserts] (vRtrPimNgIfRxAsserts)	long	The value of vRtrPimNgIfRxAsserts indicates the number of PIM Assert messages received on this interface.
rxAutoRpAnnounce [Rx Auto Rp Announce] (vRtrPimNgIfRxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounce indicates the number Auto-RP announcements received on this interface.
rxAutoRpAnnounceErrs [Rx Auto Rp Announce Errs] (vRtrPimNgIfRxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounceErrs indicates the number of errors while processing Auto-RP announcements received on this interface.
rxAutoRpGenErrs [Rx Auto Rp Gen Errs] (vRtrPimNgIfRxAutoRpGenErrs)	long	The value of the object vRtrPimNgIfRxAutoRpGenErrs indicates the number of errors while processing Auto-RP messages received on this interface.
rxAutoRpMapping [Rx Auto Rp Mapping] (vRtrPimNgIfRxAutoRpMapping)	long	The value of the object vRtrPimNgIfRxAutoRpMapping indicates the number of Auto-RP mappings received on this interface.
rxAutoRpMappingErrs [Rx Auto Rp Mapping Errs] (vRtrPimNgIfRxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfRxAutoRpMappingErrs indicates the number of errors while processing Auto-RP mappings received on this interface.
rxBadChecksumDiscards [Rx Bad Checksum Discards] (vRtrPimNgIfRxBadChecksumDiscard)	long	The value of vRtrPimNgIfRxBadChecksumDiscard indicates the number of PIM messages received on this interface which were discarded because of bad checksum.
rxBadEncodings [Rx Bad Encodings] (vRtrPimNgIfRxBadEncodings)	long	The value of vRtrPimNgIfRxBadEncodings indicates the number of PIM messages with bad encodings received on this interface.
rxBadVersionDiscards [Rx Bad Version Discards] (vRtrPimNgIfRxBadVersionDiscard)	long	The value of vRtrPimNgIfRxBadVersionDiscard indicates the number of PIM messages with bad versions received on this interface.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBsmPduDrops [Rx Bsm Pdu Drops] (vRtrPimNgIfRxBsmPduDrops)	long	The value of vRtrPimNgIfRxBsmPduDrops indicates the number of Bootstrap Messages received on this interface but were dropped.
rxBsmPdus [Rx Bsm Pdus] (vRtrPimNgIfRxBsmPdus)	long	The value of vRtrPimNgIfRxBsmPdus indicates the number of Bootstrap Messages received on this interface.
rxCRPAdvNoRouterAlert [Rx CRPAdv No Router Alert] (vRtrPimNgIfRxCRPAdvNoRtrAlert)	long	The value of vRtrPimNgIfRxCRPAdvNoRtrAlert indicates the number of Candidate-RP Advertisements(C-RP-Adv) received on this interface which had no router alert option set.
rxHellos [Rx Hellos] (vRtrPimNgIfRxHellos)	long	The value of vRtrPimNgIfRxHellos indicates the number of PIM hello messages received on this interface.
rxHellosDropped [Rx Hellos Dropped] (vRtrPimNgIfRxHellosDropped)	long	The value of vRtrPimNgIfRxHellosDropped indicates the number of PIM Hello messages which were received on this interface but were dropped.
rxNbrUnknown [Rx Nbr Unknown] (vRtrPimNgIfRxNbrUnknown)	long	The value of vRtrPimNgIfRxNbrUnknown indicates the number of PIM messages (other than Hello messages) which were received on this interface and were rejected because the adjacency with the neighbor router was not already established.
rxNullRegisters [Rx Null Registers] (vRtrPimNgIfRxNullRegisters)	long	The value of vRtrPimNgIfRxNullRegisters indicates the number of PIM Null Register messages received on this interface.
rxPkts [Rx Pkts] (vRtrPimNgIfRxPkts)	long	The value of vRtrPimNgIfRxPkts indicates the number of multicast data packets received on this interface.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxRegisterErrs [Rx Register Errs] (vRtrPimNgIfRxRegisterErrs)	long	The value of vRtrPimNgIfRxRegisterErrs indicates the number of errors while processing Register messages received on this interface.
rxRegisterStopErrs [Rx Register Stop Errs] (vRtrPimNgIfRxRegisterStopErrs)	long	The value of vRtrPimNgIfRxRegisterStopErrs indicates the number of errors while processing Register Stop messages received on this interface.
rxRegisterStops [Rx Register Stops] (vRtrPimNgIfRxRegisterStops)	long	The value of vRtrPimNgIfRxRegisterStops indicates the number of PIM Register Stop messages received on this interface.
rxRegisters [Rx Registers] (vRtrPimNgIfRxRegisters)	long	The value of vRtrPimNgIfRxRegisters indicates the number of PIM Register messages received on this interface.
rxUnknownPdus [Rx Unknown Pdus] (vRtrPimNgIfRxUnknownPdus)	long	The value of vRtrPimNgIfRxUnknownPdus indicates the number of packets received with an unsupported PIM type.
sgTypes [Sg Types] (vRtrPimNgIfSGTypes)	long	The value of vRtrPimNgIfSGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'sg'.
starGTypes [Star GTypes] (vRtrPimNgIfStarGTypes)	long	The value of vRtrPimNgIfStarGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgIfStarStarRPTypes)	long	The value of vRtrPimNgIfStarStarRPTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIfGrpSrcType is 'starStarRP'.
txAsserts [Tx Asserts] (vRtrPimNgIfTxAsserts)	long	The value of vRtrPimNgIfTxAsserts indicates the number of PIM Assert messages transmitted on this interface.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txAutoRpAnnounce [Tx Auto Rp Announce] (vRtrPimNgIfTxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounce indicates the number of Auto-RP announcements transmitted on this interface.
txAutoRpAnnounceErrs [Tx Auto Rp Announce Errs] (vRtrPimNgIfTxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounceErrs indicates the number of errors while transmitting Auto-RP announcements on this interface.
txAutoRpMapping [Tx Auto Rp Mapping] (vRtrPimNgIfTxAutoRpMapping)	long	The value of the object vRtrPimNgIfTxAutoRpMapping indicates the number of Auto-RP mappings transmitted on this interface.
txAutoRpMappingErrs [Tx Auto Rp Mapping Errs] (vRtrPimNgIfTxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfTxAutoRpMappingErrs indicates the number of errors while transmitting Auto-RP mappings on this interface.
txHellos [Tx Hellos] (vRtrPimNgIfTxHellos)	long	The value of vRtrPimNgIfTxHellos indicates the number of PIM Hello messages transmitted on this interface.
txPkts [Tx Pkts] (vRtrPimNgIfTxPkts)	long	The value of vRtrPimNgIfTxPkts indicates the number of multicast data packets transmitted on this interface.
PimGenSiteStats MIB entry name: vRtrPimNgGenStatEntry Entry description: An entry in the vRtrPimNgGenStatTable. Table description (for vRtrPimNgGenStatTable): vRtrPimNgGenStatTable lists PIM statistics for a particular PIM instance. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • pim.Site • pim.SiteExtension 		

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardCrpaDrops [Forward Crpa Drops] (vRtrPimNgGenStatFwdCrpaDrops)	long	The value of vRtrPimNgGenStatFwdCrpaDrops indicates the number of times the Candidate-RP Advertisements(C-RP-Adv) could not be forwarded by the router.
forwardCrpaPdus [Forward Crpa Pdu] (vRtrPimNgGenStatForwardCrpaPdus)	long	The value of vRtrPimNgGenStatForwardCrpaPdus indicates the number of Candidate-RP Advertisements(C-RP-Adv) that were forwarded by the router. C-RP-Adv's are forwarded when the received advertisement has a router alert set and the destination address is not the router's local address.
rxActiveMdts [Rx Active Mdts] (vRtrPimNgGenStatRxActiveMdts)	long	The value of vRtrPimNgGenStatRxActiveMdts indicates number of active Mdts on which the PE is receiving packets. This object is applicable to VPRNs only.
rxCrpaPduDrops [Rx Crpa Pdu Drops] (vRtrPimNgGenStatRxCrpaPduDrops)	long	The value of vRtrPimNgGenStatRxCrpaPduDrops indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) received by this instance, but were dropped.
rxCrpaPdus [Rx Crpa Pdu] (vRtrPimNgGenStatRxCrpaPdus)	long	The value of vRtrPimNgGenStatRxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) received by this instance.
rxMdtJoinTlvErrs [Rx Mdt Join Tlv Errs] (vRtrPimNgGenStatRxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatRxMdtJnTlvErrs indicates indicates number of times MDT Join TLVs were dropped due to errors in the received TLV.
rxMdtJoinTlvs [Rx Mdt Join Tlvs] (vRtrPimNgGenStatRxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatRxMdtJoinTlvs indicates the number of times MDT Join TLV were received.
sgTypes [Sg Types] (vRtrPimNgGenStatSGTypes)	long	The value of vRtrPimNgGenStatSGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'sg'.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
starGTypes [Star GTypes] (vRtrPimNgGenStatStarGTypes)	long	The value of vRtrPimNgGenStatStarGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgGenStatStarStarRPTypes)	long	The value of vRtrPimNgGenStatStarStarRPTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starStarRP'.
txActiveMdts [Tx Active Mdts] (vRtrPimNgGenStatTxActiveMdts)	long	The value of vRtrPimNgGenStatTxActiveMdts indicates the number of active MDTs on which the PE is forwarding packets. This object is applicable to VPRNs only.
txCrpaPduErrs [Tx Crpa Pdu Errs] (vRtrPimNgGenStatTxCrpaPduErrs)	long	The value of vRtrPimNgGenStatTxCrpaPduErrs indicates the number of errors while transmitting PIM Candidate-RP Advertisements (C-RP-Adv).
txCrpaPdus [Tx Crpa Pdus] (vRtrPimNgGenStatTxCrpaPdus)	long	The value of vRtrPimNgGenStatTxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) transmitted by this router instance.
txMdtJoinTlvErrs [Tx Mdt Join Tlv Errs] (vRtrPimNgGenStatTxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatTxMdtJnTlvErrs indicates the number of times MDT Join TLV could not be transmitted.
txMdtJoinTlvs [Tx Mdt Join Tlvs] (vRtrPimNgGenStatTxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatTxMdtJoinTlvs indicates the number of times MDT Join TLV were transmitted.
txNullRegisters [Tx Null Registers] (vRtrPimNgGenStatTxNullRegisters)	long	The value of vRtrPimNgGenStatTxNullRegisters indicates the number of PIM Null Register messages transmitted by this instance.
txRegisterErrs [Tx Register Errs] (vRtrPimNgGenStatTxRegisterErrs)	long	The value of vRtrPimNgGenStatTxRegisterErrs indicates the number the times there was an error while transmitting PIM Register messages by this instance.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txRegisterTTLDrops [Tx Register TTLDrops] (vRtrPimNgGenStatTxRegTTLDrops)	long	The value of vRtrPimNgGenStatTxRegTTLDrops indicates the number of multicast data packets which could not be encapsulated in Register messages because the Time To Live (TTL) was zero.
txRegisters [Tx Registers] (vRtrPimNgGenStatTxRegisters)	long	The value of vRtrPimNgGenStatTxRegisters indicates the number of PIM Register messages transmitted by this instance.
<p>PimGroupStats</p> <p>MIB entry name: vRtrPimNgGrpSrcStatEntry</p> <p>Entry description: An entry in the vRtrPimNgGrpSrcStatTable.</p> <p>Table description (for vRtrPimNgGrpSrcStatTable): vRtrPimNgGrpSrcStatTable contains statistics for the entries in the vRtrPimNgGrpSrcTable. These statistics are collected by the forwarding engine.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: pim.Groups</p>		
discardedPkts [Discarded Pkts] (vRtrPimNgGrpSrcStatDscrdPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatDscrdPkts indicates the number of multicast packets that matched this source group entry but were discarded. For (S,G) entries, if the traffic is getting forwarded on the SPT, the packets arriving from the RPT will be discarded.
forwardedOctets [Forwarded Octets] (vRtrPimNgGrpSrcStatFrdedOct)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrdedOct indicates the number of multicast octets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list.
forwardedPkts [Forwarded Pkts] (vRtrPimNgGrpSrcStatFrwdedPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrwdedPkts indicates the number of multicast packets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list. This packet count is calculated before ingress QoS policing or shaping is applied.

Table 662 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rpfMismatches [Rpf Mismatches] (vRtrPimNgGrpSrcStatRPFMsmtch)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatRPFMsmtch indicates the number of multicast packets that matched this source group entry but they did not arrive on the the interface indicated by vRtrPimNgGrpSrcRpfIndex.

Table 663 ptp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>IEEEPTPPortStats</p> <p>MIB entry name: tmnxPtpPortStatsEntry</p> <p>Entry description: The tmnxPtpPortStatsEntry contains the directional packet statistics for a specific Ethernet port configured for direct transport of PTP over Ethernet. Rows are created and destroyed by the system, when corresponding entries in the tmnxPtpPortTable are created and deleted.</p> <p>Table description (for tmnxPtpPortStatsTable): The tmnxPtpPortStatsTable contains packet statistics for Ethernet ports configured for direct transport of PTP over Ethernet.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPPort</p>		
ptpPortStatAnnounce [Ptp Port Stat Announce] (tmnxPtpPortStatAnnounce)	long	The value of tmnxPtpPortStatAnnounce indicates the number of accumulated PTP Announce packets transmitted or received on the Ethernet port.
ptpPortStatDelayRequest [Ptp Port Stat Delay Request] (tmnxPtpPortStatDelayRequest)	long	The value of tmnxPtpPortStatDelayRequest indicates the number of accumulated PTP Delay Request packets transmitted or received on the Ethernet port.
ptpPortStatDelayResponse [Ptp Port Stat Delay Response] (tmnxPtpPortStatDelayResponse)	long	The value of tmnxPtpPortStatDelayResponse indicates the number of accumulated PTP Delay Response packets transmitted or received on the Ethernet port.
ptpPortStatDirection [Ptp Port Stat Direction] (tmnxPtpPortStatDirection)	int	The value of tmnxPtpPortStatDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpPortStatDropAltMaster [Ptp Port Stat Drop Alt Master] (tmnxPtpPortStatDropAltMaster)	long	The value of tmnxPtpPortStatDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPortStatDropBadDomain [Ptp Port Stat Drop Bad Domain] (tmnxPtpPortStatDropBadDomain)	long	The value of tmnxPtpPortStatDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpPortStatDropOther [Ptp Port Stat Drop Other] (tmnxPtpPortStatDropOther)	long	The value of tmnxPtpPortStatDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in tmnxPtpPortStatDropBadDomain, tmnxPtpPortStatDropAltMaster, and tmnxPtpPortStatDropOutOfSeq. This object is accumulated for the 'rx' direction only.
ptpPortStatDropOutOfSeq [Ptp Port Stat Drop Out Of Seq] (tmnxPtpPortStatDropOutOfSeq)	long	The value of tmnxPtpPortStatDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpPortStatFollowUp [Ptp Port Stat Follow Up] (tmnxPtpPortStatFollowUp)	long	The value of tmnxPtpPortStatFollowUp indicates the number of accumulated PTP Follow-Up packets transmitted or received on the Ethernet port. Because 'tmnxPtpClockStep-Type' is 'oneStep (1)', the system will never transmit PTP Follow-Up packets. However, it may receive PTP Follow-Up packets from a two-step master or boundary clock.
ptpPortStatOther [Ptp Port Stat Other] (tmnxPtpPortStatOther)	long	The value of tmnxPtpPortStatOther indicates the number of accumulated PTP packets of all other types. This object is accumulated in the 'rx' direction only.
ptpPortStatSignaling [Ptp Port Stat Signaling] (tmnxPtpPortStatSignaling)	long	The value of tmnxPtpPortStatSignaling indicates the number of accumulated PTP Signaling packets received on the Ethernet port. This object is accumulated in the 'rx' direction only.
ptpPortStatSync [Ptp Port Stat Sync] (tmnxPtpPortStatSync)	long	The value of tmnxPtpPortStatSync indicates the number of accumulated PTP Sync packets transmitted or received on the Ethernet port.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPortStatTimeStampCpm [Ptp Port Stat Time Stamp Cpm] (tmnxPtpPortStatTimeStampCpm)	long	The value of tmnxPtpPortStatTimeStampCpm indicates the accumulated packet statistics for PTP event packets where the timestamp is taken at the operating system kernel on the CPM card.
ptpPortStatTimeStampPort [Ptp Port Stat Time Stamp Port] (tmnxPtpPortStatTimeStampPort)	long	The value of tmnxPtpPortStatTimeStampPort indicates the accumulated packet statistics for PTP event packets on the Ethernet port where the timestamp is taken at the physical layer on the Ethernet port.
<p>PTPClockPacketStats</p> <p>MIB entry name: tmnxPtpClockPacketStatsEntry</p> <p>Entry description: The tmnxPtpClockPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpClockPacketStatsTable): The tmnxPtpClockPacketStatsTable consists of the packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPClock</p>		
ptpClkPktStatsAnnounce [Ptp Clk Pkt Stats Announce] (tmnxPtpClkPktStatsAnnounce)	long	The value of tmnxPtpClkPktStatsAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpClkPktStatsDelayRequest [Ptp Clk Pkt Stats Delay Request] (tmnxPtpClkPktStatsDelayRequest)	long	The value of tmnxPtpClkPktStatsDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpClkPktStatsDelayResp [Ptp Clk Pkt Stats Delay Resp] (tmnxPtpClkPktStatsDelayResp)	long	The value of tmnxPtpClkPktStatsDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpClkPktStatsDirection [Ptp Clk Pkt Stats Direction] (tmnxPtpClkPktStatsDirection)	int	The value of tmnxPtpClkPktStatsDirection specifies which direction the packet statistics for the particular row are accumulated.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsDropAltMaster [Ptp Clk Pkt Stats Drop Alt Master] (tmnxPtpClkPktStatsDropAltMaster)	long	The value of tmnxPtpClkPktStatsDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropBadDomain [Ptp Clk Pkt Stats Drop Bad Domain] (tmnxPtpClkPktStatsDropBadDomain)	long	The value of tmnxPtpClkPktStatsDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOther [Ptp Clk Pkt Stats Drop Other] (tmnxPtpClkPktStatsDropOther)	long	The value of tmnxPtpClkPktStatsDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpClkPktStatsDropBadDomain', 'tmnxPtpClkPktStatsDropAltMaster', 'tmnxPtpClkPktStatsDropOutOfSeq', and 'tmnxPtpClkPktStatsDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOutOfSeq [Ptp Clk Pkt Stats Drop Out Of Seq] (tmnxPtpClkPktStatsDropOutOfSeq)	long	The value of tmnxPtpClkPktStatsDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropPeerShut [Ptp Clk Pkt Stats Drop Peer Shut] (tmnxPtpClkPktStatsDropPeerShut)	long	The value of tmnxPtpClkPktStatsDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsFollowUp [Ptp Clk Pkt Stats Follow Up] (tmnxPtpClkPktStatsFollowUp)	long	The value of tmnxPtpClkPktStatsFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpClkPktStatsOther [Ptp Clk Pkt Stats Other] (tmnxPtpClkPktStatsOther)	long	The value of tmnxPtpClkPktStatsOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsOtherTLVs [Ptp Clk Pkt Stats Other TLVs] (tmnxPtpClkPktStatsOtherTLVs)	long	The value of tmnxPtpClkPktStatsOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsSignaling [Ptp Clk Pkt Stats Signaling] (tmnxPtpClkPktStatsSignaling)	long	The value of tmnxPtpClkPktStatsSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpClkPktStatsSync [Ptp Clk Pkt Stats Sync] (tmnxPtpClkPktStatsSync)	long	The value of tmnxPtpClkPktStatsSync indicates the accumulated packet statistics for PTP Sync messages.
ptpClkPktStatsTimeStampCpm [Ptp Clk Pkt Stats Time Stamp Cpm] (tmnxPtpClkPktStatsTimeStampCpm)	long	The value of tmnxPtpClkPktStatsTimeStampCpm indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the operating system kernel.
ptpClkPktStatsTimeStampPort [Ptp Clk Pkt Stats Time Stamp Port] (tmnxPtpClkPktStatsTimeStampPort)	long	The value of tmnxPtpClkPktStatsTimeStampPort indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the physical layer.
ptpClkPktStatsUniAckCnclAnno [Ptp Clk Pkt Stats Uni Ack Cncl Anno] (tmnxPtpClkPktStatsUniAckCnclAnno)	long	The value of tmnxPtpClkPktStatsUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpClkPktStatsUniAckCnclDly [Ptp Clk Pkt Stats Uni Ack Cncl Dly] (tmnxPtpClkPktStatsUniAckCnclDly)	long	The value of tmnxPtpClkPktStatsUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpClkPktStatsUniAckCnclSync [Ptp Clk Pkt Stats Uni Ack Cncl Sync] (tmnxPtpClkPktStatsUniAckCnclSync)	long	The value of tmnxPtpClkPktStatsUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniCancelAnno [Ptp Clk Pkt Stats Uni Cancel Anno] (tmnxPtpClkPktStatsUniCancelAnno)	long	The value of tmnxPtpClkPktStatsUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpClkPktStatsUniCancelDelay [Ptp Clk Pkt Stats Uni Cancel Delay] (tmnxPtpClkPktStatsUniCancelDelay)	long	The value of tmnxPtpClkPktStatsUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpClkPktStatsUniCancelSync [Ptp Clk Pkt Stats Uni Cancel Sync] (tmnxPtpClkPktStatsUniCancelSync)	long	The value of tmnxPtpClkPktStatsUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.
ptpClkPktStatsUniDenyAnno [Ptp Clk Pkt Stats Uni Deny Anno] (tmnxPtpClkPktStatsUniDenyAnno)	long	The value of tmnxPtpClkPktStatsUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenyDelRsp [Ptp Clk Pkt Stats Uni Deny Del Rsp] (tmnxPtpClkPktStatsUniDenyDelRsp)	long	The value of tmnxPtpClkPktStatsUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenySync [Ptp Clk Pkt Stats Uni Deny Sync] (tmnxPtpClkPktStatsUniDenySync)	long	The value of tmnxPtpClkPktStatsUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniGrantAnno [Ptp Clk Pkt Stats Uni Grant Anno] (tmnxPtpClkPktStatsUniGrantAnno)	long	The value of tmnxPtpClkPktStatsUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantDelRsp [Ptp Clk Pkt Stats Uni Grant Del Rsp] (tmnxPtpClkPktStatsUniGrantDelRsp)	long	The value of tmnxPtpClkPktStatsUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniGrantSync [Ptp Clk Pkt Stats Uni Grant Sync] (tmnxPtpClkPktStatsUniGrantSync)	long	The value of tmnxPtpClkPktStatsUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniReqAnno [Ptp Clk Pkt Stats Uni Req Anno] (tmnxPtpClkPktStatsUniReqAnno)	long	The value of tmnxPtpClkPktStatsUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpClkPktStatsUniReqDelayRsp [Ptp Clk Pkt Stats Uni Req Delay Rsp] (tmnxPtpClkPktStatsUniReqDelayRsp)	long	The value of tmnxPtpClkPktStatsUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.
ptpClkPktStatsUniReqSync [Ptp Clk Pkt Stats Uni Req Sync] (tmnxPtpClkPktStatsUniReqSync)	long	The value of tmnxPtpClkPktStatsUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
PTPClockRecoveryEventStats MIB entry name: tmnxPtpClockRecoveryStatistics Supports realtime plotting Supports scheduled collection Monitored class: ptp.IEEEPTPClock		
tmnxPtpClockRecStatsDlyHiPktLss [Tmnx Ptp Clock Rec Stats Dly Hi Pkt Lss] (tmnxPtpClockRecStatsDlyHiPktLss)	long	The value of tmnxPtpClockRecStatsDlyHiPktLss indicates the number of times that the clock recovery process detected a large amount of packet loss in the delay request/response flow from the remote master clock. When this event occurs, the clock recovery process restarts.
tmnxPtpClockRecStatsDlyHighPDV [Tmnx Ptp Clock Rec Stats Dly High PDV] (tmnxPtpClockRecStatsDlyHighPDV)	long	The value of tmnxPtpClockRecStatsDlyHighPDV indicates the number of times that the clock recovery process has determined that a sample of delay request packets to the best master clock had too much packet delay variation to be useful in recovering the clock from the best master. When this event occurs, the entire sample of packets is not used in the clock recovery process.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tmnxPtpClockRecStatsDlyPktLoss [Tmnx Ptp Clock Rec Stats Dly Pkt Loss] (tmnxPtpClockRecStatsDlyPktLoss)	long	The value of tmnxPtpClockRecStatsDlyPktLoss indicates the number of times that the clock recovery process detected packet loss in the delay request/response packet flow from the best master clock.
tmnxPtpClockRecStatsDlyStep [Tmnx Ptp Clock Rec Stats Dly Step] (tmnxPtpClockRecStatsDlyStep)	long	The value of tmnxPtpClockRecStatsDlyStep indicates the number of times that the clock recovery process detected a large change in the amount of time taken for delay request packets to be sent to the best master clock. This normally occurs if the route taken by packets to the best master changes.
tmnxPtpClockRecStatsSyncHiPktLss [Tmnx Ptp Clock Rec Stats Sync Hi Pkt Lss] (tmnxPtpClockRecStatsSyncHiPktLss)	long	The value of tmnxPtpClockRecStatsSyncHiPktLss indicates the number of times that the clock recovery process detected a large amount of packet loss in the sync flow from the remote master clock. When this event occurs, the clock recovery process restarts.
tmnxPtpClockRecStatsSyncHighPDV [Tmnx Ptp Clock Rec Stats Sync High PDV] (tmnxPtpClockRecStatsSyncHighPDV)	long	The value of tmnxPtpClockRecStatsSyncHighPDV indicates the number of times that the clock recovery process has determined that a sample of sync packets from the best master clock had too much packet delay variation to be useful in recovering the clock from the best master. When this event occurs, the entire sample of packets is not used in the clock recovery process.
tmnxPtpClockRecStatsSyncPktLoss [Tmnx Ptp Clock Rec Stats Sync Pkt Loss] (tmnxPtpClockRecStatsSyncPktLoss)	long	The value of tmnxPtpClockRecStatsSyncPktLoss indicates the number of times that the clock recovery process detected packet loss in the sync packet flow from the best master clock.
tmnxPtpClockRecStatsSyncStep [Tmnx Ptp Clock Rec Stats Sync Step] (tmnxPtpClockRecStatsSyncStep)	long	The value of tmnxPtpClockRecStatsSyncStep indicates the number of times that the clock recovery process detected a large change in the amount of time taken for sync packets to be sent from the best master clock. This normally occurs if the route taken by packets from the best master changes.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
PTPClockRecoveryStateStats MIB entry name: tmnxPtpClockRecoveryStatistics Supports realtime plotting Supports scheduled collection Monitored class: ptp.IEEEPTPClock		
tmnxPtpClockRecStatsAcquiring [Tmnx Ptp Clock Rec Stats Acquiring] (tmnxPtpClockRecStatsAcquiring)	java. math. BigInteger	The value of tmnxPtpClockRecStatsAcquiring indicates the number of seconds that the clock recovery system has been in the acquiring state.
tmnxPtpClockRecStatsHoldover [Tmnx Ptp Clock Rec Stats Holdover] (tmnxPtpClockRecStatsHoldover)	java. math. BigInteger	The value of tmnxPtpClockRecStatsHoldover indicates the number of seconds that the clock recovery system has been in the hold-over state.
tmnxPtpClockRecStatsInitial [Tmnx Ptp Clock Rec Stats Initial] (tmnxPtpClockRecStatsInitial)	java. math. BigInteger	The value of tmnxPtpClockRecStatsInitial indicates the number of seconds that the clock recovery system has been in the initial state.
tmnxPtpClockRecStatsLocked [Tmnx Ptp Clock Rec Stats Locked] (tmnxPtpClockRecStatsLocked)	java. math. BigInteger	The value of tmnxPtpClockRecStatsLocked indicates the number of seconds that the clock recovery system has been in the locked state.
tmnxPtpClockRecStatsPhaseTrack [Tmnx Ptp Clock Rec Stats Phase Track] (tmnxPtpClockRecStatsPhaseTrack)	java. math. BigInteger	The value of tmnxPtpClockRecStatsPhaseTrack indicates the number of seconds that the clock recovery system has been in the phase tracking state.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPPeerPacketStats</p> <p>MIB entry name: tmnxPtpPeerPacketStatsEntry</p> <p>Entry description: The tmnxPtpPeerPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). ptpPeerPktStatAnnounce [Ptp Peer Pkt Stat Announce] (tmnxPtpPeerPktStatAnnounce)	long	The value of tmnxPtpPeerPktStatAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpPeerPktStatDelayRequest [Ptp Peer Pkt Stat Delay Request] (tmnxPtpPeerPktStatDelayRequest)	long	The value of tmnxPtpPeerPktStatDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpPeerPktStatDelayResp [Ptp Peer Pkt Stat Delay Resp] (tmnxPtpPeerPktStatDelayResp)	long	The value of tmnxPtpPeerPktStatDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpPeerPktStatDirection [Ptp Peer Pkt Stat Direction] (tmnxPtpPeerPktStatDirection)	int	The value of tmnxPtpPeerPktStatDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpPeerPktStatDropAltMaster [Ptp Peer Pkt Stat Drop Alt Master] (tmnxPtpPeerPktStatDropAltMaster)	long	The value of tmnxPtpPeerPktStatDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatDropBadDomain [Ptp Peer Pkt Stat Drop Bad Domain] (tmnxPtpPeerPktStatDropBadDomain)	long	The value of tmnxPtpPeerPktStatDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOther [Ptp Peer Pkt Stat Drop Other] (tmnxPtpPeerPktStatDropOther)	long	The value of tmnxPtpPeerPktStatDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpPeerPktStatDropBadDomain', 'tmnxPtpPeerPktStatDropAltMaster', 'tmnxPtpPeerPktStatDropOutOfSeq', and 'tmnxPtpPeerPktStatDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOutOfSeq [Ptp Peer Pkt Stat Drop Out Of Seq] (tmnxPtpPeerPktStatDropOutOfSeq)	long	The value of tmnxPtpPeerPktStatDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropPeerShut [Ptp Peer Pkt Stat Drop Peer Shut] (tmnxPtpPeerPktStatDropPeerShut)	long	The value of tmnxPtpPeerPktStatDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatFollowUp [Ptp Peer Pkt Stat Follow Up] (tmnxPtpPeerPktStatFollowUp)	long	The value of tmnxPtpPeerPktStatFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpPeerPktStatOther [Ptp Peer Pkt Stat Other] (tmnxPtpPeerPktStatOther)	long	The value of tmnxPtpPeerPktStatOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpPeerPktStatOtherTLVs [Ptp Peer Pkt Stat Other TLVs] (tmnxPtpPeerPktStatOtherTLVs)	long	The value of tmnxPtpPeerPktStatOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatSignaling [Ptp Peer Pkt Stat Signaling] (tmnxPtpPeerPktStatSignaling)	long	The value of tmnxPtpPeerPktStatSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpPeerPktStatSync [Ptp Peer Pkt Stat Sync] (tmnxPtpPeerPktStatSync)	long	The value of tmnxPtpPeerPktStatSync indicates the accumulated packet statistics for PTP Sync messages.
ptpPeerPktStatUniAckCnclAnno [Ptp Peer Pkt Stat Uni Ack Cncl Anno] (tmnxPtpPeerPktStatUniAckCnclAnno)	long	The value of tmnxPtpPeerPktStatUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpPeerPktStatUniAckCnclDly [Ptp Peer Pkt Stat Uni Ack Cncl Dly] (tmnxPtpPeerPktStatUniAckCnclDly)	long	The value of tmnxPtpPeerPktStatUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpPeerPktStatUniAckCnclSync [Ptp Peer Pkt Stat Uni Ack Cncl Sync] (tmnxPtpPeerPktStatUniAckCnclSync)	long	The value of tmnxPtpPeerPktStatUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpPeerPktStatUniCancelAnno [Ptp Peer Pkt Stat Uni Cancel Anno] (tmnxPtpPeerPktStatUniCancelAnno)	long	The value of tmnxPtpPeerPktStatUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpPeerPktStatUniCancelDelay [Ptp Peer Pkt Stat Uni Cancel Delay] (tmnxPtpPeerPktStatUniCancelDelay)	long	The value of tmnxPtpPeerPktStatUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpPeerPktStatUniCancelSync [Ptp Peer Pkt Stat Uni Cancel Sync] (tmnxPtpPeerPktStatUniCancelSync)	long	The value of tmnxPtpPeerPktStatUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniDenyAnno [Ptp Peer Pkt Stat Uni Deny Anno] (tmnxPtpPeerPktStatUniDenyAnno)	long	The value of tmnxPtpPeerPktStatUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenyDelRsp [Ptp Peer Pkt Stat Uni Deny Del Rsp] (tmnxPtpPeerPktStatUniDenyDelRsp)	long	The value of tmnxPtpPeerPktStatUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenySync [Ptp Peer Pkt Stat Uni Deny Sync] (tmnxPtpPeerPktStatUniDenySync)	long	The value of tmnxPtpPeerPktStatUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniGrantAnno [Ptp Peer Pkt Stat Uni Grant Anno] (tmnxPtpPeerPktStatUniGrantAnno)	long	The value of tmnxPtpPeerPktStatUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantDelRsp [Ptp Peer Pkt Stat Uni Grant Del Rsp] (tmnxPtpPeerPktStatUniGrantDelRsp)	long	The value of tmnxPtpPeerPktStatUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantSync [Ptp Peer Pkt Stat Uni Grant Sync] (tmnxPtpPeerPktStatUniGrantSync)	long	The value of tmnxPtpPeerPktStatUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniReqAnno [Ptp Peer Pkt Stat Uni Req Anno] (tmnxPtpPeerPktStatUniReqAnno)	long	The value of tmnxPtpPeerPktStatUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpPeerPktStatUniReqDelayRsp [Ptp Peer Pkt Stat Uni Req Delay Rsp] (tmnxPtpPeerPktStatUniReqDelayRsp)	long	The value of tmnxPtpPeerPktStatUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.

Table 663 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniReqSync [Ptp Peer Pkt Stat Uni Req Sync] (tmnxPtpPeerPktStatUniReqSync)	long	The value of tmnxPtpPeerPktStatUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
ptpPeerPktStatsTimeStampCpm [Ptp Peer Pkt Stats Time Stamp Cpm] (tmnxPtpPeerPktStatTimeStampCpm)	long	The value of tmnxPtpPeerPktStatTimeStampCpm indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the operating system kernel.
ptpPeerPktStatsTimeStampPort [Ptp Peer Pkt Stats Time Stamp Port] (tmnxPtpPeerPktStatTimeStampPort)	long	The value of tmnxPtpPeerPktStatTimeStampPort indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the physical layer.

Table 664 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceReceiveStats</p> <p>MIB entry name: vRtrRipIfStatEntry</p> <p>Entry description: vRtrRipIfStatEntry is an entry (conceptual row) in the vRtrRipIfStatTable. Each entry represents statistical information for a RIP interface.</p> <p>Table description (for vRtrRipIfStatTable): vRtrRipIfStatTable is a read-only table which keeps statistical information about the interfaces monitoring RIP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rip.Interface</p>		
badPackets [Bad Packets] (vRtrRipIfStatAllRcvBadPackets)	long	vRtrRipIfStatAllRcvBadPackets is the number of RIP updates received on this interface that were discarded as invalid.
v1BadRoutes [V1 Bad Routes] (vRtrRipIfStatV1BadRoutes)	long	vRtrRipIfStatV1BadRoutes is the number of routes, in valid RIPv1 packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
v1Requests [V1 Requests] (vRtrRipIfStatV1RcvRequests)	long	vRtrRipIfStatV1RcvRequests is the number of RIPv1 request packets received by the RIP process.
v1RequestsIgnored [V1 Requests Ignored] (vRtrRipIfStatV1BadRequests)	long	vRtrRipIfStatV1BadRequests is the number of RIPv1 request packets received by the RIP process that were subsequently discarded for any reason.
v1Updates [V1 Updates] (vRtrRipIfStatV1RcvUpdates)	long	vRtrRipIfStatV1RcvUpdates is the number of RIPv1 response packets received by the RIP process.
v1UpdatesIgnored [V1 Updates Ignored] (vRtrRipIfStatV1BadUpdates)	long	vRtrRipIfStatV1BadUpdates is the number of RIPv1 response packets received by the RIP process which were subsequently discarded for any reason.

Table 664 rip statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v2AuthenticationErrors [V2 Authentication Errors] (vRtrRipIfStatAuthErrors)	long	vRtrRipIfStatAuthErrors is the number of RIPv2 packets received by the RIP process which were subsequently discarded because of an error authenticating the packet.
v2BadRoutes [V2 Bad Routes] (vRtrRipIfStatV2BadRoutes)	long	vRtrRipIfStatV2BadRoutes is the number of routes, in valid RIPv2 packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
v2Requests [V2 Requests] (vRtrRipIfStatV2RcvRequests)	long	vRtrRipIfStatV2RcvRequests is the number of RIPv2 request packets received by the RIP process.
v2RequestsIgnored [V2 Requests Ignored] (vRtrRipIfStatV2BadRequests)	long	vRtrRipIfStatV2BadRequests is the number of RIPv2 request packets received by the RIP process that were subsequently discarded for any reason.
v2Updates [V2 Updates] (vRtrRipIfStatV2RcvUpdates)	long	vRtrRipIfStatV2RcvUpdates is the number of RIPv2 response packets received by the RIP process.
v2UpdatesIgnored [V2 Updates Ignored] (vRtrRipIfStatV2BadUpdates)	long	vRtrRipIfStatV2BadUpdates is the number of RIPv2 response packets received by the RIP process which were subsequently discarded for any reason.
InterfaceTransmitStats MIB entry name: vRtrRipIfStatEntry Entry description: vRtrRipIfStatEntry is an entry (conceptual row) in the vRtrRipIfStatTable. Each entry represents statistical information for a RIP interface. Table description (for vRtrRipIfStatTable): vRtrRipIfStatTable is a read-only table which keeps statistical information about the interfaces monitoring RIP. Supports realtime plotting Supports scheduled collection Monitored class: rip.Interface		

Table 664 rip statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalUpdates [Total Updates] (vRtrRipIfStatAllSentUpdates)	long	vRtrRipIfStatAllSentUpdates is the number of all RIP updates actually sent on this interface. This explicitly does include full updates sent containing new information.
triggeredUpdates [Triggered Updates] (vRtrRipIfStatAllTriggeredUpdates)	long	vRtrRipIfStatAllTriggeredUpdates is the number of triggered RIP updates actually sent on this interface. This explicitly does include full updates sent containing new information.

Table 665 rsvp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AuthenticationKeyStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Entries in this table cannot be created and deleted via SNMP SET operations. An entry in this table is created by the agent when the RSVP protocol is configured on a virtual router interface. The entry is destroyed when RSVP is removed from the interface.</p> <p>Table description (for vRtrRsvplfStatTable): The vRtrRsvplfStatTable contains objects for reporting statistics associated with an interface running RSVP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.AuthenticationKey</p>		
errorPacketsReceived [Error Packets Received] (vRtrRsvplfStatRxAuthErrors)	java. math. BigInteger	The total number of RSVP packets with MD5 errors received on this RSVP interface.
errorPacketsTransmitted [Error Packets Transmitted] (vRtrRsvplfStatTxAuthErrors)	java. math. BigInteger	The total number of RSVP packets with MD5 errors sent by this RSVP interface.
<p>RsvpInterfaceReceiveStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Table 665 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
acks [Acks] (vRtrRsvplfStatRxAcks)	java. math. BigInteger	The total number of RSVP ACK messages received when refresh reduction is enabled on this RSVP interface.
bundles [Bundles] (vRtrRsvplfStatRxBundles)	java. math. BigInteger	The total number of RSVP bundled packets received on this RSVP interface. Bundled packets are sent when refresh reduction is enabled.
errorPackets [Error Packets] (vRtrRsvplfStatRxErrorPkts)	java. math. BigInteger	The total number of RSVP packets with errors received on this RSVP interface.
helloTimeout [Hello Timeout] (vRtrRsvplfStatHelloTimeout)	long	The total number of hello messages that timed out on this RSVP interface.
hellos [Hellos] (vRtrRsvplfStatRxHelloReqs)	java. math. BigInteger	The total number of RSVP HELLO REQ messages received on this RSVP interface.
packets [Packets] (vRtrRsvplfStatRxPkts)	java. math. BigInteger	The total number of error free RSVP packets received on this RSVP interface.
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.

Table 665 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.
totalPackets [Total Packets] (vRtrRsvplfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.

Table 665 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>RsvpInterfaceStats</p> <p>MIB entry name: vRtrRsvplfEntry</p> <p>Entry description: Each row entry in the vRtrRsvplfTable represents additional columns for attributes specific to the Nokia 7x50 SR RSVP implementation.</p> <p>Table description (for vRtrRsvplfTable): The vRtrRsvplfTable provides an extension of the rsvplfTable in the RSVP-MIB.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Interface</p>		
activeReservations [Active Reservations] (vRtrRsvplfActiveReservationCount)	long	The total number of active RSVP sessions that have reserved bandwidth.
activeSessions [Active Sessions] (vRtrRsvplfActiveSessionCount)	long	The total number of active RSVP sessions on this interface. This count includes sessions that have requested bandwidth as well as sessions that have not requested any bandwidth.
bandwidth [Bandwidth] (vRtrRsvplfBandwidth)	long	The value of vRtrRsvplfBandwidth indicates the interface bandwidth in mega-bits per second (Mbps) for the RSVP protocol on this interface. This is typically the port Speed.
reservedBandwidth [Reserved Bandwidth] (vRtrRsvplfReservedBandwidth)	long	The value of vRtrRsvplfReservedBandwidth indicates the amount of bandwidth in mega-bits per second (Mbps) to reserved by the RSVP sessions on this interface. A value of zero (0) indicates that no bandwidth is reserved.
totalSessions [Total Sessions] (vRtrRsvplfTotalSessionCount)	long	The total number of RSVP sessions on this interface. This count includes sessions that are active as well as sessions that have been signalled but a response has not yet been received.

Table 665 rsvp statistics (continued)

Table 665 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.

Table 665 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPackets [Total Packets] (vRtrRsvpIpfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.
<p>RsvpSessionStats</p> <p>MIB entry name: vRtrRsvpSessionStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an RSVP session. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrRsvpSessionStatTable): The vRtrRsvpSessionStatTable contains statistics for an RSVP session.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Session</p>		
detourAge [Detour Age] (vRtrRsvpSessionDetourAge)	long	vRtrRsvpSessionDetourAge is the age (i.e., time from creation till now) of this detour LSP in 10-millisecond periods.
detourTimeUp [Detour Time Up] (vRtrRsvpSessionDetourTimeUp)	long	vRtrRsvpSessionDetourTimeUp is the total time in 10-millisecond units that the detour LSP has been operational.
pathsReceived [Paths Received] (vRtrRsvpSessionRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages received for this RSVP session.
pathsTransmitted [Paths Transmitted] (vRtrRsvpSessionTxPaths)	java. math. BigInteger	The total number of RSVP PATH messages transmitted for this RSVP session.

Table 665 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
refreshPathsReceived [Refresh Paths Received] (vRtrRsvpSessionRxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshPaths indicates the number of times PATH was refreshed using message ID from full PATH refresh or Srefresh message for this RSVP session.
refreshPathsTransmitted [Refresh Paths Transmitted] (vRtrRsvpSessionTxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshPaths indicates the number of times PATH refresh for the session was sent as a part of a Srefresh message.
refreshReservesReceived [Refresh Reserves Received] (vRtrRsvpSessionRxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshResvs indicates the number of times RESV was refreshed using message ID from full RESV refresh or Srefresh message for this RSVP session.
refreshReservesTransmitted [Refresh Reserves Transmitted] (vRtrRsvpSessionTxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshResvs indicates the number of times RESV refresh for the session was sent as a part of a Srefresh message.
reservesReceived [Reserves Received] (vRtrRsvpSessionRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages received for this RSVP session.
reservesTransmitted [Reserves Transmitted] (vRtrRsvpSessionTxResvs)	java. math. BigInteger	The total number of RSVP RESV messages transmitted for this RSVP session.

Table 666 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CpeCheckStats</p> <p>MIB entry name: vRtrInetStatRteCpeChkStatsEntry</p> <p>Entry description: Each row entry represents a collection of Customer-Provided Equipment (CPE) availability statistics for a virtual router static route in the system with non-default values set for the vRtrInetStaticRouteCpeAddrType and vRtrInetStaticRouteCpeAddr objects. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrInetStatRteCpeChkStatsTable): The vRtrInetStatRteCpeChkStatsTable has an entry for each entry in the vRtrInetStaticRouteTable that has a non-default values set for the vRtrInetStaticRouteCpeAddrType and vRtrInetStaticRouteCpeAddr objects.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rtr.StaticRoute</p>		
downTransitions [Down Transitions] (vRtrInetStatRteCpeChkDownTrans)	long	The value of vRtrInetStatRteCpeChkDownTrans indicates the number of times the CPE has transitioned to the unavailable state.
echoReplyPacketsReceived [Echo Reply Packets Received] (vRtrInetStatRteCpeChkInPktCnt)	long	The value of vRtrInetStatRteCpeChkInPktCnt indicates the number of echo-reply packets received.
echoRequestPacketsSent [Echo Request Packets Sent] (vRtrInetStatRteCpeChkOutPktCnt)	long	The value of vRtrInetStatRteCpeChkOutPktCnt indicates the number of echo-request packets sent.
hostUpDownTime [Host Up Down Time] (vRtrInetStatRteCpeChkUpTime)	long	The value of vRtrInetStatRteCpeChkUpTime indicates how long (in hundredths of a second) that the CPE has been available.
ttl [Ttl] (vRtrInetStatRteCpeChkTTL)	long	The value of vRtrInetStatRteCpeChkTTL indicates the time, in seconds, before the CPE will be declared down. Upon receipt of an echo reply, it has the value of vRtrInetStaticRouteCpeInterval * vRtrInetStaticRouteCpeDropCnt and is decremented by 1 every second.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
upTransitions [Up Transitions] (vRtrInetStatRteCpeChkUpTrans)	long	The value of vRtrInetStatRteCpeChkUpTrans indicates the number of times the CPE has transitioned to the available state.
<p>DhcpRelayStats</p> <p>MIB entry name: vRtrIfDHCPRelayStatsEntry</p> <p>Entry description: Each row entry represents information related to DHCP Relay statistics for a virtual router interface in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrIfDHCPRelayStatsTable): The vRtrIfDHCPRelayStatsTable contains the statistics for the DHCP Relay agent.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.DhcpRelayConfiguration • rtr.GrplfDhcpRelayCfg • rtr.SublIfDhcpRelayCfg 		
authPktsDiscarded [Auth Pkts Discarded] (vRtrIfDHCPRelayAuthPktsDiscarded)	long	vRtrIfDHCPRelayAuthPktsDiscarded indicates the total number of packets discarded because authentication was not successful.
authPktsSuccess [Auth Pkts Success] (vRtrIfDHCPRelayAuthPktsSuccess)	long	vRtrIfDHCPRelayAuthPktsSuccess indicates the total number of packets for which authentication was successful.
clientPacketsDiscarded [Client Packets Discarded] (vRtrIfDHCPRelayClientPktsDiscarded)	long	vRtrIfDHCPRelayClientPktsDiscarded indicates the total number of client packets discarded by the DHCP relay agent.
clientPacketsRelayed [Client Packets Relayed] (vRtrIfDHCPRelayClientPktsRelayed)	long	vRtrIfDHCPRelayClientPktsRelayed indicates the total number of client packets relayed by the DHCP relay agent.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
clientPktsProxLS [Client Pkts Prox LS] (vRtrIfDHCPRelayClientPktsProxLS)	long	vRtrIfDHCPRelayClientPktsProxLS indicates the total number of client packets proxied by the DHCP relay agent based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
clientPktsProxNq [Client Pkts Prox Nq] (vRtrIfDHCPRelayClientPktsProxNq)	long	The value of the object vRtrIfDHCPRelayClientPktsProxNq indicates the total number of client packets proxied by the DHCP relay agent based on data received from a Diameter NASREQ server.
clientPktsProxRad [Client Pkts Prox Rad] (vRtrIfDHCPRelayClientPktsProxRad)	long	vRtrIfDHCPRelayClientPktsProxRad indicates the total number of client packets proxied by the DHCP relay agent based on data received from a RADIUS server.
clientPktsProxUDB [Client Pkts Prox UDB] (vRtrIfDHCPRelayClientPktsProxUDB)	long	vRtrIfDHCPRelayClientPktsProxUDB indicates the total number of client packets proxied by the DHCP relay agent based on the local user database.
pktsGenForceRenew [Pkts Gen Force Renew] (vRtrIfDHCPRelayPktsGenForceRenew)	long	vRtrIfDHCPRelayPktsGenForceRenew indicates the total number of DHCP FORCERENEW messages spoofed by the DHCP relay agent to the DHCP clients.
pktsGenRelease [Pkts Gen Release] (vRtrIfDHCPRelayPktsGenRelease)	long	vRtrIfDHCPRelayPktsGenRelease indicates the total number of DHCP RELEASE messages spoofed by the DHCP relay agent to the DHCP server.
receivedMalformedPackets [Received Malformed Packets] (vRtrIfDHCPRelayRxMalformedPkts)	long	vRtrIfDHCPRelayRxMalformedPkts indicates the total number of malformed packets received by the DHCP relay agent.
receivedPackets [Received Packets] (vRtrIfDHCPRelayRxPkts)	long	vRtrIfDHCPRelayRxPkts indicates the total number of packets received by the DHCP relay agent.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedUntrustedPackets [Received Untrusted Packets] (vRtrIfDHCPRelayRxUntrustedPkts)	long	vRtrIfDHCPRelayRxUntrustedPkts indicates the total number of untrusted packets received by the DHCP relay agent.
serverPacketsDiscarded [Server Packets Discarded] (vRtrIfDHCPRelayServerPktsDiscarded)	long	vRtrIfDHCPRelayServerPktsDiscarded indicates the total number of server packets discarded by the DHCP relay agent.
serverPacketsRelayed [Server Packets Relayed] (vRtrIfDHCPRelayServerPktsRelayed)	long	vRtrIfDHCPRelayServerPktsRelayed indicates the total number of server packets relayed by the DHCP relay agent.
serverPktsSnooped [Server Pkts Snooped] (vRtrIfDHCPRelayServerPktsSnooped)	long	vRtrIfDHCPRelayServerPktsSnooped indicates the total number of server packets snooped by the DHCP relay agent.
transmittedPackets [Transmitted Packets] (vRtrIfDHCPRelayTxPkts)	long	vRtrIfDHCPRelayTxPkts indicates the total number of packets transmitted by the DHCP relay agent.
<p>IpInterfaceAdditionalStats MIB entry name: vRtrIfStatsExtEntry Entry description: Each row entry represents the statistics per virtual router interface. Entries are created and deleted when entries in the vRtrIfEntry are created and deleted. Table description (for vRtrIfStatsExtTable): The vRtrIfStatsExtTable table contains statistics per virtual router interface. ifSpeed [If Speed] (vRtrIfSpeed)	java. math. BigInteger	The value of vRtrIfSpeed indicates an estimate of the current bandwidth in bits per second for this interface.
rxBytes [Rx Bytes] (vRtrIfRxBytes)	java. math. BigInteger	The value of vRtrIfRxBytes indicates the number of bytes in IPv4 and IPv6 packets received by this interface.
rxBytesHigh32 [Rx Bytes High 32] (vRtrIfRxBytesHigh32)	long	The value of vRtrIfRxBytesHigh32 indicates the high 32 bits of the value of vRtrIfRxBytes.
rxBytesLow32 [Rx Bytes Low 32] (vRtrIfRxBytesLow32)	long	The value of vRtrIfRxBytesLow32 indicates the lower 32 bits of the value of vRtrIfRxBytes.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxPkts [Rx Pkts] (vRtrIfRxPkts)	java. math. BigInteger	The value of vRtrIfRxPkts indicates the number of IPv4 packets received by this interface.
rxPktsHigh32 [Rx Pkts High 32] (vRtrIfRxPktsHigh32)	long	The value of vRtrIfRxPktsHigh32 indicates the high 32 bits of the value of vRtrIfRxPkts.
rxPktsLow32 [Rx Pkts Low 32] (vRtrIfRxPktsLow32)	long	The value of vRtrIfRxPktsLow32 indicates the lower 32 bits of the value of vRtrIfRxPkts.
rxV4Bytes [Rx V4 Bytes] (vRtrIfRxV4Bytes)	java. math. BigInteger	The value of vRtrIfRxV4Bytes indicates the number of bytes in IPv4 packets received by this interface.
rxV4Pkts [Rx V4 Pkts] (vRtrIfRxV4Pkts)	java. math. BigInteger	The value of vRtrIfRxV4Pkts indicates the number of IPv4 packets received by this interface.
rxV6Bytes [Rx V6 Bytes] (vRtrIfRxV6Bytes)	java. math. BigInteger	The value of vRtrIfRxV6Bytes indicates the number of bytes in IPv6 packets received by this interface.
rxV6BytesHigh32 [Rx V6 Bytes High 32] (vRtrIfRxV6BytesHigh32)	long	The value of vRtrIfRxV6BytesHigh32 indicates the high 32 bits word of the value of vRtrIfRxV6Bytes.
rxV6BytesLow32 [Rx V6 Bytes Low 32] (vRtrIfRxV6BytesLow32)	long	The value of vRtrIfRxV6BytesLow32 indicates the lower 32 bits word of the value of vRtrIfRxV6Bytes.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxV6Pkts [Rx V6 Pkts] (vRtrIfRxV6Pkts)	java. math. BigInteger	The value of vRtrIfRxV6Pkts indicates the number of IPv6 packets received by this interface.
rxV6PktsHigh32 [Rx V6 Pkts High 32] (vRtrIfRxV6PktsHigh32)	long	The value of vRtrIfRxV6PktsHigh32 indicates the high 32 bits of the value of vRtrIfRxV6Pkts.
rxV6PktsLow32 [Rx V6 Pkts Low 32] (vRtrIfRxV6PktsLow32)	long	The value of vRtrIfRxV6PktsLow32 indicates the lower 32 bits of the value of vRtrIfRxV6Pkts.
txV4Bytes [Tx V4 Bytes] (vRtrIfTxV4Bytes)	java. math. BigInteger	The value of vRtrIfTxV4Bytes indicates the number of total IPv4 bytes sent from this interface.
txV4BytesHigh32 [Tx V4 Bytes High 32] (vRtrIfTxV4BytesHigh32)	long	The value of vRtrIfTxV4BytesHigh32 indicates the high 32 bits of the value of vRtrIfTxV4Bytes.
txV4BytesLow32 [Tx V4 Bytes Low 32] (vRtrIfTxV4BytesLow32)	long	The value of vRtrIfTxV4BytesLow32 indicates the lower 32 bits of the value of vRtrIfTxV4Bytes.
txV4DiscardBytes [Tx V4 Discard Bytes] (vRtrIfTxV4DiscardBytes)	java. math. BigInteger	The value of vRtrIfTxV4DiscardBytes indicates the number of total IPv4 transmit bytes discarded by this interface.
txV4DiscardBytesHigh32 [Tx V4 Discard Bytes High 32] (vRtrIfTxV4DiscardBytesHigh32)	long	The value of vRtrIfTxV4DiscardBytesHigh32 indicates the high 32 bits of the value of vRtrIfTxV4DiscardBytes.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txV4DiscardBytesLow32 [Tx V4 Discard Bytes Low 32] (vRtrIfTxV4DiscardBytesLow32)	long	The value of vRtrIfTxV4DiscardBytesLow32 indicates the lower 32 bits of the value of vRtrIfTxV4DiscardBytes.
txV4DiscardPktsHigh32 [Tx V4 Discard Pkts High 32] (vRtrIfTxV4DiscardPktsHigh32)	long	The value of vRtrIfTxV4DiscardPktsHigh32 indicates the high 32 bits of the value of vRtrIfTxV4DiscardPkts.
txV4DiscardPktsLow32 [Tx V4 Discard Pkts Low 32] (vRtrIfTxV4DiscardPktsLow32)	long	The value of vRtrIfTxV4DiscardPktsLow32 indicates the lower 32 bits of the value of vRtrIfTxV4DiscardPkts.
txV4Pkts [Tx V4 Pkts] (vRtrIfTxV4Pkts)	java. math. BigInteger	The value of vRtrIfTxV4Pkts indicates the number of total IPv4 packets sent from this interface.
txV4PktsHigh32 [Tx V4 Pkts High 32] (vRtrIfTxV4PktsHigh32)	long	The value of vRtrIfTxV4PktsHigh32 indicates the high 32 bits of the value of vRtrIfTxV4Pkts.
txV4PktsLow32 [Tx V4 Pkts Low 32] (vRtrIfTxV4PktsLow32)	long	The value of vRtrIfTxV4PktsLow32 indicates the lower 32 bits of the value of vRtrIfTxV4Pkts.
txV6Bytes [Tx V6 Bytes] (vRtrIfTxV6Bytes)	java. math. BigInteger	The value of vRtrIfTxV6Bytes indicates the number of total IPv6 bytes sent from this interface.
txV6BytesHigh32 [Tx V6 Bytes High 32] (vRtrIfTxV6BytesHigh32)	long	The value of vRtrIfTxV6BytesHigh32 indicates the high 32 bits of the value of vRtrIfTxV6Bytes.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txV6BytesLow32 [Tx V6 Bytes Low 32] (vRtrIfTxV6BytesLow32)	long	The value of vRtrIfTxV6BytesLow32 indicates the lower 32 bits of the value of vRtrIfTxV6Bytes.
txV6DiscardBytes [Tx V6 Discard Bytes] (vRtrIfTxV6DiscardBytes)	java. math. BigInteger	The value of vRtrIfTxV6DiscardBytes indicates the number of total IPv6 transmit bytes discarded by this interface.
txV6DiscardBytesHigh32 [Tx V6 Discard Bytes High 32] (vRtrIfTxV6DiscardBytesHigh32)	long	The value of vRtrIfTxV6DiscardBytesHigh32 indicates the high 32 bits of the value of vRtrIfTxV6DiscardBytes.
txV6DiscardBytesLow32 [Tx V6 Discard Bytes Low 32] (vRtrIfTxV6DiscardBytesLow32)	long	The value of vRtrIfTxV6DiscardBytesLow32 indicates the lower 32 bits of the value of vRtrIfTxV6DiscardBytes.
txV6DiscardPkts [Tx V6 Discard Pkts] (vRtrIfTxV6DiscardPkts)	java. math. BigInteger	The value of vRtrIfTxV6DiscardPkts indicates the number of total IPv6 transmit packets discarded by this interface.
txV6DiscardPktsHigh32 [Tx V6 Discard Pkts High 32] (vRtrIfTxV6DiscardPktsHigh32)	long	The value of vRtrIfTxV6DiscardPktsHigh32 indicates the high 32 bits of the value of vRtrIfTxV6DiscardPkts.
txV6DiscardPktsLow32 [Tx V6 Discard Pkts Low 32] (vRtrIfTxV6DiscardPktsLow32)	long	The value of vRtrIfTxV6DiscardPktsLow32 indicates the lower 32 bits of the value of vRtrIfTxV6DiscardPkts.
txV6Pkts [Tx V6 Pkts] (vRtrIfTxV6Pkts)	java. math. BigInteger	The value of vRtrIfTxV6Pkts indicates the number of total IPv6 packets sent from this interface.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txV6PktsHigh32 [Tx V6 Pkts High 32] (vRtrIfTxV6PktsHigh32)	long	The value of vRtrIfTxV6PktsHigh32 indicates the high 32 bits of the value of vRtrIfTxV6Pkts.
txV6PktsLow32 [Tx V6 Pkts Low 32] (vRtrIfTxV6PktsLow32)	long	The value of vRtrIfTxV6PktsLow32 indicates the lower 32 bits of the value of vRtrIfTxV6Pkts.
<p>MacAccountingStats MIB entry name: vRtrIfMacAccountingStatsEntry Entry description: Each row entry represents the MAC statistics per virtual router interface. Table description (for vRtrIfMacAccountingStatsTable): The vRtrIfMacAccountingStatsTable table contains MAC statistics per virtual router interface. Does not support realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • rtr.NetworkInterface • service.L3AccessInterface </p>		
inFrames [In Frames] (vRtrIfMacAccountingInFrames)	java. math. BigInteger	The value of the object vRtrIfMacAccountingInFrames indicates the number of total frames received in this MAC Address.
inFramesHigh32 [In Frames High 32] (vRtrIfMacAccountingInFramesH)	long	The value of vRtrIfMacAccountingInFramesH indicates the higher 32 bits of vRtrIfMacAccountingInFrames.
inFramesLow32 [In Frames Low 32] (vRtrIfMacAccountingInFramesL)	long	The value of vRtrIfMacAccountingInFramesL indicates the lower 32 bits of vRtrIfMacAccountingInFrames.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inOctets [In Octets] (vRtrIfMacAccountingInOctets)	java. math. BigInteger	The value of the object vRtrIfMacAccountingInOctets indicates the number of total octets received in this MAC Address.
inOctetsHigh32 [In Octets High 32] (vRtrIfMacAccountingInOctetsH)	long	The value of vRtrIfMacAccountingInOctetsH indicates the higher 32 bits of vRtrIfMacAccountingInOctets.
inOctetsLow32 [In Octets Low 32] (vRtrIfMacAccountingInOctetsL)	long	The value of vRtrIfMacAccountingInOctetsL indicates the lower 32 bits of vRtrIfMacAccountingInOctets.
macAddress [Mac Address] (vRtrIfSourceMacAddress)	String	The value of the object vRtrIfSourceMacAddress indicates the source MAC address.
outFrames [Out Frames] (vRtrIfMacAccountingOutFrames)	java. math. BigInteger	The value of the object vRtrIfMacAccountingOutFrames indicates the number of total frames transmitted in this MAC Address.
outFramesHigh32 [Out Frames High 32] (vRtrIfMacAccountingOutFramesH)	long	The value of vRtrIfMacAccountingOutFramesH indicates the higher 32 bits of vRtrIfMacAccountingOutFrames.
outFramesLow32 [Out Frames Low 32] (vRtrIfMacAccountingOutFramesL)	long	The value of vRtrIfMacAccountingOutFramesL indicates the lower 32 bits of vRtrIfMacAccountingOutFrames.
outOctets [Out Octets] (vRtrIfMacAccountingOutOctets)	java. math. BigInteger	The value of the object vRtrIfMacAccountingOutOctets indicates the number of total octets transmitted in this MAC Address.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outOctetsHigh32 [Out Octets High 32] (vRtrIfMacAccountingOutOctetsH)	long	The value of vRtrIfMacAccountingOutOctetsH indicates the higher 32 bits of vRtrIfMacAccountingOutOctets.
outOctetsLow32 [Out Octets Low 32] (vRtrIfMacAccountingOutOctetsL)	long	The value of vRtrIfMacAccountingOutOctetsL indicates the lower 32 bits of vRtrIfMacAccountingOutOctets.
<p>NetworkInterfaceURPFStats MIB entry name: vRtrIfStatsEntry Entry description: Each row entry represents the statistics per virtual router interface. uRPFCheckFailPkts [URPFCheck Fail Pkts] (vRtrIfuRPFCheckFailPkts)	java. math. BigInteger	The value of vRtrIfuRPFCheckFailPkts indicates the number of packets that fail uRPF check on this interface.
uRPFCheckFailPktsHigh32 [URPFCheck Fail Pkts High 32] (vRtrIfuRPFCheckFailPktsHigh32)	long	The value of vRtrIfuRPFCheckFailPktsHigh32 indicates the high 32 bits of the value of vRtrIfuRPFCheckFailPkts.
uRPFCheckFailPktsLow32 [URPFCheck Fail Pkts Low 32] (vRtrIfuRPFCheckFailPktsLow32)	long	The value of vRtrIfuRPFCheckFailPktsLow32 indicates the lower 32 bits of the value of vRtrIfuRPFCheckFailPkts.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
uRPFCheckFailV4Bytes [URPFCheck Fail V4 Bytes] (vRtrIfV4uRPFCheckFailBytes)	java. math. BigInteger	The value of vRtrIfV4uRPFCheckFailBytes indicates the number of bytes in IPv4 packets that fail uRPF check on this interface.
uRPFCheckFailV4Pkts [URPFCheck Fail V4 Pkts] (vRtrIfV4uRPFCheckFailPkts)	java. math. BigInteger	The value of vRtrIfV4uRPFCheckFailPkts indicates the number of IPv4 packets that fail uRPF check on this interface.
uRPFCheckFailV6Bytes [URPFCheck Fail V6 Bytes] (vRtrIfV6uRPFCheckFailBytes)	java. math. BigInteger	The value of vRtrIfV6uRPFCheckFailBytes indicates the number of bytes in IPv6 packets that fail uRPF check on this interface.
uRPFCheckFailV6BytesHigh32 [URPFCheck Fail V6 Bytes High 32] (vRtrIfV6uRPFCheckFailBytesHigh32)	long	The value of vRtrIfV6uRPFCheckFailBytesHigh32 indicates the high 32 bits word of the value of vRtrIfV6uRPFCheckFailBytes.
uRPFCheckFailV6BytesLow32 [URPFCheck Fail V6 Bytes Low 32] (vRtrIfV6uRPFCheckFailBytesLow32)	long	The value of vRtrIfV6uRPFCheckFailBytesLow32 indicates the lower 32 bits word of the value of vRtrIfV6uRPFCheckFailBytes.
uRPFCheckFailV6Pkts [URPFCheck Fail V6 Pkts] (vRtrIfV6uRPFCheckFailPkts)	java. math. BigInteger	The value of vRtrIfV6uRPFCheckFailPkts indicates the number of IPv6 packets that fail uRPF check on this interface.
uRPFCheckFailV6PktsHigh32 [URPFCheck Fail V6 Pkts High 32] (vRtrIfV6uRPFCheckFailPktsHigh32)	long	The value of vRtrIfV6uRPFCheckFailPktsHigh32 indicates the high 32 bits word of the value of vRtrIfV6uRPFCheckFailPkts.
uRPFCheckFailV6PktsLow32 [URPFCheck Fail V6 Pkts Low 32] (vRtrIfV6uRPFCheckFailPktsLow32)	long	The value of vRtrIfV6uRPFCheckFailPktsLow32 indicates the lower 32 bits word of the value of vRtrIfV6uRPFCheckFailPkts.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vRtrIfuRPFCheckFailBytes [VRtr Ifu RPFCheck Fail Bytes] (vRtrIfuRPFCheckFailBytes)	java. math. BigInteger	The value of vRtrIfuRPFCheckFailBytes indicates the number of bytes in the packets that fail uRPF check.
vRtrIfuRPFCheckFailBytesHigh32 [VRtr Ifu RPFCheck Fail Bytes High 32] (vRtrIfuRPFCheckFailBytesHigh32)	long	The value of vRtrIfuRPFCheckFailBytesHigh32 indicates the high 32 bits of the value of vRtrIfuRPFCheckFailBytes.
vRtrIfuRPFCheckFailBytesLow32 [VRtr Ifu RPFCheck Fail Bytes Low 32] (vRtrIfuRPFCheckFailBytesLow32)	long	The value of vRtrIfuRPFCheckFailBytesLow32 indicates the lower 32 bits of the value of vRtrIfuRPFCheckFailBytes.
<p>PolicyAccountInterfaceStats</p> <p>MIB entry name: vRtrPlcyAcctInterfaceStatsEntry</p> <p>Entry description: Each row entry in the vRtrPlcyAcctInterfaceStatsTable represents statistics related to the vRtrPlcyAcctSrcClassTable and vRtrPlcyAcctDestClassTable.</p> <p>Table description (for vRtrPlcyAcctInterfaceStatsTable): The vRtrPlcyAcctInterfaceStatsTable has stats for each source class and dest class associated with an interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ies.GroupInterface • ies.IPsecInterface • ies.L3AccessInterface • rtr.NetworkInterface • vprn.GroupInterface • vprn.IPsecInterface • vprn.L3AccessInterface 		
forwardBytes [Forward Bytes] (vRtrPlcyAcctRxFwdBytes)	java. math. BigInteger	The value of the object vRtrPlcyAcctRxFwdBytes indicates the total number of bytes received for this vRtrPlcyAcctIndex associated with the interface.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardPackets [Forward Packets] (vRtrPlyAcctRxFwdPkts)	java. math. BigInteger	The value of the object vRtrPlyAcctRxFwdPkts indicates the total number of packets received for this vRtrPlyAcctIndex associated with the interface.
incompleteCount [Incomplete Count] (vRtrPlyAcctRxIncompleteCnt)	boolean	The value of the object vRtrPlyAcctRxIncompleteCnt indicates whether the count of vRtrPlyAcctRxFwdBytes and vRtrPlyAcctRxFwdPkts is incomplete or not. When the value of vRtrPlyAcctRxIncompleteCnt is 'true', both vRtrPlyAcctRxFwdBytes and vRtrPlyAcctRxFwdPkts will be incomplete.
<p>RouteStats</p> <p>MIB entry name: vRtrStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrStatTable): The vRtrStatTable has an entry for each virtual router configured in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.VirtualRouter • vprn.DVRSSite • vprn.RoutingInstanceSite • vprn.Site 		
activeARPEntries [Active ARPEntries] (vRtrStatActiveARPEntries)	long	vRtrStatActiveARPEntries indicates the number of active ARP entries for the specified virtual router in the system.
activeBgpTunnels [Active Bgp Tunnels] (vRtrStatActiveBgpTunnels)	long	vRtrStatActiveBgpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'bgp'.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
activeMplsTpTunnels [Active Mpls Tp Tunnels] (vRtrStatActiveMplsTpTunnels)	long	vRtrStatActiveMplsTpTunnels indicates the current number of active MPLS-TP tunnels.
activeRsvpTunnels [Active Rsvp Tunnels] (vRtrStatActiveRsvpTunnels)	long	The value of vRtrStatActiveRsvpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'rsvp'.
aggregateActiveRoutes [Aggregate Active Routes] (vRtrAggregateActiveRoutes)	long	vRtrAggregateActiveRoutes indicates the current number of active aggregate routes for this instance of the route table.
aggregateRoutes [Aggregate Routes] (vRtrAggregateRoutes)	long	vRtrAggregateRoutes indicates the current number of aggregate routes for this instance of the route table.
bgpActiveRoutes [Bgp Active Routes] (vRtrBGPAciveRoutes)	long	vRtrBGPAciveRoutes indicates the current number of active bgp routes for this instance of the route table.
bgpRoutes [Bgp Routes] (vRtrBGPRoutes)	long	vRtrBGPRoutes indicates the current number of bgp routes for this instance of the route table.
bgpVpnActiveRoutes [Bgp Vpn Active Routes] (vRtrStatBGPVpnActiveRoutes)	long	vRtrStatBGPVpnActiveRoutes indicates the current number of active VPN-IPV4 routes learned by MP-BGP for this virtual router.
bgpVpnRoutes [Bgp Vpn Routes] (vRtrStatBGPVpnRoutes)	long	vRtrStatBGPVpnRoutes indicates the current number of VPN-IPV4 routes learned by MP-BGP for this virtual router.
directActiveRoutes [Direct Active Routes] (vRtrDirectActiveRoutes)	long	vRtrDirectActiveRoutes indicates the current number of active direct routes for this instance of the route table.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
directRoutes [Direct Routes] (vRtrDirectRoutes)	long	vRtrDirectRoutes indicates the current number of direct routes for this instance of the route table.
dynamicArpEntries [Dynamic Arp Entries] (vRtrStatDynamicARPEntries)	long	The value of vRtrStatDynamicARPEntries indicates the total number of active and inactive dynamic ARP entries for the specified virtual router in the system.
hostActiveRoutes [Host Active Routes] (vRtrHostActiveRoutes)	long	The value of vRtrHostActiveRoutes indicates the current number of active direct routes with prefix value 32 for this instance of the route table.
hostRoutes [Host Routes] (vRtrHostRoutes)	long	The value of vRtrHostRoutes indicates the current number of direct routes with prefix value 32 for this instance of the route table.
iPsecActiveRoutes [IPsec Active Routes] (vRtrIPsecActiveRoutes)	long	The value of the object vRtrIPsecActiveRoutes indicates the current number of active IPsec routes for this instance of the route table.
iPsecRoutes [IPsec Routes] (vRtrIPsecRoutes)	long	The value of the object vRtrIPsecRoutes indicates the current number of IPsec routes for this instance of the route table.
illegalLabelsReceived [Illegal Labels Received] (vRtrStatIllegalLabels)	long	vRtrStatIllegalLabels indicates the number of illegally received labels on this virtual router.
internalArpEntries [Internal Arp Entries] (vRtrStatInternalARPEntries)	long	The value of vRtrStatInternalARPEntries indicates the total number of active and inactive internal ARP entries for the specified virtual router in the system.
isisActiveRoutes [Isis Active Routes] (vRtrISISActiveRoutes)	long	vRtrISISActiveRoutes indicates the current number of active isis routes for this instance of the route table.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
isisRoutes [Isis Routes] (vRtrISISRoutes)	long	vRtrISISRoutes indicates the current number of isis routes for this instance of the route table.
ldpActiveRoutes [Ldp Active Routes] (vRtrLDPActiveRoutes)	long	vRtrLDPActiveRoutes indicates the current number of active ldp routes for this instance of the route table.
ldpActiveTunnels [Ldp Active Tunnels] (vRtrStatActiveLdpTunnels)	long	vRtrStatActiveLdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'ldp'.
ldpRoutes [Ldp Routes] (vRtrLDPRoutes)	long	vRtrLDPRoutes indicates the current number of ldp routes for this instance of the route table.
ldpTunnels [Ldp Tunnels] (vRtrStatTotalLdpTunnels)	long	vRtrStatTotalLdpTunnels indicates the current number of both active and inactive LDP tunnels.
localArpEntries [Local Arp Entries] (vRtrStatLocalARPEntries)	long	The value of vRtrStatLocalARPEntries indicates the total number of active and inactive local ARP entries for the specified virtual router in the system.
managedActiveRoutes [Managed Active Routes] (vRtrManagedActiveRoutes)	long	The value of vRtrManagedActiveRoutes indicates the total number of active managed routes for the specified virtual router in the system.
managedArpEntries [Managed Arp Entries] (vRtrStatManagedARPEntries)	long	The value of vRtrStatManagedARPEntries indicates the total number of active and inactive managed ARP entries for the specified virtual router in the system.
managedRoutes [Managed Routes] (vRtrManagedRoutes)	long	The value of vRtrManagedRoutes indicates the total number of active and inactive managed routes for the specified virtual router in the system.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mcastIpv4StatBGPEvpnActvRts [Mcast Ipv 4 Stat BGPEvpn Actv Rts] (vRtrMcastIpv4StatBGPEvpnActvRts)	long	The value of vRtrMcastIpv4StatBGPEvpnActvRts indicates the total number of active IPv4 Multicast BGP EVPN route entries for the specified virtual router in the system.
mcastIpv4StatBGPEvpnRoutes [Mcast Ipv 4 Stat BGPEvpn Routes] (vRtrMcastIpv4StatBGPEvpnRoutes)	long	The value of vRtrMcastIpv4StatBGPEvpnRoutes indicates the total number of IPv4 Multicast BGP EVPN route entries for the specified virtual router in the system.
multicastRoutes [Multicast Routes] (vRtrMulticastRoutes)	long	vRtrMulticastRoutes indicates the current number of rows in the vRtrPimNgGrpSrcTable.
natActiveRoutes [Nat Active Routes] (vRtrNatActiveRoutes)	long	The value of vRtrNatActiveRoutes indicates the current number of IPv4 NAT routes for this instance of the route table.
natRoutes [Nat Routes] (vRtrNatRoutes)	long	The value of vRtrNatRoutes indicates the current number of IPv4 NAT (Network Address Translation) routes for this instance of the route table.
ospfActiveRoutes [Ospf Active Routes] (vRtrOSPFActiveRoutes)	long	vRtrOSPFActiveRoutes indicates the current number of active ospf routes for this instance of the route table.
ospfRoutes [Ospf Routes] (vRtrOSPFRoutes)	long	vRtrOSPFRoutes indicates the current number of ospf routes for this instance of the route table.
perActiveRoutes [Per Active Routes] (vRtrPeriodicActiveRoutes)	long	The value of vRtrPeriodicActiveRoutes indicates the current number of active periodic routes for this instance of the route table.
perRoutes [Per Routes] (vRtrPeriodicRoutes)	long	The value of vRtrPeriodicRoutes indicates the current number of periodic routes for this instance of the route table.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ripActiveRoutes [Rip Active Routes] (vRtrRIPActiveRoutes)	long	vRtrRIPActiveRoutes indicates the current number of active rip routes for this instance of the route table.
ripRoutes [Rip Routes] (vRtrRIPRoutes)	long	vRtrRIPRoutes indicates the current number of rip routes for this instance of the route table.
routerInterfacesActive [Router Interfaces Active] (vRtrStatActiveIfs)	long	vRtrStatActiveIfs indicates the current number of router interfaces with vRtrIfAdminState equal 'inService' on this virtual router.
routerInterfacesConfigured [Router Interfaces Configured] (vRtrStatConfiguredIfs)	long	vRtrStatConfiguredIfs indicates the current number of router interfaces configured on this virtual router.
routesInVrf [Routes In Vrf] (vRtrStatCurrNumRoutes)	long	vRtrStatCurrNumRoutes indicates the current number of routes in the VRF for this virtual router.
sdpActiveTunnels [Sdp Active Tunnels] (vRtrStatActiveSdpTunnels)	long	vRtrStatActiveSdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'sdp'.
sdpTunnels [Sdp Tunnels] (vRtrStatTotalSdpTunnels)	long	vRtrStatTotalSdpTunnels indicates the current number of both active and inactive SDP tunnels.
statBGPEVPNARPEntries [Stat BGPEVPNARPEntries] (vRtrStatBGPEVPNARPEntries)	long	The value of vRtrStatBGPEVPNARPEntries indicates the total number of BGP EVPN ARP entries for the specified virtual router in the system.
statBGPEvpnActiveRoutes [Stat BGPEvpn Active Routes] (vRtrStatBGPEvpnActiveRoutes)	long	The value of vRtrStatBGPEvpnActiveRoutes indicates the total number of active IPv4 BGP EVPN route entries for the specified virtual router in the system.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statBGPEvpnRoutes [Stat BGPEvpn Routes] (vRtrStatBGPEvpnRoutes)	long	The value of vRtrStatBGPEvpnRoutes indicates the total number of IPv4 BGP EVPN route entries for the specified virtual router in the system.
statBGPLabelV4ActiveRoutes [Stat BGPLabel V4 Active Routes] (vRtrStatBGPLabelV4ActiveRoutes)	long	The value of vRtrStatBGPLabelV4ActiveRoutes indicates the total number of active labeled IPv4 BGP route entries for the specified virtual router in the system.
staticActiveRoutes [Static Active Routes] (vRtrStaticActiveRoutes)	long	vRtrStaticActiveRoutes indicates the current number of active static routes for this instance of the route table.
staticArpEntries [Static Arp Entries] (vRtrStatStaticARPEntries)	long	The value of vRtrStatStaticARPEntries indicates the total number of active and inactive static ARP entries for the specified virtual router in the system.
staticRoutes [Static Routes] (vRtrStaticRoutes)	long	vRtrStaticRoutes indicates the current number of static routes for this instance of the route table.
subMgmtActiveRoutes [Sub Mgmt Active Routes] (vRtrSubMgmtActiveRoutes)	long	The value of vRtrSubMgmtActiveRoutes indicates the number of active subscriber management routes.
subMgmtRoutes [Sub Mgmt Routes] (vRtrSubMgmtRoutes)	long	The value of vRtrSubMgmtRoutes indicates the total number of subscriber management routes in the route Table.
totalARPEntries [Total ARPEntries] (vRtrStatTotalARPEntries)	long	vRtrStatTotalARPEntries indicates the total number of active and inactive ARP entries for the specified virtual router in the system.
totalBgpTunnels [Total Bgp Tunnels] (vRtrStatTotalBgpTunnels)	long	vRtrStatTotalBgpTunnels indicates the current number of both active and inactive BGP tunnels.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalMplsTpTunnels [Total Mpls Tp Tunnels] (vRtrStatTotalMplsTpTunnels)	long	vRtrStatTotalMplsTpTunnels indicates the current number of both active and inactive MPLS-TP tunnels.
totalRsvpTunnels [Total Rsvp Tunnels] (vRtrStatTotalRsvpTunnels)	long	The value of vRtrStatTotalRsvpTunnels indicates the current number of both active and inactive RSVP tunnels.
vpnLeakActiveRoutes [Vpn Leak Active Routes] (vRtrVPNLeakActiveRoutes)	long	vRtrVPNLeakActiveRoutes indicates the current number of active VPN Leak routes for this instance of the route table.
vpnLeakRoutes [Vpn Leak Routes] (vRtrVPNLeakRoutes)	long	vRtrVPNLeakRoutes indicates the current number of VPN Leak routes for this instance of the route table.
V6RouteStats MIB entry name: vRtrStatEntry Entry description: Each row entry represents a collection of statistics for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrStatTable): The vRtrStatTable has an entry for each virtual router configured in the system. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • rtr.VirtualRouter • vprn.RoutingInstanceSite • vprn.Site 		
statBGPLabelV6ActiveRoutes [Stat BGPLabel V6 Active Routes] (vRtrStatBGPLabelV6ActiveRoutes)	long	The value of vRtrStatBGPLabelV6ActiveRoutes indicates the total number of active labeled IPv6 BGP route entries for the specified virtual router in the system.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v6ActiveNbrEntries [V6 Active Nbr Entries] (vRtrV6StatActiveNbrEntries)	long	vRtrV6StatActiveNbrEntries indicates the number of active V6 neighbor discovery entries for the specified virtual router in the system.
v6ActiveRsvpTunnels [V6 Active Rsvp Tunnels] (vRtrV6StatActiveRsvpTunnels)	long	The value of vRtrV6StatActiveRsvpTunnels indicates the current number of IPv6 rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'rsvp'.
v6AggregateActiveRoutes [V6 Aggregate Active Routes] (vRtrV6AggregateActiveRoutes)	long	vRtrV6AggregateActiveRoutes indicates the current number of active v6 aggregate routes for this instance of the route table.
v6AggregateRoutes [V6 Aggregate Routes] (vRtrV6AggregateRoutes)	long	vRtrV6AggregateRoutes indicates the current number of v6 aggregate routes for this instance of the route table.
v6BgpActiveRoutes [V6 Bgp Active Routes] (vRtrV6BGPAciveRoutes)	long	vRtrV6BGPAciveRoutes indicates the current number of v6 active bgp routes for this instance of the route table.
v6BgpRoutes [V6 Bgp Routes] (vRtrV6BGPRoutes)	long	vRtrV6BGPRoutes indicates the current number of v6 bgp routes for this instance of the route table.
v6BgpVpnActiveRoutes [V6 Bgp Vpn Active Routes] (vRtrV6StatBGPVpnActiveRoutes)	long	vRtrV6StatBGPVpnActiveRoutes indicates the current number of active VPN-IPV6 routes learned by MP-BGP for this virtual router.
v6BgpVpnRoutes [V6 Bgp Vpn Routes] (vRtrV6StatBGPVpnRoutes)	long	vRtrV6StatBGPVpnRoutes indicates the current number of VPN-IPV6 routes learned by MP-BGP for this virtual router.
v6Dhcpv6NaActiveRoutes [V6 Dhcpv 6 Na Active Routes] (vRtrV6Dhcpv6NaActiveRoutes)	long	The value of vRtrV6Dhcpv6NaActiveRoutes indicates the current number of active IPv6 DHCPv6 non-temporary address routes for this instance of the route table.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v6Dhcpv6NaRoutes [V6 Dhcpv 6 Na Routes] (vRtrV6Dhcpv6NaRoutes)	long	The value of vRtrV6Dhcpv6NaRoutes indicates the current number of IPv6 DHCPv6 non-temporary address routes for this instance of the route table.
v6Dhcpv6PdActiveRoutes [V6 Dhcpv 6 Pd Active Routes] (vRtrV6Dhcpv6PdActiveRoutes)	long	The value of vRtrV6Dhcpv6PdActiveRoutes indicates the current number of active IPv6 DHCPv6 delegated prefix routes for this instance of the route table.
v6Dhcpv6PdExclActiveRoutes [V6 Dhcpv 6 Pd Excl Active Routes] (vRtrV6Dhcpv6PdExclActiveRoutes)	long	The value of vRtrV6Dhcpv6PdExclActiveRoutes indicates the current number of active IPv6 DHCPv6 delegated prefix exclude routes for this instance of the route table.
v6Dhcpv6PdExclRoutes [V6 Dhcpv 6 Pd Excl Routes] (vRtrV6Dhcpv6PdExclRoutes)	long	The value of vRtrV6Dhcpv6PdExclRoutes indicates the current number of IPv6 DHCPv6 delegated prefix exclude routes for this instance of the route table.
v6Dhcpv6PdRoutes [V6 Dhcpv 6 Pd Routes] (vRtrV6Dhcpv6PdRoutes)	long	The value of vRtrV6Dhcpv6PdRoutes indicates the current number of IPv6 DHCPv6 delegated prefix routes for this instance of the route table.
v6Dhcpv6TaActiveRoutes [V6 Dhcpv 6 Ta Active Routes] (vRtrV6Dhcpv6TaActiveRoutes)	long	The value of vRtrV6Dhcpv6TaActiveRoutes indicates the current number of active IPv6 DHCPv6 temporary address routes for this instance of the route table.
v6Dhcpv6TaRoutes [V6 Dhcpv 6 Ta Routes] (vRtrV6Dhcpv6TaRoutes)	long	The value of vRtrV6Dhcpv6TaRoutes indicates the current number of IPv6 DHCPv6 temporary address routes for this instance of the route table.
v6DirectActiveRoutes [V6 Direct Active Routes] (vRtrV6DirectActiveRoutes)	long	vRtrV6DirectActiveRoutes indicates the current number of v6 active direct routes for this instance of the route table.
v6DirectRoutes [V6 Direct Routes] (vRtrV6DirectRoutes)	long	vRtrV6DirectRoutes indicates the current number of v6 direct routes for this instance of the route table.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v6HostActiveRoutes [V6 Host Active Routes] (vRtrV6HostActiveRoutes)	long	The value of vRtrV6HostActiveRoutes indicates the current number of v6 active direct routes with prefix value 128 for this instance of the route table.
v6HostRoutes [V6 Host Routes] (vRtrV6HostRoutes)	long	The value of vRtrV6HostRoutes indicates the current number of v6 direct routes with prefix value 128 for this instance of the route table.
v6IllegalLabelsReceived [V6 Illegal Labels Received] (vRtrV6StatIllegalLabels)	long	vRtrV6StatIllegalLabels indicates the number of illegally received v6 labels on this virtual router.
v6IsisActiveRoutes [V6 Isis Active Routes] (vRtrV6ISISActiveRoutes)	long	vRtrV6ISISActiveRoutes indicates the current number of v6 active isis routes for this instance of the route table.
v6IsisRoutes [V6 Isis Routes] (vRtrV6ISISRoutes)	long	vRtrV6ISISRoutes indicates the current number of v6 isis routes for this instance of the route table.
v6LdpActiveTunnels [V6 Ldp Active Tunnels] (vRtrV6StatActiveLdpTunnels)	long	vRtrV6StatActiveLdpTunnels indicates the current number of v6 rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'ldp'.
v6LdpTunnels [V6 Ldp Tunnels] (vRtrV6StatTotalLdpTunnels)	long	vRtrV6StatTotalLdpTunnels indicates the current number of both active and inactive v6 LDP tunnels.
v6ManagedActiveRoutes [V6 Managed Active Routes] (vRtrV6ManagedActiveRoutes)	long	The value of vRtrV6ManagedActiveRoutes indicates the total number of active IPv6 managed routes for the specified virtual router.
v6ManagedRoutes [V6 Managed Routes] (vRtrV6ManagedRoutes)	long	The value of vRtrV6ManagedRoutes indicates the total number of active and inactive IPv6 managed routes for the specified virtual router.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v6MulticastRoutes [V6 Multicast Routes] (vRtrV6MulticastRoutes)	long	vRtrV6MulticastRoutes indicates the current number of v6 rows in the vRtrPimNgGrpSrcTable.
v6MulticastStatBGPEvpnActiveRoutes [V6 Multicast Stat BGPEvpn Active Routes] (vRtrMcastIpv6StatBGPEvpnActvRts)	long	The value of vRtrMcastIpv6StatBGPEvpnActvRts indicates the total number of active IPv6 Multicast BGP EVPN route entries for the specified virtual router in the system.
v6MulticastStatBGPEvpnRoutes [V6 Multicast Stat BGPEvpn Routes] (vRtrMcastIpv6StatBGPEvpnRoutes)	long	The value of vRtrMcastIpv6StatBGPEvpnRoutes indicates the total number of IPv6 Multicast BGP EVPN route entries for the specified virtual router in the system.
v6NatActiveRoutes [V6 Nat Active Routes] (vRtrV6NatActiveRoutes)	long	The value of vRtrV6NatActiveRoutes indicates the current number of IPv6 active NAT routes for this instance of the route table.
v6NatRoutes [V6 Nat Routes] (vRtrV6NatRoutes)	long	The value of vRtrV6NatRoutes indicates the current number of IPv6 NAT routes for this instance of the route table.
v6OspfActiveRoutes [V6 Ospf Active Routes] (vRtrV6OSPFActiveRoutes)	long	vRtrV6OSPFActiveRoutes indicates the current number of v6 active ospf routes for this instance of the route table.
v6OspfRoutes [V6 Ospf Routes] (vRtrV6OSPFRoutes)	long	vRtrV6OSPFRoutes indicates the current number of v6 ospf routes for this instance of the route table.
v6PerActiveRoutes [V6 Per Active Routes] (vRtrV6PeriodicActiveRoutes)	long	The value of vRtrV6PeriodicActiveRoutes indicates the current number of active IPv6 periodic routes for this instance of the route table.
v6PerRoutes [V6 Per Routes] (vRtrV6PeriodicRoutes)	long	The value of vRtrV6PeriodicRoutes indicates the current number of IPv6 periodic routes for this instance of the route table.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v6RipActiveRoutes [V6 Rip Active Routes] (vRtrV6RIPActiveRoutes)	long	vRtrV6RIPActiveRoutes indicates the current number of active v6 rip routes for this instance of the route table.
v6RipRoutes [V6 Rip Routes] (vRtrV6RIPRoutes)	long	vRtrV6RIPRoutes indicates the current number of v6 rip routes for this instance of the route table.
v6RouterInterfacesActive [V6 Router Interfaces Active] (vRtrV6StatActiveIifs)	long	vRtrV6StatActiveIifs indicates the current number of v6 router interfaces with vRtrIfAdminState equal 'inService' on this virtual router.
v6RouterInterfacesConfigured [V6 Router Interfaces Configured] (vRtrV6StatConfiguredIifs)	long	vRtrV6StatConfiguredIifs indicates the current number of v6 router interfaces configured on this virtual router.
v6RoutesInVrf [V6 Routes In Vrf] (vRtrV6StatCurrNumRoutes)	long	vRtrV6StatCurrNumRoutes indicates the current number of v6 routes in the VRF for this virtual router.
v6SdpActiveTunnels [V6 Sdp Active Tunnels] (vRtrV6StatActiveSdpTunnels)	long	vRtrV6StatActiveSdpTunnels indicates the current number of v6 rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'sdp'.
v6SdpTunnels [V6 Sdp Tunnels] (vRtrV6StatTotalSdpTunnels)	long	vRtrV6StatTotalSdpTunnels indicates the current number of both active and inactive v6 SDP tunnels.
v6StatBGPEvpnActiveRoutes [V6 Stat BGPEvpn Active Routes] (vRtrV6StatBGPEvpnActiveRoutes)	long	The value of vRtrV6StatBGPEvpnActiveRoutes indicates the total number of active IPv6 BGP EVPN route entries for the specified virtual router in the system.
v6StatBGPEvpnRoutes [V6 Stat BGPEvpn Routes] (vRtrV6StatBGPEvpnRoutes)	long	The value of vRtrV6StatBGPEvpnRoutes indicates the total number of IPv6 BGP EVPN route entries for the specified virtual router in the system.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v6StaticActiveRoutes [V6 Static Active Routes] (vRtrV6StaticActiveRoutes)	long	vRtrV6StaticActiveRoutes indicates the current number of v6 active static routes for this instance of the route table.
v6StaticRoutes [V6 Static Routes] (vRtrV6StaticRoutes)	long	vRtrV6StaticRoutes indicates the current number of v6 static routes for this instance of the route table.
v6SubMgmtActiveRoutes [V6 Sub Mgmt Active Routes] (vRtrV6SubMgmtActiveRoutes)	long	vRtrV6SubMgmtActiveRoutes indicates the current number of v6 active subscriber management routes for this instance of the route table.
v6SubMgmtRoutes [V6 Sub Mgmt Routes] (vRtrV6SubMgmtRoutes)	long	vRtrV6SubMgmtRoutes indicates the current number of v6 subscriber management routes for this instance of the route table.
v6TotalNbrEntries [V6 Total Nbr Entries] (vRtrV6StatTotalNbrEntries)	long	vRtrV6StatTotalNbrEntries indicates the total number of active and inactive v6 neighbor discovery entries for the specified virtual router in the system.
v6TotalRsvpTunnels [V6 Total Rsvp Tunnels] (vRtrV6StatTotalRsvpTunnels)	long	The value of vRtrV6StatTotalRsvpTunnels indicates the current number of both active and inactive IPv6 RSVP tunnels.
v6VpnLeakActiveRoutes [V6 Vpn Leak Active Routes] (vRtrV6VPNLeakActiveRoutes)	long	vRtrV6VPNLeakActiveRoutes indicates the current number of v6 active VPN Leak routes for this instance of the route table.
v6VpnLeakRoutes [V6 Vpn Leak Routes] (vRtrV6VPNLeakRoutes)	long	vRtrV6VPNLeakRoutes indicates the current number of v6 VPN Leak routes for this instance of the route table.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VRtrIfDcpFpDynamicStats</p> <p>MIB entry name: tmnxCardEntry</p> <p>Entry description: Each row entry represents an IOM card slot in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. When a tmnxChassisEntry is created, a tmnxCardEntry is created for each IOM card slot in that chassis. Before a tmnxChassisEntry can be deleted, each tmnxCardEntry for that chassis must be in the proper state for removal.</p> <p>Table description (for tmnxCardTable): The tmnxCardTable has an entry for each IOM card slot in each chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.NetworkInterface • vprn.NetworkInterface 		
cardSlotNum [Card Slot Num] (tmnxCardSlotNum)	int	The unique value which identifies this IOM slot within a chassis in the system.
chassisIndex [Chassis Index] (tmnxChassisIndex)	int	The value of tmnxChassisIndex specifies a system identifier. The value of this object cannot be changed. The only supported value is '1'. Different values of TmnxPhysChassis-Index are used to identify different physical chassis (e.g. in an XRS-40 system) in tmnxPhysChassisTable.
detectionTime [Detection Time] (vRtrIfDcpFpDynDetectionTime)	long	The value of vRtrIfDcpFpDynDetectionTime indicates the detection time remaining for the dynamic policer for given protocol.
fpId [Fp Id] (tmnxFPNum)	int	The value of tmnxFPNum identifies the Forwarding Plane.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
holdDown [Hold Down] (vRtrIfDcpFpDynHoldDown)	int	The value of vRtrIfDcpFpDynHoldDown indicates the remaining hold-down period for the dynamic policer for given protocol.
id [Id] (vRtrID)	int	The unique value which identifies this virtual router in the Tmnx system. The vRtrID value for each virtual router must remain constant at least from one re-initialization of the system management processor (CPM) to the next. There will always be at least one router entry defined by the agent with vRtrID=1 which represents the transport router.
ifIndex [If Index] (vRtrIfIndex)	long	The unique value which identifies this interface of this virtual router in the Tmnx system. This field provides an identifier for virtual router interfaces similar to the ifIndex values used in the mib-2 interfaces table for physical interfaces. The vRtrIfIndex values can be reused for different virtual routers, but are unique within those entries with the same vRtrID. The vRtrIfIndex value for each virtual interface must remain constant at least from one re-initialization of the system management processor to the next.
isAllocated [Is Allocated] (vRtrIfDcpFpDynAllocated)	boolean	The value of vRtrIfDcpFpDynAllocated indicates whether dynamic policer has been allocated for this protocol.
pktsExcd [Pkts Excd] (vRtrIfDcpFpDynExcdCount)	java.math.BigInteger	The value of vRtrIfDcpFpDynExcdCount indicates number of packets exceeding the policing parameters since the dynamic policer for a given protocol was previously declared as conformant or newly instantiated.
policerState [Policer State] (vRtrIfDcpFpDynState)	int	The value of vRtrIfDcpFpDynState indicates the state of the dynamic policer for a particular protocol configured on Distributed CPU Protection Policy.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
protocolName [Protocol Name] (vRtrIfDcpFpProtocol)	int	The value of vRtrIfDcpFpProtocol specifies the protocol name to be monitored by Distributed CPU Protection Policy.
<p>VRtrIfDcpFpLocMonP1crStats MIB entry name: tmnxCardEntry</p> <p>Entry description: Each row entry represents an IOM card slot in a chassis in the system. pktsExcd [Pkts Excd] (vRtrIfDcpFpStaticExcdCount)	java. math. BigInteger	The value of vRtrIfDcpFpStaticExcdCount indicates number of packets exceeding the policing parameters since the given static-policer was previously declared as conformant or newly instantiated.
policerName [Policer Name] (vRtrIfDcpFpStaticPlcrName)	String	The value of vRtrIfDcpFpStaticPlcrName specifies the static-policer name for Distributed CPU Protection Policy.
policerState [Policer State] (vRtrIfDcpFpStaticState)	int	The value of vRtrIfDcpFpStaticState indicates the state of the static-policer configured on Distributed CPU Protection Policy.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualInterfaceIcmp6InStats</p> <p>MIB entry name: vRtrIfIcmp6Entry</p> <p>Entry description: Each row entry represents the ICMP statistics of a virtual router interface. Entries are created and deleted when entries in the vRtrIfTable are created and deleted.</p> <p>Table description (for vRtrIfIcmp6Table): The vRtrIfIcmp6Table table contains statistics of ICMPv6 messages that are received and sourced by a router interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rtr.VirtualInterfaceIcmp6Configuration</p>		
inDestinationUnreachable [In Destination Unreachable] (vRtrIfIcmp6InDestUnreachs)	long	The value of vRtrIfIcmp6InDestUnreachs indicates the number of ICMP Destination Unreachable messages received by this interface.
inEchoReplies [In Echo Replies] (vRtrIfIcmp6InEchoReplies)	long	The value of vRtrIfIcmp6InEchoReplies indicates the number of ICMP Echo Reply messages received by this interface.
inEchoRequests [In Echo Requests] (vRtrIfIcmp6InEchos)	long	The value of vRtrIfIcmp6InEchos indicates the number of ICMP Echo (request) messages received by this interface.
inErrors [In Errors] (vRtrIfIcmp6InErrors)	long	The value of vRtrIfIcmp6InErrors indicates the number of ICMP messages which this interface received but determined as having ICMP-specific errors (bad ICMP checksums, bad length , etc.).
inNeighborAdvertisements [In Neighbor Advertisements] (vRtrIfIcmp6InNbrAdvertisements)	long	The value of vRtrIfIcmp6InNbrAdvertisements indicates the number of ICMP Neighbor Advertisement messages received by this interface.
inNeighborSolicits [In Neighbor Solicits] (vRtrIfIcmp6InNbrSolicits)	long	The value of vRtrIfIcmp6InNbrSolicits indicates the number of ICMP Neighbor Solicit messages received by this interface.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inPacketTooBig [In Packet Too Big] (vRtrIflcmp6InPktTooBigs)	long	The value of vRtrIflcmp6InPktTooBigs indicates the number of ICMP Packet Too Big messages received by this interface.
inRedirects [In Redirects] (vRtrIflcmp6InRedirects)	long	The value of vRtrIflcmp6InRedirects indicates number of ICMP Redirect messages received by this interface.
inRouterAdvertisements [In Router Advertisements] (vRtrIflcmp6InRtrAdvertisements)	long	The value of vRtrIflcmp6InRtrAdvertisements indicates the number of ICMP Router Advertisement messages received by this interface.
inRouterSolicits [In Router Solicits] (vRtrIflcmp6InRtrSolicits)	long	The value of vRtrIflcmp6InRtrSolicits indicates the number of ICMP Router Solicit messages received by this interface.
inTimeExceeded [In Time Exceeded] (vRtrIflcmp6InTimeExcds)	long	The value of vRtrIflcmp6InTimeExcds indicates the number of ICMP Time Exceeded messages received by this interface.
inTotalMessages [In Total Messages] (vRtrIflcmp6InMsgs)	long	The value of vRtrIflcmp6InMsgs indicates the total number of ICMP messages received by this interface which includes all those counted by vRtrIflcmp6InErrors. Note that this interface is the interface to which the ICMP messages were addressed which may not be necessarily the input interface for the messages.

Table 666 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualInterfaceIcmp6OutStats</p> <p>MIB entry name: vRtrIflcmp6Entry</p> <p>Entry description: Each row entry represents the ICMP statistics of a virtual router interface. Entries are created and deleted when entries in the vRtrIflTable are created and deleted.</p> <p>Table description (for vRtrIflcmp6Table): The vRtrIflcmp6Table table contains statistics of ICMPv6 messages that are received and sourced by a router interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rtr.VirtualInterfaceIcmp6Configuration</p>		
outDestinationUnreachable [Out Destination Unreachable] (vRtrIflcmp6OutDestUnreachs)	long	The value of vRtrIflcmp6OutDestUnreachs indicates the number of ICMP Destination Unreachable messages sent by this interface.
outEchoReplies [Out Echo Replies] (vRtrIflcmp6OutEchoReplies)	long	The value of vRtrIflcmp6OutEchoReplies indicates the number of ICMP Echo Reply messages sent by this interface.
outEchoRequests [Out Echo Requests] (vRtrIflcmp6OutEchos)	long	The value of vRtrIflcmp6OutEchos indicates the number of ICMP Echo Request messages sent by this interface.
outErrors [Out Errors] (vRtrIflcmp6OutErrors)	long	The value of vRtrIflcmp6OutErrors indicates the number of ICMP messages which this interface did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of VRtr IPv6 to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter's value.
outGrpMembQueries [Out Grp Memb Queries] (vRtrIflcmp6OutGrpMembQueries)	long	The value of vRtrIflcmp6OutGrpMembQueries indicates the number of ICMP Group Membership Query messages sent by this interface.

DateAndTime.year = 0 is returned if no Average FLR TCAs have been generated for the specified indices since system start up.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PmSessionBaseStats</p>		
<p>MIB entry name: tmnxOamPmStsBaseEntry</p>		
<p>Entry description: tmnxOamPmStsBaseEntry contains the base statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a test is started (e.g. using tmnxOamPmCfgDelayDmmAdminStatus and tmnxOamPmCfgDelayDmmOnDmndStatus). At that time, a row for the current interval (with the index value tmnxOamPmStsIntvlNum=1) is created for each row with a matching session name in tmnxOamPmCfgMeasIntvlTable. In addition, a row is created in this table for the test's 'miRaw(1)' interval. After that, the timed creation and destruction of rows in this table is explained using the following example. Suppose the configured number of intervals to be retained is as follows (where index columns are underlined with octothorpes, and 'tmnxOamPm' is abbreviated as '_'): <u>_CfgSessName</u> <u>_CfgMeasIntvlDuration</u> <u>_CfgMeasIntvlsStored</u> ##### ##### 'mySess1' 'mi15Minutes(2)' 3 Suppose statistics collection started at t = 0 (minutes). Suppose the following rows exist in tmnxOamPmStsBaseTable at t = 59 (minutes): <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 1 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 The interval numbers are assigned as follows: 1 - the historical interval ended at t = 15 minutes 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the current interval Then, after the next 15 minute interval ends (e.g. at t = 61 minutes), the following rows will exist: <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 5 The interval numbers are assigned as follows: 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the historical interval ended at t = 60 minutes 5 - the current interval The row with interval number 1 was destroyed, because tmnxOamPmCfgMeasIntvlsStored=3 specifies that at most three historical intervals be retained. Rows are also destroyed in this table when the corresponding tmnxOamPmCfgMeasIntvlTable row is destroyed. When the index value tmnxOamPmStsMeasIntvlDuration is 'miRaw(1)', only one interval is available (i.e. tmnxOamPmStsIntvlNum = 1). When a test is running, the measurement interval data set for a test's 'miRaw(1)' measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. The change to the objects in the specified row is as follows. Object Change on Clear Operation tmnxOamPmStsBaseOperStatus No change tmnxOamPmStsBaseSuspect Set to 'true(1)' tmnxOamPmStsBaseStartTime Set to UTC time of the clear operation tmnxOamPmStsBaseElapsedTime Set to zero tmnxOamPmStsBaseTestFramesTx Set to zero tmnxOamPmStsBaseTestFramesRx Set to zero Measurement interval data sets for measurement interval durations other than 'miRaw(1)' cannot be cleared.</p>		
<p>Table description (for tmnxOamPmStsBaseTable): tmnxOamPmStsBaseTable contains the base statistics for OAM Performance Monitoring Measurement Interval Data Sets. The statistics in this table are common to all test types (e.g. DMM and SLM tests).</p>

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmStatsElapsedTime [Pm Stats Elapsed Time] (tmnxOamPmStsBaseElapsedTime)	long	The value of tmnxOamPmStsBaseElapsedTime indicates the time elapsed since data collection started for the specified measurement interval data set.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
pmStatsOperStatus [Pm Stats Oper Status] (tmnxOamPmStsBaseOperStatus)	int	The value of tmnxOamPmStsBaseOperStatus indicates the operational status of the specified measurement interval data set. If the interval is historical and the operational status is 'InProgress(1)', the interval is closing (i.e. waiting for a response for the final test request sent).
pmStatsPduRx [Pm Stats Pdu Rx] (tmnxOamPmStsBaseTestFramesRx)	long	The value of tmnxOamPmStsBaseTestFramesRx indicates the number of test frames received for the specified measurement interval data set.
pmStatsPduTx [Pm Stats Pdu Tx] (tmnxOamPmStsBaseTestFramesTx)	long	The value of tmnxOamPmStsBaseTestFramesTx indicates the number of test frames sent for the specified measurement interval data set.
pmStatsStartTime [Pm Stats Start Time] (tmnxOamPmStsBaseStartTime)	String	The value of tmnxOamPmStsBaseStartTime indicates the start time (in UTC) of the specified measurement interval data set.
pmStatsSuspect [Pm Stats Suspect] (tmnxOamPmStsBaseSuspect)	boolean	The value of tmnxOamPmStsBaseSuspect indicates whether or not the specified measurement interval data set contains suspect information.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsTestType [Pm Stats Test Type] (tmnxOamPmStsBaseTestType)	int	The value of tmnxOamPmStsBaseTestType specifies the type of test for which statistics are to be read (e.g. 'dmm(1)').
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>PrefixSrvStats</p> <p>MIB entry name: tmnxTwampSrvPrefixEntry</p> <p>Entry description: tmnxTwampSrvPrefixEntry contains the TWAMP server configuration information for the IP prefix specified by the index values. Rows in this table are created and destroyed using the tmnxTwampSrvPrefixRowStatus object.</p> <p>Table description (for tmnxTwampSrvPrefixTable): tmnxTwampSrvPrefixTable contains per-prefix TWAMP server configuration information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
srvPfxConnCount [Srv Pfx Conn Count] (tmnxTwampSrvPfxConnCount)	long	The value of tmnxTwampSrvPfxConnCount indicates, for the prefix specified by the index values, the number of control connections currently managed by the TWAMP server.
srvPfxConnsRejected [Srv Pfx Conns Rejected] (tmnxTwampSrvPfxConnsRejected)	long	The value of tmnxTwampSrvPfxConnsRejected indicates, for the prefix specified by the index values, the number of control connection requests which have been rejected by the TWAMP server. An example reject reason: the prefix's limit on the number of active connections has been reached.
srvPfxSessionCount [Srv Pfx Session Count] (tmnxTwampSrvPfxSessionCount)	long	The value of tmnxTwampSrvPfxSessionCount indicates, for the prefix specified by the index values, the number of currently in-progress TWAMP test sessions.
srvPfxTestPacketsRx [Srv Pfx Test Packets Rx] (tmnxTwampSrvPfxTestPacketsRx)	long	The value of tmnxTwampSrvPfxTestPacketsRx indicates, for the prefix specified by the index values, the number of TWAMP test packets received by the TWAMP server.
srvPfxTestPacketsTx [Srv Pfx Test Packets Tx] (tmnxTwampSrvPfxTestPacketsTx)	long	The value of tmnxTwampSrvPfxTestPacketsTx indicates, for the prefix specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
srvPfxTestSessAbort [Srv Pfx Test Sess Abort] (tmnxTwampSrvPfxTestSessAbort)	long	The value of tmnxTwampSrvPfxTestSessAbort indicates, for the prefix specified by the index values, the number of test sessions aborted by the TWAMP server.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
srvPfxTestSessCompleted [Srv Pfx Test Sess Completed] (tmnxTwampSrvPfxTestSessCompleted)	long	The value of tmnxTwampSrvPfxTestSessCompleted indicates, for the prefix specified by the index values, the number of test sessions completed by the TWAMP server.
srvPfxTestSessRejected [Srv Pfx Test Sess Rejected] (tmnxTwampSrvPfxTestSessRejected)	long	The value of tmnxTwampSrvPfxTestSessRejected indicates, for the prefix specified by the index values, the number of test sessions rejected by the TWAMP server.
<p>SrvConnsStats</p> <p>MIB entry name: tmnxTwampSrvConnStatsEntry</p> <p>Entry description: tmnxTwampSrvConnStatsEntry contains the statistics for the TWAMP control connection specified by the index values. A row is created by the system when a TWAMP control connection is established.</p> <p>Table description (for tmnxTwampSrvConnStatsTable): tmnxTwampSrvConnStatsTable contains the statistics for each active control connection managed by the TWAMP server.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
clientAddr [Client Addr] (tmnxTwampSrvConnClientAddr)	String	The value of tmnxTwampSrvConnClientAddr specifies the TWAMP client's address. This is the fifth index for tmnxTwampSrvConnStatsTable.
clientAddrType [Client Addr Type] (tmnxTwampSrvConnClientAddrType)	int	The value of tmnxTwampSrvConnClientAddrType specifies the type of tmnxTwampSrvConnClientAddr. This is the fourth index for tmnxTwampSrvConnStatsTable.
connIdleTime [Conn Idle Time] (tmnxTwampSrvConnIdleTime)	long	The value of tmnxTwampSrvConnIdleTime indicates the elapsed time, in seconds, since a TWAMP message was received on this control connection. When this value exceeds tmnxTwampSrvInactTimeout, the connection will be torn down.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
connSessionCount [Conn Session Count] (tmnxTwampSrvConnSessionCount)	long	The value of tmnxTwampSrvConnSessionCount indicates, for the connection specified by the index values, the number of currently in-progress TWAMP test sessions.
connState [Conn State] (tmnxTwampSrvConnState)	int	The value of tmnxTwampSrvConnState indicates the operational state of a control connection managed by the TWAMP server. Code points: setUp(1) - the connection is being established ready(2) - the connection is ready to accept test sessions running(3) - the connection is running a test.
connTestPacketsRx [Conn Test Packets Rx] (tmnxTwampSrvConnTestPacketsRx)	long	The value of tmnxTwampSrvConnTestPacketsRx indicates, for the connection specified by the index values, the number of TWAMP test packets received by the TWAMP server.
connTestPacketsTx [Conn Test Packets Tx] (tmnxTwampSrvConnTestPacketsTx)	long	The value of tmnxTwampSrvConnTestPacketsTx indicates, for the connection specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
connTestSessComplete [Conn Test Sess Complete] (tmnxTwampSrvConnTestSessComplete)	long	The value of tmnxTwampSrvConnTestSessComplete indicates, for the connection specified by the index values, the number of test sessions completed by the TWAMP server.
connTestSessRejected [Conn Test Sess Rejected] (tmnxTwampSrvConnTestSessRejected)	long	The value of tmnxTwampSrvConnTestSessRejected indicates, for the connection specified by the index values, the number of test sessions rejected by the TWAMP server.
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
seqNum [Seq Num] (tmnxTwampSrvConnSeqNum)	int	The value of tmnxTwampSrvConnSeqNum specifies this control connection's sequence number. This is the sixth index for tmnxTwampSrvConnStatsTable - it allows n>1 rows (i.e. n>1 connections) for one client.
<p>TWLBinStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlBinEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlBinEntry contains the TWAMP-Light frame delay per-bin statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a corresponding row is created in tmnxOamPmStsDelayTwlTable. If the tmnxOamPmStsDelayTwlTable row is created with the index value tmnxOamPmCfgBinType = 'fd(1)', then the the number of rows created in this table is tmnxOamPmCfgBinGroupFdBinCount. Similarly, 'fdr(2)' and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsDelayTwlTable row is destroyed. When a test is running, the TWAMP-Light statistics for a test's raw (i.e. 'miRaw(1)') measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session..</p> <p>Table description (for tmnxOamPmStsDelayTwlBinTable): tmnxOamPmStsDelayTwlBinTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay per-bin statistics. The frame delay per-bin statistics kept for TWAMP-Light tests are the same as the frame delay per-bin statistics specified for Ethernet DMM (Delay Measurement Message) tests in MEF-35 requirement R66.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TWLBin</p>		

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBinBwdCount [Delay Twl Bin Bwd Count] (tmnxOamPmStsDelayTwlBinBwdCount)	long	The value of tmnxOamPmStsDelayTwlBinBwdCount indicates the number of TWAMP-Light frame delay measurements in the backward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the backward direction in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinFwdCount [Delay Twl Bin Fwd Count] (tmnxOamPmStsDelayTwlBinFwdCount)	long	The value of tmnxOamPmStsDelayTwlBinFwdCount indicates the number of TWAMP-Light frame delay measurements in the forward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 9 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the forward direction in the first interval of 'twlSess1' that fit in the highest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinNum [Delay Twl Bin Num] (tmnxOamPmStsDelayTwlBinNum)	long	The value of tmnxOamPmStsDelayTwlBinNum specifies the bin number of the statistics to be read.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBintwowayCount [Delay Twl Bintwoway Count] (tmnxOamPmStsDelayTwlBin2wyCount)	long	The value of tmnxOamPmStsDelayTwlBin2wyCount indicates the number of TWAMP-Light two-way frame delay measurements that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light two-way frame delay measurements (in microseconds) in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TWLSessionStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlEntry contains the TWAMP-Light frame delay summary statistics for one OAM Performance Monitoring Measurement Interval Data Set. When a row is created in tmnxOamPmStsBaseTable with tmnxOamPmStsBaseTestType = 'twampLight(3)' (provided tmnxOamPmCfgTwampLtCollectStats is 'collectDelayStats(1)' or 'collectDelayAndLossStats(3)'), three rows are created in this table. The three rows have the following values in the tmnxOamPmCfgBinType index column: 'fd(1)', 'fdr(2)', and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsBaseTable row is destroyed. When a TWAMP-Light test is running, all the test's raw statistics can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsDelayTwlTable): tmnxOamPmStsDelayTwlTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay summary statistics. delayTwl2wyAvg [Delay Twl 2 wy Avg] (tmnxOamPmStsDelayTwl2wyAvg)	long	The value of tmnxOamPmStsDelayTwl2wyAvg indicates the average two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMax [Delay Twl 2 wy Max] (tmnxOamPmStsDelayTwl2wyMax)	long	The value of tmnxOamPmStsDelayTwl2wyMax indicates the maximum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMin [Delay Twl 2 wy Min] (tmnxOamPmStsDelayTwl2wyMin)	long	The value of tmnxOamPmStsDelayTwl2wyMin indicates the minimum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBwdAvg [Delay Twl Bwd Avg] (tmnxOamPmStsDelayTwlBwdAvg)	long	The value of tmnxOamPmStsDelayTwlBwdAvg indicates the average delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMax [Delay Twl Bwd Max] (tmnxOamPmStsDelayTwlBwdMax)	long	The value of tmnxOamPmStsDelayTwlBwdMax indicates the maximum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMin [Delay Twl Bwd Min] (tmnxOamPmStsDelayTwlBwdMin)	long	The value of tmnxOamPmStsDelayTwlBwdMin indicates the minimum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdAvg [Delay Twl Fwd Avg] (tmnxOamPmStsDelayTwlFwdAvg)	long	The value of tmnxOamPmStsDelayTwlFwdAvg indicates the average delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMax [Delay Twl Fwd Max] (tmnxOamPmStsDelayTwlFwdMax)	long	The value of tmnxOamPmStsDelayTwlFwdMax indicates the maximum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMin [Delay Twl Fwd Min] (tmnxOamPmStsDelayTwlFwdMin)	long	The value of tmnxOamPmStsDelayTwlFwdMin indicates the minimum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>TwampSrvSessionStats</p> <p>MIB entry name: tmnxTwampSrvSessStatsEntry</p> <p>Entry description: tmnxTwampSrvSessStatsEntry contains read-only information about a TWAMP test session known to the TWAMP server. A row is created when the TWAMP server accepts a session request. A row is destroyed when the session is fully torn down.</p> <p>Table description (for tmnxTwampSrvSessStatsTable): tmnxTwampSrvSessStatsTable contains read-only information about the TWAMP test sessions known to the TWAMP server.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TwampSrvSession</p>		
operStat [Oper Stat] (tmnxTwampSrvSessOperState)	int	The value of tmnxTwampSrvSessOperState indicates the operational state of the specified session. Code points: create (1) - the session has been created, but it has not yet been started active (2) - the session is active (e.g. the Session-Sender is sending TWAMP-Test PDUs) stop (3) - the session is waiting to terminate (i.e. the Session-Reflector has received a TWAMP Stop-Sessions PDU, and is waiting for a timer expiry)
reflectorAddrType [Reflector Addr Type] (tmnxTwampSrvSessReflectorAddrTyp)	int	The value of tmnxTwampSrvSessReflectorAddrTyp indicates the address type of tmnxTwampSrvSessReflectorAddress.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reflectorAddress [Reflector Address] (tmnxTwampSrvSessReflectorAddress)	String	The value of tmnxTwampSrvSessReflectorAddress indicates the address of the specified session's TWAMP Session-Reflector.
reflectorUDPPort [Reflector UDPPort] (tmnxTwampSrvSessReflectorUdpPort)	int	The value of tmnxTwampSrvSessReflectorUdpPort indicates the UDP listen port of the specified session's TWAMP Session-Reflector.
senderAddrType [Sender Addr Type] (tmnxTwampSrvSessSenderAddrType)	int	The value of tmnxTwampSrvSessSenderAddrType indicates the address type of tmnxTwampSrvSessSenderAddress.
senderAddress [Sender Address] (tmnxTwampSrvSessSenderAddress)	String	The value of tmnxTwampSrvSessSenderAddress indicates the address of the specified session's TWAMP Session-Sender.
senderUDPPort [Sender UDPPort] (tmnxTwampSrvSessSenderUdpPort)	int	The value of tmnxTwampSrvSessSenderUdpPort indicates the value present in the Source UDP port field of test packets sent by the specified session's TWAMP Session-Sender.
sessionId [Session Id] (tmnxTwampSrvSessID)	String	The value of tmnxTwampSrvSessID indicates the session identifier (SID) for the specified session.
sessionSequenceNumber [Session Sequence Number] (tmnxTwampSrvSessSeqNum)	long	The value of tmnxTwampSrvSessSeqNum specifies this TWAMP test session's sequence number. A client address, a connection sequence number, and a session sequence number identify a session. When the TWAMP server accepts the first session request from a particular client and connection, sequence number 1 is assigned to the session. The second session request accepted from the same client and connection is assigned sequence number 2, etc. The sequence number assigned after 4294967295 is 1.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
TwampSrvStats MIB entry name: tmnxTwampStatisticsScalarObjs Supports realtime plotting Supports scheduled collection Monitored class: sas.TwampSrv		
twampSrvConnectionCount [Twamp Srv Connection Count] (tmnxTwampSrvConnectionCount)	long	The value of tmnxTwampSrvConnectionCount indicates the number of control connections currently managed by the TWAMP server.
twampSrvConnectionsRejected [Twamp Srv Connections Rejected] (tmnxTwampSrvConnectionsRejected)	long	The value of tmnxTwampSrvConnectionsRejected indicates the total number of control connection requests which have been rejected by the TWAMP server. Example reject reasons: the server's limit on the number of active connections has been reached; the client's IP address does not match any of the prefixes configured on the TWAMP server.
twampSrvOperStat [Twamp Srv Oper Stat] (tmnxTwampSrvOperState)	long	The value of tmnxTwampSrvOperState indicates if the TWAMP server is operationally 'inService(2)', or 'outOfService(3)'.
twampSrvSessionCount [Twamp Srv Session Count] (tmnxTwampSrvSessionCount)	long	The value of tmnxTwampSrvSessionCount indicates the number of currently in-progress TWAMP test sessions.
twampSrvTestPacketsRx [Twamp Srv Test Packets Rx] (tmnxTwampSrvTestPacketsRx)	long	The value of tmnxTwampSrvTestPacketsRx indicates the total number of TWAMP test packets received by the TWAMP server.
twampSrvTestPacketsTx [Twamp Srv Test Packets Tx] (tmnxTwampSrvTestPacketsTx)	long	The value of tmnxTwampSrvTestPacketsTx indicates the total number of TWAMP test packets sent by the TWAMP server.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
twampSrvTestSessAborted [Twamp Srv Test Sess Aborted] (tmnxTwampSrvTestSessAborted)	long	The value of tmnxTwampSrvTestSessAborted indicates the total number of test sessions aborted by the TWAMP server.
twampSrvTestSessCompleted [Twamp Srv Test Sess Completed] (tmnxTwampSrvTestSessCompleted)	long	The value of tmnxTwampSrvTestSessCompleted indicates the total number of test sessions completed by the TWAMP server.
twampSrvTestSessRejected [Twamp Srv Test Sess Rejected] (tmnxTwampSrvTestSessRejected)	long	The value of tmnxTwampSrvTestSessRejected indicates the total number of test sessions rejected by the TWAMP server.
twampSrvUpTime [Twamp Srv Up Time] (tmnxTwampSrvUpTime)	long	The value of tmnxTwampSrvUpTime indicates the time elapsed, in seconds, since the most recent transition of tmnxTwampSrvOperState to 'inService(2)'. If tmnxTwampSrvOperState is not 'inService(2)', zero is returned.
<p>TwlLossSessionStats</p> <p>MIB entry name: tmnxOamPmStsLossTwlEntry</p> <p>Entry description: tmnxOamPmStsLossTwlEntry contains the TWAMP-Light loss test statistics for one OAM Performance Monitoring Measurement Interval Data Set. Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiAvailIndBwd [Pm Twl Avail Ind Bwd] (tmnxOamPmStsLossTwiAvailIndBwd)	long	The value of tmnxOamPmStsLossTwiAvailIndBwd indicates the number of availability indicators evaluated as Available in the backward direction for the specified measurement interval data set.
pmTwiAvailIndFwd [Pm Twl Avail Ind Fwd] (tmnxOamPmStsLossTwiAvailIndFwd)	long	The value of tmnxOamPmStsLossTwiAvailIndFwd indicates the number of availability indicators evaluated as Available in the forward direction for the specified measurement interval data set.
pmTwiAvgFlrBwd [Pm Twl Avg Flr Bwd] (tmnxOamPmStsLossTwiAvgFlrBwd)	float	The value of tmnxOamPmStsLossTwiAvgFlrBwd indicates the average Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwiAvgFlrFwd [Pm Twl Avg Flr Fwd] (tmnxOamPmStsLossTwiAvgFlrFwd)	float	The value of tmnxOamPmStsLossTwiAvgFlrFwd indicates the average Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmTwiChliBwd [Pm Twl Chli Bwd] (tmnxOamPmStsLossTwiChliBwd)	long	The value of tmnxOamPmStsLossTwiChliBwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the backward direction for the specified measurement interval data set.
pmTwiChliFwd [Pm Twl Chli Fwd] (tmnxOamPmStsLossTwiChliFwd)	long	The value of tmnxOamPmStsLossTwiChliFwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the forward direction for the specified measurement interval data set.
pmTwiHliBwd [Pm Twl Hli Bwd] (tmnxOamPmStsLossTwiHliBwd)	long	The value of tmnxOamPmStsLossTwiHliBwd indicates the number of High Loss Intervals (HLIs) in the backward direction for the specified measurement interval data set.
pmTwiHliFwd [Pm Twl Hli Fwd] (tmnxOamPmStsLossTwiHliFwd)	long	The value of tmnxOamPmStsLossTwiHliFwd indicates the number of High Loss Intervals (HLIs) in the forward direction for the specified measurement interval data set.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwlMaxFlrBwd [Pm Twl Max Flr Bwd] (tmnxOamPmStsLossTwlMaxFlrBwd)	float	The value of tmnxOamPmStsLossTwlMaxFlrBwd indicates the maximum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlMaxFlrFwd [Pm Twl Max Flr Fwd] (tmnxOamPmStsLossTwlMaxFlrFwd)	float	The value of tmnxOamPmStsLossTwlMaxFlrFwd indicates the maximum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmTwlMinFlrBwd [Pm Twl Min Flr Bwd] (tmnxOamPmStsLossTwlMinFlrBwd)	float	The value of tmnxOamPmStsLossTwlMinFlrBwd indicates the minimum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlMinFlrFwd [Pm Twl Min Flr Fwd] (tmnxOamPmStsLossTwlMinFlrFwd)	float	The value of tmnxOamPmStsLossTwlMinFlrFwd indicates the minimum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmTwlRxBwd [Pm Twl Rx Bwd] (tmnxOamPmStsLossTwlRxBwd)	long	The value of tmnxOamPmStsLossTwlRxBwd indicates the number of TWAMP-Light reply frames received in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwlRxFwd [Pm Twl Rx Fwd] (tmnxOamPmStsLossTwlRxFwd)	long	The value of tmnxOamPmStsLossTwlRxFwd indicates the number of TWAMP-Light request frames received in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwtxBwd [Pm Twt Tx Bwd] (tmnxOamPmStsLossTwtxBwd)	long	The value of tmnxOamPmStsLossTwtxBwd indicates the number of TWAMP-Light reply frames transmitted in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwtxFwd [Pm Twt Tx Fwd] (tmnxOamPmStsLossTwtxFwd)	long	The value of tmnxOamPmStsLossTwtxFwd indicates the number of TWAMP-Light request frames transmitted in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwtUnavailIndBwd [Pm Twt Unavail Ind Bwd] (tmnxOamPmStsLossTwtUnavailIndBwd)	long	The value of tmnxOamPmStsLossTwtUnavailIndBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction for the specified measurement interval data set.
pmTwtUnavailIndFwd [Pm Twt Unavail Ind Fwd] (tmnxOamPmStsLossTwtUnavailIndFwd)	long	The value of tmnxOamPmStsLossTwtUnavailIndFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction for the specified measurement interval data set.
pmTwtUndtAvlBwd [Pm Twt Undt Avl Bwd] (tmnxOamPmStsLossTwtUndtAvlBwd)	long	The value of tmnxOamPmStsLossTwtUndtAvlBwd indicates the number of availability indicators evaluated as Available in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiUndtAvlFwd [Pm Twl Undt Avl Fwd] (tmnxOamPmStsLossTwiUndtAvlFwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlFwd indicates the number of availability indicators evaluated as Available in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtUnavlBwd [Pm Twl Undt Unavl Bwd] (tmnxOamPmStsLossTwiUndtUnavlBwd)	long	The value of tmnxOamPmStsLossTwiUndtUnavlBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtUnavlFwd [Pm Twl Undt Unavl Fwd] (tmnxOamPmStsLossTwiUndtUnavlFwd)	long	The value of tmnxOamPmStsLossTwiUndtUnavlFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 667 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>TwlReflectorStats</p> <p>MIB entry name: tmnxOamPmStsTwlRflEntry</p> <p>Entry description: tmnxOamPmStsTwlRflEntry contains the statistics for the specified OAM Performance Monitoring TWAMP-Light reflector. SROS creates a row in this table when a corresponding row is created in tmnxOamPmCfgTwlRflTable. SROS destroys a row in this table when a corresponding row is destroyed in tmnxOamPmCfgTwlRflTable. The encoding of the index is explained in the DESCRIPTION clause for tmnxOamPmCfgTwlRflEntry.</p> <p>Table description (for tmnxOamPmStsTwlRflTable): tmnxOamPmStsTwlRflTable contains the statistics for OAM Performance Monitoring TWAMP-Light reflectors.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TwlReflector</p>		
framesRx [Frames Rx] (tmnxOamPmStsTwlRflFramesRx)	long	The value of tmnxOamPmStsTwlRflFramesRx indicates the number of TWAMP-Test frames received by the specified reflector.
framesTx [Frames Tx] (tmnxOamPmStsTwlRflFramesTx)	long	The value of tmnxOamPmStsTwlRflFramesTx indicates the number of TWAMP-Test frames transmitted by the specified reflector.
upTime [Up Time] (tmnxOamPmStsTwlRflUpTime)	long	The value of tmnxOamPmStsTwlRflUpTime indicates the time elapsed since the most recent transition of the reflector's administrative status to 'enabled(1)'. Zero is returned if the reflector's administrative status is 'disabled(2)'.

Table 668 service statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EgressAccessQDepthInfo</p> <p>MIB entry name: sapEgrQosQueueDepthInfoEntry</p> <p>Entry description: The value of sapEgrQosQueueDepthInfoEntry represents queue-depth monitoring information for SAP egress override queue for which the value of sapEgrQosQMonitorDepth is set to 'true (1)'. Table description (for sapEgrQosQueueDepthInfoTable): The value of sapEgrQosQueueDepthInfoTable has an entry for each SAP egress override queue for which the value of sapEgrQosQMonitorDepth is set to 'true (1)'. Supports realtime plotting Supports scheduled collection Monitored class: service.EgressAccessPolicyQueueOverride</p>		
depthAvgElpsdTime [Depth Avg Elpsd Time] (sapEgrQosQueueDepthAvgElpsdTme)	String	The value of sapEgrQosQueueDepthAvgElpsdTme represents the average elapsed time since the start of queue-depth monitoring or the last monitoring clear.
depthAvgPollPrctInterval [Depth Avg Poll Prct Interval] (sapEgrQosQueueDepthAvgPollInt)	long	The value of sapEgrQosQueueDepthAvgPollInt represents the weighted average polling interval for the elapsed time.
depthPollPrct1 [Depth Poll Prct 1] (sapEgrQosQueueDepthPollPrct1)	double	The value of sapEgrQosQueueDepthPollPrct1 represents the percentage of polls in occupancy range of 0 to 10 percent for the queue depths seen during the polling elapsed time.
depthPollPrct10 [Depth Poll Prct 10] (sapEgrQosQueueDepthPollPrct10)	double	The value of sapEgrQosQueueDepthPollPrct10 represents the percentage of polls in occupancy range of 91 to 100 percent for the queue depths seen during the polling elapsed time.
depthPollPrct2 [Depth Poll Prct 2] (sapEgrQosQueueDepthPollPrct2)	double	The value of sapEgrQosQueueDepthPollPrct2 represents the percentage of polls in occupancy range of 11 to 20 percent for the queue depths seen during the polling elapsed time.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
depthPollPrct3 [Depth Poll Prct 3] (sapEgrQosQueueDepthPollPrct3)	double	The value of sapEgrQosQueueDepthPollPrct3 represents the percentage of polls in occupancy range of 21 to 30 percent for the queue depths seen during the polling elapsed time.
depthPollPrct4 [Depth Poll Prct 4] (sapEgrQosQueueDepthPollPrct4)	double	The value of sapEgrQosQueueDepthPollPrct4 represents the percentage of polls in occupancy range of 31 to 40 percent for the queue depths seen during the polling elapsed time.
depthPollPrct5 [Depth Poll Prct 5] (sapEgrQosQueueDepthPollPrct5)	double	The value of sapEgrQosQueueDepthPollPrct5 represents the percentage of polls in occupancy range of 41 to 50 percent for the queue depths seen during the polling elapsed time.
depthPollPrct6 [Depth Poll Prct 6] (sapEgrQosQueueDepthPollPrct6)	double	The value of sapEgrQosQueueDepthPollPrct6 represents the percentage of polls in occupancy range of 51 to 60 percent for the queue depths seen during the polling elapsed time.
depthPollPrct7 [Depth Poll Prct 7] (sapEgrQosQueueDepthPollPrct7)	double	The value of sapEgrQosQueueDepthPollPrct7 represents the percentage of polls in occupancy range of 61 to 70 percent for the queue depths seen during the polling elapsed time.
depthPollPrct8 [Depth Poll Prct 8] (sapEgrQosQueueDepthPollPrct8)	double	The value of sapEgrQosQueueDepthPollPrct8 represents the percentage of polls in occupancy range of 71 to 80 percent for the queue depths seen during the polling elapsed time.
depthPollPrct9 [Depth Poll Prct 9] (sapEgrQosQueueDepthPollPrct9)	double	The value of sapEgrQosQueueDepthPollPrct9 represents the percentage of polls in occupancy range of 81 to 90 percent for the queue depths seen during the polling elapsed time.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>IngressAccessQDepthInfo</p> <p>MIB entry name: sapIngQosQueueDepthInfoEntry</p> <p>Entry description: The value of sapIngQosQueueDepthInfoEntry represents queue-depth monitoring information for SAP ingress override queue for which the value of sapIngQosQMonitorDepth is set to 'true (1)'.</p> <p>Table description (for sapIngQosQueueDepthInfoTable): The value of sapIngQosQueueDepthInfoTable has an entry for each SAP ingress override queue for which the value of sapIngQosQMonitorDepth is set to 'true (1)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: service.IngressAccessPolicyQueueOverride</p>		
depthAvgElpsdTime [Depth Avg Elpsd Time] (sapIngQosQueueDepthAvgElpsdTme)	String	The value of sapIngQosQueueDepthAvgElpsdTme represents the average elapsed time since the start of queue-depth monitoring or the last monitoring clear.
depthAvgPollPrctInterval [Depth Avg Poll Prct Interval] (sapIngQosQueueDepthAvgPollInt)	long	The value of sapIngQosQueueDepthAvgPollInt represents the weighted average polling interval for the elapsed time.
depthPollPrct1 [Depth Poll Prct 1] (sapIngQosQueueDepthPollPrct1)	double	The value of sapIngQosQueueDepthPollPrct1 represents the percentage of polls in occupancy range of 0 to 10 percent for the queue depths seen during the polling elapsed time.
depthPollPrct10 [Depth Poll Prct 10] (sapIngQosQueueDepthPollPrct10)	double	The value of sapIngQosQueueDepthPollPrct10 represents the percentage of polls in occupancy range of 91 to 100 percent for the queue depths seen during the polling elapsed time.
depthPollPrct2 [Depth Poll Prct 2] (sapIngQosQueueDepthPollPrct2)	double	The value of sapIngQosQueueDepthPollPrct2 represents the percentage of polls in occupancy range of 11 to 20 percent for the queue depths seen during the polling elapsed time.
depthPollPrct3 [Depth Poll Prct 3] (sapIngQosQueueDepthPollPrct3)	double	The value of sapIngQosQueueDepthPollPrct3 represents the percentage of polls in occupancy range of 21 to 30 percent for the queue depths seen during the polling elapsed time.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
depthPollPrct4 [Depth Poll Prct 4] (sapIngQosQueueDepthPollPrct4)	double	The value of sapIngQosQueueDepthPollPrct4 represents the percentage of polls in occupancy range of 31 to 40 percent for the queue depths seen during the polling elapsed time.
depthPollPrct5 [Depth Poll Prct 5] (sapIngQosQueueDepthPollPrct5)	double	The value of sapIngQosQueueDepthPollPrct5 represents the percentage of polls in occupancy range of 41 to 50 percent for the queue depths seen during the polling elapsed time.
depthPollPrct6 [Depth Poll Prct 6] (sapIngQosQueueDepthPollPrct6)	double	The value of sapIngQosQueueDepthPollPrct6 represents the percentage of polls in occupancy range of 51 to 60 percent for the queue depths seen during the polling elapsed time.
depthPollPrct7 [Depth Poll Prct 7] (sapIngQosQueueDepthPollPrct7)	double	The value of sapIngQosQueueDepthPollPrct7 represents the percentage of polls in occupancy range of 61 to 70 percent for the queue depths seen during the polling elapsed time.
depthPollPrct8 [Depth Poll Prct 8] (sapIngQosQueueDepthPollPrct8)	double	The value of sapIngQosQueueDepthPollPrct8 represents the percentage of polls in occupancy range of 71 to 80 percent for the queue depths seen during the polling elapsed time.
depthPollPrct9 [Depth Poll Prct 9] (sapIngQosQueueDepthPollPrct9)	double	The value of sapIngQosQueueDepthPollPrct9 represents the percentage of polls in occupancy range of 81 to 90 percent for the queue depths seen during the polling elapsed time.
<p>L3AccessInterfaceURPFStats MIB entry name: vRtrIfStatsEntry Entry description: Each row entry represents the statistics per virtual router interface. Entries are created and deleted when entries in the vRtrIfEntry are created and deleted. Table description (for vRtrIfStatsTable): The vRtrIfStatsTable table contains statistics per virtual router interface. Supports realtime plotting Supports scheduled collection Monitored class: service.L3AccessInterface</p>		

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
uRPFCheckFailPkts [URPFCheck Fail Pkts] (vRtrIfuRPFCheckFailPkts)	java. math. BigInteger	The value of vRtrIfuRPFCheckFailPkts indicates the number of packets that fail uRPF check on this interface.
uRPFCheckFailPktsHigh32 [URPFCheck Fail Pkts High 32] (vRtrIfuRPFCheckFailPktsHigh32)	long	The value of vRtrIfuRPFCheckFailPktsHigh32 indicates the high 32 bits of the value of vRtrIfuRPFCheckFailPkts.
uRPFCheckFailPktsLow32 [URPFCheck Fail Pkts Low 32] (vRtrIfuRPFCheckFailPktsLow32)	long	The value of vRtrIfuRPFCheckFailPktsLow32 indicates the lower 32 bits of the value of vRtrIfuRPFCheckFailPkts.
uRPFCheckFailV6Bytes [URPFCheck Fail V6 Bytes] (vRtrIfV6uRPFCheckFailBytes)	java. math. BigInteger	The value of vRtrIfV6uRPFCheckFailBytes indicates the number of bytes in IPv6 packets that fail uRPF check on this interface.
uRPFCheckFailV6BytesHigh32 [URPFCheck Fail V6 Bytes High 32] (vRtrIfV6uRPFCheckFailBytesHigh32)	long	The value of vRtrIfV6uRPFCheckFailBytesHigh32 indicates the high 32 bits word of the value of vRtrIfV6uRPFCheckFailBytes.
uRPFCheckFailV6BytesLow32 [URPFCheck Fail V6 Bytes Low 32] (vRtrIfV6uRPFCheckFailBytesLow32)	long	The value of vRtrIfV6uRPFCheckFailBytesLow32 indicates the lower 32 bits word of the value of vRtrIfV6uRPFCheckFailBytes.
uRPFCheckFailV6Pkts [URPFCheck Fail V6 Pkts] (vRtrIfV6uRPFCheckFailPkts)	java. math. BigInteger	The value of vRtrIfV6uRPFCheckFailPkts indicates the number of IPv6 packets that fail uRPF check on this interface.
uRPFCheckFailV6PktsHigh32 [URPFCheck Fail V6 Pkts High 32] (vRtrIfV6uRPFCheckFailPktsHigh32)	long	The value of vRtrIfV6uRPFCheckFailPktsHigh32 indicates the high 32 bits word of the value of vRtrIfV6uRPFCheckFailPkts.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
uRPFCheckFailV6PktsLow32 [URPFCheck Fail V6 Pkts Low 32] (vRtrIfV6uRPFCheckFailPktsLow32)	long	The value of vRtrIfV6uRPFCheckFailPktsLow32 indicates the lower 32 bits word of the value of vRtrIfV6uRPFCheckFailPkts.
vRtrIfuRPFCheckFailBytes [VRtr Ifu RPFCheck Fail Bytes] (vRtrIfuRPFCheckFailBytes)	java. math. BigInteger	The value of vRtrIfuRPFCheckFailBytes indicates the number of bytes in the packets that fail uRPF check.
vRtrIfuRPFCheckFailBytesHigh32 [VRtr Ifu RPFCheck Fail Bytes High 32] (vRtrIfuRPFCheckFailBytesHigh32)	long	The value of vRtrIfuRPFCheckFailBytesHigh32 indicates the high 32 bits of the value of vRtrIfuRPFCheckFailBytes.
vRtrIfuRPFCheckFailBytesLow32 [VRtr Ifu RPFCheck Fail Bytes Low 32] (vRtrIfuRPFCheckFailBytesLow32)	long	The value of vRtrIfuRPFCheckFailBytesLow32 indicates the lower 32 bits of the value of vRtrIfuRPFCheckFailBytes.
<p>SapBaseStats MIB entry name: sapBaseStatsEntry Entry description: Basic statistics about a specific SAP. Table description (for sapBaseStatsTable): A table that contains basic SAP statistics. In the descriptions below 'Pchip' refers to the Nokia SROS series Packet Processing chip, while 'Qchip' refers to the Nokia SROS series QoS Queueing Engine chip. Supports realtime plotting Supports scheduled collection Monitored classes:</p> <ul style="list-style-type: none"> • service.IPsecInterface • service.L2AccessInterface • service.L3AccessInterface • service.ServiceAccessPoint 		
authenticationPacketsDiscarded [Authentication Packets Discarded] (sapBaseStatsAuthenticationPktsDiscarded)	long	The number of DHCP packets discarded as result of authentication.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authenticationPacketsSuccessful [Authentication Packets Successful] (sapBaseStatsAuthenticationPktsSuccess)	long	The number of DHCP packets successfully authenticated.
customerId [Customer Id] (sapBaseStatsCustId)	long	The Customer ID for the associated service.
egressQChipDroppedInProfOctets [Egress QChip Dropped In Prof Octets] (sapBaseStatsEgressQchipDroppedInProfOctets)	java. math. BigInteger	The number of in-profile octets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
egressQChipDroppedInProfPackets [Egress QChip Dropped In Prof Packets] (sapBaseStatsEgressQchipDroppedInProfPackets)	java. math. BigInteger	The number of in-profile packets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
egressQChipDroppedOutProfOctets [Egress QChip Dropped Out Prof Octets] (sapBaseStatsEgressQchipDroppedOutProfOctets)	java. math. BigInteger	The number of out-of-profile packets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
egressQChipDroppedOutProfPackets [Egress QChip Dropped Out Prof Packets] (sapBaseStatsEgressQchipDroppedOutProfPackets)	java. math. BigInteger	The number of out-of-profile packets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
egressQChipForwardedInProfOctets [Egress QChip Forwarded In Prof Octets] (sapBaseStatsEgressQchipForwardedInProfOctets)	java. math. BigInteger	The number of in-profile octets (rate below CIR) forwarded by the egress Qchip.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egressQChipForwardedInProfPackets [Egress QChip Forwarded In Prof Packets] (sapBaseStatsEgressQchipFor- wardedInProfPackets)	java. math. BigInte- ger	The number of in-profile packets (rate below CIR) forwarded by the egress Qchip.
egressQChipForwardedOutProfOctets [Egress QChip Forwarded Out Prof Octets] (sapBaseStatsEgressQchipFor- wardedOutProfOctets)	java. math. BigInte- ger	The number of out-of-profile octets (rate above CIR) forwarded by the egress Qchip.
egressQChipForwardedOutProfPackets [Egress QChip Forwarded Out Prof Packets] (sapBaseStatsEgressQchipFor- wardedOutProfPackets)	java. math. BigInte- ger	The number of out-of-profile packets (rate above CIR) forwarded by the egress Qchip.
ingressPChipDroppedOctets [Ingress PChip Dropped Octets] (sapBaseStatsIngressPchipDroppedOctets)	java. math. BigInte- ger	The number of octets dropped by the ingress Pchip due to: SAP state, ingress MAC, IP or IPv6 filter, same segment discard, bad checksum, etc.
ingressPChipDroppedPackets [Ingress PChip Dropped Packets] (sapBaseStatsIngressPchip- DroppedPackets)	java. math. BigInte- ger	The number of packets dropped by the ingress Pchip due to: SAP state, ingress MAC, IP or IPv6 filter, same segment discard, bad checksum, etc.
ingressPChipOfferedHiPrioOctets [Ingress PChip Offered Hi Prio Octets] (sapBaseStatsIngressPchipOf- feredHiPrioOctets)	java. math. BigInte- ger	The number of high priority octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
ingressPChipOfferedHiPrioPackets [Ingress PChip Offered Hi Prio Packets] (sapBaseStatsIngressPchipOf- feredHiPrioPackets)	java. math. BigInte- ger	The number of high priority packets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressPChipOfferedLoPrioOctets [Ingress PChip Offered Lo Prio Octets] (sapBaseStatsIngressPchipOf- ferredLoPrioOctets)	java. math. BigInte- ger	The number of low priority octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
ingressPChipOfferedLoPrioPackets [Ingress PChip Offered Lo Prio Packets] (sapBaseStatsIngressPchipOf- ferredLoPrioPackets)	java. math. BigInte- ger	The number of low priority packets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
ingressPChipOfferedUncoloredOctets [Ingress PChip Offered Uncolored Octets] (sapBaseStatsIngressPchipOf- ferredUncoloredOctets)	java. math. BigInte- ger	The number of uncolored octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
ingressPChipOfferedUncoloredPackets [Ingress PChip Offered Uncolored Packets] (sapBaseStatsIngressPchipOf- ferredUncoloredPackets)	java. math. BigInte- ger	The number of uncolored packets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
ingressQChipDroppedHiPrioOctets [Ingress QChip Dropped Hi Prio Octets] (sapBaseStatsIngressQchip- DroppedHiPrioOctets)	java. math. BigInte- ger	The number of high priority octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
ingressQChipDroppedHiPrioPackets [Ingress QChip Dropped Hi Prio Packets] (sapBaseStatsIngressQchip- DroppedHiPrioPackets)	java. math. BigInte- ger	The number of high priority packets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
ingressQChipDroppedLoPrioOctets [Ingress QChip Dropped Lo Prio Octets] (sapBaseStatsIngressQchip- DroppedLoPrioOctets)	java. math. BigInte- ger	The number of low priority octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressQChipDroppedLoPrioPackets [Ingress QChip Dropped Lo Prio Packets] (sapBaseStatsIngressQchipDroppedLoPrioPackets)	java. math. BigInteger	The number of low priority packets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
ingressQChipForwardedInProfOctets [Ingress QChip Forwarded In Prof Octets] (sapBaseStatsIngressQchipForwardedInProfOctets)	java. math. BigInteger	The number of in-profile octets (rate below CIR) forwarded by the ingress Qchip.
ingressQChipForwardedInProfPackets [Ingress QChip Forwarded In Prof Packets] (sapBaseStatsIngressQchipForwardedInProfPackets)	java. math. BigInteger	The number of in-profile packets (rate below CIR) forwarded by the ingress Qchip.
ingressQChipForwardedOutProfOctets [Ingress QChip Forwarded Out Prof Octets] (sapBaseStatsIngressQchipForwardedOutProfOctets)	java. math. BigInteger	The number of out-of-profile octets (rate above CIR) forwarded by the ingress Qchip.
ingressQChipForwardedOutProfPackets [Ingress QChip Forwarded Out Prof Packets] (sapBaseStatsIngressQchipForwardedOutProfPackets)	java. math. BigInteger	The number of out-of-profile packets (rate above CIR) forwarded by the ingress Qchip.
ingressRcvdValidOcts [Ingress Rcvd Valid Octs] (sapBaseStatsIngPchipRcvdValidOct)	java. math. BigInteger	The value of sapBaseStatsIngPchipRcvdValidOct indicates number of received valid octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
ingressRcvdValidPkts [Ingress Rcvd Valid Pkts] (sapBaseStatsIngPchipRcvdValidPkt)	java. math. BigInteger	The value of sapBaseStatsIngPchipRcvdValidPkt indicates number of received valid packets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SapDcpFpDynamicStats</p> <p>MIB entry name: tmnxCardEntry</p> <p>Entry description: Each row entry represents an IOM card slot in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. When a tmnxChassisEntry is created, a tmnxCardEntry is created for each IOM card slot in that chassis. Before a tmnxChassisEntry can be deleted, each tmnxCardEntry for that chassis must be in the proper state for removal.</p> <p>Table description (for tmnxCardTable): The tmnxCardTable has an entry for each IOM card slot in each chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ies.L3AccessInterface • ies.ServiceAccessPoint • ipipe.L2AccessInterface • mvpls.IL2AccessInterface • mvpls.L2AccessInterface • vll.L2AccessInterface • vpls.IL2AccessInterface • vpls.L2AccessInterface • vprn.L3AccessInterface • vprn.ServiceAccessPoint 		
cardSlotNum [Card Slot Num] (tmnxCardSlotNum)	int	The unique value which identifies this IOM slot within a chassis in the system.
chassisIndex [Chassis Index] (tmnxChassisIndex)	int	The value of tmnxChassisIndex specifies a system identifier. The value of this object cannot be changed. The only supported value is '1'. Different values of TmnxPhysChassis-Index are used to identify different physical chassis (e.g. in an XRS-40 system) in tmnxPhysChassisTable.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
detectionTime [Detection Time] (sapDcpFpDynDetectionTime)	long	The value of sapDcpFpDynDetectionTime indicates the detection time remaining for the dynamic policer for a given protocol.
encapValue [Encap Value] (sapEncapValue)	long	The value of the label used to identify this SAP on the access port specified by sapPortId.
fpld [Fp Id] (tmnxFPNum)	int	The value of tmnxFPNum identifies the Forwarding Plane.
holdDown [Hold Down] (sapDcpFpDynHoldDown)	int	The value of sapDcpFpDynHoldDown indicates the remaining hold-down period for the dynamic policer for a given protocol.
isAllocated [Is Allocated] (sapDcpFpDynAllocated)	boolean	The value of sapDcpFpDynAllocated indicates whether dynamic policer has been allocated for this protocol.
pktsExcd [Pkts Excd] (sapDcpFpDynExcdCount)	java.math. BigInteger	The value of sapDcpFpDynExcdCount indicates number of packets exceeding the policing parameters since the dynamic policer for the given protocol was previously declared as conformant or newly instantiated.
policerState [Policer State] (sapDcpFpDynState)	int	The value of sapDcpFpDynState indicates the state of the dynamic policer for a particular protocol configured on Distributed CPU Protection Policy.
portId [Port Id] (sapPortId)	long	The ID of the access port where this SAP is defined.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
protocolName [Protocol Name] (sapDcpFpProtocol)	int	The value of sapDcpFpProtocol specifies the protocol name to be monitored by Distributed CPU Protection Policy.
serviceId [Service Id] (svclId)	long	The value of the object svclId specifies the Service identifier. This value should be unique within the service domain.
<p>SapDcpFpLocMonPlcrStats</p> <p>MIB entry name: tmnxCardEntry</p> <p>Entry description: Each row entry represents an IOM card slot in a chassis in the system. Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cardSlotNum [Card Slot Num] (tmnxCardSlotNum)	int	The unique value which identifies this IOM slot within a chassis in the system.
chassisIndex [Chassis Index] (tmnxChassisIndex)	int	The value of tmnxChassisIndex specifies a system identifier. The value of this object cannot be changed. The only supported value is '1'. Different values of TmnxPhysChassis-Index are used to identify different physical chassis (e.g. in an XRS-40 system) in tmnxPhysChassisTable.
detectionTime [Detection Time] (sapDcpFpStaticDetectionTime)	long	The value of sapDcpFpStaticDetectionTime indicates the detection time remaining for a given static-policer.
encapValue [Encap Value] (sapEncapValue)	long	The value of the label used to identify this SAP on the access port specified by sapPortId.
fpld [Fp Id] (tmnxFPNum)	int	The value of tmnxFPNum identifies the Forwarding Plane.
holdDown [Hold Down] (sapDcpFpStaticHoldDown)	int	The value of sapDcpFpStaticHoldDown indicates the remaining hold-down period for a given static-policer.
pktsExcd [Pkts Excd] (sapDcpFpStaticExcdCount)	java. math. BigInte- ger	The value of sapDcpFpStaticExcdCount indicates number of packets exceeding the policing parameters since the given static-policer was previously declared as conformant or newly instantiated.
policerName [Policer Name] (sapDcpFpStaticPlcrName)	String	The value of sapDcpFpStaticPlcrName specifies the static-policer name for Distributed CPU Protection Policy.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>policerState [Policer State] (sapDcpFpStaticState)</p>	int	The value of sapDcpFpStaticState indicates the state of the static-policer configured on Distributed CPU Protection Policy.
<p>portId [Port Id] (sapPortId)</p>	long	The ID of the access port where this SAP is defined.
<p>serviceId [Service Id] (svclId)</p>	long	The value of the object svclId specifies the Service identifier. This value should be unique within the service domain.
<p>SapEgrEGBaseStats MIB entry name: sapEgrEGBaseStEntry Entry description: Egress statistics about a specific Encap Group of a SAP. Table description (for sapEgrEGBaseStTable): The sapEgrEGBaseStTable contains egress Encap Group basic SAP statistics at the Group level. This statistics table is valid for Encap Groups created without enabling sapEgrEncapGroupQosPerMember. In the descriptions below 'Qchip' refers to the Nokia SROS series QoS Queueing Engine chip. Supports realtime plotting Does not support scheduled collection Monitored class: service.EncapGroup</p>		
<p>custId [Cust Id] (sapEgrEGBaseStCustId)</p>	long	The value of sapEgrEGBaseStCustId indicates the Customer ID for the associated service.
<p>dpdInPfOcts [Dpd In Pf Octs] (sapEgrEGBaseStQcDpdInPfOcts)</p>	java. math. BigInteger	The value of sapEgrEGBaseStQcDpdInPfOcts indicates the number of in-profile octets dropped by the egress Qchip due to: SAP state, egress MAC, IP or IPv6 filter, same segment discard, bad checksum, etc.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dpdInPfOctsH [Dpd In Pf Octs H] (sapEgrEGBaseStQcDpdInPfOctsH)	long	The value of sapEgrEGBaseStQcDpdInPfOctsH indicates the higher 32 bits of the value of sapEgrEGBaseStQcDpdInPfOcts.
dpdInPfOctsL [Dpd In Pf Octs L] (sapEgrEGBaseStQcDpdInPfOctsL)	long	The value of sapEgrEGBaseStQcDpdInPfOctsL indicates the lower 32 bits of the value of sapEgrEGBaseStQcDpdInPfOcts.
dpdInPfPkts [Dpd In Pf Pkts] (sapEgrEGBaseStQcDpdInPfPkts)	java. math. BigInteger	The value of sapEgrEGBaseStQcDpdInPfPkts indicates the number of in-profile packets dropped by the egress Qchip due to: SAP state, egress MAC, IP or IPv6 filter, same segment discard, bad checksum, etc.
dpdInPfPktsH [Dpd In Pf Pkts H] (sapEgrEGBaseStQcDpdInPfPktsH)	long	The value of sapEgrEGBaseStQcDpdInPfPktsH indicates the higher 32 bits of the value of sapEgrEGBaseStQcDpdInPfPkts.
dpdInPfPktsL [Dpd In Pf Pkts L] (sapEgrEGBaseStQcDpdInPfPktsL)	long	The value of sapEgrEGBaseStQcDpdInPfPktsL indicates the lower 32 bits of the value of sapEgrEGBaseStQcDpdInPfPkts.
dpdOutPfOcts [Dpd Out Pf Octs] (sapEgrEGBaseStQcDpdOutPfOcts)	java. math. BigInteger	The value of sapEgrEGBaseStQcDpdOutPfOcts indicates the number of out-of-profile octets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
dpdOutPfOctsH [Dpd Out Pf Octs H] (sapEgrEGBaseStQcDpdOutPfOctsH)	long	The value of sapEgrEGBaseStQcDpdOutPfOctsH indicates the higher 32 bits of the value of sapEgrEGBaseStQcDpdOutPfOcts.
dpdOutPfOctsL [Dpd Out Pf Octs L] (sapEgrEGBaseStQcDpdOutPfOctsL)	long	The value of sapEgrEGBaseStQcDpdOutPfOctsL indicates the lower 32 bits of the value of sapEgrEGBaseStQcDpdOutPfOcts.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dpdOutPfPkts [Dpd Out Pf Pkts] (sapEgrEGBaseStQcDpdOutPfPkts)	java. math. BigInteger	The value of sapEgrEGBaseStQcDpdOutPfPkts indicates the number of out-of-profile packets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
dpdOutPfPktsH [Dpd Out Pf Pkts H] (sapEgrEGBaseStQcDpdOutPfPktsH)	long	The value of sapEgrEGBaseStQcDpdOutPfPktsH indicates the higher 32 bits of the value of sapEgrEGBaseStQcDpdOutPfPkts.
dpdOutPfPktsL [Dpd Out Pf Pkts L] (sapEgrEGBaseStQcDpdOutPfPktsL)	long	The value of sapEgrEGBaseStQcDpdOutPfPktsL indicates the lower 32 bits of the value of sapEgrEGBaseStQcDpdOutPfPkts.
fwdInPfOcts [Fwd In Pf Octs] (sapEgrEGBaseStQcFwdInPfOcts)	java. math. BigInteger	The value of sapEgrEGBaseStQcFwdInPfOcts indicates the number of in-profile octets (rate below CIR) forwarded by the egress Qchip.
fwdInPfOctsH [Fwd In Pf Octs H] (sapEgrEGBaseStQcFwdInPfOctsH)	long	The value of sapEgrEGBaseStQcFwdInPfOctsH indicates the higher 32 bits of the value of sapEgrEGBaseStQcFwdInPfOcts.
fwdInPfOctsL [Fwd In Pf Octs L] (sapEgrEGBaseStQcFwdInPfOctsL)	long	The value of sapEgrEGBaseStQcFwdInPfOctsL indicates the lower 32 bits of the value of sapEgrEGBaseStQcFwdInPfOcts.
fwdInPfPkts [Fwd In Pf Pkts] (sapEgrEGBaseStQcFwdInPfPkts)	java. math. BigInteger	The value of sapEgrEGBaseStQcFwdInPfPkts indicates the number of in-profile packets (rate below CIR) forwarded by the egress Qchip.
fwdInPfPktsH [Fwd In Pf Pkts H] (sapEgrEGBaseStQcFwdInPfPktsH)	long	The value of sapEgrEGBaseStQcFwdInPfPktsH indicates the higher 32 bits of the value of sapEgrEGBaseStQcFwdInPfPkts.

Table 668 service statistics (continued)

This statistics table is valid for Encap Groups created by enabling sapEgrEncapGroupQosPerMember. Supports realtime plotting Does not support scheduled collection Monitored class: service.EncapGroup</p>		

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
custId [Cust Id] (sapEgrEGMbrQueueCustId)	long	The value of sapEgrEGMbrQueueCustId indicates the Customer ID for the associated service.
dpdInPfOcts [Dpd In Pf Octs] (sapEgrEGMbrQueueStDpdInPfOcts)	java. math. BigInteger	The value of sapEgrEGMbrQueueStDpdInPfOcts indicates the number of in-profile octets discarded by the egress queue due to: MBS exceeded, buffer pool limit exceeded, etc.
dpdInPfOctsH [Dpd In Pf Octs H] (sapEgrEGMbrQueueStDpdInPfOctsH)	long	The value of sapEgrEGMbrQueueStDpdInPfOctsH indicates the higher 32 bits of the value of sapEgrEGMbrQueueStDpdInPfOcts.
dpdInPfOctsL [Dpd In Pf Octs L] (sapEgrEGMbrQueueStDpdInPfOctsL)	long	The value of sapEgrEGMbrQueueStDpdInPfOctsL indicates the lower 32 bits of the value of sapEgrEGMbrQueueStDpdInPfOcts.
dpdInPfPkts [Dpd In Pf Pkts] (sapEgrEGMbrQueueStDpdInPfPkts)	java. math. BigInteger	The value of sapEgrEGMbrQueueStDpdInPfPkts indicates the number of in-profile packets discarded by the egress queue due to: MBS exceeded, buffer pool limit exceeded, etc.
dpdInPfPktsH [Dpd In Pf Pkts H] (sapEgrEGMbrQueueStDpdInPfPktsH)	long	The value of sapEgrEGMbrQueueStDpdInPfPktsH indicates the higher 32 bits of the value of sapEgrEGMbrQueueStDpdInPfPkts.
dpdInPfPktsL [Dpd In Pf Pkts L] (sapEgrEGMbrQueueStDpdInPfPktsL)	long	The value of sapEgrEGMbrQueueStDpdInPfPktsL indicates the lower 32 bits of the value of sapEgrEGMbrQueueStDpdInPfPkts.
dpdOutPfOcts [Dpd Out Pf Octs] (sapEgrEGMbrQueueStDpdOutPfOcts)	java. math. BigInteger	The value of sapEgrEGMbrQueueStDpdOutPfOcts indicates the number of out-of-profile octets discarded by the egress queue due to: MBS exceeded, buffer pool limit exceeded, etc.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dpdOutPfOctsH [Dpd Out Pf Octs H] (sapEgrEGMbrQueueStDpdOutPfOctsH)	long	The value of sapEgrEGMbrQueueStDpdOutPfOctsH indicates the higher 32 bits of the value of sapEgrEGMbrQueueStDpdOutPfOcts.
dpdOutPfOctsL [Dpd Out Pf Octs L] (sapEgrEGMbrQueueStDpdOutPfOctsL)	long	The value of sapEgrEGMbrQueueStDpdOutPfOctsL indicates the lower 32 bits of the value of sapEgrEGMbrQueueStDpdOutPfOcts.
dpdOutPfPkts [Dpd Out Pf Pkts] (sapEgrEGMbrQueueStDpdOutPfPkts)	java. math. BigInteger	The value of sapEgrEGMbrQueueStDpdOutPfPkts indicates the number of out-of-profile packets discarded by the egress queue due to: MBS exceeded, buffer pool limit exceeded, etc.
dpdOutPfPktsH [Dpd Out Pf Pkts H] (sapEgrEGMbrQueueStDpdOutPfPktsH)	long	The value of sapEgrEGMbrQueueStDpdOutPfPktsH indicates the higher 32 bits of the value of sapEgrEGMbrQueueStDpdOutPfPkts.
dpdOutPfPktsL [Dpd Out Pf Pkts L] (sapEgrEGMbrQueueStDpdOutPfPktsL)	long	The value of sapEgrEGMbrQueueStDpdOutPfPktsL indicates the lower 32 bits of the value of sapEgrEGMbrQueueStDpdOutPfPkts.
fwdInPfOcts [Fwd In Pf Octs] (sapEgrEGMbrQueueStFwdInPfOcts)	java. math. BigInteger	The value of sapEgrEGMbrQueueStFwdInPfOcts indicates the number of in-profile octets (rate below CIR) forwarded by the egress queue.
fwdInPfOctsH [Fwd In Pf Octs H] (sapEgrEGMbrQueueStFwdInPfOctsH)	long	The value of sapEgrEGMbrQueueStFwdInPfOctsH indicates the higher 32 bits of the value of sapEgrEGMbrQueueStFwdInPfOcts.
fwdInPfOctsL [Fwd In Pf Octs L] (sapEgrEGMbrQueueStFwdInPfOctsL)	long	The value of sapEgrEGMbrQueueStFwdInPfOctsL indicates the lower 32 bits of the value of sapEgrEGMbrQueueStFwdInPfOcts.

This statistics table is valid for Encap Groups created without enabling sapEgrEncapGroupQosPerMember. This table is used when the encap group's SAP is a CCAG or LAG in 'link' mode or an APS.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: service.EncapGroup</p>		

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
custId [Cust Id] (sapPortIdEgrEGSchedCustId)	long	The value of sapPortIdEgrEGSchedCustId indicates the Customer ID for the associated service.
fwdOcts [Fwd Octs] (sapPortIdEgrEGSchedFwdOcts)	java. math. BigInteger	The value sapPortIdEgrEGSchedFwdOcts indicates the number of octets forwarded by the egress port scheduler of this SAP.
fwdOctsH [Fwd Octs H] (sapPortIdEgrEGSchedFwdOctsH)	long	The value sapPortIdEgrEGSchedFwdOctsH indicates the higher 32 bits of the value of sapPortIdEgrEGSchedFwdOcts.
fwdOctsL [Fwd Octs L] (sapPortIdEgrEGSchedFwdOctsL)	long	The value of sapPortIdEgrEGSchedFwdOctsL indicates the lower 32 bits of the value of sapPortIdEgrEGSchedFwdOcts.
fwdPkts [Fwd Pkts] (sapPortIdEgrEGSchedFwdPkts)	java. math. BigInteger	The value of sapPortIdEgrEGSchedFwdPkts indicates the number of packets forwarded by the egress port scheduler of this SAP.
fwdPktsH [Fwd Pkts H] (sapPortIdEgrEGSchedFwdPktsH)	long	The value sapPortIdEgrEGSchedFwdPktsH indicates the higher 32 bits of the value of sapPortIdEgrEGSchedFwdPkts.
fwdPktsL [Fwd Pkts L] (sapPortIdEgrEGSchedFwdPktsL)	long	The value of sapPortIdEgrEGSchedFwdPktsL indicates the lower 32 bits of the value of sapPortIdEgrEGSchedFwdPkts.
portId [Port Id] (sapPortId)	long	The ID of the access port where this SAP is defined.

Table 668 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
schedName [Sched Name] (sapPortIdEgrEGSchedStName)	String	The sapPortIdEgrEGSchedStName specifies the name of the egress encapsulation group port scheduler of this SAP.

Table 669 sflow statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SflowReceiverStats</p> <p>MIB entry name: tmnxSflowRcvrStatsEntry</p> <p>Entry description: The tmnxSflowRcvrStatsEntry consists of statistics of sFlow information for the given receiver. For every entry in the SFLOW-MIB::sFlowRcvrTable, there is one entry for each tmnxSflowRcvrType in the tmnxSflowRcvrStatsTable.</p> <p>Table description (for tmnxSflowRcvrStatsTable): The tmnxSflowRcvrStatsTable contains statistics objects for the sFlow receivers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sflow.Receiver</p>		
sflowRcvrLastPacketSent [Sflow Rcvr Last Packet Sent] (tmnxSflowRcvrLastPacketSent)	long	The value of tmnxSflowRcvrLastPacketSent indicates the time, since system startup, when the last packet was sent from the given receiver. Zero indicates that no packets have been sent yet.
sflowRcvrPacketErrors [Sflow Rcvr Packet Errors] (tmnxSflowRcvrPacketErrors)	long	The value of tmnxSflowRcvrPacketErrors indicates the number of packet errors that have been detected by the given receiver.
sflowRcvrPacketsSent [Sflow Rcvr Packets Sent] (tmnxSflowRcvrPacketsSent)	long	The value of tmnxSflowRcvrPacketsSent indicates the number of packets sent from the given receiver.
sflowRcvrType [Sflow Rcvr Type] (tmnxSflowRcvrType)	int	The value of tmnxSflowRcvrType specifies the receiver type.

Table 670 sitesec statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CpmFilterQueueStats</p> <p>MIB entry name: tCpmFilterQueueStatsEntry</p> <p>Entry description: Each row entry represents the statistics related to the tCpmFilterQueueEntry indexed by the same tCpmFilterQueueId. Entries are created when tCpmFilterQueueEntry rows are created.</p> <p>Table description (for tCpmFilterQueueStatsTable): The tCpmFilterQueueStatsTable has a stats entry for each CPM filter queue configured on this system. This table is not supported on SR-1 and ESS-1, where the value of TIMETRA-CHASSIS-MIB::tmnxChassisType is '5'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sitesec.CpmFilterQueue</p>		
droppedInOctets [Dropped In Octets] (tCpmFilterQInProfileDropOctets)	java. math. BigInteger	The value of tCpmFilterQInProfileDropOctets indicates the number of octets complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedInPackets [Dropped In Packets] (tCpmFilterQInProfileDropPkts)	java. math. BigInteger	The value of tCpmFilterQInProfileDropPkts indicates the number of packets complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedOutOctets [Dropped Out Octets] (tCpmFilterQOutProfileDropOctets)	java. math. BigInteger	The value of tCpmFilterQOutProfileDropOctets indicates the number of octets not complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedOutPackets [Dropped Out Packets] (tCpmFilterQOutProfileDropPkts)	java. math. BigInteger	The value of tCpmFilterQOutProfileDropPkts indicates the number of packets not complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
forwardedInOctets [Forwarded In Octets] (tCpmFilterQInProfileFwdOctets)	java. math. BigInteger	The value of tCpmFilterQInProfileFwdOctets indicates the number of octets complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.

Table 670 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardedInPackets [Forwarded In Packets] (tCpmFilterQInProfileFwdPkts)	java. math. BigInteger	The value of tCpmFilterQInProfileFwdPkts indicates the number of packets complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.
forwardedOutOctets [Forwarded Out Octets] (tCpmFilterQOutProfileFwdOctets)	java. math. BigInteger	The value of tCpmFilterQOutProfileFwdOctets indicates the number of octets not complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.
forwardedOutPackets [Forwarded Out Packets] (tCpmFilterQOutProfileFwdPkts)	java. math. BigInteger	The value of tCpmFilterQOutProfileFwdPkts indicates the number of packets not complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.

forwardedPackets [Forwarded Packets] (tCpmlpFilterStatsForwardedPkts)	java. math. BigInteger	The value of tCpmlpFilterStatsForwardedPkts indicates the number of packets forwarded due to the tCpmlpFilterEntry with the same index.
<p>CpmMacFilterStats</p> <p>MIB entry name: tCpmMacFilterStatsEntry</p> <p>Entry description: Each row entry represents the statistics related to the tCpmMacFilterEntry indexed by the same tCpmMacFilterEntryId. Entries are created when tCpmMacFilterEntry rows are created.</p> <p>Table description (for tCpmMacFilterStatsTable): The tCpmMacFilterStatsTable has a stats entry of the CPM Mac filter configured on this system. This table is not supported on SR-1 and ESS-1, where the value of TIMETRA-CHASSIS-MIB::tmnxChassisType is '5'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sitesec.CpmMacFilterEntry</p>		

Table 670 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
droppedPackets [Dropped Packets] (tCpmMacFilterStatsDroppedPkts)	java. math. BigInteger	The value of tCpmMacFilterStatsDroppedPkts indicates the number of packets dropped due to the tCpmMacFilterEntry with the same index.
forwardedPackets [Forwarded Packets] (tCpmMacFilterStatsForwardedPkts)	java. math. BigInteger	The value of tCpmMacFilterStatsForwardedPkts indicates the number of packets forwarded due to the tCpmMacFilterEntry with the same index.
<p>MafEntryStats MIB entry name: tmnxIPMafMatchEntry Entry description: Each row entry contains information about a management access filter entry associated with a specific Management Access Filter (MAF). The filter criteria are applied in order according to the value of tmnxIPMafMatchIndex. The match algorithm is exited upon the first match found and then the action specified is executed. For this reason, entries must be sequenced from most to least explicit. An entry where tmnxIPMafMatchAction has a value of 'none' is not active. Rows can only be created for tmnxGenMafType's: - ipv4 (1), and. - ipv6 (2). For mac Maf filters a dedicated table is provided (tmnxMacMafMatchTable). Table description (for tmnxIPMafMatchTable): This table replaces the tmnxMafMatchTable. It allows to define both IPv4 and IPv6 MAF IP entries. The tmnxIPMafMatchTable contains ipvx filter match criteria associated with Management Access Filters (MAFs) configured on the system. Supports realtime plotting Supports scheduled collection Monitored class: sitesec.MafEntry</p>		
matchCount [Match Count] (tmnxIPMafMatchCount)	java. math. BigInteger	The value of tmnxIPMafMatchCount indicates the number of times a management packet has matched this filter entry.
<p>PKICertMgrStats MIB entry name: tmnxCertMgrStatsGroup Supports realtime plotting Supports scheduled collection Monitored class: sitesec.SiteSystemSecurityPublicKey</p>		

Table 670 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
certMgrAuthFailed [Cert Mgr Auth Failed] (tmnxCertMgrAuthFailed)	long	The tmnxCertMgrAuthFailed indicates the number of authentication failures using the certificates.
certMgrAuthPassed [Cert Mgr Auth Passed] (tmnxCertMgrAuthPassed)	long	The tmnxCertMgrAuthPassed indicates the number of authentication checks passed using the certificates.
certMgrTotalAuth [Cert Mgr Total Auth] (tmnxCertMgrTotalAuth)	long	The tmnxCertMgrTotalAuth indicates the number of authentication attempts using the certificates.
RadiusNotifyStats MIB entry name: tmnxSubRadNotifyStatsObjects Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
accepted [Accepted] (tmnxSubRadNotifyStatsAccepted)	long	The value of tmnxSubRadNotifyStatsAccepted indicates the number of notify Change-of-Authorization requests accepted.
badAuthentication [Bad Authentication] (tmnxSubRadNotifyStatsBadAuth)	long	The value of tmnxSubRadNotifyStatsBadAuth indicates the number of notify Change-of-Authorization requests rejected because of authentication failure.
invalidMsg [Invalid Msg] (tmnxSubRadNotifyStatsInvalidMsg)	long	The value of tmnxSubRadNotifyStatsInvalidMsg indicates the number of notify Change-of-Authorization requests rejected because of decode errors.
noNotification [No Notification] (tmnxSubRadNotifyStatsNoNotify)	long	The value of tmnxSubRadNotifyStatsNoNotify indicates the number of notify Change-of-Authorization requests rejected due to lack of notification process.

Table 670 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
noResource [No Resource] (tmnxSubRadNotifyStatsNoResource)	long	The value of tmnxSubRadNotifyStatsNoResource indicates the number of notify Change-of-Authorization requests rejected due to lack of resources.
received [Received] (tmnxSubRadNotifyStatsReceived)	long	The value of tmnxSubRadNotifyStatsReceived indicates the number of notify Change-of-Authorization requests received.
rejected [Rejected] (tmnxSubRadNotifyStatsRejected)	long	The value of tmnxSubRadNotifyStatsRejected indicates the number of notify Change-of-Authorization requests rejected.
unknownHost [Unknown Host] (tmnxSubRadNotifyStatsUnknownHost)	long	The value of tmnxSubRadNotifyStatsUnknownHost indicates the number of notify Change-of-Authorization requests which do not have NAS-Port-ID or Framed-IP-Address set or have mismatched subscriber-id.

Table 671 srrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InstanceStats</p> <p>MIB entry name: tmnxSrrpStatsEntry</p> <p>Entry description: Each row entry represents the statistics for a particular SRRP instance tied to a service group interface. Entries are created/deleted in conjunction with entries in the tmnxSrrpOperTable</p> <p>Table description (for tmnxSrrpStatsTable): The tmnxSrrpStatsTable has an entry for each Subscriber Router Redundancy Protocol instance configured on this system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: srrp.Instance</p>		
advertiseIntervalDiscards [Advertise Interval Discards] (tmnxSrrpStatsAdvIntDiscards)	long	The value for tmnxSrrpStatsAdvIntDiscards indicates the total number of SRRP advertisement packets discarded because the advertisement interval in the received packet was different than the one configured for the local virtual router.
advertiseIntervalErrors [Advertise Interval Errors] (tmnxSrrpStatsAdvIntErrors)	long	The value for tmnxSrrpStatsAdvIntErrors indicates the total number of SRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
advertiseRcvd [Advertise Rcvd] (tmnxSrrpStatsAdvRcvd)	long	The value for tmnxSrrpStatsAdvRcvd indicates the total number of SRRP advertisements received by this virtual router.
advertiseSent [Advertise Sent] (tmnxSrrpStatsAdvSent)	long	The value for tmnxSrrpStatsAdvSent indicates the total number of SRRP advertisements sent by this virtual router.
becomeBackupRouting [Become Backup Routing] (tmnxSrrpStatsBecomeBackupRouting)	long	The value for tmnxSrrpStatsBecomeBackupRouting indicates the total number of times that the virtual router's state has transitioned to backup routing state.

Table 671 srrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
becomeBackupShunt [Become Backup Shunt] (tmnxSrrpStatsBecomeBackupShunt)	long	The value for tmnxSrrpStatsBecomeBackupShunt indicates the total number of times that the virtual router's state has transitioned to backup shunt.
becomeMaster [Become Master] (tmnxSrrpStatsBecomeMaster)	long	The value for tmnxSrrpStatsBecomeMaster indicates the total number of times that the virtual router's state has transitioned to master.
becomeNonMaster [Become Non Master] (tmnxSrrpStatsBecomeNonMaster)	long	The value for tmnxSrrpStatsBecomeNonMaster indicates the total number times that the virtual router's state has transitioned from master to a non-master state.
masterChanges [Master Changes] (tmnxSrrpStatsMasterChanges)	long	The value for tmnxSrrpStatsMasterChanges indicates the total number of times the virtual router has seen the master virtual router change.
preemptEvents [Preempt Events] (tmnxSrrpStatsPreemptEvents)	long	The value for tmnxSrrpStatsPreemptEvents indicates the total number of times the virtual router has preempted another non-owner master with lower priority.
preemptedEvents [Preempted Events] (tmnxSrrpStatsPreemptedEvents)	long	The value for tmnxSrrpStatsPreemptedEvents indicates the total number of times the virtual router has been preempted by another non-owner master with higher priority.
priorityZeroPktsRcvd [Priority Zero Pkts Rcvd] (tmnxSrrpStatsPriZeroPktsSent)	long	The value for tmnxSrrpStatsPriZeroPktsSent indicates the total number of SRRP packets sent by the virtual router with a priority of '0'.
priorityZeroPktsSent [Priority Zero Pkts Sent] (tmnxSrrpStatsPriZeroPktsRcvd)	long	The value for tmnxSrrpStatsPriZeroPktsRcvd indicates the total number of SRRP packets received by the virtual router with a priority of '0'.

Table 672 svq statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CustEgrQosPortIdArbiterStats</p> <p>MIB entry name: custEgrQosPortIdArbitStatsEntry</p> <p>Entry description: Each row entry represents the egress statistics for a customer multi-service-site egress arbiter.</p> <p>Table description (for custEgrQosPortIdArbitStatsTable): The custEgrQosPortIdArbitStatsTable contains egress QoS arbiter statistics for the customer multi service site.</p> <p>Does not support realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: svq.AggregationScheduler</p>		
arbiterName [Arbiter Name] (custEgrQosPortIdArbitName)	String	The value of custEgrQosPortIdArbitName is used as an index of the egress QoS arbiter of this customer multi service site.
custEgrQosPortIdArbitFwdOcts [Cust Egr Qos Port Id Arbit Fwd Octs] (custEgrQosPortIdArbitFwdOcts)	java. math. BigInteger	The value of custEgrQosPortIdArbitFwdOcts indicates the number of forwarded octets, as determined by the customer multi service site egress arbiter policy.
custEgrQosPortIdArbitFwdPkts [Cust Egr Qos Port Id Arbit Fwd Pkts] (custEgrQosPortIdArbitFwdPkts)	java. math. BigInteger	The value of custEgrQosPortIdArbitFwdPkts indicates the number of forwarded packets, as determined by the customer multi service site egress arbiter policy.
<p>CustIngQosPortIdArbiterStats</p> <p>MIB entry name: custIngQosPortIdArbitStatsEntry</p> <p>Entry description: Each entry represents the ingress statistics about a specific customer multi service site ingress arbiter.</p> <p>Table description (for custIngQosPortIdArbitStatsTable): The custIngQosPortIdArbitStatsTable contains ingress QoS arbiter statistics for the customer multi service site.</p> <p>Does not support realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: svq.AggregationScheduler</p>		

Table 672 svq statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
arbiterName [Arbiter Name] (custIngQosPortIdArbitName)	String	The value of custIngQosPortIdArbitName is used as an index of the ingress QoS arbiter of this customer multi service site.
custIngQosPortIdArbitFwdOcts [Cust Ing Qos Port Id Arbit Fwd Octs] (custIngQosPortIdArbitFwdOcts)	java. math. BigInteger	The value of custIngQosPortIdArbitFwdOcts indicates the number of forwarded octets, as determined by the customer multi service site ingress arbiter policy.
custIngQosPortIdArbitFwdPkts [Cust Ing Qos Port Id Arbit Fwd Pkts] (custIngQosPortIdArbitFwdPkts)	java. math. BigInteger	The value of custIngQosPortIdArbitFwdPkts indicates the number of forwarded packets, as determined by the customer multi service site ingress arbiter policy.
<p>CustMultiSvcSiteEgrQosArbiterStats MIB entry name: custMssEgrQosArbitStatsEntry Entry description: Each entry represents the egress statistics about a specific customer multi service site egress arbiter. Table description (for custMssEgrQosArbitStatsTable): The custMssEgrQosArbitStatsTable contains egress QoS arbiter statistics for the customer multi service site, organized by arbiter. Supports realtime plotting Supports scheduled collection Monitored class: svq.AggregationScheduler</p>		
arbiterName [Arbiter Name] (custMssEgrQosArbitName)	String	The value of custMssEgrQosArbitName is used as an index of the egress QoS arbiter of this customer multi service site.
custMssEgrQosArbitStatsFwdOcts [Cust Mss Egr Qos Arbit Stats Fwd Octs] (custMssEgrQosArbitStatsFwdOcts)	java. math. BigInteger	The value of custMssEgrQosArbitStatsFwdOcts indicates the number of forwarded octets, as determined by the customer multi service site egress arbiter policy.
custMssEgrQosArbitStatsFwdPkts [Cust Mss Egr Qos Arbit Stats Fwd Pkts] (custMssEgrQosArbitStatsFwdPkts)	java. math. BigInteger	The value of custMssEgrQosArbitStatsFwdPkts indicates the number of forwarded packets, as determined by the customer multi service site egress arbiter policy.

arbiterName [Arbiter Name] (custMssIngQosArbitName)	String	The value of custMssIngQosArbitName is used as an index of the ingress QoS arbiter of this customer multi service site.
custMssIngQosArbitStatsFwdOcts [Cust Mss Ing Qos Arbit Stats Fwd Octs] (custMssIngQosArbitStatsFwdOcts)	java. math. BigInteger	The value of custMssIngQosArbitStatsFwdOcts indicates the number of forwarded octets, as determined by the customer multi service site ingress arbiter policy.
custMssIngQosArbitStatsFwdPkts [Cust Mss Ing Qos Arbit Stats Fwd Pkts] (custMssIngQosArbitStatsFwdPkts)	java. math. BigInteger	The value of custMssIngQosArbitStatsFwdPkts indicates the number of forwarded packets, as determined by the customer multi service site ingress arbiter policy.

Table 673 svt statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
GRE Tunnel Stats MIB entry name: tmnxIpTunnelStatsEntry Entry description: The tmnxIpTunnelStatsEntry contains statistics information for a single IP Tunnel. Table description (for tmnxIpTunnelStatsTable): The tmnxIpTunnelStatsTable contains statistics entries per IP tunnel. Supports realtime plotting Supports scheduled collection Monitored class: svt.GRETunnel		
bytesRx [Bytes Rx] (tmnxIpTunnelBytesRx)	java. math. BigInteger	The value of tmnxIpTunnelBytesRx indicates the number of bytes this IP Tunnel has received.
bytesRxHi [Bytes Rx Hi] (tmnxIpTunnelBytesRxHi)	long	The value of tmnxIpTunnelBytesRxHi indicates higher 32 bits of the value of tmnxIpTunnelBytesRx object.
bytesRxLo [Bytes Rx Lo] (tmnxIpTunnelBytesRxLo)	long	The value of tmnxIpTunnelBytesRxLo indicates lower 32 bits of the value of tmnxIpTunnelBytesRx object.
bytesTx [Bytes Tx] (tmnxIpTunnelBytesTx)	java. math. BigInteger	The value of tmnxIpTunnelBytesTx indicates the number of bytes this IP Tunnel has sent.
bytesTxHi [Bytes Tx Hi] (tmnxIpTunnelBytesTxHi)	long	The value of tmnxIpTunnelBytesTxHi indicates higher 32 bits of the value of tmnxIpTunnelBytesTx object.
bytesTxLo [Bytes Tx Lo] (tmnxIpTunnelBytesTxLo)	long	The value of tmnxIpTunnelBytesTxLo indicates lower 32 bits of the value of tmnxIpTunnelBytesTx object.

Table 673 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
invalidChksumRx [Invalid Chksum Rx] (tmnxIpTunnelInvalidChksumRx)	java. math. BigInteger	The value of tmnxIpTunnelInvalidChksumRx indicates the number of packets this IP Tunnel received with invalid checksum and were dropped.
invalidChksumRxHi [Invalid Chksum Rx Hi] (tmnxIpTunnelInvalidChksumRxHi)	long	The value of tmnxIpTunnelInvalidChksumRxHi indicates higher 32 bits of the value of tmnxIpTunnelInvalidChksumRx object.
invalidChksumRxLo [Invalid Chksum Rx Lo] (tmnxIpTunnelInvalidChksumRxLo)	long	The value of tmnxIpTunnelInvalidChksumRxLo indicates lower 32 bits of the value of tmnxIpTunnelInvalidChksumRx object.
keyIgnoredRx [Key Ignored Rx] (tmnxIpTunnelKeyIgnoredRx)	java. math. BigInteger	The value of tmnxIpTunnelKeyIgnoredRx indicates the number of packets this IP Tunnel received and processed ignoring key field.
keyIgnoredRxHi [Key Ignored Rx Hi] (tmnxIpTunnelKeyIgnoredRxHi)	long	The value of tmnxIpTunnelKeyIgnoredRxHi indicates higher 32 bits of the value of tmnxIpTunnelKeyIgnoredRx object.
keyIgnoredRxLo [Key Ignored Rx Lo] (tmnxIpTunnelKeyIgnoredRxLo)	long	The value of tmnxIpTunnelKeyIgnoredRxLo indicates lower 32 bits of the value of tmnxIpTunnelKeyIgnoredRx object.
loopsRx [Loops Rx] (tmnxIpTunnelLoopsRx)	java. math. BigInteger	The value of tmnxIpTunnelLoopsRx indicates the number of packets this IP Tunnel received with payload with destination address which could result in a loop and were dropped.
loopsRxHi [Loops Rx Hi] (tmnxIpTunnelLoopsRxHi)	long	The value of tmnxIpTunnelLoopsRxHi indicates higher 32 bits of the value of tmnxIpTunnelLoopsRx object.

Table 673 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
loopsRxLo [Loops Rx Lo] (tmnxIpTunnelLoopsRxLo)	long	The value of tmnxIpTunnelLoopsRxLo indicates lower 32 bits of the value of tmnxIpTunnelLoopsRx object.
pktsRx [Pkts Rx] (tmnxIpTunnelPktsRx)	java. math. BigInteger	The value of tmnxIpTunnelPktsRx indicates the number of packets this IP Tunnel has received.
pktsRxHi [Pkts Rx Hi] (tmnxIpTunnelPktsRxHi)	long	The value of tmnxIpTunnelPktsRxHi indicates higher 32 bits of the value of tmnxIpTunnelPktsRx object.
pktsRxLo [Pkts Rx Lo] (tmnxIpTunnelPktsRxLo)	long	The value of tmnxIpTunnelPktsRxLo indicates lower 32 bits of the value of tmnxIpTunnelPktsRx object.
pktsTx [Pkts Tx] (tmnxIpTunnelPktsTx)	java. math. BigInteger	The value of tmnxIpTunnelPktsTx indicates the number of packets this IP Tunnel has sent.
pktsTxHi [Pkts Tx Hi] (tmnxIpTunnelPktsTxHi)	long	The value of tmnxIpTunnelPktsTxHi indicates higher 32 bits of the value of tmnxIpTunnelPktsTx object.
pktsTxLo [Pkts Tx Lo] (tmnxIpTunnelPktsTxLo)	long	The value of tmnxIpTunnelPktsTxLo indicates lower 32 bits of the value of tmnxIpTunnelPktsTx object.
rxErrors [Rx Errors] (tmnxIpTunnelRxErrors)	long	The value of tmnxIpTunnelRxErrors indicates the number of packet receive errors.

Table 673 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
seqIgnoredRx [Seq Ignored Rx] (tmnxIpTunnelSeqIgnoredRx)	java. math. BigInteger	The value of tmnxIpTunnelSeqIgnoredRx indicates the number of packets this IP Tunnel and processed ignoring sequence field.
seqIgnoredRxHi [Seq Ignored Rx Hi] (tmnxIpTunnelSeqIgnoredRxHi)	long	The value of tmnxIpTunnelSeqIgnoredRxHi indicates higher 32 bits of the value of tmnxIpTunnelSeqIgnoredRx object.
seqIgnoredRxLo [Seq Ignored Rx Lo] (tmnxIpTunnelSeqIgnoredRxLo)	long	The value of tmnxIpTunnelSeqIgnoredRxLo indicates lower 32 bits of the value of tmnxIpTunnelSeqIgnoredRx object.
tooBigTx [Too Big Tx] (tmnxIpTunnelTooBigTx)	java. math. BigInteger	The value of tmnxIpTunnelTooBigTx indicates the number of packets this IP Tunnel received which were too big to transmit.
tooBigTxHi [Too Big Tx Hi] (tmnxIpTunnelTooBigTxHi)	long	The value of tmnxIpTunnelTooBigTxHi indicates higher 32 bits of the value of tmnxIpTunnelTooBigTx object.
tooBigTxLo [Too Big Tx Lo] (tmnxIpTunnelTooBigTxLo)	long	The value of tmnxIpTunnelTooBigTxLo indicates lower 32 bits of the value of tmnxIpTunnelTooBigTx object.
txErrors [Tx Errors] (tmnxIpTunnelTxErrors)	long	The value of tmnxIpTunnelTxErrors indicates the number of packet transmit errors.
versUnsupRx [Vers Unsup Rx] (tmnxIpTunnelVersUnsupRx)	java. math. BigInteger	The value of tmnxIpTunnelVersUnsupRx indicates the number of packets this IP Tunnel received with unsupported IP version and were dropped.

Table 673 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
versUnsupRxHi [Vers Unsup Rx Hi] (tmnxIpTunnelVersUnsupRxHi)	long	The value of tmnxIpTunnelVersUnsupRxHi indicates higher 32 bits of the value of tmnxIpTunnelVersUnsupRx object.
versUnsupRxLo [Vers Unsup Rx Lo] (tmnxIpTunnelVersUnsupRxLo)	long	The value of tmnxIpTunnelVersUnsupRxLo indicates lower 32 bits of the value of tmnxIpTunnelVersUnsupRx object.

Table 673 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sdpBndIgmPsnpgFwdGrpSpecQueries [Sdp Bnd IgmP Snpg Fwd Grp Spec Queries] (sdpBndIgmPsnpgFwdGrpSpecQueries)	long	The value of the object sdpBndIgmPsnpgFwdGrpSpecQueries indicates the number of IGMP Group-Specific Queries forwarded on this SDP Bind.
sdpBndIgmPsnpgFwdSrcSpecQueries [Sdp Bnd IgmP Snpg Fwd Src Spec Queries] (sdpBndIgmPsnpgFwdSrcSpecQueries)	long	The value of the object sdpBndIgmPsnpgFwdSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries forwarded on this SDP Bind.
sdpBndIgmPsnpgFwdUnknownType [Sdp Bnd IgmP Snpg Fwd Unknown Type] (sdpBndIgmPsnpgFwdUnknownType)	long	The value of the object sdpBndIgmPsnpgFwdUnknownType indicates the number of IGMP unknown type packets forwarded on this SDP Bind.
sdpBndIgmPsnpgFwdV1Reports [Sdp Bnd IgmP Snpg Fwd V1 Reports] (sdpBndIgmPsnpgFwdV1Reports)	long	The value of the object sdpBndIgmPsnpgFwdV1Reports indicates the number of IGMPv1 Reports forwarded on this SDP Bind.
sdpBndIgmPsnpgFwdV2Leaves [Sdp Bnd IgmP Snpg Fwd V2 Leaves] (sdpBndIgmPsnpgFwdV2Leaves)	long	The value of the object sdpBndIgmPsnpgFwdV2Leaves indicates the number of IGMPv2 Leaves forwarded on this SDP Bind.
sdpBndIgmPsnpgFwdV2Reports [Sdp Bnd IgmP Snpg Fwd V2 Reports] (sdpBndIgmPsnpgFwdV2Reports)	long	The value of the object sdpBndIgmPsnpgFwdV2Reports indicates the number of IGMPv2 Reports forwarded on this SDP Bind.
sdpBndIgmPsnpgFwdV3Reports [Sdp Bnd IgmP Snpg Fwd V3 Reports] (sdpBndIgmPsnpgFwdV3Reports)	long	The value of the object sdpBndIgmPsnpgFwdV3Reports indicates the number of IGMPv3 Reports forwarded on this SDP Bind.
sdpBndIgmPsnpgRxGenQueries [Sdp Bnd IgmP Snpg Rx Gen Queries] (sdpBndIgmPsnpgRxGenQueries)	long	The value of the object sdpBndIgmPsnpgRxGenQueries indicates the number of IGMP General Queries received on this SDP Bind.

Table 673 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sdpBndIgmPsnpgRxGrpSpecQueries [Sdp Bnd IgmP Snpg Rx Grp Spec Queries] (sdpBndIgmPsnpgRxGrpSpecQueries)	long	The value of the object sdpBndIgmPsnpgRxGrpSpecQueries indicates the number of IGMP Group-Specific Queries received on this SDP Bind.
sdpBndIgmPsnpgRxSrcSpecQueries [Sdp Bnd IgmP Snpg Rx Src Spec Queries] (sdpBndIgmPsnpgRxSrcSpecQueries)	long	The value of the object sdpBndIgmPsnpgRxSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries received on this SDP Bind.
sdpBndIgmPsnpgRxUnknownType [Sdp Bnd IgmP Snpg Rx Unknown Type] (sdpBndIgmPsnpgRxUnknownType)	long	The value of the object sdpBndIgmPsnpgRxUnknownType indicates the number of IGMP unknown type packets received on this SDP Bind.
sdpBndIgmPsnpgRxV1Reports [Sdp Bnd IgmP Snpg Rx V1 Reports] (sdpBndIgmPsnpgRxV1Reports)	long	The value of the object sdpBndIgmPsnpgRxV1Reports indicates the number of IGMPv1 Reports received on this SDP Bind.
sdpBndIgmPsnpgRxV2Leaves [Sdp Bnd IgmP Snpg Rx V2 Leaves] (sdpBndIgmPsnpgRxV2Leaves)	long	The value of the object sdpBndIgmPsnpgRxV2Leaves indicates the number of IGMPv2 Leaves received on this SDP Bind.
sdpBndIgmPsnpgRxV2Reports [Sdp Bnd IgmP Snpg Rx V2 Reports] (sdpBndIgmPsnpgRxV2Reports)	long	The value of the object sdpBndIgmPsnpgRxV2Reports indicates the number of IGMPv2 Reports received on this SDP Bind.
sdpBndIgmPsnpgRxV3Reports [Sdp Bnd IgmP Snpg Rx V3 Reports] (sdpBndIgmPsnpgRxV3Reports)	long	The value of the object sdpBndIgmPsnpgRxV3Reports indicates the number of IGMPv3 Reports received on this SDP Bind.
sdpBndIgmPsnpgTxGenQueries [Sdp Bnd IgmP Snpg Tx Gen Queries] (sdpBndIgmPsnpgTxGenQueries)	long	The value of the object sdpBndIgmPsnpgTxGenQueries indicates the number of IGMP General Queries transmitted on this SDP Bind.
sdpBndIgmPsnpgTxGrpSpecQueries [Sdp Bnd IgmP Snpg Tx Grp Spec Queries] (sdpBndIgmPsnpgTxGrpSpecQueries)	long	The value of the object sdpBndIgmPsnpgTxGrpSpecQueries indicates the number of IGMP Group-Specific Queries transmitted on this SDP Bind.

Table 673 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sdpBndIgmPsnpgTxSrcSpecQueries [Sdp Bnd IgmP Snpg Tx Src Spec Queries] (sdpBndIgmPsnpgTxSrcSpecQueries)	long	The value of the object sdpBndIgmPsnpgTxSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries transmitted on this SDP Bind.
sdpBndIgmPsnpgTxV1Reports [Sdp Bnd IgmP Snpg Tx V1 Reports] (sdpBndIgmPsnpgTxV1Reports)	long	The value of the object sdpBndIgmPsnpgTxV1Reports indicates the number of IGMPv1 Reports transmitted on this SDP Bind.
sdpBndIgmPsnpgTxV2Leaves [Sdp Bnd IgmP Snpg Tx V2 Leaves] (sdpBndIgmPsnpgTxV2Leaves)	long	The value of the object sdpBndIgmPsnpgTxV2Leaves indicates the number of IGMPv2 Leaves transmitted on this SDP Bind.
sdpBndIgmPsnpgTxV2Reports [Sdp Bnd IgmP Snpg Tx V2 Reports] (sdpBndIgmPsnpgTxV2Reports)	long	The value of the object sdpBndIgmPsnpgTxV2Reports indicates the number of IGMPv2 Reports transmitted on this SDP Bind.
sdpBndIgmPsnpgTxV3Reports [Sdp Bnd IgmP Snpg Tx V3 Reports] (sdpBndIgmPsnpgTxV3Reports)	long	The value of the object sdpBndIgmPsnpgTxV3Reports indicates the number of IGMPv3 Reports transmitted on this SDP Bind.
TunnelKeepAliveStats MIB entry name: sdpInfoEntry Entry description: Information about a specific SDP. Table description (for sdpInfoTable): A table that contains SDP information. Supports realtime plotting Supports scheduled collection Monitored class: svt.Tunnel		
lateHelloResponses [Late Hello Responses] (sdpKeepAliveNumLateHelloR- esponseMessages)	long	The number of SDP Echo Response messages received after the corresponding Request timeout timer expired.

Table 673 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedHelloMessages [Received Hello Messages] (sdpKeepAliveNumHelloResponseMessages)	long	The number of SDP Echo Response messages received since the keep-alive was administratively enabled or the counter was cleared.
transmittedHelloMessages [Transmitted Hello Messages] (sdpKeepAliveNumHelloRequestMessages)	long	The number of SDP Echo Request messages transmitted since the keep-alive was administratively enabled or the counter was cleared.

Table 674 vpls statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EvpnMplsIgmPsnpgErrorStats</p> <p>MIB entry name: eMplsIgmPsnpgStatsEntry</p> <p>Entry description: eMplsIgmPsnpgStatsEntry is an entry in the eMplsIgmPsnpgStatsTable. eMplsIgmPsnpgImportPolicyDrops [EMpls Igmp Snpg Import Policy Drops] (eMplsIgmPsnpgImportPolicyDrops)	long	The value of the object eMplsIgmPsnpgImportPolicyDrops indicates the number of times an IGMP Group or Source is dropped because of applying an import policy on this evpn-mpls.
eMplsIgmPsnpgMaxNumGroupsDrops [EMpls Igmp Snpg Max Num Groups Drops] (eMplsIgmPsnpgMaxNumGroupsDrops)	long	The value of the object eMplsIgmPsnpgMaxNumGroupsDrops indicates the number of times an IGMP Group is dropped because of exceeding the configured maximum number of groups on this evpn-mpls.
eMplsIgmPsnpgMaxNumGrpSrcsDrops [EMpls Igmp Snpg Max Num Grp Srcs Drops] (eMplsIgmPsnpgMaxNumGrpSrcsDrops)	long	The value of the object eMplsIgmPsnpgMaxNumGrpSrcsDrops indicates the number of times an IGMP Group Source is dropped because of exceeding the configured maximum number of group sources per group on this evpn-mpls.
eMplsIgmPsnpgMaxNumSourcesDrops [EMpls Igmp Snpg Max Num Sources Drops] (eMplsIgmPsnpgMaxNumSourcesDrops)	long	The value of the object eMplsIgmPsnpgMaxNumSourcesDrops indicates the number of times an IGMP Source is dropped because of exceeding the configured maximum number of sources per group on this evpn-mpls.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
eMplsIgmPsnpgMcacPolicyDrops [EMpls IgmP Snpg Mcac Policy Drops] (eMplsIgmPsnpgMcacPolicyDrops)	long	The value of the object eMplsIgmPsnpgMcacPolicyDrops indicates the number of times an IGMP Group is dropped because of applying a multicast CAC policy on this evpn-mpls.
eMplsIgmPsnpgMcsFailures [EMpls IgmP Snpg Mcs Failures] (eMplsIgmPsnpgMcsFailures)	long	The value of the object eMplsIgmPsnpgMcsFailures indicates the number of times an IGMP Group on this evpn-mpls could not be synced to the MCS (multi-chassis synchronization) database.
eMplsIgmPsnpgRxBadEncodedPkts [EMpls IgmP Snpg Rx Bad Encoded Pkts] (eMplsIgmPsnpgRxBadEncodedPkts)	long	The value of the object eMplsIgmPsnpgRxBadEncodedPkts indicates the number of IGMP packets dropped on this evpn-mpls because of a bad encoding.
eMplsIgmPsnpgRxBadIgmPChkSmPkts [EMpls IgmP Snpg Rx Bad IgmP ChkSm Pkts] (eMplsIgmPsnpgRxBadIgmPChkSmPkts)	long	The value of the object eMplsIgmPsnpgRxBadIgmPChkSmPkts indicates the number of dropped IGMP packets on this evpn-mpls because of a bad IGMP header checksum.
eMplsIgmPsnpgRxBadIpChkSmPkts [EMpls IgmP Snpg Rx Bad Ip ChkSm Pkts] (eMplsIgmPsnpgRxBadIpChkSmPkts)	long	The value of the object eMplsIgmPsnpgRxBadIpChkSmPkts indicates the number of dropped IGMP packets on this evpn-mpls because of a bad IPv4 header checksum.
eMplsIgmPsnpgRxBadLenPkts [EMpls IgmP Snpg Rx Bad Len Pkts] (eMplsIgmPsnpgRxBadLenPkts)	long	The value of the object eMplsIgmPsnpgRxBadLenPkts indicates the number of IGMP packets dropped on this evpn-mpls because of a bad length.
eMplsIgmPsnpgRxLocalScopePkts [EMpls IgmP Snpg Rx Local Scope Pkts] (eMplsIgmPsnpgRxLocalScopePkts)	long	The value of the object eMplsIgmPsnpgRxLocalScopePkts indicates the number of IGMP packets received on the link-local scope IPv6 multicast address.
eMplsIgmPsnpgRxNoRtrAlertPkts [EMpls IgmP Snpg Rx No Rtr Alert Pkts] (eMplsIgmPsnpgRxNoRtrAlertPkts)	long	The value of the object eMplsIgmPsnpgRxNoRtrAlertPkts indicates the number of IGMP packets dropped on this evpn-mpls because the Router Alert Option in the IP packet is not set.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
eMplsIgmPsnpgRxRsvdScopePkts [EMpls Igmp SnpG Rx Rsvd Scope Pkts] (eMplsIgmPsnpgRxRsvdScopePkts)	long	The value of the object eMplsIgmPsnpgRxRsvdScopePkts indicates the number of IGMP packets received on the reserved scope IPv6 multicast address.
eMplsIgmPsnpgRxWrongVersionPkts [EMpls Igmp SnpG Rx Wrong Version Pkts] (eMplsIgmPsnpgRxWrongVersionPkts)	long	The value of the object eMplsIgmPsnpgRxWrongVersionPkts indicates the total number of IGMP packets with a wrong version received on this evpn-mpls.
eMplsIgmPsnpgRxZeroSrcAdrPkts [EMpls Igmp SnpG Rx Zero Src Adr Pkts] (eMplsIgmPsnpgRxZeroSrcAdrPkts)	long	The value of the object eMplsIgmPsnpgRxZeroSrcAdrPkts indicates the number of IGMP packets dropped on this evpn-mpls because they contain a zero source IPv4 address.
eMplsIgmPsnpgSendQueryCfgDrops [EMpls Igmp SnpG Send Query Cfg Drops] (eMplsIgmPsnpgSendQueryCfgDrops)	long	The value of the object eMplsIgmPsnpgSendQueryCfgDrops indicates the number of times an IGMP Query is dropped because the object sapIgmPsnpgCfgSendQueries for this evpn-mpls is set to 'enabled(1)'.
<p>EvpnMplsIgmPsnpgStats</p> <p>MIB entry name: eMplsIgmPsnpgStatsEntry</p> <p>Entry description: eMplsIgmPsnpgStatsEntry is an entry in the eMplsIgmPsnpgStatsTable. Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
eMplsIgmPsnpgFwdGrpSpecQueries [EMpls IgmP SnpG Fwd Grp Spec Queries] (eMplsIgmPsnpgFwdGrpSpecQueries)	long	The value of the object eMplsIgmPsnpgFwdGrpSpecQueries indicates the number of IGMP Group-Specific Queries forwarded on this evpn-mpls.
eMplsIgmPsnpgFwdSrcSpecQueries [EMpls IgmP SnpG Fwd Src Spec Queries] (eMplsIgmPsnpgFwdSrcSpecQueries)	long	The value of the object eMplsIgmPsnpgFwdSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries forwarded on this evpn-mpls.
eMplsIgmPsnpgFwdUnknownType [EMpls IgmP SnpG Fwd Unknown Type] (eMplsIgmPsnpgFwdUnknownType)	long	The value of the object eMplsIgmPsnpgFwdUnknownType indicates the number of IGMP unknown type packets forwarded on this evpn-mpls.
eMplsIgmPsnpgFwdV1Reports [EMpls IgmP SnpG Fwd V1 Reports] (eMplsIgmPsnpgFwdV1Reports)	long	The value of the object eMplsIgmPsnpgFwdV1Reports indicates the number of IGMPv1 Reports forwarded on this evpn-mpls.
eMplsIgmPsnpgFwdV2Leaves [EMpls IgmP SnpG Fwd V2 Leaves] (eMplsIgmPsnpgFwdV2Leaves)	long	The value of the object eMplsIgmPsnpgFwdV2Leaves indicates the number of IGMPv2 Leaves forwarded on this evpn-mpls.
eMplsIgmPsnpgFwdV2Reports [EMpls IgmP SnpG Fwd V2 Reports] (eMplsIgmPsnpgFwdV2Reports)	long	The value of the object eMplsIgmPsnpgFwdV2Reports indicates the number of IGMPv2 Reports forwarded on this evpn-mpls.
eMplsIgmPsnpgFwdV3Reports [EMpls IgmP SnpG Fwd V3 Reports] (eMplsIgmPsnpgFwdV3Reports)	long	The value of the object eMplsIgmPsnpgFwdV3Reports indicates the number of IGMPv3 Reports forwarded on this evpn-mpls.
eMplsIgmPsnpgRxGenQueries [EMpls IgmP SnpG Rx Gen Queries] (eMplsIgmPsnpgRxGenQueries)	long	The value of the object eMplsIgmPsnpgRxGenQueries indicates the number of IGMP General Queries received on this evpn-mpls.
eMplsIgmPsnpgRxGrpSpecQueries [EMpls IgmP SnpG Rx Grp Spec Queries] (eMplsIgmPsnpgRxGrpSpecQueries)	long	The value of the object eMplsIgmPsnpgRxGrpSpecQueries indicates the number of IGMP Group-Specific Queries received on this evpn-mpls.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
eMplsIgmpSnpG Rx Src Spec Queries [EMpls Igmp SnpG Rx Src Spec Queries] (eMplsIgmpSnpG Rx Src Spec Queries)	long	The value of the object eMplsIgmpSnpG Rx Src Spec Queries indicates the number of IGMP Group-And-Source-Specific Queries received on this evpn-mpls.
eMplsIgmpSnpG Rx Unknown Type [EMpls Igmp SnpG Rx Unknown Type] (eMplsIgmpSnpG Rx Unknown Type)	long	The value of the object eMplsIgmpSnpG Rx Unknown Type indicates the number of IGMP unknown type packets received on this evpn-mpls.
eMplsIgmpSnpG Rx V1 Reports [EMpls Igmp SnpG Rx V1 Reports] (eMplsIgmpSnpG Rx V1 Reports)	long	The value of the object eMplsIgmpSnpG Rx V1 Reports indicates the number of IGMPv1 Reports received on this evpn-mpls.
eMplsIgmpSnpG Rx V2 Leaves [EMpls Igmp SnpG Rx V2 Leaves] (eMplsIgmpSnpG Rx V2 Leaves)	long	The value of the object eMplsIgmpSnpG Rx V2 Leaves indicates the number of IGMPv2 Leaves received on this evpn-mpls.
eMplsIgmpSnpG Rx V2 Reports [EMpls Igmp SnpG Rx V2 Reports] (eMplsIgmpSnpG Rx V2 Reports)	long	The value of the object eMplsIgmpSnpG Rx V2 Reports indicates the number of IGMPv2 Reports received on this evpn-mpls.
eMplsIgmpSnpG Rx V3 Reports [EMpls Igmp SnpG Rx V3 Reports] (eMplsIgmpSnpG Rx V3 Reports)	long	The value of the object eMplsIgmpSnpG Rx V3 Reports indicates the number of IGMPv3 Reports received on this evpn-mpls.
eMplsIgmpSnpG Tx Gen Queries [EMpls Igmp SnpG Tx Gen Queries] (eMplsIgmpSnpG Tx Gen Queries)	long	The value of the object eMplsIgmpSnpG Tx Gen Queries indicates the number of IGMP General Queries transmitted on this evpn-mpls.
eMplsIgmpSnpG Tx Grp Spec Queries [EMpls Igmp SnpG Tx Grp Spec Queries] (eMplsIgmpSnpG Tx Grp Spec Queries)	long	The value of the object eMplsIgmpSnpG Tx Grp Spec Queries indicates the number of IGMP Group-Specific Queries transmitted on this evpn-mpls.
eMplsIgmpSnpG Tx Src Spec Queries [EMpls Igmp SnpG Tx Src Spec Queries] (eMplsIgmpSnpG Tx Src Spec Queries)	long	The value of the object eMplsIgmpSnpG Tx Src Spec Queries indicates the number of IGMP Group-And-Source-Specific Queries transmitted on this evpn-mpls.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
eMplsIgmPsnpgTxV1Reports [EMpls Igmp Snpg Tx V1 Reports] (eMplsIgmPsnpgTxV1Reports)	long	The value of the object eMplsIgmPsnpgTxV1Reports indicates the number of IGMPv1 Reports transmitted on this evpn-mpls.
eMplsIgmPsnpgTxV2Leaves [EMpls Igmp Snpg Tx V2 Leaves] (eMplsIgmPsnpgTxV2Leaves)	long	The value of the object eMplsIgmPsnpgTxV2Leaves indicates the number of IGMPv2 Leaves transmitted on this evpn-mpls.
eMplsIgmPsnpgTxV2Reports [EMpls Igmp Snpg Tx V2 Reports] (eMplsIgmPsnpgTxV2Reports)	long	The value of the object eMplsIgmPsnpgTxV2Reports indicates the number of IGMPv2 Reports transmitted on this evpn-mpls.
eMplsIgmPsnpgTxV3Reports [EMpls Igmp Snpg Tx V3 Reports] (eMplsIgmPsnpgTxV3Reports)	long	The value of the object eMplsIgmPsnpgTxV3Reports indicates the number of IGMPv3 Reports transmitted on this evpn-mpls.
InterfacePimSnoopingStats MIB entry name: tmnxPimSnpgIfStatsEntry Entry description: An entry in the tmnxPimSnpgIfStatsTable. Table description (for tmnxPimSnpgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: vpls.InterfacePimSnooping		
tmnxPimSnpgIfJoinPolicyDrops [Tmnx Pim Snpg If Join Policy Drops] (tmnxPimSnpgIfJoinPolicyDrops)	long	The value of tmnxPimSnpgIfJoinPolicyDrops indicates the number of times the join policy match resulted in dropping PIM Join-Prune Message or one of the source group contained in the message.
tmnxPimSnpgIfRxBadChecksumDscrd [Tmnx Pim Snpg If Rx Bad Checksum Dscrd] (tmnxPimSnpgIfRxBadChecksumDscrd)	long	The value of tmnxPimSnpgIfRxBadChecksumDscrd indicates the number of PIM messages received on this interface which were discarded because of bad checksum.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tmnxPimSnpglfRxBadEncodings [Tmnx Pim Snpglf Rx Bad Encodings] (tmnxPimSnpglfRxBadEncodings)	long	The value of tmnxPimSnpglfRxBadEncodings indicates the number of PIM messages with bad encodings received on this interface.
tmnxPimSnpglfRxBadVersionDscrd [Tmnx Pim Snpglf Rx Bad Version Dscrd] (tmnxPimSnpglfRxBadVersionDscrd)	long	The value of tmnxPimSnpglfRxBadVersionDscrd indicates the number of PIM messages with bad versions received on this interface.
tmnxPimSnpglfRxHellos [Tmnx Pim Snpglf Rx Hellos] (tmnxPimSnpglfRxHellos)	long	The value of tmnxPimSnpglfRxHellos indicates the number of PIM hello messages received on this interface.
tmnxPimSnpglfRxHellosDropped [Tmnx Pim Snpglf Rx Hellos Dropped] (tmnxPimSnpglfRxHellosDropped)	long	The value of tmnxPimSnpglfRxHellosDropped indicates the number of PIM Hello messages which were received on this interface but were dropped.
tmnxPimSnpglfRxJoinPruneErrs [Tmnx Pim Snpglf Rx Join Prune Errs] (tmnxPimSnpglfRxJoinPruneErrs)	long	The value of tmnxPimSnpglfRxJoinPruneErrs indicates the number of errors while processing Join-Prune messages received on this interface.
tmnxPimSnpglfRxJoinPrunes [Tmnx Pim Snpglf Rx Join Prunes] (tmnxPimSnpglfRxJoinPrunes)	long	The value of tmnxPimSnpglfRxJoinPrunes indicates the number of PIM Join Prune messages received on this interface.
tmnxPimSnpglfRxNbrUnknown [Tmnx Pim Snpglf Rx Nbr Unknown] (tmnxPimSnpglfRxNbrUnknown)	long	The value of tmnxPimSnpglfRxNbrUnknown indicates the number of PIM messages (other than Hello messages) which were received on this interface and were rejected because the adjacency with the neighbor router was not already established.
tmnxPimSnpglfRxPkts [Tmnx Pim Snpglf Rx Pkts] (tmnxPimSnpglfRxPkts)	long	The value of tmnxPimSnpglfRxPkts indicates the number of multicast data packets received on this interface.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tmnxPimSnpgIfSGTypes [Tmnx Pim Snpg If SGTypes] (tmnxPimSnpgIfSGTypes)	long	The value of tmnxPimSnpgIfSGTypes indicates the number of (S,G) entries in tmnxPimSnpgIfGrpSrcTable.
tmnxPimSnpgIfStarGTypes [Tmnx Pim Snpg If Star GTypes] (tmnxPimSnpgIfStarGTypes)	long	The value of tmnxPimSnpgIfStarGTypes indicates the number of (*,G) entries in tmnxPimSnpgIfGrpSrcTable.
tmnxPimSnpgIfTxJoinPrunes [Tmnx Pim Snpg If Tx Join Prunes] (tmnxPimSnpgIfTxJoinPrunes)	long	The value of tmnxPimSnpgIfTxJoinPrunes indicates the number of PIM Join Prune messages transmitted on this interface.
tmnxPimSnpgIfTxPkts [Tmnx Pim Snpg If Tx Pkts] (tmnxPimSnpgIfTxPkts)	long	The value of tmnxPimSnpgIfTxPkts indicates the number of multicast data packets transmitted on this interface.

vxlanIcmpSnpgImportPolicyDrops [Vxlan Icmp Snpg Import Policy Drops] (vxlanIcmpSnpgImportPolicyDrops)	long	The value of the object vxlanIcmpSnpgImportPolicyDrops indicates the number of times an IGMP Group or Source is dropped because of applying an import policy on this VXLAN.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vxlanIgmpSnpGMaxNumGroupsDrops [Vxlan Igmp SnpG Max Num Groups Drops] (vxlanIgmpSnpGMaxNumGroupsDrops)	long	The value of the object vxlanIgmpSnpGMaxNumGroupsDrops indicates the number of times an IGMP Group is dropped because of exceeding the configured maximum number of groups on this VXLAN.
vxlanIgmpSnpGMaxNumGrpSrcsDrops [Vxlan Igmp SnpG Max Num Grp Srcs Drops] (vxlanIgmpSnpGMaxNumGrpSrcsDrops)	long	The value of the object vxlanIgmpSnpGMaxNumGrpSrcsDrops indicates the number of times an IGMP Group Source is dropped because of exceeding the configured maximum number of group sources per group on this VXLAN.
vxlanIgmpSnpGMaxNumSourcesDrops [Vxlan Igmp SnpG Max Num Sources Drops] (vxlanIgmpSnpGMaxNumSourcesDrops)	long	The value of the object vxlanIgmpSnpGMaxNumSourcesDrops indicates the number of times an IGMP Source is dropped because of exceeding the configured maximum number of sources per group on this VXLAN.
vxlanIgmpSnpGMcacPolicyDrops [Vxlan Igmp SnpG Mcac Policy Drops] (vxlanIgmpSnpGMcacPolicyDrops)	long	The value of the object vxlanIgmpSnpGMcacPolicyDrops indicates the number of times an IGMP Group is dropped because of applying a multicast CAC policy on this VXLAN.
vxlanIgmpSnpGMcsFailures [Vxlan Igmp SnpG Mcs Failures] (vxlanIgmpSnpGMcsFailures)	long	The value of the object vxlanIgmpSnpGMcsFailures indicates the number of times an IGMP Group on this VXLAN could not be synced to the MCS (multi-chassis synchronization) database.
vxlanIgmpSnpGRxBadEncodedPkts [Vxlan Igmp SnpG Rx Bad Encoded Pkts] (vxlanIgmpSnpGRxBadEncodedPkts)	long	The value of the object vxlanIgmpSnpGRxBadEncodedPkts indicates the number of IGMP packets dropped on this VXLAN because of a bad encoding.
vxlanIgmpSnpGRxBadIgmpChkSmPkts [Vxlan Igmp SnpG Rx Bad Igmp ChkSm Pkts] (vxlanIgmpSnpGRxBadIgmpChkSmPkts)	long	The value of the object vxlanIgmpSnpGRxBadIgmpChkSmPkts indicates the number of dropped IGMP packets on this VXLAN because of a bad IGMP header checksum.
vxlanIgmpSnpGRxBadIpChkSmPkts [Vxlan Igmp SnpG Rx Bad Ip ChkSm Pkts] (vxlanIgmpSnpGRxBadIpChkSmPkts)	long	The value of the object vxlanIgmpSnpGRxBadIpChkSmPkts indicates the number of dropped IGMP packets on this VXLAN because of a bad IPv4 header checksum.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vxlanIgmpSnpgrxBadLenPkts [Vxlan Igmp SnpgrxBadLenPkts] (vxlanIgmpSnpgrxBadLenPkts)	long	The value of the object vxlanIgmpSnpgrxBadLenPkts indicates the number of IGMP packets dropped on this VXLAN because of a bad length.
vxlanIgmpSnpgrxLocalScopePkts [Vxlan Igmp SnpgrxLocalScopePkts] (vxlanIgmpSnpgrxLocalScopePkts)	long	The value of the object vxlanIgmpSnpgrxLocalScopePkts indicates the number of IGMP packets received on the link-local scope IPv6 multicast address.
vxlanIgmpSnpgrxNoRtrAlertPkts [Vxlan Igmp SnpgrxNoRtrAlertPkts] (vxlanIgmpSnpgrxNoRtrAlertPkts)	long	The value of the object vxlanIgmpSnpgrxNoRtrAlertPkts indicates the number of IGMP packets dropped on this VXLAN because the Router Alert Option in the IP packet is not set.
vxlanIgmpSnpgrxRsvdScopePkts [Vxlan Igmp SnpgrxRsvdScopePkts] (vxlanIgmpSnpgrxRsvdScopePkts)	long	The value of the object vxlanIgmpSnpgrxRsvdScopePkts indicates the number of IGMP packets received on the reserved scope IPv6 multicast address.
vxlanIgmpSnpgrxWrongVersionPkts [Vxlan Igmp SnpgrxWrongVersionPkts] (vxlanIgmpSnpgrxWrongVersionPkts)	long	The value of the object vxlanIgmpSnpgrxWrongVersionPkts indicates the total number of IGMP packets with a wrong version received on this VXLAN.
vxlanIgmpSnpgrxZeroSrcAdrPkts [Vxlan Igmp SnpgrxZeroSrcAdrPkts] (vxlanIgmpSnpgrxZeroSrcAdrPkts)	long	The value of the object vxlanIgmpSnpgrxZeroSrcAdrPkts indicates the number of IGMP packets dropped on this VXLAN because they contain a zero source IPv4 address.
vxlanIgmpSnpgrSendQueryCfgDrops [Vxlan Igmp SnpgrSendQueryCfgDrops] (vxlanIgmpSnpgrSendQueryCfgDrops)	long	The value of the object vxlanIgmpSnpgrSendQueryCfgDrops indicates the number of times an IGMP Query is dropped because the object saplgmpSnpgrCfgSendQueries for this VXLAN is set to 'enabled(1)'.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VxlanIcmpSnpgStats</p> <p>MIB entry name: vxlanIcmpSnpgStatsEntry</p> <p>Entry description: vxlanIcmpSnpgStatsEntry is an entry in the vxlanIcmpSnpgStatsTable. Each entry contains IGMP snooping statistics for a VXLAN in a TIs.</p> <p>Table description (for vxlanIcmpSnpgStatsTable): vxlanIcmpSnpgStatsTable contains statistics on IGMP snooping per VXLAN.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vpls.Site</p>		
vxlanIcmpSnpgFwdGenQueries [Vxlan Icmp Snpg Fwd Gen Queries] (vxlanIcmpSnpgFwdGenQueries)	long	The value of the object vxlanIcmpSnpgFwdGenQueries indicates the number of IGMP General Queries forwarded on this VXLAN.
vxlanIcmpSnpgFwdGrpSpecQueries [Vxlan Icmp Snpg Fwd Grp Spec Queries] (vxlanIcmpSnpgFwdGrpSpecQueries)	long	The value of the object vxlanIcmpSnpgFwdGrpSpecQueries indicates the number of IGMP Group-Specific Queries forwarded on this VXLAN.
vxlanIcmpSnpgFwdSrcSpecQueries [Vxlan Icmp Snpg Fwd Src Spec Queries] (vxlanIcmpSnpgFwdSrcSpecQueries)	long	The value of the object vxlanIcmpSnpgFwdSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries forwarded on this VXLAN.
vxlanIcmpSnpgFwdUnknownType [Vxlan Icmp Snpg Fwd Unknown Type] (vxlanIcmpSnpgFwdUnknownType)	long	The value of the object vxlanIcmpSnpgFwdUnknownType indicates the number of IGMP unknown type packets forwarded on this VXLAN.
vxlanIcmpSnpgFwdV1Reports [Vxlan Icmp Snpg Fwd V1 Reports] (vxlanIcmpSnpgFwdV1Reports)	long	The value of the object vxlanIcmpSnpgFwdV1Reports indicates the number of IGMPv1 Reports forwarded on this VXLAN.
vxlanIcmpSnpgFwdV2Leaves [Vxlan Icmp Snpg Fwd V2 Leaves] (vxlanIcmpSnpgFwdV2Leaves)	long	The value of the object vxlanIcmpSnpgFwdV2Leaves indicates the number of IGMPv2 Leaves forwarded on this VXLAN.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vxlanIgmpSnpgFwdV2Reports [Vxlan Igmp Snpg Fwd V2 Reports] (vxlanIgmpSnpgFwdV2Reports)	long	The value of the object vxlanIgmpSnpgFwdV2Reports indicates the number of IGMPv2 Reports forwarded on this VXLAN.
vxlanIgmpSnpgFwdV3Reports [Vxlan Igmp Snpg Fwd V3 Reports] (vxlanIgmpSnpgFwdV3Reports)	long	The value of the object vxlanIgmpSnpgFwdV3Reports indicates the number of IGMPv3 Reports forwarded on this VXLAN.
vxlanIgmpSnpgRxGenQueries [Vxlan Igmp Snpg Rx Gen Queries] (vxlanIgmpSnpgRxGenQueries)	long	The value of the object vxlanIgmpSnpgRxGenQueries indicates the number of IGMP General Queries received on this VXLAN.
vxlanIgmpSnpgRxGrpSpecQueries [Vxlan Igmp Snpg Rx Grp Spec Queries] (vxlanIgmpSnpgRxGrpSpecQueries)	long	The value of the object vxlanIgmpSnpgRxGrpSpecQueries indicates the number of IGMP Group-Specific Queries received on this VXLAN.
vxlanIgmpSnpgRxSrcSpecQueries [Vxlan Igmp Snpg Rx Src Spec Queries] (vxlanIgmpSnpgRxSrcSpecQueries)	long	The value of the object vxlanIgmpSnpgRxSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries received on this VXLAN.
vxlanIgmpSnpgRxUnknownType [Vxlan Igmp Snpg Rx Unknown Type] (vxlanIgmpSnpgRxUnknownType)	long	The value of the object vxlanIgmpSnpgRxUnknownType indicates the number of IGMP unknown type packets received on this VXLAN.
vxlanIgmpSnpgRxV1Reports [Vxlan Igmp Snpg Rx V1 Reports] (vxlanIgmpSnpgRxV1Reports)	long	The value of the object vxlanIgmpSnpgRxV1Reports indicates the number of IGMPv1 Reports received on this SAP.
vxlanIgmpSnpgRxV2Leaves [Vxlan Igmp Snpg Rx V2 Leaves] (vxlanIgmpSnpgRxV2Leaves)	long	The value of the object vxlanIgmpSnpgRxV2Leaves indicates the number of IGMPv2 Leaves received on this VXLAN.
vxlanIgmpSnpgRxV2Reports [Vxlan Igmp Snpg Rx V2 Reports] (vxlanIgmpSnpgRxV2Reports)	long	The value of the object vxlanIgmpSnpgRxV2Reports indicates the number of IGMPv2 Reports received on this VXLAN.

Table 674 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vxlanIcmpSnpgrxV3Reports [Vxlan Icmp Snpgrx V3 Reports] (vxlanIcmpSnpgrxV3Reports)	long	The value of the object vxlanIcmpSnpgrxV3Reports indicates the number of IGMPv3 Reports received on this SAP.
vxlanIcmpSnpgrxTxGenQueries [Vxlan Icmp Snpgrx Tx Gen Queries] (vxlanIcmpSnpgrxTxGenQueries)	long	The value of the object vxlanIcmpSnpgrxTxGenQueries indicates the number of IGMP General Queries transmitted on this VXLAN.
vxlanIcmpSnpgrxTxGrpSpecQueries [Vxlan Icmp Snpgrx Tx Grp Spec Queries] (vxlanIcmpSnpgrxTxGrpSpecQueries)	long	The value of the object vxlanIcmpSnpgrxTxGrpSpecQueries indicates the number of IGMP Group-Specific Queries transmitted on this VXLAN.
vxlanIcmpSnpgrxTxSrcSpecQueries [Vxlan Icmp Snpgrx Tx Src Spec Queries] (vxlanIcmpSnpgrxTxSrcSpecQueries)	long	The value of the object vxlanIcmpSnpgrxTxSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries transmitted on this VXLAN.
vxlanIcmpSnpgrxTxV1Reports [Vxlan Icmp Snpgrx Tx V1 Reports] (vxlanIcmpSnpgrxTxV1Reports)	long	The value of the object vxlanIcmpSnpgrxTxV1Reports indicates the number of IGMPv1 Reports transmitted on this VXLAN.
vxlanIcmpSnpgrxTxV2Leaves [Vxlan Icmp Snpgrx Tx V2 Leaves] (vxlanIcmpSnpgrxTxV2Leaves)	long	The value of the object vxlanIcmpSnpgrxTxV2Leaves indicates the number of IGMPv2 Leaves transmitted on this VXLAN.
vxlanIcmpSnpgrxTxV2Reports [Vxlan Icmp Snpgrx Tx V2 Reports] (vxlanIcmpSnpgrxTxV2Reports)	long	The value of the object vxlanIcmpSnpgrxTxV2Reports indicates the number of IGMPv2 Reports transmitted on this VXLAN.
vxlanIcmpSnpgrxTxV3Reports [Vxlan Icmp Snpgrx Tx V3 Reports] (vxlanIcmpSnpgrxTxV3Reports)	long	The value of the object vxlanIcmpSnpgrxTxV3Reports indicates the number of IGMPv3 Reports transmitted on this VXLAN.

Table 675 vrrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InstanceAdditionalStats</p> <p>MIB entry name: tmnxVrrpRouterStatsEntry</p> <p>Entry description: Each row entry in the tmnxVrrpRouterStatsTable represents additional columns in the vrrpRouterStatsTable for statistics specific to the Nokia SROS series VRRP implementation.</p> <p>Table description (for tmnxVrrpRouterStatsTable): The tmnxVrrpRouterStatsTable provides an extension of the vrrpRouterStatsTable in the VRRP-MIB. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vrrpRouterStatsTable, and the augmenting table, tmnxVrrpRouterStatsTable. This in effect extends the vrrpRouterStatsTable with additional columns.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vrrp.Instance</p>		
addressListDiscards [Address List Discards] (tmnxVrrpStatsAddressListDiscards)	long	The total number of VRRP advertisement packets discarded because the address list did not match the locally configured list for the virtual router.
advertiseIntervalDiscards [Advertise Interval Discards] (tmnxVrrpStatsAdvertiseIntervalDiscards)	long	The total number of VRRP advertisement packets discarded because the advertisement interval in the received packet was different than the one configured for the local virtual router.
advertiseSent [Advertise Sent] (tmnxVrrpStatsAdvertiseSent)	long	The total number of VRRP advertisements sent by this virtual router.
masterChanges [Master Changes] (tmnxVrrpStatsMasterChanges)	long	The value for tmnxVrrpStatsMasterChanges indicates the total number of times the virtual router has seen the master virtual router change.
preemptEvents [Preempt Events] (tmnxVrrpStatsPreemptEvents)	long	The value for tmnxVrrpStatsPreemptEvents indicates the total number of times the virtual router has preempted another non-owner master with lower priority.

Table 675 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
preemptedEvents [Preempted Events] (tmnxVrrpStatsPreemptedEvents)	long	The value for tmnxVrrpStatsPreemptedEvents indicates the total number of times the virtual router has been preempted by another non-owner master with higher priority.
totalDiscards [Total Discards] (tmnxVrrpStatsTotalDiscards)	long	The total number of VRRP advertisement packets discarded for any reason. This includes the packets discarded due to advertise interval mismatch and address list mismatch.
<p>InstanceStats MIB entry name: vrrpRouterStatsEntry Entry description: An entry in the table, containing statistics information about a given virtual router. Table description (for vrrpRouterStatsTable): Table of virtual router statistics. Supports realtime plotting Supports scheduled collection Monitored class: vrrp.Instance</p>		
addressListErrors [Address List Errors] (vrrpStatsAddressListErrors)	long	The total number of packets received for which the address list does not match the locally configured list for the virtual router.
advertiseIntervalErrors [Advertise Interval Errors] (vrrpStatsAdvertiseIntervalErrors)	long	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
advertiseRcvd [Advertise Rcvd] (vrrpStatsAdvertiseRcvd)	long	The total number of VRRP advertisements received by this virtual router.
authFailures [Auth Failures] (vrrpStatsAuthFailures)	long	The total number of VRRP packets received that do not pass the authentication check.

Table 675 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authTypeMismatch [Auth Type Mismatch] (vrrpStatsAuthTypeMismatch)	long	The total number of packets received with 'Auth Type' not equal to the locally configured authentication method ('vrrpOperAuthType').
becomeMaster [Become Master] (vrrpStatsBecomeMaster)	long	The total number of times that this virtual router's state has transitioned to MASTER.
invalidAuthType [Invalid Auth Type] (vrrpStatsInvalidAuthType)	long	The total number of packets received with an unknown authentication type.
invalidTypePktsRcvd [Invalid Type Pkts Rcvd] (vrrpStatsInvalidTypePktsRcvd)	long	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
ipTtlErrors [Ip Ttl Errors] (vrrpStatsIpTtlErrors)	long	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
packetLengthErrors [Packet Length Errors] (vrrpStatsPacketLengthErrors)	long	The total number of packets received with a packet length less than the length of the VRRP header.
priorityZeroPktsRcvd [Priority Zero Pkts Rcvd] (vrrpStatsPriorityZeroPktsRcvd)	long	The total number of VRRP packets received by the virtual router with a priority of '0'.
priorityZeroPktsSent [Priority Zero Pkts Sent] (vrrpStatsPriorityZeroPktsSent)	long	The total number of VRRP packets sent by the virtual router with a priority of '0'.

Table 675 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InstanceV6AdditionalStats</p> <p>MIB entry name: tVrrpRtrStatisticsEntry</p> <p>Entry description: Each row entry in the tVrrpRtrStatisticsTable represents additional columns in the vrrpRouterStatisticsTable for statistics specific to the Nokia SROS series VRRP implementation.</p> <p>Table description (for tVrrpRtrStatisticsTable): The tVrrpRtrStatisticsTable provides an extension of the vrrpRouterStatisticsTable in the TIMETRA-VRRP-V3-MIB. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vrrpRouterStatisticsTable, and the augmenting table, tVrrpRtrStatisticsTable. This in effect extends the vrrpRouterStatisticsTable with additional columns.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vrrp.InstanceV6</p>		
advertiseIntervalDiscards [Advertise Interval Discards] (tVrrpStatAdvIntvlDiscards)	long	The value of tVrrpStatAdvIntvlDiscards indicates the total number of VRRP advertisement packets discarded because the advertisement interval in the received packet was different than the one configured for the local virtual router.
advertiseSent [Advertise Sent] (tVrrpStatAdvertiseSent)	long	The value of tVrrpStatAdvertiseSent indicates the total number of VRRP advertisements sent by this virtual router.
masterChanges [Master Changes] (tVrrpStatMasterChanges)	long	The value for tVrrpStatMasterChanges indicates the total number of times the virtual router has seen the master virtual router change.
preemptEvents [Preempt Events] (tVrrpStatPreemptEvents)	long	The value for tVrrpStatPreemptEvents indicates the total number of times the virtual router has preempted another non-owner master with lower priority.
preemptedEvents [Preempted Events] (tVrrpStatPreemptedEvents)	long	The value for tVrrpStatPreemptedEvents indicates the total number of times the virtual router has been preempted by another non-owner master with higher priority.

Table 675 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalDiscards [Total Discards] (tVrrpStatTotalDiscards)	long	The value of tVrrpStatTotalDiscards indicates the total number of VRRP advertisement packets discarded for any reason. This includes the packets discarded due to advertise interval mismatch and address list mismatch.
InstanceV6Stats MIB entry name: vrrpRouterStatisticsEntry Entry description: An entry in the table, containing statistics information about a given virtual router. Table description (for vrrpRouterStatisticsTable): Table of virtual router statistics. Supports realtime plotting Supports scheduled collection Monitored class: vrrp.InstanceV6		
addressListErrors [Address List Errors] (vrrpStatisticsAddressListErrors)	long	The total number of packets received for which the address list does not match the locally configured list for the virtual router. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.
advertiseIntervalErrors [Advertise Interval Errors] (vrrpStatisticsAdvIntervalErrors)	long	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.
advertiseRcvd [Advertise Rcvd] (vrrpStatisticsRcvdAdvertisements)	long	The total number of VRRP advertisements received by this virtual router. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.

Table 675 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
becomeMaster [Become Master] (vrrpStatisticsMasterTransitions)	long	The total number of times that this virtual router's state has transitioned to MASTER. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.
invalidAuthType [Invalid Auth Type] (vrrpStatisticsRcvdInvalidAuthentications)	long	The total number of packets received with an unknown authentication type.
invalidTypePktsRcvd [Invalid Type Pkts Rcvd] (vrrpStatisticsRcvdInvalidTypePkts)	long	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.
ipTtlErrors [Ip Ttl Errors] (vrrpStatisticsIpTtlErrors)	long	The total number of VRRP packets received by the Virtual router with IPv4 TTL (for VRRP over IPv4) or IPv6 Hop Limit (for VRRP over IPv6) not equal to 255. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.
packetLengthErrors [Packet Length Errors] (vrrpStatisticsPacketLengthErrors)	long	The total number of packets received with a packet length less than the length of the VRRP header. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.
priorityZeroPktsRcvd [Priority Zero Pkts Rcvd] (vrrpStatisticsRcvdPriZeroPackets)	long	The total number of VRRP packets received by the virtual router with a priority of '0'. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.

Table 675 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
priorityZeroPktsSent [Priority Zero Pkts Sent] (vrrpStatisticsSentPriZeroPackets)	long	The total number of VRRP packets sent by the virtual router with a priority of '0'. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of vrrpStatisticsDiscontinuityTime.

aggrMaintTxTDF [Aggr Maint Tx TDF] (ethAggrMaintTxTDF)	java. math. BigInteger	Total number of Ethernet frames which were chosen to be discarded due to buffer congestion
aggrMaintTxTTF [Aggr Maint Tx TTF] (ethAggrMaintTxTTF)	java. math. BigInteger	The number of Ethernet frames transmitted out by the Virtual Ethernet Interface.
aggrMaintTxTTFBroadcast [Aggr Maint Tx TTFBroadcast] (ethAggrMaintTxTTFBroadcast)	java. math. BigInteger	The number of good packets transmitted by this address that were directed to the broadcast address. This behavior is the same performed by the counter hostOutBroadcastPkts in the IETF RMON-MIB published as RFC 2819.
aggrMaintTxTTFMulticast [Aggr Maint Tx TTFMulticast] (ethAggrMaintTxTTFMulticast)	java. math. BigInteger	The number of good packets transmitted by this address that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address. This behavior is the same performed by the counter hostOutMulticastPkts in the IETF RMON-MIB published as RFC 2819.
aggrMaintTxTTFUnicast [Aggr Maint Tx TTFUnicast] (ethAggrMaintTxTTFUnicast)	java. math. BigInteger	The number of Ethernet Unicast frames transmitted out by the Virtual Ethernet Interface.
aggrMaintTxTTO [Aggr Maint Tx TTO] (ethAggrMaintTxTTO)	java. math. BigInteger	The number of octets of Ethernet frames transmitted out by the Virtual Ethernet Interface, including Ethernet headers characters

Table 677 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPduTransmitted [Lac Pdu Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPduTransmitted [Marker Pdu Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 677 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker- ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 678 mpr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IMALinkCurrentStats MIB entry name: imaLinkCurrentEntry Entry description: An entry in the IMA Link Current table. Table description (for imaLinkCurrentTable): The IMA Link Current table. Supports realtime plotting Supports scheduled collection Monitored class: mpr.IMALink		
imaLinkCurrentFeRxNumFailures [Ima Link Current Fe Rx Num Failures] (imaLinkCurrentFeRxNumFailures)	long	The number of times a far-end receive failure alarm condition has been entered on this link (i.e., Rx-Unusable-FE) in the current 15 minute interval. This is an optional attribute.
imaLinkCurrentFeRxUnusableSecs [Ima Link Current Fe Rx Unusable Secs] (imaLinkCurrentFeRxUnusableSecs)	long	Rx Unusable seconds at far-end: count of seconds with Rx Unusable indications from the far-end Rx LSM in the current 15 minute interval.
imaLinkCurrentFeSevErroredSecs [Ima Link Current Fe Sev Errored Secs] (imaLinkCurrentFeSevErroredSecs)	long	Count of one second intervals containing one or more RDI-IMA defects, except during UAS-IMA-FE condition, in the current 15 minute interval.
imaLinkCurrentFeTxNumFailures [Ima Link Current Fe Tx Num Failures] (imaLinkCurrentFeTxNumFailures)	long	The number of times a far-end transmit failure alarm condition has been entered on this link (i.e., Tx-Unusable-FE) in the current 15 minute interval. This is an optional attribute.
imaLinkCurrentFeTxUnusableSecs [Ima Link Current Fe Tx Unusable Secs] (imaLinkCurrentFeTxUnusableSecs)	long	Tx Unusable seconds at far-end: count of seconds with Tx Unusable indications from the far-end Tx LSM in the current 15 minute interval.
imaLinkCurrentFeUnavailSecs [Ima Link Current Fe Unavail Secs] (imaLinkCurrentFeUnavailSecs)	long	Count of unavailable seconds at far-end in the current 15 minute interval: unavailability begins at the onset of 10 contiguous SES-IMA-FE and ends at the onset of 10 contiguous seconds with no SES-IMA-FE.

Table 678 mpr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
imaLinkCurrentImaViolations [Ima Link Current Ima Violations] (imaLinkCurrentImaViolations)	long	ICP violations: count of errored, invalid or missing ICP cells, except during SES-IMA or UAS-IMA conditions, in the current 15 minute interval.
imaLinkCurrentNeRxNumFailures [Ima Link Current Ne Rx Num Failures] (imaLinkCurrentNeRxNumFailures)	long	The number of times a near-end receive failure alarm condition has been entered on this link (i.e., LIF, LODS, RFI-IMA, Mis-Connected, or some form of implementation specific receive fault) in the current 15 minute interval.
imaLinkCurrentNeRxUnusableSecs [Ima Link Current Ne Rx Unusable Secs] (imaLinkCurrentNeRxUnusableSecs)	long	Rx Unusable seconds: count of Unusable seconds at the near-end Rx LSM in the current 15 minute interval.
imaLinkCurrentNeSevErroredSecs [Ima Link Current Ne Sev Errored Secs] (imaLinkCurrentNeSevErroredSecs)	long	Count of one second intervals containing \geq 30% of the ICP cells counted as IV-IMAs, or one or more link defects (e.g., LOS, OOF/LOF, AIS, or LCD), LIF defects, or LODS defects, except during UAS-IMA condition, in the current 15 minute interval.
imaLinkCurrentNeTxNumFailures [Ima Link Current Ne Tx Num Failures] (imaLinkCurrentNeTxNumFailures)	long	The number of times a near-end transmit failure alarm condition has been entered on this link (i.e., some form of implementation specific transmit fault) in the current 15 minute interval.
imaLinkCurrentNeTxUnusableSecs [Ima Link Current Ne Tx Unusable Secs] (imaLinkCurrentNeTxUnusableSecs)	long	Tx Unusable seconds: count of Unusable seconds at the near-end Tx LSM in the current 15 minute interval.
imaLinkCurrentNeUnavailSecs [Ima Link Current Ne Unavail Secs] (imaLinkCurrentNeUnavailSecs)	long	Count of unavailable seconds at near-end in the current 15 minute interval: unavailability begins at the onset of 10 contiguous SES-IMA and ends at the onset of 10 contiguous seconds with no SES-IMA.
imaLinkCurrentRxStuffs [Ima Link Current Rx Stuffs] (imaLinkCurrentRxStuffs)	long	Count of stuff events detected in the receive direction in the current 15 minute interval. This is an optional attribute.

Table 678 mpr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
imaLinkCurrentTxStuffs [Ima Link Current Tx Stuffs] (imaLinkCurrentTxStuffs)	long	Count of stuff events inserted in the transmit direction in the current 15 minute interval. This is an optional attribute.
<p>MptStats MIB entry name: opticsIMEquipmentExtenEntry Entry description: An entry of the equipment extention table. Each entry (row), corresponding to a physical component of a managed element, includes additional fields not included in the associated opticsIMEquipmentEntry. Table description (for opticsIMEquipmentExtenTable): This table contains the information related to the resources that represent the physical components of a managed element, including replaceable components. Supports realtime plotting Supports scheduled collection Monitored class: equipment.PhysicalPort</p>		
equipPower [Equip Power] (equipmentPowerConsumption)	double	This object reports the value of the instantaneous power consumed by the equipment. The unit of measure is NE dependent and will be defined on own external specification
equipTemperature [Equip Temperature] (equipmentTemperature)	int	This object reports the temperature of the equipment expressed in Celsius degrees
inCurrent [In Current] (equipmentInputCurrent)	double	This object reports the value of the instantaneous electric current flowing through the equipment. The unit of measure is NE dependent and will be defined on own external specification.
inVoltage [In Voltage] (equipmentInputVoltage)	double	This object reports the value of instantaneous voltage applied to the equipment. The unit of measure is NE dependent and will be defined on own external specification.

Table 679 ptp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPStats</p> <p>MIB entry name: aluPtpPeerPacketStatsEntry</p> <p>Entry description: Configuration information concerning IEEE 1588 PTP</p> <p>Table description (for aluPtpPeerPacketStatsTable): This table allows configuration to the IEEE 1588 PTP</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPPeer</p>		
aluPtpPeerAlternateMasterDisc [Alu Ptp Peer Alternate Master Disc] (aluPtpPeerAlternateMasterDisc)	java. math. BigInteger	aluPtpPeerAlternateMasterDisc indicates the number of packets discarded on ingress as a result of the processing as described in IEEE P1588 D2.2 section 9.1.
aluPtpPeerAnnounceMsgRx [Alu Ptp Peer Announce Msg Rx] (aluPtpPeerAnnounceMsgRx)	java. math. BigInteger	Indicates the number of Announce packets received from the master.
aluPtpPeerAnnounceMsgTx [Alu Ptp Peer Announce Msg Tx] (aluPtpPeerAnnounceMsgTx)	java. math. BigInteger	aluPtpPeerAnnounceMsgTx indicates the number of Announce packets transmitted to the master.
aluPtpPeerBadDomainDisc [Alu Ptp Peer Bad Domain Disc] (aluPtpPeerBadDomainDisc)	java. math. BigInteger	aluPtpPeerBadDomainDisc indicates the number of packets discarded on ingress as a result of the processing as described in IEEE P1588 D2.2 section 9.5.1.
aluPtpPeerBadVersionDisc [Alu Ptp Peer Bad Version Disc] (aluPtpPeerBadVersionDisc)	java. math. BigInteger	aluPtpPeerBadVersionDisc indicates the number of packets discarded on ingress as a result of the IEEE P1588 D2.2 section 7.5.5 version number checking.

Table 679 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aluPtpPeerDelayReqMsgRx [Alu Ptp Peer Delay Req Msg Rx] (aluPtpPeerDelayReqMsgRx)	java. math. BigInteger	Indicates the number of Delay Request packets received from the master.
aluPtpPeerDelayReqMsgTx [Alu Ptp Peer Delay Req Msg Tx] (aluPtpPeerDelayReqMsgTx)	java. math. BigInteger	Indicates the number of Delay Request packets transmitted to the master.
aluPtpPeerDelayRespMsgRx [Alu Ptp Peer Delay Resp Msg Rx] (aluPtpPeerDelayRespMsgRx)	java. math. BigInteger	Indicates the number of Delay Response packets received from the master.
aluPtpPeerDelayRespMsgTx [Alu Ptp Peer Delay Resp Msg Tx] (aluPtpPeerDelayRespMsgTx)	java. math. BigInteger	Indicates the number of Delay Response packets transmitted to the master.
aluPtpPeerStepRemovedGreaterThan255Disc [Alu Ptp Peer Step Removed Greater Than 255 Disc] (aluPtpPeerStepRemovedGreaterThan255Disc)	java. math. BigInteger	aluPtpPeerStepRemovedGreaterThan255Disc indicates the number of packets discarded on ingress as a result of processing as described in IEEE P1588 D2.2 section 9.3.2.5.
aluPtpPeerSyncMsgRx [Alu Ptp Peer Sync Msg Rx] (aluPtpPeerSyncMsgRx)	java. math. BigInteger	Indicates the number of Sync packets received from the master.
aluPtpPeerSyncMsgTx [Alu Ptp Peer Sync Msg Tx] (aluPtpPeerSyncMsgTx)	java. math. BigInteger	Indicates the number of Sync packets transmitted to the master.

Table 679 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PtpClockRecoveryAlgStats</p> <p>MIB entry name: aluPtpPeerClkRecAlgEntry</p> <p>Entry description: Defines an entry in aluPtpPeerClkRecAlgTable. Entries are created and deleted by the system depending on the PTP clock configuration.</p> <p>Table description (for aluPtpPeerClkRecAlgTable): Defines the Alcatel-Lucent 7705 IEEE 1588 PTP recovery statistics table for retrieving statistical information relating to the frequency and time recovery algorithm that is derived from PTP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPPeer</p>		
aluPtpFreqRecAcquiringCount [Alu Ptp Freq Rec Acquiring Count] (aluPtpFreqRecAcquiringCount)	long	The number of seconds the frequency recovery algorithm was in Acquiring state.
aluPtpFreqRecExcessFreqErrCnt [Alu Ptp Freq Rec Excess Freq Err Cnt] (aluPtpFreqRecExcessFreqErrCnt)	long	The number of Excessive Frequency Error events that have been detected by the frequency recovery algorithm.
aluPtpFreqRecFreeRunCount [Alu Ptp Freq Rec Free Run Count] (aluPtpFreqRecFreeRunCount)	long	The number of seconds the frequency recovery algorithm was in Free Run state.
aluPtpFreqRecGapResetCnt [Alu Ptp Freq Rec Gap Reset Cnt] (aluPtpFreqRecGapResetCnt)	long	The number of Gap Rest events that have been detected by the frequency recovery algorithm.
aluPtpFreqRecHoldOverCount [Alu Ptp Freq Rec Hold Over Count] (aluPtpFreqRecHoldOverCount)	long	The number of seconds the frequency recovery algorithm was in Holdover state.
aluPtpFreqRecLockedCount [Alu Ptp Freq Rec Locked Count] (aluPtpFreqRecLockedCount)	long	The number of seconds the frequency recovery algorithm was in Locked state.

Table 679 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aluPtpFreqRecLossResetCnt [Alu Ptp Freq Rec Loss Reset Cnt] (aluPtpFreqRecLossResetCnt)	long	The number of Packet Loss Reset events that have been detected by the frequency recovery algorithm.
aluPtpFreqRecPacketLossCnt [Alu Ptp Freq Rec Packet Loss Cnt] (aluPtpFreqRecPacketLossCnt)	long	The number of Packet Loss events that have been detected by the frequency recovery algorithm.
aluPtpFreqRecPdvStepCnt [Alu Ptp Freq Rec Pdv Step Cnt] (aluPtpFreqRecPdvStepCnt)	long	The number of PDV Step events that have been detected by the frequency recovery algorithm.
aluPtpFreqRecPhaseTrackCount [Alu Ptp Freq Rec Phase Track Count] (aluPtpFreqRecPhaseTrackCount)	long	The number of seconds the frequency recovery algorithm was in Phase Tracking state.
aluPtpFreqRecTripCnt [Alu Ptp Freq Rec Trip Cnt] (aluPtpFreqRecTripCnt)	long	The number of Trip events that have been detected by the frequency recovery algorithm.
aluPtpFreqRecVarTooHighCnt [Alu Ptp Freq Rec Var Too High Cnt] (aluPtpFreqRecVarTooHighCnt)	long	The number of Variance Too High events that have been detected by the frequency recovery algorithm.
<p>PtpClockRecoveryShortIntvlStats MIB entry name: aluPtpPeerRecClkStatsShortIntvlEntry Entry description: An entry in the IEEE PTP 1588 peer clock recovery interval table. Table description (for aluPtpPeerRecClkStatsShortIntvlTable): The PTP Port Recovered Clock Interval Table contains various statistics collected by 1588 PTP clock recovery instance over the previous 15 minutes. The past 15 minutes are broken into 15 1 minute intervals. Each row in this table represents one such interval (identified by AluPtpPeerRecClkStatsShortIntvlEntry). Supports realtime plotting Supports scheduled collection Monitored class: ptp.IEEEPTPPeer</p>		

Table 679 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aluPtpPeerIntvlClockIndex [Alu Ptp Peer Intvl Clock Index] (aluPtpPeerIntvlClockIndex)	int	The index of the clock associated with this ptp master/peer.
aluPtpPeerIntvlIndex [Alu Ptp Peer Intvl Index] (aluPtpPeerIntvlIndex)	int	The index of the master/peer associated with this ptp port.
aluPtpPeerIntvlNumber [Alu Ptp Peer Intvl Number] (aluPtpPeerIntvlNumber)	int	A number between 1 and 15, where 1 is the most recently completed 1 minute interval and 15 is the 1 minutes interval completed 14 minutes prior to interval 1.
aluPtpPeerIntvlPhaseErrorMeanNs [Alu Ptp Peer Intvl Phase Error Mean Ns] (aluPtpPeerIntvlPhaseErrorMeanNs)	double	The mean of the phase error from the local oscillator clock in nano seconds during the interval.
aluPtpPeerIntvlPhaseErrorMeanPpb [Alu Ptp Peer Intvl Phase Error Mean Ppb] (aluPtpPeerIntvlPhaseErrorMeanPpb)	double	The mean phase error from the local oscillator clock in parts per billion during the interval.
aluPtpPeerIntvlPhaseErrorStdDevNs [Alu Ptp Peer Intvl Phase Error Std Dev Ns] (aluPtpPeerIntvlPhaseErrorStdDevNs)	long	The standard deviation of the phase error from the local oscillator clock in nano seconds during the interval.
aluPtpPeerIntvlPortIndex [Alu Ptp Peer Intvl Port Index] (aluPtpPeerIntvlPortIndex)	int	The index of the port associated with this ptp master/peer.
aluPtpPeerIntvlUpdateTime [Alu Ptp Peer Intvl Update Time] (aluPtpPeerIntvlUpdateTime)	long	The update time of the ACR interval statistics
aluPtpPeerIntvlValidData [Alu Ptp Peer Intvl Valid Data] (aluPtpPeerIntvlValidData)	boolean	This variable indicates if the data for this interval is valid.

Table 680 radioequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AdaptiveModulationCurrentDataStats</p> <p>MIB entry name: opticsIMAdaptiveModulationCurrentDataEntry</p> <p>Entry description: An entry of the Adaptive Modulation current data table. In the objects where a Default Value is specified, the write operation is allowed only to the indicated default value. The write operation to one counter is applied to all the counters of all the associated objects, which have a defined default.</p> <p>Table description (for opticsIMAdaptiveModulationCurrentDataTable): This table contains the current data for the Adaptive Modulation PM.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • genericne.GenericNeInterface 		
adaptiveModulationCDElapsedTime [Adaptive Modulation CDElapsed Time] (pmAdaptiveModulationCDElapsedTime)	long	It specifies the amount of time, measured in units of 0.01 second, that statistics for this entry (the current interval) have been counted.
adaptiveModulationCDSuspectIntervalFlag [Adaptive Modulation CDSuspect Interval Flag] (pmAdaptiveModulationCDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.
adaptiveModulationCDUsageTime1024QAM [Adaptive Modulation CDUsage Time 1024 QAM] (pmAdaptiveModulationCDUsageTime1024QAM)	long	The number of time unit (in ms) where the system is worked in 1024QAM.

Table 680 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
adaptiveModulationCDUsageTime128QAM [Adaptive Modulation CDUsage Time 128 QAM] (pmAdaptiveModulationCDUsageTime128QAM)	long	The number of time unit (in ms) where the system is worked in 128QAM.
adaptiveModulationCDUsageTime16QAM [Adaptive Modulation CDUsage Time 16 QAM] (pmAdaptiveModulationCDUsageTime16QAM)	long	The number of time unit (in ms) where the system is worked in 16QAM.
adaptiveModulationCDUsageTime2048QAM [Adaptive Modulation CDUsage Time 2048 QAM] (pmAdaptiveModulationCDUsageTime2048QAM)	long	The number of time unit (in ms) where the system is worked in 2048QAM.
adaptiveModulationCDUsageTime256QAM [Adaptive Modulation CDUsage Time 256 QAM] (pmAdaptiveModulationCDUsageTime256QAM)	long	The number of time unit (in ms) where the system is worked in 256QAM.
adaptiveModulationCDUsageTime32QAM [Adaptive Modulation CDUsage Time 32 QAM] (pmAdaptiveModulationCDUsageTime32QAM)	long	The number of time unit (in ms) where the system is worked in 32QAM.
adaptiveModulationCDUsageTime4QAM [Adaptive Modulation CDUsage Time 4 QAM] (pmAdaptiveModulationCDUsageTime4QAM)	long	The number of time unit (in ms) where the system is worked in 4QAM.
adaptiveModulationCDUsageTime512QAM [Adaptive Modulation CDUsage Time 512 QAM] (pmAdaptiveModulationCDUsageTime512QAM)	long	The number of time unit (in ms) where the system is worked in 512QAM.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pdhFrameHopCDMaxSuppressedIntervals [Pdh Frame Hop CDMax Suppressed Intervals] (pmPdhFrameHopCDMaxSuppressed-Intervals)	long	The PmMaxSuppressedIntervals object limits the maximum number of suppressed intervals that will be collected without creating an instance of the historyData object. For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of $(2^{32})-1$ implies infinite zero suppression, i.e. always suppress the zero intervals.
pdhFrameHopCDNumSuppressedIntervals [Pdh Frame Hop CDNum Suppressed Intervals] (pmPdhFrameHopCDNumSuppressed-Intervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.
pdhFrameHopCDSes [Pdh Frame Hop CDSes] (pmPdhFrameHopCDSes)	long	The number of SES.
pdhFrameHopCDSuspectIntervalFlag [Pdh Frame Hop CDSuspect Interval Flag] (pmPdhFrameHopCDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.

The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of (2^32)-1 implies infinite zero suppression, i.e. always suppress the zero intervals.
rslDivHopCDMaximumLeveldBm [Rsl Div Hop CDMaximum LeveldBm] (pmRSLDivHopCDMaximumLevel)	double	The maximum of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rslDivHopCDMinimumLeveldBm [Rsl Div Hop CDMinimum LeveldBm] (pmRSLDivHopCDMinimumLevel)	double	The minimum of the Signal Level.The associated measure unit expressed in unit of 0.1dBm

Table 680 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rslDivHopCDNumSuppressedIntervals [Rsl Div Hop CDNum Suppressed Intervals] (pmRSLDivHopCDNumSuppressed-Intervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.
rslDivHopCDSuspectIntervalFlag [Rsl Div Hop CDSuspect Interval Flag] (pmRSLDivHopCDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.
<p>RSLDivHopCurrentDataStats24Hr</p> <p>MIB entry name: opticsIMRSLDivHopCurrentDataEntry</p> <p>Entry description: An entry of the RSLDivHopCurrentDataTable. An unavailable condition starts when 10 consecutive severely errored seconds have been detected; these 10 seconds belong to the unavailable time. An unavailable condition ends when 10 consecutive seconds with no severely errored second are detected. These 10 seconds belong to the available time. If an unavailable period is ending then the UAT Clear shall be sent. These performance event counts are inhibited during unavailable time. In the objects where a Default Value is specified, the write operation is allowed only to the indicated default value. The write operation to one counter is applied to all the counters of all the the associated objects, which have a defined default.</p> <p>Table description (for opticsIMRSLDivHopCurrentDataTable): This table contains the current data for the Performance Monitoring of Receive Signal level at Radio Hop level.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.PhysicalPort</p>

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rslDivHopCDAsapIndex [Rsl Div Hop CDAsap Index] (pmRSLDivHopCDAsapIndex)	long	It indicates the ASAP object associated to this CD.
rslDivHopCDAverageLeveldBm [Rsl Div Hop CDAverage LeveldBm] (pmRSLDivHopCDAverageLevel)	double	The average of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rslDivHopCDElapsedTime [Rsl Div Hop CDElapsed Time] (pmRSLDivHopCDElapsedTime)	long	It specifies the amount of time, measured in units of 0.01 second, that statistics for this entry (the current interval) have been counted.
rslDivHopCDGranularityPeriod [Rsl Div Hop CDGranularity Period] (pmRSLDivHopCDGranularityPeriod)	long	It indicates the time base for measuring: 15 minutes,24 hours or one hour.
rslDivHopCDIndex [Rsl Div Hop CDIndex] (pmRSLDivHopCDIndex)	long	It represents an index for PM entries.
rslDivHopCDMaxSuppressedIntervals [Rsl Div Hop CDMax Suppressed Intervals] (pmRSLDivHopCDMaxSuppressed-Intervals)	long	The PmMaxSuppressedIntervals object limits the maximum number of suppressed intervals that will be collected without creating an instance of the historyData object. For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of (2^32)-1 implies infinite zero suppression, i.e. always suppress the zero intervals.

rslDivLinkHDSuspectIntervalFlag [Rsl Div Link HDSuspect Interval Flag] (pmRSLDivLinkHDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.
<p>RSLDivLinkHistoryDataStats15Min</p> <p>MIB entry name: opticsIMRSLDivLinkHistoryDataEntry</p> <p>Entry description: An entry of the RSLDivLinkHistoryDataTable. One entry of this table is created at the end of the time interval of the related CD (defined by granularity Period). At most n entries of opticsIMRSLDivLinkHistoryDataTable can be created indexed by the indexes of the corresponding CD entry and by the time of the measure (pmRSLDivLinkHDPeriodEndTime). This set of n entries is wrapped, when the n+1 measure is provided. The n+1 measure is written in the row of the table indexed by the smallest value of PeriodEndTime.</p> <p>Table description (for opticsIMRSLDivLinkHistoryDataTable): This table contains the History Data for the Performance Monitoring of Receive Signal level at Radio Link level..</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.PhysicalPort</p>		
rslDivLinkHDAverageLeveldBm [Rsl Div Link HDAverage LeveldBm] (pmRSLDivLinkHDAverageLevel)	double	The average of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rslDivLinkHDElapsedTime [Rsl Div Link HDElapsed Time] (pmRSLDivLinkHDElapsedTime)	long	It specifies the amount of time, measured in units of 0.01 second, that statistics for this entry (the current interval) have been counted.
rslDivLinkHDGranularityPeriod [Rsl Div Link HDGranularity Period] (pmRSLDivLinkHDGranularityPeriod)	long	It indicates the time base for measuring: 15 minutes,24 hours or one hour.

Table 680 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rslDivLinkHDMaximumLeveldBm [Rsl Div Link HDMaximum LevelBm] (pmRSLDivLinkHDMaximumLevel)	double	The maximum of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rslDivLinkHDMinimumLeveldBm [Rsl Div Link HDMinimum LevelBm] (pmRSLDivLinkHDMinimumLevel)	double	The minimum of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rslDivLinkHDNumSuppressedIntervals [Rsl Div Link HDNum Suppressed Intervals] (pmRSLDivLinkHDNumSuppressed-Intervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.
rslDivLinkHDPeriodEndTime [Rsl Div Link HDPeriod End Time] (pmRSLDivLinkHDPeriodEndTime)	long	The 0 value indicates the null value.
rslDivLinkHDSuspectIntervalFlag [Rsl Div Link HDSuspect Interval Flag] (pmRSLDivLinkHDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rsIHopCDMaxSuppressedIntervals [Rsl Hop CDMax Suppressed Intervals] (pmRSLHopCDMaxSuppressedIntervals)	long	The PmMaxSuppressedIntervals object limits the maximum number of suppressed intervals that will be collected without creating an instance of the historyData object. For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of $(2^{32})-1$ implies infinite zero suppression, i.e. always suppress the zero intervals.
rsIHopCDMaximumLeveldBm [Rsl Hop CDMaximum Level dBm] (pmRSLHopCDMaximumLevel)	double	The maximum of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rsIHopCDMinimumLeveldBm [Rsl Hop CDMinimum Level dBm] (pmRSLHopCDMinimumLevel)	double	The minimum of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rsIHopCDNumSuppressedIntervals [Rsl Hop CDNum Suppressed Intervals] (pmRSLHopCDNumSuppressedIntervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.

rsLinkCDAsapIndex [Rsl Link CDAsap Index] (pmRSLLinkCDAsapIndex)	long	It indicates the ASAP object associated to this CD.
rsLinkCDAverageLeveldBm [Rsl Link CDAverage LeveldBm] (pmRSLLinkCDAverageLevel)	double	The average of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rsLinkCDElapsedTime [Rsl Link CDElapsed Time] (pmRSLLinkCDElapsedTime)	long	It specifies the amount of time, measured in units of 0.01 second, that statistics for this entry (the current interval) have been counted.

Table 680 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rsLinkCDMaxSuppressedIntervals [Rsl Link CDMax Suppressed Intervals] (pmRSLLinkCDMaxSuppressedIntervals)	long	The PmMaxSuppressedIntervals object limits the maximum number of suppressed intervals that will be collected without creating an instance of the historyData object. For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of $(2^{32})-1$ implies infinite zero suppression, i.e. always suppress the zero intervals.
rsLinkCDMaximumLeveldBm [Rsl Link CDMaximum LeveldBm] (pmRSLLinkCDMaximumLevel)	double	The maximum of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rsLinkCDMinimumLeveldBm [Rsl Link CDMinimum LeveldBm] (pmRSLLinkCDMinimumLevel)	double	The minimum of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
rsLinkCDNumSuppressedIntervals [Rsl Link CDNum Suppressed Intervals] (pmRSLLinkCDNumSuppressedIntervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.

Table 680 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rsLinkCDSuspectIntervalFlag [Rsl Link CDSuspect Interval Flag] (pmRSLLinkCDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.

tslHopCDSuspectIntervalFlag [Tsl Hop CDSuspect Interval Flag] (pmTSLHopCDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.
<p>TSLHopCurrentDataStats24Hr</p> <p>MIB entry name: opticsIMTSLHopCurrentDataEntry</p> <p>Entry description: An entry of the TSLHopCurrentDataTable. An unavailable condition starts when 10 consecutive severely errored seconds have been detected; these 10 seconds belong to the unavailable time. An unavailable condition ends when 10 consecutive seconds with no severely errored second are detected. These 10 seconds belong to the available time. If an unavailable period is ending then the UAT Clear shall be sent. These performance event counts are inhibited during unavailable time. In the objects where a Default Value is specified, the write operation is allowed only to the indicated default value. The write operation to one counter is applied to all the counters of all the the associated objects, which have a defined default.</p> <p>Table description (for opticsIMTSLHopCurrentDataTable): This table contains the current data for the Performance Monitoring of Transmit Signal level at Radio Hop level.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • genericne.GenericNeInterface 		
tslHopCDAverageLeveldBm [Tsl Hop CDAverage LevelBm] (pmTSLHopCDAverageLevel)	double	The average of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
tslHopCDElapsedTime [Tsl Hop CDElapsed Time] (pmTSLHopCDElapsedTime)	long	It specifies the amount of time, measured in units of 0.01 second, that statistics for this entry (the current interval) have been counted.

Table 680 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tslHopCDGranularityPeriod [Tsl Hop CDGranularity Period] (pmTSLHopCDGranularityPeriod)	long	It indicates the time base for measuring: 15 minutes,24 hours or one hour.
tslHopCDMaxSuppressedIntervals [Tsl Hop CDMax Suppressed Intervals] (pmTSLHopCDMaxSuppressedIntervals)	long	The PmMaxSuppressedIntervals object limits the maximum number of suppressed intervals that will be collected without creating an instance of the historyData object. For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of $(2^{32})-1$ implies infinite zero suppression, i.e. always suppress the zero intervals.
tslHopCDMaximumLeveldBm [Tsl Hop CDMaximum LevelBm] (pmTSLHopCDMaximumLevel)	double	The maximum of the Signal Level. The associated measure unit expressed in unit of 0.1dBm
tslHopCDMinimumLeveldBm [Tsl Hop CDMinimum LevelBm] (pmTSLHopCDMinimumLevel)	double	The minimum of the Signal Level.The associated measure unit expressed in unit of 0.1dBm
tslHopCDNumSuppressedIntervals [Tsl Hop CDNum Suppressed Intervals] (pmTSLHopCDNumSuppressedIntervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.

For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of (2^32)-1 implies infinite zero suppression, i.e. always suppress the zero intervals.
ds1CDNumSuppressedIntervals [Ds 1 CDNum Suppressed Intervals] (pmDs1CDNumSuppressedIntervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.
ds1CDSes [Ds 1 CDSes] (pmDs1CDSes)	long	The number of SES.
ds1CDSuspectIntervalFlag [Ds 1 CDSuspect Interval Flag] (pmDs1CDSuspectIntervalFlag)	long	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.

When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.
e1CDSes [E1 CDSes] (pmE1CDSes)	long	The number of SES.
e1CDSuspectIntervalFlag [E1 CDSuspect Interval Flag] (pmE1CDSuspectIntervalFlag)	long	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
e1CDUas [E1 CDUas] (pmE1CDUas)	long	The number of UAS.
<p>E1CurrentStats15minOut</p> <p>MIB entry name: opticsIME1CurrentDataEntry</p> <p>Entry description: An entry of the E1CurrentDataTable. An unavailable condition starts when 10 consecutive severely errored seconds have been detected; these 10 seconds belong to the unavailable time. An unavailable condition ends when 10 consecutive seconds with no severely errored second are detected. These 10 seconds belong to the available time. If an unavailable period is ending then the UAT Clear shall be sent. These performance event counts are inhibited during unavailable time. In the objects where a Default Value is specified, the write operation is allowed only to the indicated default value. The write operation to one counter is applied to all the counters of all the the associated objects, which have a defined default.</p> <p>Table description (for opticsIME1CurrentDataTable): This table contains the current data for the Performance Monitoring on E1.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: tdmequipment.DS1E1PortSpecifics</p>		
e1CDBbe [E1 CDBbe] (pmE1CDBbe)	long	The number of BBE.
e1CDElapsedTime [E1 CDElapsed Time] (pmE1CDElapsedTime)	long	It specifies the amount of time, measured in units of 0.01 second, that statistics for this entry (the current interval) have been counted.
e1CDEs [E1 CDEs] (pmE1CDEs)	long	The number of ES.
e1CDGranularityPeriod [E1 CDGranularity Period] (pmE1CDGranularityPeriod)	long	It indicates the time base for measuring: 15 minutes,24 hours or one hour.

Table 682 tdmequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
e1CDMaxSuppressedIntervals [E1 CDMax Suppressed Intervals] (pmE1CDMaxSuppressedIntervals)	long	The PmMaxSuppressedIntervals object limits the maximum number of suppressed intervals that will be collected without creating an instance of the historyData object. For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of (2^32)-1 implies infinite zero suppression, i.e. always suppress the zero intervals.
e1CDNumSuppressedIntervals [E1 CDNum Suppressed Intervals] (pmE1CDNumSuppressedIntervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.
e1CDSes [E1 CDSes] (pmE1CDSes)	long	The number of SES.
e1CDSuspectIntervalFlag [E1 CDSuspect Interval Flag] (pmE1CDSuspectIntervalFlag)	long	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aggrMaintTxTDF [Aggr Maint Tx TDF] (ethAggrMaintTxTDF)	java. math. BigInteger	Total number of Ethernet frames which were chosen to be discarded due to buffer congestion
aggrMaintTxTTF [Aggr Maint Tx TTF] (ethAggrMaintTxTTF)	java. math. BigInteger	The number of Ethernet frames transmitted out by the Virtual Ethernet Interface.
aggrMaintTxTTFBroadcast [Aggr Maint Tx TTFBroadcast] (ethAggrMaintTxTTFBroadcast)	java. math. BigInteger	The number of good packets transmitted by this address that were directed to the broadcast address. This behavior is the same performed by the counter hostOutBroadcastPkts in the IETF RMON-MIB published as RFC 2819.
aggrMaintTxTTFMulticast [Aggr Maint Tx TTFMulticast] (ethAggrMaintTxTTFMulticast)	java. math. BigInteger	The number of good packets transmitted by this address that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address. This behavior is the same performed by the counter hostOutMulticastPkts in the IETF RMON-MIB published as RFC 2819.
aggrMaintTxTTFUnicast [Aggr Maint Tx TTFUnicast] (ethAggrMaintTxTTFUnicast)	java. math. BigInteger	The number of Ethernet Unicast frames transmitted out by the Virtual Ethernet Interface.
aggrMaintTxTTO [Aggr Maint Tx TTO] (ethAggrMaintTxTTO)	java. math. BigInteger	The number of octets of Ethernet frames transmitted out by the Virtual Ethernet Interface, including Ethernet headers characters

Table 684 mpr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MptStats</p> <p>MIB entry name: opticsIMEquipmentExtenEntry</p> <p>Entry description: An entry of the equipment extention table. Each entry (row), corresponding to a physical component of a managed element, includes additional fields not included in the associated opticsIMEquipmentEntry.</p> <p>Table description (for opticsIMEquipmentExtenTable): This table contains the information related to the resources that represent the physical components of a managed element, including replaceable components.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.PhysicalPort</p>		
equipPower [Equip Power] (equipmentPowerConsumption)	double	This object reports the value of the instantaneous power consumed by the equipment. The unit of measure is NE dependent and will be defined on own external specification
equipTemperature [Equip Temperature] (equipmentTemperature)	int	This object reports the temperature of the equipment expressed in Celsius degrees
inCurrent [In Current] (equipmentInputCurrent)	double	This object reports the value of the instantaneous electric current flowing through the equipment. The unit of measure is NE dependent and will be defined on own external specification.
inVoltage [In Voltage] (equipmentInputVoltage)	double	This object reports the value of instantaneous voltage applied to the equipment. The unit of measure is NE dependent and will be defined on own external specification.

aggrPerQueueMaintTCO [Aggr Per Queue Maint TCO] (ethAggrPerQueueMaintTCO)	java. math. BigInteger	The number of Ethernet conforming octets (green) accepted by the specific queue of this Ethernet interface
retrievingTime [Retrieving Time] (ethAggrPerQueueMaintRetrievingTime)	long	The NE time when counters are retrieved cause a maintenance action
<p>PdhFrameHopCurrentDataStats MIB entry name: opticsIMPdhFrameHopCurrentDataEntry Entry description: An entry of the pdhFrameHopCurrentDataTable. An unavailable condition starts when 10 consecutive severely errored seconds have been detected; these 10 seconds belong to the unavailable time. An unavailable condition ends when 10 consecutive seconds with no severely errored second are detected. These 10 seconds belong to the available time. If an unavailable period is ending then the UAT Clear shall be sent. These performance event counts are inhibited during unavailable time. In the objects where a Default Value is specified, the write operation is allowed only to the indicated default value. The write operation to one counter is applied to all the counters of all the the associated objects, which have a defined default. Table description (for opticsIMPdhFrameHopCurrentDataTable): This table contains the current data for the Performance Monitoring on PDH Frame at Radio Hop level. Supports realtime plotting Supports scheduled collection Monitored classes: • equipment.PhysicalPort • genericne.GenericNeInterface</p>		

Table 685 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pdhFrameHopCDBbe [Pdh Frame Hop CDBbe] (pmPdhFrameHopCDBbe)	long	The number of BBE.
pdhFrameHopCDElapsedTime [Pdh Frame Hop CDElapsed Time] (pmPdhFrameHopCDElapsedTime)	long	It specifies the amount of time, whose time granularity is NE-product specific (NE time granularity in units of 1 second) and independent from TimeInterval SNMP SYNTAX, that statistics for this entry (the current interval) have been counted.
pdhFrameHopCDEs [Pdh Frame Hop CDEs] (pmPdhFrameHopCDEs)	long	The number of ES.
pdhFrameHopCDMaxSuppressedIntervals [Pdh Frame Hop CDMax Suppressed Intervals] (pmPdhFrameHopCDMaxSuppressed-Intervals)	long	The PmMaxSuppressedIntervals object limits the maximum number of suppressed intervals that will be collected without creating an instance of the historyData object. For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of (2^32)-1 implies infinite zero suppression, i.e. always suppress the zero intervals.

Table 685 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pdhFrameHopCDNumSuppressedIntervals [Pdh Frame Hop CDNum Suppressed Intervals] (pmPdhFrameHopCDNumSuppressed-Intervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.
pdhFrameHopCDSes [Pdh Frame Hop CDSes] (pmPdhFrameHopCDSes)	long	The number of SES.
pdhFrameHopCDSuspectIntervalFlag [Pdh Frame Hop CDSuspect Interval Flag] (pmPdhFrameHopCDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.
pdhFrameHopCDUas [Pdh Frame Hop CDUas] (pmPdhFrameHopCDUas)	long	The number of UAS.

The write operation to one counter is applied to all the counters of all the the associated objects, which have a defined default.</p> <p>Table description (for opticsIMPdhFrameHopCurrentDataTable): This table contains the current data for the Performance Monitoring on PDH Frame at Radio Hop level.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • genericne.GenericNeInterface 		
pdhFrameHopCDBbe [Pdh Frame Hop CDBbe] (pmPdhFrameHopCDBbe)	long	The number of BBE.
pdhFrameHopCDElapsedTime [Pdh Frame Hop CDElapsed Time] (pmPdhFrameHopCDElapsedTime)	long	It specifies the amount of time, whose time granularity is NE-product specific (NE time granularity in units of 1 second) and independent from TimeInterval SNMP SYNTAX, that statistics for this entry (the current interval) have been counted.
pdhFrameHopCDEs [Pdh Frame Hop CDEs] (pmPdhFrameHopCDEs)	long	The number of ES.
pdhFrameHopCDGranularityPeriod [Pdh Frame Hop CDGranularity Period] (pmPdhFrameHopCDGranularityPeriod)	long	It indicates the time base for measuring: 15 minutes,24 hours or one hour.

Table 685 radioequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pdhFrameHopCDMaxSuppressedIntervals [Pdh Frame Hop CDMax Suppressed Intervals] (pmPdhFrameHopCDMaxSuppressed-Intervals)	long	The PmMaxSuppressedIntervals object limits the maximum number of suppressed intervals that will be collected without creating an instance of the historyData object. For example, consider an instance of current Data associated to one resource with maxSuppressedIntervals set to 32, and the interval set to 15 minutes: it means that after 32 consecutive suppressed (e.g., all-zero) intervals (8 hours) at least one historyData record (with all zero PM Parameters) will be generated with a NumSuppressedIntervals equal to 32. This ensures that at least one historyData record per maxSuppressedIntervals will be created. The value of this attribute cannot exceed the maximum possible value of the numSuppressedIntervals attribute. A value of $(2^{32})-1$ implies infinite zero suppression, i.e. always suppress the zero intervals.
pdhFrameHopCDNumSuppressedIntervals [Pdh Frame Hop CDNum Suppressed Intervals] (pmPdhFrameHopCDNumSuppressed-Intervals)	long	This attribute is non-zero only if the NE is suppressing History Data entry creation for the measured resource when the current interval terminates with 'all-zeroes' performance measurements. When non-zero, this attribute represents the number of 'all-zeroes' intervals that were suppressed immediately prior to the current interval. This attribute gets increment at the end of an interval if suppression has occurred, otherwise, the attribute is reset.
pdhFrameHopCDSes [Pdh Frame Hop CDSes] (pmPdhFrameHopCDSes)	long	The number of SES.
pdhFrameHopCDSuspectIntervalFlag [Pdh Frame Hop CDSuspect Interval Flag] (pmPdhFrameHopCDSuspectIntervalFlag)	int	This attribute is used to indicate that the performance data for the current period may not be reliable. Some reasons for this to occur are: - Suspect data were detected by the actual resource doing data collection - Transition of the row status attribute to/from the 'inService' state. - The performance counters were reset during the interval. - The current Data object associated to a resource was created during the monitoring period.

Table 686 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 686 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 686 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

36.1.1 Counters

Table 687 bgp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerAdditionalStats</p> <p>MIB entry name: bgpPeerEntry</p> <p>Entry description: Entry containing information about the connection with a BGP peer.</p> <p>Table description (for bgpPeerTable): BGP peer table. This table contains, one entry per BGP peer, information about the connections with BGP peers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
fsmEstablishedTime [Fsm Established Time] (bgpPeerFsmEstablishedTime)	long	This timer indicates how long (in seconds) this peer has been in the established state or how long since this peer was last in the established state. It is set to zero when a new peer is configured or when the router is booted.
<p>PeerGNEStats</p> <p>MIB entry name: bgpPeerEntry</p> <p>Entry description: Entry containing information about the connection with a BGP peer.</p> <p>Table description (for bgpPeerTable): BGP peer table. This table contains, one entry per BGP peer, information about the connections with BGP peers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
fsmEstablishedTransitions [Fsm Established Transitions] (bgpPeerFsmEstablishedTransitions)	long	The total number of times the BGP FSM transitioned into the established state for this peer.
inTotalMessages [In Total Messages] (bgpPeerInTotalMessages)	long	The total number of messages received from the remote peer on this connection.

Table 687 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inUpdates [In Updates] (bgpPeerInUpdates)	long	The number of BGP UPDATE messages received on this connection.
outTotalMessages [Out Total Messages] (bgpPeerOutTotalMessages)	long	The total number of messages transmitted to the remote peer on this connection.
outUpdates [Out Updates] (bgpPeerOutUpdates)	long	The number of BGP UPDATE messages transmitted on this connection.

Table 688 entity statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PhysicalSensorStats</p> <p>MIB entry name: entPhySensorEntry</p> <p>Entry description: Information about a particular physical sensor. An entry in this table describes the present reading of a sensor, the measurement units and scale, and sensor operational status. Entries are created in this table by the agent. An entry for each physical sensor SHOULD be created at the same time as the associated entPhysicalEntry. An entry SHOULD be destroyed if the associated entPhysicalEntry is destroyed.</p> <p>Table description (for entPhySensorTable): This table contains one row per physical sensor represented by an associated row in the entPhysicalTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: entity.PhysicalSensor</p>		
statsSensorOperStatus [Stats Sensor Oper Status] (entPhySensorOperStatus)	int	The operational status of the sensor.
statsSensorUnitsDisplay [Stats Sensor Units Display] (entPhySensorUnitsDisplay)	String	A textual description of the data units that should be used in the display of entPhySensorValue.
statsSensorValueTimeStamp [Stats Sensor Value Time Stamp] (entPhySensorValueTimeStamp)	long	The value of sysUpTime at the time the status and/or value of this sensor was last obtained by the agent.
statsSensorValueUpdateRate [Stats Sensor Value Update Rate] (entPhySensorValueUpdateRate)	long	An indication of the frequency that the agent updates the associated entPhySensorValue object, representing in milliseconds. The value zero indicates: - the sensor value is updated on demand (e.g., when polled by the agent for a get-request), - the sensor value is updated when the sensor value changes (event-driven), - the agent does not know the update rate.

Table 688 entity statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PhysicalSensorTruthStats</p> <p>MIB entry name: entPhySensorEntry</p> <p>Entry description: Information about a particular physical sensor. An entry in this table describes the present reading of a sensor, the measurement units and scale, and sensor operational status. Entries are created in this table by the agent. An entry for each physical sensor SHOULD be created at the same time as the associated entPhysicalEntry. An entry SHOULD be destroyed if the associated entPhysicalEntry is destroyed.</p> <p>Table description (for entPhySensorTable): This table contains one row per physical sensor represented by an associated row in the entPhysicalTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: entity.PhysicalSensor</p>		
statsSensorOperStatus [Stats Sensor Oper Status] (entPhySensorOperStatus)	int	The operational status of the sensor.
statsSensorUnitsDisplay [Stats Sensor Units Display] (entPhySensorUnitsDisplay)	String	A textual description of the data units that should be used in the display of entPhySensorValue.
statsSensorValue [Stats Sensor Value] (entPhySensorValue)	String	The most recent measurement obtained by the agent for this sensor. To correctly interpret the value of this object, the associated entPhySensorType, entPhySensorScale, and entPhySensorPrecision objects must also be examined.
statsSensorValueTimeStamp [Stats Sensor Value Time Stamp] (entPhySensorValueTimeStamp)	long	The value of sysUpTime at the time the status and/or value of this sensor was last obtained by the agent.

Table 688 entity statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsSensorValueUpdateRate [Stats Sensor Value Update Rate] (entPhySensorValueUpdateRate)	long	An indication of the frequency that the agent updates the associated entPhySensorValue object, representing in milliseconds. The value zero indicates: - the sensor value is updated on demand (e.g., when polled by the agent for a get-request), - the sensor value is updated when the sensor value changes (event-driven), - the agent does not know the update rate.
<p>PhysicalSensorUnknownStats</p> <p>MIB entry name: entPhySensorEntry</p> <p>Entry description: Information about a particular physical sensor. An entry in this table describes the present reading of a sensor, the measurement units and scale, and sensor operational status. Entries are created in this table by the agent. An entry for each physical sensor SHOULD be created at the same time as the associated entPhysicalEntry. An entry SHOULD be destroyed if the associated entPhysicalEntry is destroyed.</p> <p>Table description (for entPhySensorTable): This table contains one row per physical sensor represented by an associated row in the entPhysicalTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: entity.PhysicalSensor</p>		
statsSensorOperStatus [Stats Sensor Oper Status] (entPhySensorOperStatus)	int	The operational status of the sensor.
statsSensorUnitsDisplay [Stats Sensor Units Display] (entPhySensorUnitsDisplay)	String	A textual description of the data units that should be used in the display of entPhySensorValue.
statsSensorValue [Stats Sensor Value] (entPhySensorValue)	double	The most recent measurement obtained by the agent for this sensor. To correctly interpret the value of this object, the associated entPhySensorType, entPhySensorScale, and entPhySensorPrecision objects must also be examined.

Table 689 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 689 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 689 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 690 genericne statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 691 igmp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceGNEStats MIB entry name: igmpInterfaceEntry Entry description: An entry (conceptual row) representing an interface on which IGMP is enabled. Table description (for igmpInterfaceTable): The (conceptual) table listing the interfaces on which IGMP is enabled. Supports realtime plotting Supports scheduled collection Monitored class: igmp.Interface</p>		
rxGenQueries [Rx Gen Queries] (igmpInterfaceJoins)	long	The number of times a group membership has been added on this interface; that is, the number of times an entry for this interface has been added to the Cache Table. This object gives an indication of the amount of IGMP activity over the lifetime of the row entry.
rxWrongVersions [Rx Wrong Versions] (igmpInterfaceWrongVersionQueries)	long	The number of queries received whose IGMP version does not match igmpInterfaceVersion, over the lifetime of the row entry. IGMP requires that all routers on a LAN be configured to run the same version of IGMP. Thus, if any queries are received with the wrong version, this indicates a configuration error.

Table 692 Ldp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TargetedPeerGNEStats</p> <p>MIB entry name: mplsLdpEntityStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Entity. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP PDU received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e., the Session remains), then the error is counted in the mplsLdpSessionStatsEntry.</p> <p>Table description (for mplsLdpEntityStatsTable): This table is a read-only table which augments the mplsLdpEntityTable. The purpose of this table is to keep statistical information about the LDP Entities on the LSR.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.TargetedPeer</p>		
statsBadLdpIdentifierErrors [Stats Bad Ldp Identifier Errors] (mplsLdpEntityStatsBadLdpIdentifierErrors)	long	This object counts the number of Bad LDP Identifier Fatal Errors detected by the session(s) (past and present) associated with this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsBadMessageLengthErrors [Stats Bad Message Length Errors] (mplsLdpEntityStatsBadMessageLengthErrors)	long	This object counts the number of Bad Message Length Fatal Errors detected by the session(s) (past and present) associated with this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsBadPduLengthErrors [Stats Bad Pdu Length Errors] (mplsLdpEntityStatsBadPduLengthErrors)	long	This object counts the number of Bad PDU Length Fatal Errors detected by the session(s) (past and present) associated with this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.

Table 692 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsBadTlvLengthErrors [Stats Bad Tlv Length Errors] (mplsLdpEntityStatsBadTlvLengthErrors)	long	This object counts the number of Bad TLV Length Fatal Errors detected by the session(s) (past and present) associated with this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsKeepAliveTimerExpErrors [Stats Keep Alive Timer Exp Errors] (mplsLdpEntityStatsKeepAliveTimerExpErrors)	long	This object counts the number of Session Keep Alive Timer Expired Errors detected by the session(s) (past and present) associated with this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsMalformedTlvValueErrors [Stats Malformed Tlv Value Errors] (mplsLdpEntityStatsMalformedTlvValueErrors)	long	This object counts the number of Malformed TLV Value Fatal Errors detected by the session(s) (past and present) associated with this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsSessionAttempts [Stats Session Attempts] (mplsLdpEntityStatsSessionAttempts)	long	A count of the Session Initialization messages which were sent or received by this LDP Entity and were NAK'd. In other words, this counter counts the number of session initializations that failed. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsSessionRejectedAdErrors [Stats Session Rejected Ad Errors] (mplsLdpEntityStatsSessionRejectedAdErrors)	long	A count of the Session Rejected/Parameters Advertisement Mode Error Notification Messages sent or received by this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.

Table 692 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsSessionRejectedLRErrors [Stats Session Rejected LRErrors] (mplsLdpEntityStatsSessionRe- jectedLRErrors)	long	A count of the Session Rejected/Parameters Label Range Notification Messages sent or received by this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsSessionRejectedMaxPduErrors [Stats Session Rejected Max Pdu Errors] (mplsLdpEntityStatsSessionRe- jectedMaxPduErrors)	long	A count of the Session Rejected/Parameters Max Pdu Length Error Notification Messages sent or received by this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsSessionRejectedNoHelloErrors [Stats Session Rejected No Hello Errors] (mplsLdpEntityStatsSessionRe- jectedNoHelloErrors)	long	A count of the Session Rejected/No Hello Error Notification Messages sent or received by this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsShutdownReceivedNotifications [Stats Shutdown Received Notifications] (mplsLdpEntityStatsShutdownRe- ceivedNotifications)	long	This object counts the number of Shutdown Notifications received related to session(s) (past and present) associated with this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.
statsShutdownSentNotifications [Stats Shutdown Sent Notifications] (mplsLdpEntityStatsShutdownS- entNotifications)	long	This object counts the number of Shutdown Notifications sent related to session(s) (past and present) associated with this LDP Entity. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of mplsLdpEntityDiscontinuityTime.

Table 693 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description

Table 694 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 694 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 694 equipment statistics (continued)

Table 694 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 694 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 694 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 695 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 695 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 695 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 695 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 695 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 695 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 695 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 696 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PathEndPointStats MIB entry name: alaErpStatsEntry Entry description: The Statistics table entry. Table description (for alaErpStatsTable): There is one ERP Stats table per bridge. This table contains the statistics for the ERP on per Ring basis. Supports realtime plotting Supports scheduled collection Monitored class: ethring.PathEndpoint</p>		
noRequestPduDrop [No Request Pdu Drop] (alaErpStatsNoRequestPduDrop)	long	A count of the number of valid R-APS (NR) PDUs dropped.
noRequestPduRx [No Request Pdu Rx] (alaErpStatsNoRequestPduTx)	long	A count of the number of R-APS (NR) PDUs transmitted on this interface for this Ring.
noRequestPduTx [No Request Pdu Tx] (alaErpStatsNoRequestPduRx)	long	A count of the number of valid R-APS (NR) PDUs received on this interface for this Ring.
rplBlockPDUDrop [Rpl Block PDUDrop] (alaErpStatsRPLBlockPDUDrop)	long	A count of the number of valid R-APS (NR, RB) PDUs dropped.
rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 696 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	The trap shall be raised whenever the ring is removed dynamically in Unlike NI Scenario only.

Table 697 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 697 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 698 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 698 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 698 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 698 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (lldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
lldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (lldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: lldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for lldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the lldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lldp.LLDPPortConfiguration</p>		
lldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (lldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 699 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement</p>		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.

Table 699 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was 'badValue'.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was 'genErr'.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.

Table 699 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.

Table 699 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status was 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.

Table 699 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutTooBig [Snmp Out Too Bigs] (snmpOutTooBig)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 700 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: ospfAreaEntry</p> <p>Entry description: Information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for ospfAreaTable): Information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
totalLSACount [Total LSACount] (ospfAreaLsaCount)	long	The total number of link-state advertisements in this area's link-state database, excluding AS External LSA's.
totalSpfRuns [Total Spf Runs] (ospfSpfRuns)	long	The number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
<p>InterfaceGeneralStats</p> <p>MIB entry name: ospfIfEntry</p> <p>Entry description: The OSPF Interface Entry describes one interface from the viewpoint of OSPF.</p> <p>Table description (for ospfIfTable): The OSPF Interface Table describes the interfaces from the viewpoint of OSPF.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (ospfIfEvents)	long	The number of times this OSPF interface has changed its state, or an error has occurred.

egressPacketCount [Egress Packet Count] (alaSvcEgressPacketCount)	long	The total egress packet count flowing through this service.
ingressByteCount [Ingress Byte Count] (alaSvcIngressByteCount)	java. math. BigInteger	The total ingress byte count flowing through this service.
ingressPacketCount [Ingress Packet Count] (alaSvcIngressPacketCount)	long	The total ingress packet count flowing through this service.

Table 702 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AOSInterfaceStats MIB entry name: rip2IfStatEntry Entry description: A Single Routing Domain in a single Subnet. Table description (for rip2IfStatTable): A list of subnets which require separate status monitoring in RIP. Supports realtime plotting Supports scheduled collection Monitored class: rip.Interface</p>		
badPackets [Bad Packets] (rip2IfStatRcvBadPackets)	long	The number of RIP response packets received by the RIP process which were subsequently discarded for any reason (e.g. a version 0 packet, or an unknown command type).
badRoutes [Bad Routes] (rip2IfStatRcvBadRoutes)	long	The number of routes, in valid RIP packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
totalUpdates [Total Updates] (rip2IfStatSentUpdates)	long	The number of triggered RIP updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information.

Table 703 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 703 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 703 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 704 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPServiceStats</p> <p>MIB entry name: iphelperStatEntry</p> <p>Entry description: An entry in the stat table.</p> <p>Table description (for iphelperStatTable): This keeps statistics for each next hop IP Address.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.UDPServiceDestination</p>		
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperTxToServer [iphelper Tx To Server] (iphelperTxToNextHop)	long	This keeps track of the number of packets transmitted to the server.
<p>UDPServiceStats</p> <p>MIB entry name: genericUdpServiceDstEntry</p> <p>Entry description: An entry in Generic UDP Relay table</p> <p>Table description (for genericUdpServiceDstTable): This table defines the destination VLAN for the Generic UDP Relay Service. UDP packet with destination port genericUdpServiceUdpPort are forwarded to VLAN defined in genericUdpServiceDstVlan.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.UDPServiceDestination</p>		
udpTxToServer [Udp Tx To Server] (genericUdpServiceStatTxToVlan)	long	This keeps track of the number of packets transmitted to the destination VLAN with UDP destination port matching genericUdpServicePort.

Table 706 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 706 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 706 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 707 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 707 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 707 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 707 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 707 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 707 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 707 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 708 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PathEndPointStats</p> <p>MIB entry name: alaErpStatsEntry</p> <p>Entry description: The Statistics table entry.</p> <p>Table description (for alaErpStatsTable): There is one ERP Stats table per bridge. This table contains the statistics for the ERP on per Ring basis.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethring.PathEndpoint</p>		
noRequestPduDrop [No Request Pdu Drop] (alaErpStatsNoRequestPduDrop)	long	A count of the number of valid R-APS (NR) PDUs dropped.
noRequestPduRx [No Request Pdu Rx] (alaErpStatsNoRequestPduTx)	long	A count of the number of R-APS (NR) PDUs transmitted on this interface for this Ring.
noRequestPduTx [No Request Pdu Tx] (alaErpStatsNoRequestPduRx)	long	A count of the number of valid R-APS (NR) PDUs received on this interface for this Ring.
rplBlockPDUDrop [Rpl Block PDUDrop] (alaErpStatsRPLBlockPDUDrop)	long	A count of the number of valid R-APS (NR, RB) PDUs dropped.
rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 708 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	A count of the number of error R-APS PDUs received.

Table 709 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 709 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 710 layer2 statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
EServiceNNIPortL2ProtocolStats MIB entry name: alaEServiceNNIPortL2ProtocolStatisticsEntry Entry description: An E-Service NNI port L2 protocol statistics entry associated with port. Table description (for alaEServiceNNIPortL2ProtocolStatisticsTable): A table, that contains NNI port L2 protocol frame statistics. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.PhysicalPort • lag.Interface 		
eServiceNNIPortID [EService NNIPort ID] (alaEServiceNNIPortID)	int	The interface index of the NNI.
eServiceNNIPortL2MACTunneledDiscardFrames [EService NNIPort L2 MACTunneled Discard Frames] (alaEServiceNNIPortL2MACTunneledDiscardFrames)	long	This object describes the total number of discarded frames that are trapped to CPU with tunnel MAC.
eServiceNNIPortL2RxMACTunneledFrames [EService NNIPort L2 Rx MACTunneled Frames] (alaEServiceNNIPortL2RxMACTunneledFrames)	long	This object describes the total number of frames trapped to CPU with tunnel MAC.

Table 710 layer2 statistics (continued)

eServiceUNIPProfile [EService UNIPProfile] (alaEServiceUNIPProfile)	String	A label given to uniquely identify this profile. Must be at least one character long.
eServiceUNIPProfileL2ProtocolClearStats [EService UNIPProfile L2 Protocol Clear Stats] (alaEServiceUNIPProfileL2ProtocolClearStats)	int	This object is used to clear the UNI profile statistics of the interface.

Table 710 layer2 statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
eServiceUNIPProfileL2ProtocolTotalRxFrames [EService UNIPProfile L2 Protocol Total Rx Frames] (alaEServiceUNIPProfileL2ProtocolTotalRxFrames)	long	This object describes the total number of frames L2 protocol frames received by all the ports of bind to this profile.

Table 711 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 711 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPConfiguration</p>		

Table 711 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 711 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (lldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
lldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (lldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: lldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for lldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the lldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lldp.LLDPPortConfiguration</p>		
lldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (lldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 712 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 712 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 712 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 712 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBigs [Snmp Out Too Bigs] (snmpOutTooBigs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 713 ntp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>NTPServerStats</p> <p>MIB entry name: alaNtpStatsPeerEntry</p> <p>Entry description: Each entry corresponds to a synchronization host.</p> <p>Table description (for alaNtpStatsPeerTable): Table containing the synchronization host statistics.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ntp.NTPServer</p>		
alaNtpStatsPeerAddress [Ala Ntp Stats Peer Address] (alaNtpStatsPeerAddress)	String	The InetAddress of the synchronization host.
alaNtpStatsPeerAddressType [Ala Ntp Stats Peer Address Type] (alaNtpStatsPeerAddressType)	int	The InetAddress type of the synchronization host. InetAddressIPv4 (1) is the only type currently supported.
alaNtpStatsPeerBadAuth [Ala Ntp Stats Peer Bad Auth] (alaNtpStatsPeerBadAuth)	long	The number of packets received with bad authentication.
alaNtpStatsPeerBadDispersion [Ala Ntp Stats Peer Bad Dispersion] (alaNtpStatsPeerBadDispersion)	long	The number bad dispersions.
alaNtpStatsPeerBadRefTime [Ala Ntp Stats Peer Bad Ref Time] (alaNtpStatsPeerBadRefTime)	long	The number of bad reference times received.
alaNtpStatsPeerBogusOrigin [Ala Ntp Stats Peer Bogus Origin] (alaNtpStatsPeerBogusOrigin)	long	The number of bogus packets.

Table 713 ntp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
alaNtpStatsPeerCandidateOrder [Ala Ntp Stats Peer Candidate Order] (alaNtpStatsPeerCandidateOrder)	long	The order of synchronization candidates.
alaNtpStatsPeerDuplicate [Ala Ntp Stats Peer Duplicate] (alaNtpStatsPeerDuplicate)	long	The number of duplicated packets received.
alaNtpStatsPeerLastRcv [Ala Ntp Stats Peer Last Rcv] (alaNtpStatsPeerLastRcv)	long	The time since the last packet was received.
alaNtpStatsPeerNextSend [Ala Ntp Stats Peer Next Send] (alaNtpStatsPeerNextSend)	long	The time until the next packet is to be sent.
alaNtpStatsPeerPacketsRcvd [Ala Ntp Stats Peer Packets Rcvd] (alaNtpStatsPeerPacketsRcvd)	long	The number of packets that have been received.
alaNtpStatsPeerPacketsSent [Ala Ntp Stats Peer Packets Sent] (alaNtpStatsPeerPacketsSent)	long	The number of packets that have been sent.
alaNtpStatsPeerReachChange [Ala Ntp Stats Peer Reach Change] (alaNtpStatsPeerReachChange)	long	The time that the peer has been reachable.
alaNtpStatsPeerReset [Ala Ntp Stats Peer Reset] (alaNtpStatsPeerReset)	long	The number of seconds since the statistics for this peer were last reset. Writing any value will reset the peer statistics.

Table 714 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 714 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 714 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 715 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
UDPPortStats MIB entry name: iphelperDhcpSnoopingPortEntry Entry description: A DHCP Snooping Port entry. Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.DHCPSnoopingPort		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 715 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPServerStats</p> <p>MIB entry name: iphelperStatEntry</p> <p>Entry description: An entry in the stat table.</p> <p>Table description (for iphelperStatTable): This keeps statistics for each service by server address.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.UDPServiceDestination</p>		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 715 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 717 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 717 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 717 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 717 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 718 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 718 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 718 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 718 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 718 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 718 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 718 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 718 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 719 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PathEndPointStats</p> <p>MIB entry name: alaErpStatsEntry</p> <p>Entry description: The Statistics table entry.</p> <p>Table description (for alaErpStatsTable): There is one ERP Stats table per bridge. This table contains the statistics for the ERP on per Ring basis.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethring.PathEndpoint</p>		
noRequestPduDrop [No Request Pdu Drop] (alaErpStatsNoRequestPduDrop)	long	A count of the number of valid R-APS (NR) PDUs dropped.
noRequestPduRx [No Request Pdu Rx] (alaErpStatsNoRequestPduTx)	long	A count of the number of R-APS (NR) PDUs transmitted on this interface for this Ring.
noRequestPduTx [No Request Pdu Tx] (alaErpStatsNoRequestPduRx)	long	A count of the number of valid R-APS (NR) PDUs received on this interface for this Ring.
rplBlockPDUDrop [Rpl Block PDUDrop] (alaErpStatsRPLBlockPDUDrop)	long	A count of the number of valid R-APS (NR, RB) PDUs dropped.
rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 719 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	A count of the number of error R-APS PDUs received.

Table 720 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 720 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 721 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 721 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 721 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 721 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (IldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (IldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: IldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		
IldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (IldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 722 mvrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortStatsRecieve MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.PhysicalPort • lag.Interface 		
emptyTransmitted [Empty Transmitted] (alaMvrpPortStatsEmptyTransmitted)	long	The number of Empty messages transmitted.
failedRegistrations [Failed Registrations] (alaMvrpPortFailedRegistrations)	long	The total number of failed GVRP registrations, for any reason, on this port.

Table 722 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTransmitted [In Transmitted] (alaMvrpPortStatsInTransmitted)	long	The number of In messages transmitted.
joinEmptyTransmitted [Join Empty Transmitted] (alaMvrpPortStatsJoinEmptyTransmitted)	long	The number of Join Empty messages transmitted.
joinInTransmitted [Join In Transmitted] (alaMvrpPortStatsJoinInTransmitted)	long	The number of Join In messages transmitted.
leaveAllTransmitted [Leave All Transmitted] (alaMvrpPortStatsLeaveAllTransmitted)	long	The number of Leave all messages transmitted.
leaveTransmitted [Leave Transmitted] (alaMvrpPortStatsLeaveTransmitted)	long	The number of Leave messages transmitted.
newTransmitted [New Transmitted] (alaMvrpPortStatsNewTransmitted)	long	The number of New messages transmitted.
totalMsgsTransmitted [Total Msgs Transmitted] (alaMvrpPortStatsTotalMsgsTransmitted)	long	The total number of MVRP messages transmitted.
totalPDUTransmitted [Total PDUTransmitted] (alaMvrpPortStatsTotalPDUTransmitted)	long	The total number of MVRP PDUs transmitted.

Table 723 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `badValue`.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `genErr`.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 723 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 723 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 723 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBigs [Snmp Out Too Bigs] (snmpOutTooBigs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 724 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
AOSInterfaceStats MIB entry name: rip2IfStatEntry Entry description: A Single Routing Domain in a single Subnet. Table description (for rip2IfStatTable): A list of subnets which require separate status monitoring in RIP. Supports realtime plotting Supports scheduled collection Monitored class: rip.Interface		
badPackets [Bad Packets] (rip2IfStatRcvBadPackets)	long	The number of RIP response packets received by the RIP process which were subsequently discarded for any reason (e.g. a version 0 packet, or an unknown command type).
badRoutes [Bad Routes] (rip2IfStatRcvBadRoutes)	long	The number of routes, in valid RIP packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
totalUpdates [Total Updates] (rip2IfStatSentUpdates)	long	The number of triggered RIP updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information.

Table 725 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 725 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 725 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 726 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPPortStats</p> <p>MIB entry name: iphelperDhcpSnoopingPortEntry</p> <p>Entry description: A DHCP Snooping Port entry.</p> <p>Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.DHCPSnoopingPort</p>		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 726 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPServerStats MIB entry name: iphelperStatEntry Entry description: An entry in the stat table. Table description (for iphelperStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination</p>		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 726 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 728 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 728 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 728 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 729 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 729 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 729 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 729 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 729 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 729 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 729 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 730 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description

rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 730 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	A count of the number of error R-APS PDUs received.

Table 731 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdup Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 731 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 732 layer2 statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EServiceNNIPortL2ProtocolStats</p> <p>MIB entry name: alaEServiceNNIPortL2ProtocolStatisticsEntry</p> <p>Entry description: An E-Service NNI port L2 protocol statistics entry associated with port.</p> <p>Table description (for alaEServiceNNIPortL2ProtocolStatisticsTable): A table, that contains NNI port L2 protocol frame statistics.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • lag.Interface 		
eServiceNNIPortID [EService NNIPort ID] (alaEServiceNNIPortID)	int	The interface index of the NNI.
eServiceNNIPortL2MACTunneledDiscardFrames [EService NNIPort L2 MACTunneled Discard Frames] (alaEServiceNNIPortL2MACTunneledDiscardFrames)	long	This object describes the total number of discarded frames that are trapped to CPU with tunnel MAC.
eServiceNNIPortL2RxMACTunneledFrames [EService NNIPort L2 Rx MACTunneled Frames] (alaEServiceNNIPortL2RxMACTunneledFrames)	long	This object describes the total number of frames trapped to CPU with tunnel MAC.

Table 732 layer2 statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EServiceUNIProfileCustomL2ProtocolStats MIB entry name: alaEServiceUNIProfileCustomL2ProtocolStatisticsEntry Entry description: An E-Service UNI profile L2 protocol RX statistics entry associated with all ports of the UNI profile. Table description (for alaEServiceUNIProfileCustomL2ProtocolStatisticsTable): A table, that contains UNI profile L2 protocol frame RX statistics of all ports of the profile. Each entry represents statistics collected for one protocol of the UNI profile. Supports realtime plotting Supports scheduled collection Monitored class: ethernetservice.UniProfile</p>		
eServiceUNIProfileCustomL2ProtocolIndex [EService UNIProfile Custom L2 Protocol Index] (alaEServiceUNIProfileCustomL2ProtocolIndex)	String	Name of the L2 protocol entry. Must be at least one character long.
eServiceUNIProfileCustomL2ProtocolRxFrames [EService UNIProfile Custom L2 Protocol Rx Frames] (alaEServiceUNIProfileCustomL2ProtocolRxFrames)	Long	This object describes the total number of frames of this protocol received on this port and trapped to CPU.
eServiceUNIProfileCustomL2ProtocolTreatment [EService UNIProfile Custom L2 Protocol Treatment] (alaEServiceUNIProfileCustomL2ProtocolTreatment)	Int	This object describes the behavior of the bridge in regards to the destination Mac address matching with the L2 Custom protocol entry mac address on the UNI. Tunnel (1) enables the PDU to be tunneled across the provider network. Discard (2) causes the PDU of the protocol to be discarded and not enter the provider network. Peer (3) means that on this port the bridge is to participate in the protocol. Mac-Tunnel (4) enables mac-tunneling.
eServiceUNIProfileCustomL2StatsProfileID [EService UNIProfile Custom L2 Stats Profile ID] (alaEServiceUNIProfileCustomL2StatsProfileID)	String	A label given to uniquely identify this profile. Must be at least one character long.

Table 732 layer2 statistics (continued)

eServiceUNIPProfile [EService UNIPProfile] (alaEServiceUNIPProfile)	String	A label given to uniquely identify this profile. Must be at least one character long.
eServiceUNIPProfileL2ProtocolClearStats [EService UNIPProfile L2 Protocol Clear Stats] (alaEServiceUNIPProfileL2ProtocolClearStats)	int	This object is used to clear the UNI profile statistics of the interface.

Table 732 layer2 statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
eServiceUNIPProfileL2ProtocolTotalRxFrames [EService UNIPProfile L2 Protocol Total Rx Frames] (alaEServiceUNIPProfileL2ProtocolTotalRxFrames)	long	This object describes the total number of frames L2 protocol frames received by all the ports of bind to this profile.

Table 733 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 733 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPConfiguration</p>		

Table 733 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 733 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (IldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (IldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: IldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPConfiguration</p>		
IldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (IldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 734 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 734 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 734 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 734 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBigs [Snmp Out Too Bigs] (snmpOutTooBigs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 735 ntp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>NTPServerStats MIB entry name: alaNtpStatsPeerEntry Entry description: Each entry corresponds to a synchronization host. Table description (for alaNtpStatsPeerTable): Table containing the synchronization host statistics. Supports realtime plotting Supports scheduled collection Monitored class: ntp.NTPServer</p>		
alaNtpStatsPeerAddress [Ala Ntp Stats Peer Address] (alaNtpStatsPeerAddress)	String	The InetAddress of the synchronization host.
alaNtpStatsPeerAddressType [Ala Ntp Stats Peer Address Type] (alaNtpStatsPeerAddressType)	int	The InetAddress type of the synchronization host. InetAddressIPv4 (1) is the only type currently supported.
alaNtpStatsPeerBadAuth [Ala Ntp Stats Peer Bad Auth] (alaNtpStatsPeerBadAuth)	long	The number of packets received with bad authentication.
alaNtpStatsPeerBadDispersion [Ala Ntp Stats Peer Bad Dispersion] (alaNtpStatsPeerBadDispersion)	long	The number bad dispersions.
alaNtpStatsPeerBadRefTime [Ala Ntp Stats Peer Bad Ref Time] (alaNtpStatsPeerBadRefTime)	long	The number of bad reference times received.
alaNtpStatsPeerBogusOrigin [Ala Ntp Stats Peer Bogus Origin] (alaNtpStatsPeerBogusOrigin)	long	The number of bogus packets.

Table 735 ntp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
alaNtpStatsPeerCandidateOrder [Ala Ntp Stats Peer Candidate Order] (alaNtpStatsPeerCandidateOrder)	long	The order of synchronization candidates.
alaNtpStatsPeerDuplicate [Ala Ntp Stats Peer Duplicate] (alaNtpStatsPeerDuplicate)	long	The number of duplicated packets received.
alaNtpStatsPeerLastRcv [Ala Ntp Stats Peer Last Rcv] (alaNtpStatsPeerLastRcv)	long	The time since the last packet was received.
alaNtpStatsPeerNextSend [Ala Ntp Stats Peer Next Send] (alaNtpStatsPeerNextSend)	long	The time until the next packet is to be sent.
alaNtpStatsPeerPacketsRcvd [Ala Ntp Stats Peer Packets Rcvd] (alaNtpStatsPeerPacketsRcvd)	long	The number of packets that have been received.
alaNtpStatsPeerPacketsSent [Ala Ntp Stats Peer Packets Sent] (alaNtpStatsPeerPacketsSent)	long	The number of packets that have been sent.
alaNtpStatsPeerReachChange [Ala Ntp Stats Peer Reach Change] (alaNtpStatsPeerReachChange)	long	The time that the peer has been reachable.
alaNtpStatsPeerReset [Ala Ntp Stats Peer Reset] (alaNtpStatsPeerReset)	long	The number of seconds since the statistics for this peer were last reset. Writing any value will reset the peer statistics.

Table 736 ptp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
EsmPtpStats MIB entry name: esmPtpStatsEntry Entry description: An entry corresponding to each port. Table description (for esmPtpStatsTable): The table lists the Statistics params of PTP. Supports realtime plotting Supports scheduled collection Monitored class: equipment.PhysicalPort		
esmPtpStatsEgrPtpDrop [Esm Ptp Stats Egr Ptp Drop] (esmPtpStatsEgrPtpDrop)	long	The number of PTP packets dropped at egress by the port
esmPtpStatsEgrPtpUpdateRes [Esm Ptp Stats Egr Ptp Update Res] (esmPtpStatsEgrPtpUpdateRes)	long	The compliance statement for the esm per slot information.
esmPtpStatsEgrPtpv1 [Esm Ptp Stats Egr Ptpv 1] (esmPtpStatsEgrPtpv1)	long	The number of PTP V1 packets egress from the port
esmPtpStatsEgrPtpv2 [Esm Ptp Stats Egr Ptpv 2] (esmPtpStatsEgrPtpv2)	long	The number of PTP V2 packets egress from the port

esmPtpStatsIngPtpPigBag [Esm Ptp Stats Ing Ptp Pig Bag] (esmPtpStatsIngPtpPigBag)	long	The number of PTP Piggy Bag added to ingress packets in the port

Table 736 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
esmPtpStatsIngPtpv1 [Esm Ptp Stats Ing Ptpv 1] (esmPtpStatsIngPtpv1)	long	The number of PTP V1 packets ingress in to the port
esmPtpStatsIngPtpv2 [Esm Ptp Stats Ing Ptpv 2] (esmPtpStatsIngPtpv2)	long	The number of PTP V2 packets ingress in to the port

Table 737 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 737 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 737 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 738 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPPortStats</p> <p>MIB entry name: iphelperDhcpSnoopingPortEntry</p> <p>Entry description: A DHCP Snooping Port entry.</p> <p>Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.DHCPSnoopingPort</p>		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 738 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPServerStats</p> <p>MIB entry name: iphelperStatEntry</p> <p>Entry description: An entry in the stat table.</p> <p>Table description (for iphelperStatTable): This keeps statistics for each service by server address.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.UDPServiceDestination</p>		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 738 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

Table 740 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 740 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 740 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 740 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 740 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 741 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 741 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 741 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 741 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 741 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 741 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 741 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 741 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 742 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PathEndPointStats</p> <p>MIB entry name: alaErpStatsEntry</p> <p>Entry description: The Statistics table entry.</p> <p>Table description (for alaErpStatsTable): There is one ERP Stats table per bridge. This table contains the statistics for the ERP on per Ring basis.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethring.PathEndpoint</p>		
noRequestPduDrop [No Request Pdu Drop] (alaErpStatsNoRequestPduDrop)	long	A count of the number of valid R-APS (NR) PDUs dropped.
noRequestPduRx [No Request Pdu Rx] (alaErpStatsNoRequestPduTx)	long	A count of the number of R-APS (NR) PDUs transmitted on this interface for this Ring.
noRequestPduTx [No Request Pdu Tx] (alaErpStatsNoRequestPduRx)	long	A count of the number of valid R-APS (NR) PDUs received on this interface for this Ring.
rplBlockPDUDrop [Rpl Block PDUDrop] (alaErpStatsRPLBlockPDUDrop)	long	A count of the number of valid R-APS (NR, RB) PDUs dropped.
rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 742 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	A count of the number of error R-APS PDUs received.

Table 743 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 743 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 744 layer2 statistics

eServiceUNIPProfile [EService UNIPProfile] (alaEServiceUNIPProfile)	String	A label given to uniquely identify this profile. Must be at least one character long.
eServiceUNIPProfileL2ProtocolClearStats [EService UNIPProfile L2 Protocol Clear Stats] (alaEServiceUNIPProfileL2ProtocolClearStats)	int	This object is used to clear the UNI profile statistics of the interface.

Table 744 layer2 statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
eServiceUNIPProfileL2ProtocolTotalRxFrames [EService UNIPProfile L2 Protocol Total Rx Frames] (alaEServiceUNIPProfileL2ProtocolTotalRxFrames)	long	This object describes the total number of frames L2 protocol frames received by all the ports of bind to this profile.

Table 745 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 745 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 745 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 745 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (lldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
lldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (lldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: lldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for lldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the lldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lldp.LLDPPortConfiguration</p>		
lldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (lldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 746 mvrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortStatsRecieve MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. Supports realtime plotting Supports scheduled collection Monitored class: mvrp.Interface</p>		
emptyReceived [Empty Received] (alaMvrpPortStatsEmptyReceived)	long	The number of Empty messages received.
inReceived [In Received] (alaMvrpPortStatsInReceived)	long	The number of In messages received.
invalidMsgsReceived [Invalid Msgs Received] (alaMvrpPortStatsInvalidMsgsReceived)	long	The number of Invalid messages received.
joinEmptyReceived [Join Empty Received] (alaMvrpPortStatsJoinEmptyReceived)	long	The number of Join Empty messages received.
joinInReceived [Join In Received] (alaMvrpPortStatsJoinInReceived)	long	The number of Join In messages received.
leaveAllReceived [Leave All Received] (alaMvrpPortStatsLeaveAllReceived)	long	The number of Leave all messages received.

Table 746 mvrp statistics (continued)

leaveReceived [Leave Received] (alaMvrpPortStatsLeaveReceived)	long	The number of Leave messages received.
newReceived [New Received] (alaMvrpPortStatsNewReceived)	long	The number of New messages received.
totalMsgsReceived [Total Msgs Received] (alaMvrpPortStatsTotalMsgsReceived)	long	The total number of MVRP messages received.
totalPDURceived [Total PDURceived] (alaMvrpPortStatsTotalPDURceived)	long	The total number of MVRP PDUs received.
PortStatsTransmit MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.PhysicalPort • lag.Interface 		
emptyTransmitted [Empty Transmitted] (alaMvrpPortStatsEmptyTransmitted)	long	The number of Empty messages transmitted.
failedRegistrations [Failed Registrations] (alaMvrpPortFailedRegistrations)	long	The total number of failed GVRP registrations, for any reason, on this port.

Table 746 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTransmitted [In Transmitted] (alaMvrpPortStatsInTransmitted)	long	The number of In messages transmitted.
joinEmptyTransmitted [Join Empty Transmitted] (alaMvrpPortStatsJoinEmptyTransmitted)	long	The number of Join Empty messages transmitted.
joinInTransmitted [Join In Transmitted] (alaMvrpPortStatsJoinInTransmitted)	long	The number of Join In messages transmitted.
leaveAllTransmitted [Leave All Transmitted] (alaMvrpPortStatsLeaveAllTransmitted)	long	The number of Leave all messages transmitted.
leaveTransmitted [Leave Transmitted] (alaMvrpPortStatsLeaveTransmitted)	long	The number of Leave messages transmitted.
newTransmitted [New Transmitted] (alaMvrpPortStatsNewTransmitted)	long	The number of New messages transmitted.
totalMsgsTransmitted [Total Msgs Transmitted] (alaMvrpPortStatsTotalMsgsTransmitted)	long	The total number of MVRP messages transmitted.
totalPDUTransmitted [Total PDUTransmitted] (alaMvrpPortStatsTotalPDUTransmitted)	long	The total number of MVRP PDUs transmitted.

Table 747 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `badValue`.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `genErr`.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 747 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 747 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 747 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBigs [Snmp Out Too Bigs] (snmpOutTooBigs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 748 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
AreaBasicStats MIB entry name: ospfAreaEntry Entry description: Information describing the configured parameters and cumulative statistics of one of the router's attached areas. Table description (for ospfAreaTable): Information describing the configured parameters and cumulative statistics of the router's attached areas. Supports realtime plotting Supports scheduled collection Monitored class: ospf.AreaSite		
totalLSACount [Total LSACount] (ospfAreaLsaCount)	long	The total number of link-state advertisements in this area's link-state database, excluding AS External LSA's.
totalSpfRuns [Total Spf Runs] (ospfSpfRuns)	long	The number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
InterfaceGeneralStats MIB entry name: ospfIfEntry Entry description: The OSPF Interface Entry describes one interface from the viewpoint of OSPF. Table description (for ospfIfTable): The OSPF Interface Table describes the interfaces from the viewpoint of OSPF. Supports realtime plotting Supports scheduled collection Monitored class: ospf.Interface		
events [Events] (ospfIfEvents)	long	The number of times this OSPF interface has changed its state, or an error has occurred.

Table 748 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
NeighborGeneralStats MIB entry name: ospfNbrEntry Entry description: The information regarding a single neighbor. Table description (for ospfNbrTable): A table of non-virtual neighbor information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • ospf.Neighbor • ospf.OspfNeighbor 		
events [Events] (ospfNbrEvents)	long	The number of times this neighbor relationship has changed state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (ospfNbrLsRetransQLen)	long	The current length of the retransmission queue.
NeighborLinkStateStats MIB entry name: alaOspfNbrAugEntry Entry description: Additions to neighbor table Table description (for alaOspfNbrAugTable): Extensions to the ospfNbrTable Supports realtime plotting Supports scheduled collection Monitored class: ospf.OspfNeighbor		
outstandingLSAcks [Outstanding LSAcks] (alaOspfNbrPendingLSack)	long	Number of outstanding link state acknowledgements to be sent to this neighbor
outstandingLSRequests [Outstanding LSRequests] (alaOspfNbrPendingLSreq)	long	Number of outstanding link state requests to be sent to this neighbor

Table 748 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outstandingLSRetramit [Outstanding LSRetramit] (alaOspfNbrPendingLSupd)	long	Number of outstanding link state update packets to be sent to this neighbor
VirtualNeighborGeneralStats MIB entry name: ospfVirtNbrEntry Entry description: Virtual neighbor information. Table description (for ospfVirtNbrTable): A table of virtual neighbor information. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor		
events [Events] (ospfVirtNbrEvents)	long	The number of times this virtual link has changed its state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (ospfVirtNbrLsRetransQLen)	long	The current length of the retransmission queue.
VirtualNeighborLinkStateStats MIB entry name: alaOspfVirtNbrAugEntry Entry description: Information regarding a single virtual neighbor. Table description (for alaOspfVirtNbrAugTable): Extensions to ospfVirtNbrTable Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor		
outstandingLSAcks [Outstanding LSAcks] (alaOspfVirtNbrPendingLSack)	long	Number of outstanding link state acknowledgements to be sent to this neighbor

Table 748 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outstandingLSRequests [Outstanding LSRequests] (alaOspfVirtNbrPendingLSreq)	long	Number of outstanding link state requests to be sent to this neighbor
outstandingLSRetramit [Outstanding LSRetramit] (alaOspfVirtNbrPendingLSupd)	long	Number of outstanding link state update packets to be sent to this neighbor

Table 749 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
AOSInterfaceStats MIB entry name: rip2IfStatEntry Entry description: A Single Routing Domain in a single Subnet. Table description (for rip2IfStatTable): A list of subnets which require separate status monitoring in RIP. Supports realtime plotting Supports scheduled collection Monitored class: rip.Interface		
badPackets [Bad Packets] (rip2IfStatRcvBadPackets)	long	The number of RIP response packets received by the RIP process which were subsequently discarded for any reason (e.g. a version 0 packet, or an unknown command type).
badRoutes [Bad Routes] (rip2IfStatRcvBadRoutes)	long	The number of routes, in valid RIP packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
totalUpdates [Total Updates] (rip2IfStatSentUpdates)	long	The number of triggered RIP updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information.

Table 750 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 750 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 750 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 751 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
UDPPortStats MIB entry name: iphelperDhcpSnoopingPortEntry Entry description: A DHCP Snooping Port entry. Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.DHCPSnoopingPort		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 751 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPServerStats MIB entry name: iphelperStatEntry Entry description: An entry in the stat table. Table description (for iphelperStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination</p>		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 751 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 753 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 753 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 753 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 753 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 754 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 754 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 754 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 754 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 754 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 754 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 754 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 754 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 755 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PathEndPointStats MIB entry name: alaErpStatsEntry Entry description: The Statistics table entry. Table description (for alaErpStatsTable): There is one ERP Stats table per bridge. This table contains the statistics for the ERP on per Ring basis. Supports realtime plotting Supports scheduled collection Monitored class: ethring.PathEndpoint</p>		
noRequestPduDrop [No Request Pdu Drop] (alaErpStatsNoRequestPduDrop)	long	A count of the number of valid R-APS (NR) PDUs dropped.
noRequestPduRx [No Request Pdu Rx] (alaErpStatsNoRequestPduTx)	long	A count of the number of R-APS (NR) PDUs transmitted on this interface for this Ring.
noRequestPduTx [No Request Pdu Tx] (alaErpStatsNoRequestPduRx)	long	A count of the number of valid R-APS (NR) PDUs received on this interface for this Ring.
rplBlockPDUDrop [Rpl Block PDUDrop] (alaErpStatsRPLBlockPDUDrop)	long	A count of the number of valid R-APS (NR, RB) PDUs dropped.
rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 755 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	A count of the number of error R-APS PDUs received.

Table 756 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 756 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 757 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 757 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 757 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 757 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (lldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
lldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (lldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: lldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for lldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the lldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lldp.LLDPPortConfiguration</p>		
lldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (lldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 758 mvrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortStatsRecieve MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. Supports realtime plotting Supports scheduled collection Monitored class: mvrp.Interface</p>		
emptyReceived [Empty Received] (alaMvrpPortStatsEmptyReceived)	long	The number of Empty messages received.
inReceived [In Received] (alaMvrpPortStatsInReceived)	long	The number of In messages received.
invalidMsgsReceived [Invalid Msgs Received] (alaMvrpPortStatsInvalidMsgsReceived)	long	The number of Invalid messages received.
joinEmptyReceived [Join Empty Received] (alaMvrpPortStatsJoinEmptyReceived)	long	The number of Join Empty messages received.
joinInReceived [Join In Received] (alaMvrpPortStatsJoinInReceived)	long	The number of Join In messages received.
leaveAllReceived [Leave All Received] (alaMvrpPortStatsLeaveAllReceived)	long	The number of Leave all messages received.

Table 758 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
leaveReceived [Leave Received] (alaMvrpPortStatsLeaveReceived)	long	The number of Leave messages received.
newReceived [New Received] (alaMvrpPortStatsNewReceived)	long	The number of New messages received.
totalMsgsReceived [Total Msgs Received] (alaMvrpPortStatsTotalMsgsReceived)	long	The total number of MVRP messages received.
totalPDURceived [Total PDURceived] (alaMvrpPortStatsTotalPDURceived)	long	The total number of MVRP PDUs received.
PortStatsTransmit MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.PhysicalPort • lag.Interface 		
emptyTransmitted [Empty Transmitted] (alaMvrpPortStatsEmptyTransmitted)	long	The number of Empty messages transmitted.
failedRegistrations [Failed Registrations] (alaMvrpPortFailedRegistrations)	long	The total number of failed GVRP registrations, for any reason, on this port.

Table 758 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTransmitted [In Transmitted] (alaMvrpPortStatsInTransmitted)	long	The number of In messages transmitted.
joinEmptyTransmitted [Join Empty Transmitted] (alaMvrpPortStatsJoinEmptyTransmitted)	long	The number of Join Empty messages transmitted.
joinInTransmitted [Join In Transmitted] (alaMvrpPortStatsJoinInTransmitted)	long	The number of Join In messages transmitted.
leaveAllTransmitted [Leave All Transmitted] (alaMvrpPortStatsLeaveAllTransmitted)	long	The number of Leave all messages transmitted.
leaveTransmitted [Leave Transmitted] (alaMvrpPortStatsLeaveTransmitted)	long	The number of Leave messages transmitted.
newTransmitted [New Transmitted] (alaMvrpPortStatsNewTransmitted)	long	The number of New messages transmitted.
totalMsgsTransmitted [Total Msgs Transmitted] (alaMvrpPortStatsTotalMsgsTransmitted)	long	The total number of MVRP messages transmitted.
totalPDUTransmitted [Total PDUTransmitted] (alaMvrpPortStatsTotalPDUTransmitted)	long	The total number of MVRP PDUs transmitted.

Table 759 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `badValue`.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `genErr`.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 759 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 759 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 759 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBig [Snmp Out Too Bigs] (snmpOutTooBig)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 760 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: ospfAreaEntry</p> <p>Entry description: Information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for ospfAreaTable): Information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
totalLSACount [Total LSACount] (ospfAreaLsaCount)	long	The total number of link-state advertisements in this area's link-state database, excluding AS External LSA's.
totalSpfRuns [Total Spf Runs] (ospfSpfRuns)	long	The number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
<p>InterfaceGeneralStats</p> <p>MIB entry name: ospfIfEntry</p> <p>Entry description: The OSPF Interface Entry describes one interface from the viewpoint of OSPF.</p> <p>Table description (for ospfIfTable): The OSPF Interface Table describes the interfaces from the viewpoint of OSPF.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (ospfIfEvents)	long	The number of times this OSPF interface has changed its state, or an error has occurred.

Table 760 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description

Table 761 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
AOSInterfaceStats MIB entry name: rip2IfStatEntry Entry description: A Single Routing Domain in a single Subnet. Table description (for rip2IfStatTable): A list of subnets which require separate status monitoring in RIP. Supports realtime plotting Supports scheduled collection Monitored class: rip.Interface		
badPackets [Bad Packets] (rip2IfStatRcvBadPackets)	long	The number of RIP response packets received by the RIP process which were subsequently discarded for any reason (e.g. a version 0 packet, or an unknown command type).
badRoutes [Bad Routes] (rip2IfStatRcvBadRoutes)	long	The number of routes, in valid RIP packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
totalUpdates [Total Updates] (rip2IfStatSentUpdates)	long	The number of triggered RIP updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information.

Table 762 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 762 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 762 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 763 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
UDPPortStats MIB entry name: iphelperDhcpSnoopingPortEntry Entry description: A DHCP Snooping Port entry. Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.DHCPSnoopingPort		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 763 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPServerStats MIB entry name: iphelperStatEntry Entry description: An entry in the stat table. Table description (for iphelperStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination</p>		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 763 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

Table 764 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 764 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 764 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 764 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 764 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 765 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 765 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 765 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 765 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 765 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 765 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 765 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 765 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 766 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
PathEndPointStats MIB entry name: alaErpStatsEntry Entry description: The Statistics table entry. Table description (for alaErpStatsTable): There is one ERP Stats table per bridge. This table contains the statistics for the ERP on per Ring basis. Supports realtime plotting Supports scheduled collection Monitored class: ethring.PathEndpoint		
noRequestPduDrop [No Request Pdu Drop] (alaErpStatsNoRequestPduDrop)	long	A count of the number of valid R-APS (NR) PDUs dropped.
noRequestPduRx [No Request Pdu Rx] (alaErpStatsNoRequestPduTx)	long	A count of the number of R-APS (NR) PDUs transmitted on this interface for this Ring.
noRequestPduTx [No Request Pdu Tx] (alaErpStatsNoRequestPduRx)	long	A count of the number of valid R-APS (NR) PDUs received on this interface for this Ring.
rplBlockPDUDrop [Rpl Block PDUDrop] (alaErpStatsRPLBlockPDUDrop)	long	A count of the number of valid R-APS (NR, RB) PDUs dropped.
rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 766 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	The trap shall be raised whenever the ring is removed dynamically in Unlike NI Scenario only.

Table 767 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 767 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 768 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 768 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 768 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 768 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (lldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
lldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (lldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: lldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for lldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the lldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lldp.LLDPPortConfiguration</p>		
lldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (lldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 769 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement</p>		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.

Table 769 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was 'badValue'.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was 'genErr'.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.

Table 769 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.

Table 769 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status was 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.

Table 769 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutTooBigs [Snmp Out Too Bigs] (snmpOutTooBigs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was `tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 770 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: ospfAreaEntry</p> <p>Entry description: Information describing the configured parameters and cumulative statistics of one of the router's attached areas. The interfaces and virtual links are configured as part of these areas. Area 0.0.0.0, by definition, is the backbone area. Information in this table is persistent and when this object is written the entity SHOULD save the change to non-volatile storage.</p> <p>Table description (for ospfAreaTable): Information describing the configured parameters and cumulative statistics of the router's attached areas. The interfaces and virtual links are configured as part of these areas. Area 0.0.0.0, by definition, is the backbone area.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
totalLSACount [Total LSACount] (ospfAreaLsaCount)	long	The total number of link state advertisements in this area's link state database, excluding AS-external LSAs.
totalSpfRuns [Total Spf Runs] (ospfSpfRuns)	long	The number of times that the intra-area route table has been calculated using this area's link state database. This is typically done using Dijkstra's algorithm. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
<p>InterfaceGeneralStats</p> <p>MIB entry name: ospflfEntry</p> <p>Entry description: The OSPF interface entry describes one interface from the viewpoint of OSPF. Information in this table is persistent and when this object is written the entity SHOULD save the change to non-volatile storage.</p> <p>Table description (for ospflfTable): The OSPF Interface Table describes the interfaces from the viewpoint of OSPF. It augments the ipAddrTable with OSPF specific information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		

Table 770 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
events [Events] (ospfIfEvents)	long	The number of times this OSPF interface has changed its state or an error has occurred. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
NeighborGeneralStats MIB entry name: ospfNbrEntry Entry description: The information regarding a single neighbor. Information in this table is persistent and when this object is written the entity SHOULD save the change to non-volatile storage. Table description (for ospfNbrTable): A table describing all non-virtual neighbors in the locality of the OSPF router. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • ospf.Neighbor • ospf.OspfNeighbor 		
events [Events] (ospfNbrEvents)	long	The number of times this neighbor relationship has changed state or an error has occurred. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
retransmissionQueueLength [Retransmission Queue Length] (ospfNbrLsRetransQLen)	long	The current length of the retransmission queue.
NeighborLinkStateStats MIB entry name: alaOspfNbrAugEntry Entry description: Additions to neighbor table Table description (for alaOspfNbrAugTable): Extensions to the ospfNbrTable Supports realtime plotting Supports scheduled collection Monitored class: ospf.OspfNeighbor		

Table 770 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outstandingLSAcks [Outstanding LSAcks] (alaOspfNbrPendingLSAck)	long	Number of outstanding link state acknowledgements to be sent to this neighbor
outstandingLSRequests [Outstanding LSRequests] (alaOspfNbrPendingLSreq)	long	Number of outstanding link state requests to be sent to this neighbor
outstandingLSRetramit [Outstanding LSRetramit] (alaOspfNbrPendingLSupd)	long	Number of outstanding link state update packets to be sent to this neighbor
OspfStats MIB entry name: alaOspfGeneralTable Table description (for alcatelIND1OSPFMIBObjects): Branch For Open Shortest Path First (OSPF) Subsystem Managed Objects. Supports realtime plotting Supports scheduled collection Monitored class: ospf.Site		
activeAreas [Active Areas] (alaOspfTotalActiveAreas)	long	Total Number of active areas configured on this router
attachedAreas [Attached Areas] (alaOspfTotalAreas)	long	Total Number of areas configured on this router
attachedNSSAs [Attached NSSAs] (alaOspfTotalNSSA)	long	Total Number of NSSA areas on this router

Table 770 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
exchStateNbrs [Exch State Nbrs] (alaOspfTotalExchNbrs)	long	Number of EXCHANGE state neighbors on this router
fullStateNbrs [Full State Nbrs] (alaOspfTotalFullNbrs)	long	Number of FULL state neighbors on this router
incrSpfRunsDone [Incr Spf Runs Done] (alaOspfTotalIncrSpfRuns)	long	Total number of Incremental SPF runs performed on this router
initStateNbrs [Init State Nbrs] (alaOspfTotalInitNbrs)	long	Number of INIT state neighbors on this router
newLsasOriginated [New Lsas Originated] (ospfOriginateNewLsas)	long	The number of new link state advertisements that have been originated. This number is incremented each time the router originates a new LSA. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
newLsasReceived [New Lsas Received] (ospfRxNewLsas)	long	The number of link state advertisements received that are determined to be new instantiations. This number does not include newer instantiations of self-originated link state advertisements. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
routeCount [Route Count] (alaOspfRouteNumber)	long	The number of network routes in OSPF routing table.

Table 770 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
spfRunsDone [Spf Runs Done] (alaOspfTotalSpfRuns)	long	Total number of SPF runs performed on this router
transitAreas [Transit Areas] (alaOspfTotalTransitAreas)	long	Number of transit areas on this router
twoWayStateNbrs [Two Way State Nbrs] (alaOspfTotal2wayNbrs)	long	Number of 2-way state neighbors on this router
VirtualNeighborGeneralStats MIB entry name: ospfVirtNbrEntry Entry description: Virtual neighbor information. Table description (for ospfVirtNbrTable): This table describes all virtual neighbors. Since virtual links are configured in the Virtual Interface Table, this table is read-only. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor		
events [Events] (ospfVirtNbrEvents)	long	The number of times this virtual link has changed its state or an error has occurred. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
retransmissionQueueLength [Retransmission Queue Length] (ospfVirtNbrLsRetransQLen)	long	The current length of the retransmission queue.

Table 770 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualNeighborLinkStateStats MIB entry name: alaOspfVirtNbrAugEntry Entry description: Information regarding a single virtual neighbor. Table description (for alaOspfVirtNbrAugTable): Extensions to ospfVirtNbrTable Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
outstandingLSAcks [Outstanding LSAcks] (alaOspfVirtNbrPendingLSack)	long	Number of outstanding link state acknowledgements to be sent to this neighbor
outstandingLSRequests [Outstanding LSRequests] (alaOspfVirtNbrPendingLSreq)	long	Number of outstanding link state requests to be sent to this neighbor
outstandingLSRetramit [Outstanding LSRetramit] (alaOspfVirtNbrPendingLSupd)	long	Number of outstanding link state update packets to be sent to this neighbor

Table 771 pbbvlan statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SPBServicesMeshSdpStats MIB entry name: alaSdpBindEntry Entry description: Information about a specific SDP binding. Table description (for alaSdpBindTable): A table that contains SDP binding information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • pbbvlan.Site • svt.VlanPBEdgeMeshSdpBinding 		
egressByteCount [Egress Byte Count] (alaSdpBindEgressByteCount)	java. math. BigInteger	The total egress byte count flowing through this SDP Bind.
egressPacketCount [Egress Packet Count] (alaSdpBindEgressPacketCount)	long	The total egress packet count flowing through this SDP Bind.
ingressByteCount [Ingress Byte Count] (alaSdpBindIngressByteCount)	java. math. BigInteger	The total ingress byte count flowing through this SDP Bind.
ingressPacketCount [Ingress Packet Count] (alaSdpBindIngressPacketCount)	long	The total ingress packet count flowing through this SDP Bind.

<p>SPBServicesSiteStats</p> <p>MIB entry name: alaSvcBaseInfoEntry</p> <p>Entry description: Basic information about a specific service.</p> <p>Table description (for alaSvcBaseInfoTable): A table that contains basic service information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: pbbvlan.Site</p>		
egressByteCount [Egress Byte Count] (alaSvcEgressByteCount)	java. math. BigInteger	The total egress byte count flowing through this service.
egressPacketCount [Egress Packet Count] (alaSvcEgressPacketCount)	long	The total egress packet count flowing through this service.
ingressByteCount [Ingress Byte Count] (alaSvcIngressByteCount)	java. math. BigInteger	The total ingress byte count flowing through this service.
ingressPacketCount [Ingress Packet Count] (alaSvcIngressPacketCount)	long	The total ingress packet count flowing through this service.

Table 772 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AOSInterfaceStats</p> <p>MIB entry name: rip2IfStatEntry</p> <p>Entry description: A Single Routing Domain in a single Subnet.</p> <p>Table description (for rip2IfStatTable): A list of subnets which require separate status monitoring in RIP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rip.Interface</p>		
badPackets [Bad Packets] (rip2IfStatRcvBadPackets)	long	The number of RIP response packets received by the RIP process which were subsequently discarded for any reason (e.g. a version 0 packet, or an unknown command type).
badRoutes [Bad Routes] (rip2IfStatRcvBadRoutes)	long	The number of routes, in valid RIP packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
totalUpdates [Total Updates] (rip2IfStatSentUpdates)	long	The number of triggered RIP updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information.

Table 773 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 773 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 773 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 774 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>IpHelperStats MIB entry name: iphelperMIB Table description (for alcatelIND1UDPRelayMIBObjects): Branch For UDP Relay Subsystem Managed Objects. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPRelayService</p>		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation.
<p>UDPServerStats MIB entry name: iphelperStatEntry Entry description: An entry in the stat table. Table description (for iphelperStatTable): This keeps statistics for each next hop IP Address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination</p>		

Table 774 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperTxToServer [iphelper Tx To Server] (iphelperTxToNextHop)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: genericUdpServiceDstEntry Entry description: An entry in Generic UDP Relay table Table description (for genericUdpServiceDstTable): This table defines the destination VLAN for the Generic UDP Relay Service. UDP packet with destination port genericUdpServiceUdpPort are forwarded to VLAN defined in genericUdpServiceDstVlan. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpTxToServer [Udp Tx To Server] (genericUdpServiceStatTxToVlan)	long	This keeps track of the number of packets transmitted to the destination VLAN with UDP destination port matching genericUdpServicePort.

Table 775 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 775 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 775 equipment statistics (continued)

Table 775 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 775 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 775 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 776 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 776 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 776 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 776 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 776 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 776 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 776 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 776 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 777 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
PathEndPointStats MIB entry name: alaErpStatsEntry Entry description: The Statistics table entry. Table description (for alaErpStatsTable): There is one ERP Stats table per bridge. This table contains the statistics for the ERP on per Ring basis. Supports realtime plotting Supports scheduled collection Monitored class: ethring.PathEndpoint		
noRequestPduDrop [No Request Pdu Drop] (alaErpStatsNoRequestPduDrop)	long	A count of the number of valid R-APS (NR) PDUs dropped.
noRequestPduRx [No Request Pdu Rx] (alaErpStatsNoRequestPduTx)	long	A count of the number of R-APS (NR) PDUs transmitted on this interface for this Ring.
noRequestPduTx [No Request Pdu Tx] (alaErpStatsNoRequestPduRx)	long	A count of the number of valid R-APS (NR) PDUs received on this interface for this Ring.
rplBlockPDUDrop [Rpl Block PDUDrop] (alaErpStatsRPLBlockPDUDrop)	long	A count of the number of valid R-APS (NR, RB) PDUs dropped.
rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 777 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	The trap shall be raised whenever the ring is removed dynamically in Unlike NI Scenario only.

Table 778 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 778 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 779 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 779 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 779 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 779 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (IldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (IldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: IldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		
IldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (IldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 780 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement</p>		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.

Table 780 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `badValue`.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `genErr`.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.

Table 780 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field was `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.

Table 780 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status was 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.

Table 780 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutTooBigs [Snmp Out Too Bigs] (snmpOutTooBigs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field was `tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 781 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: ospfAreaEntry</p> <p>Entry description: Information describing the configured parameters and cumulative statistics of one of the router's attached areas. The interfaces and virtual links are configured as part of these areas. Area 0.0.0.0, by definition, is the backbone area. Information in this table is persistent and when this object is written the entity SHOULD save the change to non-volatile storage.</p> <p>Table description (for ospfAreaTable): Information describing the configured parameters and cumulative statistics of the router's attached areas. The interfaces and virtual links are configured as part of these areas. Area 0.0.0.0, by definition, is the backbone area.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
totalLSACount [Total LSACount] (ospfAreaLsaCount)	long	The total number of link state advertisements in this area's link state database, excluding AS-external LSAs.
totalSpfRuns [Total Spf Runs] (ospfSpfRuns)	long	The number of times that the intra-area route table has been calculated using this area's link state database. This is typically done using Dijkstra's algorithm. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
<p>InterfaceGeneralStats</p> <p>MIB entry name: ospflfEntry</p> <p>Entry description: The OSPF interface entry describes one interface from the viewpoint of OSPF. Information in this table is persistent and when this object is written the entity SHOULD save the change to non-volatile storage.</p> <p>Table description (for ospflfTable): The OSPF Interface Table describes the interfaces from the viewpoint of OSPF. It augments the ipAddrTable with OSPF specific information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		

Table 781 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
events [Events] (ospfIfEvents)	long	The number of times this OSPF interface has changed its state or an error has occurred. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
NeighborGeneralStats MIB entry name: ospfNbrEntry Entry description: The information regarding a single neighbor. Information in this table is persistent and when this object is written the entity SHOULD save the change to non-volatile storage. Table description (for ospfNbrTable): A table describing all non-virtual neighbors in the locality of the OSPF router. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • ospf.Neighbor • ospf.OspfNeighbor 		
events [Events] (ospfNbrEvents)	long	The number of times this neighbor relationship has changed state or an error has occurred. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
retransmissionQueueLength [Retransmission Queue Length] (ospfNbrLsRetransQLen)	long	The current length of the retransmission queue.
NeighborLinkStateStats MIB entry name: alaOspfNbrAugEntry Entry description: Additions to neighbor table Table description (for alaOspfNbrAugTable): Extensions to the ospfNbrTable Supports realtime plotting Supports scheduled collection Monitored class: ospf.OspfNeighbor		

Table 781 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outstandingLSAcks [Outstanding LSAcks] (alaOspfNbrPendingLSAck)	long	Number of outstanding link state acknowledgements to be sent to this neighbor
outstandingLSRequests [Outstanding LSRequests] (alaOspfNbrPendingLSreq)	long	Number of outstanding link state requests to be sent to this neighbor
outstandingLSRetramit [Outstanding LSRetramit] (alaOspfNbrPendingLSupd)	long	Number of outstanding link state update packets to be sent to this neighbor
OspfStats MIB entry name: alaOspfGeneralTable Table description (for alcatelIND1OSPFMIBObjects): Branch For Open Shortest Path First (OSPF) Subsystem Managed Objects. Supports realtime plotting Supports scheduled collection Monitored class: ospf.Site		
activeAreas [Active Areas] (alaOspfTotalActiveAreas)	long	Total Number of active areas configured on this router
attachedAreas [Attached Areas] (alaOspfTotalAreas)	long	Total Number of areas configured on this router
attachedNSSAs [Attached NSSAs] (alaOspfTotalNSSA)	long	Total Number of NSSA areas on this router

Table 781 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
exchStateNbrs [Exch State Nbrs] (alaOspfTotalExchNbrs)	long	Number of EXCHANGE state neighbors on this router
fullStateNbrs [Full State Nbrs] (alaOspfTotalFullNbrs)	long	Number of FULL state neighbors on this router
incrSpfRunsDone [Incr Spf Runs Done] (alaOspfTotalIncrSpfRuns)	long	Total number of Incremental SPF runs performed on this router
initStateNbrs [Init State Nbrs] (alaOspfTotalInitNbrs)	long	Number of INIT state neighbors on this router
newLsasOriginated [New Lsas Originated] (ospfOriginateNewLsas)	long	The number of new link state advertisements that have been originated. This number is incremented each time the router originates a new LSA. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
newLsasReceived [New Lsas Received] (ospfRxNewLsas)	long	The number of link state advertisements received that are determined to be new instantiations. This number does not include newer instantiations of self-originated link state advertisements. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
routeCount [Route Count] (alaOspfRouteNumber)	long	The number of network routes in OSPF routing table.

Table 781 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
spfRunsDone [Spf Runs Done] (alaOspfTotalSpfRuns)	long	Total number of SPF runs performed on this router
transitAreas [Transit Areas] (alaOspfTotalTransitAreas)	long	Number of transit areas on this router
twoWayStateNbrs [Two Way State Nbrs] (alaOspfTotal2wayNbrs)	long	Number of 2-way state neighbors on this router
VirtualNeighborGeneralStats MIB entry name: ospfVirtNbrEntry Entry description: Virtual neighbor information. Table description (for ospfVirtNbrTable): This table describes all virtual neighbors. Since virtual links are configured in the Virtual Interface Table, this table is read-only. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor		
events [Events] (ospfVirtNbrEvents)	long	The number of times this virtual link has changed its state or an error has occurred. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ospfDiscontinuityTime.
retransmissionQueueLength [Retransmission Queue Length] (ospfVirtNbrLsRetransQLen)	long	The current length of the retransmission queue.

Table 781 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualNeighborLinkStateStats MIB entry name: alaOspfVirtNbrAugEntry Entry description: Information regarding a single virtual neighbor. Table description (for alaOspfVirtNbrAugTable): Extensions to ospfVirtNbrTable Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
outstandingLSAcks [Outstanding LSAcks] (alaOspfVirtNbrPendingLSack)	long	Number of outstanding link state acknowledgements to be sent to this neighbor
outstandingLSRequests [Outstanding LSRequests] (alaOspfVirtNbrPendingLSreq)	long	Number of outstanding link state requests to be sent to this neighbor
outstandingLSRetramit [Outstanding LSRetramit] (alaOspfVirtNbrPendingLSupd)	long	Number of outstanding link state update packets to be sent to this neighbor

Table 782 pbbvlan statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SPBServicesMeshSdpStats MIB entry name: alaSdpBindEntry Entry description: Information about a specific SDP binding. Table description (for alaSdpBindTable): A table that contains SDP binding information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • pbbvlan.Site • svt.VlanPBEdgeMeshSdpBinding 		
egressByteCount [Egress Byte Count] (alaSdpBindEgressByteCount)	java. math. BigInteger	The total egress byte count flowing through this SDP Bind.
egressPacketCount [Egress Packet Count] (alaSdpBindEgressPacketCount)	long	The total egress packet count flowing through this SDP Bind.
ingressByteCount [Ingress Byte Count] (alaSdpBindIngressByteCount)	java. math. BigInteger	The total ingress byte count flowing through this SDP Bind.
ingressPacketCount [Ingress Packet Count] (alaSdpBindIngressPacketCount)	long	The total ingress packet count flowing through this SDP Bind.

Table 782 pbbvlan statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SPBServicesSapStats MIB entry name: alaSapBaselInfoEntry Entry description: Information about a specific SAP. Table description (for alaSapBaselInfoTable): A table that contains basic SAP information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • pbbvlan.L2AccessInterface • pbbvlan.Site </p>		
egressByteCount [Egress Byte Count] (alaSapEgressByteCount)	java. math. BigInteger	The total egress byte count flowing through this SAP.
egressPacketCount [Egress Packet Count] (alaSapEgressPacketCount)	long	The total egress packet count flowing through this SAP.
ingressByteCount [Ingress Byte Count] (alaSapIngressByteCount)	java. math. BigInteger	The total ingress byte count flowing through this SAP.
ingressPacketCount [Ingress Packet Count] (alaSapIngressPacketCount)	long	The total ingress packet count flowing through this SAP.

Table 782 pbbvlan statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SPBServicesSiteStats MIB entry name: alaSvcBaseInfoEntry Entry description: Basic information about a specific service. Table description (for alaSvcBaseInfoTable): A table that contains basic service information. Supports realtime plotting Supports scheduled collection Monitored class: pbbvlan.Site		
egressByteCount [Egress Byte Count] (alaSvcEgressByteCount)	java. math. BigInteger	The total egress byte count flowing through this service.
egressPacketCount [Egress Packet Count] (alaSvcEgressPacketCount)	long	The total egress packet count flowing through this service.
ingressByteCount [Ingress Byte Count] (alaSvcIngressByteCount)	java. math. BigInteger	The total ingress byte count flowing through this service.
ingressPacketCount [Ingress Packet Count] (alaSvcIngressPacketCount)	long	The total ingress packet count flowing through this service.

Table 783 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AOSInterfaceStats</p> <p>MIB entry name: rip2IfStatEntry</p> <p>Entry description: A Single Routing Domain in a single Subnet.</p> <p>Table description (for rip2IfStatTable): A list of subnets which require separate status monitoring in RIP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rip.Interface</p>		
badPackets [Bad Packets] (rip2IfStatRcvBadPackets)	long	The number of RIP response packets received by the RIP process which were subsequently discarded for any reason (e.g. a version 0 packet, or an unknown command type).
badRoutes [Bad Routes] (rip2IfStatRcvBadRoutes)	long	The number of routes, in valid RIP packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
totalUpdates [Total Updates] (rip2IfStatSentUpdates)	long	The number of triggered RIP updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information.

Table 784 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 784 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 784 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 785 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>IpHelperStats MIB entry name: iphelperMIB Table description (for alcatelIND1UDPRelayMIBObjects): Branch For UDP Relay Subsystem Managed Objects. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPRelayService</p>		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation.
<p>UDPServerStats MIB entry name: iphelperStatEntry Entry description: An entry in the stat table. Table description (for iphelperStatTable): This keeps statistics for each next hop IP Address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination</p>		

Table 785 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperTxToServer [iphelper Tx To Server] (iphelperTxToNextHop)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: genericUdpServiceDstEntry Entry description: An entry in Generic UDP Relay table Table description (for genericUdpServiceDstTable): This table defines the destination VLAN for the Generic UDP Relay Service. UDP packet with destination port genericUdpServiceUdpPort are forwarded to VLAN defined in genericUdpServiceDstVlan. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpTxToServer [Udp Tx To Server] (genericUdpServiceStatTxToVlan)	long	This keeps track of the number of packets transmitted to the destination VLAN with UDP destination port matching genericUdpServicePort.

Table 787 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 787 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

<p>InterfaceStats</p> <p>MIB entry name: ifEntry</p> <p>Entry description: An entry containing management information applicable to a particular interface.</p> <p>Table description (for ifTable): A list of interface entries. The number of entries is given by the value of ifNumber.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • bundle.Interface • ccag.CcagPathCcNetSap • ccag.CcagPathCcSapNet • ccag.CcagPathCcSapSap • equipment.ManagementPort • equipment.PhysicalPort • equipment.ScadaBranch • equipment.ScadaMddb • ies.L3AccessInterface • lag.Interface • pxc.PortCrossConnectSubPort • rtr.NetworkInterface • sonetequipment.Sts12Channel • sonetequipment.Sts192Channel • sonetequipment.Sts1Channel • sonetequipment.Sts3Channel • sonetequipment.Sts48Channel • sonetequipment.TributaryChannel • sonetequipment.Tu3Channel • tdmequipment.DS0ChannelGroup • tdmequipment.DS1E1Channel • tdmequipment.DS3E3Channel • vprn.L3AccessInterface 		

Table 787 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 787 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 787 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 788 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 788 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 788 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 788 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 788 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 788 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 788 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 788 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 789 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 789 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 790 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 790 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 790 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 790 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (IldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (IldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: IldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		
IldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (IldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 791 mvrp statistics

<p>PortStatsRecieve</p> <p>MIB entry name: alaMvrpPortStatsEntry</p> <p>Entry description: A MVRP port statistics entry.</p> <p>Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mvrp.Interface</p>		
emptyReceived [Empty Received] (alaMvrpPortStatsEmptyReceived)	long	The number of Empty messages received.
inReceived [In Received] (alaMvrpPortStatsInReceived)	long	The number of In messages received.
invalidMsgsReceived [Invalid Msgs Received] (alaMvrpPortStatsInvalidMsgsReceived)	long	The number of Invalid messages received.
joinEmptyReceived [Join Empty Received] (alaMvrpPortStatsJoinEmptyReceived)	long	The number of Join Empty messages received.
joinInReceived [Join In Received] (alaMvrpPortStatsJoinInReceived)	long	The number of Join In messages received.
leaveAllReceived [Leave All Received] (alaMvrpPortStatsLeaveAllReceived)	long	The number of Leave all messages received.

Table 791 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
leaveReceived [Leave Received] (alaMvrpPortStatsLeaveReceived)	long	The number of Leave messages received.
newReceived [New Received] (alaMvrpPortStatsNewReceived)	long	The number of New messages received.
totalMsgsReceived [Total Msgs Received] (alaMvrpPortStatsTotalMsgsReceived)	long	The total number of MVRP messages received.
totalPDURceived [Total PDURceived] (alaMvrpPortStatsTotalPDURceived)	long	The total number of MVRP PDUs received.
PortStatsTransmit MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.PhysicalPort • lag.Interface 		
emptyTransmitted [Empty Transmitted] (alaMvrpPortStatsEmptyTransmitted)	long	The number of Empty messages transmitted.
failedRegistrations [Failed Registrations] (alaMvrpPortFailedRegistrations)	long	The total number of failed GVRP registrations, for any reason, on this port.

Table 791 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTransmitted [In Transmitted] (alaMvrpPortStatsInTransmitted)	long	The number of In messages transmitted.
joinEmptyTransmitted [Join Empty Transmitted] (alaMvrpPortStatsJoinEmptyTransmitted)	long	The number of Join Empty messages transmitted.
joinInTransmitted [Join In Transmitted] (alaMvrpPortStatsJoinInTransmitted)	long	The number of Join In messages transmitted.
leaveAllTransmitted [Leave All Transmitted] (alaMvrpPortStatsLeaveAllTransmitted)	long	The number of Leave all messages transmitted.
leaveTransmitted [Leave Transmitted] (alaMvrpPortStatsLeaveTransmitted)	long	The number of Leave messages transmitted.
newTransmitted [New Transmitted] (alaMvrpPortStatsNewTransmitted)	long	The number of New messages transmitted.
totalMsgsTransmitted [Total Msgs Transmitted] (alaMvrpPortStatsTotalMsgsTransmitted)	long	The total number of MVRP messages transmitted.
totalPDUTransmitted [Total PDUTransmitted] (alaMvrpPortStatsTotalPDUTransmitted)	long	The total number of MVRP PDUs transmitted.

Table 792 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `badValue`.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `genErr`.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 792 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 792 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 792 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBig [Snmp Out Too Bigs] (snmpOutTooBig)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 793 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 793 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 793 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 794 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPPortStats</p> <p>MIB entry name: iphelperDhcpSnoopingPortEntry</p> <p>Entry description: A DHCP Snooping Port entry.</p> <p>Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.DHCPSnoopingPort</p>		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 794 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPServiceStats</p> <p>MIB entry name: iphelperStatEntry</p> <p>Entry description: An entry in the stat table.</p> <p>Table description (for iphelperStatTable): This keeps statistics for each service by server address.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.UDPServiceDestination</p>		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 794 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 796 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 796 equipment statistics (continued)

Table 796 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 796 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 796 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 797 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 797 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 797 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 797 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 797 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 797 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 797 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 797 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 798 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 798 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker-ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 799 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 799 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPConfiguration</p>		

Table 799 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 799 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (IldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (IldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: IldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		
IldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (IldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 800 mvrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortStatsRecieve MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. Supports realtime plotting Supports scheduled collection Monitored class: mvrp.Interface</p>		
emptyReceived [Empty Received] (alaMvrpPortStatsEmptyReceived)	long	The number of Empty messages received.
inReceived [In Received] (alaMvrpPortStatsInReceived)	long	The number of In messages received.
invalidMsgsReceived [Invalid Msgs Received] (alaMvrpPortStatsInvalidMsgsReceived)	long	The number of Invalid messages received.
joinEmptyReceived [Join Empty Received] (alaMvrpPortStatsJoinEmptyReceived)	long	The number of Join Empty messages received.
joinInReceived [Join In Received] (alaMvrpPortStatsJoinInReceived)	long	The number of Join In messages received.
leaveAllReceived [Leave All Received] (alaMvrpPortStatsLeaveAllReceived)	long	The number of Leave all messages received.

Table 800 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
leaveReceived [Leave Received] (alaMvrpPortStatsLeaveReceived)	long	The number of Leave messages received.
newReceived [New Received] (alaMvrpPortStatsNewReceived)	long	The number of New messages received.
totalMsgsReceived [Total Msgs Received] (alaMvrpPortStatsTotalMsgsReceived)	long	The total number of MVRP messages received.
totalPDURceived [Total PDURceived] (alaMvrpPortStatsTotalPDURceived)	long	The total number of MVRP PDUs received.
PortStatsTransmit MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. emptyTransmitted [Empty Transmitted] (alaMvrpPortStatsEmptyTransmitted)	long	The number of Empty messages transmitted.
failedRegistrations [Failed Registrations] (alaMvrpPortFailedRegistrations)	long	The total number of failed GVRP registrations, for any reason, on this port.

Table 800 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTransmitted [In Transmitted] (alaMvrpPortStatsInTransmitted)	long	The number of In messages transmitted.
joinEmptyTransmitted [Join Empty Transmitted] (alaMvrpPortStatsJoinEmptyTransmitted)	long	The number of Join Empty messages transmitted.
joinInTransmitted [Join In Transmitted] (alaMvrpPortStatsJoinInTransmitted)	long	The number of Join In messages transmitted.
leaveAllTransmitted [Leave All Transmitted] (alaMvrpPortStatsLeaveAllTransmitted)	long	The number of Leave all messages transmitted.
leaveTransmitted [Leave Transmitted] (alaMvrpPortStatsLeaveTransmitted)	long	The number of Leave messages transmitted.
newTransmitted [New Transmitted] (alaMvrpPortStatsNewTransmitted)	long	The number of New messages transmitted.
totalMsgsTransmitted [Total Msgs Transmitted] (alaMvrpPortStatsTotalMsgsTransmitted)	long	The total number of MVRP messages transmitted.
totalPDUTransmitted [Total PDUTransmitted] (alaMvrpPortStatsTotalPDUTransmitted)	long	The total number of MVRP PDUs transmitted.

Table 801 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 801 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 801 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 801 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBig [Snmp Out Too Bigs] (snmpOutTooBig)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 802 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 802 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 802 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 803 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPPortStats</p> <p>MIB entry name: iphelperDhcpSnoopingPortEntry</p> <p>Entry description: A DHCP Snooping Port entry.</p> <p>Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.DHCPSnoopingPort</p>		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 803 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
UDPServiceStats MIB entry name: iphelperStatEntry Entry description: An entry in the stat table. Table description (for iphelperStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 803 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
<p>UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination</p>		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

Table 805 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 805 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 805 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 805 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 805 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 806 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 806 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 806 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 806 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 806 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 806 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 806 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 806 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 807 ethring statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PathEndPointStats MIB entry name: alaErpStatsEntry Entry description: The Statistics table entry. Table description (for alaErpStatsTable): There is one ERP Stats table per bridge. This table contains the statistics for the ERP on per Ring basis. Supports realtime plotting Supports scheduled collection Monitored class: ethring.PathEndpoint</p>		
noRequestPduDrop [No Request Pdu Drop] (alaErpStatsNoRequestPduDrop)	long	A count of the number of valid R-APS (NR) PDUs dropped.
noRequestPduRx [No Request Pdu Rx] (alaErpStatsNoRequestPduTx)	long	A count of the number of R-APS (NR) PDUs transmitted on this interface for this Ring.
noRequestPduTx [No Request Pdu Tx] (alaErpStatsNoRequestPduRx)	long	A count of the number of valid R-APS (NR) PDUs received on this interface for this Ring.
rplBlockPDUDrop [Rpl Block PDUDrop] (alaErpStatsRPLBlockPDUDrop)	long	A count of the number of valid R-APS (NR, RB) PDUs dropped.
rplBlockPDURx [Rpl Block PDURx] (alaErpStatsRPLBlockPDURx)	long	A count of the number of valid R-APS (NR, RB) PDUs received on this interface for this Ring.
rplBlockPDUTx [Rpl Block PDUTx] (alaErpStatsRPLBlockPDUTx)	long	A count of the number of R-APS (NR, RB) PDUs transmitted on this interface for this Ring.

Table 807 ethring statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalFailPduDrop [Signal Fail Pdu Drop] (alaErpStatsSignalFailPduDrop)	long	A count of the number of valid R-APS (SF) PDUs dropped.
signalFailPduRx [Signal Fail Pdu Rx] (alaErpStatsSignalFailPduRx)	long	A count of the number of valid R-APS (SF) PDUs received on this interface for this Ring.
signalFailPduTx [Signal Fail Pdu Tx] (alaErpStatsSignalFailPduTx)	long	A count of the number of R-APS (SF) PDUs transmitted on this interface for this Ring.
statsPDUErr [Stats PDUErr] (alaErpStatsPDUErr)	long	A count of the number of error R-APS PDUs received.

Table 808 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 808 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker- ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 809 Ldp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats</p> <p>MIB entry name: vRtrLdpIfStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Interface or Targeted peer. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpSessionStatsEntry.</p> <p>Table description (for vRtrLdpIfStatsTable): vRtrLdpIfStatsTable is a read-only table. The purpose of this table is to keep statistical information about the LDP Interfaces and Targeted peers on the LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpIfTable, and the augmenting table, vRtrLdpIfStatsTable. This in effect extends the vRtrLdpIfTable with additional columns. Creation or deletion of a row in the vRtrLdpIfTable results in the same fate for the row in the vRtrLdpIfStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.Interface</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpIfExistingAdjacencies)	long	The value of vRtrLdpIfExistingAdjacencies gives a count of the total active adjacencies on this LDP interface or with this targeted peer.

Table 809 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SessionStats</p> <p>MIB entry name: vRtrLdpSessionStatsEntry</p> <p>Entry description: A row in this table represents statistical information about a single session between an LDP entity and an LDP Peer.</p> <p>Table description (for vRtrLdpSessionStatsTable): vRtrLdpSessionStatsTable is a read-only table. addressMessagesReceived [Address Messages Received] (vRtrLdpSessStatsAddrIn)	long	The value of vRtrLdpSessStatsAddrIn counts the number of Address Messages that have been received during this session.
addressMessagesSent [Address Messages Sent] (vRtrLdpSessStatsAddrOut)	long	The value of vRtrLdpSessStatsAddrOut counts the number of Address Messages that have been sent during this session.
addressWithdrawMessagesReceived [Address Withdraw Messages Received] (vRtrLdpSessStatsAddrWithdrawIn)	long	The value of vRtrLdpSessStatsAddrWithdrawIn counts the number of Address Withdraw Messages that have been received during this session.
addressWithdrawMessagesSent [Address Withdraw Messages Sent] (vRtrLdpSessStatsAddrWithdrawOut)	long	The value of vRtrLdpSessStatsAddrWithdrawOut counts the number of Address Withdraw Messages that have been sent during this session.
fecReceived [Fec Received] (vRtrLdpSessStatsFECRecv)	long	The value of vRtrLdpSessStatsFECRecv counts the number of FECs received for this session.

Table 809 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fecSent [Fec Sent] (vRtrLdpSessStatsFECSent)	long	The value of vRtrLdpSessStatsFECSent counts the number of FECs sent for this session.
helloMessagesReceived [Hello Messages Received] (vRtrLdpSessStatsHelloIn)	long	The value of vRtrLdpSessStatsHelloIn counts the number of Hello Messages that have been received during this session.
helloMessagesSent [Hello Messages Sent] (vRtrLdpSessStatsHelloOut)	long	The value of vRtrLdpSessStatsHelloOut counts the number of Hello Messages that have been sent during this session.
initMessagesReceived [Init Messages Received] (vRtrLdpSessStatsInitIn)	long	The value of vRtrLdpSessStatsInitIn counts the number of Init Messages that have been received during this session.
initMessagesSent [Init Messages Sent] (vRtrLdpSessStatsInitOut)	long	The value of vRtrLdpSessStatsInitOut counts the number of Init Messages that have been sent during this session.
keepAliveMessagesReceived [Keep Alive Messages Received] (vRtrLdpSessStatsKeepaliveIn)	long	The value of vRtrLdpSessStatsKeepaliveIn counts the number of Keepalive Messages that have been received during this session.
keepAliveMessagesSent [Keep Alive Messages Sent] (vRtrLdpSessStatsKeepaliveOut)	long	The value of vRtrLdpSessStatsKeepaliveOut counts the number of Keepalive Messages that have been sent during this session.
labelAbortsReceived [Label Aborts Received] (vRtrLdpSessStatsLabelAbortIn)	long	The value of vRtrLdpSessStatsLabelAbortIn counts the number of Label Abort Messages that have been received during this session.
labelAbortsSent [Label Aborts Sent] (vRtrLdpSessStatsLabelAbortOut)	long	The value of vRtrLdpSessStatsLabelAbortOut counts the number of Label Abort Messages that have been sent during this session.

Table 809 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
labelMappingsReceived [Label Mappings Received] (vRtrLdpSessStatsLabelMappingIn)	long	The value of vRtrLdpSessStatsLabelMappingIn counts the number of Label Mapping Messages that have been received during this session.
labelMappingsSent [Label Mappings Sent] (vRtrLdpSessStatsLabelMappingOut)	long	The value of vRtrLdpSessStatsLabelMappingOut counts the number of Label Mapping Messages that have been sent during this session.
labelReleasesReceived [Label Releases Received] (vRtrLdpSessStatsLabelReleaseIn)	long	The value of vRtrLdpSessStatsLabelReleaseIn counts the number of Label Release Messages that have been received during this session.
labelReleasesSent [Label Releases Sent] (vRtrLdpSessStatsLabelReleaseOut)	long	The value of vRtrLdpSessStatsLabelReleaseOut counts the number of Label Release Messages that have been sent during this session.
labelRequestsReceived [Label Requests Received] (vRtrLdpSessStatsLabelRequestIn)	long	The value of vRtrLdpSessStatsLabelRequestIn counts the number of Label Request Messages that have been received during this session.
labelRequestsSent [Label Requests Sent] (vRtrLdpSessStatsLabelRequestOut)	long	The value of vRtrLdpSessStatsLabelRequestOut counts the number of Label Request Messages that have been sent during this session.
labelWithdrawsReceived [Label Withdraws Received] (vRtrLdpSessStatsLabelWithdrawIn)	long	The value of vRtrLdpSessStatsLabelWithdrawIn counts the number of Label Withdraw Messages that have been received during this session.
labelWithdrawsSent [Label Withdraws Sent] (vRtrLdpSessStatsLabelWithdrawOut)	long	The value of vRtrLdpSessStatsLabelWithdrawOut counts the number of Label Withdraw Messages that have been sent during this session.
linkAdjacencies [Link Adjacencies] (vRtrLdpSessStatsLinkAdj)	long	The value of vRtrLdpSessStatsLinkAdj specifies the number of link adjacencies for this session.

Table 809 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
notificationMessagesReceived [Notification Messages Received] (vRtrLdpSessStatsNotificationIn)	long	The value of vRtrLdpSessStatsNotificationIn counts the number of Notification Messages that have been received during this session.
notificationMessagesSent [Notification Messages Sent] (vRtrLdpSessStatsNotificationOut)	long	The value of vRtrLdpSessStatsNotificationOut counts the number of Notification Messages that have been sent during this session.
targetedAdjacencies [Targeted Adjacencies] (vRtrLdpSessStatsTargAdj)	long	The value of vRtrLdpSessStatsTargAdj specifies the number of targeted adjacencies for this session.
<p>SiteStats</p> <p>MIB entry name: vRtrLdpStatsEntry</p> <p>Entry description: A row in this table represents statistical information about an LDP instance.</p> <p>Table description (for vRtrLdpStatsTable): vRtrLdpStatsTable is a read-only table. The purpose of this table is to keep statistical information about an LDP Instance. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpGeneralTable, and the augmenting table, vRtrLdpStatsTable. This in effect extends the vRtrLdpGeneralTable with additional columns. Creation or deletion of a row in the vRtrLdpGeneralTable results in the same fate for the row in the vRtrLdpStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.Site</p>		
activeAdjacencies [Active Adjacencies] (vRtrLdpStatsActiveAdjacencies)	long	The value of vRtrLdpStatsActiveAdjacencies specifies the number of active adjacencies (i.e. established sessions) associated with the LDP instance.
activeInterfaces [Active Interfaces] (vRtrLdpStatsActiveInterfaces)	long	The value of vRtrLdpStatsActiveInterfaces specifies the number of active (i.e. operationally up) interfaces associated with the LDP instance.

Table 809 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
activeSessions [Active Sessions] (vRtrLdpStatsActiveSessions)	long	The value of vRtrLdpStatsActiveSessions specifies the number of active sessions (i.e. session in some form of creation) associated with the LDP instance.
activeTargetedSessions [Active Targeted Sessions] (vRtrLdpStatsActiveTargSessions)	long	The value of vRtrLdpStatsActiveTargSessions specifies the number of active (i.e. operationally up) targeted sessions associated with the LDP instance.
addressFECsReceived [Address FECs Received] (vRtrLdpStatsAddrFECRecv)	long	The value of vRtrLdpStatsAddrFECRecv specifies the number of Address FECs received by the LDP instance from its neighbors.
addressFECsSent [Address FECs Sent] (vRtrLdpStatsAddrFECSent)	long	The value of vRtrLdpStatsAddrFECSent specifies the number of Address FECs sent by the LDP instance to its neighbors.
attemptedSessions [Attempted Sessions] (vRtrLdpStatsAttemptedSessions)	long	The value of vRtrLdpStatsAttemptedSessions specifies the total number of attempted sessions for this LDP instance.
badLdpIdentifierErrors [Bad Ldp Identifier Errors] (vRtrLdpStatsBadLdpIdentifierErrors)	long	The value of vRtrLdpStatsBadLdpIdentifierErrors gives the number of Bad LDP Identifier Fatal Errors detected for sessions associated with this LDP instance.
badMessageLengthErrors [Bad Message Length Errors] (vRtrLdpStatsBadMessageLengthErrors)	long	The value of vRtrLdpStatsBadMessageLengthErrors gives the number of Bad Message Length Fatal Errors detected for sessions associated with this LDP instance.
badPduLengthErrors [Bad Pdu Length Errors] (vRtrLdpStatsBadPduLengthErrors)	long	The value of vRtrLdpStatsBadPduLengthErrors gives the number of Bad Pdu Length Fatal Errors detected for sessions associated with this LDP instance.
badTlvLengthErrors [Bad Tlv Length Errors] (vRtrLdpStatsBadTlvLengthErrors)	long	The value of vRtrLdpStatsBadTlvLengthErrors gives the number of Bad TLV Length Fatal Errors detected for sessions associated with this LDP instance.

Table 809 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inactiveInterfaces [Inactive Interfaces] (vRtrLdpStatsInactiveInterfaces)	long	The value of vRtrLdpStatsInactiveInterfaces specifies the number of inactive (i.e. operationally down) interfaces associated with the LDP instance.
inactiveTargetedSessions [Inactive Targeted Sessions] (vRtrLdpStatsInactiveTargSessions)	long	The value of vRtrLdpStatsInactiveTargSessions specifies the number of inactive (i.e. operationally down) targeted sessions associated with the LDP instance.
keepAliveExpiredErrors [Keep Alive Expired Errors] (vRtrLdpStatsKeepAliveExpiredErrors)	long	The value of vRtrLdpStatsKeepAliveExpiredErrors gives the number of Session Keep Alive Timer Expired Errors detected for sessions associated with this LDP instance.
malformedTlvValueErrors [Malformed Tlv Value Errors] (vRtrLdpStatsMalformedTlvValueErrors)	long	The value of vRtrLdpStatsMalformedTlvValueErrors gives the number of Malformed TLV Value Fatal Errors detected for sessions associated with this LDP instance.
operDownEvents [Oper Down Events] (vRtrLdpStatsOperDownEvents)	long	The value of vRtrLdpStatsOperDownEvents specifies the number of times the LDP instance has gone operationally down since the instance was created.
serviceFECsReceived [Service FECs Received] (vRtrLdpStatsSvcFECRecv)	long	The value of vRtrLdpStatsSvcFECRecv specifies the number of Service FECs received by the LDP instance from its neighbors.
serviceFECsSent [Service FECs Sent] (vRtrLdpStatsSvcFECSent)	long	The value of vRtrLdpStatsSvcFECSent specifies the number of Service FECs sent by the LDP instance to its neighbors.
sessionRejectedAdvertisementModeErrors [Session Rejected Advertisement Mode Errors] (vRtrLdpStatsSessRejAdvErrors)	long	The value of vRtrLdpStatsSessRejAdvErrors gives the total number of Session Rejected/Parameters Advertisement Mode Error Notification Messages sent or received by this LDP instance.

Table 809 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionRejectedLabelRangeErrors [Session Rejected Label Range Errors] (vRtrLdpStatsSessRejLabelRangeErrors)	long	The value of vRtrLdpStatsSessRejLabelRangeErrors gives the total number of Session Rejected/Parameters Label Range Error Notification Messages sent or received by this LDP instance.
sessionRejectedMaxPduLengthErrors [Session Rejected Max Pdu Length Errors] (vRtrLdpStatsSessRejMaxPduErrors)	long	The value of vRtrLdpStatsSessRejMaxPduErrors gives the total number of Session Rejected/Parameters Max Pdu Length Error Notification Messages sent or received by this LDP instance.
sessionRejectedNoHelloErrors [Session Rejected No Hello Errors] (vRtrLdpStatsSessRejNoHelloErrors)	long	The value of vRtrLdpStatsSessRejNoHelloErrors gives the total number of Session Rejected/No Hello Error Notification Messages sent or received by this LDP instance.
shutdownNotificationsReceived [Shutdown Notifications Received] (vRtrLdpStatsShutdownNotifRecv)	long	The value of vRtrLdpStatsShutdownNotifRecv gives the number of Shutdown Notifications received related to sessions associated with this LDP instance.
shutdownNotificationsSent [Shutdown Notifications Sent] (vRtrLdpStatsShutdownNotifSent)	long	The value of vRtrLdpStatsShutdownNotifSent gives the number of Shutdown Notifications sent related to sessions associated with this LDP instance.

Table 809 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TargetedPeerStats</p> <p>MIB entry name: vRtrLdpIfStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Interface or Targeted peer. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpSessionStatsEntry.</p> <p>Table description (for vRtrLdpIfStatsTable): vRtrLdpIfStatsTable is a read-only table. The purpose of this table is to keep statistical information about the LDP Interfaces and Targeted peers on the LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpIfTable, and the augmenting table, vRtrLdpIfStatsTable. This in effect extends the vRtrLdpIfTable with additional columns. Creation or deletion of a row in the vRtrLdpIfTable results in the same fate for the row in the vRtrLdpIfStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.TargetedPeer</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpIfExistingAdjacencies)	long	The value of vRtrLdpIfExistingAdjacencies gives a count of the total active adjacencies on this LDP interface or with this targeted peer.

Table 810 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 810 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPConfiguration</p>		

Table 810 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 810 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (IldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (IldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: IldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. newTransmitted [New Transmitted] (alaMvrpPortStatsNewTransmitted)	long	The number of New messages transmitted.
totalMsgsTransmitted [Total Msgs Transmitted] (alaMvrpPortStatsTotalMsgsTransmitted)	long	The total number of MVRP messages transmitted.
totalPDUTransmitted [Total PDUTransmitted] (alaMvrpPortStatsTotalPDUTransmitted)	long	The total number of MVRP PDUs transmitted.

Table 813 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 813 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmplnGetRequests [Snmpln Get Requests] (snmplnGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmplnGetResponses [Snmpln Get Responses] (snmplnGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmplnNoSuchNames [Snmpln No Such Names] (snmplnNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmplnPkts [Snmpln Pkts] (snmplnPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmplnReadOnlys [Snmpln Read Onlys] (snmplnReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmplnSetRequests [Snmpln Set Requests] (snmplnSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmplnTooBigs [Snmpln Too Bigs] (snmplnTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmplnTotalReqVars [Snmpln Total Req Vars] (snmplnTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 813 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 813 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBigs [Snmp Out Too Bigs] (snmpOutTooBigs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 814 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: ospfAreaEntry</p> <p>Entry description: Information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for ospfAreaTable): Information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
totalLSACount [Total LSACount] (ospfAreaLsaCount)	long	The total number of link-state advertisements in this area's link-state database, excluding AS External LSA's.
totalSpfRuns [Total Spf Runs] (ospfSpfRuns)	long	The number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
<p>InterfaceGeneralStats</p> <p>MIB entry name: ospflfEntry</p> <p>Entry description: The OSPF Interface Entry describes one interface from the viewpoint of OSPF.</p> <p>Table description (for ospflfTable): The OSPF Interface Table describes the interfaces from the viewpoint of OSPF.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (ospflfEvents)	long	The number of times this OSPF interface has changed its state, or an error has occurred.

Table 814 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
NeighborGeneralStats MIB entry name: ospfNbrEntry Entry description: The information regarding a single neighbor. Table description (for ospfNbrTable): A table of non-virtual neighbor information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • ospf.Neighbor • ospf.OspfNeighbor 		
events [Events] (ospfNbrEvents)	long	The number of times this neighbor relationship has changed state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (ospfNbrLsRetransQLen)	long	The current length of the retransmission queue.
NeighborLinkStateStats MIB entry name: alaOspfNbrAugEntry Entry description: Additions to neighbor table Table description (for alaOspfNbrAugTable): Extensions to the ospfNbrTable Supports realtime plotting Supports scheduled collection Monitored class: ospf.OspfNeighbor		
outstandingLSAcks [Outstanding LSAs] (alaOspfNbrPendingLSAck)	long	Number of outstanding link state acknowledgements to be sent to this neighbor
outstandingLSRequests [Outstanding LSRequests] (alaOspfNbrPendingLSReq)	long	Number of outstanding link state requests to be sent to this neighbor

Table 814 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outstandingLSRetramit [Outstanding LSRetramit] (alaOspfNbrPendingLSupd)	long	Number of outstanding link state update packets to be sent to this neighbor
OspfStats MIB entry name: alaOspfGeneralTable Table description (for alcatelIND1OSPFMIBObjects): Branch For Open Shortest Path First (OSPF) Subsystem Managed Objects. Supports realtime plotting Supports scheduled collection Monitored class: ospf.Site		
activeAreas [Active Areas] (alaOspfTotalActiveAreas)	long	Total Number of active areas configured on this router
attachedAreas [Attached Areas] (alaOspfTotalAreas)	long	Total Number of areas configured on this router
attachedNSSAs [Attached NSSAs] (alaOspfTotalNSSA)	long	Total Number of NSSA areas on this router
exchStateNbrs [Exch State Nbrs] (alaOspfTotalExchNbrs)	long	Number of EXCHANGE state neighbors on this router
fullStateNbrs [Full State Nbrs] (alaOspfTotalFullNbrs)	long	Number of FULL state neighbors on this router

Table 814 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
incrSpfRunsDone [Incr Spf Runs Done] (alaOspfTotalIncrSpfRuns)	long	Total number of Incremental SPF runs performed on this router
initStateNbrs [Init State Nbrs] (alaOspfTotalInitNbrs)	long	Number of INIT state neighbors on this router
newLsasOriginated [New Lsas Originated] (ospfOriginateNewLsas)	long	The number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
newLsasReceived [New Lsas Received] (ospfRxNewLsas)	long	The number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
routeCount [Route Count] (alaOspfRouteNumber)	long	The number of network routes in OSPF routing table.
spfRunsDone [Spf Runs Done] (alaOspfTotalSpfRuns)	long	Total number of SPF runs performed on this router
transitAreas [Transit Areas] (alaOspfTotalTransitAreas)	long	Number of transit areas on this router
twoWayStateNbrs [Two Way State Nbrs] (alaOspfTotal2wayNbrs)	long	Number of 2-way state neighbors on this router

Table 814 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualNeighborGeneralStats MIB entry name: ospfVirtNbrEntry Entry description: Virtual neighbor information. Table description (for ospfVirtNbrTable): A table of virtual neighbor information. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
events [Events] (ospfVirtNbrEvents)	long	The number of times this virtual link has changed its state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (ospfVirtNbrLsRetransQLen)	long	The current length of the retransmission queue.
<p>VirtualNeighborLinkStateStats MIB entry name: alaOspfVirtNbrAugEntry Entry description: Information regarding a single virtual neighbor. Table description (for alaOspfVirtNbrAugTable): Extensions to ospfVirtNbrTable Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
outstandingLSAcks [Outstanding LSAcks] (alaOspfVirtNbrPendingLSack)	long	Number of outstanding link state acknowledgements to be sent to this neighbor
outstandingLSRequests [Outstanding LSRequests] (alaOspfVirtNbrPendingLSreq)	long	Number of outstanding link state requests to be sent to this neighbor

Table 814 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outstandingLSRetramit [Outstanding LSRetramit] (alaOspfVirtNbrPendingLSupd)	long	Number of outstanding link state update packets to be sent to this neighbor

Table 815 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AOSInterfaceStats MIB entry name: rip2IfStatEntry Entry description: A Single Routing Domain in a single Subnet. Table description (for rip2IfStatTable): A list of subnets which require separate status monitoring in RIP. Supports realtime plotting Supports scheduled collection Monitored class: rip.Interface</p>		
badPackets [Bad Packets] (rip2IfStatRcvBadPackets)	long	The number of RIP response packets received by the RIP process which were subsequently discarded for any reason (e.g. a version 0 packet, or an unknown command type).
badRoutes [Bad Routes] (rip2IfStatRcvBadRoutes)	long	The number of routes, in valid RIP packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
totalUpdates [Total Updates] (rip2IfStatSentUpdates)	long	The number of triggered RIP updates actually sent on this interface. This explicitly does NOT include full updates sent containing new information.

Table 816 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 816 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 816 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 817 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPPortStats</p> <p>MIB entry name: iphelperDhcpSnoopingPortEntry</p> <p>Entry description: A DHCP Snooping Port entry.</p> <p>Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.DHCPSnoopingPort</p>		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 817 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
UDPServerStats MIB entry name: iphelperStatEntry Entry description: An entry in the stat table. Table description (for iphelperStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 817 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

Table 819 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 819 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 819 equipment statistics (continued)

<p>InterfaceStats</p> <p>MIB entry name: ifEntry</p> <p>Entry description: An entry containing management information applicable to a particular interface.</p> <p>Table description (for ifTable): A list of interface entries. The number of entries is given by the value of ifNumber.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • bundle.Interface • ccag.CcagPathCcNetSap • ccag.CcagPathCcSapNet • ccag.CcagPathCcSapSap • equipment.ManagementPort • equipment.PhysicalPort • equipment.ScadaBranch • equipment.ScadaMddb • ies.L3AccessInterface • lag.Interface • pxc.PortCrossConnectSubPort • rtr.NetworkInterface • sonetequipment.Sts12Channel • sonetequipment.Sts192Channel • sonetequipment.Sts1Channel • sonetequipment.Sts3Channel • sonetequipment.Sts48Channel • sonetequipment.TributaryChannel • sonetequipment.Tu3Channel • tdmequipment.DS0ChannelGroup • tdmequipment.DS1E1Channel • tdmequipment.DS3E3Channel • vprn.L3AccessInterface 		

Table 819 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 819 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 819 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 820 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)	long	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for 8-bit wide group encoding schemes. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 820 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 820 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 820 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 820 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetHighCapacityStats</p> <p>MIB entry name: alcetherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named alcetherStatsPkts.1</p> <p>Table description (for alcetherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
crcAlignErrors [Crc Align Errors] (alcetherStatsCRCAAlignErrors)	java. math. BigInteger	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
jabbers [Jabbers] (alcetherStatsRxJabbers)	java. math. BigInteger	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
oversizePackets [Oversize Packets] (alcetherStatsTxOversizePkts)	java. math. BigInteger	The total number of packets transmitted that were longer than 1518 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 820 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets1024to1518Octets [Packets 1024 to 1518 Octets] (alcetherStatsPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets). For both Ethernet and GigaEthernet.
packets128to255Octets [Packets 128 to 255 Octets] (alcetherStatsPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets1519to4095Octets [Packets 1519 to 4095 Octets] (gigaEtherStatsPkts1519to4095Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 and 4095 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets256to511Octets [Packets 256 to 511 Octets] (alcetherStatsPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets4095to9215Octets [Packets 4095 to 9215 Octets] (gigaEtherStatsPkts4096to9215Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 4096 and 9215 octets in length inclusive (excluding framing bits but including FCS octets). Only for GigaEthernet interfaces
packets512to1023Octets [Packets 512 to 1023 Octets] (alcetherStatsPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (alcetherStatsPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (alcetherStatsPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 820 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxCollisions [Rx Collisions] (alcetherStatsRxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in reception). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
rxUndersizePackets [Rx Undersize Packets] (alcetherStatsRxUndersizePkts)	java. math. BigInteger	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 820 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txCollisions [Tx Collisions] (alcetherStatsTxCollisions)	java. math. BigInteger	The best estimate of the total number of collisions on this Ethernet segment (in transmission). Only for Ethernet Interfaces. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
txUndersizePackets [Tx Undersize Packets] (alcetherStatsTxUndersizePkts)	java. math. BigInteger	The total number of packets transmitted that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 821 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagPortStats</p> <p>MIB entry name: alclnkaggAggPortStatsEntry</p> <p>Entry description: A list of Link Aggregation Control Protocol statistics for each port on this device.</p> <p>Table description (for alclnkaggAggPortStatsTable): A table that contains Link Aggregation information about every port that is associated with this device. A row appears in this table for each physical port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.PortTermination</p>		
illegalPdusReceived [Illegal Pdus Received] (alclnkaggAggPortStatsIllegalRx)	long	The number of frames received that carry the Slow Protocols Ethernet Type value (), but contain a badly formed PDU or an illegal value of Protocol Subtype (). This value is read-only.
lacPDUsReceived [Lac PDUs Received] (alclnkaggAggPortStatsLACPDUsRx)	long	The number of valid LACPDUs received on this Aggregation Port. This value is read-only.
lacPdusTransmitted [Lac Pdus Transmitted] (alclnkaggAggPortStatsLACPDUsTx)	long	The number of LACPDUs transmitted on this Aggregation Port. This value is read-only.
markerPDUsReceived [Marker PDUs Received] (alclnkaggAggPortStatsMarkerPDUsRx)	long	The number of valid Marker PDUs received on this Aggregation Port. This value is read-only.
markerPdusTransmitted [Marker Pdus Transmitted] (alclnkaggAggPortStatsMarkerPDUsTx)	long	The number of Marker PDUs transmitted on this Aggregation Port. This value is read-only.
markerRspPDUsReceived [Marker Rsp PDUs Received] (alclnkaggAggPortStatsMarker-ResponsePDUsRx)	long	The number of valid Marker Response PDUs received on this Aggregation Port. This value is read-only.

Table 821 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
markerRspPduTransmitted [Marker Rsp Pdu Transmitted] (alclnkaggAggPortStatsMarker- ResponsePDUsTx)	long	The number of Marker Response PDUs transmitted on this Aggregation Port. This value is read-only.
unknownPduReceived [Unknown Pdu Received] (alclnkaggAggPortStatsUnknownRx)	long	The number of frames received that either: - carry the Slow Protocols Ethernet Type value (), but contain an unknown PDU, or: - are addressed to the Slow Protocols group MAC Address (), but do not carry the Slow Protocols Ethernet Type. This value is read-only.

Table 822 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 822 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: IldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 822 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (IldpStatsRxPortAgeoutsTotal)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the IldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial aging is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (IldpStatsRxPortFramesDiscardedTotal)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (IldpStatsRxPortFramesErrors)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (IldpStatsRxPortFramesTotal)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 822 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (IldpStatsRxPortTLVsDiscardedTotal)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (IldpStatsRxPortTLVsUnrecognizedTotal)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2005. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: IldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rxInfoTTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the adminStatus is disabled for the same port.</p> <p>Table description (for IldpStatsTxPortTable): A table containing LLDP transmission statistics for individual ports. Entries are not required to exist in this table while the IldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ildp.LLDPConfiguration</p>		
IldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (IldpStatsTxPortFramesTotal)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 823 mvrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortStatsRecieve MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. Supports realtime plotting Supports scheduled collection Monitored class: mvrp.Interface</p>		
emptyReceived [Empty Received] (alaMvrpPortStatsEmptyReceived)	long	The number of Empty messages received.
inReceived [In Received] (alaMvrpPortStatsInReceived)	long	The number of In messages received.
invalidMsgsReceived [Invalid Msgs Received] (alaMvrpPortStatsInvalidMsgsReceived)	long	The number of Invalid messages received.
joinEmptyReceived [Join Empty Received] (alaMvrpPortStatsJoinEmptyReceived)	long	The number of Join Empty messages received.
joinInReceived [Join In Received] (alaMvrpPortStatsJoinInReceived)	long	The number of Join In messages received.
leaveAllReceived [Leave All Received] (alaMvrpPortStatsLeaveAllReceived)	long	The number of Leave all messages received.

Table 823 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
leaveReceived [Leave Received] (alaMvrpPortStatsLeaveReceived)	long	The number of Leave messages received.
newReceived [New Received] (alaMvrpPortStatsNewReceived)	long	The number of New messages received.
totalMsgsReceived [Total Msgs Received] (alaMvrpPortStatsTotalMsgsReceived)	long	The total number of MVRP messages received.
totalPDURceived [Total PDURceived] (alaMvrpPortStatsTotalPDURceived)	long	The total number of MVRP PDUs received.
PortStatsTransmit MIB entry name: alaMvrpPortStatsEntry Entry description: A MVRP port statistics entry. Table description (for alaMvrpPortStatsTable): A table containing MVRP port statistics information. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.PhysicalPort • lag.Interface 		
emptyTransmitted [Empty Transmitted] (alaMvrpPortStatsEmptyTransmitted)	long	The number of Empty messages transmitted.
failedRegistrations [Failed Registrations] (alaMvrpPortFailedRegistrations)	long	The total number of failed GVRP registrations, for any reason, on this port.

Table 823 mvrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTransmitted [In Transmitted] (alaMvrpPortStatsInTransmitted)	long	The number of In messages transmitted.
joinEmptyTransmitted [Join Empty Transmitted] (alaMvrpPortStatsJoinEmptyTransmitted)	long	The number of Join Empty messages transmitted.
joinInTransmitted [Join In Transmitted] (alaMvrpPortStatsJoinInTransmitted)	long	The number of Join In messages transmitted.
leaveAllTransmitted [Leave All Transmitted] (alaMvrpPortStatsLeaveAllTransmitted)	long	The number of Leave all messages transmitted.
leaveTransmitted [Leave Transmitted] (alaMvrpPortStatsLeaveTransmitted)	long	The number of Leave messages transmitted.
newTransmitted [New Transmitted] (alaMvrpPortStatsNewTransmitted)	long	The number of New messages transmitted.
totalMsgsTransmitted [Total Msgs Transmitted] (alaMvrpPortStatsTotalMsgsTransmitted)	long	The total number of MVRP messages transmitted.
totalPDUTransmitted [Total PDUTransmitted] (alaMvrpPortStatsTotalPDUTransmitted)	long	The total number of MVRP PDUs transmitted.

Table 824 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: snmp Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity.
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message.
snmpInBadValues [Snmp In Bad Values] (snmpInBadValues)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `badValue`.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInGenErrs [Snmp In Gen Errs] (snmpInGenErrs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `genErr`.
snmpInGetNexts [Snmp In Get Nexts] (snmpInGetNexts)	long	The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

Table 824 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInGetRequests [Snmp In Get Requests] (snmpInGetRequests)	long	The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses [Snmp In Get Responses] (snmpInGetResponses)	long	The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInNoSuchNames [Snmp In No Such Names] (snmpInNoSuchNames)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpInReadOnlys [Snmp In Read Onlys] (snmpInReadOnlys)	long	The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInSetRequests [Snmp In Set Requests] (snmpInSetRequests)	long	The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInTooBigs [Snmp In Too Bigs] (snmpInTooBigs)	long	The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.
snmpInTotalReqVars [Snmp In Total Req Vars] (snmpInTotalReqVars)	long	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

Table 824 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInTotalSetVars [Snmp In Total Set Vars] (snmpInTotalSetVars)	long	The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
snmpInTraps [Snmp In Traps] (snmpInTraps)	long	The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.
snmpOutBadValues [Snmp Out Bad Values] (snmpOutBadValues)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
snmpOutGenErrs [Snmp Out Gen Errs] (snmpOutGenErrs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'genErr'.
snmpOutGetNexts [Snmp Out Get Nexts] (snmpOutGetNexts)	long	The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
snmpOutGetRequests [Snmp Out Get Requests] (snmpOutGetRequests)	long	The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutGetResponses [Snmp Out Get Responses] (snmpOutGetResponses)	long	The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
snmpOutNoSuchNames [Snmp Out No Such Names] (snmpOutNoSuchNames)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is 'noSuchName'.
snmpOutPkts [Snmp Out Pkts] (snmpOutPkts)	long	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

Table 824 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpOutSetRequests [Snmp Out Set Requests] (snmpOutSetRequests)	long	The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
snmpOutTooBigs [Snmp Out Too Bigs] (snmpOutTooBigs)	long	The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is 'tooBig.'
snmpOutTraps [Snmp Out Traps] (snmpOutTraps)	long	The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response-PDU could be returned.
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 825 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IpInTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
deliveredToUsers [Delivered To Users] (ipInDelivers)	long	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
destinationIpError [Destination Ip Error] (ipInAddrErrors)	long	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipHeaderError [Ip Header Error] (ipInHdrErrors)	long	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
localDiscards [Local Discards] (ipInDiscards)	long	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
reassembleNeeded [Reassemble Needed] (ipReasmReqds)	long	The number of IP fragments received which needed to be reassembled at this entity.

Table 825 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
reassembled [Reassembled] (ipReasmOKs)	long	The number of IP datagrams successfully re-assembled.
reassemblefailed [Reassemblefailed] (ipReasmFails)	long	The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
total [Total] (ipInReceives)	long	The total number of input datagrams received from interfaces, including those received in error.
unknownError [Unknown Error] (ipInUnknownProtos)	long	The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
IpOutTrafficStats MIB entry name: ip Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualRouter		
forwarded [Forwarded] (ipForwDatagrams)	long	The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

Table 825 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragmentFailed [Fragment Failed] (ipFragFails)	long	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
fragmentGenerated [Fragment Generated] (ipFragCreates)	long	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
fragmented [Fragmented] (ipFragOKs)	long	The number of IP datagrams that have been successfully fragmented at this entity.
generated [Generated] (ipOutRequests)	long	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
localDiscards [Local Discards] (ipOutDiscards)	long	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
noRouteDiscards [No Route Discards] (ipOutNoRoutes)	long	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default routers are down.

Table 826 udprelay statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>UDPPortStats</p> <p>MIB entry name: iphelperDhcpSnoopingPortEntry</p> <p>Entry description: A DHCP Snooping Port entry.</p> <p>Table description (for iphelperDhcpSnoopingPortTable): A list of ports that have DHCP Snooping trust status.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: udprelay.DHCPSnoopingPort</p>		
dhcpSnoopingPortBindingViolation [Dhcp Snooping Port Binding Violation] (iphelperDhcpSnoopingPortBindingViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP Release or DHCP Decline message that contains a MAC address in the DHCP snooping binding table, but the interface information in the binding table does not match the interface on which the message was received.
dhcpSnoopingPortDhcpServerViolation [Dhcp Snooping Port Dhcp Server Violation] (iphelperDhcpSnoopingPortDhcpServerViolation)	long	This keeps track of the number of packets dropped due to receiving an DHCP server packet on a DHCP Snooping enabled port.
dhcpSnoopingPortMacAddrViolation [Dhcp Snooping Port Mac Addr Violation] (iphelperDhcpSnoopingPortMacAddrViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with the source MAC Address not equal the client DHCP Hardware address in the DHCP packet.
dhcpSnoopingPortOption82Violation [Dhcp Snooping Port Option 82 Violation] (iphelperDhcpSnoopingPortOption82Violation)	long	This keeps track of the number of packets dropped due to a relay agent forwards a packet that includes option 82 info to an untrusted port.
dhcpSnoopingPortRelayAgentViolation [Dhcp Snooping Port Relay Agent Violation] (iphelperDhcpSnoopingPortRelayAgentViolation)	long	This keeps track of the number of packets dropped due to an DHCP relay agent forwards a DHCP packate includes an relay agent ip address that is not 0.0.0.0.

Table 826 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
UDPServerStats MIB entry name: iphelperStatEntry Entry description: An entry in the stat table. Table description (for iphelperStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
iphelperAgentInfoViolation [iphelper Agent Info Violation] (iphelperAgentInfoViolation)	long	This keeps track of the number of packets dropped due to DHCP packet with giaddr field not equal to zero and Relay Agent Information option is present and also the Relay Agent Information Policy is set to DROP.
iphelperForwDelayViolation [iphelper Forw Delay Violation] (iphelperForwDelayViolation)	long	This keeps track of the number of packets dropped due to forward delay violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperInvalidAgentInfoOptFrmSrver [iphelper Invalid Agent Info Opt Frm Srver] (iphelperInvalidAgentInfoOptFrmSrver)	long	This keeps track of the number of packets dropped due to invalid from DHCP server with Relay Agent Information option in the DHCP packet.
iphelperInvalidGatewayIP [iphelper Invalid Gateway IP] (iphelperInvalidGatewayIP)	long	This keeps track of the number of packets dropped due to giaddr matching a local subnet and Relay Agent Information option is present in the DHCP packet.
iphelperMaxHopsViolation [iphelper Max Hops Violation] (iphelperMaxHopsViolation)	long	This keeps track of the number of packets dropped due to max hops violation. Only meaningful for entries with ipHelperService equal to iphelperBootp(1).
iphelperRxFromClient [iphelper Rx From Client] (iphelperRxFromClient)	long	This keeps track of the number of packets recieved from the client.

Table 826 udprelay statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
iphelperTxToServer [Iphelper Tx To Server] (iphelperTxToServer)	long	This keeps track of the number of packets transmitted to the server.
UDPServiceStats MIB entry name: iphelperxStatEntry Entry description: An entry in the stat table. Table description (for iphelperxStatTable): This keeps statistics for each service by server address. Supports realtime plotting Supports scheduled collection Monitored class: udprelay.UDPServiceDestination		
udpRxFromClient [Udp Rx From Client] (iphelperxStatRxFromClient)	long	This keeps track of the number of packets recieved from the client.
udpTxToServer [Udp Tx To Server] (iphelperxStatTxToServer)	long	This keeps track of the number of packets transmitted to the server.
udpvlan [Udpvlan] (iphelperxStatVlan)	long	This specifies the unique Vlan of the server.

egressHitCount [Egress Hit Count] (tMacFilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.
ingressHitByteCount [Ingress Hit Byte Count] (tMacFilterParamsIngrHitByteCount)	java. math. BigInteger	The value of tMacFilterParamsIngrHitByteCount indicates the number of bytes of all ingress packets that matched this entry.
ingressHitCount [Ingress Hit Count] (tMacFilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.

Table 828 bgp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerAdditionalStats</p> <p>MIB entry name: bgpPeerEntry</p> <p>Entry description: Entry containing information about the connection with a BGP peer.</p> <p>Table description (for bgpPeerTable): BGP peer table. This table contains, one entry per BGP peer, information about the connections with BGP peers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
fsmEstablishedTime [Fsm Established Time] (bgpPeerFsmEstablishedTime)	long	This timer indicates how long (in seconds) this peer has been in the Established state or how long since this peer was last in the Established state. It is set to zero when a new peer is configured or the router is booted.
<p>PeerRouteTargetStats</p> <p>MIB entry name: tBgpPeerNgOperEntry</p> <p>Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable.</p> <p>Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
rtActivePfxs [Rt Active Pfxs] (tBgpPeerNgOperRtTgtActivePfxs)	long	The value of tBgpPeerNgOperRtTgtActivePfxs indicates the number of active route target prefixes from this peer.
rtRecvPfxs [Rt Recv Pfxs] (tBgpPeerNgOperRtTgtRecvPfxs)	long	The value of tBgpPeerNgOperRtTgtRecvPfxs indicates the number of route target prefixes received from this peer.

Table 828 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rtSentPfxs [Rt Sent Pfxs] (tBgpPeerNgOperRtTgtSentPfxs)	long	The value of tBgpPeerNgOperRtTgtSentPfxs indicates the number of route target prefixes transmitted to this peer.
rtSuppPfxDamp [Rt Supp Pfx Damp] (tBgpPeerNgOperRtTgtSuppPfxDamp)	long	The value of tBgpPeerNgOperRtTgtRecvPfxs indicates the number of route target prefixes from this peer, which have been suppressed by damping.
<p>PeerStats</p> <p>MIB entry name: tBgpPeerNgOperEntry</p> <p>Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable.</p> <p>Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
flaps [Flaps] (tBgpPeerNgOperFlaps)	long	The value of tBgpPeerNgOperFlaps indicates the number of flaps of updates from this peer.
inputQueueMessages [Input Queue Messages] (tBgpPeerNgOperInputQueueMsgs)	long	The value of tBgpPeerNgOperInputQueueMsgs indicates the number of unprocessed messages in the queue, from this peer.
l2VpnActivePfxs [L2 Vpn Active Pfxs] (tBgpPeerNgOperl2VpnActivePfxs)	long	The value of tBgpPeerNgOperl2VpnActivePfxs indicates the number of active L2VPN prefixes from this peer.
l2VpnRecvPfxs [L2 Vpn Recv Pfxs] (tBgpPeerNgOperl2VpnRecvPfxs)	long	The value of tBgpPeerNgOperl2VpnRecvPfxs indicates the number L2VPN prefixes received from this peer.

Table 828 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
I2VpnSentPfxs [L2 Vpn Sent Pfxs] (tBgpPeerNgOperI2VpnSentPfxs)	long	The value of tBgpPeerNgOperI2VpnSentPfxs indicates the number of L2VPN prefixes transmitted to this peer.
I2VpnSuppPfxDamp [L2 Vpn Supp Pfx Damp] (tBgpPeerNgOperI2VpnSuppPfxDamp)	long	The value of tBgpPeerNgOperI2VpnSuppPfxDamp indicates the number of L2VPN prefixes from this peer, which have been suppressed by damping.
lastEvent [Last Event] (tBgpPeerNgOperLastEvent)	long	The value of tBgpPeerNgOperLastEvent indicates the last BGP event of this peer.
lastRestartTime [Last Restart Time] (tBgpPeerNgOperLastRestartTime)	long	The value of tBgpPeerNgOperLastRestartTime indicates the last time the peer attempted restart.
lastState [Last State] (tBgpPeerNgOperLastState)	long	The value of tBgpPeerNgOperLastState indicates the last BGP state of this peer.
mcastActivePrefixes [Mcast Active Prefixes] (tBgpPeerNgOperMCastV4ActivePfxs)	long	The value of tBgpPeerNgOperMCastV4ActivePfxs indicates the number of active IPv4 multicast prefixes from this peer.
mcastPrefixesSuppressedByDamping [Mcast Prefixes Suppressed By Damping] (tBgpPeerNgOperMCastV4SuppPfxDamp)	long	The value of tBgpPeerNgOperMCastV4SuppPfxDamp indicates the number of IPv4 multicast prefixes from this peer, which have been suppressed by damping.
mcastReceivedPrefixes [Mcast Received Prefixes] (tBgpPeerNgOperMCastV4RecvPfxs)	long	The value of tBgpPeerNgOperMCastV4RecvPfxs indicates the number of IPv4 multicast prefixes received from this peer.
mcastSentPrefixes [Mcast Sent Prefixes] (tBgpPeerNgOperMCastV4SentPfxs)	long	The value of tBgpPeerNgOperMCastV4SentPfxs indicates the number of IPv4 multicast prefixes transmitted to this peer.

Table 828 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mdtSafiActivePrefixes [Mdt Safi Active Prefixes] (tBgpPeerNgOperMdtSafiActivePfxs)	long	The value of tBgpPeerNgOperMdtSafiActivePfxs indicates the number of active MDT-SAFI prefixes from this peer.
mdtSafiPrefixesSuppressedByDamping [Mdt Safi Prefixes Suppressed By Damping] (tBgpPeerNgOperMdtSafiSuppPfxDamp)	long	The value of tBgpPeerNgOperMdtSafiSuppPfxDamp indicates the number of MDT-SAFI prefixes from this peer, which have been suppressed by damping.
mdtSafiReceivedPrefixes [Mdt Safi Received Prefixes] (tBgpPeerNgOperMdtSafiRecvPfxs)	long	The value of tBgpPeerNgOperMdtSafiRecvPfxs indicates the number of MDT-SAFI prefixes received from this peer.
mdtSafiSentPrefixes [Mdt Safi Sent Prefixes] (tBgpPeerNgOperMdtSafiSentPfxs)	long	The value of tBgpPeerNgOperMdtSafiSentPfxs indicates the number of MDT-SAFI prefixes transmitted to this peer.
messageOctetsReceived [Message Octets Received] (tBgpPeerNgOperMsgOctetsRcvd)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsRcvd indicates the number of octets received from this peer.
messageOctetsSent [Message Octets Sent] (tBgpPeerNgOperMsgOctetsSent)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsSent indicates the number of octets transmitted to this peer.
numberOfRestarts [Number Of Restarts] (tBgpPeerNgOperNumRestarts)	long	The value of tBgpPeerNgOperNumRestarts indicates the number of times the peer has attempted restart.
outputQueueMessages [Output Queue Messages] (tBgpPeerNgOperOutputQueueMsgs)	long	The value of tBgpPeerNgOperOutputQueueMsgs indicates the number of untransmitted messages in the queue, to this peer.

Table 828 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pathsReceived [Paths Received] (tBgpPeerNgOperReceivedPaths)	long	The value of tBgpPeerNgOperReceivedPaths indicates the number of paths received from this peer.
prefixesActive [Prefixes Active] (tBgpPeerNgOperActivePrefixes)	long	The value of tBgpPeerNgOperActivePrefixes indicates the number of active prefixes from this peer.
prefixesReceived [Prefixes Received] (tBgpPeerNgOperReceivedPrefixes)	long	The value of tBgpPeerNgOperReceivedPrefixes indicates the number of prefixes received from this peer.
prefixesSent [Prefixes Sent] (tBgpPeerNgOperSentPrefixes)	long	The value of tBgpPeerNgOperSentPrefixes indicates the number of prefixes transmitted to this peer.
prefixesSuppressedByDamping [Prefixes Suppressed By Damping] (tBgpPeerNgOperV4SuppPfxDamp)	long	The value of tBgpPeerNgOperV4SuppPfxDamp indicates the number of IPv6 prefixes from this peer, which have been suppressed by damping.
v6ActivePrefixes [V6 Active Prefixes] (tBgpPeerNgOperV6ActivePrefixes)	long	The value of tBgpPeerNgOperV6ActivePrefixes indicates the number of active IPv6 prefixes from this peer.
v6PrefixesSuppressedByDamping [V6 Prefixes Suppressed By Damping] (tBgpPeerNgOperV6SuppPfxDamp)	long	The value of tBgpPeerNgOperV6SuppPfxDamp indicates the number of IPv6 prefixes from this peer, which have been suppressed by damping.
v6ReceivedPrefixes [V6 Received Prefixes] (tBgpPeerNgOperV6ReceivedPrefixes)	long	The value of tBgpPeerNgOperV6ReceivedPrefixes indicates the number of IPv6 prefixes received from this peer.
v6SentPrefixes [V6 Sent Prefixes] (tBgpPeerNgOperV6SentPrefixes)	long	The value of tBgpPeerNgOperV6SentPrefixes indicates the number of IPv6 prefixes transmitted to this peer.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vpnActivePrefixes [Vpn Active Prefixes] (tBgpPeerNgOperVpnActivePrefixes)	long	The value of tBgpPeerNgOperVpnActivePrefixes indicates the number of active VPN prefixes from this BGP peer.
vpnPrefixesSuppressedByDamping [Vpn Prefixes Suppressed By Damping] (tBgpPeerNgOperVpnSuppPfxDamp)	long	The value of tBgpPeerNgOperVpnSuppPfxDamp indicates the number of VPN IPv4 prefixes from this peer, which have been suppressed by damping.
vpnReceivedPrefixes [Vpn Received Prefixes] (tBgpPeerNgOperVpnRecvPrefixes)	long	The value of tBgpPeerNgOperVpnRecvPrefixes indicates the number of received VPN prefixes.
vpnSentPrefixes [Vpn Sent Prefixes] (tBgpPeerNgOperVpnSentPrefixes)	long	The value of tBgpPeerNgOperVpnSentPrefixes indicates the number of transmitted VPN prefixes.
<p>PeerVprnlpv6Stats</p> <p>MIB entry name: tBgpPeerNgOperEntry</p> <p>Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable.</p> <p>Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
vpnIpv6ActivePfxs [Vpn Ipv 6 Active Pfxs] (tBgpPeerNgOperVpnIpv6ActivePfxs)	long	The value of tBgpPeerNgOperVpnIpv6ActivePfxs indicates the number of active VPN IPv6 prefixes from this peer.
vpnIpv6RecvPfxs [Vpn Ipv 6 Recv Pfxs] (tBgpPeerNgOperVpnIpv6RecvPfxs)	long	The value of tBgpPeerNgOperVpnIpv6RecvPfxs indicates the number of VPN IPv6 prefixes received from this peer.

Table 828 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vpnIpv6SentPfxs [Vpn Ipv 6 Sent Pfxs] (tBgpPeerNgOperVpnIpv6SentPfxs)	long	The value of tBgpPeerNgOperVpnIpv6SentPfxs indicates the number of VPN IPv6 prefixes transmitted to this peer.
vpnIpv6SuppPfxDamp [Vpn Ipv 6 Supp Pfx Damp] (tBgpPeerNgOperVpnIpv6SuppPfxDamp)	long	The value of tBgpPeerNgOperVpnIpv6SuppPfxDamp indicates the number of VPN IPv6 prefixes from this peer, which have been suppressed by damping.

Table 829 cflowd statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>NeCflowdStats</p> <p>MIB entry name: tmnxCflowdVersionStatsEntry</p> <p>Entry description: The tmnxCflowdVersionStatsEntry contains the information pertaining to the system wide statistics for the specified version index.</p> <p>Table description (for tmnxCflowdVersionStatsTable): The tmnxCflowdVersionStatsTable consists of the overall statistics based on collector version.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.NeCollector</p>		
packetErrors [Packet Errors] (tmnxCflowdVersionErrors)	long	The value of tmnxCflowdVersionErrors indicates the number of errored packets for the specified version.
packetsOpen [Packets Open] (tmnxCflowdVersionOpen)	long	The value of tmnxCflowdVersionOpen indicates the number of open packets pending for the specified version.
packetsSent [Packets Sent] (tmnxCflowdVersionSent)	long	The value of tmnxCflowdVersionSent indicates the number of packets transmitted for the specified version.
version [Version] (tmnxCflowdVersionIndex)	long	The value of tmnxCflowdVersionIndex specifies the row in the tmnxCflowdVersionStatsTable that pertains to the cflowd collector version.
versionStatus [Version Status] (tmnxCflowdVersionStatus)	int	The value of tmnxCflowdVersionStatus indicates whether or not the version is in use in the system.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
helloRx [Hello Rx] (tmnxDCvShelloRx)	java. math. BigInteger	The value of tmnxDCvShelloRx indicates the total number of hello packets received.
helloTx [Hello Tx] (tmnxDCvShelloTx)	java. math. BigInteger	The value of tmnxDCvShelloTx indicates the total number of hello packets transmitted.
statsReqRx [Stats Req Rx] (tmnxDCvSstatsReqRx)	java. math. BigInteger	The value of tmnxDCvSstatsReqRx indicates the total number of stats-req packets received.
statsReqTx [Stats Req Tx] (tmnxDCvSstatsReqTx)	java. math. BigInteger	The value of tmnxDCvSstatsReqTx indicates the total number of stats-req packets transmitted.
statsRespRx [Stats Resp Rx] (tmnxDCvSstatsRespRx)	java. math. BigInteger	The value of tmnxDCvSstatsRespRx indicates the total number of stats-req packets received.
statsRespTx [Stats Resp Tx] (tmnxDCvSstatsRespTx)	java. math. BigInteger	The value of tmnxDCvSstatsRespTx indicates the total number of stats-req packets transmitted.

Table 831 equipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AllocatedMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
allocatedMemory [Allocated Memory] (sgiMemoryPoolAllocated)	long	The value of sgiMemoryPoolAllocated indicates the total memory currently allocated in memory-pools on the system. This memory may or may not be currently in use, but is pre-allocated should the software need to use it. If the value is greater than the maximum value reportable by this object then this object reports its maximum value (4,294,967,295) and sgiKbMemoryPoolAllocated must be used to determine the total memory allocated in memory-pools.
<p>AvailableMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
availableMemory [Available Memory] (sgiMemoryAvailable)	long	The value of sgiMemoryAvailable indicates the amount of free memory in the overall system that is not allocated to memory pools, but is available in case a memory pool needs to grow.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>FPNwIngQGrpArbiterStats</p> <p>MIB entry name: tFPNetIngQGrpArbitStatEntry</p> <p>Entry description: The value of tFPNetIngQGrpArbitStatEntry defines an entry in the tFPNetIngQGrpArbitStatTable. It represents statistics about a specific QoS ingress queue group arbiter.</p> <p>Table description (for tFPNetIngQGrpArbitStatTable): The value of tFPNetIngQGrpArbitStatTable contains forwarding-plane ingress QoS queue group arbiter statistics on network side.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.FPNwIngQGrpEntry</p>		
fpNetIngQGrpArbitStatFwdOcts [Fp Net Ing QGrp Arbit Stat Fwd Octs] (tFPNetIngQGrpArbitStatFwdOcts)	java. math. BigInteger	The value of tFPNetIngQGrpArbitStatFwdOcts indicates the number of forwarded octets by the ingress queue group arbiter Pchip.
fpNetIngQGrpArbitStatFwdOctsH [Fp Net Ing QGrp Arbit Stat Fwd Octs H] (tFPNetIngQGrpArbitStatFwdOctsH)	long	The value of tFPNetIngQGrpArbitStatFwdOctsH indicates the upper 32 bits of tFPNetIngQGrpArbitStatFwdOcts.
fpNetIngQGrpArbitStatFwdOctsL [Fp Net Ing QGrp Arbit Stat Fwd Octs L] (tFPNetIngQGrpArbitStatFwdOctsL)	long	The value of tFPNetIngQGrpArbitStatFwdOctsL indicates the lower 32 bits of tFPNetIngQGrpArbitStatFwdOcts.
fpNetIngQGrpArbitStatFwdPkts [Fp Net Ing QGrp Arbit Stat Fwd Pkts] (tFPNetIngQGrpArbitStatFwdPkts)	java. math. BigInteger	The value of tFPNetIngQGrpArbitStatFwdPkts indicates the number of forwarded packets by the ingress queue group arbiter Pchip.
fpNetIngQGrpArbitStatFwdPktsH [Fp Net Ing QGrp Arbit Stat Fwd Pkts H] (tFPNetIngQGrpArbitStatFwdPktsH)	long	The value of tFPNetIngQGrpArbitStatFwdPktsH indicates the upper 32 bits of tFPNetIngQGrpArbitStatFwdPkts.
fpNetIngQGrpArbitStatFwdPktsL [Fp Net Ing QGrp Arbit Stat Fwd Pkts L] (tFPNetIngQGrpArbitStatFwdPktsL)	long	The value of tFPNetIngQGrpArbitStatFwdPktsL indicates the lower 32 bits of tFPNetIngQGrpArbitStatFwdPkts.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fpNetIngQGrpArbitStatName [Fp Net Ing QGrp Arbit Stat Name] (tFPNetIngQGrpArbitStatName)	String	The value of tFPNetIngQGrpArbitStatName specifies the name of the ingress QoS arbiter of this forwarding-plane queue group on network.
<p>FibNextHopStats</p> <p>MIB entry name: vRtrFibStatNextHopEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an IOM card in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrFibStatNextHopTable): The vRtrFibStatNextHopTable has an entry for each IOM in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.BaseCard</p>		
ipActive [Ip Active] (vRtrFibStatNextHopIPActive)	long	vRtrFibStatNextHopIPActive indicates current active IP next-hop counts for the FIB on the IOM.
ipAvailable [Ip Available] (vRtrFibStatNextHopIPAvailable)	long	vRtrFibStatNextHopIPAvailable indicates the available IP next-hop counts for the FIB on the IOM.
tunnelActive [Tunnel Active] (vRtrFibStatNextHopTunnelActive)	long	vRtrFibStatNextHopTunnelActive indicates current active Tunnel next-hop counts for the FIB on the IOM.
tunnelAvailable [Tunnel Available] (vRtrFibStatNextHopTunnelAvailable)	long	vRtrFibStatNextHopTunnelAvailable indicates the available Tunnel next-hop counts for the FIB on the IOM.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>FibStats</p> <p>MIB entry name: vRtrFibStatEntry</p> <p>Entry description: Each row entry represents a collection of summarized statistics for each virtual router on an IOM card in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrFibStatTable): The vRtrStatTable has an entry for IOM card configured in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.BaseCard</p>		
aggrRoutes [Aggr Routes] (vRtrFibStatAggrRoutes)	long	vRtrFibStatAggrRoutes indicates current aggregate route counts for the virtual router.
alarmCount [Alarm Count] (vRtrFibStatAlarmCount)	long	vRtrFibStatAlarmCount indicates the number of times the FIB has raised an alarm due to high FIB usage.
bgpRoutes [Bgp Routes] (vRtrFibStatBGPRoutes)	long	vRtrFibStatBGPRoutes indicates current BGP route counts for the virtual router.
bgpVpnRoutes [Bgp Vpn Routes] (vRtrFibStatBGPVpnRoutes)	long	vRtrFibStatBGPVpnRoutes indicates current BGP VPN route counts for the virtual router.
directRoutes [Direct Routes] (vRtrFibStatDirectRoutes)	long	vRtrFibStatDirectRoutes indicates current direct route counts for the virtual router.
highUtilization [High Utilization] (vRtrFibStatHighUtilization)	boolean	vRtrFibStatHighUtilization indicates whether or not the FIB on the IOM is experiences persistent high occupancy.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
hostRoutes [Host Routes] (vRtrFibStatHostRoutes)	long	vRtrFibStatHostRoutes indicates current host route counts for the virtual router.
isisRoutes [Isis Routes] (vRtrFibStatISISRoutes)	long	vRtrFibStatISISRoutes indicates current ISIS route counts for the virtual router.
lastAlarmTime [Last Alarm Time] (vRtrFibStatLastAlarmTime)	long	vRtrFibStatLastAlarmTime indicates the last time a high FIB usage alarm was raised.
managedRoutes [Managed Routes] (vRtrFibStatManagedRoutes)	long	vRtrFibStatManagedRoutes indicates current managed route counts for the virtual router.
natRoutes [Nat Routes] (vRtrFibStatNatRoutes)	long	vRtrFibStatNatRoutes indicates current NAT route counts for the virtual router.
ospfRoutes [Ospf Routes] (vRtrFibStatOSPFRoutes)	long	vRtrFibStatOSPFRoutes indicates current OSPF route counts for the virtual router.
overflows [Overflows] (vRtrFibStatOverflows)	long	vRtrFibStatOverflows indicates the number of times the FIB has run out of space.
ripRoutes [Rip Routes] (vRtrFibStatRIPRoutes)	long	vRtrFibStatRIPRoutes indicates current RIP route counts for the virtual router.
staticRoutes [Static Routes] (vRtrFibStatStaticRoutes)	long	vRtrFibStatStaticRoutes indicates current static route counts for the virtual router.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
subMgmtRoutes [Sub Mgmt Routes] (vRtrFibStatSubMgmtRoutes)	long	vRtrFibStatSubMgmtRoutes indicates current Sub-management route counts for the virtual router.
v6AggrRoutes [V6 Aggr Routes] (vRtrFibStatV6AggrRoutes)	long	vRtrFibStatV6AggrRoutes indicates current aggregate route counts for the virtual router.
v6BGPRoutes [V6 BGP Routes] (vRtrFibStatV6BGPRoutes)	long	vRtrFibStatV6BGPRoutes indicates current BGP route counts for the virtual router.
v6BGPVpnRoutes [V6 BGPVpn Routes] (vRtrFibStatV6BGPVpnRoutes)	long	vRtrFibStatV6BGPVpnRoutes indicates current BGP VPN route counts for the virtual router.
v6DirectRoutes [V6 Direct Routes] (vRtrFibStatV6DirectRoutes)	long	vRtrFibStatV6DirectRoutes indicates current direct route counts for the virtual router.
v6HostRoutes [V6 Host Routes] (vRtrFibStatV6HostRoutes)	long	vRtrFibStatV6HostRoutes indicates current host route counts for the virtual router.
v6ISISRoutes [V6 ISIS Routes] (vRtrFibStatV6ISISRoutes)	long	vRtrFibStatV6ISISRoutes indicates current ISIS route counts for the virtual router.
v6ManagedRoutes [V6 Managed Routes] (vRtrFibStatV6ManagedRoutes)	long	vRtrFibStatV6ManagedRoutes indicates current managed route counts for the virtual router.
v6NatRoutes [V6 Nat Routes] (vRtrFibStatV6NatRoutes)	long	vRtrFibStatV6NatRoutes indicates current NAT IPv6 route counts for the virtual router.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v6OSPFRoutes [V6 OSPFRoutes] (vRtrFibStatV6OSPFRoutes)	long	vRtrFibStatV6OSPFRoutes indicates current OSPF route counts for the virtual router.
v6RIPRoutes [V6 RIPRoutes] (vRtrFibStatV6RIPRoutes)	long	vRtrFibStatV6RIPRoutes indicates current RIP route counts for the virtual router.
v6StaticRoutes [V6 Static Routes] (vRtrFibStatV6StaticRoutes)	long	vRtrFibStatV6StaticRoutes indicates current static route counts for the virtual router.
v6SubMgmtRoutes [V6 Sub Mgmt Routes] (vRtrFibStatV6SubMgmtRoutes)	long	vRtrFibStatV6SubMgmtRoutes indicates current Sub-management route counts for the virtual router.
v6VpnLeakRoutes [V6 Vpn Leak Routes] (vRtrFibStatV6VPNLeakRoutes)	long	vRtrFibStatV6VPNLeakRoutes indicates current IPv6 VPN Leak route counts for the virtual router.
vpnLeakRoutes [Vpn Leak Routes] (vRtrFibStatVPNLeakRoutes)	long	vRtrFibStatVPNLeakRoutes indicates current VPN Leak route counts for the virtual router.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
<p>MediaIndependentStats</p> <p>MIB entry name: mediaIndependentEntry</p> <p>Entry description: Media independent statistics for promiscuous monitoring of any media.</p> <p>Table description (for mediaIndependentTable): Media independent statistics for promiscuous monitoring of any media. The following table defines media independent statistics that provide information for full and/or half-duplex links as well as high capacity links. For half-duplex links, or full-duplex-capable links operating in half-duplex mode, the mediaIndependentIn* objects shall be used and the mediaIndependentOut* objects shall not increment. For full-duplex links, the mediaIndependentOut* objects shall be present and shall increment. Whenever possible, the probe should count packets moving away from the closest terminating equipment as output packets. Failing that, the probe should count packets moving away from the DTE as output packets.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
dropEvents [Drop Events] (mediaIndependentDropEvents)	long	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
droppedFrames [Dropped Frames] (mediaIndependentDroppedFrames)	long	The total number of frames which were received by the probe and therefore not accounted for in the mediaIndependentDropEvents, but for which the probe chose not to count for this entry for whatever reason. Most often, this event occurs when the probe is out of some resources and decides to shed load from this collection. This count does not include packets that were not counted because they had MAC-layer errors. Note that, unlike the dropEvents counter, this number is the exact number of frames dropped.
duplex [Duplex] (mediaIndependentDuplexMode)	int	The current mode of this link. Note that if the link has full-duplex capabilities but is operating in half-duplex mode, this value will be halfduplex(1).
duplexChanges [Duplex Changes] (mediaIndependentDuplexChanges)	long	The number of times this link has changed from full-duplex mode to half-duplex mode or from half-duplex mode to full-duplex mode.
inputSpeed [Input Speed] (mediaIndependentInputSpeed)	long	The nominal maximum speed in kilobits per second of this half-duplex link or on the inbound connection of this full-duplex link. If the speed is unknown or there is no fixed maximum (e.g. a compressed link), this value shall be zero.
outputSpeed [Output Speed] (mediaIndependentOutputSpeed)	long	The nominal maximum speed in kilobits per second of this full-duplex link in the direction of the network. If the speed is unknown, the link is half-duplex, or there is no fixed maximum (e.g. a compressed link), this value shall be zero.
receivedBadPackets [Received Bad Packets] (mediaIndependentInErrors)	long	The total number of bad packets received on a half-duplex link or on the inbound connection of a full-duplex link.
receivedNonUnicastPackets [Received Non Unicast Packets] (mediaIndependentInNUCastHigh-CapacityPkts)	java. math. BigInteger	The total number of non-unicast packets (including bad packets) received on a half-duplex link or on the inbound connection of a full-duplex link.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedOctets [Received Octets] (mediaIndependentInHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received (excluding framing bits but including FCS octets) on a half-duplex link or on the inbound connection of a full-duplex link.
receivedPackets [Received Packets] (mediaIndependentInHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received on a half-duplex link or on the inbound connection of a full-duplex link.
transmittedBadPackets [Transmitted Bad Packets] (mediaIndependentOutErrors)	long	The total number of bad packets received on a full-duplex link in the direction of the network.
transmittedNonUnicastPackets [Transmitted Non Unicast Packets] (mediaIndependentOutNUC- astHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets) received on a full-duplex link in the direction of the network.
transmittedOctets [Transmitted Octets] (mediaIndependentOutHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received on a full-duplex link in the direction of the network (excluding framing bits but including FCS octets).
transmittedPackets [Transmitted Packets] (mediaIndependentOutHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received on a full-duplex link in the direction of the network.

bundleMemberImaErrorIcpCells [Bundle Member Ima Error Icp Cells] (tmnxBundleMemberImaErrorIcpCells)	long	tmnxBundleMemberImaErrorIcpCells indicates the number of ICP cells with HEC or CRC-10 errors.
bundleMemberImaFeRxNumFails [Bundle Member Ima Fe Rx Num Fails] (tmnxBundleMemberImaFeRxNumFails)	long	tmnxBundleMemberImaFeRxNumFails indicates the number of times that a far-end receive alarm is set on the IMA link.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
bundleMemberImaFeRxUnuseSecs [Bundle Member Ima Fe Rx Unuse Secs] (tmnxBundleMemberImaFeRxUnuseSecs)	long	tmnxBundleMemberImaFeRxUnuseSecs indicates the number of unavailable seconds at the far-end receive link state machine.
bundleMemberImaFeSevErrSecs [Bundle Member Ima Fe Sev Err Secs] (tmnxBundleMemberImaFeSevErrSecs)	long	tmnxBundleMemberImaFeSevErrSecs indicates the number of one second intervals in which the far-end contains IMA-RDI defects.
bundleMemberImaFeTxNumFails [Bundle Member Ima Fe Tx Num Fails] (tmnxBundleMemberImaFeTxNumFails)	long	tmnxBundleMemberImaFeTxNumFails indicates the number of times that a far-end transmit alarm is set on the IMA link.
bundleMemberImaFeTxUnuseSecs [Bundle Member Ima Fe Tx Unuse Secs] (tmnxBundleMemberImaFeTxUnuseSecs)	long	tmnxBundleMemberImaFeTxUnuseSecs indicates the number of unavailable seconds at the far-end transmit link state machine.
bundleMemberImaFeUnavailSecs [Bundle Member Ima Fe Unavail Secs] (tmnxBundleMemberImaFeUnavailSecs)	long	tmnxBundleMemberImaFeUnavailSecs indicates the number of unavailable seconds at the near-end.
bundleMemberImaLstRxlcpCells [Bundle Member Ima Lst Rx lcp Cells] (tmnxBundleMemberImaLstRxlcpCells)	long	tmnxBundleMemberImaLstRxlcpCells indicates the number of lost ICP cells at the expected offset.
bundleMemberImaNeRxNumFails [Bundle Member Ima Ne Rx Num Fails] (tmnxBundleMemberImaNeRxNumFails)	long	tmnxBundleMemberImaNeRxNumFails indicates the number of times that a near-end receive alarm is set on the IMA link.
bundleMemberImaNeRxUnuseSecs [Bundle Member Ima Ne Rx Unuse Secs] (tmnxBundleMemberImaNeRxUnuseSecs)	long	tmnxBundleMemberImaNeRxUnuseSecs indicates the number of unavailable seconds at the near-end receive link state machine.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
bundleMemberImaNeSevErrSecs [Bundle Member Ima Ne Sev Err Secs] (tmnxBundleMemberImaNeSevErrSecs)	long	tmnxBundleMemberImaNeSevErrSecs indicates the number of one second intervals in which thirty percent or more of the near-end ICP cells are in violation, or link defects have occurred.
bundleMemberImaNeTxNumFails [Bundle Member Ima Ne Tx Num Fails] (tmnxBundleMemberImaNeTxNumFails)	long	tmnxBundleMemberImaNeTxNumFails indicates the number of times that a near-end transmit alarm is set on the IMA link.
bundleMemberImaNeTxUnuseSecs [Bundle Member Ima Ne Tx Unuse Secs] (tmnxBundleMemberImaNeTxUnuseSecs)	long	tmnxBundleMemberImaNeTxUnuseSecs indicates the number of unavailable seconds at the near-end transmit link state machine.
bundleMemberImaNeUnavailSecs [Bundle Member Ima Ne Unavail Secs] (tmnxBundleMemberImaNeUnavailSecs)	long	tmnxBundleMemberImaNeUnavailSecs indicates the number of unavailable seconds at the near-end.
bundleMemberImaOifAnomalies [Bundle Member Ima Oif Anomalies] (tmnxBundleMemberImaOifAnomalies)	long	tmnxBundleMemberImaOifAnomalies indicates the number of OIF anomalies at the near-end.
bundleMemberImaRxIcpCells [Bundle Member Ima Rx Icp Cells] (tmnxBundleMemberImaRxIcpCells)	long	tmnxBundleMemberImaRxIcpCells indicates the number of ICP cells that have been received on the IMA link.
bundleMemberImaTxIcpCells [Bundle Member Ima Tx Icp Cells] (tmnxBundleMemberImaTxIcpCells)	long	tmnxBundleMemberImaTxIcpCells indicates the number of ICP cells that have been transmitted on the IMA link.
bundleMemberImaViolations [Bundle Member Ima Violations] (tmnxBundleMemberImaViolations)	long	tmnxBundleMemberImaViolations indicates the number of ICP violations including errored, invalid or missing ICP cells.

Table 831 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SystemCpuMonStats</p> <p>MIB entry name: tmnxSysCpuMonEntry</p> <p>Entry description: tmnxSysCpuMonEntry contains the system level CPU monitoring statistics over a specified sample-time.</p> <p>Table description (for tmnxSysCpuMonTable): tmnxSysCpuMonTable consists of the system level CPU monitoring statistics.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.SystemStatsHolder</p>		
tmnxSysCpuMonBusyCoreUtil [Tmnx Sys Cpu Mon Busy Core Util] (tmnxSysCpuMonBusyCoreUtil)	float	The value of tmnxSysCpuMonBusyCoreUtil indicates the utilization percentage of the busiest processor core over the specified sample-time. On single core CPUs, this is the overall system utilization percentage over the specified sample-time.
tmnxSysCpuMonBusyGroupName [Tmnx Sys Cpu Mon Busy Group Name] (tmnxSysCpuMonBusyGroupName)	String	The value of tmnxSysCpuMonBusyGroupName indicates the name of the group that is running at the highest capacity utilization. Capacity utilization is the CPU utilization relative to the maximum CPU resources available to that group. A group is a set of related applications, services, tasks or protocol handlers that consumes some part of the system CPU resources. The capacity utilization of the busiest group is indicated by tmnxSysCpuMonBusyGroupUtil.
tmnxSysCpuMonBusyGroupUtil [Tmnx Sys Cpu Mon Busy Group Util] (tmnxSysCpuMonBusyGroupUtil)	float	The value of tmnxSysCpuMonBusyGroupUtil indicates the capacity utilization of the group that is running at the highest capacity utilization. Capacity utilization is the CPU utilization relative to the maximum CPU resources available to that group. A group is a set of related applications, services, tasks or protocol handlers that consumes some part of the system CPU resources. The name of the busiest group is indicated by tmnxSysCpuMonBusyGroupName.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tmnxSysCpuMonCpuIdle [Tmnx Sys Cpu Mon Cpu Idle] (tmnxSysCpuMonCpuIdle)	float	The value of tmnxSysCpuMonCpuIdle indicates the overall percentage of CPU idleness over the specified sample-time.
tmnxSysCpuMonSampleTime [Tmnx Sys Cpu Mon Sample Time] (tmnxSysCpuMonSampleTime)	int	The value of tmnxSysCpuMonSampleTime specifies the sample-time used to calculate the utilization results for the row.
SystemCpuStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder		
systemCpuUsage [System Cpu Usage] (sgiCpuUsage)	long	The value of sgiCpuUsage indicates the current CPU utilization for the system.
SystemMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder		
systemMemoryUsage [System Memory Usage] (sgiMemoryUsed)	long	The value of sgiMemoryUsed indicates the total pre-allocated pool memory currently in use on the system. If the value is greater than the maximum value reportable by this object then this object reports its maximum value (4,294,967,295) and sgiKbMemoryUsed must be used to determine the total pre-allocated pool memory.

Table 832 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AdditionalEthernetStats</p> <p>MIB entry name: tmnxPortEtherEntry</p> <p>Entry description: Each row entry represents an Ethernet port on a IOM card in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. Before an IOM card entry can be deleted from the tmnxMDATable, its supported tmnxPortEntry and tmnxPortEtherEntry rows must be in the proper state for removal. The tmnxPortEtherEntry contains attributes that are unique to the Ethernet TmnxPortType.</p> <p>Table description (for tmnxPortEtherTable): The tmnxPortEtherTable has an entry for each Ethernet (faste, gige, xcme or xgige) port on each IOM card in each chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
highCapacityPackets1519toMaxFrameSize [High Capacity Packets 1519 to Max Frame Size] (tmnxPortEtherHCPkts1519toMax)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 octets in length and the maximum frame size, usually 12287 octets inclusive (excluding framing bits but including FCS octets). The lower 32-bits of this 64-bit counter will equal the value of tmnxPortEtherHCPkts1519toMax. The high 32-bits of this counter will equal the value of tmnxPortEtherHCOverPkts1519toMax.
packets1519toMaxFrameSize [Packets 1519 to Max Frame Size] (tmnxPortEtherPkts1519toMax)	long	The total number of packets received that were longer than 1518 octets but less than the maximum frame size for the particular medium, usually 12287 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
<p>alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)</p>	<p>long</p>	<p>A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for group encoding schemes greater than 4 bits per group. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsAlignmentErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.</p>

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
carrierSenseErrors [Carrier Sense Errors] (dot3StatsCarrierSenseErrors)	long	The number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular interface. The count represented by an instance of this object is incremented at most once per transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsFCSErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. For interfaces operating at 10 Gb/s, this counter can roll over in less than 80 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsFrameTooLongs object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalMacReceiveErrors [Internal Mac Receive Errors] (dot3StatsInternalMacReceiveErrors)	long	A count of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsFrameTooLongs object, the dot3StatsAlignmentErrors object, or the dot3StatsFCSErrors object. The precise meaning of the count represented by an instance of this object is implementation- specific. In particular, an instance of this object may represent a count of receive errors on a particular interface that are not otherwise counted. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsInternalMacReceiveErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalMacTransmitErrors [Internal Mac Transmit Errors] (dot3StatsInternalMacTransmitErrors)	long	A count of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object. The precise meaning of the count represented by an instance of this object is implementation- specific. In particular, an instance of this object may represent a count of transmission errors on a particular interface that are not otherwise counted. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsInternalMacTransmitErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of frames that are involved in more than one collision and are subsequently transmitted successfully. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of frames that are involved in a single collision, and are subsequently transmitted successfully. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
sqeTestErrors [Sqe Test Errors] (dot3StatsSQETestErrors)	long	A count of times that the SQE TEST ERROR is received on a particular interface. The SQE TEST ERROR is set in accordance with the rules for verification of the SQE detection mechanism in the PLS Carrier Sense Function as described in IEEE Std. 802.3, 2000 Edition, section 7.2.4.6. This counter does not increment on interfaces operating at speeds greater than 10 Mb/s, or on interfaces operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
symbolErrors [Symbol Errors] (dot3StatsSymbolErrors)	long	<p>For an interface operating at 100 Mb/s, the number of times there was an invalid data symbol when a valid carrier was present. For an interface operating in half-duplex mode at 1000 Mb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than slotTime, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Data reception error' or 'carrier extend error' on the GMII. For an interface operating in full-duplex mode at 1000 Mb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than minFrameSize, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Data reception error' on the GMII. For an interface operating at 10 Gb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than minFrameSize, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Receive Error' on the XGMII. The count represented by an instance of this object is incremented at most once per carrier event, even if multiple symbol errors occur during the carrier event. This count does not increment if a collision is present. This counter does not increment when the interface is operating at 10 Mb/s. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsSymbolErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.</p>

packets1024to1518Octets [Packets 1024 to 1518 Octets] (etherStatsHighCapacityPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).
packets128to255Octets [Packets 128 to 255 Octets] (etherStatsHighCapacityPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets256to511Octets [Packets 256 to 511 Octets] (etherStatsHighCapacityPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets512to1023Octets [Packets 512 to 1023 Octets] (etherStatsHighCapacityPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets64Octets [Packets 64 Octets] (etherStatsHighCapacityPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (etherStatsHighCapacityPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalOctets [Total Octets] (etherStatsHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). If the network is half-duplex Fast Ethernet, this object can be used as a reasonable estimate of utilization. If greater precision is desired, the etherStatsHighCapacityPkts and etherStatsHighCapacityOctets objects should be sampled before and after a common interval. The differences in the sampled values are Pkts and Octets, respectively, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows: $Pkts * (.96 + .64) + (Octets * .08)$ Utilization = - Interval * 10,000 The result of this equation is the value Utilization which is the percent utilization of the ethernet segment on a scale of 0 to 100 percent. This table is not appropriate for monitoring full-duplex ethernets. If the network is a full-duplex ethernet and the medialIndependentTable is monitoring that network, the utilization can be calculated as follows: 1) Determine the utilization of the inbound path by using the appropriate equation (for ethernet or fast ethernet) to determine the utilization, substituting medialIndependentInPkts for etherStatsHighCapacityPkts, and medialIndependentInOctets for etherStatsHighCapacityOctets. Call the resulting utilization inUtilization. 2) Determine the utilization of the outbound path by using the same equation to determine the utilization, substituting medialIndependentOutPkts for etherStatsHighCapacityPkts, and medialIndependentOutOctets for etherStatsHighCapacityOctets. Call the resulting utilization outUtilization. 3) The utilization is the maximum of inUtilization and outUtilization. This metric shows the amount of percentage of bandwidth that is left before congestion will be experienced on the link.
totalPackets [Total Packets] (etherStatsHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetStats</p> <p>MIB entry name: etherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named etherStatsPkts.1</p> <p>Table description (for etherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
broadcastPackets [Broadcast Packets] (etherStatsBroadcastPkts)	long	The total number of good packets received that were directed to the broadcast address. Note that this does not include multicast packets.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
collisions [Collisions] (etherStatsCollisions)	long	The best estimate of the total number of collisions on this Ethernet segment. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
crcAlignErrors [Crc Align Errors] (etherStatsCRCAlignErrors)	long	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
dropEvents [Drop Events] (etherStatsDropEvents)	long	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragments [Fragments] (etherStatsFragments)	long	The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that it is entirely normal for etherStatsFragments to increment. This is because it counts both runts (which are normal occurrences due to collisions) and noise hits.
jabbers [Jabbers] (etherStatsJabbers)	long	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
multicastPackets [Multicast Packets] (etherStatsMulticastPkts)	long	The total number of good packets received that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address.
oversizePackets [Oversize Packets] (etherStatsOversizePkts)	long	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.
packets1024to1518Octets [Packets 1024 to 1518 Octets] (etherStatsPkts1024to1518Octets)	long	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).
packets128to255Octets [Packets 128 to 255 Octets] (etherStatsPkts128to255Octets)	long	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets256to511Octets [Packets 256 to 511 Octets] (etherStatsPkts256to511Octets)	long	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets512to1023Octets [Packets 512 to 1023 Octets] (etherStatsPkts512to1023Octets)	long	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (etherStatsPkts64Octets)	long	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (etherStatsPkts65to127Octets)	long	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).
totalOctets [Total Octets] (etherStatsOctets)	long	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). This object can be used as a reasonable estimate of 10-Megabit ethernet utilization. If greater precision is desired, the etherStatsPkts and etherStatsOctets objects should be sampled before and after a common interval. The differences in the sampled values are Pkts and Octets, respectively, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows: $Pkts * (9.6 + 6.4) + (Octets * .8)$ Utilization = - Interval * 10,000 The result of this equation is the value Utilization which is the percent utilization of the ethernet segment on a scale of 0 to 100 percent.
totalPackets [Total Packets] (etherStatsPkts)	long	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
undersizePackets [Undersize Packets] (etherStatsUndersizePkts)	long	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.
<p>OtulfStats MIB entry name: tmnxOtulfRawStatsEntry Entry description: The tmnxOtulfRawStatsEntry stores the statistics for an individual OTU interface. tmnxOtulfRawStatsEntry rows are created and destroyed by the system when rows are added or removed in the tmnxOtulfTable. Table description (for tmnxOtulfRawStatsTable): The tmnxOtulfRawStatsTable consists of the raw statistics associated with the OTU interfaces contained in the tmnxOtulfTable. Supports realtime plotting Supports scheduled collection Monitored class: equipment.PhysicalPort</p>		
elapsedSec [Elapsed Sec] (tmnxOtulfRawStatsElapsedSec)	long	The value of tmnxOtulfRawStatsElapsedSec indicates the number of Elapsed seconds since the last OTU raw statistics clearing.
feCes [Fe Ces] (tmnxOtulfRawStatsFECES)	long	The value of tmnxOtulfRawStatsFECES indicates the number of Forward Error Correction (FEC) Errors Seconds (ES).
fecCorrOnes [Fec Corr Ones] (tmnxOtulfRawStatsFECCorrOnes)	long	The value of tmnxOtulfRawStatsFECCorrOnes indicates the number of Forward Error Correction (FEC) corrected ones.
fecCorrZeros [Fec Corr Zeros] (tmnxOtulfRawStatsFECCorrZeros)	long	The value of tmnxOtulfRawStatsFECCorrZeros indicates the number of Forward Error Correction (FEC) corrected zeros.
fecSes [Fec Ses] (tmnxOtulfRawStatsFECSES)	long	The value of tmnxOtulfRawStatsFECSES indicates the number of Forward Error Correction (FEC) Severely Errors Seconds (SES).

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fecUas [Fec Uas] (tmnxOtuIfRawStatsFECUAS)	long	The value of tmnxOtuIfRawStatsFECUAS indicates the number of Forward Error Correction (FEC) Unavailable Seconds (UAS).
fecUncorrSr [Fec Uncorr Sr] (tmnxOtuIfRawStatsFECUncorrSR)	long	The value of tmnxOtuIfRawStatsFECUncorrSR indicates the number of Forward Error Correction (FEC) Uncorrectable Sub-Rows.
hcFecCorrOnes [Hc Fec Corr Ones] (tmnxOtuIfRawStatsHCFECCorrOnes)	java. math. BigInteger	The value of tmnxOtuIfRawStatsFECCorrOnes indicates the High Capacity number of Forward Error Correction (FEC) corrected ones.
hcFecCorrZeros [Hc Fec Corr Zeros] (tmnxOtuIfRawStatsHCFECCorrZeros)	java. math. BigInteger	The value of tmnxOtuIfRawStatsHCFECCorrZeros indicates the High Capacity number of Forward Error Correction (FEC) corrected zeros.
hcFecUncorrSr [Hc Fec Uncorr Sr] (tmnxOtuIfRawStatsHCFECUncorrSR)	java. math. BigInteger	The value of tmnxOtuIfRawStatsHCFECUncorrSR indicates the High Capacity number of Forward Error Correction (FEC) Uncorrectable Sub-Rows.
hcPmBei [Hc Pm Bei] (tmnxOtuIfRawStatsHCPMBEI)	java. math. BigInteger	The value of tmnxOtuIfRawStatsPMBEI indicates the High Capacity number of Path Monitoring (PM) Backward Error Indication (BEI) errors.
hcPmBip8 [Hc Pm Bip 8] (tmnxOtuIfRawStatsHCPMBIP8)	java. math. BigInteger	The value of tmnxOtuIfRawStatsHCPMBIP8 indicates the High Capacity number of Path Monitoring (PM) BIP8 errors.
hcSmBei [Hc Sm Bei] (tmnxOtuIfRawStatsHCSMBEI)	java. math. BigInteger	The value of tmnxOtuIfRawStatsHCSMBEI indicates the High Capacity number of Section Monitoring (SM) Backward Error Indication (BEI) errors.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
hcSmBip8 [Hc Sm Bip 8] (tmnxOtuIfRawStatsHCSMBIP8)	java. math. BigInteger	The value of tmnxOtuIfRawStatsHCSMBIP8 indicates the High Capacity number of Section Monitoring (SM) BIP8 errors.
npj [Npj] (tmnxOtuIfRawStatsNPJ)	long	The value of tmnxOtuIfRawStatsNPJ indicates the number of Negative Pointer justifications that occurred during the asynchronous demapping of the received payload inside the OTU frame.
ofFecCorrOnes [Of Fec Corr Ones] (tmnxOtuIfRawStatsOFFECCorrOnes)	long	The value of tmnxOtuIfRawStatsFECCorrOnes indicates the number of times the tmnxOtuIfRawStatsFECCorrOnes overflowed.
ofFecCorrZeros [Of Fec Corr Zeros] (tmnxOtuIfRawStatsOFFECCorrZeros)	long	The value of tmnxOtuIfRawStatsOFFECCorrZeros indicates the number of times the tmnxOtuIfRawStatsFECCorrZeros overflowed.
ofFecUncorrSr [Of Fec Uncorr Sr] (tmnxOtuIfRawStatsOFFECUncorrSR)	long	The value of tmnxOtuIfRawStatsOFFECUncorrSR indicates the number of times the tmnxOtuIfRawStatsFECUncorrSR overflowed.
ofPmBei [Of Pm Bei] (tmnxOtuIfRawStatsOFPMBEI)	long	The value of tmnxOtuIfRawStatsOFPMBEI indicates the number of times tmnxOtuIfRawStatsPMBEI overflowed.
ofPmBip8 [Of Pm Bip 8] (tmnxOtuIfRawStatsOFPMBIP8)	long	The value of tmnxOtuIfRawStatsOFPMBIP8 indicates the number of times the tmnxOtuIfRawStatsPMBIP8 overflowed.
ofSmBei [Of Sm Bei] (tmnxOtuIfRawStatsOFSMBEI)	long	The value of tmnxOtuIfRawStatsOFSMBEI indicates the number of times the tmnxOtuIfRawStatsSMBEI overflowed.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ofSmBip8 [Of Sm Bip 8] (tmnxOtuIfRawStatsOFSMBIP8)	long	The value of tmnxOtuIfRawStatsOFSMBIP8 indicates the number of times the tmnxOtuIfRawStatsSMBIP8 overflowed.
pmBei [Pm Bei] (tmnxOtuIfRawStatsPMBEI)	long	The value of tmnxOtuIfRawStatsPMBEI indicates the number of Path Monitoring (PM) Backward Error Indication (BEI) errors.
pmBip8 [Pm Bip 8] (tmnxOtuIfRawStatsPMBIP8)	long	The value of tmnxOtuIfRawStatsPMBIP8 indicates the number of Path Monitoring (PM) BIP8 errors.
pmEs [Pm Es] (tmnxOtuIfRawStatsPMES)	long	The value of tmnxOtuIfRawStatsPMES indicates the number of Path Monitoring (PM) Errored Seconds (ES).
pmSes [Pm Ses] (tmnxOtuIfRawStatsPMSES)	long	The value of tmnxOtuIfRawStatsPMSES indicates the number of Path Monitoring (PM) Severely Errored Seconds (SES).
pmUas [Pm Uas] (tmnxOtuIfRawStatsPMUAS)	long	The value of tmnxOtuIfRawStatsPMUAS indicates the number of Path Monitoring (PM) Unavailable Seconds (UAS).
ppj [Ppj] (tmnxOtuIfRawStatsPPJ)	long	The value of tmnxOtuIfRawStatsPPJ indicates the number of Positive Pointer justifications that occurred during the asynchronous demapping of the received payload inside the OTU frame.
smBei [Sm Bei] (tmnxOtuIfRawStatsSMBEI)	long	The value of tmnxOtuIfRawStatsSMBEI indicates the number of Section Monitoring (SM) Backward Error Indication (BEI) errors.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
smBip8 [Sm Bip 8] (tmnxOtuIfRawStatsSMBIP8)	long	The value of tmnxOtuIfRawStatsSMBIP8 indicates the number of Section Monitoring (SM) BIP8 errors.
smEs [Sm Es] (tmnxOtuIfRawStatsSMES)	long	The value of tmnxOtuIfRawStatsSMES indicates the number of Section Monitoring (SM) Errored Seconds (ES).
smSes [Sm Ses] (tmnxOtuIfRawStatsSMSES)	long	The value of tmnxOtuIfRawStatsSMSES indicates the number of Section Monitoring (SM) Severely Errored Seconds (SES).
smUas [Sm Uas] (tmnxOtuIfRawStatsSMUAS)	long	The value of tmnxOtuIfRawStatsSMUAS indicates the number of Section Monitoring (SM) Unavailable Seconds (UAS).
<p>PortEgrQosQueueStat MIB entry name: tmnxPortEgrQosQStatEntry Entry description: Egress statistics about a specific port's QoS queue-group queue. Table description (for tmnxPortEgrQosQStatTable): A table that contains egress QoS queue-group queue port statistics. Supports realtime plotting Does not support scheduled collection Monitored class: ethernetequipment.AccessEgrQGroup</p>		
portEgrQosQStatDpdInProfOcts [Port Egr Qos QStat Dpd In Prof Octs] (tmnxPortEgrQosQStatDpdInProfOcts)	java. math. BigInteger	The value of tmnxPortEgrQosQStatDpdInProfOcts indicates the number of in-profile octets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
portEgrQosQStatDpdInProfPkts [Port Egr Qos QStat Dpd In Prof Pkts] (tmnxPortEgrQosQStatDpdInProfPkts)	java. math. BigInteger	The value of tmnxPortEgrQosQStatDpdInProfPkts indicates the number of in-profile packets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portEgrQosQStatDpdOutProfOcts [Port Egr Qos QStat Dpd Out Prof Octs] (tmnxPortEgrQosQStatDpdOutProfOcts)	java. math. BigInteger	The value of tmnxPortEgrQosQStatDpdOutProfOcts indicates the number of out-of-profile octets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
portEgrQosQStatDpdOutProfPkts [Port Egr Qos QStat Dpd Out Prof Pkts] (tmnxPortEgrQosQStatDpdOutProfPkts)	java. math. BigInteger	The value of tmnxPortEgrQosQStatDpdOutProfPkts indicates the number of out-of-profile packets discarded by the egress Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
portEgrQosQStatFwdInProfOcts [Port Egr Qos QStat Fwd In Prof Octs] (tmnxPortEgrQosQStatFwdInProfOcts)	java. math. BigInteger	The value of tmnxPortEgrQosQStatFwdInProfOcts indicates the number of in-profile octets (rate below CIR) forwarded by the egress Qchip.
portEgrQosQStatFwdInProfPkts [Port Egr Qos QStat Fwd In Prof Pkts] (tmnxPortEgrQosQStatFwdInProfPkts)	java. math. BigInteger	The value of tmnxPortEgrQosQStatFwdInProfPkts indicates the number of in-profile packets (rate below CIR) forwarded by the egress Qchip.
portEgrQosQStatFwdOutProfOcts [Port Egr Qos QStat Fwd Out Prof Octs] (tmnxPortEgrQosQStatFwdOutProfOcts)	java. math. BigInteger	The value of tmnxPortEgrQosQStatFwdOutProfOcts indicates the number of out-of-profile octets (rate above CIR) forwarded by the egress Qchip.
portEgrQosQStatFwdOutProfPkts [Port Egr Qos QStat Fwd Out Prof Pkts] (tmnxPortEgrQosQStatFwdOutProfPkts)	java. math. BigInteger	The value of tmnxPortEgrQosQStatFwdOutProfPkts indicates the number of out-of-profile packets (rate above CIR) forwarded by the egress Qchip.
portEgrQosQStatQueueId [Port Egr Qos QStat Queue Id] (tmnxPortEgrQosQStatQueueId)	long	The value of tmnxPortEgrQosQStatQueueId specifies the queue-group queue ID which is used as the fourth index to the table entry.

portEgrExpShaperCls2StMonOvrOct [Port Egr Exp Shaper Cls 2 St Mon Ovr Oct] (tPortEgrExpShaperCls2StMonOvrOct)	java. math. BigInteger	The value of tPortEgrExpShaperCls2StMonOvrOct indicates the number of octets above the configured monitor-threshold (since last read) by the class '2' egress expanded shaper.
portEgrExpShaperCls3StFwdOcts [Port Egr Exp Shaper Cls 3 St Fwd Octs] (tPortEgrExpShaperCls3StFwdOcts)	java. math. BigInteger	The value of tPortEgrExpShaperCls3StFwdOcts indicates the number of octets forwarded by the class '3' egress expanded shaper.
portEgrExpShaperCls3StFwdPkts [Port Egr Exp Shaper Cls 3 St Fwd Pkts] (tPortEgrExpShaperCls3StFwdPkts)	java. math. BigInteger	The value of tPortEgrExpShaperCls3StFwdPkts indicates the number of packets forwarded by the class '3' egress expanded shaper.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portEgrExpShaperCls3StMonOvrOct [Port Egr Exp Shaper Cls 3 St Mon Ovr Oct] (tPortEgrExpShaperCls3StMonOvrOct)	java. math. BigInteger	The value of tPortEgrExpShaperCls3StMonOvrOct indicates the number of octets above the configured monitor-threshold (since last read) by the class '3' egress expanded shaper.
portEgrExpShaperCls4StFwdOcts [Port Egr Exp Shaper Cls 4 St Fwd Octs] (tPortEgrExpShaperCls4StFwdOcts)	java. math. BigInteger	The value of tPortEgrExpShaperCls4StFwdOcts indicates the number of octets forwarded by the class '4' egress expanded shaper.
portEgrExpShaperCls4StFwdPkts [Port Egr Exp Shaper Cls 4 St Fwd Pkts] (tPortEgrExpShaperCls4StFwdPkts)	java. math. BigInteger	The value of tPortEgrExpShaperCls4StFwdPkts indicates the number of packets forwarded by the class '4' egress expanded shaper.
portEgrExpShaperCls4StMonOvrOct [Port Egr Exp Shaper Cls 4 St Mon Ovr Oct] (tPortEgrExpShaperCls4StMonOvrOct)	java. math. BigInteger	The value of tPortEgrExpShaperCls4StMonOvrOct indicates the number of octets above the configured monitor-threshold (since last read) by the class '4' egress expanded shaper.
portEgrExpShaperCls5StFwdOcts [Port Egr Exp Shaper Cls 5 St Fwd Octs] (tPortEgrExpShaperCls5StFwdOcts)	java. math. BigInteger	The value of tPortEgrExpShaperCls5StFwdOcts indicates the number of octets forwarded by the class '5' egress expanded shaper.
portEgrExpShaperCls5StFwdPkts [Port Egr Exp Shaper Cls 5 St Fwd Pkts] (tPortEgrExpShaperCls5StFwdPkts)	java. math. BigInteger	The value of tPortEgrExpShaperCls5StFwdPkts indicates the number of packets forwarded by the class '5' egress expanded shaper.
portEgrExpShaperCls5StMonOvrOct [Port Egr Exp Shaper Cls 5 St Mon Ovr Oct] (tPortEgrExpShaperCls5StMonOvrOct)	java. math. BigInteger	The value of tPortEgrExpShaperCls5StMonOvrOct indicates the number of octets above the configured monitor-threshold (since last read) by the class '5' egress expanded shaper.
portEgrExpShaperCls6StFwdOcts [Port Egr Exp Shaper Cls 6 St Fwd Octs] (tPortEgrExpShaperCls6StFwdOcts)	java. math. BigInteger	The value of tPortEgrExpShaperCls6StFwdOcts indicates the number of octets forwarded by the class '6' egress expanded shaper.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portEgrExpShaperCls6StFwdPkts [Port Egr Exp Shaper Cls 6 St Fwd Pkts] (tPortEgrExpShaperCls6StFwdPkts)	java. math. BigInteger	The value of tPortEgrExpShaperCls6StFwdPkts indicates the number of packets forwarded by the class '6' egress expanded shaper.
portEgrExpShaperCls6StMonOvrOct [Port Egr Exp Shaper Cls 6 St Mon Ovr Oct] (tPortEgrExpShaperCls6StMonOvrOct)	java. math. BigInteger	The value of tPortEgrExpShaperCls6StMonOvrOct indicates the number of octets above the configured monitor-threshold (since last read) by the class '6' egress expanded shaper.
portEgrExpShaperCls7StFwdPkts [Port Egr Exp Shaper Cls 7 St Fwd Pkts] (tPortEgrExpShaperCls7StFwdPkts)	java. math. BigInteger	The value of tPortEgrExpShaperCls7StFwdPkts indicates the number of packets forwarded by the class '7' egress expanded shaper.
portEgrExpShaperCls7StFwdOcts [Port Egr Exp Shaper Cls 7 St Fwd Octs] (tPortEgrExpShaperCls7StFwdOcts)	java. math. BigInteger	The value of tPortEgrExpShaperCls7StFwdOcts indicates the number of octets forwarded by the class '7' egress expanded shaper.
portEgrExpShaperCls7StMonOvrOct [Port Egr Exp Shaper Cls 7 St Mon Ovr Oct] (tPortEgrExpShaperCls7StMonOvrOct)	java. math. BigInteger	The value of tPortEgrExpShaperCls7StMonOvrOct indicates the number of octets above the configured monitor-threshold (since last read) by the class '7' egress expanded shaper.
portEgrExpShaperCls8StFwdPkts [Port Egr Exp Shaper Cls 8 St Fwd Pkts] (tPortEgrExpShaperCls8StFwdPkts)	java. math. BigInteger	The value of tPortEgrExpShaperCls8StFwdPkts indicates the number of packets forwarded by the class '8' egress expanded shaper.
portEgrExpShaperCls8StFwdOcts [Port Egr Exp Shaper Cls 8 St Fwd Octs] (tPortEgrExpShaperCls8StFwdOcts)	java. math. BigInteger	The value of tPortEgrExpShaperCls8StFwdOcts indicates the number of octets forwarded by the class '8' egress expanded shaper.
portEgrExpShaperCls8StMonOvrOct [Port Egr Exp Shaper Cls 8 St Mon Ovr Oct] (tPortEgrExpShaperCls8StMonOvrOct)	java. math. BigInteger	The value of tPortEgrExpShaperCls8StMonOvrOct indicates the number of octets above the configured monitor-threshold (since last read) by the class '8' egress expanded shaper.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortIngQosQueueStat MIB entry name: tmnxPortIngQosQStatEntry Entry description: Ingress statistics about a specific port's QoS queue-group queue. Table description (for tmnxPortIngQosQStatTable): A table that contains ingress QoS queue-group queue port statistics. Supports realtime plotting Does not support scheduled collection Monitored class: ethernetequipment.AccessIngrQGroup</p>		
portIngQosQStatDpdHiPrioOcts [Port Ing Qos QStat Dpd Hi Prio Octs] (tmnxPortIngQosQStatDpdHiPrioOcts)	java. math. BigInteger	The value of tmnxPortIngQosQStatDpdHiPrioOcts indicates the number of high priority octets, as determined by the port ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
portIngQosQStatDpdHiPrioPkts [Port Ing Qos QStat Dpd Hi Prio Pkts] (tmnxPortIngQosQStatDpdHiPrioPkts)	java. math. BigInteger	The value of tmnxPortIngQosQStatDpdHiPrioPkts indicates the number of high priority packets, as determined by the port ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
portIngQosQStatDpdLoPrioOcts [Port Ing Qos QStat Dpd Lo Prio Octs] (tmnxPortIngQosQStatDpdLoPrioOcts)	java. math. BigInteger	The value of tmnxPortIngQosQStatDpdLoPrioOcts indicates the number of low priority octets, as determined by the port ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
portIngQosQStatDpdLoPrioPkts [Port Ing Qos QStat Dpd Lo Prio Pkts] (tmnxPortIngQosQStatDpdLoPrioPkts)	java. math. BigInteger	The value of tmnxPortIngQosQStatDpdLoPrioPkts indicates the number of low priority packets, as determined by the port ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
portIngQosQStatFwdInProfOcts [Port Ing Qos QStat Fwd In Prof Octs] (tmnxPortIngQosQStatFwdInProfOcts)	java. math. BigInteger	The value of tmnxPortIngQosQStatFwdInProfOcts indicates the number of in-profile octets (rate below CIR) forwarded by the ingress Qchip.
portIngQosQStatFwdInProfPkts [Port Ing Qos QStat Fwd In Prof Pkts] (tmnxPortIngQosQStatFwdInProfPkts)	java. math. BigInteger	The value of tmnxPortIngQosQStatFwdInProfPkts indicates the number of in-profile packets (rate below CIR) forwarded by the ingress Qchip.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portIngQosQStatFwdOutProfOcts [Port Ing Qos QStat Fwd Out Prof Octs] (tmnxPortIngQosQStatFwdOutProfOcts)	java. math. BigInteger	The value of tmnxPortIngQosQStatFwdOutProfOcts indicates the number of out-of-profile octets (rate above CIR) forwarded by the ingress Qchip.
portIngQosQStatFwdOutProfPkts [Port Ing Qos QStat Fwd Out Prof Pkts] (tmnxPortIngQosQStatFwdOutProfPkts)	java. math. BigInteger	The value of tmnxPortIngQosQStatFwdOutProfPkts indicates the number of out-of-profile packets (rate above CIR) forwarded by the ingress Qchip.
portIngQosQStatOffHiPrioOcts [Port Ing Qos QStat Off Hi Prio Octs] (tmnxPortIngQosQStatOffHiPrioOcts)	java. math. BigInteger	The value of tmnxPortIngQosQStatOffHiPrioOcts indicates the number of high priority octets, as determined by the port ingress QoS policy, offered by the Pchip to the Qchip.
portIngQosQStatOffHiPrioPkts [Port Ing Qos QStat Off Hi Prio Pkts] (tmnxPortIngQosQStatOffHiPrioPkts)	java. math. BigInteger	The value of tmnxPortIngQosQStatOffHiPrioPkts indicates the number of high priority packets, as determined by the port ingress QoS policy, offered by the Pchip to the Qchip.
portIngQosQStatOffLoPrioOcts [Port Ing Qos QStat Off Lo Prio Octs] (tmnxPortIngQosQStatOffLoPrioOcts)	java. math. BigInteger	The value of tmnxPortIngQosQStatOffLoPrioOcts indicates the number of low priority octets, as determined by the port ingress QoS policy, offered by the Pchip to the Qchip.
portIngQosQStatOffLoPrioPkts [Port Ing Qos QStat Off Lo Prio Pkts] (tmnxPortIngQosQStatOffLoPrioPkts)	java. math. BigInteger	The value of tmnxPortIngQosQStatOffLoPrioPkts indicates the number of low priority packets, as determined by the port ingress QoS policy, offered by the Pchip to the Qchip.
portIngQosQStatQueueId [Port Ing Qos QStat Queue Id] (tmnxPortIngQosQStatQueueId)	long	The value of tmnxPortIngQosQStatQueueId specifies the queue-group queue ID which is used as the fourth index to the table entry.
portIngQosQStatUncolOctsOff [Port Ing Qos QStat Uncol Octs Off] (tmnxPortIngQosQStatUncolOctsOff)	java. math. BigInteger	The value of tmnxPortIngQosQStatUncolOctsOff indicates the number of uncolored octets offered to the ingress Qchip.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portIngQosQStatUncolPktsOff [Port Ing Qos QStat Uncol Pkts Off] (tmnxPortIngQosQStatUncolPktsOff)	java. math. BigInteger	The value of tmnxPortIngQosQStatUncolPktsOff indicates the number of uncolored packets offered to the ingress Qchip.
<p>PortNetEgrQGrpArbitStat</p> <p>MIB entry name: tPortNetEgrQGrpArbitStatEntry</p> <p>Entry description: The value of tPortNetEgrQGrpArbitStatEntry defines an entry in the tPortNetEgrQGrpArbitStatTable. It represents statistics about a specific QoS egress queue group arbiter.</p> <p>Table description (for tPortNetEgrQGrpArbitStatTable): The value of tPortNetEgrQGrpArbitStatTable contains egress QoS queue group arbiter statistics on network side.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethernetequipment.NetworkEgrQGroup</p>		
portNetEgrQGrpArbitStatFwdOcts [Port Net Egr QGrp Arbit Stat Fwd Octs] (tPortNetEgrQGrpArbitStatFwdOcts)	java. math. BigInteger	The value of tPortNetEgrQGrpArbitStatFwdOcts indicates the number of fowrwarded octets by the egress queue group arbiter Pchip.
portNetEgrQGrpArbitStatFwdOctsH [Port Net Egr QGrp Arbit Stat Fwd Octs H] (tPortNetEgrQGrpArbitStatFwdOctsH)	long	The value of tPortNetEgrQGrpArbitStatFwdOctsH indicates the upper 32 bits of tPortNetEgrQGrpArbitStatFwdOcts.
portNetEgrQGrpArbitStatFwdOctsL [Port Net Egr QGrp Arbit Stat Fwd Octs L] (tPortNetEgrQGrpArbitStatFwdOctsL)	long	The value of tPortNetEgrQGrpArbitStatFwdOctsL indicates the lower 32 bits of tPortNetEgrQGrpArbitStatFwdOcts.
portNetEgrQGrpArbitStatFwdPkts [Port Net Egr QGrp Arbit Stat Fwd Pkts] (tPortNetEgrQGrpArbitStatFwdPkts)	java. math. BigInteger	The value of tPortNetEgrQGrpArbitStatFwdPkts indicates the number of fowrwarded packets by the egress queue group arbiter Pchip.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portNetEgrQGrpArbitStatFwdPktsH [Port Net Egr QGrp Arbit Stat Fwd Pkts H] (tPortNetEgrQGrpArbitStatFwdPktsH)	long	The value of tPortNetEgrQGrpArbitStatFwdPktsH indicates the upper 32 bits of tPortNetEgrQGrpArbitStatFwdPkts.
portNetEgrQGrpArbitStatFwdPktsL [Port Net Egr QGrp Arbit Stat Fwd Pkts L] (tPortNetEgrQGrpArbitStatFwdPktsL)	long	The value of tPortNetEgrQGrpArbitStatFwdPktsL indicates the lower 32 bits of tPortNetEgrQGrpArbitStatFwdPkts.
portNetEgrQGrpArbitStatName [Port Net Egr QGrp Arbit Stat Name] (tPortNetEgrQGrpArbitStatName)	String	The value of tPortNetEgrQGrpArbitStatName specifies the name of the egress QoS arbiter of this port network queue group.
<p>PortNetEgrQGrpPStat MIB entry name: tPortNetEgrQGrpPStatEntry Entry description: The value of tPortNetEgrQGrpPStatEntry defines an entry in the tPortNetEgrQGrpPStatTable. It represents statistics about a specific QoS egress queue group policer on the specified port. Table description (for tPortNetEgrQGrpPStatTable): The value of tPortNetEgrQGrpPStatTable contains port egress queue group policer statistics on network side. Supports realtime plotting Supports scheduled collection Monitored class: ethernetequipment.NetworkEgrQGroup</p>		
portNetEgrQGrpPStDrpInProfOct [Port Net Egr QGrp PSt Drp In Prof Oct] (tPortNetEgrQGrpPStDrpInProfOct)	java. math. BigInteger	The value of tPortNetEgrQGrpPStDrpInProfOct indicates the number of in-profile octets discarded by the egress Pchip due to: MBS exceeded, buffer pool limit exceeded, etc.
portNetEgrQGrpPStDrpInProfOctH [Port Net Egr QGrp PSt Drp In Prof Oct H] (tPortNetEgrQGrpPStDrpInProfOctH)	long	The value of tPortNetEgrQGrpPStDrpInProfOctH indicates the upper 32 bits of tPortNetEgrQGrpPStDrpInProfOct.
portNetEgrQGrpPStDrpInProfOctL [Port Net Egr QGrp PSt Drp In Prof Oct L] (tPortNetEgrQGrpPStDrpInProfOctL)	long	The value of tPortNetEgrQGrpPStDrpInProfOctL indicates the lower 32 bits of tPortNetEgrQGrpPStDrpInProfOct.

portNetEgrQGrpPStUncolOctOff [Port Net Egr QGrp PSt Uncol Oct Off] (tPortNetEgrQGrpPStUncolOctOff)	java. math. BigInteger	The value of tPortNetEgrQGrpPStUncolOctOff indicates the number of uncolored octets forwarded by the egress Pchip.
portNetEgrQGrpPStUncolOctOffH [Port Net Egr QGrp PSt Uncol Oct Off H] (tPortNetEgrQGrpPStUncolOctOffH)	long	The value of tPortNetEgrQGrpPStUncolOctOffH indicates the upper 32 bits of tPortNetEgrQGrpPStUncolOctOff.
portNetEgrQGrpPStUncolOctOffL [Port Net Egr QGrp PSt Uncol Oct Off L] (tPortNetEgrQGrpPStUncolOctOffL)	long	The value of tPortNetEgrQGrpPStUncolOctOffL indicates the lower 32 bits of tPortNetEgrQGrpPStUncolOctOff.
portNetEgrQGrpPStUncolPktOff [Port Net Egr QGrp PSt Uncol Pkt Off] (tPortNetEgrQGrpPStUncolPktOff)	java. math. BigInteger	The value of tPortNetEgrQGrpPStUncolPktOff indicates the number of uncolored packets forwarded by the egress Pchip.
portNetEgrQGrpPStUncolPktOffH [Port Net Egr QGrp PSt Uncol Pkt Off H] (tPortNetEgrQGrpPStUncolPktOffH)	long	The value of tPortNetEgrQGrpPStUncolPktOffH indicates the upper 32 bits of tPortNetEgrQGrpPStUncolPktOff.
portNetEgrQGrpPStUncolPktOffL [Port Net Egr QGrp PSt Uncol Pkt Off L] (tPortNetEgrQGrpPStUncolPktOffL)	long	The value of tPortNetEgrQGrpPStUncolPktOffL indicates the lower 32 bits of tPortNetEgrQGrpPStUncolPktOff.
portNetEgrQGrpPStatMode [Port Net Egr QGrp PStat Mode] (tPortNetEgrQGrpPStatMode)	int	The value of tPortNetEgrQGrpPStatMode indicates the stat mode used by this policer.

Table 832 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portNetEgrQGrpPStatQosPolicerId [Port Net Egr QGrp PStat Qos Policer Id] (tPortNetEgrQGrpPStatQosPolicerId)	long	The value of tPortNetEgrQGrpPStatQosPolicerId specifies the index of the egress QoS policer queue group on network port.
<p>PortNetEgrQueueStat MIB entry name: tmnxPortNetEgrQStatEntry Entry description: Defines an entry in tmnxPortNetEgrQStatTable. Entries are created and deleted by the system depending on the queue policy being used at the specific port. In release 10.0 tPortNetEgrQGrpInstancelId is added as another index before tmnxPortEgrQosQStatQueueId for this tmnxPortNetEgrQStatTable. Table description (for tmnxPortNetEgrQStatTable): Defines the Alcatel-Lucent SROS series network port egress statistics table for providing, via SNMP, the capability of retrieving the traffic statistics for the queue-group queues being used for the ports to forward the network egress traffic. Supports realtime plotting Does not support scheduled collection Monitored class: ethernetequipment.NetworkEgrQGroup</p>		
portNetEgrQDroInProfOcts [Port Net Egr QDro In Prof Octs] (tmnxPortNetEgrQDroInProfOcts)	java. math. BigInteger	The value of tmnxPortNetEgrQDroInProfOcts indicates the number of conforming network egress octets dropped on this port using this queue-group queue.
portNetEgrQDroInProfPkts [Port Net Egr QDro In Prof Pkts] (tmnxPortNetEgrQDroInProfPkts)	java. math. BigInteger	The value of tmnxPortNetEgrQDroInProfPkts indicates the number of conforming network egress packets dropped on this port using this queue-group queue.
portNetEgrQDroOutProfOcts [Port Net Egr QDro Out Prof Octs] (tmnxPortNetEgrQDroOutProfOcts)	java. math. BigInteger	The value of tmnxPortNetEgrQDroOutProfOcts indicates the number of exceeding network egress octets dropped on this port using this queue-group queue.
portNetEgrQDroOutProfPkts [Port Net Egr QDro Out Prof Pkts] (tmnxPortNetEgrQDroOutProfPkts)	java. math. BigInteger	The value of tmnxPortNetEgrQDroOutProfPkts indicates the number of exceeding network egress packets dropped on this port using this queue-group queue.

psnpDropped [Psnp Dropped] (vRtrIisisPSNPDrop)	long	The count of link state PDUs dropped by this instance of the protocol is maintained by vRtrIisisPSNPDrop.
psnpReceived [Psnp Received] (vRtrIisisPSNPRecd)	long	The count of link state PDUs received by this instance of the protocol is maintained by vRtrIisisPSNPRecd.
psnpRetransmitted [Psnp Retransmitted] (vRtrIisisPSNPRetrans)	long	The count of link state PDUs that had to be retransmitted by this instance of the protocol is maintained by vRtrIisisPSNPRetrans.

Table 834 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
psnpSent [Psnp Sent] (vRtrIsisPSNPSent)	long	The count of link state PDUs sent out by this instance of the protocol is maintained by vRtrIsisPSNPSent.
unknownDropped [Unknown Dropped] (vRtrIsisUnknownDrop)	long	The count of link state PDUs dropped by this instance of the protocol is maintained by vRtrIsisUnknownDrop.
unknownReceived [Unknown Received] (vRtrIsisUnknownRecd)	long	The count of link state PDUs received by this instance of the protocol is maintained by vRtrIsisUnknownRecd.
unknownRetransmitted [Unknown Retransmitted] (vRtrIsisUnknownRetrans)	long	The count of link state PDUs that had to be retransmitted by this instance of the protocol is maintained by vRtrIsisUnknownRetrans.
unknownSent [Unknown Sent] (vRtrIsisUnknownSent)	long	The count of link state PDUs sent out by this instance of the protocol is maintained by vRtrIsisUnknownSent.
SiteLfaStats MIB entry name: vRtrIsisLfaEntry Entry description: Each row entry in the vRtrIsisLfaTable represents information on LFA coverage for various topologies of the system. Table description (for vRtrIsisLfaTable): The vRtrIsisLfaTable maintains information on loopfree-alternate (LFA) coverage for each instance of IS-IS protocol. Supports realtime plotting Supports scheduled collection Monitored class: isis.Site		
isisLfaIpv4Coverage [Isis Lfa Ipv 4 Coverage] (vRtrIsisLfaIpv4Coverage)	long	The value of vRtrIsisLfaIpv4Coverage indicates how much LFA coverage is being obtained for the available Ipv4 routes.

Table 834 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
isisLfaIpv4NodesCovered [Isis Lfa Ipv 4 Nodes Covered] (vRtrIsisLfaIpv4NodesCovered)	long	The value of vRtrIsisLfaIpv4NodesCovered indicates in absolute numbers how much LFA coverage is being obtained for the available Ipv4 routes.
isisLfaIpv4TotalNodes [Isis Lfa Ipv 4 Total Nodes] (vRtrIsisLfaIpv4TotalNodes)	long	The value of vRtrIsisLfaIpv4TotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available Ipv4 routes.
isisLfaIpv6Coverage [Isis Lfa Ipv 6 Coverage] (vRtrIsisLfaIpv6Coverage)	long	The value of vRtrIsisLfaIpv6Coverage indicates how much LFA coverage is being obtained for the available Ipv6 routes.
isisLfaIpv6NodesCovered [Isis Lfa Ipv 6 Nodes Covered] (vRtrIsisLfaIpv6NodesCovered)	long	The value of vRtrIsisLfaIpv6NodesCovered indicates in absolute numbers how much LFA coverage is being obtained for available Ipv6 routes.
isisLfaIpv6TotalNodes [Isis Lfa Ipv 6 Total Nodes] (vRtrIsisLfaIpv6TotalNodes)	long	The value of vRtrIsisLfaIpv6TotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available Ipv6 routes.
isisLfaNodeCoverage [Isis Lfa Node Coverage] (vRtrIsisLfaNodeCoverage)	long	The value of vRtrIsisLfaNodeCoverage indicates how much LFA coverage is being obtained for the set of available nodes.
isisLfaNodesCovered [Isis Lfa Nodes Covered] (vRtrIsisLfaNodesCovered)	long	The value of vRtrIsisLfaNodesCovered indicates in absolute numbers how much LFA coverage is being obtained for the available routes.
isisLfaTotalNodes [Isis Lfa Total Nodes] (vRtrIsisLfaTotalNodes)	long	The value of vRtrIsisLfaTotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available routes.

Table 834 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SiteStats MIB entry name: vRtrIsisStatsEntry Entry description: Each row entry in the vRtrIsisStatsTable stores statistics for an instance of IS-IS protocol configured. Table description (for vRtrIsisStatsTable): The vRtrIsisStatsTable provides statistics for each instance of IS-IS protocol configured. There is a one-to-one dependent relationship between the tables vRtrIsisTable and vRtrIsisStatsTable. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • isis.Site • spb.Site 		
cspfDroppedRequests [Cspf Dropped Requests] (vRtrIsisCSPFDroppedRequests)	long	vRtrIsisCSPFDroppedRequests maintains the number of dropped CSPF requests by the protocol.
cspfPathsFound [Cspf Paths Found] (vRtrIsisCSPFPathsFound)	long	vRtrIsisCSPFPathsFound maintains the number of responses to CSPF requests for which paths satisfying the constraints were found.
cspfPathsNotFound [Cspf Paths Not Found] (vRtrIsisCSPFPathsNotFound)	long	vRtrIsisCSPFPathsFound maintains the number of responses to CSPF requests for which no paths satisfying the constraints were found.
cspfRequests [Cspf Requests] (vRtrIsisCSPFRequests)	long	vRtrIsisCSPFRequests maintains the number of CSPF requests made to the protocol.
initiatedPurges [Initiated Purges] (vRtrIsisInitiatedPurges)	long	The value of vRtrIsisInitiatedPurges counts the number of times purges have been initiated.
lfaRuns [Lfa Runs] (vRtrIsisLfaRuns)	long	The value of vRtrIsisLfaRuns indicates the number of times loopfree-alternate calculations have been made.

Table 834 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lspRegenerations [Lsp Regenerations] (vRtrIsisLSPRegenerations)	long	The value of vRtrIsisLSPRegenerations maintains the count of LSP regenerations.
spfRuns [Spf Runs] (vRtrIsisSpfRuns)	long	The value of vRtrIsisSpfRuns indicates the number of times shortest path first calculations have been made.

Table 835 I2fib statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MFibGrpSrcStats</p> <p>MIB entry name: tIsMFibStatsEntry</p> <p>Entry description: An entry in the tIsMFibStatsTable.</p> <p>Table description (for tIsMFibStatsTable): tIsMFibStatsTable contains statistics for the entries in the IPv4 Multicast FIB for this TIs. These statistics are collected by the forwarding engine.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: I2fib.MFibGrpSrc</p>		
forwardedOctets [Forwarded Octets] (tIsMFibStatsForwardedOctets)	java. math. BigInteger	The value of tIsMFibStatsForwardedOctets indicates the number of octets that were forwarded to the SAPs and SDPs listed in the tIsMFibInfoTable.
forwardedPkts [Forwarded Pkts] (tIsMFibStatsForwardedPkts)	java. math. BigInteger	The value of tIsMFibStatsForwardedPkts indicates the number of multicast packets that were forwarded to the SAPs and SDPs listed in the tIsMFibInfoTable.

Table 836 I2fwd statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CircuitStpStats MIB entry name: sdpBindTlsEntry Entry description: TLS specific information about an SDP Bind. Table description (for sdpBindTlsTable): A table that contains TLS spoke SDP Bind information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.CircuitStp</p>		
forwardTransitions [Forward Transitions] (sdpBindTlsStpForwardTransitions)	long	The value of the object sdpBindTlsStpForwardTransitions indicates the number of times this port has transitioned from the Learning state to the Forwarding state.
inBadBpdus [In Bad Bpdus] (sdpBindTlsStpInBadBpdus)	long	The value of the object sdpBindTlsStpInBadBpdus indicates the number of bad BPDUs received on this SDP Bind.
inConfigBpdus [In Config Bpdus] (sdpBindTlsStpInConfigBpdus)	long	The value of the object sdpBindTlsStpInConfigBpdus indicates the number of Configuration BPDUs received on this SDP Bind.
inRapidSpanningTreeBpdus [In Rapid Spanning Tree Bpdus] (sdpBindTlsStpInRstBpdus)	long	The value of the object sdpBindTlsStpInRstBpdus indicates the number of Rapid Spanning Tree (Rst) BPDUs received on this SDP.
inTcnBpdus [In Tcn Bpdus] (sdpBindTlsStpInTcnBpdus)	long	The value of the object sdpBindTlsStpInTcnBpdus indicates the number of Topology Change Notification BPDUs received on this SDP Bind.
outConfigBpdus [Out Config Bpdus] (sdpBindTlsStpOutConfigBpdus)	long	The value of the object sdpBindTlsStpOutConfigBpdus indicates the number of Configuration BPDUs sent out this SDP Bind.

Table 836 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outRapidSpanningTreeBpdus [Out Rapid Spanning Tree Bpdus] (sdpBindTlsStpOutRstBpdus)	long	The value of the object sdpBindTlsStpOutRstBpdus indicates the number of Rapid Spanning Tree (Rstp) BPDUs sent out on this SDP.
outTcnBpdus [Out Tcn Bpdus] (sdpBindTlsStpOutTcnBpdus)	long	The value of the object sdpBindTlsStpOutTcnBpdus indicates the number of Topology Change Notification BPDUs sent out this SDP Bind.
<p>PipStpInfoStats MIB entry name: tlsPipInfoEntry Entry description: TLS specific information about PIP uplink. Table description (for tlsPipInfoTable): A table that contains TLS PIP (Provider Internal Port) uplink information. PIP is the virtual link between I and B components of PBB (Provider Backbone Bridging) model. I component refers to a service with svcVplsType set to 'iVpls (3)' and B component refers to a service with svcVplsType set to 'bVpls (2)'. When any form of STP is enabled in the iVpls domain, the PIP uplink is modeled as a regular STP port. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.PipStpInfo</p>		
pipInTcBitBpdus [Pip In Tc Bit Bpdus] (tlsPipInTcBitBpdus)	long	The value of the object tlsPipInTcBitBpdus indicates the number of BPDUs received on this PIP uplink with the Topology Change bit set.
pipOutTcBitBpdus [Pip Out Tc Bit Bpdus] (tlsPipOutTcBitBpdus)	long	This object specifies the number of BPDUs sent out this PIP uplink with the Topology Change bit set.
pipStpForwardTransitions [Pip Stp Forward Transitions] (tlsPipStpForwardTransitions)	long	The value of the object tlsPipStpForwardTransitions indicates the number of times this port has transitioned from the Learning state to the Forwarding state.
pipStpInBadBpdus [Pip Stp In Bad Bpdus] (tlsPipStpInBadBpdus)	long	This object specifies the number of bad BPDUs received on this PIP uplink.

Table 836 l2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pipStpInConfigBpdus [Pip Stp In Config Bpdus] (tlsPipStpInConfigBpdus)	long	The value of the object tlsPipStpInConfigBpdus indicates the number of Configuration BPDUs received on this PIP uplink.
pipStpInMstBpdus [Pip Stp In Mst Bpdus] (tlsPipStpInMstBpdus)	long	The value of the object tlsPipStpInMstBpdus indicates the number of Multiple Spanning Tree (MST) BPDUs received on this PIP uplink.
pipStpInRstBpdus [Pip Stp In Rst Bpdus] (tlsPipStpInRstBpdus)	long	The value of the object tlsPipStpInRstBpdus indicates the number of Rapid Spanning Tree (RST) BPDUs received on this PIP uplink.
pipStpInTcnBpdus [Pip Stp In Tcn Bpdus] (tlsPipStpInTcnBpdus)	long	The value of the object tlsPipStpInTcnBpdus indicates the number of Topology Change Notification BPDUs received on this PIP uplink.
pipStpOutConfigBpdus [Pip Stp Out Config Bpdus] (tlsPipStpOutConfigBpdus)	long	The value of the object tlsPipStpOutConfigBpdus indicates the number of Configuration BPDUs sent out this PIP uplink.
pipStpOutMstBpdus [Pip Stp Out Mst Bpdus] (tlsPipStpOutMstBpdus)	long	The value of the object tlsPipStpOutMstBpdus indicates the number of Multiple Spanning Tree (MST) BPDUs sent out on this PIP uplink.
pipStpOutRstBpdus [Pip Stp Out Rst Bpdus] (tlsPipStpOutRstBpdus)	long	The value of the object tlsPipStpOutRstBpdus indicates the number of Rapid Spanning Tree (RST) BPDUs sent out on this PIP uplink.
pipStpOutTcnBpdus [Pip Stp Out Tcn Bpdus] (tlsPipStpOutTcnBpdus)	long	This object specifies the number of Topology Change Notification BPDUs sent out this PIP uplink.

Table 836 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteFibStats MIB entry name: svcTlsInfoEntry Entry description: TLS specific information about a service. Table description (for svcTlsInfoTable): A table that contains TLS service information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.SiteFib</p>		
entries [Entries] (svcTlsFdbNumEntries)	long	The value of the object svcTlsFdbNumEntries indicates the current number of entries in the FDB of this service.
provisionedSize [Provisioned Size] (svcTlsFdbTableSize)	long	The value of the object svcTlsFdbTableSize specifies the maximum number of learned and static entries allowed in the FDB of this service. The maximum value of svcTlsFdbTableSize is '511999', when the the value of TIMETRA-CHASSIS-MIB::tmnxChassisOperMode is 'd'. The maximum value of svcTlsFdbTableSize is '196607', when the the value of TIMETRA-CHASSIS-MIB::tmnxChassisOperMode is 'c'. In other cases, the maximum value of svcTlsFdbTableSize is '131071'.
staticEntries [Static Entries] (svcTlsFdbNumStaticEntries)	long	The value of the object svcTlsFdbNumStaticEntries indicates the current number of static entries in the FDB of this service.

Table 837 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagStats</p> <p>MIB entry name: tLagOperationEntry</p> <p>Entry description: An entry (conceptual row) in the tLagOperationTable. Each entry represents an active Link Aggregation Group.</p> <p>Table description (for tLagOperationTable): Operational information about each Link Aggregation Group.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.Interface</p>		
portThresholdFalling [Port Threshold Falling] (tLagPortThresholdFalling)	long	counts the number of linkDown or dynamicCost events for the Link Aggregation Group caused by the number of physical ports being less than or equal to tLagPortThreshold value.
portThresholdRising [Port Threshold Rising] (tLagPortThresholdRising)	long	counts the number of linkUp or dynamicCost events for the Link Aggregation Group caused by the number of physical ports being greater than tLagPortThreshold value.
<p>MultiChassisLagMemberStats</p> <p>MIB entry name: tmnxMcLagLagStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a lag that participates in a multi-chassis configuration with a given peer. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcLagLagStatsTable): The tmnxMcLagLagStatsTable has an entry for each lag that participates in a multi-chassis configuration for the indicated peer.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • lag.MultiChassisLagMember • multichassis.MultiChassisLagMember 		
configPacketsReceived [Config Packets Received] (tmnxMcLagLagStatsPktsRxConfig)	long	The value of tmnxMcLagLagStatsPktsRxConfig indicates how many MC-Lag control packets of type lag config were received on this system from the peer for this lag.

Table 837 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
configPacketsTransmitted [Config Packets Transmitted] (tmnxMcLagLagStatsPktsTxConfig)	long	The value of tmnxMcLagLagStatsPktsTxConfig indicates how many MC-Lag control packets of type lag config were sent on this system to the peer for this lag.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagLagStatsPktsTxFailed)	long	The value of tmnxMcLagLagStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted on this system to the peer for this lag.
statePacketsReceived [State Packets Received] (tmnxMcLagLagStatsPktsRxState)	long	The value of tmnxMcLagLagStatsPktsRxState indicates how many MC-Lag control packets of type lag state were received on this system from the peer for this lag.
statePacketsTransmitted [State Packets Transmitted] (tmnxMcLagLagStatsPktsTxState)	long	The value of tmnxMcLagLagStatsPktsTxState indicates how many MC-Lag control packets of type lag state were sent on this system to the peer for this lag.
MultiChassisLagStats MIB entry name: tmnxMcRedundancyStatsObjs Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.CardSlot • netw.NetworkElement 		
configPacketsReceived [Config Packets Received] (tmnxMcLagStatsPktsRxConfig)	long	The value of tmnxMcLagStatsPktsRxConfig indicates how many valid MC-Lag control packets indicating the lag configuration were received on this system.
configPacketsTransmitted [Config Packets Transmitted] (tmnxMcLagStatsPktsTxConfig)	long	The value of tmnxMcLagStatsPktsTxConfig indicates how many MC-Lag control packets were transmitted from this system of type lag config.

Table 837 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
failedMD5AuthenticationPacketsDropped [Failed MD5 Authentication Packets Dropped] (tmnxMcLagStatsDropMD5)	long	The value of tmnxMcLagStatsDropMD5 indicates how many MC-Lag control packets were dropped on this system because they failed MD5 authentication.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagStatsPktsTxFailed)	long	The value of tmnxMcLagStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted.
invalidLagIdPacketsDropped [Invalid Lag Id Packets Dropped] (tmnxMcLagStatsDropTlvInvlLagId)	long	The value of tmnxMcLagStatsDropTlvInvlLagId indicates how many MC-Lag control packets were dropped on this system because they refer to an invalid or non multi-chassis lag.
invalidSizePacketsDropped [Invalid Size Packets Dropped] (tmnxMcLagStatsDropTlvInvalidSize)	long	The value of tmnxMcLagStatsDropTlvInvalidSize indicates how many MC-Lag control packets were dropped on this system because of invalid size.
keepalivePacketsReceived [Keepalive Packets Received] (tmnxMcLagStatsPktsRxKeepalive)	long	The value of tmnxMcLagStatsPktsRxKeepalive indicates how many valid MC-Lag control packets of type keepalive were received on this system.
keepalivePacketsTransmitted [Keepalive Packets Transmitted] (tmnxMcLagStatsPktsTxKeepalive)	long	The value of tmnxMcLagStatsPktsTxKeepalive indicates how many MC-Lag control packets were transmitted from this system of type keepalive.
outOfSequencePacketsDropped [Out Of Sequence Packets Dropped] (tmnxMcLagStatsDropOutOfSeq)	long	The value of tmnxMcLagStatsDropOutOfSeq indicates how many MC-Lag control packets were dropped on this system because they were out of sequence.
packetsDropped [Packets Dropped] (tmnxMcLagStatsDropPktKpaliveTask)	long	The value of tmnxMcLagStatsDropPktKpaliveTask indicates how many MC-Lag control packets were dropped on this system because of invalid size, authentication or unknown peer.

Table 837 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packetsReceived [Packets Received] (tmnxMcLagStatsPktsRx)	long	The value of tmnxMcLagStatsPktsRx indicates how many MC-Lag control packets with valid authentication were received on this system.
packetsTransmitted [Packets Transmitted] (tmnxMcLagStatsPktsTx)	long	The value of tmnxMcLagStatsPktsTx indicates how many MC-Lag control packets were transmitted from this system.
peerConfigPacketsReceived [Peer Config Packets Received] (tmnxMcLagStatsPktsRxPeerConfig)	long	The value of tmnxMcLagStatsPktsRxPeerConfig indicates how many valid MC-Lag control packets indicating the peer configuration were received on this system.
peerConfigPacketsTransmitted [Peer Config Packets Transmitted] (tmnxMcLagStatsPktsTxPeerConfig)	long	The value of tmnxMcLagStatsPktsTxPeerConfig indicates how many MC-Lag control packets were transmitted from this system of type peer config.
statePacketsReceived [State Packets Received] (tmnxMcLagStatsPktsRxState)	long	The value of tmnxMcLagStatsPktsRxState indicates how many valid MC-Lag control packets indicating the lag state were received on this system.
statePacketsTransmitted [State Packets Transmitted] (tmnxMcLagStatsPktsTxState)	long	The value of tmnxMcLagStatsPktsTxState indicates how many MC-Lag control packets were transmitted from this system of type lag state.
tooShortPacketsDropped [Too Short Packets Dropped] (tmnxMcLagStatsDropPktTooShort)	long	The value of tmnxMcLagStatsDropPktTooShort indicates how many MC-Lag control packets were dropped on this system because the packet was too small.
unknownPeerPacketsDropped [Unknown Peer Packets Dropped] (tmnxMcLagStatsDropUnknownPeer)	long	The value of tmnxMcLagStatsDropUnknownPeer indicates how many MC-Lag control packets were dropped on this system because they are coming from an unknown peer.
unknownTlvPacketsDropped [Unknown Tlv Packets Dropped] (tmnxMcLagStatsDropUnknownTlv)	long	The value of tmnxMcLagStatsDropUnknownTlv indicates how many MC-Lag control packets were dropped on this system because they contained an unknown TLV.

Table 837 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
verifyFailedPacketsDropped [Verify Failed Packets Dropped] (tmnxMcLagStatsDropPktVerifyFaild)	long	The value of tmnxMcLagStatsDropPktVerifyFaild indicates how many MC-Lag control packets were dropped on this system because of invalid formatting.

Table 838 Ldp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats</p> <p>MIB entry name: vRtrLdpIfStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Interface or Targeted peer. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpSessionStatsEntry.</p> <p>Table description (for vRtrLdpIfStatsTable): vRtrLdpIfStatsTable is a read-only table. The purpose of this table is to keep statistical information about the LDP Interfaces and Targeted peers on the LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpIfTable, and the augmenting table, vRtrLdpIfStatsTable. This in effect extends the vRtrLdpIfTable with additional columns. Creation or deletion of a row in the vRtrLdpIfTable results in the same fate for the row in the vRtrLdpIfStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Idp.Interface</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpIfExistingAdjacencies)	long	The value of vRtrLdpIfExistingAdjacencies gives a count of the total active adjacencies on this LDP interface or with this targeted peer.
<p>LdpEgressStats</p> <p>MIB entry name: vRtrLdpEgrStatisticsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrLdpEgrStatisticsTable): The vRtrLdpEgrStatisticsTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: Idp.AccountingFecPrefix</p>		

Table 838 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ldpInProfileOctetsFc0 [Ldp In Profile Octets Fc 0] (vRtrLdpInProfileOctetsFc0)	java. math. BigInteger	The value of vRtrLdpInProfileOctetsFc0 indicates the number of in profile octets received for Forwarding Class 0.
ldpInProfileOctetsFc1 [Ldp In Profile Octets Fc 1] (vRtrLdpInProfileOctetsFc1)	java. math. BigInteger	The value of vRtrLdpInProfileOctetsFc1 indicates the number of in profile octets received for Forwarding Class 1.
ldpInProfileOctetsFc2 [Ldp In Profile Octets Fc 2] (vRtrLdpInProfileOctetsFc2)	java. math. BigInteger	The value of vRtrLdpInProfileOctetsFc2 indicates the number of in profile octets received for Forwarding Class 2.
ldpInProfileOctetsFc3 [Ldp In Profile Octets Fc 3] (vRtrLdpInProfileOctetsFc3)	java. math. BigInteger	The value of vRtrLdpInProfileOctetsFc3 indicates the number of in profile octets received for Forwarding Class 3.
ldpInProfileOctetsFc4 [Ldp In Profile Octets Fc 4] (vRtrLdpInProfileOctetsFc4)	java. math. BigInteger	The value of vRtrLdpInProfileOctetsFc4 indicates the number of in profile octets received for Forwarding Class 4.
ldpInProfileOctetsFc5 [Ldp In Profile Octets Fc 5] (vRtrLdpInProfileOctetsFc5)	java. math. BigInteger	The value of vRtrLdpInProfileOctetsFc5 indicates the number of in profile octets received for Forwarding Class 5.
ldpInProfileOctetsFc6 [Ldp In Profile Octets Fc 6] (vRtrLdpInProfileOctetsFc6)	java. math. BigInteger	The value of vRtrLdpInProfileOctetsFc6 indicates the number of in profile octets received for Forwarding Class 6.
ldpInProfileOctetsFc7 [Ldp In Profile Octets Fc 7] (vRtrLdpInProfileOctetsFc7)	java. math. BigInteger	The value of vRtrLdpInProfileOctetsFc7 indicates the number of in profile octets received for Forwarding Class 7.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ldpOutOfProfOctetsFc0 [Ldp Out Of Prof Octets Fc 0] (vRtrLdpOutOfProfOctetsFc0)	java. math. BigInteger	The value of vRtrLdpOutOfProfOctetsFc0 indicates the number of out of profile octets received for Forwarding Class 0.
ldpOutOfProfOctetsFc1 [Ldp Out Of Prof Octets Fc 1] (vRtrLdpOutOfProfOctetsFc1)	java. math. BigInteger	The value of vRtrLdpOutOfProfOctetsFc1 indicates the number of out of profile octets received for Forwarding Class 1.
ldpOutOfProfOctetsFc2 [Ldp Out Of Prof Octets Fc 2] (vRtrLdpOutOfProfOctetsFc2)	java. math. BigInteger	The value of vRtrLdpOutOfProfOctetsFc2 indicates the number of out of profile octets received for Forwarding Class 2.
ldpOutOfProfOctetsFc3 [Ldp Out Of Prof Octets Fc 3] (vRtrLdpOutOfProfOctetsFc3)	java. math. BigInteger	The value of vRtrLdpOutOfProfOctetsFc3 indicates the number of out of profile octets received for Forwarding Class 3.
ldpOutOfProfOctetsFc4 [Ldp Out Of Prof Octets Fc 4] (vRtrLdpOutOfProfOctetsFc4)	java. math. BigInteger	The value of vRtrLdpOutOfProfOctetsFc4 indicates the number of out of profile octets received for Forwarding Class 4.
ldpOutOfProfOctetsFc5 [Ldp Out Of Prof Octets Fc 5] (vRtrLdpOutOfProfOctetsFc5)	java. math. BigInteger	The value of vRtrLdpOutOfProfOctetsFc5 indicates the number of out of profile octets received for Forwarding Class 5.
ldpOutOfProfOctetsFc6 [Ldp Out Of Prof Octets Fc 6] (vRtrLdpOutOfProfOctetsFc6)	java. math. BigInteger	The value of vRtrLdpOutOfProfOctetsFc6 indicates the number of out of profile octets received for Forwarding Class 6.
ldpOutOfProfOctetsFc7 [Ldp Out Of Prof Octets Fc 7] (vRtrLdpOutOfProfOctetsFc7)	java. math. BigInteger	The value of vRtrLdpOutOfProfOctetsFc7 indicates the number of out of profile octets received for Forwarding Class 7.

Table 838 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ldpOutOfProfPktsFc0 [Ldp Out Of Prof Pkts Fc 0] (vRtrLdpOutOfProfPktsFc0)	java. math. BigInteger	The value of vRtrLdpOutOfProfPktsFc0 indicates the number of out of profile packets received for Forwarding Class 0.
ldpOutOfProfPktsFc1 [Ldp Out Of Prof Pkts Fc 1] (vRtrLdpOutOfProfPktsFc1)	java. math. BigInteger	The value of vRtrLdpOutOfProfPktsFc1 indicates the number of out of profile packets received for Forwarding Class 1.
ldpOutOfProfPktsFc2 [Ldp Out Of Prof Pkts Fc 2] (vRtrLdpOutOfProfPktsFc2)	java. math. BigInteger	The value of vRtrLdpOutOfProfPktsFc2 indicates the number of out of profile packets received for Forwarding Class 2.
ldpOutOfProfPktsFc3 [Ldp Out Of Prof Pkts Fc 3] (vRtrLdpOutOfProfPktsFc3)	java. math. BigInteger	The value of vRtrLdpOutOfProfPktsFc3 indicates the number of out of profile packets received for Forwarding Class 3.
ldpOutOfProfPktsFc4 [Ldp Out Of Prof Pkts Fc 4] (vRtrLdpOutOfProfPktsFc4)	java. math. BigInteger	The value of vRtrLdpOutOfProfPktsFc4 indicates the number of out of profile packets received for Forwarding Class 4.
ldpOutOfProfPktsFc5 [Ldp Out Of Prof Pkts Fc 5] (vRtrLdpOutOfProfPktsFc5)	java. math. BigInteger	The value of vRtrLdpOutOfProfPktsFc5 indicates the number of out of profile packets received for Forwarding Class 5.
ldpOutOfProfPktsFc6 [Ldp Out Of Prof Pkts Fc 6] (vRtrLdpOutOfProfPktsFc6)	java. math. BigInteger	The value of vRtrLdpOutOfProfPktsFc6 indicates the number of out of profile packets received for Forwarding Class 6.
ldpOutOfProfPktsFc7 [Ldp Out Of Prof Pkts Fc 7] (vRtrLdpOutOfProfPktsFc7)	java. math. BigInteger	The value of vRtrLdpOutOfProfPktsFc7 indicates the number of out of profile packets received for Forwarding Class 7.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SessionStats</p> <p>MIB entry name: vRtrLdpSessionStatsEntry</p> <p>Entry description: A row in this table represents statistical information about a single session between an LDP entity and an LDP Peer.</p> <p>Table description (for vRtrLdpSessionStatsTable): vRtrLdpSessionStatsTable is a read-only table. The purpose of this table is to keep statistical information about a single session between an LDP entity and an LDP Peer. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpSessionTable, and the augmenting table, vRtrLdpSessionStatsTable. This in effect extends the vRtrLdpSessionTable with additional columns. Creation or deletion of a row in the vRtrLdpSessionTable results in the same fate for the row in the vRtrLdpSessionStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ldp.Session</p>		
addressMessagesReceived [Address Messages Received] (vRtrLdpSessStatsAddrIn)	long	The value of vRtrLdpSessStatsAddrIn counts the number of Address Messages that have been received during this session.
addressMessagesSent [Address Messages Sent] (vRtrLdpSessStatsAddrOut)	long	The value of vRtrLdpSessStatsAddrOut counts the number of Address Messages that have been sent during this session.
addressWithdrawMessagesReceived [Address Withdraw Messages Received] (vRtrLdpSessStatsAddrWithdrawIn)	long	The value of vRtrLdpSessStatsAddrWithdrawIn counts the number of Address Withdraw Messages that have been received during this session.
addressWithdrawMessagesSent [Address Withdraw Messages Sent] (vRtrLdpSessStatsAddrWithdrawOut)	long	The value of vRtrLdpSessStatsAddrWithdrawOut counts the number of Address Withdraw Messages that have been sent during this session.
fecReceived [Fec Received] (vRtrLdpSessStatsFECRecv)	long	The value of vRtrLdpSessStatsFECRecv counts the number of FECs received for this session.

Table 838 ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fecSent [Fec Sent] (vRtrLdpSessStatsFECSent)	long	The value of vRtrLdpSessStatsFECSent counts the number of FECs sent for this session.
helloMessagesReceived [Hello Messages Received] (vRtrLdpSessStatsHelloIn)	long	The value of vRtrLdpSessStatsHelloIn counts the number of Hello Messages that have been received during this session.
helloMessagesSent [Hello Messages Sent] (vRtrLdpSessStatsHelloOut)	long	The value of vRtrLdpSessStatsHelloOut counts the number of Hello Messages that have been sent during this session.
initMessagesReceived [Init Messages Received] (vRtrLdpSessStatsInitIn)	long	The value of vRtrLdpSessStatsInitIn counts the number of Init Messages that have been received during this session.
initMessagesSent [Init Messages Sent] (vRtrLdpSessStatsInitOut)	long	The value of vRtrLdpSessStatsInitOut counts the number of Init Messages that have been sent during this session.
keepAliveMessagesReceived [Keep Alive Messages Received] (vRtrLdpSessStatsKeepaliveIn)	long	The value of vRtrLdpSessStatsKeepaliveIn counts the number of Keepalive Messages that have been received during this session.
keepAliveMessagesSent [Keep Alive Messages Sent] (vRtrLdpSessStatsKeepaliveOut)	long	The value of vRtrLdpSessStatsKeepaliveOut counts the number of Keepalive Messages that have been sent during this session.
labelAbortsReceived [Label Aborts Received] (vRtrLdpSessStatsLabelAbortIn)	long	The value of vRtrLdpSessStatsLabelAbortIn counts the number of Label Abort Messages that have been received during this session.
labelAbortsSent [Label Aborts Sent] (vRtrLdpSessStatsLabelAbortOut)	long	The value of vRtrLdpSessStatsLabelAbortOut counts the number of Label Abort Messages that have been sent during this session.

Table 838 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
labelMappingsReceived [Label Mappings Received] (vRtrLdpSessStatsLabelMappingIn)	long	The value of vRtrLdpSessStatsLabelMappingIn counts the number of Label Mapping Messages that have been received during this session.
labelMappingsSent [Label Mappings Sent] (vRtrLdpSessStatsLabelMappingOut)	long	The value of vRtrLdpSessStatsLabelMappingOut counts the number of Label Mapping Messages that have been sent during this session.
labelReleasesReceived [Label Releases Received] (vRtrLdpSessStatsLabelReleaseIn)	long	The value of vRtrLdpSessStatsLabelReleaseIn counts the number of Label Release Messages that have been received during this session.
labelReleasesSent [Label Releases Sent] (vRtrLdpSessStatsLabelReleaseOut)	long	The value of vRtrLdpSessStatsLabelReleaseOut counts the number of Label Release Messages that have been sent during this session.
labelRequestsReceived [Label Requests Received] (vRtrLdpSessStatsLabelRequestIn)	long	The value of vRtrLdpSessStatsLabelRequestIn counts the number of Label Request Messages that have been received during this session.
labelRequestsSent [Label Requests Sent] (vRtrLdpSessStatsLabelRequestOut)	long	The value of vRtrLdpSessStatsLabelRequestOut counts the number of Label Request Messages that have been sent during this session.
labelWithdrawsReceived [Label Withdraws Received] (vRtrLdpSessStatsLabelWithdrawIn)	long	The value of vRtrLdpSessStatsLabelWithdrawIn counts the number of Label Withdraw Messages that have been received during this session.
labelWithdrawsSent [Label Withdraws Sent] (vRtrLdpSessStatsLabelWithdrawOut)	long	The value of vRtrLdpSessStatsLabelWithdrawOut counts the number of Label Withdraw Messages that have been sent during this session.
linkAdjacencies [Link Adjacencies] (vRtrLdpSessStatsLinkAdj)	long	The value of vRtrLdpSessStatsLinkAdj specifies the number of link adjacencies for this session.

Table 838 ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
notificationMessagesReceived [Notification Messages Received] (vRtrLdpSessStatsNotificationIn)	long	The value of vRtrLdpSessStatsNotificationIn counts the number of Notification Messages that have been received during this session.
notificationMessagesSent [Notification Messages Sent] (vRtrLdpSessStatsNotificationOut)	long	The value of vRtrLdpSessStatsNotificationOut counts the number of Notification Messages that have been sent during this session.
targetedAdjacencies [Targeted Adjacencies] (vRtrLdpSessStatsTargAdj)	long	The value of vRtrLdpSessStatsTargAdj specifies the number of targeted adjacencies for this session.
<p>SiteStats</p> <p>MIB entry name: vRtrLdpStatsEntry</p> <p>Entry description: A row in this table represents statistical information about an LDP instance.</p> <p>Table description (for vRtrLdpStatsTable): vRtrLdpStatsTable is a read-only table. The purpose of this table is to keep statistical information about an LDP Instance. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpGeneralTable, and the augmenting table, vRtrLdpStatsTable. This in effect extends the vRtrLdpGeneralTable with additional columns. activeAdjacencies [Active Adjacencies] (vRtrLdpStatsActiveAdjacencies)	long	The value of vRtrLdpStatsActiveAdjacencies specifies the number of active adjacencies (i.e. established sessions) associated with the LDP instance.
activeInterfaces [Active Interfaces] (vRtrLdpStatsActiveInterfaces)	long	The value of vRtrLdpStatsActiveInterfaces specifies the number of active (i.e. operationally up) interfaces associated with the LDP instance.

Table 838 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
activeSessions [Active Sessions] (vRtrLdpStatsActiveSessions)	long	The value of vRtrLdpStatsActiveSessions specifies the number of active sessions (i.e. session in some form of creation) associated with the LDP instance.
activeTargetedSessions [Active Targeted Sessions] (vRtrLdpStatsActiveTargSessions)	long	The value of vRtrLdpStatsActiveTargSessions specifies the number of configured targeted peers that are administratively up in an LDP instance.
addressFECsReceived [Address FECs Received] (vRtrLdpStatsAddrFECRecv)	long	The value of vRtrLdpStatsAddrFECRecv specifies the number of Address FECs received by the LDP instance from its neighbors.
addressFECsSent [Address FECs Sent] (vRtrLdpStatsAddrFECSent)	long	The value of vRtrLdpStatsAddrFECSent specifies the number of Address FECs sent by the LDP instance to its neighbors.
attemptedSessions [Attempted Sessions] (vRtrLdpStatsAttemptedSessions)	long	The value of vRtrLdpStatsAttemptedSessions specifies the total number of attempted sessions for this LDP instance.
badLdpIdentifierErrors [Bad Ldp Identifier Errors] (vRtrLdpStatsBadLdpIdentifierErrors)	long	The value of vRtrLdpStatsBadLdpIdentifierErrors gives the number of Bad LDP Identifier Fatal Errors detected for sessions associated with this LDP instance.
badMessageLengthErrors [Bad Message Length Errors] (vRtrLdpStatsBadMessageLengthErrors)	long	The value of vRtrLdpStatsBadMessageLengthErrors gives the number of Bad Message Length Fatal Errors detected for sessions associated with this LDP instance.
badPduLengthErrors [Bad Pdu Length Errors] (vRtrLdpStatsBadPduLengthErrors)	long	The value of vRtrLdpStatsBadPduLengthErrors gives the number of Bad Pdu Length Fatal Errors detected for sessions associated with this LDP instance.
badTlvLengthErrors [Bad Tlv Length Errors] (vRtrLdpStatsBadTlvLengthErrors)	long	The value of vRtrLdpStatsBadTlvLengthErrors gives the number of Bad TLV Length Fatal Errors detected for sessions associated with this LDP instance.

Table 838 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egrFecPfxCount [Egr Fec Pfx Count] (vRtrLdpStatsEgrFecPfxCount)	long	The value of vRtrLdpStatsEgrFecPfxCount indicates the number of egress FEC prefix statistics configured for this LDP instance.
inactiveInterfaces [Inactive Interfaces] (vRtrLdpStatsInactiveInterfaces)	long	The value of vRtrLdpStatsInactiveInterfaces specifies the number of inactive (i.e. operationally down) interfaces associated with the LDP instance.
inactiveTargetedSessions [Inactive Targeted Sessions] (vRtrLdpStatsInactiveTargSessions)	long	The value of vRtrLdpStatsInactiveTargSessions specifies the number of inactive (i.e. operationally down) targeted sessions associated with the LDP instance.
keepAliveExpiredErrors [Keep Alive Expired Errors] (vRtrLdpStatsKeepAliveExpiredErrors)	long	The value of vRtrLdpStatsKeepAliveExpiredErrors gives the number of Session Keep Alive Timer Expired Errors detected for sessions associated with this LDP instance.
malformedTlvValueErrors [Malformed Tlv Value Errors] (vRtrLdpStatsMalformedTlvValueErrors)	long	The value of vRtrLdpStatsMalformedTlvValueErrors gives the number of Malformed TLV Value Fatal Errors detected for sessions associated with this LDP instance.
operDownEvents [Oper Down Events] (vRtrLdpStatsOperDownEvents)	long	The value of vRtrLdpStatsOperDownEvents specifies the number of times the LDP instance has gone operationally down since the instance was created.
serviceFECsReceived [Service FECs Received] (vRtrLdpStatsSvcFECRecv)	long	The value of vRtrLdpStatsSvcFECRecv specifies the number of Service FECs received by the LDP instance from its neighbors.
serviceFECsSent [Service FECs Sent] (vRtrLdpStatsSvcFECSent)	long	The value of vRtrLdpStatsSvcFECSent specifies the number of Service FECs sent by the LDP instance to its neighbors.

Table 838 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionRejectedAdvertisementModeErrors [Session Rejected Advertisement Mode Errors] (vRtrLdpStatsSessRejAdvErrors)	long	The value of vRtrLdpStatsSessRejAdvErrors gives the total number of Session Rejected/Parameters Advertisement Mode Error Notification Messages sent or received by this LDP instance.
sessionRejectedLabelRangeErrors [Session Rejected Label Range Errors] (vRtrLdpStatsSessRejLabelRangeErrors)	long	The value of vRtrLdpStatsSessRejLabelRangeErrors gives the total number of Session Rejected/Parameters Label Range Error Notification Messages sent or received by this LDP instance.
sessionRejectedMaxPduLengthErrors [Session Rejected Max Pdu Length Errors] (vRtrLdpStatsSessRejMaxPduErrors)	long	The value of vRtrLdpStatsSessRejMaxPduErrors gives the total number of Session Rejected/Parameters Max Pdu Length Error Notification Messages sent or received by this LDP instance.
sessionRejectedNoHelloErrors [Session Rejected No Hello Errors] (vRtrLdpStatsSessRejNoHelloErrors)	long	The value of vRtrLdpStatsSessRejNoHelloErrors gives the total number of Session Rejected/No Hello Error Notification Messages sent or received by this LDP instance.
shutdownNotificationsReceived [Shutdown Notifications Received] (vRtrLdpStatsShutdownNotifRecv)	long	The value of vRtrLdpStatsShutdownNotifRecv gives the number of Shutdown Notifications received related to sessions associated with this LDP instance.
shutdownNotificationsSent [Shutdown Notifications Sent] (vRtrLdpStatsShutdownNotifSent)	long	The value of vRtrLdpStatsShutdownNotifSent gives the number of Shutdown Notifications sent related to sessions associated with this LDP instance.
unknownTlvErrors [Unknown Tlv Errors] (vRtrLdpStatsUnknownTlvErrors)	long	The value of vRtrLdpStatsUnknownTlvErrors indicates the number of Unknown TLV Fatal Errors detected for sessions associated with this LDP instance.

Table 838 Ldp statistics (continued)

p2mpFecReceived [P2 mp Fec Received] (vRtrLdpStatsP2MPFECRecv)	long	The value of vRtrLdpStatsP2MPFECRecv specifies the number of P2MP FECs received by the LDP instance from its neighbors.
p2mpFecSent [P2 mp Fec Sent] (vRtrLdpStatsP2MPFECSent)	long	The value of vRtrLdpStatsP2MPFECSent specifies the number of P2MP FECs sent by the LDP instance to its neighbors.

Table 838 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TargetedPeerStats</p> <p>MIB entry name: vRtrLdpIfStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Interface or Targeted peer. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpSessionStatsEntry.</p> <p>Table description (for vRtrLdpIfStatsTable): vRtrLdpIfStatsTable is a read-only table. The purpose of this table is to keep statistical information about the LDP Interfaces and Targeted peers on the LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpIfTable, and the augmenting table, vRtrLdpIfStatsTable. This in effect extends the vRtrLdpIfTable with additional columns. Creation or deletion of a row in the vRtrLdpIfTable results in the same fate for the row in the vRtrLdpIfStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.TargetedPeer</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpIfExistingAdjacencies)	long	The value of vRtrLdpIfExistingAdjacencies gives a count of the total active adjacencies on this LDP interface or with this targeted peer.

Table 839 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 839 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: tmnxLldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports and destination MAC addresses. Entries are not required to exist in this table while the tmnxLldpPortCfgAdminStatus object is equal to 'disabled(4)'. Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration</p>		

Table 839 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (tmnxLldpStatsRxPortAgeouts)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in tmnxLldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the tmnxLldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial ageing is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (tmnxLldpStatsRxPortFrameDiscard)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (tmnxLldpStatsRxPortFrameErrs)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (tmnxLldpStatsRxPortFrames)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 839 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (tmnxLldpStatsRxPortTLVDiscard)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (tmnxLldpStatsRxPortTLVUnknown)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2004. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats MIB entry name: tmnxLldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port and destination MAC address. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsTxPortTable): A table containing LLDP transmission statistics for individual port/destination address combinations. Entries are not required to exist in this table while the tmnxLldpPortConfigEntry object is equal to 'disabled(4)'. Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration</p>		
IldpStatsTxLLDPDULengthErrs [Lldp Stats Tx LLDPDULength Errs] (tmnxLldpStatsTxLLDPDULengthErrs)	long	The number of LLDPD Length Errors recorded for the Port.
IldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (tmnxLldpStatsTxPortFrames)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 840 mld statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
InterfaceStats MIB entry name: vRtrMldIfStatsEntry Entry description: An entry in the vRtrMldIfStatsTable. Table description (for vRtrMldIfStatsTable): The vRtrMldIfStatsTable contains objects corresponding to the MLD statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: mld.Interface		
importPolicyDrops [Import Policy Drops] (vRtrMldIfImportPolicyDrops)	long	The value of vRtrMldIfImportPolicyDrops indicates the total number of times the MLD protocol instance matched the host IP address or group or source addresses specified in the import policy vRtrMldIfImportPolicy.
rxBadChecksumPkts [Rx Bad Checksum Pkts] (vRtrMldIfRxBadChecksumPkts)	long	The value of vRtrMldIfRxBadChecksumPkts indicates the total number of MLD packets with bad checksum received on this interface.
rxBadEncodings [Rx Bad Encodings] (vRtrMldIfRxBadEncodings)	long	The value of vRtrMldIfRxBadEncodings indicates the total number of MLD packets received on this interface which were not encoded correctly.
rxBadLenPkts [Rx Bad Len Pkts] (vRtrMldIfRxBadLenPkts)	long	The value of vRtrMldIfRxBadLenPkts indicates the total number of MLD packets with bad length received on this interface.
rxBadReceiveIfPkts [Rx Bad Receive If Pkts] (vRtrMldIfRxBadReceiveIfPkts)	long	The value of vRtrMldIfRxBadReceiveIfPkts indicates the total number of MLD packets incorrectly received on this interface.
rxGenQueries [Rx Gen Queries] (vRtrMldIfRxGenQueries)	long	The value of vRtrMldIfRxGenQueries indicates the total number of MLD General Queries received on this interface.

Table 840 mld statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxGrpQueries [Rx Grp Queries] (vRtrMldIfRxGrpQueries)	long	The value of vRtrMldIfRxGrpQueries indicates the number of MLD Group Specific Queries received on this interface.
rxGrpSrcQueries [Rx Grp Src Queries] (vRtrMldIfRxGrpSrcQueries)	long	The value of vRtrMldIfRxGrpSrcQueries indicates the number of MLD Group and Source Specific Queries received on this interface.
rxLeaves [Rx Leaves] (vRtrMldIfRxLeaves)	long	The value of vRtrMldIfRxLeaves indicates the total number of MLD V2 Leaves received on this interface.
rxLocalScopePkts [Rx Local Scope Pkts] (vRtrMldIfRxLocalScopePkts)	long	The value of the object vRtrMldIfRxLocalScopePkts indicates the number of MLD packets received on the link-local scope IPv6 multicast address.
rxNoRtrAlertPkts [Rx No Rtr Alert Pkts] (vRtrMldIfRxNoRtrAlertPkts)	long	The value of vRtrMldIfRxNoRtrAlertPkts indicates the total number of MLDv3 packets received on this interface which did not have the router alert flag set.
rxNonLocal [Rx Non Local] (vRtrMldIfRxNonLocal)	long	The value of vRtrMldIfRxNonLocal indicates the total number of MLD packets received from a non-local sender.
rxPktDrops [Rx Pkt Drops] (vRtrMldIfRxPktDrops)	long	The value of vRtrMldIfRxPktDrops indicates the total number of MLD packets that were received on this interface but were dropped.
rxRsvdScopePkts [Rx Rsvd Scope Pkts] (vRtrMldIfRxRsvdScopePkts)	long	The value of the object vRtrMldIfRxRsvdScopePkts indicates the number of MLD packets received on the reserved scope IPv6 multicast address.
rxUnknownTypePkts [Rx Unknown Type Pkts] (vRtrMldIfRxUnknownTypePkts)	long	The value of vRtrMldIfRxUnknownTypePkts indicates the total number of MLD packets with unknown type received on this interface.

Table 840 mld statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxV1Reports [Rx V1 Reports] (vRtrMldIfRxV1Reports)	long	The value of vRtrMldIfRxV1Reports indicates the total number of MLD V1 Reports received on this interface.
rxV2Reports [Rx V2 Reports] (vRtrMldIfRxV2Reports)	long	The value of vRtrMldIfRxV2Reports indicates the total number of MLD V2 Reports received on this interface.
rxWrongVersions [Rx Wrong Versions] (vRtrMldIfRxWrongVersions)	long	The value of vRtrMldIfRxWrongVersions indicates the total number of MLD packets with wrong versions received on this interface.
statsSGTypes [Stats SGTypes] (vRtrMldIfStatsSGTypes)	long	The value of vRtrMldIfStatsSGTypes indicates the number of entries on this interface for which the source type is 'sg'.
statsStarGTypes [Stats Star GTypes] (vRtrMldIfStatsStarGTypes)	long	vRtrMldIfStatsStarGTypes indicates the number of entries on this interface for which the source type is 'starG'.
txErrors [Tx Errors] (vRtrMldIfTxErrors)	long	The value of vRtrMldIfTxErrors indicates the total number of times there was an error transmitting the MLD packets on this interface.
txGenQueries [Tx Gen Queries] (vRtrMldIfTxGenQueries)	long	The value of vRtrMldIfTxGenQueries indicates the number of MLD General Queries transmitted on this interface.
txGrpQueries [Tx Grp Queries] (vRtrMldIfTxGrpQueries)	long	The value of vRtrMldIfTxGrpQueries indicates the number of MLD Group Specific Queries transmitted on this interface.
txGrpSrcQueries [Tx Grp Src Queries] (vRtrMldIfTxGrpSrcQueries)	long	The value of vRtrMldIfTxGrpSrcQueries indicates the number of MLD Group and Source Specific Queries transmitted on this interface.

Table 840 mld statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txLeaves [Tx Leaves] (vRtrMldIfTxLeaves)	long	The value of vRtrMldIfTxLeaves indicates the total number of MLD Leaves transmitted on this interface.
txV1Reports [Tx V1 Reports] (vRtrMldIfTxV1Reports)	long	The value of vRtrMldIfTxV1Reports indicates the total number of MLD V1 Reports transmitted on this interface.
txV2Reports [Tx V2 Reports] (vRtrMldIfTxV2Reports)	long	The value of vRtrMldIfTxV2Reports indicates the total number of MLD V2 Reports transmitted on this interface.

Table 841 mpls statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DynamicLspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp 		
configuredPaths [Configured Paths] (vRtrMplsLspConfiguredPaths)	long	The number of paths configured for this LSP.
operationalPaths [Operational Paths] (vRtrMplsLspOperationalPaths)	long	The number of operational paths for this LSP. This includes the path currently active, as well as operational standby paths.
pathChanges [Path Changes] (vRtrMplsLspPathChanges)	long	The number of path changes this LSP has had. For every path change (path down, path up, path change), a corresponding syslog/trap (if enabled) is generated for it.
standbyPaths [Standby Paths] (vRtrMplsLspStandbyPaths)	long	The number of standby paths configured for this LSP.
timeSinceLastPathChange [Time Since Last Path Change] (vRtrMplsLspLastPathChange)	long	The time in 10-millisecond units since the last change occurred on this LSP.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastPrimaryUpState [Time Since Last Primary Up State] (vRtrMplsLspPrimaryTimeUp)	long	The total time in 10-millisecond units that this LSP's primary path has been operational. For example, the percentage contribution of the primary path to the operational time is given by (vRtrMplsLspPrimaryTimeUp/vRtrMplsLspTimeUp * 100) %.
<p>LspPathStats</p> <p>MIB entry name: vRtrMplsLspPathStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspPathStatTable): The vRtrMplsLspPathStatTable has an entry for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.LspPath</p>		
cspfQueries [Cspf Queries] (vRtrMplsLspPathCspfQueries)	long	The value of vRtrMplsLspPathCspfQueries specifies the number of CSPF queries that have been made for this LSP path.
retryAttempts [Retry Attempts] (vRtrMplsLspPathRetryAttempts)	long	The number of unsuccessful attempts which have been made to signal this path. As soon as the path gets signalled, this is set to 0.
timeDown [Time Down] (vRtrMplsLspPathTimeDown)	long	The total time in 10-millisecond units that this LSP Path has not been operational.
timeUp [Time Up] (vRtrMplsLspPathTimeUp)	long	The total time in 10-millisecond units that this LSP path has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspPathTimeUp/vRtrMplsLspAge * 100 %).

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitionCount [Transition Count] (vRtrMplsLspPathTransitionCount)	long	The object vRtrMplsLspPathTransitionCount maintains the number of transitions that have occurred for this LSP.
<p>LspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.BypassOnlyLsp • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp • mpls.StaticLsp 		
age [Age] (vRtrMplsLspAge)	long	The age (i.e., time from creation till now) of this LSP in 10-millisecond periods.
timeSinceLastDownState [Time Since Last Down State] (vRtrMplsLspTimeDown)	long	The total time in 10-millisecond units that this LSP has not been operational.
timeSinceLastTransition [Time Since Last Transition] (vRtrMplsLspLastTransition)	long	The time in 10-millisecond units since the last transition occurred on this LSP.
timeSinceLastUpState [Time Since Last Up State] (vRtrMplsLspTimeUp)	long	The total time in 10-millisecond units that this LSP has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspTimeUp/ vRtrMplsLspAge * 100 %).

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitions [Transitions] (vRtrMplsLspTransitions)	long	The number of state transitions (up -> down and down -> up) this LSP has undergone.
<p>MplsInterfaceStats MIB entry name: vRtrMplsIfStatEntry Entry description: Each row entry represents a collection of statistics for an interface on this virtual router that participates in the MPLS protocol. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrMplsIfStatTable): The vRtrMplsIfStatTable has an entry for each router interface configured for MPLS in the system. Supports realtime plotting Supports scheduled collection Monitored class: mpls.Interface</p>		
receiveOctets [Receive Octets] (vRtrMplsIfRxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets received on this interface.
receivePackets [Receive Packets] (vRtrMplsIfRxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets received on this interface.
transmitOctets [Transmit Octets] (vRtrMplsIfTxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets transmitted on this interface.
transmitPackets [Transmit Packets] (vRtrMplsIfTxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets transmitted from this interface.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MplsLspEgressStats</p> <p>MIB entry name: vRtrMplsLspStatisticsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. mplsInProfileOctetsFc0 [Mpls In Profile Octets Fc 0] (vRtrMplsInProfileOctetsFc0)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc0 indicates the number of in profile octets received for Forwarding Class 0.
mplsInProfileOctetsFc1 [Mpls In Profile Octets Fc 1] (vRtrMplsInProfileOctetsFc1)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc1 indicates the number of in profile octets received for Forwarding Class 1.
mplsInProfileOctetsFc2 [Mpls In Profile Octets Fc 2] (vRtrMplsInProfileOctetsFc2)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc2 indicates the number of in profile octets received for Forwarding Class 2.
mplsInProfileOctetsFc3 [Mpls In Profile Octets Fc 3] (vRtrMplsInProfileOctetsFc3)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc3 indicates the number of in profile octets received for Forwarding Class 3.
mplsInProfileOctetsFc4 [Mpls In Profile Octets Fc 4] (vRtrMplsInProfileOctetsFc4)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc4 indicates the number of in profile octets received for Forwarding Class 4.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mplsInProfileOctetsFc5 [Mpls In Profile Octets Fc 5] (vRtrMplsInProfileOctetsFc5)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc5 indicates the number of in profile octets received for Forwarding Class 5.
mplsInProfileOctetsFc6 [Mpls In Profile Octets Fc 6] (vRtrMplsInProfileOctetsFc6)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc6 indicates the number of in profile octets received for Forwarding Class 6.
mplsInProfileOctetsFc7 [Mpls In Profile Octets Fc 7] (vRtrMplsInProfileOctetsFc7)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc7 indicates the number of in profile octets received for Forwarding Class 7.
mplsInProfilePktsFc0 [Mpls In Profile Pkts Fc 0] (vRtrMplsInProfilePktsFc0)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc0 indicates the number of in profile packets received for Forwarding Class 0.
mplsInProfilePktsFc1 [Mpls In Profile Pkts Fc 1] (vRtrMplsInProfilePktsFc1)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc1 indicates the number of in profile packets received for Forwarding Class 1.
mplsInProfilePktsFc2 [Mpls In Profile Pkts Fc 2] (vRtrMplsInProfilePktsFc2)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc2 indicates the number of in profile packets received for Forwarding Class 2.
mplsInProfilePktsFc3 [Mpls In Profile Pkts Fc 3] (vRtrMplsInProfilePktsFc3)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc3 indicates the number of in profile packets received for Forwarding Class 3.
mplsInProfilePktsFc4 [Mpls In Profile Pkts Fc 4] (vRtrMplsInProfilePktsFc4)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc4 indicates the number of in profile packets received for Forwarding Class 4.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mplsInProfilePktsFc5 [Mpls In Profile Pkts Fc 5] (vRtrMplsInProfilePktsFc5)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc5 indicates the number of in profile packets received for Forwarding Class 5.
mplsInProfilePktsFc6 [Mpls In Profile Pkts Fc 6] (vRtrMplsInProfilePktsFc6)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc6 indicates the number of in profile packets received for Forwarding Class 6.
mplsInProfilePktsFc7 [Mpls In Profile Pkts Fc 7] (vRtrMplsInProfilePktsFc7)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc7 indicates the number of in profile packets received for Forwarding Class 7.
mplsOutOfProfOctetsFc0 [Mpls Out Of Prof Octets Fc 0] (vRtrMplsOutOfProfOctetsFc0)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc0 indicates the number of out of profile octets received for Forwarding Class 0.
mplsOutOfProfOctetsFc1 [Mpls Out Of Prof Octets Fc 1] (vRtrMplsOutOfProfOctetsFc1)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc1 indicates the number of out of profile octets received for Forwarding Class 1.
mplsOutOfProfOctetsFc2 [Mpls Out Of Prof Octets Fc 2] (vRtrMplsOutOfProfOctetsFc2)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc2 indicates the number of out of profile octets received for Forwarding Class 2.
mplsOutOfProfOctetsFc3 [Mpls Out Of Prof Octets Fc 3] (vRtrMplsOutOfProfOctetsFc3)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc3 indicates the number of out of profile octets received for Forwarding Class 3.
mplsOutOfProfOctetsFc4 [Mpls Out Of Prof Octets Fc 4] (vRtrMplsOutOfProfOctetsFc4)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc4 indicates the number of out of profile octets received for Forwarding Class 4.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mplsOutOfProfOctetsFc5 [Mpls Out Of Prof Octets Fc 5] (vRtrMplsOutOfProfOctetsFc5)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc5 indicates the number of out of profile octets received for Forwarding Class 5.
mplsOutOfProfOctetsFc6 [Mpls Out Of Prof Octets Fc 6] (vRtrMplsOutOfProfOctetsFc6)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc6 indicates the number of out of profile octets received for Forwarding Class 6.
mplsOutOfProfOctetsFc7 [Mpls Out Of Prof Octets Fc 7] (vRtrMplsOutOfProfOctetsFc7)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc7 indicates the number of out of profile octets received for Forwarding Class 7.
mplsOutOfProfPktsFc0 [Mpls Out Of Prof Pkts Fc 0] (vRtrMplsOutOfProfPktsFc0)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc0 indicates the number of out of profile packets received for Forwarding Class 0.
mplsOutOfProfPktsFc1 [Mpls Out Of Prof Pkts Fc 1] (vRtrMplsOutOfProfPktsFc1)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc1 indicates the number of out of profile packets received for Forwarding Class 1.
mplsOutOfProfPktsFc2 [Mpls Out Of Prof Pkts Fc 2] (vRtrMplsOutOfProfPktsFc2)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc2 indicates the number of out of profile packets received for Forwarding Class 2.
mplsOutOfProfPktsFc3 [Mpls Out Of Prof Pkts Fc 3] (vRtrMplsOutOfProfPktsFc3)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc3 indicates the number of out of profile packets received for Forwarding Class 3.
mplsOutOfProfPktsFc4 [Mpls Out Of Prof Pkts Fc 4] (vRtrMplsOutOfProfPktsFc4)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc4 indicates the number of out of profile packets received for Forwarding Class 4.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mplsOutOfProfPktsFc5 [Mpls Out Of Prof Pkts Fc 5] (vRtrMplsOutOfProfPktsFc5)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc5 indicates the number of out of profile packets received for Forwarding Class 5.
mplsOutOfProfPktsFc6 [Mpls Out Of Prof Pkts Fc 6] (vRtrMplsOutOfProfPktsFc6)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc6 indicates the number of out of profile packets received for Forwarding Class 6.
mplsOutOfProfPktsFc7 [Mpls Out Of Prof Pkts Fc 7] (vRtrMplsOutOfProfPktsFc7)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc7 indicates the number of out of profile packets received for Forwarding Class 7.
psbMatch [Psb Match] (vRtrMplsLspStatsPSBMatch)	boolean	The value of vRtrMplsLspStatsPSBMatch indicates if a path state block (PSB) match was made against this LSP name.
<p>MplsLspIngressStats MIB entry name: vRtrMplsLspStatisticsEntry Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrMplsLspStatisticsTable): The vRtrMplsLspStatisticsTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system. Supports realtime plotting Supports scheduled collection Monitored class: mpls.IngStatsPolicy</p>		
mplsInProfileOctetsFc0 [Mpls In Profile Octets Fc 0] (vRtrMplsInProfileOctetsFc0)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc0 indicates the number of in profile octets received for Forwarding Class 0.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mplsInProfileOctetsFc1 [Mpls In Profile Octets Fc 1] (vRtrMplsInProfileOctetsFc1)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc1 indicates the number of in profile octets received for Forwarding Class 1.
mplsInProfileOctetsFc2 [Mpls In Profile Octets Fc 2] (vRtrMplsInProfileOctetsFc2)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc2 indicates the number of in profile octets received for Forwarding Class 2.
mplsInProfileOctetsFc3 [Mpls In Profile Octets Fc 3] (vRtrMplsInProfileOctetsFc3)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc3 indicates the number of in profile octets received for Forwarding Class 3.
mplsInProfileOctetsFc4 [Mpls In Profile Octets Fc 4] (vRtrMplsInProfileOctetsFc4)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc4 indicates the number of in profile octets received for Forwarding Class 4.
mplsInProfileOctetsFc5 [Mpls In Profile Octets Fc 5] (vRtrMplsInProfileOctetsFc5)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc5 indicates the number of in profile octets received for Forwarding Class 5.
mplsInProfileOctetsFc6 [Mpls In Profile Octets Fc 6] (vRtrMplsInProfileOctetsFc6)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc6 indicates the number of in profile octets received for Forwarding Class 6.
mplsInProfileOctetsFc7 [Mpls In Profile Octets Fc 7] (vRtrMplsInProfileOctetsFc7)	java. math. BigInteger	The value of vRtrMplsInProfileOctetsFc7 indicates the number of in profile octets received for Forwarding Class 7.
mplsInProfilePktsFc0 [Mpls In Profile Pkts Fc 0] (vRtrMplsInProfilePktsFc0)	java. math. BigInteger	The value of vRtrMplsInProfilePktsFc0 indicates the number of in profile packets received for Forwarding Class 0.

mplsOutOfProfOctetsFc2 [Mpls Out Of Prof Octets Fc 2] (vRtrMplsOutOfProfOctetsFc2)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc2 indicates the number of out of profile octets received for Forwarding Class 2.
mplsOutOfProfOctetsFc3 [Mpls Out Of Prof Octets Fc 3] (vRtrMplsOutOfProfOctetsFc3)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc3 indicates the number of out of profile octets received for Forwarding Class 3.
mplsOutOfProfOctetsFc4 [Mpls Out Of Prof Octets Fc 4] (vRtrMplsOutOfProfOctetsFc4)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc4 indicates the number of out of profile octets received for Forwarding Class 4.
mplsOutOfProfOctetsFc5 [Mpls Out Of Prof Octets Fc 5] (vRtrMplsOutOfProfOctetsFc5)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc5 indicates the number of out of profile octets received for Forwarding Class 5.
mplsOutOfProfOctetsFc6 [Mpls Out Of Prof Octets Fc 6] (vRtrMplsOutOfProfOctetsFc6)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc6 indicates the number of out of profile octets received for Forwarding Class 6.
mplsOutOfProfOctetsFc7 [Mpls Out Of Prof Octets Fc 7] (vRtrMplsOutOfProfOctetsFc7)	java. math. BigInteger	The value of vRtrMplsOutOfProfOctetsFc7 indicates the number of out of profile octets received for Forwarding Class 7.
mplsOutOfProfPktsFc0 [Mpls Out Of Prof Pkts Fc 0] (vRtrMplsOutOfProfPktsFc0)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc0 indicates the number of out of profile packets received for Forwarding Class 0.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mplsOutOfProfPktsFc1 [Mpls Out Of Prof Pkts Fc 1] (vRtrMplsOutOfProfPktsFc1)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc1 indicates the number of out of profile packets received for Forwarding Class 1.
mplsOutOfProfPktsFc2 [Mpls Out Of Prof Pkts Fc 2] (vRtrMplsOutOfProfPktsFc2)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc2 indicates the number of out of profile packets received for Forwarding Class 2.
mplsOutOfProfPktsFc3 [Mpls Out Of Prof Pkts Fc 3] (vRtrMplsOutOfProfPktsFc3)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc3 indicates the number of out of profile packets received for Forwarding Class 3.
mplsOutOfProfPktsFc4 [Mpls Out Of Prof Pkts Fc 4] (vRtrMplsOutOfProfPktsFc4)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc4 indicates the number of out of profile packets received for Forwarding Class 4.
mplsOutOfProfPktsFc5 [Mpls Out Of Prof Pkts Fc 5] (vRtrMplsOutOfProfPktsFc5)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc5 indicates the number of out of profile packets received for Forwarding Class 5.
mplsOutOfProfPktsFc6 [Mpls Out Of Prof Pkts Fc 6] (vRtrMplsOutOfProfPktsFc6)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc6 indicates the number of out of profile packets received for Forwarding Class 6.
mplsOutOfProfPktsFc7 [Mpls Out Of Prof Pkts Fc 7] (vRtrMplsOutOfProfPktsFc7)	java. math. BigInteger	The value of vRtrMplsOutOfProfPktsFc7 indicates the number of out of profile packets received for Forwarding Class 7.
psbMatch [Psb Match] (vRtrMplsLspStatsPSBMatch)	boolean	The value of vRtrMplsLspStatsPSBMatch indicates if a path state block (PSB) match was made against this LSP name.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>P2MPInstanceStats</p> <p>MIB entry name: vRtrMplsP2mplInstStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a P2MP Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsP2mplInstStatTable): The vRtrMplsP2mplInstStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.P2MPInstance</p>		
configuredS2Is [Configured S2 Is] (vRtrMplsP2mplInstStatConfiguredS2Is)	long	The value of vRtrMplsP2mplInstStatConfiguredS2Is indicates the number of S2Is configured for this P2MP LSP.
lastS2IChange [Last S2 I Change] (vRtrMplsP2mplInstStatLastS2IChange)	long	The value of vRtrMplsP2mplInstStatLastS2IChange indicates the time since the last change occurred on this P2MP LSP.
lastS2ITimeDown [Last S2 I Time Down] (vRtrMplsP2mplInstStatLastS2ITimeDown)	long	The value of vRtrMplsP2mplInstStatLastS2ITimeDown indicates the total time that this S2I has not been operational.
lastTrans [Last Trans] (vRtrMplsP2mplInstStatLastTrans)	long	The value of vRtrMplsP2mplInstStatLastTrans indicates the time since the last transition occurred on this P2mp instance.
operationalS2Is [Operational S2 Is] (vRtrMplsP2mplInstStatOperationalS2Is)	long	The value of vRtrMplsP2mplInstStatOperationalS2Is indicates the number of operational S2Is for this P2MP LSP. This includes the S2Is currently active.
s2IChanges [S2 I Changes] (vRtrMplsP2mplInstStatS2IChanges)	long	The value of vRtrMplsP2mplInstStatS2IChanges indicates the number of S2I changes this P2MP LSP has had. For every S2I change (S2I down, S2I up, S2I change), a corresponding syslog/trap (if enabled) is generated for it.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
s2lTimeUp [S2l Time Up] (vRtrMplsP2mplInstStatLastS2lTimeUp)	long	The value of vRtrMplsP2mplInstStatLastS2lTimeUp indicates the total time that this S2l has been operational.
timeDown [Time Down] (vRtrMplsP2mplInstStatTimeDown)	long	The value of vRtrMplsP2mplInstStatTimeDown indicates the total time that this P2MP instance has not been operational.
timeUp [Time Up] (vRtrMplsP2mplInstStatTimeUp)	long	The value of vRtrMplsP2mplInstStatTimeUp indicates the total time that this P2MP instance has been operational.
transitions [Transitions] (vRtrMplsP2mplInstStatTransitions)	long	The The value of vRtrMplsP2mplInstStatTransitions indicates the number of state transitions (up -> down and down -> up) this P2mp instance has undergone.
S2LPathStats MIB entry name: vRtrMplsS2lSubLspStatEntry Entry description: Each row entry represents a collection of statistics for a P2MP Source to Leaf (S2L) Sub Labeled Switch Path (LSP) configured for a i virtual router in the system. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrMplsS2lSubLspStatTable): The vRtrMplsS2lSubLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system. Supports realtime plotting Supports scheduled collection Monitored class: mpls.S2LPath		
cspfQueries [Cspf Queries] (vRtrMplsS2lSubLspCspfQueries)	long	The value of vRtrMplsS2lSubLspCspfQueries indicates the number of CSPF queries that have been made for this LSP S2l.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
retryAttempts [Retry Attempts] (vRtrMplsS2ISubLspRetryAttempts)	long	The value of vRtrMplsS2ISubLspRetryAttempts indicates the number of unsuccessful attempts which have been made to signal this S2I. As soon as the S2I gets signalled, this is set to 0.
timeDown [Time Down] (vRtrMplsS2ISubLspTimeDown)	long	The value of vRtrMplsS2ISubLspTimeUp indicates the total time that this LSP S2I has not been operational.
timeUp [Time Up] (vRtrMplsS2ISubLspTimeUp)	long	The value of vRtrMplsS2ISubLspTimeUp indicates the total time that this LSP S2I has been operational. For example, the percentage up time can be determined by computing $(vRtrMplsS2ISubLspTimeUp/vRtrMplsLspAge * 100 \%)$.
transitionCount [Transition Count] (vRtrMplsS2ISubLspTransitionCount)	long	The value of vRtrMplsS2ISubLspTransitionCount indicates the number of transitions that have occurred for this LSP.
<p>SiteStats</p> <p>MIB entry name: vRtrMplsGeneralStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an instance of the MPLS protocol running within a virtual router. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsGeneralStatTable): The vRtrMplsGeneralStatTable contains statistics for an MPLS protocol instance within a virtual router.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.Site</p>		
detourOriginate [Detour Originate] (vRtrMplsGeneralDetourLspOriginate)	long	The value of vRtrMplsGeneralDetourLspOriginate indicates the number of detour LSPs that originate at this virtual router.
detourTerminate [Detour Terminate] (vRtrMplsGeneralDetourLspTerminate)	long	The value of vRtrMplsGeneralDetourLspTerminate indicates the number of detour LSPs that terminate at this virtual router.

Table 841 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
detourTransit [Detour Transit] (vRtrMplsGeneralDetourLspTransit)	long	The value of vRtrMplsGeneralDetourLspTransit indicates the number of detour LSPs that transit through this virtual router.
dynamicOriginate [Dynamic Originate] (vRtrMplsGeneralDynamicLspOriginate)	long	The value of vRtrMplsGeneralDynamicLspOriginate indicates the number of dynamic LSPs that originate at this virtual router.
dynamicTerminate [Dynamic Terminate] (vRtrMplsGeneralDynamicLspTerminate)	long	The value of vRtrMplsGeneralDynamicLspTerminate indicates the number of dynamic LSPs that terminate at this virtual router.
dynamicTransit [Dynamic Transit] (vRtrMplsGeneralDynamicLspTransit)	long	The value of vRtrMplsGeneralDynamicLspTransit indicates the number of dynamic LSPs that transit through this virtual router.
staticOriginate [Static Originate] (vRtrMplsGeneralStaticLspOriginate)	long	The value of vRtrMplsGeneralStaticLspOriginate indicates the number of static LSPs that originate at this virtual router.
staticTerminate [Static Terminate] (vRtrMplsGeneralStaticLspTerminate)	long	The value of vRtrMplsGeneralStaticLspTerminate indicates the number of static LSPs that terminate at this virtual router.
staticTransit [Static Transit] (vRtrMplsGeneralStaticLspTransit)	long	The value of vRtrMplsGeneralStaticLspTransit indicates the number of static LSPs that transit through this virtual router.

Table 842 multichassis statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MultiChassisPeerRingStats</p> <p>MIB entry name: tmnxMcrPeerStatsEntry</p> <p>Entry description: Each row entry in the tmnxMcrPeerStatsTable represents additional columns of operational data for a multi-chassis peer.</p> <p>Table description (for tmnxMcrPeerStatsTable): The tmnxMcrPeerStatsTable has an entry for each multi-chassis peer.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: multichassis.Peer</p>		
keepAlivePacketsTransmitted [Keep Alive Packets Transmitted] (tmnxMcrPeerStatsTxKeepAlive)	long	The value of tmnxMcrPeerStatsTxKeepAlive indicates how many valid MC-Ring control packets of type 'keepalive' were transmitted to the peer.
mcsIdRequestPacketsReceived [Mcs Id Request Packets Received] (tmnxMcrPeerStatsRxMcsIdReq)	long	The value of tmnxMcrPeerStatsRxMcsIdReq indicates how many valid MCS ID requests were received from the peer.
mcsIdRequestPacketsTransmitted [Mcs Id Request Packets Transmitted] (tmnxMcrPeerStatsTxMcsIdReq)	long	The value of tmnxMcrPeerStatsTxMcsIdReq indicates how many valid MCS ID requests were transmitted to the peer.
mcsIdResponsePacketsReceived [Mcs Id Response Packets Received] (tmnxMcrPeerStatsRxMcsIdRsp)	long	The value of tmnxMcrPeerStatsRxMcsIdRsp indicates how many valid MCS ID responses were received from the peer.
mcsIdResponsePacketsTransmitted [Mcs Id Response Packets Transmitted] (tmnxMcrPeerStatsTxMcsIdRsp)	long	The value of tmnxMcrPeerStatsTxMcsIdRsp indicates how many valid MCS ID responses were transmitted to the peer.
ringExistsRequestPacketsReceived [Ring Exists Request Packets Received] (tmnxMcrPeerStatsRxRingExistsReq)	long	The value of tmnxMcrPeerStatsRxRingExistsReq indicates how many valid 'ring exists' requests were received from the peer.

Table 842 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ringExistsRequestPacketsTransmitted [Ring Exists Request Packets Transmitted] (tmnxMcrPeerStatsTxRingExistsReq)	long	The value of tmnxMcrPeerStatsTxRingExistsReq indicates how many valid 'ring exists' requests were transmitted to the peer.
ringExistsResponsePacketsReceived [Ring Exists Response Packets Received] (tmnxMcrPeerStatsRxRingExistsRsp)	long	The value of tmnxMcrPeerStatsRxRingExistsRsp indicates how many valid 'ring exists' responses were received from the peer.
ringExistsResponsePacketsTransmitted [Ring Exists Response Packets Transmitted] (tmnxMcrPeerStatsTxRingExistsRsp)	long	The value of tmnxMcrPeerStatsTxRingExistsRsp indicates how many valid 'ring exists' responses were transmitted to the peer.
ringKeepAlivePacketsReceived [Ring Keep Alive Packets Received] (tmnxMcrPeerStatsRxKeepAlive)	long	The value of tmnxMcrPeerStatsRxKeepAlive indicates how many valid MC-Ring control packets of type 'keepalive' were received from the peer.
ringSignallingPacketsReceived [Ring Signalling Packets Received] (tmnxMcrPeerStatsRx)	long	The value of tmnxMcrPeerStatsRx indicates how many valid MC-Ring signalling messages were received from the peer.
ringSignallingPacketsTransmitted [Ring Signalling Packets Transmitted] (tmnxMcrPeerStatsTx)	long	The value of tmnxMcrPeerStatsTx indicates how many valid MC-Ring signalling messages were transmitted to the peer.
MultiChassisRingGlobalStats MIB entry name: tmnxMcRedundancyStatsObjs Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
deliveredToPeerPacketsReceived [Delivered To Peer Packets Received] (tmnxMcrStatsRxDelivrdToPeer)	long	The value of tmnxMcrStatsRxDelivrdToPeer indicates how many MC-Ring signalling packets were received by this system that were correctly delivered to their peer.

Table 842 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
deliveredToRingNodePacketsReceived [Delivered To Ring Node Packets Received] (tmnxMcrStatsRxDelivrdToRingNode)	long	The value of tmnxMcrStatsRxDelivrdToRingNode indicates how many MC-R signalling packets were received by this system that were correctly delivered to their ring node.
deliveredToRingPacketsReceived [Delivered To Ring Packets Received] (tmnxMcrStatsRxDelivrdToRing)	long	The value of tmnxMcrStatsRxDelivrdToRing indicates how many MC-Ring signalling packets were received by this system that were correctly delivered to their ring.
incompletePacketsReceived [Incomplete Packets Received] (tmnxMcrStatsRxIncomplete)	long	The value of tmnxMcrStatsRxIncomplete indicates how many MC-Ring signalling packets were received by this system that were incomplete.
invalidTlvPacketsReceived [Invalid Tlv Packets Received] (tmnxMcrStatsRxInvalidTlv)	long	The value of tmnxMcrStatsRxInvalidTlv indicates how many MC-Ring signalling packets were received by this system with invalid TLV.
missedBfdEvents [Missed Bfd Events] (tmnxMcrStatsMissedBfdEvent)	long	The value of tmnxMcrStatsMissedBfdEvent indicates the number of missed BFD events on this system.
missedConfigEvents [Missed Config Events] (tmnxMcrStatsMissedConfigEvent)	long	The value of tmnxMcrStatsMissedConfigEvent indicates the number of missed configuration events on this system.
noBufferPacketsNotTransmitted [No Buffer Packets Not Transmitted] (tmnxMcrStatsTxNoBuffer)	long	The value of tmnxMcrStatsTxNoBuffer indicates how many MC-Ring signalling packets could not be transmitted by this system due to a lack of packet buffers.
signallingPacketsNotTransmitted [Signalling Packets Not Transmitted] (tmnxMcrStatsTxTransmitFailed)	long	The value of tmnxMcrStatsTxTransmitFailed indicates how many MC-Ring signalling packets could not be transmitted by this system due to a transmission failure.
signallingPacketsReceived [Signalling Packets Received] (tmnxMcrStatsRx)	long	The value of tmnxMcrStatsRx indicates how many MC-Ring signalling packets were received by this system.

Table 842 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signallingPacketsTransmitted [Signalling Packets Transmitted] (tmnxMcrStatsTx)	long	The value of tmnxMcrStatsTx indicates how many MC-Ring signalling packets were transmitted by this system.
tooShortPacketsReceived [Too Short Packets Received] (tmnxMcrStatsRxTooShort)	long	The value of tmnxMcrStatsRxTooShort indicates how many MC-Ring signalling packets were received by this system that were too short.
unknownDestinationPacketsDropped [Unknown Destination Packets Dropped] (tmnxMcrStatsTxUnknownDest)	long	The value of tmnxMcrStatsTxUnknownDest indicates how many MC-R signalling packets were dropped because the destination was unknown.
unknownPeerPacketsReceived [Unknown Peer Packets Received] (tmnxMcrStatsRxUnknownPeer)	long	The value of tmnxMcrStatsRxUnknownPeer indicates how many MC-Ring signalling packets were received by this system that were related to an unknown peer.
unknownRingNodePacketsReceived [Unknown Ring Node Packets Received] (tmnxMcrStatsRxUnknownRingNode)	long	The value of tmnxMcrStatsRxUnknownRingNode indicates how many MC-Ring signalling packets were received by this system that were related to an unknown ring node.
unknownRingPacketsReceived [Unknown Ring Packets Received] (tmnxMcrStatsRxUnknownRing)	long	The value of tmnxMcrStatsRxUnknownRing indicates how many MC-Ring signalling packets were received by this system that were related to an unknown ring.
unknownTypePacketsReceived [Unknown Type Packets Received] (tmnxMcrStatsRxUnknownType)	long	The value of tmnxMcrStatsRxUnknownType indicates how many MC-Ring signalling packets were received by this system that were of unknown type.
wrongAuthenticationPacketsReceived [Wrong Authentication Packets Received] (tmnxMcrStatsRxWrongAuth)	long	The value of tmnxMcrStatsRxWrongAuth indicates how many MC-Ring signalling packets were received by this system with invalid authentication.

Table 842 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MultiChassisRingNodeStats</p> <p>MIB entry name: tmnxMcrRingNodeStatsEntry</p> <p>Entry description: Each row entry represents statistics related to an access node that participates in a multi-chassis ring configuration with a given peer. Rows are created or removed automatically by the system.</p> <p>Table description (for tmnxMcrRingNodeStatsTable): The tmnxMcrRingNodeStatsTable has an entry for each access node that participates in a multi-chassis ring configuration for the indicated peer.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: multichassis.MultiChassisRingNode</p>		
detectedPacketsAcknowledged [Detected Packets Acknowledged] (tmnxMcrRingNodeStatsTxDetectAck)	long	The value of tmnxMcrRingNodeStatsTxDetectAck indicates how many valid 'detected ring node' signalling messages were acknowledged to the peer for this multi-chassis ring node.
detectedPacketsPeerAcknowledged [Detected Packets Peer Acknowledged] (tmnxMcrRingNodeStatsRxDetectAck)	long	The value of tmnxMcrRingNodeStatsRxDetectAck indicates how many valid 'detected ring node' signalling messages were acknowledged by the peer for this multi-chassis ring node.
detectedPacketsReceived [Detected Packets Received] (tmnxMcrRingNodeStatsRxDetect)	long	The value of tmnxMcrRingNodeStatsRxDetect indicates how many valid 'detected ring node' signalling messages were received from the peer for this multi-chassis ring node.
detectedPacketsTransmitted [Detected Packets Transmitted] (tmnxMcrRingNodeStatsTxDetect)	long	The value of tmnxMcrRingNodeStatsTxDetect indicates how many valid 'detected ring node' signalling messages were transmitted to the peer for this multi-chassis ring node.
rncvPacketsReceived [Rncv Packets Received] (tmnxMcrRingNodeStatsRncvRxResp)	long	The value of tmnxMcrRingNodeStatsRncvRxResp indicates how many valid connectivity verification messages were received from this multi-chassis ring node.

Table 842 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rcvPacketsRoundTripTime [Rcv Packets Round Trip Time] (tmnxMcrRingNodeStatsRcvRtTime)	long	The value of tmnxMcrRingNodeStatsRcvRtTime indicates the round-trip-time of the last successful connectivity verification for this multi-chassis ring node. If there has not been a successful connectivity verification, the value of tmnxMcrRingNodeStatsRcvRtTime is zero.
rcvPacketsTransmitted [Rcv Packets Transmitted] (tmnxMcrRingNodeStatsRcvTxReq)	long	The value of tmnxMcrRingNodeStatsRcvTxReq indicates how many valid connectivity verification messages were transmitted to this multi-chassis ring node.
<p>MultiChassisRingStats MIB entry name: tmnxMcrRingStatsEntry Entry description: Each row entry in the tmnxMcrRingStatsTable represents additional columns of operational data for a ring that participates in a multi-chassis operation with a given peer. Table description (for tmnxMcrRingStatsTable): The tmnxMcrRingStatsTable has an entry for each multi-chassis ring that participates in a multi-chassis configuration for the indicated peer. Supports realtime plotting Supports scheduled collection Monitored class: multichassis.MultiChassisRing</p>		
opaquePacketsReceivedDelivered [Opaque Packets Received Delivered] (tmnxMcrRingStatsRxOpaqueDelivrd)	long	The value of tmnxMcrRingStatsRxOpaqueDelivrd indicates how many valid opaque signalling messages were received from the peer and delivered for this multi-chassis ring.
opaquePacketsReceivedNoDestination [Opaque Packets Received No Destination] (tmnxMcrRingStatsRxOpaqueNoDest)	long	The value of tmnxMcrRingStatsRxOpaqueNoDest indicates how many valid opaque signalling messages were received from the peer and for which no destination could be found.
opaquePacketsTransmitted [Opaque Packets Transmitted] (tmnxMcrRingStatsTxOpaque)	long	The value of tmnxMcrRingStatsTxOpaque indicates how many valid opaque signalling messages were transmitted to the peer for this multi-chassis ring.

Table 842 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapsChangedPacketsReceived [Saps Changed Packets Received] (tmnxMcrRingStatsRxSapsChanged)	long	The value of tmnxMcrRingStatsRxSapsChanged indicates how many valid 'SAPs changed info' signalling messages were received from the peer for this multi-chassis ring.
sapsChangedPacketsTransmitted [Saps Changed Packets Transmitted] (tmnxMcrRingStatsTxSapsChanged)	long	The value of tmnxMcrRingStatsTxSapsChanged indicates how many valid 'SAPs changed info' signalling messages were transmitted to the peer for this multi-chassis ring.

Table 843 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
sgiSnmpInGetBulks [Sgi Snmp In Get Bulks] (sgiSnmpInGetBulks)	long	The value of sgiSnmpInGetBulks indicates the total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.

Table 843 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.

Table 843 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 844 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: tmnxOspfAreaEntry</p> <p>Entry description: The tmnxOspfAreaEntry contains information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for tmnxOspfAreaTable): The tmnxOspfAreaTable contains information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
nssaTranslatorEvents [Nssa Translator Events] (tmnxOspfAreaNssaTranslatorEvents)	long	The value of tmnxOspfAreaNssaTranslatorEvents indicates the number of Translator State changes that have occurred since the last boot-up.
totalLSACount [Total LSACount] (tmnxOspfAreaScopeLsaCount)	long	The value of tmnxOspfAreaScopeLsaCount indicates the total number of Area-Scope link state advertisements in this area's link-state database.
totalSpfRuns [Total Spf Runs] (tmnxOspfAreaSpfRuns)	long	The value of tmnxOspfAreaSpfRuns indicates the number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
totalUnknownLSACount [Total Unknown LSACount] (tmnxOspfAreaScopeUnkLsaCount)	long	The value of tmnxOspfAreaScopeUnkLsaCount indicates the total number of unknown Area-Scope link-state advertisements in this area's link-state database.

Table 844 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaSiteLfaStats</p> <p>MIB entry name: tmnxOspfLfaStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfLfaStatsTable represents information on LFA coverage for a given OSPF area</p> <p>Table description (for tmnxOspfLfaStatsTable): The tmnxOspfLfaStatsTable maintains information on loopfree-alternate (LFA) coverage for each instance of OSPF protocol.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
ospfLfaCoverage [Ospf Lfa Coverage] (tmnxOspfLfaCoverage)	long	The value of tmnxOspfLfaCoverage indicates how much LFA coverage is being obtained for the set of available LFA eligible nodes.
ospfLfaNodesCovered [Ospf Lfa Nodes Covered] (tmnxOspfLfaNodesCovered)	long	The value of tmnxOspfLfaNodesCovered indicates in absolute numbers the number of nodes for which an LFA is found.
ospfLfaPrefixCoverage [Ospf Lfa Prefix Coverage] (tmnxOspfLfaPfxCoverage)	long	The value of tmnxOspfLfaPfxCoverage indicates how much LFA prefix coverage is being obtained for the set of available LFA eligible prefixes.
ospfLfaPrefixCovered [Ospf Lfa Prefix Covered] (tmnxOspfLfaPfxCovered)	long	The value of tmnxOspfLfaPfxCovered indicates in absolute numbers the number of prefixes for which an LFA is found.
ospfLfaTotalNodes [Ospf Lfa Total Nodes] (tmnxOspfLfaTotalNodes)	long	The value of tmnxOspfLfaTotalNodes indicates in absolute numbers the number of nodes eligible for LFA calculation.
ospfLfaTotalPrefix [Ospf Lfa Total Prefix] (tmnxOspfLfaTotalPfx)	long	The value of tmnxOspfLfaTotalPfx indicates in absolute numbers the number of prefixes eligible for LFA calculation.

Table 844 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceGeneralStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (tmnxOspfNgIfEvents)	long	The value of tmnxOspfNgIfEvents indicates the number of times this OSPF interface has changed its state, or an error has occurred.
<p>InterfaceReceiveStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 844 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfNgIfRxBadChecksums)	long	The value of tmnxOspfNgIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
InterfaceStatusStats MIB entry name: tmnxOspfNgIfStatsEntry Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface. Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface. Supports realtime plotting Supports scheduled collection Monitored class: ospf.Interface		
authorizationFailures [Authorization Failures] (tmnxOspfNgIfAuthFailures)	long	The value of tmnxOspfNgIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.

Table 844 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfNglfBadAreas)	long	The value of tmnxOspfNglfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfNglfBadAuthTypes)	long	The value of tmnxOspfNglfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfNglfBadDeadIntervals)	long	The value of tmnxOspfNglfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfNglfBadDstAddrs)	long	The value of tmnxOspfNglfBadDstAddrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfNglfBadHelloIntervals)	long	The value of tmnxOspfNglfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfNglfBadLengths)	long	The value of tmnxOspfNglfBadLengths indicates the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfNglfBadNeighbors)	long	The value of tmnxOspfNglfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.

Table 844 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNetworks [Bad Networks] (tmnxOspfNgIfBadNetworks)	long	The value of tmnxOspfNgIfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfNgIfBadOptions)	long	The value of tmnxOspfNgIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this interface or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfNgIfBadPacketTypes)	long	The value of tmnxOspfNgIfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfNgIfBadVersions)	long	The value of tmnxOspfNgIfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
badVirtualLinks [Bad Virtual Links] (tmnxOspfNgIfBadVirtualLinks)	long	The value of tmnxOspfNgIfBadVirtualLinks indicates the total number of OSPF packets received on this interface that are destined to a virtual link that does not exist since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfNgIfDiscardPackets)	long	The value of tmnxOspfNgIfDiscardPackets indicates the total number of OSPF packets discarded on this interface since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfNgIfRetransmitOuts)	long	The value of tmnxOspfNgIfRetransmitOuts indicates the total number of OSPF Retransmits sent on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 844 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceTransmitStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
