statePacketsTransmitted [State Packets Transmitted] (tmnxMcLagLagStatsPktsTxState)	long	The value of tmnxMcLagLagStatsPktsTxState indicates how many MC-Lag control packets of type lag state were sent on this system to the peer for this lag.

Table 138 Ldp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats</p> <p>MIB entry name: vRtrLdpNgInetIfStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Interface for given Inet address family. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpNgSessionStatsEntry.</p> <p>Table description (for vRtrLdpNgInetIfStatsTable): The vRtrLdpNgInetIfStatsTable is a read-only table. The purpose of this table is to keep statistical information about the LDP Interfaces for given Inet address family on this LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgInetIfTable, and the augmenting table, vRtrLdpNgInetIfStatsTable. This in effect extends the vRtrLdpNgInetIfTable with additional columns. Creation or deletion of a row in the vRtrLdpNgInetIfTable results in the same fate for the row in the vRtrLdpNgInetIfStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ldp.Interface</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpNgInetIfStatsExistingAdj)	long	The value of vRtrLdpNgInetIfStatsExistingAdj indicates a count of the total active adjacencies on this LDP interface for given Inet address family.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SessionStats</p> <p>MIB entry name: vRtrLdpNgSessionStatsEntry</p> <p>Entry description: A row in this table represents statistical information about a single session between an LDP entity and an LDP Peer.</p> <p>Table description (for vRtrLdpNgSessionStatsTable): The vRtrLdpNgSessionStatsTable is a read-only table. The purpose of this table is to keep statistical information about a single session between an LDP entity and an LDP Peer. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgSessionTable, and the augmenting table, vRtrLdpNgSessionStatsTable. This in effect extends the vRtrLdpNgSessionTable with additional columns. Creation or deletion of a row in the vRtrLdpNgSessionTable results in the same fate for the row in the vRtrLdpNgSessionStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ldp.Session</p>		
addressMessagesReceived [Address Messages Received] (vRtrLdpNgSessStatsAddrIn)	long	The value of vRtrLdpNgSessStatsAddrIn counts the number of Address Messages that have been received during this session.
addressMessagesSent [Address Messages Sent] (vRtrLdpNgSessStatsAddrOut)	long	The value of vRtrLdpNgSessStatsAddrOut counts the number of Address Messages that have been sent during this session.
addressWithdrawMessagesReceived [Address Withdraw Messages Received] (vRtrLdpNgSessStatsAddrWithdrIn)	long	The value of vRtrLdpNgSessStatsAddrWithdrIn counts the number of Address Withdraw Messages that have been received during this session.
addressWithdrawMessagesSent [Address Withdraw Messages Sent] (vRtrLdpNgSessStatsAddrWithdrOut)	long	The value of vRtrLdpNgSessStatsAddrWithdrOut counts the number of Address Withdraw Messages that have been sent during this session.
capabilityMessageIn [Capability Message In] (vRtrLdpNgSessStatsCapabilityIn)	long	The value of vRtrLdpNgSessStatsCapabilityIn counts the number of Capability Messages that have been received during this session.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
capabilityMessageOut [Capability Message Out] (vRtrLdpNgSessStatsCapabilityOut)	long	The value of vRtrLdpNgSessStatsCapabilityOut counts the number of Capability Messages that have been sent during this session.
helloMessagesReceived [Hello Messages Received] (vRtrLdpNgSessStatsHelloIn)	long	The value of vRtrLdpNgSessStatsHelloIn counts the number of Hello Messages that have been received during this session.
helloMessagesSent [Hello Messages Sent] (vRtrLdpNgSessStatsHelloOut)	long	The value of vRtrLdpNgSessStatsHelloOut counts the number of Hello Messages that have been sent during this session.
initMessagesReceived [Init Messages Received] (vRtrLdpNgSessStatsInitIn)	long	The value of vRtrLdpNgSessStatsInitIn counts the number of Init Messages that have been received during this session.
initMessagesSent [Init Messages Sent] (vRtrLdpNgSessStatsInitOut)	long	The value of vRtrLdpNgSessStatsInitOut counts the number of Init Messages that have been sent during this session.
ipv4AddrReceived [Ipv 4 Addr Received] (vRtrLdpNgSessStatsIPv4AddrRcv)	long	The value of vRtrLdpNgSessStatsIPv4AddrRcv counts the number of IPv4 local addresses received for this session.
ipv4AddrSent [Ipv 4 Addr Sent] (vRtrLdpNgSessStatsIPv4AddrSent)	long	The value of vRtrLdpNgSessStatsIPv4AddrSent counts the number of IPv4 local addresses sent for this session.
ipv4P2mpFecReceived [Ipv 4 P2 mp Fec Received] (vRtrLdpNgSessStatsIPv4P2MPFecRcv)	long	The value of vRtrLdpNgSessStatsIPv4P2MPFecRcv counts the number of IPv4 P2MP FECs received for this session.
ipv4P2mpFecSent [Ipv 4 P2 mp Fec Sent] (vRtrLdpNgSessStatsIPv4P2MPFecSnt)	long	The value of vRtrLdpNgSessStatsIPv4P2MPFecSnt counts the number of IPv4 P2MP FECs sent for this session.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ipv4PfxFecReceived [Ipv 4 Pfx Fec Received] (vRtrLdpNgSessStatsIPv4PfxFecRcv)	long	The value of vRtrLdpNgSessStatsIPv4PfxFecRcv counts the number of IPv4 prefix FECs received for this session.
ipv4PfxFecSent [Ipv 4 Pfx Fec Sent] (vRtrLdpNgSessStatsIPv4PfxFecSnt)	long	The value of vRtrLdpNgSessStatsIPv4PfxFecSnt counts the number of IPv4 prefix FECs sent for this session.
ipv6AddrReceived [Ipv 6 Addr Received] (vRtrLdpNgSessStatsIPv6AddrRcv)	long	The value of vRtrLdpNgSessStatsIPv6AddrRcv counts the number of IPv6 local addresses received for this session.
ipv6AddrSent [Ipv 6 Addr Sent] (vRtrLdpNgSessStatsIPv6AddrSnt)	long	The value of vRtrLdpNgSessStatsIPv6AddrSnt counts the number of IPv6 local addresses sent for this session.
ipv6P2mpFecReceived [Ipv 6 P2 mp Fec Received] (vRtrLdpNgSessStatsIPv6P2MPFecRcv)	long	The value of vRtrLdpNgSessStatsIPv6P2MPFecRcv counts the number of IPv6 P2MP FECs received for this session.
ipv6P2mpFecSent [Ipv 6 P2 mp Fec Sent] (vRtrLdpNgSessStatsIPv6P2MPFecSnt)	long	The value of vRtrLdpNgSessStatsIPv6P2MPFecSnt counts the number of IPv6 P2MP FECs sent for this session.
ipv6PfxFecReceived [Ipv 6 Pfx Fec Received] (vRtrLdpNgSessStatsIPv6PfxFecRcv)	long	The value of vRtrLdpNgSessStatsIPv6PfxFecRcv counts the number of IPv6 prefix FECs received for this session.
ipv6PfxFecSent [Ipv 6 Pfx Fec Sent] (vRtrLdpNgSessStatsIPv6PfxFecSnt)	long	The value of vRtrLdpNgSessStatsIPv6PfxFecSnt counts the number of IPv6 prefix FECs sent for this session.
keepAliveMessagesReceived [Keep Alive Messages Received] (vRtrLdpNgSessStatsKeepaliveIn)	long	The value of vRtrLdpNgSessStatsKeepaliveIn counts the number of Keepalive Messages that have been received during this session.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAliveMessagesSent [Keep Alive Messages Sent] (vRtrLdpNgSessStatsKeepaliveOut)	long	The value of vRtrLdpNgSessStatsKeepaliveOut counts the number of Keepalive Messages that have been sent during this session.
labelAbortsReceived [Label Aborts Received] (vRtrLdpNgSessStatsLblAbortIn)	long	The value of vRtrLdpNgSessStatsLblAbortIn counts the number of Label Abort Messages that have been received during this session.
labelAbortsSent [Label Aborts Sent] (vRtrLdpNgSessStatsLblAbortOut)	long	The value of vRtrLdpNgSessStatsLblAbortOut counts the number of Label Abort Messages that have been sent during this session.
labelMappingsReceived [Label Mappings Received] (vRtrLdpNgSessStatsLblMappingIn)	long	The value of vRtrLdpNgSessStatsLblMappingIn counts the number of Label Mapping Messages that have been received during this session.
labelMappingsSent [Label Mappings Sent] (vRtrLdpNgSessStatsLblMappingOut)	long	The value of vRtrLdpNgSessStatsLblMappingOut counts the number of Label Mapping Messages that have been sent during this session.
labelReleasesReceived [Label Releases Received] (vRtrLdpNgSessStatsLblReleaseIn)	long	The value of vRtrLdpNgSessStatsLblReleaseIn counts the number of Label Release Messages that have been received during this session.
labelReleasesSent [Label Releases Sent] (vRtrLdpNgSessStatsLblReleaseOut)	long	The value of vRtrLdpNgSessStatsLblReleaseOut counts the number of Label Release Messages that have been sent during this session.
labelRequestsReceived [Label Requests Received] (vRtrLdpNgSessStatsLblRequestIn)	long	The value of vRtrLdpNgSessStatsLblRequestIn counts the number of Label Request Messages that have been received during this session.
labelRequestsSent [Label Requests Sent] (vRtrLdpNgSessStatsLblRequestOut)	long	The value of vRtrLdpNgSessStatsLblRequestOut counts the number of Label Request Messages that have been sent during this session.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
labelWithdrawsReceived [Label Withdraws Received] (vRtrLdpNgSessStatsLblWithdrawIn)	long	The value of vRtrLdpNgSessStatsLblWithdrawIn counts the number of Label Withdraw Messages that have been received during this session.
labelWithdrawsSent [Label Withdraws Sent] (vRtrLdpNgSessStatsLblWithdrawOut)	long	The value of vRtrLdpNgSessStatsLblWithdrawOut counts the number of Label Withdraw Messages that have been sent during this session.
linkAdjacencies [Link Adjacencies] (vRtrLdpNgSessStatsLinkAdj)	long	The value of vRtrLdpNgSessStatsLinkAdj indicates the number of link adjacencies for this session.
notificationMessagesReceived [Notification Messages Received] (vRtrLdpNgSessStatsNotifIn)	long	The value of vRtrLdpNgSessStatsNotifIn counts the number of Notification Messages that have been received during this session.
notificationMessagesSent [Notification Messages Sent] (vRtrLdpNgSessStatsNotifOut)	long	The value of vRtrLdpNgSessStatsNotifOut counts the number of Notification Messages that have been sent during this session.
svcFec128Received [Svc Fec 128 Received] (vRtrLdpNgSessStatsSvcFec128Recv)	long	The value of vRtrLdpNgSessStatsSvcFec128Recv counts the number of service FEC 128 received for this session.
svcFec128Sent [Svc Fec 128 Sent] (vRtrLdpNgSessStatsSvcFec128Sent)	long	The value of vRtrLdpNgSessStatsSvcFec128Sent counts the number of service FEC 128 sent for this session.
svcFec129Received [Svc Fec 129 Received] (vRtrLdpNgSessStatsSvcFec129Recv)	long	The value of vRtrLdpNgSessStatsSvcFec129Recv counts the number of service FEC 129 received for this session.
svcFec129Sent [Svc Fec 129 Sent] (vRtrLdpNgSessStatsSvcFec129Sent)	long	The value of vRtrLdpNgSessStatsSvcFec129Sent counts the number of service FEC 129 sent for this session.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
targetedAdjacencies [Targeted Adjacencies] (vRtrLdpNgSessStatsTargAdj)	long	The value of vRtrLdpNgSessStatsTargAdj indicates the number of targeted adjacencies for this session.
<p>SiteStats</p> <p>MIB entry name: vLdpNgStatsEntry</p> <p>Entry description: A row in this table represents statistical information about an LDP instance.</p> <p>Table description (for vLdpNgStatsTable): vLdpNgStatsTable is a read-only table. The purpose of this table is to keep statistical information about an LDP Instance. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgGeneralTable, and the augmenting table, vLdpNgStatsTable. This in effect extends the vRtrLdpNgGeneralTable with additional columns. Creation or deletion of a row in the vRtrLdpNgGeneralTable results in the same fate for the row in the vLdpNgStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ldp.Site</p>		
activeAdjacencies [Active Adjacencies] (vLdpNgStatsIPv4ActiveLinkAdj)	long	The value of vLdpNgStatsIPv4ActiveLinkAdj specifies the number of active IPv4 link adjacencies (i.e. established adjacencies) associated with the LDP instance.
activeInterfaces [Active Interfaces] (vLdpNgStatsIPv4ActiveIf)	long	The value of vLdpNgStatsIPv4ActiveIf specifies the number of active (i.e. operationally up) IPv4 interfaces associated with the LDP instance.
activeSessions [Active Sessions] (vLdpNgStatsIPv4ActiveSess)	long	The value of vLdpNgStatsIPv4ActiveSess specifies the number of active IPv4 sessions (i.e. session in some form of creation) associated with the LDP instance.
activeTargetedSessions [Active Targeted Sessions] (vLdpNgStatsIPv4ActiveTargPeers)	long	The value of vLdpNgStatsIPv4ActiveTargPeers specifies the number of configured IPv4 targeted peers that are administratively up in an LDP instance.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
addressFECsReceived [Address FECs Received] (vLdpNgStatsIPv4PfxFecRecv)	long	The value of vLdpNgStatsIPv4PfxFecRecv specifies the number of IPv4 Address FECs received by the LDP instance from its neighbors.
addressFECsSent [Address FECs Sent] (vLdpNgStatsIPv4PfxFecSent)	long	The value of vLdpNgStatsIPv4PfxFecSent specifies the number of IPv4 Address FECs sent by the LDP instance to its neighbors.
attemptedSessions [Attempted Sessions] (vLdpNgStatsIPv4AttemptedSessions)	long	The value of vLdpNgStatsIPv4AttemptedSessions specifies the total number of attempted IPv4 sessions for this LDP instance.
badLdpIdentifierErrors [Bad Ldp Identifier Errors] (vLdpNgStatsBadLdpIdErrors)	long	The value of vLdpNgStatsBadLdpIdErrors gives the number of Bad LDP Identifier Fatal Errors detected for sessions associated with this LDP instance.
badMessageLengthErrors [Bad Message Length Errors] (vLdpNgStatsBadMsgLengthErrors)	long	The value of vLdpNgStatsBadMsgLengthErrors gives the number of Bad Message Length Fatal Errors detected for sessions associated with this LDP instance.
badPduLengthErrors [Bad Pdu Length Errors] (vLdpNgStatsBadPduLengthErrors)	long	The value of vLdpNgStatsBadPduLengthErrors gives the number of Bad Pdu Length Fatal Errors detected for sessions associated with this LDP instance.
badTlvLengthErrors [Bad Tlv Length Errors] (vLdpNgStatsBadTlvLengthErrors)	long	The value of vLdpNgStatsBadTlvLengthErrors gives the number of Bad TLV Length Fatal Errors detected for sessions associated with this LDP instance.
inactiveInterfaces [Inactive Interfaces] (vLdpNgStatsIPv4Inactifelf)	long	The value of vLdpNgStatsIPv4Inactifelf specifies the number of inactive (i.e. operationally down) IPv4 interfaces associated with the LDP instance.
inactiveTargetedSessions [Inactive Targeted Sessions] (vLdpNgStatsIPv6ActiveTargPeers)	long	The value of vLdpNgStatsIPv6ActiveTargPeers specifies the number of configured IPv6 targeted peers that are administratively up in an LDP instance.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAliveExpiredErrors [Keep Alive Expired Errors] (vLdpNgStatsKeepAliveExpErrors)	long	The value of vLdpNgStatsKeepAliveExpErrors gives the number of Session Keep Alive Timer Expired Errors detected for sessions associated with this LDP instance.
malformedTlvValueErrors [Malformed Tlv Value Errors] (vLdpNgStatsMalformedTlvErrors)	long	The value of vLdpNgStatsMalformedTlvErrors gives the number of Malformed TLV Value Fatal Errors detected for sessions associated with this LDP instance.
operDownEvents [Oper Down Events] (vLdpNgStatsIPv4OperDownEvents)	long	The value of vLdpNgStatsIPv4OperDownEvents specifies the number of times the IPv4 LDP instance has gone operationally down since the instance was created.
serviceFECsReceived [Service FECs Received] (vLdpNgStatsFec128FecRecv)	long	The value of vLdpNgStatsFec128FecRecv specifies the number of Pseudo wire ID FECs received by the LDP instance from its neighbors.
serviceFECsSent [Service FECs Sent] (vLdpNgStatsFec128FecSent)	long	The value of vLdpNgStatsFec128FecSent specifies the number of Pseudo wire ID FECs sent by the LDP instance to its neighbors.
sessionRejectedAdvertisementModeErrors [Session Rejected Advertisement Mode Errors] (vLdpNgStatsSessRejAdvErrors)	long	The value of vLdpNgStatsSessRejAdvErrors gives the total number of Session Rejected/Parameters Advertisement Mode Error Notification Messages sent or received by this LDP instance.
sessionRejectedLabelRangeErrors [Session Rejected Label Range Errors] (vLdpNgStatsSessRejLblRngeErrs)	long	The value of vLdpNgStatsSessRejLblRngeErrs gives the total number of Session Rejected/Parameters Label Range Error Notification Messages sent or received by this LDP instance.
sessionRejectedMaxPduLengthErrors [Session Rejected Max Pdu Length Errors] (vLdpNgStatsSessRejMaxPduErrs)	long	The value of vLdpNgStatsSessRejMaxPduErrs gives the total number of Session Rejected/Parameters Max Pdu Length Error Notification Messages sent or received by this LDP instance.

Table 138 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionRejectedNoHelloErrors [Session Rejected No Hello Errors] (vLdpNgStatsSessRejNoHelloErrs)	long	The value of vLdpNgStatsSessRejNoHelloErrs gives the total number of Session Rejected/No Hello Error Notification Messages sent or received by this LDP instance.
shutdownNotificationsReceived [Shutdown Notifications Received] (vLdpNgStatsShutdownNotifRecv)	long	The value of vLdpNgStatsShutdownNotifRecv gives the number of Shutdown Notifications received related to sessions associated with this LDP instance.
shutdownNotificationsSent [Shutdown Notifications Sent] (vLdpNgStatsShutdownNotifSent)	long	The value of vLdpNgStatsShutdownNotifSent gives the number of Shutdown Notifications sent related to sessions associated with this LDP instance.
<p>TargetedPeerStats</p> <p>MIB entry name: vRtrLdpNgTargPeerStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Targeted peer. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpNgSessionStatsEntry.</p> <p>Table description (for vRtrLdpNgTargPeerStatsTable): The vRtrLdpNgTargPeerStatsTable is a read-only table. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgTargPeerTable, and the augmenting table, vRtrLdpNgTargPeerStatsTable. This in effect extends the vRtrLdpNgTargPeerTable with additional columns. Creation or deletion of a row in the vRtrLdpNgTargPeerTable results in the same fate for the row in the vRtrLdpNgTargPeerTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.TargetedPeer</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpNgTargPeerStatExistingAdj)	long	The value of vRtrLdpNgTargPeerStatExistingAdj indicates a count of the total active adjacencies with this targeted peer.

Table 139 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 139 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: tmnxLldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports and destination MAC addresses. Entries are not required to exist in this table while the tmnxLldpPortCfgAdminStatus object is equal to 'disabled(4)'. Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration</p>		

Table 139 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (tmnxLldpStatsRxPortAgeouts)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in tmnxLldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the tmnxLldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial ageing is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (tmnxLldpStatsRxPortFrameDiscard)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (tmnxLldpStatsRxPortFrameErrs)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (tmnxLldpStatsRxPortFrames)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 139 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (tmnxLldpStatsRxPortTLVDiscard)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
lldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (tmnxLldpStatsRxPortTLVUnknown)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2004. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats MIB entry name: tmnxLldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port and destination MAC address. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsTxPortTable): A table containing LLDP transmission statistics for individual port/destination address combinations. Entries are not required to exist in this table while the tmnxLldpPortConfigEntry object is equal to 'disabled(4)'. Supports realtime plotting Supports scheduled collection Monitored class: lldp.LLDPConfiguration</p>		
lldpStatsTxLLDPDULengthErrs [Lldp Stats Tx LLDPDULength Errs] (tmnxLldpStatsTxLLDPDULengthErrs)	long	The number of LLDPD Length Errors recorded for the Port.
lldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (tmnxLldpStatsTxPortFrames)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 140 mpls statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DynamicLspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp 		
configuredPaths [Configured Paths] (vRtrMplsLspConfiguredPaths)	long	The number of paths configured for this LSP.
operationalPaths [Operational Paths] (vRtrMplsLspOperationalPaths)	long	The number of operational paths for this LSP. This includes the path currently active, as well as operational standby paths.
pathChanges [Path Changes] (vRtrMplsLspPathChanges)	long	The number of path changes this LSP has had. For every path change (path down, path up, path change), a corresponding syslog/trap (if enabled) is generated for it.
standbyPaths [Standby Paths] (vRtrMplsLspStandbyPaths)	long	The number of standby paths configured for this LSP.
timeSinceLastPathChange [Time Since Last Path Change] (vRtrMplsLspLastPathChange)	long	The time in 10-millisecond units since the last change occurred on this LSP.

Table 140 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastPrimaryUpState [Time Since Last Primary Up State] (vRtrMplsLspPrimaryTimeUp)	long	The total time in 10-millisecond units that this LSP's primary path has been operational. For example, the percentage contribution of the primary path to the operational time is given by (vRtrMplsLspPrimaryTimeUp/vRtrMplsLspTimeUp * 100) %.
<p>LspPathStats</p> <p>MIB entry name: vRtrMplsLspPathStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspPathStatTable): The vRtrMplsLspPathStatTable has an entry for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.LspPath</p>		
cspfQueries [Cspf Queries] (vRtrMplsLspPathCspfQueries)	long	The value of vRtrMplsLspPathCspfQueries specifies the number of CSPF queries that have been made for this LSP path.
retryAttempts [Retry Attempts] (vRtrMplsLspPathRetryAttempts)	long	The number of unsuccessful attempts which have been made to signal this path. As soon as the path gets signalled, this is set to 0.
timeDown [Time Down] (vRtrMplsLspPathTimeDown)	long	The total time in 10-millisecond units that this LSP Path has not been operational.
timeUp [Time Up] (vRtrMplsLspPathTimeUp)	long	The total time in 10-millisecond units that this LSP path has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspPathTimeUp/vRtrMplsLspAge * 100 %).

Table 140 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitionCount [Transition Count] (vRtrMplsLspPathTransitionCount)	long	The object vRtrMplsLspPathTransitionCount maintains the number of transitions that have occurred for this LSP.
<p>LspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.BypassOnlyLsp • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp • mpls.StaticLsp 		
age [Age] (vRtrMplsLspAge)	long	The age (i.e., time from creation till now) of this LSP in 10-millisecond periods.
timeSinceLastDownState [Time Since Last Down State] (vRtrMplsLspTimeDown)	long	The total time in 10-millisecond units that this LSP has not been operational.
timeSinceLastTransition [Time Since Last Transition] (vRtrMplsLspLastTransition)	long	The time in 10-millisecond units since the last transition occurred on this LSP.
timeSinceLastUpState [Time Since Last Up State] (vRtrMplsLspTimeUp)	long	The total time in 10-millisecond units that this LSP has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspTimeUp/ vRtrMplsLspAge * 100 %).

Table 140 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitions [Transitions] (vRtrMplsLspTransitions)	long	The number of state transitions (up -> down and down -> up) this LSP has undergone.
<p>MplsInterfaceStats MIB entry name: vRtrMplsIfStatEntry Entry description: Each row entry represents a collection of statistics for an interface on this virtual router that participates in the MPLS protocol. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrMplsIfStatTable): The vRtrMplsIfStatTable has an entry for each router interface configured for MPLS in the system. Supports realtime plotting Supports scheduled collection Monitored class: mpls.Interface</p>		
receiveOctets [Receive Octets] (vRtrMplsIfRxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets received on this interface.
receivePackets [Receive Packets] (vRtrMplsIfRxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets received on this interface.
transmitOctets [Transmit Octets] (vRtrMplsIfTxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets transmitted on this interface.
transmitPackets [Transmit Packets] (vRtrMplsIfTxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets transmitted from this interface.

Table 140 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteStats</p> <p>MIB entry name: vRtrMplsGeneralStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an instance of the MPLS protocol running within a virtual router. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsGeneralStatTable): The vRtrMplsGeneralStatTable contains statistics for an MPLS protocol instance within a virtual router.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.Site</p>		
detourOriginate [Detour Originate] (vRtrMplsGeneralDetourLspOriginate)	long	The value of vRtrMplsGeneralDetourLspOriginate indicates the number of detour LSPs that originate at this virtual router.
detourTerminate [Detour Terminate] (vRtrMplsGeneralDetourLspTerminate)	long	The value of vRtrMplsGeneralDetourLspTerminate indicates the number of detour LSPs that terminate at this virtual router.
detourTransit [Detour Transit] (vRtrMplsGeneralDetourLspTransit)	long	The value of vRtrMplsGeneralDetourLspTransit indicates the number of detour LSPs that transit through this virtual router.
dynamicOriginate [Dynamic Originate] (vRtrMplsGeneralDynamicLspOriginate)	long	The value of vRtrMplsGeneralDynamicLspOriginate indicates the number of dynamic LSPs that originate at this virtual router.
dynamicTerminate [Dynamic Terminate] (vRtrMplsGeneralDynamicLspTerminate)	long	The value of vRtrMplsGeneralDynamicLspTerminate indicates the number of dynamic LSPs that terminate at this virtual router.
dynamicTransit [Dynamic Transit] (vRtrMplsGeneralDynamicLspTransit)	long	The value of vRtrMplsGeneralDynamicLspTransit indicates the number of dynamic LSPs that transit through this virtual router.

Table 140 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
staticOriginate [Static Originate] (vRtrMplsGeneralStaticLspOriginate)	long	The value of vRtrMplsGeneralStaticLspOriginate indicates the number of static LSPs that originate at this virtual router.
staticTerminate [Static Terminate] (vRtrMplsGeneralStaticLspTerminate)	long	The value of vRtrMplsGeneralStaticLspTerminate indicates the number of static LSPs that terminate at this virtual router.
staticTransit [Static Transit] (vRtrMplsGeneralStaticLspTransit)	long	The value of vRtrMplsGeneralStaticLspTransit indicates the number of static LSPs that transit through this virtual router.

Table 141 multichassis statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerStats</p> <p>MIB entry name: tmnxMcLagPeerStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a multi-chassis peer. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcLagPeerStatsTable): The tmnxMcLagPeerStatsTable has an entry for each multi-chassis peer configured on this system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • multichassis.PSSPeer • multichassis.Peer 		
configPacketsReceived [Config Packets Received] (tmnxMcLagPeerStatsPktsRxConfig)	long	The value of tmnxMcLagPeerStatsPktsRxConfig indicates how many valid MC-Lag control packets of type lag config were received on this system from the peer.
failedMD5AuthenticationPacketsDropped [Failed MD5 Authentication Packets Dropped] (tmnxMcLagPeerStatsDropMD5)	long	The value of tmnxMcLagPeerStatsDropMD5 indicates how many MC-Lag control packets were dropped on this system from the peer because the packet failed MD5 authentication.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagPeerStatsPktsTxFailed)	long	The value of tmnxMcLagPeerStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted from this system to the peer.
invalidLagIdPacketsDropped [Invalid Lag Id Packets Dropped] (tmnxMcLagPeerStatsDropTlvInvlId)	long	The value of tmnxMcLagPeerStatsDropTlvInvlId indicates how many MC-Lag control packets were dropped on this system from the peer because the packet referred to an invalid or non multi-chassis lag.
invalidSizePacketsDropped [Invalid Size Packets Dropped] (tmnxMcLagPeerStatsDropTlvInvlSz)	long	The value of tmnxMcLagPeerStatsDropTlvInvlSz indicates how many MC-Lag control packets were dropped on this system from the peer because the packet size was invalid.

Table 141 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAlivePacketsReceived [Keep Alive Packets Received] (tmnxMcLagPeerStatsPktsRxKpalive)	long	The value of tmnxMcLagPeerStatsPktsRxKpalive indicates how many valid MC-Lag control packets of type keepalive were received on this system from the peer.
keepalivePacketsTransmitted [Keepalive Packets Transmitted] (tmnxMcLagPeerStatsPktsTxKpalive)	long	The value of tmnxMcLagPeerStatsPktsTxKpalive indicates how many MC-Lag control packets of type keepalive were transmitted from this system to the peer.
outOfSequencePacketsDropped [Out Of Sequence Packets Dropped] (tmnxMcLagPeerStatsDropOutOfSeq)	long	The value of tmnxMcLagPeerStatsDropOutOfSeq indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was out of sequence.
packetsReceived [Packets Received] (tmnxMcLagPeerStatsPktsRx)	long	The value of tmnxMcLagPeerStatsPktsRx indicates how many valid MC-Lag control packets were received on this system from the peer.
packetsTransmitted [Packets Transmitted] (tmnxMcLagPeerStatsPktsTx)	long	The value of tmnxMcLagPeerStatsPktsTx indicates how many MC-Lag control packets were transmitted from this system to the peer.
peerConfigPacketsReceived [Peer Config Packets Received] (tmnxMcLagPeerStatsPktsRxPeerCfg)	long	The value of tmnxMcLagPeerStatsPktsRxPeerCfg indicates how many valid MC-Lag control packets of type peer config were received on this system from the peer.
peerConfigPacketsTransmitted [Peer Config Packets Transmitted] (tmnxMcLagPeerStatsPktsTxPeerCfg)	long	The value of tmnxMcLagPeerStatsPktsTxPeerCfg indicates how many MC-Lag control packets of type peer config were transmitted from this system to the peer.
stateDisabledPacketsDropped [State Disabled Packets Dropped] (tmnxMcLagPeerStatsDropStateDsblid)	long	The value of tmnxMcLagPeerStatsDropStateDsblid indicates how many MC-Lag control packets were dropped on this system from the peer because the peer was administratively disabled.

Table 141 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statePacketsReceived [State Packets Received] (tmnxMcLagPeerStatsPktsRxState)	long	The value of tmnxMcLagPeerStatsPktsRxState indicates how many valid MC-Lag control packets of type lag state were received on this system from the peer.
tooShortPacketsDropped [Too Short Packets Dropped] (tmnxMcLagPeerStatsDropPktTooShrt)	long	The value of tmnxMcLagPeerStatsDropPktTooShrt indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was too short.
unknownTlvPacketsDropped [Unknown Tlv Packets Dropped] (tmnxMcLagPeerStatsDropUnknownTlv)	long	The value of tmnxMcLagPeerStatsDropUnknownTlv indicates how many MC-Lag control packets were dropped on this system from the peer because the packet contained an unknown TLV.
<p>PeerSynchronizationProtocolStats MIB entry name: tmnxMcPeerSyncStatsEntry Entry description: Each row entry represents a collection of statistics for a multi-chassis synchronization protocol entry. Entries cannot be created and deleted via SNMP SET operations. Table description (for tmnxMcPeerSyncStatsTable): The tmnxMcPeerSyncStatsTable has an entry for each multi-chassis peer synchronization protocol entry. Supports realtime plotting Supports scheduled collection Monitored class: multichassis.PeerSynchronizationProtocol</p>		
bodyDecodeErrorPacketsReceived [Body Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrBody)	long	The value of tmnxMcPeerSyncPktsRxErrBody indicates the number of packets with body decode errors received from the multi-chassis peer.
dataPacketsReceived [Data Packets Received] (tmnxMcPeerSyncPktsRxData)	long	The value of tmnxMcPeerSyncPktsRxData indicates the number of hello packets received from the multi-chassis peer.
dataPacketsTransmitted [Data Packets Transmitted] (tmnxMcPeerSyncPktsTxData)	long	The value of tmnxMcPeerSyncPktsTxData indicates the number of data packets transmitted to the multi-chassis peer.

Table 141 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
erroneousPacketsReceived [Erroneous Packets Received] (tmnxMcPeerSyncPktsRxErr)	long	The value of tmnxMcPeerSyncPktsRxErr indicates the number of erroneous packets received from the multi-chassis peer.
headerDecodeErrorPacketsReceived [Header Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrHeader)	long	The value of tmnxMcPeerSyncPktsRxErrHeader indicates the number of packets with header decode errors received from the multi-chassis peer.
helloPacketsReceived [Hello Packets Received] (tmnxMcPeerSyncPktsRxHello)	long	The value of tmnxMcPeerSyncPktsRxHello indicates the number of hello packets received from the multi-chassis peer.
helloPacketsTransmitted [Hello Packets Transmitted] (tmnxMcPeerSyncPktsTxHello)	long	The value of tmnxMcPeerSyncPktsTxHello indicates the number of hello packets transmitted to the multi-chassis peer.
otherPacketsReceived [Other Packets Received] (tmnxMcPeerSyncPktsRxOther)	long	The value of tmnxMcPeerSyncPktsRxOther indicates the number of all other packet types received from the multi-chassis peer.
otherPacketsTransmitted [Other Packets Transmitted] (tmnxMcPeerSyncPktsTxOther)	long	The value of tmnxMcPeerSyncPktsTxOther indicates the number of all other packet types transmitted to the multi-chassis peer.
packetTransmissionErrors [Packet Transmission Errors] (tmnxMcPeerSyncPktsTxErr)	long	The value of tmnxMcPeerSyncPktsTxErr indicates the number of packet transmission errors.
sequenceNumberErrorPacketsReceived [Sequence Number Error Packets Received] (tmnxMcPeerSyncPktsRxErrSeqNum)	long	The value of tmnxMcPeerSyncPktsRxErrSeqNum indicates the number of packets with sequence number errors received from the multi-chassis peer.

Table 141 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPacketsReceived [Total Packets Received] (tmnxMcPeerSyncPktsRxAll)	long	The value of tmnxMcPeerSyncPktsRxAll indicates the total number of packets received from the multi-chassis peer.
totalPacketsTransmitted [Total Packets Transmitted] (tmnxMcPeerSyncPktsTxAll)	long	The value of tmnxMcPeerSyncPktsTxAll indicates the total number of packets transmitted to the multi-chassis peer.

Table 142 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
sgiSnmplnGetBulks [Sgi Snmp In Get Bulks] (sgiSnmplnGetBulks)	long	The value of sgiSnmplnGetBulks indicates the total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmplnASNParseErrs [Snmp In ASNParse Errs] (snmplnASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmplnBadCommunityNames [Snmp In Bad Community Names] (snmplnBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.

Table 142 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.

Table 142 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 143 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: tmnxOspfAreaEntry</p> <p>Entry description: The tmnxOspfAreaEntry contains information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for tmnxOspfAreaTable): The tmnxOspfAreaTable contains information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
nssaTranslatorEvents [Nssa Translator Events] (tmnxOspfAreaNssaTranslatorEvents)	long	The value of tmnxOspfAreaNssaTranslatorEvents indicates the number of Translator State changes that have occurred since the last boot-up.
totalLSACount [Total LSACount] (tmnxOspfAreaScopeLsaCount)	long	The value of tmnxOspfAreaScopeLsaCount indicates the total number of Area-Scope link state advertisements in this area's link-state database.
totalSpfRuns [Total Spf Runs] (tmnxOspfAreaSpfRuns)	long	The value of tmnxOspfAreaSpfRuns indicates the number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
totalUnknownLSACount [Total Unknown LSACount] (tmnxOspfAreaScopeUnkLsaCount)	long	The value of tmnxOspfAreaScopeUnkLsaCount indicates the total number of unknown Area-Scope link-state advertisements in this area's link-state database.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaSiteLfaStats</p> <p>MIB entry name: tmnxOspfLfaStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfLfaStatsTable represents information on LFA coverage for a given OSPF area</p> <p>Table description (for tmnxOspfLfaStatsTable): The tmnxOspfLfaStatsTable maintains information on loopfree-alternate (LFA) coverage for each instance of OSPF protocol.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
ospfLfaCoverage [Ospf Lfa Coverage] (tmnxOspfLfaCoverage)	long	The value of tmnxOspfLfaCoverage indicates how much LFA coverage is being obtained for the set of available LFA eligible nodes.
ospfLfaNodesCovered [Ospf Lfa Nodes Covered] (tmnxOspfLfaNodesCovered)	long	The value of tmnxOspfLfaNodesCovered indicates in absolute numbers the number of nodes for which an LFA is found.
ospfLfaPrefixCoverage [Ospf Lfa Prefix Coverage] (tmnxOspfLfaPfxCoverage)	long	The value of tmnxOspfLfaPfxCoverage indicates how much LFA prefix coverage is being obtained for the set of available LFA eligible prefixes.
ospfLfaPrefixCovered [Ospf Lfa Prefix Covered] (tmnxOspfLfaPfxCovered)	long	The value of tmnxOspfLfaPfxCovered indicates in absolute numbers the number of prefixes for which an LFA is found.
ospfLfaTotalNodes [Ospf Lfa Total Nodes] (tmnxOspfLfaTotalNodes)	long	The value of tmnxOspfLfaTotalNodes indicates in absolute numbers the number of nodes eligible for LFA calculation.
ospfLfaTotalPrefix [Ospf Lfa Total Prefix] (tmnxOspfLfaTotalPfx)	long	The value of tmnxOspfLfaTotalPfx indicates in absolute numbers the number of prefixes eligible for LFA calculation.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceGeneralStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (tmnxOspfNgIfEvents)	long	The value of tmnxOspfNgIfEvents indicates the number of times this OSPF interface has changed its state, or an error has occurred.
<p>InterfaceReceiveStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfNgIfRxBadChecksums)	long	The value of tmnxOspfNgIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
<p>InterfaceStatusStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
authorizationFailures [Authorization Failures] (tmnxOspfNgIfAuthFailures)	long	The value of tmnxOspfNgIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfNglfBadAreas)	long	The value of tmnxOspfNglfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfNglfBadAuthTypes)	long	The value of tmnxOspfNglfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfNglfBadDeadIntervals)	long	The value of tmnxOspfNglfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfNglfBadDstAddrs)	long	The value of tmnxOspfNglfBadDstAddrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfNglfBadHelloIntervals)	long	The value of tmnxOspfNglfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfNglfBadLengths)	long	The value of tmnxOspfNglfBadLengths indicates the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfNglfBadNeighbors)	long	The value of tmnxOspfNglfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNetworks [Bad Networks] (tmnxOspfNglfBadNetworks)	long	The value of tmnxOspfNglfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfNglfBadOptions)	long	The value of tmnxOspfNglfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this interface or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfNglfBadPacketTypes)	long	The value of tmnxOspfNglfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfNglfBadVersions)	long	The value of tmnxOspfNglfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
badVirtualLinks [Bad Virtual Links] (tmnxOspfNglfBadVirtualLinks)	long	The value of tmnxOspfNglfBadVirtualLinks indicates the total number of OSPF packets received on this interface that are destined to a virtual link that does not exist since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfNglfDiscardPackets)	long	The value of tmnxOspfNglfDiscardPackets indicates the total number of OSPF packets discarded on this interface since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfNglfRetransmitOuts)	long	The value of tmnxOspfNglfRetransmitOuts indicates the total number of OSPF Retransmits sent on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceTransmitStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>NeighborGeneralStats</p> <p>MIB entry name: tmnxOspfNgNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgNbrStatsTable represents additional columns for statistics for an OSPF neighbor.</p> <p>Table description (for tmnxOspfNgNbrStatsTable): The tmnxOspfNgNbrStatsTable provides an extension of the tmnxOspfNgNbrTable for statistics for an OSPF neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ospf.Neighbor • ospf.OspfNeighbor 		
events [Events] (tmnxOspfNgNbrEvents)	long	The value of tmnxOspfNgNbrEvents indicates the number of times this neighbor relationship has changed state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfNgNbrLsRetransQLen)	long	The value of tmnxOspfNgNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>NeighborStatusStats</p> <p>MIB entry name: tmnxOspfNgNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgNbrStatsTable represents additional columns for statistics for an OSPF neighbor.</p> <p>Table description (for tmnxOspfNgNbrStatsTable): The tmnxOspfNgNbrStatsTable provides an extension of the tmnxOspfNgNbrTable for statistics for an OSPF neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Neighbor</p>		

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badMtus [Bad Mtus] (tmnxOspfNgNbrBadMTUs)	long	The value of tmnxOspfNgNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badNeighborStates [Bad Neighbor States] (tmnxOspfNgNbrBadNbrStates)	long	The value of tmnxOspfNgNbrBadNbrStates indicates the total number of OSPF packets received when the neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfNgNbrBadPackets)	long	The value of tmnxOspfNgNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfNgNbrBadSeqNums)	long	The value of tmnxOspfNgNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfNgNbrDuplicates)	long	The value of tmnxOspfNgNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfNgNbrLsaInstallFailed)	long	The value of tmnxOspfNgNbrLsaInstallFailed indicates the total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfNgNbrLsaNotInLsdb)	long	The value of tmnxOspfNgNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfNgNbrNumRestarts)	long	The value of tmnxOspfNgNbrNumRestarts indicates the number of times the neighbor has attempted restart.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
optionMismatches [Option Mismatches] (tmnxOspfNgNbrOptionMismatches)	long	The value of tmnxOspfNgNbrOptionMismatches indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
ShamLinkGeneralStats MIB entry name: tmnxOspfShamIfStatsEntry Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link. Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link. Supports realtime plotting Supports scheduled collection Monitored class: ospf.ShamLink		
events [Events] (tmnxOspfShamIfEvents)	long	The value of tmnxOspfShamIfEvents indicates the number of state changes or error events on this sham link.
ShamLinkReceiveStats MIB entry name: tmnxOspfShamIfStatsEntry Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link. Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link. Supports realtime plotting Supports scheduled collection Monitored class: ospf.ShamLink		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamIfRxDBDs)	long	The value of tmnxOspfShamIfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfShamIfRxBadChecksums)	long	The value of tmnxOspfShamIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
<p>ShamLinkStatusStats MIB entry name: tmnxOspfShamIfStatsEntry Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link. Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link. Supports realtime plotting Supports scheduled collection Monitored class: ospf.ShamLink</p>		

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authorizationFailures [Authorization Failures] (tmnxOspfShamIfAuthFailures)	long	The value of tmnxOspfShamIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.
badAreas [Bad Areas] (tmnxOspfShamIfBadAreas)	long	The value of tmnxOspfShamIfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfShamIfBadAuthTypes)	long	The value of tmnxOspfShamIfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfShamIfBadDeadIntervals)	long	The value of tmnxOspfShamIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfShamIfBadDstAdrs)	long	The value of tmnxOspfShamIfBadDstAdrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfShamIfBadHelloIntervals)	long	The value of tmnxOspfShamIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfShamIfBadLengths)	long	The value of tmnxOspfShamIfBadLengths indicates the total number of OSPF packets received on this sham link with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNeighbors [Bad Neighbors] (tmnxOspfShamIfBadNeighbors)	long	The value of tmnxOspfShamIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.
badNetworks [Bad Networks] (tmnxOspfShamIfBadNetworks)	long	The value of tmnxOspfShamIfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfShamIfBadOptions)	long	The value of tmnxOspfShamIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this sham link or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfShamIfBadPacketTypes)	long	The value of tmnxOspfShamIfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfShamIfBadVersions)	long	The value of tmnxOspfShamIfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfShamIfDiscardPackets)	long	The value of tmnxOspfShamIfDiscardPackets indicates the total number of OSPF packets discarded on this sham link since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfShamIfRetransmitOuts)	long	The value of tmnxOspfShamIfRetransmitOuts indicates the total number of OSPF Retransmits sent on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

<p>ShamLinkTransmitStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamIfRxDBDs)	long	The value of tmnxOspfShamIfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteStats</p> <p>MIB entry name: tmnxOspfStatisticsEntry</p> <p>Entry description: Each row entry in the tmnxOspfStatisticsTable represents additional columns for statistics for an OSPF instance.</p> <p>Table description (for tmnxOspfStatisticsTable): The tmnxOspfStatisticsTable provides an extension of the tmnxOspfGeneralTable for statistics for an OSPF instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Site</p>		
addRouteFailed [Add Route Failed] (tmnxOspfRoutesAddsFailed)	long	The value of tmnxOspfRoutesAddsFailed indicates the number of times an attempt to add a route to the Route Table Manager (RTM) failed for this OSPF instance.
cspfDroppedRequests [Cspf Dropped Requests] (tmnxOspfCSPFDroppedRequests)	long	The value of tmnxOspfCSPFDroppedRequests indicates the number of dropped CSPF requests made by the OSPF protocol.
cspfPathsFound [Cspf Paths Found] (tmnxOspfCSPFPathsFound)	long	The value of tmnxOspfCSPFPathsFound indicates the number of of paths found for the requests made to OSPF protocol.
cspfPathsNotFound [Cspf Paths Not Found] (tmnxOspfCSPFPathsNotFound)	long	The value of tmnxOspfCSPFPathsNotFound indicates the number of of paths not found for the requests made to OSPF protocol.
cspfRequests [Cspf Requests] (tmnxOspfCSPFRequests)	long	The value of tmnxOspfCSPFRequests indicates the number of CSPF requests made to the OSPF protocol.
deleteRouteFailed [Delete Route Failed] (tmnxOspfRoutesDelsFailed)	long	The value of tmnxOspfRoutesDelsFailed indicates the number of times an attempt to delete a route from the Route Table Manager (RTM) failed for this instance of OSPF.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inOverflowCount [In Overflow Count] (tmnxOspfNumTimesInOverflow)	long	The value of tmnxOspfNumTimesInOverflow indicates the count of the number of times the system was in the overflow state.
inOverloadCount [In Overload Count] (tmnxOspfNumTimesInOverload)	long	The value of tmnxOspfNumTimesInOverload indicates the count of the number of times the system was overloaded.
modifyRouteFailed [Modify Route Failed] (tmnxOspfRoutesModsFailed)	long	The value of tmnxOspfRoutesModsFailed indicates the number of times an attempt to modify a route in the Route Table Manager (RTM) failed for this instance of OSPF.
newLsasOriginated [New Lsas Originated] (tmnxOspfOriginateNewLsas)	long	The value of tmnxOspfOriginateNewLsas indicates the number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
newLsasReceived [New Lsas Received] (tmnxOspfRxNewLsas)	long	The value of tmnxOspfRxNewLsas indicates the number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
spfAttemptsFailed [Spf Attempts Failed] (tmnxOspfSpfAttemptsFailed)	long	The value of tmnxOspfSpfAttemptsFailed indicates the number of times an attempt to run SPF has failed because SPF runs have been stopped as a result of insufficient memory resources.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description

events [Events] (tmnxOspfVirtIfEvents)	long	The value of tmnxOspfVirtIfEvents indicates the number of state changes or error events on this Virtual Link
<p>VirtualLinkReceiveStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfVirtIfRxBadChecksums)	long	The value of tmnxOspfVirtIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
<p>VirtualLinkStatusStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
authorizationFailures [Authorization Failures] (tmnxOspfVirtIfAuthFailures)	long	The value of tmnxOspfVirtIfAuthFailures indicates the total number of OSPF packets received on this virtual interface with invalid authentication keys.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfVirtIfBadAreas)	long	The value of tmnxOspfVirtIfBadAreas indicates the total number of OSPF packets received on this virtual interface with area mismatches.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfVirtIfBadAuthTypes)	long	The value of tmnxOspfVirtIfBadAuthTypes indicates the total number of OSPF packets received on this virtual interface with invalid authentication types.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfVirtIfBadDeadIntervals)	long	The value of tmnxOspfVirtIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfVirtIfBadDstAddrs)	long	The value of tmnxOspfVirtIfBadDstAddrs indicates the total number of OSPF packets received on this virtual interface with invalid destination IP address.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfVirtIfBadHelloIntervals)	long	The value of tmnxOspfVirtIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfVirtIfBadLengths)	long	The value of tmnxOspfVirtIfBadLengths indicates the total number of OSPF packets received on this virtual interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfVirtIfBadNeighbors)	long	The value of tmnxOspfVirtIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the configuration this router has for the neighbor.
badNetworks [Bad Networks] (tmnxOspfVirtIfBadNetworks)	long	The value of tmnxOspfVirtIfBadNetworks indicates the total number of OSPF packets received on this virtual interface with invalid network or mask fields.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badOptions [Bad Options] (tmnxOspfVirtIfBadOptions)	long	The value of tmnxOspfVirtIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this virtual interface or transit-area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfVirtIfBadPacketTypes)	long	The value of tmnxOspfVirtIfBadPacketTypes indicates the total number of OSPF packets received on this virtual interface with invalid OSPF packet types.
badVersions [Bad Versions] (tmnxOspfVirtIfBadVersions)	long	The value of tmnxOspfVirtIfBadVersions indicates the total number of OSPF packets received on this virtual interface with invalid OSPF version numbers.
discardPackets [Discard Packets] (tmnxOspfVirtIfDiscardPackets)	long	The value of tmnxOspfVirtIfDiscardPackets indicates the total number of OSPF packets discarded on this virtual interface.
retransmitOuts [Retransmit Outs] (tmnxOspfVirtIfRetransmitOuts)	long	The value of tmnxOspfVirtIfRetransmitOuts indicates the total number of OSPF packets retransmitted on this virtual interface.
<p>VirtualLinkTransmitStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
VirtualNeighborGeneralStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor		

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
events [Events] (tmnxOspfVirtNbrEvents)	long	The value of tmnxOspfVirtNbrEvents indicates the number of times this virtual link has changed its state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfVirtNbrLsRetransQLen)	long	The value of tmnxOspfVirtNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>VirtualNeighborStatusStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
badMtus [Bad Mtus] (tmnxOspfVirtNbrBadMTUs)	long	The value of tmnxOspfVirtNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfVirtNbrBadPackets)	long	The value of tmnxOspfVirtNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfVirtNbrBadSeqNums)	long	The value of tmnxOspfVirtNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 143 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badVirtualNeighborStates [Bad Virtual Neighbor States] (tmnxOspfVirtNbrBadNbrStates)	long	The value of tmnxOspfVirtNbrBadNbrStates indicates the total number of OSPF packets received when the virtual neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfVirtNbrDuplicates)	long	The value of tmnxOspfVirtNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfVirtNbrLsaInstallFail)	long	The value of tmnxOspfVirtNbrLsaInstallFail indicates the total number of times when an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfVirtNbrLsaNotInLsdb)	long	The value of tmnxOspfVirtNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfVirtNbrNumRestarts)	long	The value of tmnxOspfVirtNbrNumRestarts indicates the number of times the virtual neighbor has attempted restart since tmnxOspfAdminState was last set to 'enabled'.
optionMismatches [Option Mismatches] (tmnxOspfVirtNbrOptionMismatch)	long	The value of tmnxOspfVirtNbrOptionMismatch indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 144 pae802_1x statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PaePortAuthenticatorDiagStats</p> <p>MIB entry name: dot1xAuthDiagEntry</p> <p>Entry description: The diagnostics information for an Authenticator PAE.</p> <p>Table description (for dot1xAuthDiagTable): A table that contains the diagnostics objects for the Authenticator PAE associated with each Port. dot1xAuthAuthEapLogoffWhileAuthenticated [Dot 1 x Auth Auth Eap Logoff While Authenticated] (dot1xAuthAuthEapLogoffWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to DISCONNECTED, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapLogoffWhileAuthenticating [Dot 1 x Auth Auth Eap Logoff While Authenticating] (dot1xAuthAuthEapLogoffWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticated [Dot 1 x Auth Auth Eap Starts While Authenticated] (dot1xAuthAuthEapStartsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of an EAPOL-Start message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticating [Dot 1 x Auth Auth Eap Starts While Authenticating] (dot1xAuthAuthEapStartsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Start message being received from the Supplicant.

Table 144 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthAuthFailWhileAuthenticating [Dot 1 x Auth Auth Fail While Authenticating] (dot1xAuthAuthFailWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to HELD, as a result of the Backend Authentication state machine indicating authentication failure (authFail = TRUE).
dot1xAuthAuthReauthsWhileAuthenticated [Dot 1 x Auth Auth Reauths While Authenticated] (dot1xAuthAuthReauthsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthReauthsWhileAuthenticating [Dot 1 x Auth Auth Reauths While Authenticating] (dot1xAuthAuthReauthsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthSuccessWhileAuthenticating [Dot 1 x Auth Auth Success While Authenticating] (dot1xAuthAuthSuccessWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to AUTHENTICATED, as a result of the Backend Authentication state machine indicating successful authentication of the Supplicant (authSuccess = TRUE).
dot1xAuthAuthTimeoutsWhileAuthenticating [Dot 1 x Auth Auth Timeouts While Authenticating] (dot1xAuthAuthTimeoutsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of the Backend Authentication state machine indicating authentication timeout (authTimeout = TRUE).
dot1xAuthBackendAccessChallenges [Dot 1 x Auth Backend Access Challenges] (dot1xAuthBackendAccessChallenges)	long	Counts the number of times that the state machine receives an initial Access-Challenge packet from the Authentication server (i.e., aReq becomes TRUE, causing exit from the RESPONSE state). Indicates that the Authentication Server has communication with the Authenticator.
dot1xAuthBackendAuthFails [Dot 1 x Auth Backend Auth Fails] (dot1xAuthBackendAuthFails)	long	Counts the number of times that the state machine receives an EAP-Failure message from the Authentication Server (i.e., aFail becomes TRUE, causing a transition from RESPONSE to FAIL). Indicates that the Supplicant has not authenticated to the Authentication Server.

Table 144 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthBackendAuthSuccesses [Dot 1 x Auth Backend Auth Successes] (dot1xAuthBackendAuthSuccesses)	long	Counts the number of times that the state machine receives an EAP-Success message from the Authentication Server (i.e., aSuccess becomes TRUE, causing a transition from RESPONSE to SUCCESS). Indicates that the Supplicant has successfully authenticated to the Authentication Server.
dot1xAuthBackendNonNakResponsesFromSupplicant [Dot 1 x Auth Backend Non Nak Responses From Supplicant] (dot1xAuthBackendNonNakResponsesFromSupplicant)	long	Counts the number of times that the state machine receives a response from the Supplicant to an initial EAP-Request, and the response is something other than EAP-NAK (i.e., rxResp becomes TRUE, causing the state machine to transition from REQUEST to RESPONSE, and the response is not an EAP-NAK). Indicates that the Supplicant can respond to the Authenticator's chosen EAP-method.
dot1xAuthBackendOtherRequestsToSupplicant [Dot 1 x Auth Backend Other Requests To Supplicant] (dot1xAuthBackendOtherRequestsToSupplicant)	long	Counts the number of times that the state machine sends an EAP-Request packet (other than an Identity, Notification, Failure or Success message) to the Supplicant (i.e., executes txReq on entry to the REQUEST state). Indicates that the Authenticator chose an EAP-method.
dot1xAuthBackendResponses [Dot 1 x Auth Backend Responses] (dot1xAuthBackendResponses)	long	Counts the number of times that the state machine sends an initial Access-Request packet to the Authentication server (i.e., executes sendRespToServer on entry to the RESPONSE state). Indicates that the Authenticator attempted communication with the Authentication Server.
dot1xAuthEapLogoffsWhileConnecting [Dot 1 x Auth Eap Logoffs While Connecting] (dot1xAuthEapLogoffsWhileConnecting)	long	Counts the number of times that the state machine transitions from CONNECTING to DISCONNECTED as a result of receiving an EAPOL-Logoff message.
dot1xAuthEntersAuthenticating [Dot 1 x Auth Enters Authenticating] (dot1xAuthEntersAuthenticating)	long	Counts the number of times that the state machine transitions from CONNECTING to AUTHENTICATING, as a result of an EAP-Response/Identity message being received from the Supplicant.

Table 144 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEntersConnecting [Dot 1 x Auth Enters Connecting] (dot1xAuthEntersConnecting)	long	Counts the number of times that the state machine transitions to the CONNECTING state from any other state.
<p>PaePortAuthenticatorSessionStats MIB entry name: dot1xAuthSessionStatsEntry Entry description: The session statistics information for an Authenticator PAE. This shows the current values being collected for each session that is still in progress, or the final values for the last valid session on each port where there is no session currently active. Table description (for dot1xAuthSessionStatsTable): A table that contains the session statistics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself. Supports realtime plotting Supports scheduled collection Monitored classes: • equipment.ManagementPort • equipment.PhysicalPort</p>		
dot1xAuthSessionAuthenticMethod [Dot 1 x Auth Session Authentic Method] (dot1xAuthSessionAuthenticMethod)	int	The authentication method used to establish the session.
dot1xAuthSessionFramesRx [Dot 1 x Auth Session Frames Rx] (dot1xAuthSessionFramesRx)	long	The number of user data frames received on this Port during the session.
dot1xAuthSessionFramesTx [Dot 1 x Auth Session Frames Tx] (dot1xAuthSessionFramesTx)	long	The number of user data frames transmitted on this Port during the session.
dot1xAuthSessionOctetsRx [Dot 1 x Auth Session Octets Rx] (dot1xAuthSessionOctetsRx)	java. math. BigInteger	The number of octets received in user data frames on this Port during the session.

Table 144 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthSessionOctetsTx [Dot 1 x Auth Session Octets Tx] (dot1xAuthSessionOctetsTx)	java. math. BigInteger	The number of octets transmitted in user data frames on this Port during the session.
dot1xAuthSessionTerminateCause [Dot 1 x Auth Session Terminate Cause] (dot1xAuthSessionTerminateCause)	int	The reason for the session termination.
dot1xAuthSessionTime [Dot 1 x Auth Session Time] (dot1xAuthSessionTime)	long	The duration of the session in seconds.
<p>PaePortAuthenticatorStats MIB entry name: dot1xAuthStatsEntry Entry description: The statistics information for an Authenticator PAE. Table description (for dot1xAuthStatsTable): A table that contains the statistics objects for the Authenticator PAE associated with each Port. Supports realtime plotting Supports scheduled collection Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort 		
dot1xAuthEapLengthErrorFramesRx [Dot 1 x Auth Eap Length Error Frames Rx] (dot1xAuthEapLengthErrorFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the Packet Body Length field is invalid.
dot1xAuthEapolFramesRx [Dot 1 x Auth Eapol Frames Rx] (dot1xAuthEapolFramesRx)	long	The number of valid EAPOL frames of any type that have been received by this Authenticator.

Table 144 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEapolFramesTx [Dot 1 x Auth Eapol Frames Tx] (dot1xAuthEapolFramesTx)	long	The number of EAPOL frames of any type that have been transmitted by this Authenticator.
dot1xAuthEapolLogoffFramesRx [Dot 1 x Auth Eapol Logoff Frames Rx] (dot1xAuthEapolLogoffFramesRx)	long	The number of EAPOL Logoff frames that have been received by this Authenticator.
dot1xAuthEapolReqFramesTx [Dot 1 x Auth Eapol Req Frames Tx] (dot1xAuthEapolReqFramesTx)	long	The number of EAP Request frames (other than Rq/Id frames) that have been transmitted by this Authenticator.
dot1xAuthEapolReqIdFramesTx [Dot 1 x Auth Eapol Req Id Frames Tx] (dot1xAuthEapolReqIdFramesTx)	long	The number of EAP Req/Id frames that have been transmitted by this Authenticator.
dot1xAuthEapolRespFramesRx [Dot 1 x Auth Eapol Resp Frames Rx] (dot1xAuthEapolRespFramesRx)	long	The number of valid EAP Response frames (other than Resp/Id frames) that have been received by this Authenticator.
dot1xAuthEapolRespIdFramesRx [Dot 1 x Auth Eapol Resp Id Frames Rx] (dot1xAuthEapolRespIdFramesRx)	long	The number of EAP Resp/Id frames that have been received by this Authenticator.
dot1xAuthEapolStartFramesRx [Dot 1 x Auth Eapol Start Frames Rx] (dot1xAuthEapolStartFramesRx)	long	The number of EAPOL Start frames that have been received by this Authenticator.
dot1xAuthInvalidEapolFramesRx [Dot 1 x Auth Invalid Eapol Frames Rx] (dot1xAuthInvalidEapolFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the frame type is not recognized.
dot1xAuthLastEapolFrameVersion [Dot 1 x Auth Last Eapol Frame Version] (dot1xAuthLastEapolFrameVersion)	long	The protocol version number carried in the most recently received EAPOL frame.

Table 145 pim statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceAdditionalStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface</p>		
bootstrapExpPolicyDrops [Bootstrap Exp Policy Drops] (vRtrPimNgIfBtrExpPolicyDrops)	long	The value of vRtrPimNgIfBtrExpPolicyDrops indicates the number of Bootstrap Messages that were not transmitted on this interface because of Bootstrap export policy. PIM Bootstrap export policies are configured using bootstrap export policy objects in vRtrPimNgGenPolicyTable.
bootstrapImpPolicyDrops [Bootstrap Imp Policy Drops] (vRtrPimNgIfBtrImpPolicyDrops)	long	The value of vRtrPimNgIfBtrImpPolicyDrops indicates the number of Bootstrap Messages received on this interface but were dropped because of Bootstrap import policy. PIM Bootstrap import policies are configured using bootstrap import policy objects in vRtrPimNgGenPolicyTable.
joinPolicyDrops [Join Policy Drops] (vRtrPimNgIfJoinPolicyDrops)	long	The value of vRtrPimNgIfJoinPolicyDrops indicates the number of times the join policy match resulted in dropping PIM Join-Prune Message or one of the source group contained in the message. PIM Join policies are configured using join policy objects in vRtrPimNgGenPolicyTable.
registerPolicyDrops [Register Policy Drops] (vRtrPimNgIfRegisterPolicyDrops)	long	The value of vRtrPimNgIfRegisterPolicyDrops indicates the number of times the register policy match resulted in dropping PIM Register Message. PIM Register policies are configured using the register policy objects in vRtrPimNgGenPolicyTable.
rxBSMNoRouterAlertDrops [Rx BSMNo Router Alert Drops] (vRtrPimNgIfRxBSMNoRouterAlertDrops)	long	The value of vRtrPimNgIfRxBSMNoRouterAlertDrops indicates the number of BSM messages that were dropped because router alert option was not present.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBSMWrongIfDrops [Rx BSMWrong If Drops] (vRtrPimNgIfRxBSMWrongIfDrops)	long	The value of vRtrPimNgIfRxBSMWrongIfDrops indicates the number of BSM messages that were dropped either because they were not sent by the correct RPF neighbor or because they arrived on the wrong interface.
rxInvalidJoinPrunes [Rx Invalid Join Prunes] (vRtrPimNgIfRxInvalidJoinPrunes)	long	The value of vRtrPimNgIfRxInvalidJoinPrunes indicates the number of invalid PIM Join Prune messages received on this interface. A Join Prune message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidJoinPrune notification is sent.
rxInvalidRegisters [Rx Invalid Registers] (vRtrPimNgIfRxInvalidRegisters)	long	The value of vRtrPimNgIfRxInvalidRegisters indicates the number of invalid PIM Register messages received on this interface. A Register message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidRegister notification is sent.
rxJoinPruneErrs [Rx Join Prune Errs] (vRtrPimNgIfRxJoinPruneErrs)	long	The value of vRtrPimNgIfRxJoinPruneErrs indicates the number of errors while processing Join-Prune messages received on this interface.
rxJoinPrunes [Rx Join Prunes] (vRtrPimNgIfRxJoinPrunes)	long	The value of vRtrPimNgIfRxJoinPrunes indicates the number of PIM Join Prune messages received on this interface.
txJoinPrunes [Tx Join Prunes] (vRtrPimNgIfTxJoinPrunes)	long	The value of vRtrPimNgIfTxJoinPrunes indicates the number of PIM Join Prune messages transmitted on this interface.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface</p>		
bsmErrs [Bsm Errs] (vRtrPimNgIfTxBsmErrs)	long	The value of vRtrPimNgIfTxBsmErrs indicates the number of errors while transmitting PIM Bootstrap Messages (BSM) on this interface.
bsmPdus [Bsm Pdus] (vRtrPimNgIfTxBsmPdus)	long	The value of vRtrPimNgIfTxBsmPdus indicates the number of PIM Bootstrap Messages (BSM) transmitted on this interface.
mcacPolicyDrops [Mcac Policy Drops] (vRtrPimNgIfMcacPolicyDrops)	long	The value of the object vRtrPimNgIfMcacPolicyDrops indicates the number times a PIM Group is dropped because of applying a multicast CAC policy on this interface.
registerStopErrs [Register Stop Errs] (vRtrPimNgIfTxRegisterStopErrs)	long	The value of vRtrPimNgIfTxRegisterStopErrs indicates the number of PIM errors while trasmitting PIM Register Stop messages on this interface.
registerStops [Register Stops] (vRtrPimNgIfTxRegisterStops)	long	The value of vRtrPimNgIfTxRegisterStops indicates the number of PIM Register Stop messages transmitted on this interface.
rxAssertErrs [Rx Assert Errs] (vRtrPimNgIfRxAssertErrs)	long	The value of vRtrPimNgIfRxAssertErrs indicates the number of errors while processing Assert messages received on this interface.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxAsserts [Rx Asserts] (vRtrPimNgIfRxAsserts)	long	The value of vRtrPimNgIfRxAsserts indicates the number of PIM Assert messages received on this interface.
rxAutoRpAnnounce [Rx Auto Rp Announce] (vRtrPimNgIfRxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounce indicates the number Auto-RP announcements received on this interface.
rxAutoRpAnnounceErrs [Rx Auto Rp Announce Errs] (vRtrPimNgIfRxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounceErrs indicates the number of errors while processing Auto-RP announcements received on this interface.
rxAutoRpGenErrs [Rx Auto Rp Gen Errs] (vRtrPimNgIfRxAutoRpGenErrs)	long	The value of the object vRtrPimNgIfRxAutoRpGenErrs indicates the number of errors while processing Auto-RP messages received on this interface.
rxAutoRpMapping [Rx Auto Rp Mapping] (vRtrPimNgIfRxAutoRpMapping)	long	The value of the object vRtrPimNgIfRxAutoRpMapping indicates the number of Auto-RP mappings received on this interface.
rxAutoRpMappingErrs [Rx Auto Rp Mapping Errs] (vRtrPimNgIfRxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfRxAutoRpMappingErrs indicates the number of errors while processing Auto-RP mappings received on this interface.
rxBadChecksumDiscards [Rx Bad Checksum Discards] (vRtrPimNgIfRxBadChecksumDiscard)	long	The value of vRtrPimNgIfRxBadChecksumDiscard indicates the number of PIM messages received on this interface which were discarded because of bad checksum.
rxBadEncodings [Rx Bad Encodings] (vRtrPimNgIfRxBadEncodings)	long	The value of vRtrPimNgIfRxBadEncodings indicates the number of PIM messages with bad encodings received on this interface.
rxBadVersionDiscards [Rx Bad Version Discards] (vRtrPimNgIfRxBadVersionDiscard)	long	The value of vRtrPimNgIfRxBadVersionDiscard indicates the number of PIM messages with bad versions received on this interface.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBsmPduDrops [Rx Bsm Pdu Drops] (vRtrPimNgIfRxBsmPduDrops)	long	The value of vRtrPimNgIfRxBsmPduDrops indicates the number of Bootstrap Messages received on this interface but were dropped.
rxBsmPdus [Rx Bsm Pdus] (vRtrPimNgIfRxBsmPdus)	long	The value of vRtrPimNgIfRxBsmPdus indicates the number of Bootstrap Messages received on this interface.
rxCRPAdvNoRouterAlert [Rx CRPAdv No Router Alert] (vRtrPimNgIfRxCRPAdvNoRtrAlert)	long	The value of vRtrPimNgIfRxCRPAdvNoRtrAlert indicates the number of Candidate-RP Advertizements(C-RP-Adv) received on this interface which had no router alert option set.
rxHellos [Rx Hellos] (vRtrPimNgIfRxHellos)	long	The value of vRtrPimNgIfRxHellos indicates the number of PIM hello messages received on this interface.
rxHellosDropped [Rx Hellos Dropped] (vRtrPimNgIfRxHellosDropped)	long	The value of vRtrPimNgIfRxHellosDropped indicates the number of PIM Hello messages which were received on this interface but were dropped.
rxNbrUnknown [Rx Nbr Unknown] (vRtrPimNgIfRxNbrUnknown)	long	The value of vRtrPimNgIfRxNbrUnknown indicates the number of PIM messages (other than Hello messages) which were received on this interface and were rejected because the adjacency with the neighbor router was not already established.
rxNullRegisters [Rx Null Registers] (vRtrPimNgIfRxNullRegisters)	long	The value of vRtrPimNgIfRxNullRegisters indicates the number of PIM Null Register messages received on this interface.
rxPkts [Rx Pkts] (vRtrPimNgIfRxPkts)	long	The value of vRtrPimNgIfRxPkts indicates the number of multicast data packets received on this interface.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxRegisterErrs [Rx Register Errs] (vRtrPimNgIfRxRegisterErrs)	long	The value of vRtrPimNgIfRxRegisterErrs indicates the number of errors while processing Register messages received on this interface.
rxRegisterStopErrs [Rx Register Stop Errs] (vRtrPimNgIfRxRegisterStopErrs)	long	The value of vRtrPimNgIfRxRegisterStopErrs indicates the number of errors while processing Register Stop messages received on this interface.
rxRegisterStops [Rx Register Stops] (vRtrPimNgIfRxRegisterStops)	long	The value of vRtrPimNgIfRxRegisterStops indicates the number of PIM Register Stop messages received on this interface.
rxRegisters [Rx Registers] (vRtrPimNgIfRxRegisters)	long	The value of vRtrPimNgIfRxRegisters indicates the number of PIM Register messages received on this interface.
rxUnknownPdus [Rx Unknown Pdus] (vRtrPimNgIfRxUnknownPdus)	long	The value of vRtrPimNgIfRxUnknownPdus indicates the number of packets received with an unsupported PIM type.
sgTypes [Sg Types] (vRtrPimNgIfSGTypes)	long	The value of vRtrPimNgIfSGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'sg'.
starGTypes [Star GTypes] (vRtrPimNgIfStarGTypes)	long	The value of vRtrPimNgIfStarGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgIfStarStarRPTypes)	long	The value of vRtrPimNgIfStarStarRPTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIfGrpSrcType is 'starStarRP'.
txAsserts [Tx Asserts] (vRtrPimNgIfTxAsserts)	long	The value of vRtrPimNgIfTxAsserts indicates the number of PIM Assert messages transmitted on this interface.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txAutoRpAnnounce [Tx Auto Rp Announce] (vRtrPimNgIfTxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounce indicates the number of Auto-RP announcements transmitted on this interface.
txAutoRpAnnounceErrs [Tx Auto Rp Announce Errs] (vRtrPimNgIfTxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounceErrs indicates the number of errors while transmitting Auto-RP announcements on this interface.
txAutoRpMapping [Tx Auto Rp Mapping] (vRtrPimNgIfTxAutoRpMapping)	long	The value of the object vRtrPimNgIfTxAutoRpMapping indicates the number of Auto-RP mappings transmitted on this interface.
txAutoRpMappingErrs [Tx Auto Rp Mapping Errs] (vRtrPimNgIfTxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfTxAutoRpMappingErrs indicates the number of errors while transmitting Auto-RP mappings on this interface.
txHellos [Tx Hellos] (vRtrPimNgIfTxHellos)	long	The value of vRtrPimNgIfTxHellos indicates the number of PIM Hello messages transmitted on this interface.
txPkts [Tx Pkts] (vRtrPimNgIfTxPkts)	long	The value of vRtrPimNgIfTxPkts indicates the number of multicast data packets transmitted on this interface.
<p>PimGenSiteStats</p> <p>MIB entry name: vRtrPimNgGenStatEntry</p> <p>Entry description: An entry in the vRtrPimNgGenStatTable.</p> <p>Table description (for vRtrPimNgGenStatTable): vRtrPimNgGenStatTable lists PIM statistics for a particular PIM instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • pim.Site • pim.SiteExtension 		

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardCrpaDrops [Forward Crpa Drops] (vRtrPimNgGenStatFwdCrpaDrops)	long	The value of vRtrPimNgGenStatFwdCrpaDrops indicates the number of times the Candidate-RP Advertisements(C-RP-Adv) could not be forwarded by the router.
forwardCrpaPdus [Forward Crpa Pdu] (vRtrPimNgGenStatForwardCrpaPdus)	long	The value of vRtrPimNgGenStatForwardCrpaPdus indicates the number of Candidate-RP Advertisements(C-RP-Adv) that were forwarded by the router. C-RP-Adv's are forwarded when the received advertisement has a router alert set and the destination address is not the router's local address.
rxActiveMdts [Rx Active Mdts] (vRtrPimNgGenStatRxActiveMdts)	long	The value of vRtrPimNgGenStatRxActiveMdts indicates number of active Mdts on which the PE is receiving packets. This object is applicable to VPRNs only.
rxCrpaPduDrops [Rx Crpa Pdu Drops] (vRtrPimNgGenStatRxCrpaPduDrops)	long	The value of vRtrPimNgGenStatRxCrpaPduDrops indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) received by this instance, but were dropped.
rxCrpaPdus [Rx Crpa Pdu] (vRtrPimNgGenStatRxCrpaPdus)	long	The value of vRtrPimNgGenStatRxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) received by this instance.
rxMdtJoinTlvErrs [Rx Mdt Join Tlv Errs] (vRtrPimNgGenStatRxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatRxMdtJnTlvErrs indicates indicates number of times MDT Join TLVs were dropped due to errors in the received TLV.
rxMdtJoinTlvs [Rx Mdt Join Tlvs] (vRtrPimNgGenStatRxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatRxMdtJoinTlvs indicates the number of times MDT Join TLV were received.
sgTypes [Sg Types] (vRtrPimNgGenStatSGTypes)	long	The value of vRtrPimNgGenStatSGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'sg'.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
starGTypes [Star GTypes] (vRtrPimNgGenStatStarGTypes)	long	The value of vRtrPimNgGenStatStarGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgGenStatStarStarRPTypes)	long	The value of vRtrPimNgGenStatStarStarRPTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starStarRP'.
txActiveMdts [Tx Active Mdts] (vRtrPimNgGenStatTxActiveMdts)	long	The value of vRtrPimNgGenStatTxActiveMdts indicates the number of active MDTs on which the PE is forwarding packets. This object is applicable to VPRNs only.
txCrpaPduErrs [Tx Crpa Pdu Errs] (vRtrPimNgGenStatTxCrpaPduErrs)	long	The value of vRtrPimNgGenStatTxCrpaPduErrs indicates the number of errors while transmitting PIM Candidate-RP Advertisements (C-RP-Adv).
txCrpaPdus [Tx Crpa Pdus] (vRtrPimNgGenStatTxCrpaPdus)	long	The value of vRtrPimNgGenStatTxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) transmitted by this router instance.
txMdtJoinTlvErrs [Tx Mdt Join Tlv Errs] (vRtrPimNgGenStatTxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatTxMdtJnTlvErrs indicates the number of times MDT Join TLV could not be transmitted.
txMdtJoinTlvs [Tx Mdt Join Tlvs] (vRtrPimNgGenStatTxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatTxMdtJoinTlvs indicates the number of times MDT Join TLV were transmitted.
txNullRegisters [Tx Null Registers] (vRtrPimNgGenStatTxNullRegisters)	long	The value of vRtrPimNgGenStatTxNullRegisters indicates the number of PIM Null Register messages transmitted by this instance.
txRegisterErrs [Tx Register Errs] (vRtrPimNgGenStatTxRegisterErrs)	long	The value of vRtrPimNgGenStatTxRegisterErrs indicates the number the times there was an error while transmitting PIM Register messages by this instance.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txRegisterTTLDrops [Tx Register TTLDrops] (vRtrPimNgGenStatTxRegTTLDrops)	long	The value of vRtrPimNgGenStatTxRegTTLDrops indicates the number of multicast data packets which could not be encapsulated in Register messages because the Time To Live (TTL) was zero.
txRegisters [Tx Registers] (vRtrPimNgGenStatTxRegisters)	long	The value of vRtrPimNgGenStatTxRegisters indicates the number of PIM Register messages transmitted by this instance.
<p>PimGroupStats MIB entry name: vRtrPimNgGrpSrcStatEntry Entry description: An entry in the vRtrPimNgGrpSrcStatTable. Table description (for vRtrPimNgGrpSrcStatTable): vRtrPimNgGrpSrcStatTable contains statistics for the entries in the vRtrPimNgGrpSrcTable. These statistics are collected by the forwarding engine. Supports realtime plotting Supports scheduled collection Monitored class: pim.Groups</p>		
discardedPkts [Discarded Pkts] (vRtrPimNgGrpSrcStatDscrdPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatDscrdPkts indicates the number of multicast packets that matched this source group entry but were discarded. For (S,G) entries, if the traffic is getting forwarded on the SPT, the packets arriving from the RPT will be discarded.
forwardedOctets [Forwarded Octets] (vRtrPimNgGrpSrcStatFrddedOct)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrddedOct indicates the number of multicast octets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list.
forwardedPkts [Forwarded Pkts] (vRtrPimNgGrpSrcStatFrwdedPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrwdedPkts indicates the number of multicast packets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list. This packet count is calculated before ingress QoS policing or shaping is applied.

Table 145 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rpfMismatches [Rpf Mismatches] (vRtrPimNgGrpSrcStatRPFMsmatch)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatRPFMsmatch indicates the number of multicast packets that matched this source group entry but they did not arrive on the the interface indicated by vRtrPimNgGrpSrcRpfIndex.

Table 146 ptp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPClockPacketStats</p> <p>MIB entry name: tmnxPtpClockPacketStatsEntry</p> <p>Entry description: The tmnxPtpClockPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpClockPacketStatsTable): The tmnxPtpClockPacketStatsTable consists of the packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPClock</p>		
ptpClkPktStatsAnnounce [Ptp Clk Pkt Stats Announce] (tmnxPtpClkPktStatsAnnounce)	long	The value of tmnxPtpClkPktStatsAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpClkPktStatsDelayRequest [Ptp Clk Pkt Stats Delay Request] (tmnxPtpClkPktStatsDelayRequest)	long	The value of tmnxPtpClkPktStatsDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpClkPktStatsDelayResp [Ptp Clk Pkt Stats Delay Resp] (tmnxPtpClkPktStatsDelayResp)	long	The value of tmnxPtpClkPktStatsDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpClkPktStatsDirection [Ptp Clk Pkt Stats Direction] (tmnxPtpClkPktStatsDirection)	int	The value of tmnxPtpClkPktStatsDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpClkPktStatsDropAltMaster [Ptp Clk Pkt Stats Drop Alt Master] (tmnxPtpClkPktStatsDropAltMaster)	long	The value of tmnxPtpClkPktStatsDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsDropBadDomain [Ptp Clk Pkt Stats Drop Bad Domain] (tmnxPtpClkPktStatsDropBadDomain)	long	The value of tmnxPtpClkPktStatsDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOther [Ptp Clk Pkt Stats Drop Other] (tmnxPtpClkPktStatsDropOther)	long	The value of tmnxPtpClkPktStatsDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpClkPktStatsDropBadDomain', 'tmnxPtpClkPktStatsDropAltMaster', 'tmnxPtpClkPktStatsDropOutOfSeq', and 'tmnxPtpClkPktStatsDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOutOfSeq [Ptp Clk Pkt Stats Drop Out Of Seq] (tmnxPtpClkPktStatsDropOutOfSeq)	long	The value of tmnxPtpClkPktStatsDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropPeerShut [Ptp Clk Pkt Stats Drop Peer Shut] (tmnxPtpClkPktStatsDropPeerShut)	long	The value of tmnxPtpClkPktStatsDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsFollowUp [Ptp Clk Pkt Stats Follow Up] (tmnxPtpClkPktStatsFollowUp)	long	The value of tmnxPtpClkPktStatsFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpClkPktStatsOther [Ptp Clk Pkt Stats Other] (tmnxPtpClkPktStatsOther)	long	The value of tmnxPtpClkPktStatsOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpClkPktStatsOtherTLVs [Ptp Clk Pkt Stats Other TLVs] (tmnxPtpClkPktStatsOtherTLVs)	long	The value of tmnxPtpClkPktStatsOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsSignaling [Ptp Clk Pkt Stats Signaling] (tmnxPtpClkPktStatsSignaling)	long	The value of tmnxPtpClkPktStatsSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpClkPktStatsSync [Ptp Clk Pkt Stats Sync] (tmnxPtpClkPktStatsSync)	long	The value of tmnxPtpClkPktStatsSync indicates the accumulated packet statistics for PTP Sync messages.
ptpClkPktStatsUniAckCnclAnno [Ptp Clk Pkt Stats Uni Ack Cncl Anno] (tmnxPtpClkPktStatsUniAckCnclAnno)	long	The value of tmnxPtpClkPktStatsUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpClkPktStatsUniAckCnclDly [Ptp Clk Pkt Stats Uni Ack Cncl Dly] (tmnxPtpClkPktStatsUniAckCnclDly)	long	The value of tmnxPtpClkPktStatsUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpClkPktStatsUniAckCnclSync [Ptp Clk Pkt Stats Uni Ack Cncl Sync] (tmnxPtpClkPktStatsUniAckCnclSync)	long	The value of tmnxPtpClkPktStatsUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpClkPktStatsUniCancelAnno [Ptp Clk Pkt Stats Uni Cancel Anno] (tmnxPtpClkPktStatsUniCancelAnno)	long	The value of tmnxPtpClkPktStatsUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpClkPktStatsUniCancelDelay [Ptp Clk Pkt Stats Uni Cancel Delay] (tmnxPtpClkPktStatsUniCancelDelay)	long	The value of tmnxPtpClkPktStatsUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpClkPktStatsUniCancelSync [Ptp Clk Pkt Stats Uni Cancel Sync] (tmnxPtpClkPktStatsUniCancelSync)	long	The value of tmnxPtpClkPktStatsUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniDenyAnno [Ptp Clk Pkt Stats Uni Deny Anno] (tmnxPtpClkPktStatsUniDenyAnno)	long	The value of tmnxPtpClkPktStatsUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenyDelRsp [Ptp Clk Pkt Stats Uni Deny Del Rsp] (tmnxPtpClkPktStatsUniDenyDelRsp)	long	The value of tmnxPtpClkPktStatsUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenySync [Ptp Clk Pkt Stats Uni Deny Sync] (tmnxPtpClkPktStatsUniDenySync)	long	The value of tmnxPtpClkPktStatsUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniGrantAnno [Ptp Clk Pkt Stats Uni Grant Anno] (tmnxPtpClkPktStatsUniGrantAnno)	long	The value of tmnxPtpClkPktStatsUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantDelRsp [Ptp Clk Pkt Stats Uni Grant Del Rsp] (tmnxPtpClkPktStatsUniGrantDelRsp)	long	The value of tmnxPtpClkPktStatsUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantSync [Ptp Clk Pkt Stats Uni Grant Sync] (tmnxPtpClkPktStatsUniGrantSync)	long	The value of tmnxPtpClkPktStatsUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniReqAnno [Ptp Clk Pkt Stats Uni Req Anno] (tmnxPtpClkPktStatsUniReqAnno)	long	The value of tmnxPtpClkPktStatsUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpClkPktStatsUniReqDelayRsp [Ptp Clk Pkt Stats Uni Req Delay Rsp] (tmnxPtpClkPktStatsUniReqDelayRsp)	long	The value of tmnxPtpClkPktStatsUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniReqSync [Ptp Clk Pkt Stats Uni Req Sync] (tmnxPtpClkPktStatsUniReqSync)	long	The value of tmnxPtpClkPktStatsUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
PTPClockRecoveryStateStats MIB entry name: tmnxPtpClockRecoveryStatistics Supports realtime plotting Supports scheduled collection Monitored class: ptp.IEEEPTPClock		
tmnxPtpClockRecStatsAcquiring [Tmnx Ptp Clock Rec Stats Acquiring] (tmnxPtpClockRecStatsAcquiring)	java. math. BigInteger	The value of tmnxPtpClockRecStatsAcquiring indicate the number of seconds that the clock recovery system has been in the acquiring state.
tmnxPtpClockRecStatsHoldover [Tmnx Ptp Clock Rec Stats Holdover] (tmnxPtpClockRecStatsHoldover)	java. math. BigInteger	The value of tmnxPtpClockRecStatsHoldover indicate the number of seconds that the clock recovery system has been in the hold-over state.
tmnxPtpClockRecStatsInitial [Tmnx Ptp Clock Rec Stats Initial] (tmnxPtpClockRecStatsInitial)	java. math. BigInteger	The value of tmnxPtpClockRecStatsInitial indicates the number of seconds that the clock recovery system has been in the initial state.
tmnxPtpClockRecStatsLocked [Tmnx Ptp Clock Rec Stats Locked] (tmnxPtpClockRecStatsLocked)	java. math. BigInteger	The value of tmnxPtpClockRecStatsLocked indicate the number of seconds that the clock recovery system has been in the locked state.
tmnxPtpClockRecStatsPhaseTrack [Tmnx Ptp Clock Rec Stats Phase Track] (tmnxPtpClockRecStatsPhaseTrack)	java. math. BigInteger	The value of tmnxPtpClockRecStatsPhaseTrack indicate the number of seconds that the clock recovery system has been in the phase tracking state.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPPeerPacketStats</p> <p>MIB entry name: tmnxPtpPeerPacketStatsEntry</p> <p>Entry description: The tmnxPtpPeerPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpPeerPacketStatsTable): The tmnxPtpPeerPacketStatsTable consists of the per peer packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEEPTPPeer</p>		
ptpPeerPktStatAnnounce [Ptp Peer Pkt Stat Announce] (tmnxPtpPeerPktStatAnnounce)	long	The value of tmnxPtpPeerPktStatAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpPeerPktStatDelayRequest [Ptp Peer Pkt Stat Delay Request] (tmnxPtpPeerPktStatDelayRequest)	long	The value of tmnxPtpPeerPktStatDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpPeerPktStatDelayResp [Ptp Peer Pkt Stat Delay Resp] (tmnxPtpPeerPktStatDelayResp)	long	The value of tmnxPtpPeerPktStatDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpPeerPktStatDirection [Ptp Peer Pkt Stat Direction] (tmnxPtpPeerPktStatDirection)	int	The value of tmnxPtpPeerPktStatDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpPeerPktStatDropAltMaster [Ptp Peer Pkt Stat Drop Alt Master] (tmnxPtpPeerPktStatDropAltMaster)	long	The value of tmnxPtpPeerPktStatDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatDropBadDomain [Ptp Peer Pkt Stat Drop Bad Domain] (tmnxPtpPeerPktStatDropBadDomain)	long	The value of tmnxPtpPeerPktStatDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOther [Ptp Peer Pkt Stat Drop Other] (tmnxPtpPeerPktStatDropOther)	long	The value of tmnxPtpPeerPktStatDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpPeerPktStatDropBadDomain', 'tmnxPtpPeerPktStatDropAltMaster', 'tmnxPtpPeerPktStatDropOutOfSeq', and 'tmnxPtpPeerPktStatDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOutOfSeq [Ptp Peer Pkt Stat Drop Out Of Seq] (tmnxPtpPeerPktStatDropOutOfSeq)	long	The value of tmnxPtpPeerPktStatDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropPeerShut [Ptp Peer Pkt Stat Drop Peer Shut] (tmnxPtpPeerPktStatDropPeerShut)	long	The value of tmnxPtpPeerPktStatDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatFollowUp [Ptp Peer Pkt Stat Follow Up] (tmnxPtpPeerPktStatFollowUp)	long	The value of tmnxPtpPeerPktStatFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpPeerPktStatOther [Ptp Peer Pkt Stat Other] (tmnxPtpPeerPktStatOther)	long	The value of tmnxPtpPeerPktStatOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpPeerPktStatOtherTLVs [Ptp Peer Pkt Stat Other TLVs] (tmnxPtpPeerPktStatOtherTLVs)	long	The value of tmnxPtpPeerPktStatOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatSignaling [Ptp Peer Pkt Stat Signaling] (tmnxPtpPeerPktStatSignaling)	long	The value of tmnxPtpPeerPktStatSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpPeerPktStatSync [Ptp Peer Pkt Stat Sync] (tmnxPtpPeerPktStatSync)	long	The value of tmnxPtpPeerPktStatSync indicates the accumulated packet statistics for PTP Sync messages.
ptpPeerPktStatUniAckCnclAnno [Ptp Peer Pkt Stat Uni Ack Cncl Anno] (tmnxPtpPeerPktStatUniAckCnclAnno)	long	The value of tmnxPtpPeerPktStatUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpPeerPktStatUniAckCnclDly [Ptp Peer Pkt Stat Uni Ack Cncl Dly] (tmnxPtpPeerPktStatUniAckCnclDly)	long	The value of tmnxPtpPeerPktStatUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpPeerPktStatUniAckCnclSync [Ptp Peer Pkt Stat Uni Ack Cncl Sync] (tmnxPtpPeerPktStatUniAckCnclSync)	long	The value of tmnxPtpPeerPktStatUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpPeerPktStatUniCancelAnno [Ptp Peer Pkt Stat Uni Cancel Anno] (tmnxPtpPeerPktStatUniCancelAnno)	long	The value of tmnxPtpPeerPktStatUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpPeerPktStatUniCancelDelay [Ptp Peer Pkt Stat Uni Cancel Delay] (tmnxPtpPeerPktStatUniCancelDelay)	long	The value of tmnxPtpPeerPktStatUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpPeerPktStatUniCancelSync [Ptp Peer Pkt Stat Uni Cancel Sync] (tmnxPtpPeerPktStatUniCancelSync)	long	The value of tmnxPtpPeerPktStatUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniDenyAnno [Ptp Peer Pkt Stat Uni Deny Anno] (tmnxPtpPeerPktStatUniDenyAnno)	long	The value of tmnxPtpPeerPktStatUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenyDelRsp [Ptp Peer Pkt Stat Uni Deny Del Rsp] (tmnxPtpPeerPktStatUniDenyDelRsp)	long	The value of tmnxPtpPeerPktStatUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenySync [Ptp Peer Pkt Stat Uni Deny Sync] (tmnxPtpPeerPktStatUniDenySync)	long	The value of tmnxPtpPeerPktStatUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniGrantAnno [Ptp Peer Pkt Stat Uni Grant Anno] (tmnxPtpPeerPktStatUniGrantAnno)	long	The value of tmnxPtpPeerPktStatUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantDelRsp [Ptp Peer Pkt Stat Uni Grant Del Rsp] (tmnxPtpPeerPktStatUniGrantDelRsp)	long	The value of tmnxPtpPeerPktStatUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantSync [Ptp Peer Pkt Stat Uni Grant Sync] (tmnxPtpPeerPktStatUniGrantSync)	long	The value of tmnxPtpPeerPktStatUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniReqAnno [Ptp Peer Pkt Stat Uni Req Anno] (tmnxPtpPeerPktStatUniReqAnno)	long	The value of tmnxPtpPeerPktStatUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpPeerPktStatUniReqDelayRsp [Ptp Peer Pkt Stat Uni Req Delay Rsp] (tmnxPtpPeerPktStatUniReqDelayRsp)	long	The value of tmnxPtpPeerPktStatUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.

Table 146 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniReqSync [Ptp Peer Pkt Stat Uni Req Sync] (tmnxPtpPeerPktStatUniReqSync)	long	The value of tmnxPtpPeerPktStatUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
ptpPeerPktStatsTimeStampCpm [Ptp Peer Pkt Stats Time Stamp Cpm] (tmnxPtpPeerPktStatTimeStampCpm)	long	The value of tmnxPtpPeerPktStatTimeStampCpm indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the operating system kernel.
ptpPeerPktStatsTimeStampPort [Ptp Peer Pkt Stats Time Stamp Port] (tmnxPtpPeerPktStatTimeStampPort)	long	The value of tmnxPtpPeerPktStatTimeStampPort indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the physical layer.

Table 147 rip statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
InterfaceReceiveStats MIB entry name: vRtrRipIfStatEntry Entry description: vRtrRipIfStatEntry is an entry (conceptual row) in the vRtrRipIfStatTable. Each entry represents statistical information for a RIP interface. Table description (for vRtrRipIfStatTable): vRtrRipIfStatTable is a read-only table which keeps statistical information about the interfaces monitoring RIP. Supports realtime plotting Supports scheduled collection Monitored class: rip.Interface		
badPackets [Bad Packets] (vRtrRipIfStatAllRcvBadPackets)	long	vRtrRipIfStatAllRcvBadPackets is the number of RIP updates received on this interface that were discarded as invalid.
v1BadRoutes [V1 Bad Routes] (vRtrRipIfStatV1BadRoutes)	long	vRtrRipIfStatV1BadRoutes is the number of routes, in valid RIPv1 packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
v1Requests [V1 Requests] (vRtrRipIfStatV1RcvRequests)	long	vRtrRipIfStatV1RcvRequests is the number of RIPv1 request packets received by the RIP process.
v1RequestsIgnored [V1 Requests Ignored] (vRtrRipIfStatV1BadRequests)	long	vRtrRipIfStatV1BadRequests is the number of RIPv1 request packets received by the RIP process that were subsequently discarded for any reason.
v1Updates [V1 Updates] (vRtrRipIfStatV1RcvUpdates)	long	vRtrRipIfStatV1RcvUpdates is the number of RIPv1 response packets received by the RIP process.
v1UpdatesIgnored [V1 Updates Ignored] (vRtrRipIfStatV1BadUpdates)	long	vRtrRipIfStatV1BadUpdates is the number of RIPv1 response packets received by the RIP process which were subsequently discarded for any reason.

Table 147 rip statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
v2AuthenticationErrors [V2 Authentication Errors] (vRtrRipIfStatAuthErrors)	long	vRtrRipIfStatAuthErrors is the number of RIPv2 packets received by the RIP process which were subsequently discarded because of an error authenticating the packet.
v2BadRoutes [V2 Bad Routes] (vRtrRipIfStatV2BadRoutes)	long	vRtrRipIfStatV2BadRoutes is the number of routes, in valid RIPv2 packets, which were ignored for any reason (e.g. unknown address family, or invalid metric).
v2Requests [V2 Requests] (vRtrRipIfStatV2RcvRequests)	long	vRtrRipIfStatV2RcvRequests is the number of RIPv2 request packets received by the RIP process.
v2RequestsIgnored [V2 Requests Ignored] (vRtrRipIfStatV2BadRequests)	long	vRtrRipIfStatV2BadRequests is the number of RIPv2 request packets received by the RIP process that were subsequently discarded for any reason.
v2Updates [V2 Updates] (vRtrRipIfStatV2RcvUpdates)	long	vRtrRipIfStatV2RcvUpdates is the number of RIPv2 response packets received by the RIP process.
v2UpdatesIgnored [V2 Updates Ignored] (vRtrRipIfStatV2BadUpdates)	long	vRtrRipIfStatV2BadUpdates is the number of RIPv2 response packets received by the RIP process which were subsequently discarded for any reason.

Table 147 rip statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalUpdates [Total Updates] (vRtrRipIfStatAllSentUpdates)	long	vRtrRipIfStatAllSentUpdates is the number of all RIP updates actually sent on this interface. This explicitly does include full updates sent containing new information.
triggeredUpdates [Triggered Updates] (vRtrRipIfStatAllTriggeredUpdates)	long	vRtrRipIfStatAllTriggeredUpdates is the number of triggered RIP updates actually sent on this interface. This explicitly does include full updates sent containing new information.

Table 148 rsvp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AuthenticationKeyStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Entries in this table cannot be created and deleted via SNMP SET operations. An entry in this table is created by the agent when the RSVP protocol is configured on a virtual router interface. The entry is destroyed when RSVP is removed from the interface.</p> <p>Table description (for vRtrRsvplfStatTable): The vRtrRsvplfStatTable contains objects for reporting statistics associated with an interface running RSVP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.AuthenticationKey</p>		
errorPacketsReceived [Error Packets Received] (vRtrRsvplfStatRxAuthErrors)	java. math. BigInteger	The total number of RSVP packets with MD5 errors received on this RSVP interface.
errorPacketsTransmitted [Error Packets Transmitted] (vRtrRsvplfStatTxAuthErrors)	java. math. BigInteger	The total number of RSVP packets with MD5 errors sent by this RSVP interface.
<p>RsvpInterfaceReceiveStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Entries in this table cannot be created and deleted via SNMP SET operations. An entry in this table is created by the agent when the RSVP protocol is configured on a virtual router interface. The entry is destroyed when RSVP is removed from the interface.</p> <p>Table description (for vRtrRsvplfStatTable): The vRtrRsvplfStatTable contains objects for reporting statistics associated with an interface running RSVP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Interface</p>		

Table 148 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
acks [Acks] (vRtrRsvplfStatRxAcks)	java. math. BigInteger	The total number of RSVP ACK messages received when refresh reduction is enabled on this RSVP interface.
bundles [Bundles] (vRtrRsvplfStatRxBundles)	java. math. BigInteger	The total number of RSVP bundled packets received on this RSVP interface. Bundled packets are sent when refresh reduction is enabled.
errorPackets [Error Packets] (vRtrRsvplfStatRxErrorPkts)	java. math. BigInteger	The total number of RSVP packets with errors received on this RSVP interface.
helloTimeout [Hello Timeout] (vRtrRsvplfStatHelloTimeout)	long	The total number of hello messages that timed out on this RSVP interface.
hellos [Hellos] (vRtrRsvplfStatRxHelloReqs)	java. math. BigInteger	The total number of RSVP HELLO REQ messages received on this RSVP interface.
packets [Packets] (vRtrRsvplfStatRxPkts)	java. math. BigInteger	The total number of error free RSVP packets received on this RSVP interface.
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.

Table 148 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.
totalPackets [Total Packets] (vRtrRsvplfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.

Table 148 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
RsvpInterfaceStats MIB entry name: vRtrRsvplfEntry Entry description: Each row entry in the vRtrRsvplfTable represents additional columns for attributes specific to the Nokia 7x50 SR RSVP implementation. Table description (for vRtrRsvplfTable): The vRtrRsvplfTable provides an extension of the rsvplfTable in the RSVP-MIB. Supports realtime plotting Supports scheduled collection Monitored class: rsvp.Interface		
activeReservations [Active Reservations] (vRtrRsvplfActiveReservationCount)	long	The total number of active RSVP sessions that have reserved bandwidth.
activeSessions [Active Sessions] (vRtrRsvplfActiveSessionCount)	long	The total number of active RSVP sessions on this interface. This count includes sessions that have requested bandwidth as well as sessions that have not requested any bandwidth.
bandwidth [Bandwidth] (vRtrRsvplfBandwidth)	long	The value of vRtrRsvplfBandwidth indicates the interface bandwidth in mega-bits per second (Mbps) for the RSVP protocol on this interface. This is typically the port Speed.
reservedBandwidth [Reserved Bandwidth] (vRtrRsvplfReservedBandwidth)	long	The value of vRtrRsvplfReservedBandwidth specifies the amount of bandwidth in mega-bits per second (Mbps) to reserved by the RSVP sessions on this interface. A value of zero (0) indicates that no bandwidth is reserved.
totalSessions [Total Sessions] (vRtrRsvplfTotalSessionCount)	long	The total number of RSVP sessions on this interface. This count includes sessions that are active as well as sessions that have been signalled but a response has not yet been received.

Table 148 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>RsvpInterfaceTransmitStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. acks [Acks] (vRtrRsvplfStatRxAcks)	java. math. BigInteger	The total number of RSVP ACK messages received when refresh reduction is enabled on this RSVP interface.
bundles [Bundles] (vRtrRsvplfStatRxBundles)	java. math. BigInteger	The total number of RSVP bundled packets received on this RSVP interface. Bundled packets are sent when refresh reduction is enabled.
errorPackets [Error Packets] (vRtrRsvplfStatRxErrorPkts)	java. math. BigInteger	The total number of RSVP packets with errors received on this RSVP interface.
hellos [Hellos] (vRtrRsvplfStatRxHelloReqs)	java. math. BigInteger	The total number of RSVP HELLO REQ messages received on this RSVP interface.
packets [Packets] (vRtrRsvplfStatRxPkts)	java. math. BigInteger	The total number of error free RSVP packets received on this RSVP interface.

Table 148 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.

Table 148 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPackets [Total Packets] (vRtrRsvpIfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.
<p>RsvpSessionStats</p> <p>MIB entry name: vRtrRsvpSessionStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an RSVP session. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrRsvpSessionStatTable): The vRtrRsvpSessionStatTable contains statistics for an RSVP session.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Session</p>		
detourAge [Detour Age] (vRtrRsvpSessionDetourAge)	long	vRtrRsvpSessionDetourAge is the age (i.e., time from creation till now) of this detour LSP in 10-millisecond periods.
detourTimeUp [Detour Time Up] (vRtrRsvpSessionDetourTimeUp)	long	vRtrRsvpSessionDetourTimeUp is the total time in 10-millisecond units that the detour LSP has been operational.
pathsReceived [Paths Received] (vRtrRsvpSessionRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages received for this RSVP session.
pathsTransmitted [Paths Transmitted] (vRtrRsvpSessionTxPaths)	java. math. BigInteger	The total number of RSVP PATH messages transmitted for this RSVP session.

Table 148 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
refreshPathsReceived [Refresh Paths Received] (vRtrRsvpSessionRxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshPaths indicates the number of times PATH was refreshed using message ID from full PATH refresh or Srefresh message for this RSVP session.
refreshPathsTransmitted [Refresh Paths Transmitted] (vRtrRsvpSessionTxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshPaths indicates the number of times PATH refresh for the session was sent as a part of a Srefresh message.
refreshReservesReceived [Refresh Reserves Received] (vRtrRsvpSessionRxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshResvs indicates the number of times RESV was refreshed using message ID from full RESV refresh or Srefresh message for this RSVP session.
refreshReservesTransmitted [Refresh Reserves Transmitted] (vRtrRsvpSessionTxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshResvs indicates the number of times RESV refresh for the session was sent as a part of a Srefresh message.
reservesReceived [Reserves Received] (vRtrRsvpSessionRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages received for this RSVP session.
reservesTransmitted [Reserves Transmitted] (vRtrRsvpSessionTxResvs)	java. math. BigInteger	The total number of RSVP RESV messages transmitted for this RSVP session.

Table 149 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DhcpRelayStats</p> <p>MIB entry name: vRtrIfDHCPRelayStatsEntry</p> <p>Entry description: Each row entry represents information related to DHCP Relay statistics for a virtual router interface in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrIfDHCPRelayStatsTable): The vRtrIfDHCPRelayStatsTable contains the statistics for the DHCP Relay agent.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.DhcpRelayConfiguration • rtr.GrplfDhcpRelayCfg • rtr.SublIfDhcpRelayCfg 		
authPktsDiscarded [Auth Pkts Discarded] (vRtrIfDHCPRelayAuthPktsDiscarded)	long	vRtrIfDHCPRelayAuthPktsDiscarded indicates the total number of packets discarded because authentication was not successful.
authPktsSuccess [Auth Pkts Success] (vRtrIfDHCPRelayAuthPktsSuccess)	long	vRtrIfDHCPRelayAuthPktsSuccess indicates the total number of packets for which authentication was successful.
clientPacketsDiscarded [Client Packets Discarded] (vRtrIfDHCPRelayClientPktsDiscarded)	long	vRtrIfDHCPRelayClientPktsDiscarded indicates the total number of client packets discarded by the DHCP relay agent.
clientPacketsRelayed [Client Packets Relayed] (vRtrIfDHCPRelayClientPktsRelayed)	long	vRtrIfDHCPRelayClientPktsRelayed indicates the total number of client packets relayed by the DHCP relay agent.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
clientPktsProxLS [Client Pkts Prox LS] (vRtrIfDHCPRelayClientPktsProxLS)	long	vRtrIfDHCPRelayClientPktsProxLS indicates the total number of client packets proxied by the DHCP relay agent based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
clientPktsProxRad [Client Pkts Prox Rad] (vRtrIfDHCPRelayClientPktsProxRad)	long	vRtrIfDHCPRelayClientPktsProxRad indicates the total number of client packets proxied by the DHCP relay agent based on data received from a RADIUS server.
pktsGenForceRenew [Pkts Gen Force Renew] (vRtrIfDHCPRelayPktsGenForceRenew)	long	vRtrIfDHCPRelayPktsGenForceRenew indicates the total number of DHCP FORCERENEW messages spoofed by the DHCP relay agent to the DHCP clients.
pktsGenRelease [Pkts Gen Release] (vRtrIfDHCPRelayPktsGenRelease)	long	vRtrIfDHCPRelayPktsGenRelease indicates the total number of DHCP RELEASE messages spoofed by the DHCP relay agent to the DHCP server.
receivedMalformedPackets [Received Malformed Packets] (vRtrIfDHCPRelayRxMalformedPkts)	long	vRtrIfDHCPRelayRxMalformedPkts indicates the total number of malformed packets received by the DHCP relay agent.
receivedPackets [Received Packets] (vRtrIfDHCPRelayRxPkts)	long	vRtrIfDHCPRelayRxPkts indicates the total number of packets received by the DHCP relay agent.
receivedUntrustedPackets [Received Untrusted Packets] (vRtrIfDHCPRelayRxUntrustedPkts)	long	vRtrIfDHCPRelayRxUntrustedPkts indicates the total number of untrusted packets received by the DHCP relay agent.
serverPacketsDiscarded [Server Packets Discarded] (vRtrIfDHCPRelayServerPktsDiscarded)	long	vRtrIfDHCPRelayServerPktsDiscarded indicates the total number of server packets discarded by the DHCP relay agent.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
serverPacketsRelayed [Server Packets Relayed] (vRtrIfDHCPRelayServerPktsRelayed)	long	vRtrIfDHCPRelayServerPktsRelayed indicates the total number of server packets relayed by the DHCP relay agent.
serverPktsSnooped [Server Pkts Snooped] (vRtrIfDHCPRelayServerPktsSnooped)	long	vRtrIfDHCPRelayServerPktsSnooped indicates the total number of server packets snooped by the DHCP relay agent.
transmittedPackets [Transmitted Packets] (vRtrIfDHCPRelayTxPkts)	long	vRtrIfDHCPRelayTxPkts indicates the total number of packets transmitted by the DHCP relay agent.
<p>NetworkInterfaceIngressStats MIB entry name: vRtrNetIfIngressStatsEntry Entry description: Each row entry has statistics information for each router interface for each meter configured in the system. Table description (for vRtrNetIfIngressStatsTable): The vRtrNetIfIngressStatsTable has statistics entry for each router interface for each meter configured in the system. Supports realtime plotting Does not support scheduled collection Monitored class: rtr.NetworkInterface</p>		
ingressFwdInProfPkts [Ingress Fwd In Prof Pkts] (vRtrNetIfIngressFwdInProfPkts)	java. math. BigInteger	vRtrNetIfIngressFwdInProfPkts indicates the number of conforming network interface ingress packets forwarded on this router interface using this meter.
ingressFwdOutProfPkts [Ingress Fwd Out Prof Pkts] (vRtrNetIfIngressFwdOutProfPkts)	java. math. BigInteger	vRtrNetIfIngressFwdOutProfPkts indicates the number of exceeding network interface ingress packets forwarded on this router interface using this meter.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressMeterIndex [Ingress Meter Index] (vRtrNetIfIngressMeterIndex)	long	vRtrNetIfIngressMeterIndex serves as the tertiary index. When used in conjunction with vRtrID and vRtrIfIndex, it uniquely identifies a network ingress meter for the specified router interface in the managed system.
<p>RouteStats</p> <p>MIB entry name: vRtrStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrStatTable): The vRtrStatTable has an entry for each virtual router configured in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.VirtualRouter • vprn.DVRSSite • vprn.RoutingInstanceSite • vprn.Site 		
activeARPEntries [Active ARPEntries] (vRtrStatActiveARPEntries)	long	vRtrStatActiveARPEntries indicates the number of active ARP entries for the specified virtual router in the system.
aggregateActiveRoutes [Aggregate Active Routes] (vRtrAggregateActiveRoutes)	long	vRtrAggregateActiveRoutes indicates the current number of active aggregate routes for this instance of the route table.
aggregateRoutes [Aggregate Routes] (vRtrAggregateRoutes)	long	vRtrAggregateRoutes indicates the current number of aggregate routes for this instance of the route table.
bgpActiveRoutes [Bgp Active Routes] (vRtrBGPActiveRoutes)	long	vRtrBGPActiveRoutes indicates the current number of active bgp routes for this instance of the route table.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
bgpRoutes [Bgp Routes] (vRtrBGPRoutes)	long	vRtrBGPRoutes indicates the current number of bgp routes for this instance of the route table.
bgpVpnActiveRoutes [Bgp Vpn Active Routes] (vRtrStatBGPVpnActiveRoutes)	long	vRtrStatBGPVpnActiveRoutes indicates the current number of active VPN-IPV4 routes learned by MP-BGP for this virtual router.
bgpVpnRoutes [Bgp Vpn Routes] (vRtrStatBGPVpnRoutes)	long	vRtrStatBGPVpnRoutes indicates the current number of VPN-IPV4 routes learned by MP-BGP for this virtual router.
directActiveRoutes [Direct Active Routes] (vRtrDirectActiveRoutes)	long	vRtrDirectActiveRoutes indicates the current number of active direct routes for this instance of the route table.
directRoutes [Direct Routes] (vRtrDirectRoutes)	long	vRtrDirectRoutes indicates the current number of direct routes for this instance of the route table.
illegalLabelsReceived [Illegal Labels Received] (vRtrStatIllegalLabels)	long	vRtrStatIllegalLabels indicates the number of illegally received labels on this virtual router.
isisActiveRoutes [Isis Active Routes] (vRtrISISActiveRoutes)	long	vRtrISISActiveRoutes indicates the current number of active isis routes for this instance of the route table.
isisRoutes [Isis Routes] (vRtrISISRoutes)	long	vRtrISISRoutes indicates the current number of isis routes for this instance of the route table.
ldpActiveTunnels [Ldp Active Tunnels] (vRtrStatActiveLdpTunnels)	long	vRtrStatActiveLdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'ldp'.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ldpTunnels [Ldp Tunnels] (vRtrStatTotalLdpTunnels)	long	vRtrStatTotalLdpTunnels indicates the current number of both active and inactive LDP tunnels.
ospfActiveRoutes [Ospf Active Routes] (vRtrOSPFActiveRoutes)	long	vRtrOSPFActiveRoutes indicates the current number of active ospf routes for this instance of the route table.
ospfRoutes [Ospf Routes] (vRtrOSPFRoutes)	long	vRtrOSPFRoutes indicates the current number of ospf routes for this instance of the route table.
routerInterfacesActive [Router Interfaces Active] (vRtrStatActiveIfs)	long	vRtrStatActiveIfs indicates the current number of router interfaces with vRtrIfAdminState equal 'inService' on this virtual router.
routerInterfacesConfigured [Router Interfaces Configured] (vRtrStatConfiguredIfs)	long	vRtrStatConfiguredIfs indicates the current number of router interfaces configured on this virtual router.
routesInVrf [Routes In Vrf] (vRtrStatCurrNumRoutes)	long	vRtrStatCurrNumRoutes indicates the current number of routes in the VRF for this virtual router.
sdpActiveTunnels [Sdp Active Tunnels] (vRtrStatActiveSdpTunnels)	long	vRtrStatActiveSdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'sdp'.
sdpTunnels [Sdp Tunnels] (vRtrStatTotalSdpTunnels)	long	vRtrStatTotalSdpTunnels indicates the current number of both active and inactive SDP tunnels.
staticActiveRoutes [Static Active Routes] (vRtrStaticActiveRoutes)	long	vRtrStaticActiveRoutes indicates the current number of active static routes for this instance of the route table.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
staticRoutes [Static Routes] (vRtrStaticRoutes)	long	vRtrStaticRoutes indicates the current number of static routes for this instance of the route table.
totalARPEntries [Total ARPEntries] (vRtrStatTotalARPEntries)	long	vRtrStatTotalARPEntries indicates the total number of active and inactive ARP entries for the specified virtual router in the system.
<p>VirtualInterfaceIcmp6InStats MIB entry name: vRtrIfIcmp6Entry Entry description: Each row entry represents the ICMP statistics of a virtual router interface. Entries are created and deleted when entries in the vRtrIfTable are created and deleted. Table description (for vRtrIfIcmp6Table): The vRtrIfIcmp6Table table contains statistics of ICMPv6 messages that are received and sourced by a router interface. Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualInterfaceIcmp6Configuration</p>		
inDestinationUnreachable [In Destination Unreachable] (vRtrIfIcmp6InDestUnreachs)	long	The value of vRtrIfIcmp6InDestUnreachs indicates the number of ICMP Destination Unreachable messages received by this interface.
inEchoReplies [In Echo Replies] (vRtrIfIcmp6InEchoReplies)	long	The value of vRtrIfIcmp6InEchoReplies indicates the number of ICMP Echo Reply messages received by this interface.
inEchoRequests [In Echo Requests] (vRtrIfIcmp6InEchos)	long	The value of vRtrIfIcmp6InEchos indicates the number of ICMP Echo (request) messages received by this interface.
inErrors [In Errors] (vRtrIfIcmp6InErrors)	long	The value of vRtrIfIcmp6InErrors indicates the number of ICMP messages which this interface received but determined as having ICMP-specific errors (bad ICMP checksums, bad length , etc.).

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inNeighborAdvertisements [In Neighbor Advertisements] (vRtrIflcmp6InNbrAdvertisements)	long	The value of vRtrIflcmp6InNbrAdvertisements indicates the number of ICMP Neighbor Advertisement messages received by this interface.
inNeighborSolicits [In Neighbor Solicits] (vRtrIflcmp6InNbrSolicits)	long	The value of vRtrIflcmp6InNbrSolicits indicates the number of ICMP Neighbor Solicit messages received by this interface.
inPacketTooBig [In Packet Too Big] (vRtrIflcmp6InPktTooBigs)	long	The value of vRtrIflcmp6InPktTooBigs indicates the number of ICMP Packet Too Big messages received by this interface.
inRedirects [In Redirects] (vRtrIflcmp6InRedirects)	long	The value of vRtrIflcmp6InRedirects indicates number of ICMP Redirect messages received by this interface.
inRouterAdvertisements [In Router Advertisements] (vRtrIflcmp6InRtrAdvertisements)	long	The value of vRtrIflcmp6InRtrAdvertisements indicates the number of ICMP Router Advertisement messages received by this interface.
inRouterSolicits [In Router Solicits] (vRtrIflcmp6InRtrSolicits)	long	The value of vRtrIflcmp6InRtrSolicits indicates the number of ICMP Router Solicit messages received by this interface.
inTimeExceeded [In Time Exceeded] (vRtrIflcmp6InTimeExcds)	long	The value of vRtrIflcmp6InTimeExcds indicates the number of ICMP Time Exceeded messages received by this interface.
inTotalMessages [In Total Messages] (vRtrIflcmp6InMsgs)	long	The value of vRtrIflcmp6InMsgs indicates the total number of ICMP messages received by this interface which includes all those counted by vRtrIflcmp6InErrors. Note that this interface is the interface to which the ICMP messages were addressed which may not be necessarily the input interface for the messages.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualInterfaceIcmp6OutStats</p> <p>MIB entry name: vRtrIfIcmp6Entry</p> <p>Entry description: Each row entry represents the ICMP statistics of a virtual router interface. Entries are created and deleted when entries in the vRtrIfTable are created and deleted.</p> <p>Table description (for vRtrIfIcmp6Table): The vRtrIfIcmp6Table table contains statistics of ICMPv6 messages that are received and sourced by a router interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rtr.VirtualInterfaceIcmp6Configuration</p>		
outDestinationUnreachable [Out Destination Unreachable] (vRtrIfIcmp6OutDestUnreachs)	long	The value of vRtrIfIcmp6OutDestUnreachs indicates the number of ICMP Destination Unreachable messages sent by this interface.
outEchoReplies [Out Echo Replies] (vRtrIfIcmp6OutEchoReplies)	long	The value of vRtrIfIcmp6OutEchoReplies indicates the number of ICMP Echo Reply messages sent by this interface.
outEchoRequests [Out Echo Requests] (vRtrIfIcmp6OutEchos)	long	The value of vRtrIfIcmp6OutEchos indicates the number of ICMP Echo Request messages sent by this interface.
outErrors [Out Errors] (vRtrIfIcmp6OutErrors)	long	The value of vRtrIfIcmp6OutErrors indicates the number of ICMP messages which this interface did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of VRtr IPv6 to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter's value.
outGrpMembQueries [Out Grp Memb Queries] (vRtrIfIcmp6OutGrpMembQueries)	long	The value of vRtrIfIcmp6OutGrpMembQueries indicates the number of ICMP Group Membership Query messages sent by this interface.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outGrpMembReductions [Out Grp Memb Reductions] (vRtrIfIcmp6OutGrpMembReductions)	long	The value of vRtrIfIcmp6OutGrpMembReductions indicates the number of ICMP Group Membership Reduction messages sent by this interface.
outGrpMembResponses [Out Grp Memb Responses] (vRtrIfIcmp6OutGrpMembResponses)	long	The value of vRtrIfIcmp6OutGrpMembResponses indicates the number of ICMP Group Membership Response messages sent by this interface.
outNeighborAdvertisements [Out Neighbor Advertisements] (vRtrIfIcmp6OutNbrAdvertisements)	long	The value of vRtrIfIcmp6OutNbrAdvertisements indicates the number of ICMP Neighbor Advertisement messages sent by this interface.
outNeighborSolicits [Out Neighbor Solicits] (vRtrIfIcmp6OutNbrSolicits)	long	The value of vRtrIfIcmp6OutNbrSolicits indicates the number of ICMP Neighbor Solicitation messages sent by this interface.
outPacketTooBig [Out Packet Too Big] (vRtrIfIcmp6OutPktTooBigs)	long	The value of vRtrIfIcmp6OutPktTooBigs indicates the number of ICMP Packet Too Big messages sent by this interface.
outRedirects [Out Redirects] (vRtrIfIcmp6OutRedirects)	long	The value of vRtrIfIcmp6OutRedirects indicates the number of ICMP Redirect messages sent by this interface.
outRouterAdvertisements [Out Router Advertisements] (vRtrIfIcmp6OutRtrAdvertisements)	long	The value of vRtrIfIcmp6OutRtrAdvertisements indicates the number of ICMP Router Advertisement messages sent by this interface.
outRouterSolicits [Out Router Solicits] (vRtrIfIcmp6OutRtrSolicits)	long	The value of vRtrIfIcmp6OutRtrSolicits indicates the number of ICMP Router Solicitation messages sent by this interface.
outTimeExceeded [Out Time Exceeded] (vRtrIfIcmp6OutTimeExcds)	long	The value of vRtrIfIcmp6OutTimeExcds indicates the number of ICMP Time Exceeded messages sent by this interface.

Table 149 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outTotalMessages [Out Total Messages] (vRtrIfIcmp6OutMsgs)	long	The value of vRtrIfIcmp6OutMsgs indicates the total number of ICMP messages which this interface attempted to send. Note that this counter includes all those counted by icmpOutErrors.

Table 150 sas statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DelayTCAStats</p> <p>MIB entry name: tmnxOamPmStsTcaDelayEntry</p> <p>Entry description: tmnxOamPmStsTcaDelayEntry contains the OAM-PM delay TCA statistics for the combination of an OAM-PM session name, test type, bin type, and direction (e.g. {'oam_pm_sess_1', 'dmm(1)', 'ifdv(3)', 'twoWay(3)}'). Nine rows are created/destroyed in this table when a delay test is created/destroyed. A delay test is created/destroyed using tmnxOamPmCfgDelayDmmRowStatus or tmnxOamPmCfgTwampLtRowStatus. The nine rows are indexed by the session name, the test type, and the nine combinations of bin type and direction.</p> <p>Table description (for tmnxOamPmStsTcaDelayTable): tmnxOamPmStsTcaDelayTable contains statistics for delay-based OAM-PM Threshold Crossing Alerts (TCAs).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ethernetOam.CfmDmmSession • sas.TWLSession 		
active [Active] (tmnxOamPmStsTcaDelayOperState)	int	The value of tmnxOamPmStsTcaDelayOperState indicates the operational state of delay-based TCAs for the specified indices.
direction [Direction] (tmnxOamPmCfgForwardBackward2Way)	int	The value of tmnxOamPmCfgForwardBackward2Way specifies the direction of the row to be configured or read.
lastTime [Last Time] (tmnxOamPmStsTcaDelayLastTime)	String	The value of tmnxOamPmStsTcaDelayLastTime indicates the UTC date and time at the start of the measurement interval which generated the most recent delay-based Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no TCAs have been generated for the specified indices since system start up.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>LossTCAAgStats</p> <p>MIB entry name: tmnxOamPmStsTcaLossFwBwAgEntry</p> <p>Entry description: tmnxOamPmStsTcaLossFwBwAgEntry contains the TCA statistics for the forward, backward, or aggregate direction of one OAM-PM loss test. For example, a row may contain TCA statistics for the forward direction for the SLM test belonging to OAM-PM session OAM_PM_Eth_session_1.</p> <p>Table description (for tmnxOamPmStsTcaLossFwBwAgTable): tmnxOamPmStsTcaLossFwBwAgTable contains statistics for loss-based OAM-PM Threshold Crossing Alerts (TCAs). flrActive [Flr Active] (tmnxOamPmStsTcaLossAvgFlrOperSt)	int	The value of tmnxOamPmStsTcaLossAvgFlrOperSt indicates the operational state of Average Frame Loss Ratio (FLR) TCAs for the specified indices.
flrLastTime [Flr Last Time] (tmnxOamPmStsTcaLossAvgFlrLstTime)	String	The value of tmnxOamPmStsTcaLossAvgFlrLstTime indicates the UTC date and time at the start of the measurement interval which generated the most recent Average Frame Loss Ratio (FLR) Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no Average FLR TCAs have been generated for the specified indices since system start up.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PmSessionBaseStats</p>		
<p>MIB entry name: tmnxOamPmStsBaseEntry</p>		
<p>Entry description: tmnxOamPmStsBaseEntry contains the base statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a test is started (e.g. using tmnxOamPmCfgDelayDmmAdminStatus and tmnxOamPmCfgDelayDmmOnDmndStatus). At that time, a row for the current interval (with the index value tmnxOamPmStsIntvlNum=1) is created for each row with a matching session name in tmnxOamPmCfgMeasIntvlTable. In addition, a row is created in this table for the test's 'miRaw(1)' interval. After that, the timed creation and destruction of rows in this table is explained using the following example. Suppose the configured number of intervals to be retained is as follows (where index columns are underlined with octothorpes, and 'tmnxOamPm' is abbreviated as '_'): <u>_CfgSessName</u> <u>_CfgMeasIntvlDuration</u> <u>_CfgMeasIntvlsStored</u> ##### ##### 'mySess1' 'mi15Minutes(2)' 3 Suppose statistics collection started at t = 0 (minutes). Suppose the following rows exist in tmnxOamPmStsBaseTable at t = 59 (minutes): <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 1 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 The interval numbers are assigned as follows: 1 - the historical interval ended at t = 15 minutes 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the current interval Then, after the next 15 minute interval ends (e.g. at t = 61 minutes), the following rows will exist: <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 5 The interval numbers are assigned as follows: 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the historical interval ended at t = 60 minutes 5 - the current interval The row with interval number 1 was destroyed, because tmnxOamPmCfgMeasIntvlsStored=3 specifies that at most three historical intervals be retained. Rows are also destroyed in this table when the corresponding tmnxOamPmCfgMeasIntvlTable row is destroyed. When the index value tmnxOamPmStsMeasIntvlDuration is 'miRaw(1)', only one interval is available (i.e. tmnxOamPmStsIntvlNum = 1). When a test is running, the measurement interval data set for a test's 'miRaw(1)' measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. The change to the objects in the specified row is as follows. Object Change on Clear Operation tmnxOamPmStsBaseOperStatus No change tmnxOamPmStsBaseSuspect Set to 'true(1)' tmnxOamPmStsBaseStartTime Set to UTC time of the clear operation tmnxOamPmStsBaseElapsedTime Set to zero tmnxOamPmStsBaseTestFramesTx Set to zero tmnxOamPmStsBaseTestFramesRx Set to zero Measurement interval data sets for measurement interval durations other than 'miRaw(1)' cannot be cleared.</p>		
<p>Table description (for tmnxOamPmStsBaseTable): tmnxOamPmStsBaseTable contains the base statistics for OAM Performance Monitoring Measurement Interval Data Sets. The statistics in this table are common to all test types (e.g. DMM and SLM tests).</p>		
<p>Supports realtime plotting</p>		
<p>Supports scheduled collection</p>

<ul style="list-style-type: none"> • ethernetoam.CfmDmmSession • ethernetoam.CfmLmmSession • ethernetoam.CfmSlmSession 		

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmStatsElapsedTime [Pm Stats Elapsed Time] (tmnxOamPmStsBaseElapsedTime)	long	The value of tmnxOamPmStsBaseElapsedTime indicates the time elapsed since data collection started for the specified measurement interval data set.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
pmStatsOperStatus [Pm Stats Oper Status] (tmnxOamPmStsBaseOperStatus)	int	The value of tmnxOamPmStsBaseOperStatus indicates the operational status of the specified measurement interval data set. If the interval is historical and the operational status is 'inprogress(1)', the interval is closing (i.e. waiting for a response for the final test request sent).
pmStatsPduRx [Pm Stats Pdu Rx] (tmnxOamPmStsBaseTestFramesRx)	long	The value of tmnxOamPmStsBaseTestFramesRx indicates the number of test frames received for the specified measurement interval data set.
pmStatsPduTx [Pm Stats Pdu Tx] (tmnxOamPmStsBaseTestFramesTx)	long	The value of tmnxOamPmStsBaseTestFramesTx indicates the number of test frames sent for the specified measurement interval data set.
pmStatsStartTime [Pm Stats Start Time] (tmnxOamPmStsBaseStartTime)	String	The value of tmnxOamPmStsBaseStartTime indicates the start time (in UTC) of the specified measurement interval data set.
pmStatsSuspect [Pm Stats Suspect] (tmnxOamPmStsBaseSuspect)	boolean	The value of tmnxOamPmStsBaseSuspect indicates whether or not the specified measurement interval data set contains suspect information.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsTestType [Pm Stats Test Type] (tmnxOamPmStsBaseTestType)	int	The value of tmnxOamPmStsBaseTestType specifies the type of test for which statistics are to be read (e.g. 'dmm(1)').
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>PrefixSrvStats</p> <p>MIB entry name: tmnxTwampSrvPrefixEntry</p> <p>Entry description: tmnxTwampSrvPrefixEntry contains the TWAMP server configuration information for the IP prefix specified by the index values. Rows in this table are created and destroyed using the tmnxTwampSrvPrefixRowStatus object.</p> <p>Table description (for tmnxTwampSrvPrefixTable): tmnxTwampSrvPrefixTable contains per-prefix TWAMP server configuration information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
srvPfxConnCount [Srv Pfx Conn Count] (tmnxTwampSrvPfxConnCount)	long	The value of tmnxTwampSrvPfxConnCount indicates, for the prefix specified by the index values, the number of control connections currently managed by the TWAMP server.
srvPfxConnsRejected [Srv Pfx Conns Rejected] (tmnxTwampSrvPfxConnsRejected)	long	The value of tmnxTwampSrvPfxConnsRejected indicates, for the prefix specified by the index values, the number of control connection requests which have been rejected by the TWAMP server. An example reject reason: the prefix's limit on the number of active connections has been reached.
srvPfxSessionCount [Srv Pfx Session Count] (tmnxTwampSrvPfxSessionCount)	long	The value of tmnxTwampSrvPfxSessionCount indicates, for the prefix specified by the index values, the number of currently in-progress TWAMP test sessions.
srvPfxTestPacketsRx [Srv Pfx Test Packets Rx] (tmnxTwampSrvPfxTestPacketsRx)	long	The value of tmnxTwampSrvPfxTestPacketsRx indicates, for the prefix specified by the index values, the number of TWAMP test packets received by the TWAMP server.
srvPfxTestPacketsTx [Srv Pfx Test Packets Tx] (tmnxTwampSrvPfxTestPacketsTx)	long	The value of tmnxTwampSrvPfxTestPacketsTx indicates, for the prefix specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
srvPfxTestSessAbort [Srv Pfx Test Sess Abort] (tmnxTwampSrvPfxTestSessAbort)	long	The value of tmnxTwampSrvPfxTestSessAbort indicates, for the prefix specified by the index values, the number of test sessions aborted by the TWAMP server.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
srvPfxTestSessCompleted [Srv Pfx Test Sess Completed] (tmnxTwampSrvPfxTestSessCompleted)	long	The value of tmnxTwampSrvPfxTestSessCompleted indicates, for the prefix specified by the index values, the number of test sessions completed by the TWAMP server.
srvPfxTestSessRejected [Srv Pfx Test Sess Rejected] (tmnxTwampSrvPfxTestSessRejected)	long	The value of tmnxTwampSrvPfxTestSessRejected indicates, for the prefix specified by the index values, the number of test sessions rejected by the TWAMP server.
<p>SrvConnsStats</p> <p>MIB entry name: tmnxTwampSrvConnStatsEntry</p> <p>Entry description: tmnxTwampSrvConnStatsEntry contains the statistics for the TWAMP control connection specified by the index values. A row is created by the system when a TWAMP control connection is established.</p> <p>Table description (for tmnxTwampSrvConnStatsTable): tmnxTwampSrvConnStatsTable contains the statistics for each active control connection managed by the TWAMP server.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
clientAddr [Client Addr] (tmnxTwampSrvConnClientAddr)	String	The value of tmnxTwampSrvConnClientAddr specifies the TWAMP client's address. This is the fifth index for tmnxTwampSrvConnStatsTable.
clientAddrType [Client Addr Type] (tmnxTwampSrvConnClientAddrType)	int	The value of tmnxTwampSrvConnClientAddrType specifies the type of tmnxTwampSrvConnClientAddr. This is the fourth index for tmnxTwampSrvConnStatsTable.
connIdleTime [Conn Idle Time] (tmnxTwampSrvConnIdleTime)	long	The value of tmnxTwampSrvConnIdleTime specifies the elapsed time, in seconds, since a TWAMP message was received on this control connection. When this value exceeds tmnxTwampSrvInactTimeout, the connection will be torn down.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
connSessionCount [Conn Session Count] (tmnxTwampSrvConnSessionCount)	long	The value of tmnxTwampSrvConnSessionCount indicates, for the connection specified by the index values, the number of currently in-progress TWAMP test sessions.
connState [Conn State] (tmnxTwampSrvConnState)	int	The value of tmnxTwampSrvConnState indicates the operational state of a control connection managed by the TWAMP server. Code points: setUp(1) - the connection is being established ready(2) - the connection is ready to accept test sessions running(3) - the connection is running a test.
connTestPacketsRx [Conn Test Packets Rx] (tmnxTwampSrvConnTestPacketsRx)	long	The value of tmnxTwampSrvConnTestPacketsRx indicates, for the connection specified by the index values, the number of TWAMP test packets received by the TWAMP server.
connTestPacketsTx [Conn Test Packets Tx] (tmnxTwampSrvConnTestPacketsTx)	long	The value of tmnxTwampSrvConnTestPacketsTx indicates, for the connection specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
connTestSessComplete [Conn Test Sess Complete] (tmnxTwampSrvConnTestSessComplete)	long	The value of tmnxTwampSrvConnTestSessComplete indicates, for the connection specified by the index values, the number of test sessions completed by the TWAMP server.
connTestSessRejected [Conn Test Sess Rejected] (tmnxTwampSrvConnTestSessRejected)	long	The value of tmnxTwampSrvConnTestSessRejected indicates, for the connection specified by the index values, the number of test sessions rejected by the TWAMP server.
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
seqNum [Seq Num] (tmnxTwampSrvConnSeqNum)	int	The value of tmnxTwampSrvConnSeqNum specifies this control connection's sequence number. This is the sixth index for tmnxTwampSrvConnStatsTable - it allows n>1 rows (i.e. n>1 connections) for one client.
<p>TWLBInStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlBinEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlBinEntry contains the TWAMP-Light frame delay per-bin statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a corresponding row is created in tmnxOamPmStsDelayTwlTable. If the tmnxOamPmStsDelayTwlTable row is created with the index value tmnxOamPmCfgBinType = 'fd(1)', then the the number of rows created in this table is tmnxOamPmCfgBinGroupFdBinCount. Similarly, 'fdr(2)' and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsDelayTwlTable row is destroyed. When a test is running, the TWAMP-Light statistics for a test's raw (i.e. 'miRaw(1)') measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session..</p> <p>Table description (for tmnxOamPmStsDelayTwlBinTable): tmnxOamPmStsDelayTwlBinTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay per-bin statistics. The frame delay per-bin statistics kept for TWAMP-Light tests are the same as the frame delay per-bin statistics specified for Ethernet DMM (Delay Measurement Message) tests in MEF-35 requirement R66.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TWLBIn</p>		

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBinBwdCount [Delay Twl Bin Bwd Count] (tmnxOamPmStsDelayTwlBinBwdCount)	long	The value of tmnxOamPmStsDelayTwlBinBwdCount indicates the number of TWAMP-Light frame delay measurements in the backward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the backward direction in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinFwdCount [Delay Twl Bin Fwd Count] (tmnxOamPmStsDelayTwlBinFwdCount)	long	The value of tmnxOamPmStsDelayTwlBinFwdCount indicates the number of TWAMP-Light frame delay measurements in the forward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 9 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the forward direction in the first interval of 'twlSess1' that fit in the highest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinNum [Delay Twl Bin Num] (tmnxOamPmStsDelayTwlBinNum)	long	The value of tmnxOamPmStsDelayTwlBinNum specifies the bin number of the statistics to be read.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBintwowayCount [Delay Twl Bintwoway Count] (tmnxOamPmStsDelayTwlBin2wyCount)	long	The value of tmnxOamPmStsDelayTwlBin2wyCount indicates the number of TWAMP-Light two-way frame delay measurements that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light two-way frame delay measurements (in microseconds) in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TWLSessionStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlEntry contains the TWAMP-Light frame delay summary statistics for one OAM Performance Monitoring Measurement Interval Data Set. When a row is created in tmnxOamPmStsBaseTable with tmnxOamPmStsBaseTestType = 'twampLight(3)' (provided tmnxOamPmCfgTwampLtCollectStats is 'collectDelayStats(1)' or 'collectDelayAndLossStats(3)'), three rows are created in this table. The three rows have the following values in the tmnxOamPmCfgBinType index column: 'fd(1)', 'fdr(2)', and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsBaseTable row is destroyed. When a TWAMP-Light test is running, all the test's raw statistics can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsDelayTwlTable): tmnxOamPmStsDelayTwlTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay summary statistics. The frame delay summary statistics kept for TWAMP-Light tests are the same as the frame delay summary statistics specified for Ethernet DMM (Delay Measurement Message) tests in MEF-35 requirement R66.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TWLSession</p>		
delayTwl2wyAvg [Delay Twl 2 wy Avg] (tmnxOamPmStsDelayTwl2wyAvg)	long	The value of tmnxOamPmStsDelayTwl2wyAvg indicates the average two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMax [Delay Twl 2 wy Max] (tmnxOamPmStsDelayTwl2wyMax)	long	The value of tmnxOamPmStsDelayTwl2wyMax indicates the maximum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMin [Delay Twl 2 wy Min] (tmnxOamPmStsDelayTwl2wyMin)	long	The value of tmnxOamPmStsDelayTwl2wyMin indicates the minimum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBwdAvg [Delay Twl Bwd Avg] (tmnxOamPmStsDelayTwlBwdAvg)	long	The value of tmnxOamPmStsDelayTwlBwdAvg indicates the average delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMax [Delay Twl Bwd Max] (tmnxOamPmStsDelayTwlBwdMax)	long	The value of tmnxOamPmStsDelayTwlBwdMax indicates the maximum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMin [Delay Twl Bwd Min] (tmnxOamPmStsDelayTwlBwdMin)	long	The value of tmnxOamPmStsDelayTwlBwdMin indicates the minimum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdAvg [Delay Twl Fwd Avg] (tmnxOamPmStsDelayTwlFwdAvg)	long	The value of tmnxOamPmStsDelayTwlFwdAvg indicates the average delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMax [Delay Twl Fwd Max] (tmnxOamPmStsDelayTwlFwdMax)	long	The value of tmnxOamPmStsDelayTwlFwdMax indicates the maximum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMin [Delay Twl Fwd Min] (tmnxOamPmStsDelayTwlFwdMin)	long	The value of tmnxOamPmStsDelayTwlFwdMin indicates the minimum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
TwampSrvStats MIB entry name: tmnxTwampStatisticsScalarObjs Supports realtime plotting Supports scheduled collection Monitored class: sas.TwampSrv		
twampSrvConnectionCount [Twamp Srv Connection Count] (tmnxTwampSrvConnectionCount)	long	The value of tmnxTwampSrvConnectionCount indicates the number of control connections currently managed by the TWAMP server.
twampSrvConnectionsRejected [Twamp Srv Connections Rejected] (tmnxTwampSrvConnectionsRejected)	long	The value of tmnxTwampSrvConnectionsRejected indicates the total number of control connection requests which have been rejected by the TWAMP server. Example reject reasons: the server's limit on the number of active connections has been reached; the client's IP address does not match any of the prefixes configured on the TWAMP server.
twampSrvOperStat [Twamp Srv Oper Stat] (tmnxTwampSrvOperState)	long	The value of tmnxTwampSrvOperState indicates if the TWAMP server is operationally 'inService(2)', or 'outOfService(3)'.
twampSrvSessionCount [Twamp Srv Session Count] (tmnxTwampSrvSessionCount)	long	The value of tmnxTwampSrvSessionCount indicates the number of currently in-progress TWAMP test sessions.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
twampSrvTestPacketsRx [Twamp Srv Test Packets Rx] (tmnxTwampSrvTestPacketsRx)	long	The value of tmnxTwampSrvTestPacketsRx indicates the total number of TWAMP test packets received by the TWAMP server.
twampSrvTestPacketsTx [Twamp Srv Test Packets Tx] (tmnxTwampSrvTestPacketsTx)	long	The value of tmnxTwampSrvTestPacketsTx indicates the total number of TWAMP test packets sent by the TWAMP server.
twampSrvTestSessAborted [Twamp Srv Test Sess Aborted] (tmnxTwampSrvTestSessAborted)	long	The value of tmnxTwampSrvTestSessAborted indicates the total number of test sessions aborted by the TWAMP server.
twampSrvTestSessCompleted [Twamp Srv Test Sess Completed] (tmnxTwampSrvTestSessCompleted)	long	The value of tmnxTwampSrvTestSessCompleted indicates the total number of test sessions completed by the TWAMP server.
twampSrvTestSessRejected [Twamp Srv Test Sess Rejected] (tmnxTwampSrvTestSessRejected)	long	The value of tmnxTwampSrvTestSessRejected indicates the total number of test sessions rejected by the TWAMP server.
twampSrvUpTime [Twamp Srv Up Time] (tmnxTwampSrvUpTime)	long	The value of tmnxTwampSrvUpTime indicates the time elapsed, in seconds, since the most recent transition of tmnxTwampSrvOperState to 'inService(2)'. If tmnxTwampSrvOperState is not 'inService(2)', zero is returned.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TwLossSessionStats</p> <p>MIB entry name: tmnxOamPmStsLossTwEntry</p> <p>Entry description: tmnxOamPmStsLossTwEntry contains the TWAMP-Light loss test statistics for one OAM Performance Monitoring Measurement Interval Data Set. pmTwAvailIndBwd [Pm Twl Avail Ind Bwd] (tmnxOamPmStsLossTwAvailIndBwd)	long	The value of tmnxOamPmStsLossTwAvailIndBwd indicates the number of availability indicators evaluated as Available in the backward direction for the specified measurement interval data set.
pmTwAvailIndFwd [Pm Twl Avail Ind Fwd] (tmnxOamPmStsLossTwAvailIndFwd)	long	The value of tmnxOamPmStsLossTwAvailIndFwd indicates the number of availability indicators evaluated as Available in the forward direction for the specified measurement interval data set.
pmTwAvgFlrBwd [Pm Twl Avg Flr Bwd] (tmnxOamPmStsLossTwAvgFlrBwd)	float	The value of tmnxOamPmStsLossTwAvgFlrBwd indicates the average Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwAvgFlrFwd [Pm Twl Avg Flr Fwd] (tmnxOamPmStsLossTwAvgFlrFwd)	float	The value of tmnxOamPmStsLossTwAvgFlrFwd indicates the average Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwlChliBwd [Pm Twl Chli Bwd] (tmnxOamPmStsLossTwlChliBwd)	long	The value of tmnxOamPmStsLossTwlChliBwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the backward direction for the specified measurement interval data set.
pmTwlChliFwd [Pm Twl Chli Fwd] (tmnxOamPmStsLossTwlChliFwd)	long	The value of tmnxOamPmStsLossTwlChliFwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the forward direction for the specified measurement interval data set.
pmTwlHliBwd [Pm Twl Hli Bwd] (tmnxOamPmStsLossTwlHliBwd)	long	The value of tmnxOamPmStsLossTwlHliBwd indicates the number of High Loss Intervals (HLIs) in the backward direction for the specified measurement interval data set.
pmTwlHliFwd [Pm Twl Hli Fwd] (tmnxOamPmStsLossTwlHliFwd)	long	The value of tmnxOamPmStsLossTwlHliFwd indicates the number of High Loss Intervals (HLIs) in the forward direction for the specified measurement interval data set.
pmTwlMaxFlrBwd [Pm Twl Max Flr Bwd] (tmnxOamPmStsLossTwlMaxFlrBwd)	float	The value of tmnxOamPmStsLossTwlMaxFlrBwd indicates the maximum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlMaxFlrFwd [Pm Twl Max Flr Fwd] (tmnxOamPmStsLossTwlMaxFlrFwd)	float	The value of tmnxOamPmStsLossTwlMaxFlrFwd indicates the maximum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmTwlMinFlrBwd [Pm Twl Min Flr Bwd] (tmnxOamPmStsLossTwlMinFlrBwd)	float	The value of tmnxOamPmStsLossTwlMinFlrBwd indicates the minimum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlMinFlrFwd [Pm Twl Min Flr Fwd] (tmnxOamPmStsLossTwlMinFlrFwd)	float	The value of tmnxOamPmStsLossTwlMinFlrFwd indicates the minimum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiRxBwd [Pm Twl Rx Bwd] (tmnxOamPmStsLossTwiRxBwd)	long	The value of tmnxOamPmStsLossTwiRxBwd indicates the number of TWAMP-Light reply frames received in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwiRxFwd [Pm Twl Rx Fwd] (tmnxOamPmStsLossTwiRxFwd)	long	The value of tmnxOamPmStsLossTwiRxFwd indicates the number of TWAMP-Light request frames received in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwiTxBwd [Pm Twl Tx Bwd] (tmnxOamPmStsLossTwiTxBwd)	long	The value of tmnxOamPmStsLossTwiTxBwd indicates the number of TWAMP-Light reply frames transmitted in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwiTxFwd [Pm Twl Tx Fwd] (tmnxOamPmStsLossTwiTxFwd)	long	The value of tmnxOamPmStsLossTwiTxFwd indicates the number of TWAMP-Light request frames transmitted in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwiUnavailIndBwd [Pm Twl Unavail Ind Bwd] (tmnxOamPmStsLossTwiUnavailIndBwd)	long	The value of tmnxOamPmStsLossTwiUnavailIndBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction for the specified measurement interval data set.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiUnavailIndFwd [Pm Twl Unavail Ind Fwd] (tmnxOamPmStsLossTwiUnavlIndFwd)	long	The value of tmnxOamPmStsLossTwiUnavlIndFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction for the specified measurement interval data set.
pmTwiUndtAvlBwd [Pm Twl Undt Avl Bwd] (tmnxOamPmStsLossTwiUndtAvlBwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlBwd indicates the number of availability indicators evaluated as Available in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtAvlFwd [Pm Twl Undt Avl Fwd] (tmnxOamPmStsLossTwiUndtAvlFwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlFwd indicates the number of availability indicators evaluated as Available in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiUndtUnavlBwd [Pm Twl Undt Unavl Bwd] (tmnxOamPmStsLossTwiUndtUnavlBwd)	long	The value of tmnxOamPmStsLossTwiUndtUnavlBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtUnavlFwd [Pm Twl Undt Unavl Fwd] (tmnxOamPmStsLossTwiUndtUnavlFwd)	long	The value of tmnxOamPmStsLossTwiUndtUnavlFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 150 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TwIReflectorStats</p> <p>MIB entry name: tmnxOamPmStsTwIRflEntry</p> <p>Entry description: tmnxOamPmStsTwIRflEntry contains the statistics for the specified OAM Performance Monitoring TWAMP-Light reflector. SROS creates a row in this table when a corresponding row is created in tmnxOamPmCfgTwIRflTable. SROS destroys a row in this table when a corresponding row is destroyed in tmnxOamPmCfgTwIRflTable. The encoding of the index is explained in the DESCRIPTION clause for tmnxOamPmCfgTwIRflEntry.</p> <p>Table description (for tmnxOamPmStsTwIRflTable): tmnxOamPmStsTwIRflTable contains the statistics for OAM Performance Monitoring TWAMP-Light reflectors.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TwIReflector</p>		
framesRx [Frames Rx] (tmnxOamPmStsTwIRflFramesRx)	long	The value of tmnxOamPmStsTwIRflFramesRx indicates the number of TWAMP-Test frames received by the specified reflector.
framesTx [Frames Tx] (tmnxOamPmStsTwIRflFramesTx)	long	The value of tmnxOamPmStsTwIRflFramesTx indicates the number of TWAMP-Test frames transmitted by the specified reflector.
upTime [Up Time] (tmnxOamPmStsTwIRflUpTime)	long	The value of tmnxOamPmStsTwIRflUpTime indicates the time elapsed since the most recent transition of the reflector's administrative status to 'enabled(1)'. Zero is returned if the reflector's administrative status is 'disabled(2)'.

Table 151 service statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CemSapStats MIB entry name: sapCemStatsEntry Entry description: Statistics for a specific CEM SAP. Table description (for sapCemStatsTable): A table that contains CEM SAP statistics. Supports realtime plotting Supports scheduled collection Monitored class: service.L2AccessInterface</p>		
cemStatsEgressDroppedPkts [Cem Stats Egress Dropped Pkts] (sapCemStatsEgressDroppedPkts)	long	The value of sapCemStatsEgressDroppedPkts indicates the total number of packets that were dropped due to errors.
cemStatsEgressESs [Cem Stats Egress ESs] (sapCemStatsEgressESs)	long	The value of sapCemStatsEgressESs indicates the number of Error Seconds (ESs) encountered. Any malformed packet, seq. error, LOPS and similar are considered as error seconds.
cemStatsEgressFailureCounts [Cem Stats Egress Failure Counts] (sapCemStatsEgressFailureCounts)	long	The value of sapCemStatsEgressFailureCounts indicates the number failure events. A failure event begins when the LOPS failure is declared, and ends when the failure is cleared.
cemStatsEgressForwardedPkts [Cem Stats Egress Forwarded Pkts] (sapCemStatsEgressForwardedPkts)	long	The value of sapCemStatsEgressForwardedPkts indicates the number of packets that were successfully forwarded.
cemStatsEgressJtrBfrDepth [Cem Stats Egress Jtr Bfr Depth] (sapCemStatsEgressJtrBfrDepth)	long	The value of sapCemStatsEgressJtrBfrDepth indicates the current packet depth of the jitter buffer.
cemStatsEgressJtrBfrOverruns [Cem Stats Egress Jtr Bfr Overruns] (sapCemStatsEgressJtrBfrOverruns)	long	The value of sapCemStatsEgressJtrBfrOverruns indicates the number of times a packet was dropped because it could not fit in the jitter buffer.

Table 151 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cemStatsEgressJtrBfrUnderruns [Cem Stats Egress Jtr Bfr Underruns] (sapCemStatsEgressJtrBfrUnderruns)	long	The value of sapCemStatsEgressJtrBfrUnderruns indicates the number of times a packet needed to be played out and the jitter buffer was empty.
cemStatsEgressLBitDropped [Cem Stats Egress LBit Dropped] (sapCemStatsEgressLBitDropped)	long	The value of sapCemStatsEgressLBitDropped indicates the number of packets dropped due to the L bit set by the far end.
cemStatsEgressMalformedPkts [Cem Stats Egress Malformed Pkts] (sapCemStatsEgressMalformedPkts)	long	The value of sapCemStatsEgressMalformedPkts indicates the number of packets detected with unexpected size, or bad headers' stack.
cemStatsEgressMisOrderDropped [Cem Stats Egress Mis Order Dropped] (sapCemStatsEgressMisOrderDropped)	long	The value of sapCemStatsEgressMisOrderDropped indicates the number of packets detected out of order (via control word sequence numbers), and could not be re-ordered, or could not be placed in the jitter buffer because it was out of the current window.
cemStatsEgressMissingPkts [Cem Stats Egress Missing Pkts] (sapCemStatsEgressMissingPkts)	long	The value of sapCemStatsEgressMissingPkts indicates the number of missing packets (as detected via control word sequence number gaps).
cemStatsEgressMultipleDropped [Cem Stats Egress Multiple Dropped] (sapCemStatsEgressMultipleDropped)	long	The value of sapCemStatsEgressMultipleDropped indicates the number of packets dropped due to multiple sequence numbers.
cemStatsEgressOverrunCounts [Cem Stats Egress Overrun Counts] (sapCemStatsEgressOverrunCounts)	long	The value of sapCemStatsEgressOverrunCounts indicates the number of times the jitter buffer went into an overrun state.
cemStatsEgressPktsReOrder [Cem Stats Egress Pkts Re Order] (sapCemStatsEgressPktsReOrder)	long	The value of sapCemStatsEgressPktsReOrder indicates the number of packets detected out of sequence (via control word sequence number), but successfully re-ordered.

Table 151 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cemStatsEgressSESSs [Cem Stats Egress SESSs] (sapCemStatsEgressSESSs)	long	The value of sapCemStatsEgressSESSs indicates the number of Severely Error Seconds (SESSs) encountered. This is when more than 30 percent of the packets within a one second window are missing.
cemStatsEgressUASs [Cem Stats Egress UASs] (sapCemStatsEgressUASs)	long	The value of sapCemStatsEgressUASs indicates the number of Unavailable Seconds (UASs) encountered. Any consecutive ten seconds of SESSs are counted as one UAS.
cemStatsEgressUnderrunCounts [Cem Stats Egress Underrun Counts] (sapCemStatsEgressUnderrunCounts)	long	The value of sapCemStatsEgressUnderrunCounts indicates the number of times the jitter buffer went into an underrun state.
cemStatsIngressDroppedPkts [Cem Stats Ingress Dropped Pkts] (sapCemStatsIngressDroppedPkts)	long	The value of sapCemStatsIngressDroppedPkts indicates the total number of packets that were dropped due to errors.
cemStatsIngressForwardedPkts [Cem Stats Ingress Forwarded Pkts] (sapCemStatsIngressForwardedPkts)	long	The value of sapCemStatsIngressForwardedPkts indicates the number of packets that were successfully forwarded.

Supports realtime plotting Does not support scheduled collection Monitored classes:</p> <ul style="list-style-type: none"> • service.IPsecInterface • service.L2AccessInterface • service.L3AccessInterface 		
forwardedInProfOctets [Forwarded In Prof Octets] (sapInqQosMeterStatsForwardedInProfOctets)	java. math. BigInteger	The number of in-profile octets (rate below CIR) forwarded by the ingress Qchip.

Table 151 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardedInProfPackets [Forwarded In Prof Packets] (sapIngQosMeterStatsForwardedInProfPackets)	java. math. BigInteger	The number of in-profile packets (rate below CIR) forwarded by the ingress Qchip.
forwardedOutProfOctets [Forwarded Out Prof Octets] (sapIngQosMeterStatsForwardedOutProfOctets)	java. math. BigInteger	The number of out-of-profile octets (rate above CIR) forwarded by the ingress Qchip.
forwardedOutProfPackets [Forwarded Out Prof Packets] (sapIngQosMeterStatsForwardedOutProfPackets)	java. math. BigInteger	The number of out-of-profile packets (rate above CIR) forwarded by the ingress Qchip.
meterId [Meter Id] (sapIngQosMeterId)	long	The index of the ingress QoS meter of this SAP.
Y1564TestHeadBiDirStats MIB entry name: tmnxTestHdSessEntry Entry description: Information about a particular test head result. Entries are read-only for the user. Table description (for tmnxTestHdSessTable): This table maintains the mapping of a particular forwarding class traffic into the specified queue. Supports realtime plotting Supports scheduled collection Monitored class: service.Y1564TestHeadBiDirectional		
maxLatency [Max Latency] (tmnxTestHdSessMaxLatency)	java. math. BigInteger	The Latency measured maximum for this test

Table 151 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
measuredJitter [Measured Jitter] (tmnxTestHdSessMeasuredJitter)	long	The Jitter measured for this test
measuredLatency [Measured Latency] (tmnxTestHdSessMeasuredLatency)	java. math. BigInteger	The Latency measured for this test
minLatency [Min Latency] (tmnxTestHdSessMinLatency)	java. math. BigInteger	The Latency measured minimum for this test
packetsReceivedCount [Packets Received Count] (tmnxTestHdSessRecvCount)	java. math. BigInteger	The total number of packets received
packetsTransferredCount [Packets Transferred Count] (tmnxTestHdSessTransCount)	java. math. BigInteger	The total number of packets injected

Table 152 sitesec statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CpmFilterQueueStats</p> <p>MIB entry name: tCpmFilterQueueStatsEntry</p> <p>Entry description: Each row entry represents the statistics related to the tCpmFilterQueueEntry indexed by the same tCpmFilterQueueId. Entries are created when tCpmFilterQueueEntry rows are created.</p> <p>Table description (for tCpmFilterQueueStatsTable): The tCpmFilterQueueStatsTable has a stats entry for each CPM filter queue configured on this system. This table is not supported on SR-1 and ESS-1, where the value of TIMETRA-CHASSIS-MIB::tmnxChassisType is '5'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sitesec.CpmFilterQueue</p>		
droppedInOctets [Dropped In Octets] (tCpmFilterQInProfileDropOctets)	java. math. BigInteger	The value of tCpmFilterQInProfileDropOctets indicates the number of octets complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedInPackets [Dropped In Packets] (tCpmFilterQInProfileDropPkts)	java. math. BigInteger	The value of tCpmFilterQInProfileDropPkts indicates the number of packets complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedOutOctets [Dropped Out Octets] (tCpmFilterQOutProfileDropOctets)	java. math. BigInteger	The value of tCpmFilterQOutProfileDropOctets indicates the number of octets not complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedOutPackets [Dropped Out Packets] (tCpmFilterQOutProfileDropPkts)	java. math. BigInteger	The value of tCpmFilterQOutProfileDropPkts indicates the number of packets not complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
forwardedInOctets [Forwarded In Octets] (tCpmFilterQInProfileFwdOctets)	java. math. BigInteger	The value of tCpmFilterQInProfileFwdOctets indicates the number of octets complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.

Table 152 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardedInPackets [Forwarded In Packets] (tCpmFilterQInProfileFwdPkts)	java. math. BigInteger	The value of tCpmFilterQInProfileFwdPkts indicates the number of packets complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.
forwardedOutOctets [Forwarded Out Octets] (tCpmFilterQOutProfileFwdOctets)	java. math. BigInteger	The value of tCpmFilterQOutProfileFwdOctets indicates the number of octets not complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.
forwardedOutPackets [Forwarded Out Packets] (tCpmFilterQOutProfileFwdPkts)	java. math. BigInteger	The value of tCpmFilterQOutProfileFwdPkts indicates the number of packets not complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.
<p>CpmlpFilterStats MIB entry name: tCpmlpFilterStatsEntry Entry description: Each row entry represents the statistics related to the tCpmlpFilterEntry indexed by the same tCpmlpFilterEntryId. Entries are created when tCpmlpFilterEntry rows are created. Table description (for tCpmlpFilterStatsTable): The tCpmlpFilterStatsTable has a stats entry for each entry in each CPM filter configured on this system. This table is not supported on SR-1 and ESS-1, where the value of TIMETRA-CHASSIS-MIB::tmnxChassisType is '5'. Supports realtime plotting Supports scheduled collection Monitored class: sitesec.CpmlpFilterEntry</p>		
droppedPackets [Dropped Packets] (tCpmlpFilterStatsDroppedPkts)	java. math. BigInteger	The value of tCpmlpFilterStatsDroppedPkts indicates the number of packets dropped due to the tCpmlpFilterEntry with the same index.
forwardedPackets [Forwarded Packets] (tCpmlpFilterStatsForwardedPkts)	java. math. BigInteger	The value of tCpmlpFilterStatsForwardedPkts indicates the number of packets forwarded due to the tCpmlpFilterEntry with the same index.

Table 152 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MafEntryStats</p> <p>MIB entry name: tmnxIPMafMatchEntry</p> <p>Entry description: Each row entry contains information about a management access filter entry associated with a specific Management Access Filter (MAF). The filter criter is applied in order according to the value of tmnxIPMafMatchIndex. The match algorithm is exited upon the first match found and then the action specified is executed. For this reason, entries must be sequenced from most to least explicit. An entry where tmnxIPMafMatchAction has a value of 'none' is not active. Rows can only be created for tmnxGenMafType's: - ipv4 (1), and. - ipv6 (2). For mac Maf filters a dedicated table is provided (tmnxMacMafMatchTable).</p> <p>Table description (for tmnxIPMafMatchTable): This table replaces the tmnxMafMatchTable. It allows to define both IPv4 and IPv6 MAF IP entries. The tmnxIPMafMatchTable contains ipvx filter match criteria associated with Management Access Filters (MAFs) configured on the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sitesec.MafEntry</p>		
matchCount [Match Count] (tmnxIPMafMatchCount)	java. math. BigInteger	The value of tmnxIPMafMatchCount indicates the number of times a management packet has matched this filter entry.

Table 153 svt statistics

controlledSlipSeconds [Controlled Slip Seconds] (dsx1IntervalCSSs)	long	The number of Controlled Slip Seconds.
degradedMinutes [Degraded Minutes] (dsx1IntervalDMs)	long	The number of Degraded Minutes.
erroredSeconds [Errored Seconds] (dsx1IntervalESs)	long	The number of Errored Seconds.
intervalNumber [Interval Number] (dsx1IntervalNumber)	int	A number between 1 and 96, where 1 is the most recently completed 15 minute interval and 96 is the 15 minutes interval completed 23 hours and 45 minutes prior to interval 1.
lineCodingViolations [Line Coding Violations] (dsx1IntervalLCVs)	long	The number of Line Code Violations.
lineErroredSeconds [Line Errored Seconds] (dsx1IntervalLESs)	long	The number of Line Errored Seconds.
pBitCodingViolations [PBit Coding Violations] (dsx1IntervalPCVs)	long	The number of Path Coding Violations.
severelyErroredFramingSeconds [Severely Errored Framing Seconds] (dsx1IntervalSEFSs)	long	The number of Severely Errored Framing Seconds.
severelyErroredSeconds [Severely Errored Seconds] (dsx1IntervalSESSs)	long	The number of Severely Errored Seconds.

Table 154 tdmequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
unavailableSeconds [Unavailable Seconds] (dsx1IntervalUASs)	long	The number of Unavailable Seconds. This object may decrease if the occurrence of unavailable seconds occurs across an interval boundary.
<p>DS1TotalStats MIB entry name: dsx1TotalEntry Entry description: An entry in the DS1 Total table. Table description (for dsx1TotalTable): The DS1 Total Table contains the cumulative sum of the various statistics for the 24 hour period preceding the current interval. Supports realtime plotting Supports scheduled collection Monitored class: tdmequipment.DS1E1Channel</p>		
burstyErroredSeconds [Bursty Errored Seconds] (dsx1TotalBESs)	long	The number of Bursty Errored Seconds (BESs) encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
controlledSlipSeconds [Controlled Slip Seconds] (dsx1TotalCSSs)	long	The number of Controlled Slip Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
degradedMinutes [Degraded Minutes] (dsx1TotalDMs)	long	The number of Degraded Minutes (DMs) encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
erroredSeconds [Errored Seconds] (dsx1TotalESs)	long	The sum of Errored Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
lineCodingViolations [Line Coding Violations] (dsx1TotalLCVs)	long	The number of Line Code Violations (LCVs) encountered by a DS1 interface in the current 15 minute interval. Invalid 15 minute intervals count as 0.

Table 154 tdmequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lineErroredSeconds [Line Errored Seconds] (dsx1TotalLESSs)	long	The number of Line Errored Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
pBitCodingViolations [PBit Coding Violations] (dsx1TotalPCVs)	long	The number of Path Coding Violations encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
severelyErroredFramingSeconds [Severely Errored Framing Seconds] (dsx1TotalSEFSs)	long	The number of Severely Errored Framing Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
severelyErroredSeconds [Severely Errored Seconds] (dsx1TotalSESs)	long	The number of Severely Errored Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
unavailableSeconds [Unavailable Seconds] (dsx1TotalUASs)	long	The number of Unavailable Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.

Table 155 vpls statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>L2AccessInterfaceIgmppSnpgErrorStats</p> <p>MIB entry name: saplgmpSnpgStatsEntry</p> <p>Entry description: saplgmpSnpgStatsEntry is an entry in the saplgmpSnpgStatsTable. saplgmpSnpgImportPolicyDrops [Sap Igmp Snpg Import Policy Drops] (saplgmpSnpgImportPolicyDrops)	long	The value of the object saplgmpSnpgImportPolicyDrops indicates the number of times an IGMP Group or Source is dropped because of applying an import policy on this SAP.
saplgmpSnpgMaxNumGroupsDrops [Sap Igmp Snpg Max Num Groups Drops] (saplgmpSnpgMaxNumGroupsDrops)	long	The value of the object saplgmpSnpgMaxNumGroupsDrops indicates the number of times an IGMP Group is dropped because of exceeding the configured maximum number of groups on this SAP.
saplgmpSnpgRxBadEncodedPkts [Sap Igmp Snpg Rx Bad Encoded Pkts] (saplgmpSnpgRxBadEncodedPkts)	long	The value of the object saplgmpSnpgRxBadEncodedPkts indicates the number of IGMP packets dropped on this SAP because of a bad encoding.
saplgmpSnpgRxBadIgmppChksumPkts [Sap Igmp Snpg Rx Bad Igmp Chksum Pkts] (saplgmpSnpgRxBadIgmppChksumPkts)	long	The value of the object saplgmpSnpgRxBadIgmppChksumPkts indicates the number of dropped IGMP packets on this SAP because of a bad IGMP header checksum.
saplgmpSnpgRxBadIppChksumPkts [Sap Igmp Snpg Rx Bad Ip Chksum Pkts] (saplgmpSnpgRxBadIppChksumPkts)	long	The value of the object saplgmpSnpgRxBadIppChksumPkts indicates the number of dropped IGMP packets on this SAP because of a bad IPv4 header checksum.

Table 155 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
saplgmpSnpgrxBadLenPkts [Sap Igmp SnpgrxBadLenPkts] (saplgmpSnpgrxBadLenPkts)	long	The value of the object saplgmpSnpgrxBadLenPkts indicates the number of IGMP packets dropped on this SAP because of a bad length.
saplgmpSnpgrxNoRtrAlertPkts [Sap Igmp SnpgrxNoRtrAlertPkts] (saplgmpSnpgrxNoRtrAlertPkts)	long	The value of the object saplgmpSnpgrxNoRtrAlertPkts indicates the number of IGMP packets dropped on this SAP because the Router Alert Option in the IP packet is not set.
saplgmpSnpgrxWrongVersionPkts [Sap Igmp SnpgrxWrongVersionPkts] (saplgmpSnpgrxWrongVersionPkts)	long	The value of the object saplgmpSnpgrxWrongVersionPkts indicates the total number of IGMP packets with a wrong version received on this SAP.
saplgmpSnpgrxZeroSrcAdrPkts [Sap Igmp SnpgrxZeroSrcAdrPkts] (saplgmpSnpgrxZeroSrcAdrPkts)	long	The value of the object saplgmpSnpgrxZeroSrcAdrPkts indicates the number of IGMP packets dropped on this SAP because they contain a zero source IPv4 address.
saplgmpSnpgrSendQueryCfgDrops [Sap Igmp SnpgrSendQueryCfgDrops] (saplgmpSnpgrSendQueryCfgDrops)	long	The value of the object saplgmpSnpgrSendQueryCfgDrops indicates the number of times an IGMP Query is dropped because the object saplgmpSnpgrCfgSendQueries for this SAP is set to 'enabled(1)'.
<p>L2AccessInterfaceIgmprSnpgrStats</p> <p>MIB entry name: saplgmpSnpgrStatsEntry</p> <p>Entry description: saplgmpSnpgrStatsEntry is an entry in the saplgmpSnpgrStatsTable. Table 155 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapIgmPsnpgFwdGenQueries [Sap Igmp Snpg Fwd Gen Queries] (sapIgmPsnpgFwdGenQueries)	long	The value of the object sapIgmPsnpgFwdGenQueries indicates the number of IGMP General Queries forwarded on this SAP.
sapIgmPsnpgFwdGrpSpecQueries [Sap Igmp Snpg Fwd Grp Spec Queries] (sapIgmPsnpgFwdGrpSpecQueries)	long	The value of the object sapIgmPsnpgFwdGrpSpecQueries indicates the number of IGMP Group-Specific Queries forwarded on this SAP.
sapIgmPsnpgFwdUnknownType [Sap Igmp Snpg Fwd Unknown Type] (sapIgmPsnpgFwdUnknownType)	long	The value of the object sapIgmPsnpgFwdUnknownType indicates the number of IGMP unknown type packets forwarded on this SAP.
sapIgmPsnpgFwdV1Reports [Sap Igmp Snpg Fwd V1 Reports] (sapIgmPsnpgFwdV1Reports)	long	The value of the object sapIgmPsnpgFwdV1Reports indicates the number of IGMPv1 Reports forwarded on this SAP.
sapIgmPsnpgFwdV2Leaves [Sap Igmp Snpg Fwd V2 Leaves] (sapIgmPsnpgFwdV2Leaves)	long	The value of the object sapIgmPsnpgFwdV2Leaves indicates the number of IGMPv2 Leaves forwarded on this SAP.
sapIgmPsnpgFwdV2Reports [Sap Igmp Snpg Fwd V2 Reports] (sapIgmPsnpgFwdV2Reports)	long	The value of the object sapIgmPsnpgFwdV2Reports indicates the number of IGMPv2 Reports forwarded on this SAP.
sapIgmPsnpgFwdV3Reports [Sap Igmp Snpg Fwd V3 Reports] (sapIgmPsnpgFwdV3Reports)	long	The value of the object sapIgmPsnpgFwdV3Reports indicates the number of IGMPv3 Reports forwarded on this SAP.
sapIgmPsnpgRxGenQueries [Sap Igmp Snpg Rx Gen Queries] (sapIgmPsnpgRxGenQueries)	long	The value of the object sapIgmPsnpgRxGenQueries indicates the number of IGMP General Queries received on this SAP.
sapIgmPsnpgRxGrpSpecQueries [Sap Igmp Snpg Rx Grp Spec Queries] (sapIgmPsnpgRxGrpSpecQueries)	long	The value of the object sapIgmPsnpgRxGrpSpecQueries indicates the number of IGMP Group-Specific Queries received on this SAP.

Table 155 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
saplgmpSnpgrxSrcSpecQueries [Sap Igmp Snpgrx Src Spec Queries] (saplgmpSnpgrxSrcSpecQueries)	long	The value of the object saplgmpSnpgrxSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries received on this SAP.
saplgmpSnpgrxUnknownType [Sap Igmp Snpgrx Unknown Type] (saplgmpSnpgrxUnknownType)	long	The value of the object saplgmpSnpgrxUnknownType indicates the number of IGMP unknown type packets received on this SAP.
saplgmpSnpgrxV1Reports [Sap Igmp Snpgrx V1 Reports] (saplgmpSnpgrxV1Reports)	long	The value of the object saplgmpSnpgrxV1Reports indicates the number of IGMPv1 Reports received on this SAP.
saplgmpSnpgrxV2Leaves [Sap Igmp Snpgrx V2 Leaves] (saplgmpSnpgrxV2Leaves)	long	The value of the object saplgmpSnpgrxV2Leaves indicates the number of IGMPv2 Leaves received on this SAP.
saplgmpSnpgrxV2Reports [Sap Igmp Snpgrx V2 Reports] (saplgmpSnpgrxV2Reports)	long	The value of the object saplgmpSnpgrxV2Reports indicates the number of IGMPv2 Reports received on this SAP.
saplgmpSnpgrxV3Reports [Sap Igmp Snpgrx V3 Reports] (saplgmpSnpgrxV3Reports)	long	The value of the object saplgmpSnpgrxV3Reports indicates the number of IGMPv3 Reports received on this SAP.
saplgmpSnpgrxTxGenQueries [Sap Igmp Snpgrx Tx Gen Queries] (saplgmpSnpgrxTxGenQueries)	long	The value of the object saplgmpSnpgrxTxGenQueries indicates the number of IGMP General Queries transmitted on this SAP.
saplgmpSnpgrxTxGrpSpecQueries [Sap Igmp Snpgrx Tx Grp Spec Queries] (saplgmpSnpgrxTxGrpSpecQueries)	long	The value of the object saplgmpSnpgrxTxGrpSpecQueries indicates the number of IGMP Group-Specific Queries transmitted on this SAP.
saplgmpSnpgrxTxSrcSpecQueries [Sap Igmp Snpgrx Tx Src Spec Queries] (saplgmpSnpgrxTxSrcSpecQueries)	long	The value of the object saplgmpSnpgrxTxSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries transmitted on this SAP.

Table 155 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapIgmPsnpgTxV1Reports [Sap Igmp Snpg Tx V1 Reports] (sapIgmPsnpgTxV1Reports)	long	The value of the object sapIgmPsnpgTxV1Reports indicates the number of IGMPv1 Reports transmitted on this SAP.
sapIgmPsnpgTxV2Leaves [Sap Igmp Snpg Tx V2 Leaves] (sapIgmPsnpgTxV2Leaves)	long	The value of the object sapIgmPsnpgTxV2Leaves indicates the number of IGMPv2 Leaves transmitted on this SAP.
sapIgmPsnpgTxV2Reports [Sap Igmp Snpg Tx V2 Reports] (sapIgmPsnpgTxV2Reports)	long	The value of the object sapIgmPsnpgTxV2Reports indicates the number of IGMPv2 Reports transmitted on this SAP.
sapIgmPsnpgTxV3Reports [Sap Igmp Snpg Tx V3 Reports] (sapIgmPsnpgTxV3Reports)	long	The value of the object sapIgmPsnpgTxV3Reports indicates the number of IGMPv3 Reports transmitted on this SAP.
L2AccessInterfaceMvrStats MIB entry name: sapIgmPsnpgStatsEntry Entry description: sapIgmPsnpgStatsEntry is an entry in the sapIgmPsnpgStatsTable. Each entry contains IGMP snooping statics for a SAP in a TIs. Table description (for sapIgmPsnpgStatsTable): sapIgmPsnpgStatsTable contains statistics on IGMP snooping per SAP. Supports realtime plotting Supports scheduled collection Monitored class: vpls.AbstractL2AccessInterface		
sapIgmPsnpgMvrFromVplsCfgDrops [Sap Igmp Snpg Mvr From Vpls Cfg Drops] (sapIgmPsnpgMvrFromVplsCfgDrops)	long	The value of the object sapIgmPsnpgMvrFromVplsCfgDrops indicates the number of times an IGMP Group or Query is dropped because of applying the sapIgmPsnpgCfgMvrFromVplsId configuration on this SAP.
sapIgmPsnpgMvrToSapCfgDrops [Sap Igmp Snpg Mvr To Sap Cfg Drops] (sapIgmPsnpgMvrToSapCfgDrops)	long	The value of the object sapIgmPsnpgMvrToSapCfgDrops indicates the number times an IGMP Report or Query is dropped because of applying the sapIgmPsnpgCfgMvrToSapPortId and sapIgmPsnpgCfgMvrToSapEncapVal configuration on this SAP.

Table 155 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>L2AccessIfDhcpRelayCfgStats</p> <p>MIB entry name: sapTlsDhcpStatsEntry</p> <p>Entry description: DHCP statistics for a TLS SAP.</p> <p>Table description (for sapTlsDhcpStatsTable): sapTlsDhcpStatsTable contains DHCP statistics related to a TLS SAP. This table complements sapTlsInfoTable, and contains an entry for each Tls SAP. Rows in this table are created and deleted automatically by the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vpls.AbstractL2AccessInterface</p>		
sapTlsDhcpStatsClntDropdPckts [Sap Tls Dhcp Stats Clnt Dropd Pckts] (sapTlsDhcpStatsClntDropdPckts)	long	The value of the object sapTlsDhcpStatsClntDropdPckts indicates the number of DHCP client packets that have been dropped on this SAP.
sapTlsDhcpStatsClntForwdPckts [Sap Tls Dhcp Stats Clnt Forwd Pckts] (sapTlsDhcpStatsClntForwdPckts)	long	The value of the object sapTlsDhcpStatsClntForwdPckts indicates the number of DHCP client packets that have been forwarded on this SAP.
sapTlsDhcpStatsClntProxLSPckts [Sap Tls Dhcp Stats Clnt Prox LSPckts] (sapTlsDhcpStatsClntProxLSPckts)	long	The value of the object sapTlsDhcpStatsClntProxLSPckts indicates the number of DHCP client packets that have been proxied on this SAP based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
sapTlsDhcpStatsClntProxRadPckts [Sap Tls Dhcp Stats Clnt Prox Rad Pckts] (sapTlsDhcpStatsClntProxRadPckts)	long	The value of the object sapTlsDhcpStatsClntProxRadPckts indicates the number of DHCP client packets that have been proxied on this SAP based on data received from a RADIUS server.
sapTlsDhcpStatsClntSnoopdPckts [Sap Tls Dhcp Stats Clnt Snoopd Pckts] (sapTlsDhcpStatsClntSnoopdPckts)	long	The value of the object sapTlsDhcpStatsClntSnoopdPckts indicates the number of DHCP client packets that have been snooped on this SAP.

Table 155 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapTlsDhcpStatsGenForceRenPckts [Sap Tls Dhcp Stats Gen Force Ren Pckts] (sapTlsDhcpStatsGenForceRenPckts)	long	The value of the object sapTlsDhcpStatsGenForceRenPckts indicates the number of DHCP FORCERENEW messages spoofed on this SAP to the DHCP clients.
sapTlsDhcpStatsGenReleasePckts [Sap Tls Dhcp Stats Gen Release Pckts] (sapTlsDhcpStatsGenReleasePckts)	long	The value of the object sapTlsDhcpStatsGenReleasePckts indicates the number of DHCP RELEASE messages spoofed on this SAP to the DHCP server.
sapTlsDhcpStatsSrvrDropdPckts [Sap Tls Dhcp Stats Srvr Dropd Pckts] (sapTlsDhcpStatsSrvrDropdPckts)	long	The value of the object sapTlsDhcpStatsSrvrDropdPckts indicates the number of DHCP server packets that have been dropped on this SAP.
sapTlsDhcpStatsSrvrForwdPckts [Sap Tls Dhcp Stats Srvr Forwd Pckts] (sapTlsDhcpStatsSrvrForwdPckts)	long	The value of the object sapTlsDhcpStatsSrvrForwdPckts indicates the number of DHCP server packets that have been forwarded on this SAP.
sapTlsDhcpStatsSrvrSnoopdPckts [Sap Tls Dhcp Stats Srvr Snoopd Pckts] (sapTlsDhcpStatsSrvrSnoopdPckts)	long	The value of the object sapTlsDhcpStatsSrvrSnoopdPckts indicates the number of DHCP server packets that have been snooped on this SAP.

Table 156 vrrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InstanceAdditionalStats</p> <p>MIB entry name: tmnxVrrpRouterStatsEntry</p> <p>Entry description: Each row entry in the tmnxVrrpRouterStatsTable represents additional columns in the vrrpRouterStatsTable for statistics specific to the Nokia SROS series VRRP implementation.</p> <p>Table description (for tmnxVrrpRouterStatsTable): The tmnxVrrpRouterStatsTable provides an extension of the vrrpRouterStatsTable in the VRRP-MIB. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vrrpRouterStatsTable, and the augmenting table, tmnxVrrpRouterStatsTable. This in effect extends the vrrpRouterStatsTable with additional columns.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vrrp.Instance</p>		
addressListDiscards [Address List Discards] (tmnxVrrpStatsAddressListDiscards)	long	The total number of VRRP advertisement packets discarded because the address list did not match the locally configured list for the virtual router.
advertiseIntervalDiscards [Advertise Interval Discards] (tmnxVrrpStatsAdvertiseIntervalDiscards)	long	The total number of VRRP advertisement packets discarded because the advertisement interval in the received packet was different than the one configured for the local virtual router.
advertiseSent [Advertise Sent] (tmnxVrrpStatsAdvertiseSent)	long	The total number of VRRP advertisements sent by this virtual router.
masterChanges [Master Changes] (tmnxVrrpStatsMasterChanges)	long	The value for tmnxVrrpStatsMasterChanges specifies the total number of times the virtual router has seen the master virtual router change.
preemptEvents [Preempt Events] (tmnxVrrpStatsPreemptEvents)	long	The value for tmnxVrrpStatsPreemptEvents specifies the total number of times the virtual router has preempted another non-owner master with lower priority.

Table 156 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
preemptedEvents [Preempted Events] (tmnxVrrpStatsPreemptedEvents)	long	The value for tmnxVrrpStatsPreemptedEvents specifies the total number of times the virtual router has been preempted by another non-owner master with higher priority.
totalDiscards [Total Discards] (tmnxVrrpStatsTotalDiscards)	long	The total number of VRRP advertisement packets discarded for any reason. This includes the packets discarded due to advertise interval mismatch and address list mismatch.
InstanceStats MIB entry name: vrrpRouterStatsEntry Entry description: An entry in the table, containing statistics information about a given virtual router. Table description (for vrrpRouterStatsTable): Table of virtual router statistics. Supports realtime plotting Supports scheduled collection Monitored class: vrrp.Instance		
addressListErrors [Address List Errors] (vrrpStatsAddressListErrors)	long	The total number of packets received for which the address list does not match the locally configured list for the virtual router.
advertiseIntervalErrors [Advertise Interval Errors] (vrrpStatsAdvertiseIntervalErrors)	long	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
advertiseRcvd [Advertise Rcvd] (vrrpStatsAdvertiseRcvd)	long	The total number of VRRP advertisements received by this virtual router.
authFailures [Auth Failures] (vrrpStatsAuthFailures)	long	The total number of VRRP packets received that do not pass the authentication check.

Table 156 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authTypeMismatch [Auth Type Mismatch] (vrrpStatsAuthTypeMismatch)	long	The total number of packets received with 'Auth Type' not equal to the locally configured authentication method ('vrrpOperAuthType').
becomeMaster [Become Master] (vrrpStatsBecomeMaster)	long	The total number of times that this virtual router's state has transitioned to MASTER.
invalidAuthType [Invalid Auth Type] (vrrpStatsInvalidAuthType)	long	The total number of packets received with an unknown authentication type.
invalidTypePktsRcvd [Invalid Type Pkts Rcvd] (vrrpStatsInvalidTypePktsRcvd)	long	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
ipTtlErrors [Ip Ttl Errors] (vrrpStatsIpTtlErrors)	long	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
packetLengthErrors [Packet Length Errors] (vrrpStatsPacketLengthErrors)	long	The total number of packets received with a packet length less than the length of the VRRP header.
priorityZeroPktsRcvd [Priority Zero Pkts Rcvd] (vrrpStatsPriorityZeroPktsRcvd)	long	The total number of VRRP packets received by the virtual router with a priority of '0'.
priorityZeroPktsSent [Priority Zero Pkts Sent] (vrrpStatsPriorityZeroPktsSent)	long	The total number of VRRP packets sent by the virtual router with a priority of '0'.

egressHitCount [Egress Hit Count] (tMacFilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.

Table 157 acfilter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressHitCount [Ingress Hit Count] (tMacFilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.

Table 158 bgp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerAdditionalStats</p> <p>MIB entry name: bgpPeerEntry</p> <p>Entry description: Entry containing information about the connection with a BGP peer.</p> <p>Table description (for bgpPeerTable): BGP peer table. This table contains, one entry per BGP peer, information about the connections with BGP peers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
fsmEstablishedTime [Fsm Established Time] (bgpPeerFsmEstablishedTime)	long	This timer indicates how long (in seconds) this peer has been in the Established state or how long since this peer was last in the Established state. It is set to zero when a new peer is configured or the router is booted.
<p>PeerStats</p> <p>MIB entry name: tBgpPeerNgOperEntry</p> <p>Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable.</p> <p>Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
flaps [Flaps] (tBgpPeerNgOperFlaps)	long	The value of tBgpPeerNgOperFlaps indicates the number of flaps of updates from this peer.
inputQueueMessages [Input Queue Messages] (tBgpPeerNgOperInputQueueMsgs)	long	The value of tBgpPeerNgOperInputQueueMsgs indicates the number of unprocessed messages in the queue, from this peer.

Table 158 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lastEvent [Last Event] (tBgpPeerNgOperLastEvent)	long	The value of tBgpPeerNgOperLastEvent indicates the last BGP event of this peer.
lastRestartTime [Last Restart Time] (tBgpPeerNgOperLastRestartTime)	long	The value of tBgpPeerNgOperLastRestartTime indicates the last time the peer attempted restart.
lastState [Last State] (tBgpPeerNgOperLastState)	long	The value of tBgpPeerNgOperLastState indicates the last BGP state of this peer.
messageOctetsReceived [Message Octets Received] (tBgpPeerNgOperMsgOctetsRcvd)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsRcvd indicates the number of octets received from this peer.
messageOctetsSent [Message Octets Sent] (tBgpPeerNgOperMsgOctetsSent)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsSent indicates the number of octets transmitted to this peer.
numberOfRestarts [Number Of Restarts] (tBgpPeerNgOperNumRestarts)	long	The value of tBgpPeerNgOperNumRestarts indicates the number of times the peer has attempted restart.
outputQueueMessages [Output Queue Messages] (tBgpPeerNgOperOutputQueueMsgs)	long	The value of tBgpPeerNgOperOutputQueueMsgs indicates the number of untransmitted messages in the queue, to this peer.
pathsReceived [Paths Received] (tBgpPeerNgOperReceivedPaths)	long	The value of tBgpPeerNgOperReceivedPaths indicates the number of paths received from this peer.

Table 158 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixesActive [Prefixes Active] (tBgpPeerNgOperActivePrefixes)	long	The value of tBgpPeerNgOperActivePrefixes indicates the number of active prefixes from this peer.
prefixesReceived [Prefixes Received] (tBgpPeerNgOperReceivedPrefixes)	long	The value of tBgpPeerNgOperReceivedPrefixes indicates the number of prefixes received from this peer.
prefixesSent [Prefixes Sent] (tBgpPeerNgOperSentPrefixes)	long	The value of tBgpPeerNgOperSentPrefixes indicates the number of prefixes transmitted to this peer.
prefixesSuppressedByDamping [Prefixes Suppressed By Damping] (tBgpPeerNgOperV4SuppPfxDamp)	long	The value of tBgpPeerNgOperV4SuppPfxDamp indicates the number of IPv6 prefixes from this peer, which have been suppressed by damping.
vpnActivePrefixes [Vpn Active Prefixes] (tBgpPeerNgOperVpnActivePrefixes)	long	The value of tBgpPeerNgOperVpnActivePrefixes indicates the number of active VPN prefixes from this BGP peer.
vpnPrefixesSuppressedByDamping [Vpn Prefixes Suppressed By Damping] (tBgpPeerNgOperVpnSuppPfxDamp)	long	The value of tBgpPeerNgOperVpnSuppPfxDamp indicates the number of VPN IPv4 prefixes from this peer, which have been suppressed by damping.
vpnReceivedPrefixes [Vpn Received Prefixes] (tBgpPeerNgOperVpnRecvPrefixes)	long	The value of tBgpPeerNgOperVpnRecvPrefixes indicates the number of received VPN prefixes.
vpnSentPrefixes [Vpn Sent Prefixes] (tBgpPeerNgOperVpnSentPrefixes)	long	The value of tBgpPeerNgOperVpnSentPrefixes indicates the number of transmitted VPN prefixes.

Table 159 equipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AllocatedMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
allocatedMemory [Allocated Memory] (sgiMemoryPoolAllocated)	long	The value of sgiMemoryPoolAllocated indicates the total memory currently allocated in memory-pools on the system. This memory may or may not be currently in use, but is pre-allocated should the software need to use it. If the value is greater than the maximum value reportable by this object then this object reports its maximum value (4,294,967,295) and sgiKbMemoryPoolAllocated must be used to determine the total memory allocated in memory-pools.
<p>AvailableMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
availableMemory [Available Memory] (sgiMemoryAvailable)	long	The value of sgiMemoryAvailable indicates the amount of free memory in the overall system that is not allocated to memory pools, but is available in case a memory pool needs to grow.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DDMStats</p> <p>MIB entry name: tmnxDigitalDiagMonitorEntry</p> <p>Entry description: Each row represents a particular SFF that supports Digital Diagnostic Monitoring. Entries are created and deleted internally by the system.</p> <p>Table description (for tmnxDigitalDiagMonitorTable): The tmnxDigitalDiagMonitorTable has an entry for each SFF in the system that supports Digital Diagnostic Monitoring (DDM). The table is indexed by TmnxPortID. Each row in this table is dynamically added and removed internally by the system based on the presence or absence of DDM capable SFF components.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.DigitalDiagnosticMonitoring</p>		
aux1 [Aux 1] (tmnxDDMAux1)	float	The value of tmnxDDMAux1 indicates the Manufacturer specific Auxiliary 1 information of the XFP.
aux1Type [Aux 1 Type] (tmnxDDMAux1Type)	int	The value of tmnxDDMAux1Type indicates the measurement type of the Manufacturer specific Auxiliary 1 information of the XFP: none (0) - not specified. adp-bias-voltage (1) - LSB is 10mV. reserved-2 (2) - reserved for future use. tec-current (3) - LSB is 100uA. laser-temp (4) - degrees Celsius. laser-wavelength (5) - LSB is 0.05 nm. voltage-50 (6) - 5.0 supply voltage, LSB=100uV. voltage-33 (7) - 3.3 supply voltage, LSB=100uV. voltage-18 (8) - 1.8 supply voltage, LSB=100uV, voltage-52 (9) - -5.2 supply voltage, LSB=100uV. current-50 (10) - 5.0V supply current, LSB=100uA. reserved-11 (11) - reserved for future use. reserved-12 (12) - reserved for future use. current-33 (13) - 3.3V supply current, LSB=100uA. current-18 (14) - 1.8V supply current, LSB=100uA. current-52 (15) - -5.2V supply current, LSB=100uA.
aux2 [Aux 2] (tmnxDDMAux2)	float	The value of tmnxDDMAux2 indicates the Manufacturer specific Auxiliary 2 information of the SFF.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aux2Type [Aux 2 Type] (tmnxDDMAux2Type)	int	The value of tmnxDDMAux2Type indicates the measurement type of the Manufacturer specific Auxiliary 2 information of the XFP: none (0) - not specified. adp-bias-voltage (1) - LSB is 10mV. reserved-2 (2) - reserved for future use. tec-current (3) - LSB is 100uA. laser-temp (4) - degrees Celsius(C). laser-wavelength (5) - LSB is 0.05 nm. voltage-50 (6) - 5.0 supply voltage, LSB=100uV. voltage-33 (7) - 3.3 supply voltage, LSB=100uV. voltage-18 (8) - 1.8 supply voltage, LSB=100uV, voltage-52 (9) - -5.2 supply voltage, LSB=100uV. current-50 (10) - 5.0V supply current, LSB=100uA. reserved-11 (11) - reserved for future use. reserved-12 (12) - reserved for future use. current-33 (13) - 3.3V supply current, LSB=100uA. current-18 (14) - 1.8V supply current, LSB=100uA. current-52 (15) - -5.2V supply current, LSB=100uA.
rxOpticalPower [Rx Optical Power] (tmnxDDMRxOpticalPower)	float	The value of tmnxDDMRxOpticalPower indicates the current Received Optical Power of the SFF in one tenths of a microwatt (uW). If the SFF is externally calibrated, the objects tmnxDDMExtCalRxPower4, tmnxDDMExtCalRxPower3, tmnxDDMExtCalRxPower2, tmnxDDMExtCalRxPower1 and tmnxDDMExtCalRxPower0 affect the output power calculation. For example (internally calibrated SFF): Using the SNMP value of 790, and using units of tenths of microwatt, 790 becomes 79 microwatts or 0.079 milliwatts. Converting to dBm: $10 \times \log_{10}(0.079) = -11.0$ dBm
rxOpticalPowerType [Rx Optical Power Type] (tmnxDDMRxOpticalPowerType)	int	The value of tmnxDDMRxOpticalPowerType indicates whether the tmnxDDMRxOpticalPower was taken as an average, or as an Optical Modulation Amplitude (OMA).

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
supplyVoltage [Supply Voltage] (tmnxDDMSupplyVoltage)	float	The value of tmnxDDMSupplyVoltage indicates the current supply voltage of the SFF in 1/10000 of a Volt(V). If the SFF is externally calibrated, the objects tmnxDDMExtCalVoltageSlope and tmnxDDMExtCalVoltageOffset affect the voltage calculation. The formula for translating between the value of tmnxDDMSupplyVoltage and Voltage is: Internally Calibrated only: $\text{tmnxDDMSupplyVoltage} / 10000$ Externally Calibrated: $(\text{tmnxDDMSupplyVoltage} * (\text{tmnxDDMExtCalVoltageSlope} / 256) + \text{tmnxDDMExtCalVoltageOffset}) / 10000$ For example (internally calibrated SFF): The SNMP value 32851 is 3.2851 Volts (V).
temperature [Temperature] (tmnxDDMTemperature)	float	The value of tmnxDDMTemperature indicates the current temperature of the SFF in 1/256th degrees Celsius. If the SFF is externally calibrated, the objects tmnxDDMExtCalTemperatureSlope and tmnxDDMExtCalTemperatureOffset affect the temperature calculation. The formula for translating between the value of tmnxDDMTemperature and degrees Celsius is: Internally Calibrated only: $\text{tmnxDDMTemperature} / 256$ Externally Calibrated: $(\text{tmnxDDMTemperature} * (\text{tmnxDDMExtCalTemperatureSlope} / 256) + \text{tmnxDDMExtCalTemperatureOffset}) / 256$ For example (internally calibrated SFF): The SNMP value 5734 is 22.4 degrees Celsius.
txBiasCurrent [Tx Bias Current] (tmnxDDMTxBiasCurrent)	float	The value of tmnxDDMTxBiasCurrent indicates the current Transmit Bias Current of the SFF in 1/500 milliamperes (mA). If the SFF is externally calibrated, the objects tmnxDDMExtCalTxLaserBiasSlope and tmnxDDMExtCalTxLaserBiasOffset affect the ampere calculation. The formula for translating between the value of tmnxDDMTxBiasCurrent and amperes is: Internally Calibrated only: $\text{tmnxDDMTxBiasCurrent} / 500$ Externally Calibrated: $(\text{tmnxDDMTxBiasCurrent} * (\text{tmnxDDMExtCalTxLaserBiasSlope} / 256) + \text{tmnxDDMExtCalTxLaserBiasOffset}) / 500$ For example (internally calibrated SFF): The SNMP value 2565 is 5.1 milliamperes (mA).

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txOutputPower [Tx Output Power] (tmnxDDMTxOutputPower)	float	The value of tmnxDDMTxOutputPower indicates the current Output Power of the SFF in one tenths of a microwatt (uW). If the SFF is externally calibrated, the objects tmnxDDMExtCalTemperatureSlope and tmnxDDMExtCalTemperatureOffset affect the output power calculation. For example (internally calibrated SFF): Using the SNMP value of 790, and using units of tenths of microwatt, 790 becomes 79 microwatts or 0.079 milliwatts. Converting to dBm: $10 \times \log_{10}(0.079) = -11.0$ dBm

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>HardwareTemperature</p> <p>MIB entry name: tmnxHwEntry</p> <p>Entry description: Each row entry represents an Nokia SROS series manufactured hardware component. Entries cannot be created and deleted via SNMP SET operations. When an entry is created in one of the card tables, IOM, CPM, Fabric or MDA, a tmnxHwEntry is created for the common hardware management information for that card in that chassis. When the card is removed from the chassis, its corresponding tmnxHwEntry is deleted. The tmnxHwIndex is bitmapped. The tmnxPhysChassisClass is used to indicate a sub-class of a TmnxHwClass type. A value of 0 instead of 'routerChassis (3)' is used to represent router chassis: 32 25 24 17 16 9 8 1 +-----+----- +-----+-----+ TmnxHwClass TmnxPhysChassisClass Slot number +-----+----- +-----+-----+ The Slot field is only used for components on cards in slots. It is zero for all others. The number field starts from 1 and indicates which component. E.g. Power supply 1 or 2.</p> <p>Table description (for tmnxHwTable): The tmnxHwTable has an entry for each managed hardware component in the Nokia SROS series system's chassis. Examples of these hardware component types are IOM, Fabric, and CPM cards, MCM and CCM, and MDA modules. Similar information for physical ports is in the tmnxPortObjs.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.BaseCard • equipment.CCM • equipment.CardSlot • equipment.ControlProcessor • equipment.DaughterCard • equipment.FanTray • equipment.MCMCard • equipment.PowerSupplyTray • equipment.SwitchFabricProcessor 		
<p>temperature [Temperature] (tmnxHwTemperature)</p>	int	<p>The current temperature reading in degrees celsius from this hardware component's temperature sensor. If this component does not contain a temperature sensor, then the value -1 is returned.</p>

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
<p>MediaIndependentStats</p> <p>MIB entry name: mediaIndependentEntry</p> <p>Entry description: Media independent statistics for promiscuous monitoring of any media.</p> <p>Table description (for mediaIndependentTable): Media independent statistics for promiscuous monitoring of any media. The following table defines media independent statistics that provide information for full and/or half-duplex links as well as high capacity links. For half-duplex links, or full-duplex-capable links operating in half-duplex mode, the mediaIndependentIn* objects shall be used and the mediaIndependentOut* objects shall not increment. For full-duplex links, the mediaIndependentOut* objects shall be present and shall increment. Whenever possible, the probe should count packets moving away from the closest terminating equipment as output packets. Failing that, the probe should count packets moving away from the DTE as output packets.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
dropEvents [Drop Events] (mediaIndependentDropEvents)	long	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
droppedFrames [Dropped Frames] (mediaIndependentDroppedFrames)	long	The total number of frames which were received by the probe and therefore not accounted for in the mediaIndependentDropEvents, but for which the probe chose not to count for this entry for whatever reason. Most often, this event occurs when the probe is out of some resources and decides to shed load from this collection. This count does not include packets that were not counted because they had MAC-layer errors. Note that, unlike the dropEvents counter, this number is the exact number of frames dropped.
duplex [Duplex] (mediaIndependentDuplexMode)	int	The current mode of this link. Note that if the link has full-duplex capabilities but is operating in half-duplex mode, this value will be halfduplex(1).
duplexChanges [Duplex Changes] (mediaIndependentDuplexChanges)	long	The number of times this link has changed from full-duplex mode to half-duplex mode or from half-duplex mode to full-duplex mode.
inputSpeed [Input Speed] (mediaIndependentInputSpeed)	long	The nominal maximum speed in kilobits per second of this half-duplex link or on the inbound connection of this full-duplex link. If the speed is unknown or there is no fixed maximum (e.g. a compressed link), this value shall be zero.
outputSpeed [Output Speed] (mediaIndependentOutputSpeed)	long	The nominal maximum speed in kilobits per second of this full-duplex link in the direction of the network. If the speed is unknown, the link is half-duplex, or there is no fixed maximum (e.g. a compressed link), this value shall be zero.
receivedBadPackets [Received Bad Packets] (mediaIndependentInErrors)	long	The total number of bad packets received on a half-duplex link or on the inbound connection of a full-duplex link.
receivedNonUnicastPackets [Received Non Unicast Packets] (mediaIndependentInNUCastHigh-CapacityPkts)	java. math. BigInteger	The total number of non-unicast packets (including bad packets) received on a half-duplex link or on the inbound connection of a full-duplex link.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedOctets [Received Octets] (mediaIndependentInHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received (excluding framing bits but including FCS octets) on a half-duplex link or on the inbound connection of a full-duplex link.
receivedPackets [Received Packets] (mediaIndependentInHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received on a half-duplex link or on the inbound connection of a full-duplex link.
transmittedBadPackets [Transmitted Bad Packets] (mediaIndependentOutErrors)	long	The total number of bad packets received on a full-duplex link in the direction of the network.
transmittedNonUnicastPackets [Transmitted Non Unicast Packets] (mediaIndependentOutNUC- astHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets) received on a full-duplex link in the direction of the network.
transmittedOctets [Transmitted Octets] (mediaIndependentOutHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received on a full-duplex link in the direction of the network (excluding framing bits but including FCS octets).
transmittedPackets [Transmitted Packets] (mediaIndependentOutHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received on a full-duplex link in the direction of the network.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortAccessEgressQueueStats</p> <p>MIB entry name: tmnxPortAccessEgressQueueStatsEntry</p> <p>Entry description: Defines an entry in tmnxPortAccessEgressQueueStatsTable. Entries are created and deleted by the system depending on the queue policy being used at the specific port.</p> <p>Table description (for tmnxPortAccessEgressQueueStatsTable): Defines the Nokia SAS series access port egress statistics table for providing, via SNMP, the capability of retrieving the traffic statistics for the physical queues being used for the ports to forward the access egress traffic.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: equipment.PhysicalPort</p>		
portAccessEgressQueueStatsDroOcts [Port Access Egress Queue Stats Dro Octs] (tmnxPortAccessEgress- QueueStatsDroOcts)	java. math. BigInteger	tmnxPortAccessEgressQueueStatsDroOcts indicates the number of dropped network egress octets on this port using this queue.
portAccessEgressQueueStatsDroPkts [Port Access Egress Queue Stats Dro Pkts] (tmnxPortAccessEgress- QueueStatsDroPkts)	java. math. BigInteger	tmnxPortAccessEgressQueueStatsDroPkts indicates the number of dropped access egress packets on this port using this queue.
portAccessEgressQueueStatsFwdOcts [Port Access Egress Queue Stats Fwd Octs] (tmnxPortAccessEgress- QueueStatsFwdOcts)	java. math. BigInteger	tmnxPortAccessEgressQueueStatsFwdOcts indicates the number of forward access egress octets forwarded on this port using this queue.
portAccessEgressQueueStatsFwdPkts [Port Access Egress Queue Stats Fwd Pkts] (tmnxPortAccessEgress- QueueStatsFwdPkts)	java. math. BigInteger	tmnxPortAccessEgressQueueStatsFwdPkts indicates the number of forwarded access egress packets forwarded on this port using this queue.

Table 159 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portAccessEgressQueueStatsIndex [Port Access Egress Queue Stats Index] (tmnxPortAccessEgressQueueStatsIndex)	long	'tmnxPortAccessEgressQueueIndex' serves as the tertiary index. When used in conjunction with tmnxChassisIndex and tmnxPortPortID, it uniquely identifies a access egress queue for the specified port in the managed system.
<p>PortNetEgressQueueStats</p> <p>MIB entry name: tmnxPortNetEgressQueueStatsEntry</p> <p>Entry description: Defines an entry in tmnxPortNetEgressQueueStatsTable. <p>AdditionalEthernetStats</p> <p>MIB entry name: tmnxPortEtherEntry</p> <p>Entry description: Each row entry represents an Ethernet port on a IOM card in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. Before an IOM card entry can be deleted from the tmnxMDATable, its supported tmnxPortEntry and tmnxPortEtherEntry rows must be in the proper state for removal. The tmnxPortEtherEntry contains attributes that are unique to the Ethernet TmnxPortType.</p> <p>Table description (for tmnxPortEtherTable): The tmnxPortEtherTable has an entry for each Ethernet (faste, gige, xcme or xgige) port on each IOM card in each chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
highCapacityPackets1519toMaxFrameSize [High Capacity Packets 1519 to Max Frame Size] (tmnxPortEtherHCPkts1519toMax)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 octets in length and the maximum frame size, usually 12287 octets inclusive (excluding framing bits but including FCS octets). The lower 32-bits of this 64-bit counter will equal the value of tmnxPortEtherHCPkts1519toMax. The high 32-bits of this counter will equal the value of tmnxPortEtherHCOverPkts1519toMax.
packets1519toMaxFrameSize [Packets 1519 to Max Frame Size] (tmnxPortEtherPkts1519toMax)	long	The total number of packets received that were longer than 1518 octets but less than the maximum frame size for the particular medium, usually 12287 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
<p>alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)</p>	<p>long</p>	<p>A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for group encoding schemes greater than 4 bits per group. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsAlignmentErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.</p>

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
carrierSenseErrors [Carrier Sense Errors] (dot3StatsCarrierSenseErrors)	long	The number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular interface. The count represented by an instance of this object is incremented at most once per transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsFCSErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. For interfaces operating at 10 Gb/s, this counter can roll over in less than 80 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsFrameTooLongs object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalMacReceiveErrors [Internal Mac Receive Errors] (dot3StatsInternalMacReceiveErrors)	long	A count of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsFrameTooLongs object, the dot3StatsAlignmentErrors object, or the dot3StatsFCSErrors object. The precise meaning of the count represented by an instance of this object is implementation- specific. In particular, an instance of this object may represent a count of receive errors on a particular interface that are not otherwise counted. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsInternalMacReceiveErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalMacTransmitErrors [Internal Mac Transmit Errors] (dot3StatsInternalMacTransmitErrors)	long	A count of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object. The precise meaning of the count represented by an instance of this object is implementation- specific. In particular, an instance of this object may represent a count of transmission errors on a particular interface that are not otherwise counted. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsInternalMacTransmitErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of frames that are involved in more than one collision and are subsequently transmitted successfully. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of frames that are involved in a single collision, and are subsequently transmitted successfully. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
sqeTestErrors [Sqe Test Errors] (dot3StatsSQETestErrors)	long	A count of times that the SQE TEST ERROR is received on a particular interface. The SQE TEST ERROR is set in accordance with the rules for verification of the SQE detection mechanism in the PLS Carrier Sense Function as described in IEEE Std. 802.3, 2000 Edition, section 7.2.4.6. This counter does not increment on interfaces operating at speeds greater than 10 Mb/s, or on interfaces operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
symbolErrors [Symbol Errors] (dot3StatsSymbolErrors)	long	<p>For an interface operating at 100 Mb/s, the number of times there was an invalid data symbol when a valid carrier was present. For an interface operating in half-duplex mode at 1000 Mb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than slotTime, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Data reception error' or 'carrier extend error' on the GMII. For an interface operating in full-duplex mode at 1000 Mb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than minFrameSize, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Data reception error' on the GMII. For an interface operating at 10 Gb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than minFrameSize, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Receive Error' on the XGMII. The count represented by an instance of this object is incremented at most once per carrier event, even if multiple symbol errors occur during the carrier event. This count does not increment if a collision is present. This counter does not increment when the interface is operating at 10 Mb/s. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsSymbolErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.</p>

packets64Octets [Packets 64 Octets] (etherStatsHighCapacityPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (etherStatsHighCapacityPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalOctets [Total Octets] (etherStatsHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). If the network is half-duplex Fast Ethernet, this object can be used as a reasonable estimate of utilization. If greater precision is desired, the etherStatsHighCapacityPkts and etherStatsHighCapacityOctets objects should be sampled before and after a common interval. The differences in the sampled values are Pkts and Octets, respectively, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows: $Pkts * (.96 + .64) + (Octets * .08)$ Utilization = - Interval * 10,000 The result of this equation is the value Utilization which is the percent utilization of the ethernet segment on a scale of 0 to 100 percent. This table is not appropriate for monitoring full-duplex ethernetets. If the network is a full-duplex ethernet and the medialIndependentTable is monitoring that network, the utilization can be calculated as follows: 1) Determine the utilization of the inbound path by using the appropriate equation (for ethernet or fast ethernet) to determine the utilization, substituting medialIndependentInPkts for etherStatsHighCapacityPkts, and medialIndependentInOctets for etherStatsHighCapacityOctets. Call the resulting utilization inUtilization. 2) Determine the utilization of the outbound path by using the same equation to determine the utilization, substituting medialIndependentOutPkts for etherStatsHighCapacityPkts, and medialIndependentOutOctets for etherStatsHighCapacityOctets. Call the resulting utilization outUtilization. 3) The utilization is the maximum of inUtilization and outUtilization. This metric shows the amount of percentage of bandwidth that is left before congestion will be experienced on the link.
totalPackets [Total Packets] (etherStatsHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetStats</p> <p>MIB entry name: etherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named etherStatsPkts.1</p> <p>Table description (for etherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
broadcastPackets [Broadcast Packets] (etherStatsBroadcastPkts)	long	The total number of good packets received that were directed to the broadcast address. Note that this does not include multicast packets.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
collisions [Collisions] (etherStatsCollisions)	long	The best estimate of the total number of collisions on this Ethernet segment. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
crcAlignErrors [Crc Align Errors] (etherStatsCRCAlignErrors)	long	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
dropEvents [Drop Events] (etherStatsDropEvents)	long	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragments [Fragments] (etherStatsFragments)	long	The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that it is entirely normal for etherStatsFragments to increment. This is because it counts both runts (which are normal occurrences due to collisions) and noise hits.
jabbers [Jabbers] (etherStatsJabbers)	long	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
multicastPackets [Multicast Packets] (etherStatsMulticastPkts)	long	The total number of good packets received that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address.
oversizePackets [Oversize Packets] (etherStatsOversizePkts)	long	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.
packets1024to1518Octets [Packets 1024 to 1518 Octets] (etherStatsPkts1024to1518Octets)	long	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).
packets128to255Octets [Packets 128 to 255 Octets] (etherStatsPkts128to255Octets)	long	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets256to511Octets [Packets 256 to 511 Octets] (etherStatsPkts256to511Octets)	long	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets512to1023Octets [Packets 512 to 1023 Octets] (etherStatsPkts512to1023Octets)	long	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (etherStatsPkts64Octets)	long	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (etherStatsPkts65to127Octets)	long	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).
totalOctets [Total Octets] (etherStatsOctets)	long	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). This object can be used as a reasonable estimate of 10-Megabit ethernet utilization. If greater precision is desired, the etherStatsPkts and etherStatsOctets objects should be sampled before and after a common interval. The differences in the sampled values are Pkts and Octets, respectively, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows: $Pkts * (9.6 + 6.4) + (Octets * .8)$ Utilization = - Interval * 10,000 The result of this equation is the value Utilization which is the percent utilization of the ethernet segment on a scale of 0 to 100 percent.
totalPackets [Total Packets] (etherStatsPkts)	long	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.

Table 160 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
undersizePackets [Undersize Packets] (etherStatsUndersizePkts)	long	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.
<p>QosDroppedOctetStats</p> <p>MIB entry name: tmnxPortIngrMdaQosStatEntry</p> <p>Entry description: Each row indicates the MDA QoS discard statistics on an ethernet or SONET/SDH port located on an oversubscribed MDA. Table 161 ethernetoam statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CfmDmmBinStats</p> <p>MIB entry name: tmnxOamPmStsDelayDmmBinEntry</p> <p>Entry description: tmnxOamPmStsDelayDmmBinEntry contains the per-bin DMM (Delay Measurement Message) statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a corresponding row is created in tmnxOamPmStsDelayDmmTable. If the tmnxOamPmStsDelayDmmTable row is created with the index value tmnxOamPmCfgBinType = 'fd(1)', then the the number of rows created in this table is tmnxOamPmCfgBinGroupFdBinCount. Similarly, 'fdr(2)' and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsDelayDmmTable row is destroyed. When a test is running, the DMM statistics for a test's raw (i.e. 'miRaw(1)') measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros all the raw DMM statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsDelayDmmBinTable): tmnxOamPmStsDelayDmmBinTable contains the per-bin DMM (Delay Measurement Message) statistics for OAM Performance Monitoring Measurement Interval Data Sets.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethernetoam.CfmDmmBin</p>		
delayDmmBinBwdCount [Delay Dmm Bin Bwd Count] (tmnxOamPmStsDelayDmmBinBwdCount)	long	The value of tmnxOamPmStsDelayDmmBinBwdCount indicates the number of measurements in the backward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'dmmSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of DMM measurements (in microseconds) in the backward direction in the first interval of 'dmmSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayDmmBinFwdCount [Delay Dmm Bin Fwd Count] (tmnxOamPmStsDelayDmmBinFwdCount)	long	The value of tmnxOamPmStsDelayDmmBinFwdCount indicates the number of measurements in the forward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'dmmSess1' 'mi15Minutes(2)' 1 'fd(1)' 9 Then, the value of this object indicates the number of DMM measurements (in microseconds) in the forward direction in the first interval of 'dmmSess1' that fit in the highest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayDmmBinNum [Delay Dmm Bin Num] (tmnxOamPmStsDelayDmmBinNum)	long	The value of tmnxOamPmStsDelayDmmBinNum specifies the bin number of the statistics to be read.
delayDmmBintwoyCount [Delay Dmm Bintwoy Count] (tmnxOamPmStsDelayDmmBin2wyCount)	long	The value of tmnxOamPmStsDelayDmmBin2wyCount indicates the number of two-way measurements that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'dmmSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of two-way DMM measurements (in microseconds) in the first interval of 'dmmSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>CfmDmmSessionStats</p> <p>MIB entry name: tmnxOamPmStsDelayDmmEntry</p> <p>Entry description: tmnxOamPmStsDelayDmmEntry contains the summarized DMM (Delay Measurement Message) statistics for one OAM Performance Monitoring Measurement Interval Data Set. delayDmm2wyAvg [Delay Dmm 2 wy Avg] (tmnxOamPmStsDelayDmm2wyAvg)	long	The value of tmnxOamPmStsDelayDmm2wyAvg indicates the average two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayDmm2wyMax [Delay Dmm 2 wy Max] (tmnxOamPmStsDelayDmm2wyMax)	long	The value of tmnxOamPmStsDelayDmm2wyMax indicates the maximum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmm2wyMin [Delay Dmm 2 wy Min] (tmnxOamPmStsDelayDmm2wyMin)	long	The value of tmnxOamPmStsDelayDmm2wyMin indicates the minimum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdAvg [Delay Dmm Bwd Avg] (tmnxOamPmStsDelayDmmBwdAvg)	long	The value of tmnxOamPmStsDelayDmmBwdAvg indicates the average delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdMax [Delay Dmm Bwd Max] (tmnxOamPmStsDelayDmmBwdMax)	long	The value of tmnxOamPmStsDelayDmmBwdMax indicates the maximum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdMin [Delay Dmm Bwd Min] (tmnxOamPmStsDelayDmmBwdMin)	long	The value of tmnxOamPmStsDelayDmmBwdMin indicates the minimum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdAvg [Delay Dmm Fwd Avg] (tmnxOamPmStsDelayDmmFwdAvg)	long	The value of tmnxOamPmStsDelayDmmFwdAvg indicates the average delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdMax [Delay Dmm Fwd Max] (tmnxOamPmStsDelayDmmFwdMax)	long	The value of tmnxOamPmStsDelayDmmFwdMax indicates the maximum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdMin [Delay Dmm Fwd Min] (tmnxOamPmStsDelayDmmFwdMin)	long	The value of tmnxOamPmStsDelayDmmFwdMin indicates the minimum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 161 ethernetOam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CfmSlmSessionStats</p> <p>MIB entry name: tmnxOamPmStsBaseEntry</p> <p>Entry description: tmnxOamPmStsBaseEntry contains the base statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a test is started (e.g. using tmnxOamPmCfgDelayDmmAdminStatus and tmnxOamPmCfgDelayDmmOnDmndStatus). At that time, a row for the current interval (with the index value tmnxOamPmStsIntvlNum=1) is created for each row with a matching session name in tmnxOamPmCfgMeasIntvlTable. In addition, a row is created in this table for the test's 'miRaw(1)' interval. After that, the timed creation and destruction of rows in this table is explained using the following example. Suppose the configured number of intervals to be retained is as follows (where index columns are underlined with octothorpes, and 'tmnxOamPm' is abbreviated as '_'): <u>_CfgSessName</u> <u>_CfgMeasIntvlDuration</u> <u>_CfgMeasIntvlStored</u> ##### ##### 'mySess1' 'mi15Minutes(2)' 3 Suppose statistics collection started at t = 0 (minutes). Suppose the following rows exist in tmnxOamPmStsBaseTable at t = 59 (minutes): <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 1 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 The interval numbers are assigned as follows: 1 - the historical interval ended at t = 15 minutes 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the current interval Then, after the next 15 minute interval ends (e.g. at t = 61 minutes), the following rows will exist: <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 5 The interval numbers are assigned as follows: 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the historical interval ended at t = 60 minutes 5 - the current interval The row with interval number 1 was destroyed, because tmnxOamPmCfgMeasIntvlStored=3 specifies that at most three historical intervals be retained. Rows are also destroyed in this table when the corresponding tmnxOamPmCfgMeasIntvlTable row is destroyed. When the index value tmnxOamPmStsMeasIntvlDuration is 'miRaw(1)', only one interval is available (i.e. tmnxOamPmStsIntvlNum = 1). When a test is running, the measurement interval data set for a test's 'miRaw(1)' measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. The change to the objects in the specified row is as follows. Object Change on Clear Operation tmnxOamPmStsBaseOperStatus No change tmnxOamPmStsBaseSuspect Set to 'true(1)' tmnxOamPmStsBaseStartTime Set to UTC time of the clear operation tmnxOamPmStsBaseElapsedTime Set to zero tmnxOamPmStsBaseTestFramesTx Set to zero tmnxOamPmStsBaseTestFramesRx Set to zero Measurement interval data sets for measurement interval durations other than 'miRaw(1)' cannot be cleared.</p> <p>Table description (for tmnxOamPmStsBaseTable): tmnxOamPmStsBaseTable contains the base statistics for OAM Performance Monitoring Measurement Interval Data Sets. The statistics in this table are common to all test types (e.g. DMM and SLM tests).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethernetoam.CfmSlmSession</p>		

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmSlmAvailIndBwd [Pm Slm Avail Ind Bwd] (tmnxOamPmStsLossSlmAvailIndBwd)	long	The value of tmnxOamPmStsLossSlmAvailIndBwd indicates the number of availability indicators evaluated as Available in the backward direction for the specified measurement interval data set.
pmSlmAvailIndFwd [Pm Slm Avail Ind Fwd] (tmnxOamPmStsLossSlmAvailIndFwd)	long	The value of tmnxOamPmStsLossSlmAvailIndFwd indicates the number of availability indicators evaluated as Available in the forward direction for the specified measurement interval data set.
pmSlmAvgFlrBwd [Pm Slm Avg Flr Bwd] (tmnxOamPmStsLossSlmAvgFlrBwd)	float	The value of tmnxOamPmStsLossSlmAvgFlrBwd indicates the average Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmAvgFlrFwd [Pm Slm Avg Flr Fwd] (tmnxOamPmStsLossSlmAvgFlrFwd)	float	The value of tmnxOamPmStsLossSlmAvgFlrFwd indicates the average Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmChliBwd [Pm Slm Chli Bwd] (tmnxOamPmStsLossSlmChliBwd)	long	The value of tmnxOamPmStsLossSlmChliBwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the backward direction for the specified measurement interval data set.
pmSlmChliFwd [Pm Slm Chli Fwd] (tmnxOamPmStsLossSlmChliFwd)	long	The value of tmnxOamPmStsLossSlmChliFwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the forward direction for the specified measurement interval data set.
pmSlmHliBwd [Pm Slm Hli Bwd] (tmnxOamPmStsLossSlmHliBwd)	long	The value of tmnxOamPmStsLossSlmHliBwd indicates the number of High Loss Intervals (HLIs) in the backward direction for the specified measurement interval data set.

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmHliFwd [Pm Slm Hli Fwd] (tmnxOamPmStsLossSlmHliFwd)	long	The value of tmnxOamPmStsLossSlmHliFwd indicates the number of High Loss Intervals (HLIs) in the forward direction for the specified measurement interval data set.
pmSlmMaxFlrBwd [Pm Slm Max Flr Bwd] (tmnxOamPmStsLossSlmMaxFlrBwd)	float	The value of tmnxOamPmStsLossSlmMaxFlrBwd indicates the maximum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmMaxFlrFwd [Pm Slm Max Flr Fwd] (tmnxOamPmStsLossSlmMaxFlrFwd)	float	The value of tmnxOamPmStsLossSlmMaxFlrFwd indicates the maximum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmMinFlrBwd [Pm Slm Min Flr Bwd] (tmnxOamPmStsLossSlmMinFlrBwd)	float	The value of tmnxOamPmStsLossSlmMinFlrBwd indicates the minimum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmMinFlrFwd [Pm Slm Min Flr Fwd] (tmnxOamPmStsLossSlmMinFlrFwd)	float	The value of tmnxOamPmStsLossSlmMinFlrFwd indicates the minimum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmRxBwd [Pm Slm Rx Bwd] (tmnxOamPmStsLossSlmRxBwd)	long	The value of tmnxOamPmStsLossSlmRxBwd indicates the number of SLR reply frames received in the backward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmSlmRxFwd [Pm Slm Rx Fwd] (tmnxOamPmStsLossSlmRxFwd)	long	The value of tmnxOamPmStsLossSlmRxFwd indicates the number of SLM request frames received in the forward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmTxBwd [Pm Slm Tx Bwd] (tmnxOamPmStsLossSlmTxBwd)	long	The value of tmnxOamPmStsLossSlmTxBwd indicates the number of SLR reply frames transmitted in the backward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmSlmTxFwd [Pm Slm Tx Fwd] (tmnxOamPmStsLossSlmTxFwd)	long	The value of tmnxOamPmStsLossSlmTxFwd indicates the number of SLM request frames transmitted in the forward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmSlmUnavailIndBwd [Pm Slm Unavail Ind Bwd] (tmnxOamPmStsLossSlmUnavlIndBwd)	long	The value of tmnxOamPmStsLossSlmUnavlIndBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction for the specified measurement interval data set.
pmSlmUnavailIndFwd [Pm Slm Unavail Ind Fwd] (tmnxOamPmStsLossSlmUnavlIndFwd)	long	The value of tmnxOamPmStsLossSlmUnavlIndFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction for the specified measurement interval data set.
pmSlmUndtAvlBwd [Pm Slm Undt Avl Bwd] (tmnxOamPmStsLossSlmUndtAvlBwd)	long	The value of tmnxOamPmStsLossSlmUndtAvlBwd indicates the number of availability indicators evaluated as Available in the backward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmUndtAvlFwd [Pm Slm Undt Avl Fwd] (tmnxOamPmStsLossSlmUndtAvlFwd)	long	The value of tmnxOamPmStsLossSlmUndtAvlFwd indicates the number of availability indicators evaluated as Available in the forward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmSlmUndtUnavlBwd [Pm Slm Undt Unavl Bwd] (tmnxOamPmStsLossSlmUndtUnavlBwd)	long	The value of tmnxOamPmStsLossSlmUndtUnavlBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmSlmUndtUnavlFwd [Pm Slm Undt Unavl Fwd] (tmnxOamPmStsLossSlmUndtUnavlFwd)	long	The value of tmnxOamPmStsLossSlmUndtUnavlFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 161 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 162 igmp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
InterfaceStats MIB entry name: vRtrIgmplfStatsEntry Entry description: An entry in the vRtrIgmplfStatsTable. Table description (for vRtrIgmplfStatsTable): The table listing the IGMP statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: igmp.Interface		
importPolicyDrops [Import Policy Drops] (vRtrIgmplfImportPolicyDrops)	long	The value of vRtrIgmplfImportPolicyDrops indicates the total number of times IGMP protocol instance matched the host IP address or group/source addresses specified in the import policy vRtrIgmplfImportPolicy.
mcacPolicyDrops [Mcac Policy Drops] (vRtrIgmplfStatsMcacPolicyDrops)	long	The value of the object vRtrIgmplfStatsMcacPolicyDrops indicates the number times an IGMP Group is dropped because of applying a multicast CAC policy on this interface.
rxBadChecksumPkts [Rx Bad Checksum Pkts] (vRtrIgmplfRxBadChecksumPkts)	long	The value of vRtrIgmplfRxBadChecksumPkts indicates the total number of IGMP packets with bad checksum received on this interface.
rxBadEncodings [Rx Bad Encodings] (vRtrIgmplfRxBadEncodings)	long	The value of vRtrIgmplfRxBadEncodings indicates the total number of IGMP packets received on this interface which were not encoded correctly.
rxBadLenPkts [Rx Bad Len Pkts] (vRtrIgmplfRxBadLenPkts)	long	The value of vRtrIgmplfRxBadLenPkts indicates the total number of IGMP packets with bad length received on this interface.
rxBadReceiveIfPkts [Rx Bad Receive If Pkts] (vRtrIgmplfRxBadReceiveIfPkts)	long	The value of vRtrIgmplfRxBadReceiveIfPkts indicates the total number of IGMP packets incorrectly received on this interface.

Table 162 igmp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxGenQueries [Rx Gen Queries] (vRtrIgmplfRxGenQueries)	long	The value of vRtrIgmplfRxGenQueries indicates the total number of IGMP General Queries received on this interface.
rxGrpQueries [Rx Grp Queries] (vRtrIgmplfRxGrpQueries)	long	The value of vRtrIgmplfRxGrpQueries indicates the number of IGMP Group Specific Queries received on this interface.
rxGrpSrcQueries [Rx Grp Src Queries] (vRtrIgmplfRxGrpSrcQueries)	long	The value of vRtrIgmplfRxGrpSrcQueries indicates the number of IGMP Group and Source Specific Queries received on this interface.
rxLeaves [Rx Leaves] (vRtrIgmplfRxLeaves)	long	The value of vRtrIgmplfRxLeaves indicates the total number of IGMP V2 Leaves received on this interface.
rxNoRtrAlertPkts [Rx No Rtr Alert Pkts] (vRtrIgmplfRxNoRtrAlertPkts)	long	The value of vRtrIgmplfRxNoRtrAlertPkts indicates the total number of IGMPv3 packets received on this interface which did not have the router alert flag set.
rxNonLocal [Rx Non Local] (vRtrIgmplfRxNonLocal)	long	The value of vRtrIgmplfRxNonLocal indicates the total number of IGMP packets received from a non-local sender.
rxPktDrops [Rx Pkt Drops] (vRtrIgmplfRxPktDrops)	long	The value of vRtrIgmplfRxPktDrops indicates the total number of IGMP packets that were received on this interface but were dropped.
rxUnknownTypePkts [Rx Unknown Type Pkts] (vRtrIgmplfRxUnknownTypePkts)	long	The value of vRtrIgmplfRxUnknownTypePkts indicates the total number of IGMP packets with unknown type received on this interface.
rxV1Reports [Rx V1 Reports] (vRtrIgmplfRxV1Reports)	long	The value of vRtrIgmplfRxV1Reports indicates the total number of IGMP V1 Reports received on this interface.

Table 162 igmp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxV2Reports [Rx V2 Reports] (vRtrIgmplfRxV2Reports)	long	The value of vRtrIgmplfRxV2Reports indicates the total number of IGMP V2 Reports received on this interface.
rxV3Reports [Rx V3 Reports] (vRtrIgmplfRxV3Reports)	long	The value of vRtrIgmplfRxV3Reports indicates the total number of IGMP V3 Reports received on this interface.
rxWrongVersions [Rx Wrong Versions] (vRtrIgmplfRxWrongVersions)	long	The value of vRtrIgmplfRxWrongVersions indicates the total number of IGMP packets with wrong versions received on this interface.
statsSGTypes [Stats SGTypes] (vRtrIgmplfStatsSGTypes)	long	The value of vRtrIgmplfStatsSGTypes indicates the number of entries on this interface for which the source type is 'sg'.
statsStarGTypes [Stats Star GTypes] (vRtrIgmplfStatsStarGTypes)	long	vRtrIgmplfStatsStarGTypes indicates the number of entries on this interface for which the source type is 'starG'.
txErrors [Tx Errors] (vRtrIgmplfTxErrors)	long	The value of vRtrIgmplfTxErrors indicates the total number of times there was an error transmitting IGMP packets on this interface..
txGenQueries [Tx Gen Queries] (vRtrIgmplfTxGenQueries)	long	The value of vRtrIgmplfTxGenQueries indicates the number of IGMP General Queries transmitted on this interface.
txGrpQueries [Tx Grp Queries] (vRtrIgmplfTxGrpQueries)	long	The value of vRtrIgmplfTxGrpQueries indicates the number of IGMP Group Specific Queries transmitted on this interface.
txGrpSrcQueries [Tx Grp Src Queries] (vRtrIgmplfTxGrpSrcQueries)	long	The value of vRtrIgmplfTxGrpSrcQueries indicates the number of IGMP Group and Source Specific Queries transmitted on this interface.

psnpRetransmitted [Psnp Retransmitted] (tmnxIisisStatsPSNPRetrans)	long	The value of the object tmnxIisisStatsPSNPRetrans indicates the count of link state PDUs that had to be retransmitted by this instance of the protocol is maintained by tmnxIisisStatsPSNPRetrans.
psnpSent [Psnp Sent] (tmnxIisisStatsPSNPSent)	long	The value of the object tmnxIisisStatsPSNPSent indicates the count of link state PDUs sent out by this instance of the protocol is maintained by tmnxIisisStatsPSNPSent.
unknownDropped [Unknown Dropped] (tmnxIisisStatsUnknownDrop)	long	The value of the object tmnxIisisStatsUnknownDrop indicates the count of link state PDUs dropped by this instance of the protocol is maintained by tmnxIisisStatsUnknownDrop.
unknownReceived [Unknown Received] (tmnxIisisStatsUnknownRecd)	long	The value of the object tmnxIisisStatsUnknownRecd indicates the count of link state PDUs received by this instance of the protocol is maintained by tmnxIisisStatsUnknownRecd.
unknownRetransmitted [Unknown Retransmitted] (tmnxIisisStatsUnknownRetrans)	long	The value of the object tmnxIisisStatsUnknownRetrans indicates the count of link state PDUs that had to be retransmitted by this instance of the protocol is maintained by tmnxIisisStatsUnknownRetrans.
unknownSent [Unknown Sent] (tmnxIisisStatsUnknownSent)	long	The value of the object tmnxIisisStatsUnknownSent indicates the count of link state PDUs sent out by this instance of the protocol is maintained by tmnxIisisStatsUnknownSent.

Table 163 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteLfaStats</p> <p>MIB entry name: tmnxIsisLfaEntry</p> <p>Entry description: Each row entry in the tmnxIsisLfaTable represents information on LFA coverage for various topologies of the system.</p> <p>Table description (for tmnxIsisLfaTable): The tmnxIsisLfaTable maintains information on loopfree-alternate (LFA) coverage for each instance of IS-IS protocol.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: isis.Site</p>		
isisLfalpv4Coverage [Isis Lfa Ipv 4 Coverage] (tmnxIsisLfalIpv4Coverage)	long	The value of the object tmnxIsisLfalIpv4Coverage indicates how much LFA coverage is being obtained for the available IPv4 routes.
isisLfalpv4NodesCovered [Isis Lfa Ipv 4 Nodes Covered] (tmnxIsisLfalIpv4NodesCovered)	long	The value of the object tmnxIsisLfalIpv4NodesCovered indicates in absolute numbers how much LFA coverage is being obtained for the available IPv4 routes.
isisLfalpv4TotalNodes [Isis Lfa Ipv 4 Total Nodes] (tmnxIsisLfalIpv4TotalNodes)	long	The value of the object tmnxIsisLfalIpv4TotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available IPv4 routes.
isisLfalpv6Coverage [Isis Lfa Ipv 6 Coverage] (tmnxIsisLfalIpv6Coverage)	long	The value of the object tmnxIsisLfalIpv6Coverage indicates how much LFA coverage is being obtained for the available IPv6 routes.
isisLfalpv6NodesCovered [Isis Lfa Ipv 6 Nodes Covered] (tmnxIsisLfalIpv6NodesCovered)	long	The value of the object tmnxIsisLfalIpv6NodesCovered indicates in absolute numbers how much LFA coverage is being obtained for available IPv6 routes.
isisLfalpv6TotalNodes [Isis Lfa Ipv 6 Total Nodes] (tmnxIsisLfalIpv6TotalNodes)	long	The value of the object tmnxIsisLfalIpv6TotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available IPv6 routes.

Table 163 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
isisLfaNodeCoverage [Isis Lfa Node Coverage] (tmnxIsisLfaNodeCoverage)	long	The value of the object tmnxIsisLfaNodeCoverage indicates how much LFA coverage is being obtained for the set of available nodes.
isisLfaNodesCovered [Isis Lfa Nodes Covered] (tmnxIsisLfaNodesCovered)	long	The value of the object tmnxIsisLfaNodesCovered indicates in absolute numbers how much LFA coverage is being obtained for the available routes.
isisLfaTotalNodes [Isis Lfa Total Nodes] (tmnxIsisLfaTotalNodes)	long	The value of the object tmnxIsisLfaTotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available routes.
<p>SiteStats MIB entry name: tmnxIsisStatsEntry Entry description: Each row entry in the tmnxIsisStatsTable stores statistics for an instance of IS-IS protocol configured. Table description (for tmnxIsisStatsTable): The tmnxIsisStatsTable provides statistics for each instance of IS-IS protocol configured. There is a one-to-one dependent relationship between the tables tmnxIsisTable and tmnxIsisStatsTable. Supports realtime plotting Supports scheduled collection Monitored classes:</p> <ul style="list-style-type: none"> • isis.Site • spb.Site 		
cspfDroppedRequests [Cspf Dropped Requests] (tmnxIsisStatsCSPFDroppedRequests)	long	The value of the object tmnxIsisStatsCSPFDroppedRequests indicates the number of dropped CSPF requests by the protocol.
cspfPathsFound [Cspf Paths Found] (tmnxIsisStatsCSPFPathsFound)	long	The value of the object tmnxIsisStatsCSPFPathsFound indicates the number of responses to CSPF requests for which paths satisfying the constraints were found.

Table 163 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cspfPathsNotFound [Cspf Paths Not Found] (tmnxIsisStatsCSPFPathsNotFound)	long	The value of the object tmnxIsisStatsCSPFPathsFound indicates the number of responses to CSPF requests for which no paths satisfying the constraints were found.
cspfRequests [Cspf Requests] (tmnxIsisStatsCSPFRequests)	long	The value of the object tmnxIsisStatsCSPFRequests indicates the number of CSPF requests made to the protocol.
initiatedPurges [Initiated Purges] (tmnxIsisStatsInitiatedPurges)	long	The value of the object tmnxIsisStatsInitiatedPurges indicates the number of times purges have been initiated.
lspRegenerations [Lsp Regenerations] (tmnxIsisStatsLSPRegenerations)	long	The value of the object tmnxIsisStatsLSPRegenerations indicates the count of LSP regenerations.
spfRuns [Spf Runs] (tmnxIsisStatsSpfRuns)	long	The value of the object tmnxIsisStatsSpfRuns indicates the number of times shortest path first calculations have been made.

Table 164 I2fwd statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
AccessInterfaceStpStats MIB entry name: sapTlsInfoEntry Entry description: TLS specific information about a SAP. Table description (for sapTlsInfoTable): A table that contains TLS SAP information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.AccessInterfaceStp		
forwardTransitions [Forward Transitions] (sapTlsStpForwardTransitions)	long	The value of the object sapTlsStpForwardTransitions indicates the number of times this port has transitioned from the Learning state to the Forwarding state.
inBadBpdus [In Bad Bpdus] (sapTlsStpInBadBpdus)	long	This object specifies the number of bad BPDUs received on this SAP.
inConfigBpdus [In Config Bpdus] (sapTlsStpInConfigBpdus)	long	The value of the object sapTlsStpInConfigBpdus indicates the number of Configuration BPDUs received on this SAP.
inRapidSpanningTreeBpdus [In Rapid Spanning Tree Bpdus] (sapTlsStpInRstBpdus)	long	The value of the object sapTlsStpInRstBpdus indicates the number of Rapid Spanning Tree (RST) BPDUs received on this SAP.
inTcnBpdus [In Tcn Bpdus] (sapTlsStpInTcnBpdus)	long	The value of the object sapTlsStpInTcnBpdus indicates the number of Topology Change Notification BPDUs received on this SAP.
outConfigBpdus [Out Config Bpdus] (sapTlsStpOutConfigBpdus)	long	The value of the object sapTlsStpOutConfigBpdus indicates the number of Configuration BPDUs sent out this SAP.

Table 164 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outRapidSpanningTreeBpdus [Out Rapid Spanning Tree Bpdus] (sapTlsStpOutRstBpdus)	long	The value of the object sapTlsStpOutRstBpdus indicates the number of Rapid Spanning Tree (RST) BPDUs sent out on this SAP.
outTcnBpdus [Out Tcn Bpdus] (sapTlsStpOutTcnBpdus)	long	This object specifies the number of Topology Change Notification BPDUs sent out this SAP.
CircuitStpStats MIB entry name: sdpBindTlsEntry Entry description: TLS specific information about an SDP Bind. Table description (for sdpBindTlsTable): A table that contains TLS spoke SDP Bind information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.CircuitStp		
forwardTransitions [Forward Transitions] (sdpBindTlsStpForwardTransitions)	long	The value of the object sdpBindTlsStpForwardTransitions indicates the number of times this port has transitioned from the Learning state to the Forwarding state.
inBadBpdus [In Bad Bpdus] (sdpBindTlsStpInBadBpdus)	long	The value of the object sdpBindTlsStpInBadBpdus indicates the number of bad BPDUs received on this SDP Bind.
inConfigBpdus [In Config Bpdus] (sdpBindTlsStpInConfigBpdus)	long	The value of the object sdpBindTlsStpInConfigBpdus indicates the number of Configuration BPDUs received on this SDP Bind.
inRapidSpanningTreeBpdus [In Rapid Spanning Tree Bpdus] (sdpBindTlsStpInRstBpdus)	long	The value of the object sdpBindTlsStpInRstBpdus indicates the number of Rapid Spanning Tree (Rst) BPDUs received on this SDP.

Table 164 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTcnBpdus [In Tcn Bpdus] (sdpBindTlsStpInTcnBpdus)	long	The value of the object sdpBindTlsStpInTcnBpdus indicates the number of Topology Change Notification BPDUs received on this SDP Bind.
outConfigBpdus [Out Config Bpdus] (sdpBindTlsStpOutConfigBpdus)	long	The value of the object sdpBindTlsStpOutConfigBpdus indicates the number of Configuration BPDUs sent out this SDP Bind.
outRapidSpanningTreeBpdus [Out Rapid Spanning Tree Bpdus] (sdpBindTlsStpOutRstBpdus)	long	The value of the object sdpBindTlsStpOutRstBpdus indicates the number of Rapid Spanning Tree (Rstp) BPDUs sent out on this SDP.
outTcnBpdus [Out Tcn Bpdus] (sdpBindTlsStpOutTcnBpdus)	long	The value of the object sdpBindTlsStpOutTcnBpdus indicates the number of Topology Change Notification BPDUs sent out this SDP Bind.
SiteFibStats MIB entry name: svcTlsInfoEntry Entry description: TLS specific information about a service. Table description (for svcTlsInfoTable): A table that contains TLS service information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.SiteFib		
entries [Entries] (svcTlsFdbNumEntries)	long	The value of the object svcTlsFdbNumEntries indicates the current number of entries in the FDB of this service.

Table 164 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
provisionedSize [Provisioned Size] (svcTlsFdbTableSize)	long	The value of the object svcTlsFdbTableSize specifies the maximum number of learned and static entries allowed in the FDB of this service. The maximum value of svcTlsFdbTableSize is '511999', when the the value of TIMETRA-CHASSIS-MIB::tmnxChassisOperMode is 'd'. The maximum value of svcTlsFdbTableSize is '196607', when the the value of TIMETRA-CHASSIS-MIB::tmnxChassisOperMode is 'c'. In other cases, the maximum value of svcTlsFdbTableSize is '131071'.
staticEntries [Static Entries] (svcTlsFdbNumStaticEntries)	long	The value of the object svcTlsFdbNumStaticEntries indicates the current number of static entries in the FDB of this service.
SiteStpStats MIB entry name: svcTlsInfoEntry Entry description: TLS specific information about a service. Table description (for svcTlsInfoTable): A table that contains TLS service information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.SiteStp		
timeSinceTopologyChange [Time Since Topology Change] (svcTlsStpTimeSinceTopologyChange)	long	The value of the object svcTlsStpTimeSinceTopologyChange indicates the time (in hundredths of a second) since the last time a topology change was detected by the Spanning Tree Protocol instance associated with this service.
topologyChanges [Topology Changes] (svcTlsStpTopologyChanges)	long	The value of the object svcTlsStpTopologyChanges indicates the total number of topology changes detected by the Spanning Tree Protocol instance associated with this service since the management entity was last reset or initialized.

Table 165 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagStats</p> <p>MIB entry name: tLagOperationEntry</p> <p>Entry description: An entry (conceptual row) in the tLagOperationTable. Each entry represents an active Link Aggregation Group.</p> <p>Table description (for tLagOperationTable): Operational information about each Link Aggregation Group.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.Interface</p>		
portThresholdFalling [Port Threshold Falling] (tLagPortThresholdFalling)	long	counts the number of linkDown or dynamicCost events for the Link Aggregation Group caused by the number of physical ports being less than or equal to tLagPortThreshold value.
portThresholdRising [Port Threshold Rising] (tLagPortThresholdRising)	long	counts the number of linkUp or dynamicCost events for the Link Aggregation Group caused by the number of physical ports being greater than tLagPortThreshold value.
<p>MultiChassisLagMemberStats</p> <p>MIB entry name: tmnxMcLagLagStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a lag that participates in a multi-chassis configuration with a given peer. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcLagLagStatsTable): The tmnxMcLagLagStatsTable has an entry for each lag that participates in a multi-chassis configuration for the indicated peer.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • lag.MultiChassisLagMember • multichassis.MultiChassisLagMember 		
configPacketsReceived [Config Packets Received] (tmnxMcLagLagStatsPktsRxConfig)	long	The value of tmnxMcLagLagStatsPktsRxConfig indicates how many MC-Lag control packets of type lag config were received on this system from the peer for this lag.

Table 165 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
configPacketsTransmitted [Config Packets Transmitted] (tmnxMcLagLagStatsPktsTxConfig)	long	The value of tmnxMcLagLagStatsPktsTxConfig indicates how many MC-Lag control packets of type lag config were sent on this system to the peer for this lag.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagLagStatsPktsTxFailed)	long	The value of tmnxMcLagLagStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted on this system to the peer for this lag.
statePacketsReceived [State Packets Received] (tmnxMcLagLagStatsPktsRxState)	long	The value of tmnxMcLagLagStatsPktsRxState indicates how many MC-Lag control packets of type lag state were received on this system from the peer for this lag.
statePacketsTransmitted [State Packets Transmitted] (tmnxMcLagLagStatsPktsTxState)	long	The value of tmnxMcLagLagStatsPktsTxState indicates how many MC-Lag control packets of type lag state were sent on this system to the peer for this lag.

Table 166 Ldp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats</p> <p>MIB entry name: vRtrLdpNgInetIfStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Interface for given Inet address family. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpNgSessionStatsEntry.</p> <p>Table description (for vRtrLdpNgInetIfStatsTable): The vRtrLdpNgInetIfStatsTable is a read-only table. The purpose of this table is to keep statistical information about the LDP Interfaces for given Inet address family on this LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgInetIfTable, and the augmenting table, vRtrLdpNgInetIfStatsTable. This in effect extends the vRtrLdpNgInetIfTable with additional columns. Creation or deletion of a row in the vRtrLdpNgInetIfTable results in the same fate for the row in the vRtrLdpNgInetIfStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.Interface</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpNgInetIfStatsExistingAdj)	long	The value of vRtrLdpNgInetIfStatsExistingAdj indicates a count of the total active adjacencies on this LDP interface for given Inet address family.

Table 166 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SessionStats</p> <p>MIB entry name: vRtrLdpNgSessionStatsEntry</p> <p>Entry description: A row in this table represents statistical information about a single session between an LDP entity and an LDP Peer.</p> <p>Table description (for vRtrLdpNgSessionStatsTable): The vRtrLdpNgSessionStatsTable is a read-only table. The purpose of this table is to keep statistical information about a single session between an LDP entity and an LDP Peer. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgSessionTable, and the augmenting table, vRtrLdpNgSessionStatsTable. This in effect extends the vRtrLdpNgSessionTable with additional columns. Creation or deletion of a row in the vRtrLdpNgSessionTable results in the same fate for the row in the vRtrLdpNgSessionStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ldp.Session</p>		
addressMessagesReceived [Address Messages Received] (vRtrLdpNgSessStatsAddrIn)	long	The value of vRtrLdpNgSessStatsAddrIn counts the number of Address Messages that have been received during this session.
addressMessagesSent [Address Messages Sent] (vRtrLdpNgSessStatsAddrOut)	long	The value of vRtrLdpNgSessStatsAddrOut counts the number of Address Messages that have been sent during this session.
addressWithdrawMessagesReceived [Address Withdraw Messages Received] (vRtrLdpNgSessStatsAddrWithdrawIn)	long	The value of vRtrLdpNgSessStatsAddrWithdrawIn counts the number of Address Withdraw Messages that have been received during this session.
addressWithdrawMessagesSent [Address Withdraw Messages Sent] (vRtrLdpNgSessStatsAddrWithdrawOut)	long	The value of vRtrLdpNgSessStatsAddrWithdrawOut counts the number of Address Withdraw Messages that have been sent during this session.
capabilityMessageIn [Capability Message In] (vRtrLdpNgSessStatsCapabilityIn)	long	The value of vRtrLdpNgSessStatsCapabilityIn counts the number of Capability Messages that have been received during this session.

Table 166 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
capabilityMessageOut [Capability Message Out] (vRtrLdpNgSessStatsCapabilityOut)	long	The value of vRtrLdpNgSessStatsCapabilityOut counts the number of Capability Messages that have been sent during this session.
helloMessagesReceived [Hello Messages Received] (vRtrLdpNgSessStatsHelloIn)	long	The value of vRtrLdpNgSessStatsHelloIn counts the number of Hello Messages that have been received during this session.
helloMessagesSent [Hello Messages Sent] (vRtrLdpNgSessStatsHelloOut)	long	The value of vRtrLdpNgSessStatsHelloOut counts the number of Hello Messages that have been sent during this session.
initMessagesReceived [Init Messages Received] (vRtrLdpNgSessStatsInitIn)	long	The value of vRtrLdpNgSessStatsInitIn counts the number of Init Messages that have been received during this session.
initMessagesSent [Init Messages Sent] (vRtrLdpNgSessStatsInitOut)	long	The value of vRtrLdpNgSessStatsInitOut counts the number of Init Messages that have been sent during this session.
ipv4AddrReceived [Ipv 4 Addr Received] (vRtrLdpNgSessStatsIPv4AddrRecv)	long	The value of vRtrLdpNgSessStatsIPv4AddrRecv counts the number of IPv4 local addresses received for this session.
ipv4AddrSent [Ipv 4 Addr Sent] (vRtrLdpNgSessStatsIPv4AddrSent)	long	The value of vRtrLdpNgSessStatsIPv4AddrSent counts the number of IPv4 local addresses sent for this session.
ipv4P2mpFecReceived [Ipv 4 P2 mp Fec Received] (vRtrLdpNgSessStatsIPv4P2MPFecRcv)	long	The value of vRtrLdpNgSessStatsIPv4P2MPFecRcv counts the number of IPv4 P2MP FECs received for this session.
ipv4P2mpFecSent [Ipv 4 P2 mp Fec Sent] (vRtrLdpNgSessStatsIPv4P2MPFecSnt)	long	The value of vRtrLdpNgSessStatsIPv4P2MPFecSnt counts the number of IPv4 P2MP FECs sent for this session.

Table 166 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ipv4PfxFecReceived [Ipv 4 Pfx Fec Received] (vRtrLdpNgSessStatsIPv4PfxFecRcv)	long	The value of vRtrLdpNgSessStatsIPv4PfxFecRcv counts the number of IPv4 prefix FECs received for this session.
ipv4PfxFecSent [Ipv 4 Pfx Fec Sent] (vRtrLdpNgSessStatsIPv4PfxFecSnt)	long	The value of vRtrLdpNgSessStatsIPv4PfxFecSnt counts the number of IPv4 prefix FECs sent for this session.
ipv6AddrReceived [Ipv 6 Addr Received] (vRtrLdpNgSessStatsIPv6AddrRecv)	long	The value of vRtrLdpNgSessStatsIPv6AddrRecv counts the number of IPv6 local addresses received for this session.
ipv6AddrSent [Ipv 6 Addr Sent] (vRtrLdpNgSessStatsIPv6AddrSent)	long	The value of vRtrLdpNgSessStatsIPv6AddrSent counts the number of IPv6 local addresses sent for this session.
ipv6P2mpFecReceived [Ipv 6 P2 mp Fec Received] (vRtrLdpNgSessStatsIPv6P2MPFecRcv)	long	The value of vRtrLdpNgSessStatsIPv6P2MPFecRcv counts the number of IPv6 P2MP FECs received for this session.
ipv6P2mpFecSent [Ipv 6 P2 mp Fec Sent] (vRtrLdpNgSessStatsIPv6P2MPFecSnt)	long	The value of vRtrLdpNgSessStatsIPv6P2MPFecSnt counts the number of IPv6 P2MP FECs sent for this session.
ipv6PfxFecReceived [Ipv 6 Pfx Fec Received] (vRtrLdpNgSessStatsIPv6PfxFecRcv)	long	The value of vRtrLdpNgSessStatsIPv6PfxFecRcv counts the number of IPv6 prefix FECs received for this session.
ipv6PfxFecSent [Ipv 6 Pfx Fec Sent] (vRtrLdpNgSessStatsIPv6PfxFecSnt)	long	The value of vRtrLdpNgSessStatsIPv6PfxFecSnt counts the number of IPv6 prefix FECs sent for this session.
keepAliveMessagesReceived [Keep Alive Messages Received] (vRtrLdpNgSessStatsKeepaliveIn)	long	The value of vRtrLdpNgSessStatsKeepaliveIn counts the number of Keepalive Messages that have been received during this session.

Table 166 Idp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAliveMessagesSent [Keep Alive Messages Sent] (vRtrLdpNgSessStatsKeepaliveOut)	long	The value of vRtrLdpNgSessStatsKeepaliveOut counts the number of Keepalive Messages that have been sent during this session.
labelAbortsReceived [Label Aborts Received] (vRtrLdpNgSessStatsLblAbortIn)	long	The value of vRtrLdpNgSessStatsLblAbortIn counts the number of Label Abort Messages that have been received during this session.
labelAbortsSent [Label Aborts Sent] (vRtrLdpNgSessStatsLblAbortOut)	long	The value of vRtrLdpNgSessStatsLblAbortOut counts the number of Label Abort Messages that have been sent during this session.
labelMappingsReceived [Label Mappings Received] (vRtrLdpNgSessStatsLblMappingIn)	long	The value of vRtrLdpNgSessStatsLblMappingIn counts the number of Label Mapping Messages that have been received during this session.
labelMappingsSent [Label Mappings Sent] (vRtrLdpNgSessStatsLblMappingOut)	long	The value of vRtrLdpNgSessStatsLblMappingOut counts the number of Label Mapping Messages that have been sent during this session.
labelReleasesReceived [Label Releases Received] (vRtrLdpNgSessStatsLblReleaseIn)	long	The value of vRtrLdpNgSessStatsLblReleaseIn counts the number of Label Release Messages that have been received during this session.
labelReleasesSent [Label Releases Sent] (vRtrLdpNgSessStatsLblReleaseOut)	long	The value of vRtrLdpNgSessStatsLblReleaseOut counts the number of Label Release Messages that have been sent during this session.
labelRequestsReceived [Label Requests Received] (vRtrLdpNgSessStatsLblRequestIn)	long	The value of vRtrLdpNgSessStatsLblRequestIn counts the number of Label Request Messages that have been received during this session.
labelRequestsSent [Label Requests Sent] (vRtrLdpNgSessStatsLblRequestOut)	long	The value of vRtrLdpNgSessStatsLblRequestOut counts the number of Label Request Messages that have been sent during this session.

Table 166 ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
labelWithdrawsReceived [Label Withdraws Received] (vRtrLdpNgSessStatsLblWithdrawIn)	long	The value of vRtrLdpNgSessStatsLblWithdrawIn counts the number of Label Withdraw Messages that have been received during this session.
labelWithdrawsSent [Label Withdraws Sent] (vRtrLdpNgSessStatsLblWithdrawOut)	long	The value of vRtrLdpNgSessStatsLblWithdrawOut counts the number of Label Withdraw Messages that have been sent during this session.
linkAdjacencies [Link Adjacencies] (vRtrLdpNgSessStatsLinkAdj)	long	The value of vRtrLdpNgSessStatsLinkAdj indicates the number of link adjacencies for this session.
notificationMessagesReceived [Notification Messages Received] (vRtrLdpNgSessStatsNotifIn)	long	The value of vRtrLdpNgSessStatsNotifIn counts the number of Notification Messages that have been received during this session.
notificationMessagesSent [Notification Messages Sent] (vRtrLdpNgSessStatsNotifOut)	long	The value of vRtrLdpNgSessStatsNotifOut counts the number of Notification Messages that have been sent during this session.
svcFec128Received [Svc Fec 128 Received] (vRtrLdpNgSessStatsSvcFec128Recv)	long	The value of vRtrLdpNgSessStatsSvcFec128Recv counts the number of service FEC 128 received for this session.
svcFec128Sent [Svc Fec 128 Sent] (vRtrLdpNgSessStatsSvcFec128Sent)	long	The value of vRtrLdpNgSessStatsSvcFec128Sent counts the number of service FEC 128 sent for this session.
svcFec129Received [Svc Fec 129 Received] (vRtrLdpNgSessStatsSvcFec129Recv)	long	The value of vRtrLdpNgSessStatsSvcFec129Recv counts the number of service FEC 129 received for this session.
svcFec129Sent [Svc Fec 129 Sent] (vRtrLdpNgSessStatsSvcFec129Sent)	long	The value of vRtrLdpNgSessStatsSvcFec129Sent counts the number of service FEC 129 sent for this session.

Table 166 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
targetedAdjacencies [Targeted Adjacencies] (vRtrLdpNgSessStatsTargAdj)	long	The value of vRtrLdpNgSessStatsTargAdj indicates the number of targeted adjacencies for this session.
<p>SiteStats</p> <p>MIB entry name: vLdpNgStatsEntry</p> <p>Entry description: A row in this table represents statistical information about an LDP instance.</p> <p>Table description (for vLdpNgStatsTable): vLdpNgStatsTable is a read-only table. The purpose of this table is to keep statistical information about an LDP Instance. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgGeneralTable, and the augmenting table, vLdpNgStatsTable. This in effect extends the vRtrLdpNgGeneralTable with additional columns. activeAdjacencies [Active Adjacencies] (vLdpNgStatsIPv4ActiveLinkAdj)	long	The value of vLdpNgStatsIPv4ActiveLinkAdj specifies the number of active IPv4 link adjacencies (i.e. established adjacencies) associated with the LDP instance.
activeInterfaces [Active Interfaces] (vLdpNgStatsIPv4ActiveIf)	long	The value of vLdpNgStatsIPv4ActiveIf specifies the number of active (i.e. operationally up) IPv4 interfaces associated with the LDP instance.
activeSessions [Active Sessions] (vLdpNgStatsIPv4ActiveSess)	long	The value of vLdpNgStatsIPv4ActiveSess specifies the number of active IPv4 sessions (i.e. session in some form of creation) associated with the LDP instance.
activeTargetedSessions [Active Targeted Sessions] (vLdpNgStatsIPv4ActiveTargPeers)	long	The value of vLdpNgStatsIPv4ActiveTargPeers specifies the number of configured IPv4 targeted peers that are administratively up in an LDP instance.

Table 166 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
addressFECsReceived [Address FECs Received] (vLdpNgStatsIPv4PfxFecRecv)	long	The value of vLdpNgStatsIPv4PfxFecRecv specifies the number of IPv4 Address FECs received by the LDP instance from its neighbors.
addressFECsSent [Address FECs Sent] (vLdpNgStatsIPv4PfxFecSent)	long	The value of vLdpNgStatsIPv4PfxFecSent specifies the number of IPv4 Address FECs sent by the LDP instance to its neighbors.
attemptedSessions [Attempted Sessions] (vLdpNgStatsIPv4AttemptedSessions)	long	The value of vLdpNgStatsIPv4AttemptedSessions specifies the total number of attempted IPv4 sessions for this LDP instance.
badLdpIdentifierErrors [Bad Ldp Identifier Errors] (vLdpNgStatsBadLdpIdErrors)	long	The value of vLdpNgStatsBadLdpIdErrors gives the number of Bad LDP Identifier Fatal Errors detected for sessions associated with this LDP instance.
badMessageLengthErrors [Bad Message Length Errors] (vLdpNgStatsBadMsgLengthErrors)	long	The value of vLdpNgStatsBadMsgLengthErrors gives the number of Bad Message Length Fatal Errors detected for sessions associated with this LDP instance.
badPduLengthErrors [Bad Pdu Length Errors] (vLdpNgStatsBadPduLengthErrors)	long	The value of vLdpNgStatsBadPduLengthErrors gives the number of Bad Pdu Length Fatal Errors detected for sessions associated with this LDP instance.
badTlvLengthErrors [Bad Tlv Length Errors] (vLdpNgStatsBadTlvLengthErrors)	long	The value of vLdpNgStatsBadTlvLengthErrors gives the number of Bad TLV Length Fatal Errors detected for sessions associated with this LDP instance.
inactiveInterfaces [Inactive Interfaces] (vLdpNgStatsIPv4Inactivesf)	long	The value of vLdpNgStatsIPv4Inactivesf specifies the number of inactive (i.e. operationally down) IPv4 interfaces associated with the LDP instance.
inactiveTargetedSessions [Inactive Targeted Sessions] (vLdpNgStatsIPv6ActiveTargPeers)	long	The value of vLdpNgStatsIPv6ActiveTargPeers specifies the number of configured IPv6 targeted peers that are administratively up in an LDP instance.

Table 166 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAliveExpiredErrors [Keep Alive Expired Errors] (vLdpNgStatsKeepAliveExpErrors)	long	The value of vLdpNgStatsKeepAliveExpErrors gives the number of Session Keep Alive Timer Expired Errors detected for sessions associated with this LDP instance.
malformedTlvValueErrors [Malformed Tlv Value Errors] (vLdpNgStatsMalformedTlvErrors)	long	The value of vLdpNgStatsMalformedTlvErrors gives the number of Malformed TLV Value Fatal Errors detected for sessions associated with this LDP instance.
operDownEvents [Oper Down Events] (vLdpNgStatsIPv4OperDownEvents)	long	The value of vLdpNgStatsIPv4OperDownEvents specifies the number of times the IPv4 LDP instance has gone operationally down since the instance was created.
serviceFECsReceived [Service FECs Received] (vLdpNgStatsFec128FecRecv)	long	The value of vLdpNgStatsFec128FecRecv specifies the number of Pseudo wire ID FECs received by the LDP instance from its neighbors.
serviceFECsSent [Service FECs Sent] (vLdpNgStatsFec128FecSent)	long	The value of vLdpNgStatsFec128FecSent specifies the number of Pseudo wire ID FECs sent by the LDP instance to its neighbors.
sessionRejectedAdvertisementModeErrors [Session Rejected Advertisement Mode Errors] (vLdpNgStatsSessRejAdvErrors)	long	The value of vLdpNgStatsSessRejAdvErrors gives the total number of Session Rejected/Parameters Advertisement Mode Error Notification Messages sent or received by this LDP instance.
sessionRejectedLabelRangeErrors [Session Rejected Label Range Errors] (vLdpNgStatsSessRejLblRngeErrs)	long	The value of vLdpNgStatsSessRejLblRngeErrs gives the total number of Session Rejected/Parameters Label Range Error Notification Messages sent or received by this LDP instance.
sessionRejectedMaxPduLengthErrors [Session Rejected Max Pdu Length Errors] (vLdpNgStatsSessRejMaxPduErrs)	long	The value of vLdpNgStatsSessRejMaxPduErrs gives the total number of Session Rejected/Parameters Max Pdu Length Error Notification Messages sent or received by this LDP instance.

Table 166 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionRejectedNoHelloErrors [Session Rejected No Hello Errors] (vLdpNgStatsSessRejNoHelloErrs)	long	The value of vLdpNgStatsSessRejNoHelloErrs gives the total number of Session Rejected/No Hello Error Notification Messages sent or received by this LDP instance.
shutdownNotificationsReceived [Shutdown Notifications Received] (vLdpNgStatsShutdownNotifRecv)	long	The value of vLdpNgStatsShutdownNotifRecv gives the number of Shutdown Notifications received related to sessions associated with this LDP instance.
shutdownNotificationsSent [Shutdown Notifications Sent] (vLdpNgStatsShutdownNotifSent)	long	The value of vLdpNgStatsShutdownNotifSent gives the number of Shutdown Notifications sent related to sessions associated with this LDP instance.
<p>TargetedPeerStats</p> <p>MIB entry name: vRtrLdpNgTargPeerStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Targeted peer. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpNgSessionStatsEntry.</p> <p>Table description (for vRtrLdpNgTargPeerStatsTable): The vRtrLdpNgTargPeerStatsTable is a read-only table. The purpose of this table is to keep statistical information about the Targeted peers on the LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgTargPeerTable, and the augmenting table, vRtrLdpNgTargPeerStatsTable. This in effect extends the vRtrLdpNgTargPeerTable with additional columns. Creation or deletion of a row in the vRtrLdpNgTargPeerTable results in the same fate for the row in the vRtrLdpNgTargPeerTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Idp.TargetedPeer</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpNgTargPeerStatExistingAdj)	long	The value of vRtrLdpNgTargPeerStatExistingAdj indicates a count of the total active adjacencies with this targeted peer.

Table 167 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 167 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: tmnxLldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports and destination MAC addresses. Entries are not required to exist in this table while the tmnxLldpPortCfgAdminStatus object is equal to 'disabled(4)'. Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPPortConfiguration</p>		

Table 167 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (tmnxLldpStatsRxPortAgeouts)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in tmnxLldpRemoteSystemsData and lldpExtensions objects because the information timeliness interval has expired. This counter is similar to lldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the tmnxLldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial ageing is not allowed, and thus, should not change the value of this counter.
lldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (tmnxLldpStatsRxPortFrameDiscard)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
lldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (tmnxLldpStatsRxPortFrameErrs)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
lldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (tmnxLldpStatsRxPortFrames)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 167 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (tmnxLldpStatsRxPortTLVDiscard)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
lldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (tmnxLldpStatsRxPortTLVUnknown)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2004. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats</p> <p>MIB entry name: tmnxLldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port and destination MAC address. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsTxPortTable): A table containing LLDP transmission statistics for individual port/destination address combinations. Entries are not required to exist in this table while the tmnxLldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lldp.LLDPPortConfiguration</p>		
lldpStatsTxLLDPDULengthErrs [Lldp Stats Tx LLDPDULength Errs] (tmnxLldpStatsTxLLDPDULengthErrs)	long	The number of LLDPD Length Errors recorded for the Port.
lldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (tmnxLldpStatsTxPortFrames)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 168 mpls statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DynamicLspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp 		
configuredPaths [Configured Paths] (vRtrMplsLspConfiguredPaths)	long	The number of paths configured for this LSP.
operationalPaths [Operational Paths] (vRtrMplsLspOperationalPaths)	long	The number of operational paths for this LSP. This includes the path currently active, as well as operational standby paths.
pathChanges [Path Changes] (vRtrMplsLspPathChanges)	long	The number of path changes this LSP has had. For every path change (path down, path up, path change), a corresponding syslog/trap (if enabled) is generated for it.
standbyPaths [Standby Paths] (vRtrMplsLspStandbyPaths)	long	The number of standby paths configured for this LSP.
timeSinceLastPathChange [Time Since Last Path Change] (vRtrMplsLspLastPathChange)	long	The time in 10-millisecond units since the last change occurred on this LSP.

Table 168 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastPrimaryUpState [Time Since Last Primary Up State] (vRtrMplsLspPrimaryTimeUp)	long	The total time in 10-millisecond units that this LSP's primary path has been operational. For example, the percentage contribution of the primary path to the operational time is given by (vRtrMplsLspPrimaryTimeUp/vRtrMplsLspTimeUp * 100) %.
<p>LspPathStats MIB entry name: vRtrMplsLspPathStatEntry Entry description: Each row entry represents a collection of statistics for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrMplsLspPathStatTable): The vRtrMplsLspPathStatTable has an entry for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable. Supports realtime plotting Supports scheduled collection Monitored class: mpls.LspPath</p>		
cspfQueries [Cspf Queries] (vRtrMplsLspPathCspfQueries)	long	The value of vRtrMplsLspPathCspfQueries specifies the number of CSPF queries that have been made for this LSP path.
retryAttempts [Retry Attempts] (vRtrMplsLspPathRetryAttempts)	long	The number of unsuccessful attempts which have been made to signal this path. As soon as the path gets signalled, this is set to 0.
timeDown [Time Down] (vRtrMplsLspPathTimeDown)	long	The total time in 10-millisecond units that this LSP Path has not been operational.
timeUp [Time Up] (vRtrMplsLspPathTimeUp)	long	The total time in 10-millisecond units that this LSP path has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspPathTimeUp/vRtrMplsLspAge * 100 %).

Table 168 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitionCount [Transition Count] (vRtrMplsLspPathTransitionCount)	long	The object vRtrMplsLspPathTransitionCount maintains the number of transitions that have occurred for this LSP.
<p>LspStats MIB entry name: vRtrMplsLspStatEntry Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system. Supports realtime plotting Supports scheduled collection Monitored classes:</p> <ul style="list-style-type: none"> • mpls.BypassOnlyLsp • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp • mpls.StaticLsp 		
age [Age] (vRtrMplsLspAge)	long	The age (i.e., time from creation till now) of this LSP in 10-millisecond periods.
timeSinceLastDownState [Time Since Last Down State] (vRtrMplsLspTimeDown)	long	The total time in 10-millisecond units that this LSP has not been operational.
timeSinceLastTransition [Time Since Last Transition] (vRtrMplsLspLastTransition)	long	The time in 10-millisecond units since the last transition occurred on this LSP.
timeSinceLastUpState [Time Since Last Up State] (vRtrMplsLspTimeUp)	long	The total time in 10-millisecond units that this LSP has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspTimeUp/ vRtrMplsLspAge * 100 %).

Table 168 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitions [Transitions] (vRtrMplsLspTransitions)	long	The number of state transitions (up -> down and down -> up) this LSP has undergone.
<p>MplsInterfaceStats MIB entry name: vRtrMplsIfStatEntry Entry description: Each row entry represents a collection of statistics for an interface on this virtual router that participates in the MPLS protocol. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrMplsIfStatTable): The vRtrMplsIfStatTable has an entry for each router interface configured for MPLS in the system. Supports realtime plotting Supports scheduled collection Monitored class: mpls.Interface</p>		
receiveOctets [Receive Octets] (vRtrMplsIfRxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets received on this interface.
receivePackets [Receive Packets] (vRtrMplsIfRxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets received on this interface.
transmitOctets [Transmit Octets] (vRtrMplsIfTxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets transmitted on this interface.
transmitPackets [Transmit Packets] (vRtrMplsIfTxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets transmitted from this interface.

Table 168 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteStats</p> <p>MIB entry name: vRtrMplsGeneralStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an instance of the MPLS protocol running within a virtual router. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsGeneralStatTable): The vRtrMplsGeneralStatTable contains statistics for an MPLS protocol instance within a virtual router.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.Site</p>		
detourOriginate [Detour Originate] (vRtrMplsGeneralDetourLspOriginate)	long	The value of vRtrMplsGeneralDetourLspOriginate indicates the number of detour LSPs that originate at this virtual router.
detourTerminate [Detour Terminate] (vRtrMplsGeneralDetourLspTerminate)	long	The value of vRtrMplsGeneralDetourLspTerminate indicates the number of detour LSPs that terminate at this virtual router.
detourTransit [Detour Transit] (vRtrMplsGeneralDetourLspTransit)	long	The value of vRtrMplsGeneralDetourLspTransit indicates the number of detour LSPs that transit through this virtual router.
dynamicOriginate [Dynamic Originate] (vRtrMplsGeneralDynamicLspOriginate)	long	The value of vRtrMplsGeneralDynamicLspOriginate indicates the number of dynamic LSPs that originate at this virtual router.
dynamicTerminate [Dynamic Terminate] (vRtrMplsGeneralDynamicLspTerminate)	long	The value of vRtrMplsGeneralDynamicLspTerminate indicates the number of dynamic LSPs that terminate at this virtual router.
dynamicTransit [Dynamic Transit] (vRtrMplsGeneralDynamicLspTransit)	long	The value of vRtrMplsGeneralDynamicLspTransit indicates the number of dynamic LSPs that transit through this virtual router.

Table 168 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
staticOriginate [Static Originate] (vRtrMplsGeneralStaticLspOriginate)	long	The value of vRtrMplsGeneralStaticLspOriginate indicates the number of static LSPs that originate at this virtual router.
staticTerminate [Static Terminate] (vRtrMplsGeneralStaticLspTerminate)	long	The value of vRtrMplsGeneralStaticLspTerminate indicates the number of static LSPs that terminate at this virtual router.
staticTransit [Static Transit] (vRtrMplsGeneralStaticLspTransit)	long	The value of vRtrMplsGeneralStaticLspTransit indicates the number of static LSPs that transit through this virtual router.

Table 169 mplstp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PathMepStats</p> <p>MIB entry name: vRtrMplsTpLspPtPathMepStatEntry</p> <p>Entry description: The vRtrMplsTpLspPathMepEntry represents a Maintenance Endpoint for a MPLS-TP LSP protection Path. Rows are created and destroyed by the system based on the configuration of the MEP protection-type.</p> <p>Table description (for vRtrMplsTpLspPtPathMepStatTable): The vRtrMplsTpLspPtPathMepStatTable maintains the Maintenance End Points (MEPs) statistics for MPLS-TP LSP protection paths.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: mplstp.PathMep</p>		
wtrTimer [Wtr Timer] (vRtrMplsTpLspPtPathMepWTRTimer)	long	The value of vRtrMplsTpLspPtPathMepWTRTimer indicates the remaining Wait-To-Restore time, in seconds, before the protection path can switch back to the working path. A value of zero (0) indicates that there is no WTR timer in effect.
<p>SiteStats</p> <p>MIB entry name: vRtrMplsGeneralStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an instance of the MPLS protocol running within a virtual router. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsGeneralStatTable): The vRtrMplsGeneralStatTable contains statistics for an MPLS protocol instance within a virtual router.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mplstp.Site</p>		
mplsTpLspOriginate [Mpls Tp Lsp Originate] (vRtrMplsGenMplsTpLspOriginate)	long	The value of vRtrMplsGenMplsTpLspOriginate indicates the number of MPLS TP LSPs that originate at this virtual router.
mplsTpLspTerminate [Mpls Tp Lsp Terminate] (vRtrMplsGenMplsTpLspTerminate)	long	The value of vRtrMplsGenMplsTpLspTerminate indicates the number of MPLS TP LSPs that terminate at this virtual router.

Table 169 mplsTp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mplsTpLspTransit [Mpls Tp Lsp Transit] (vRtrMplsGenMplsTpLspTransit)	long	The value of vRtrMplsGenMplsTpLspTransit indicates the number of MPLS TP LSPs that transit through this virtual router.
mplsTpOrigPathInst [Mpls Tp Orig Path Inst] (vRtrMplsGenMplsTpOrigPathInst)	long	The value of vRtrMplsGenMplsTpOrigPathInst indicates the number of MPLS TP LSPs originate path instances.
mplsTpTermPathInst [Mpls Tp Term Path Inst] (vRtrMplsGenMplsTpTermPathInst)	long	The value of vRtrMplsGenMplsTpTermPathInst indicates the number of MPLS TP LSPs terminated path instances.
mplsTpTranPathInst [Mpls Tp Tran Path Inst] (vRtrMplsGenMplsTpTranPathInst)	long	The value of vRtrMplsGenMplsTpTranPathInst indicates the number of MPLS TP LSPs transit path instances.

Table 170 multichassis statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerStats</p> <p>MIB entry name: tmnxMcLagPeerStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a multi-chassis peer. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcLagPeerStatsTable): The tmnxMcLagPeerStatsTable has an entry for each multi-chassis peer configured on this system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • multichassis.PSSPeer • multichassis.Peer 		
configPacketsReceived [Config Packets Received] (tmnxMcLagPeerStatsPktsRxConfig)	long	The value of tmnxMcLagPeerStatsPktsRxConfig indicates how many valid MC-Lag control packets of type lag config were received on this system from the peer.
failedMD5AuthenticationPacketsDropped [Failed MD5 Authentication Packets Dropped] (tmnxMcLagPeerStatsDropMD5)	long	The value of tmnxMcLagPeerStatsDropMD5 indicates how many MC-Lag control packets were dropped on this system from the peer because the packet failed MD5 authentication.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagPeerStatsPktsTxFailed)	long	The value of tmnxMcLagPeerStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted from this system to the peer.
invalidLagIdPacketsDropped [Invalid Lag Id Packets Dropped] (tmnxMcLagPeerStatsDropTlvInvlId)	long	The value of tmnxMcLagPeerStatsDropTlvInvlId indicates how many MC-Lag control packets were dropped on this system from the peer because the packet referred to an invalid or non multi-chassis lag.
invalidSizePacketsDropped [Invalid Size Packets Dropped] (tmnxMcLagPeerStatsDropTlvInvlSz)	long	The value of tmnxMcLagPeerStatsDropTlvInvlSz indicates how many MC-Lag control packets were dropped on this system from the peer because the packet size was invalid.

Table 170 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAlivePacketsReceived [Keep Alive Packets Received] (tmnxMcLagPeerStatsPktsRxKpalive)	long	The value of tmnxMcLagPeerStatsPktsRxKpalive indicates how many valid MC-Lag control packets of type keepalive were received on this system from the peer.
keepalivePacketsTransmitted [Keepalive Packets Transmitted] (tmnxMcLagPeerStatsPktsTxKpalive)	long	The value of tmnxMcLagPeerStatsPktsTxKpalive indicates how many MC-Lag control packets of type keepalive were transmitted from this system to the peer.
outOfSequencePacketsDropped [Out Of Sequence Packets Dropped] (tmnxMcLagPeerStatsDropOutOfSeq)	long	The value of tmnxMcLagPeerStatsDropOutOfSeq indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was out of sequence.
packetsReceived [Packets Received] (tmnxMcLagPeerStatsPktsRx)	long	The value of tmnxMcLagPeerStatsPktsRx indicates how many valid MC-Lag control packets were received on this system from the peer.
packetsTransmitted [Packets Transmitted] (tmnxMcLagPeerStatsPktsTx)	long	The value of tmnxMcLagPeerStatsPktsTx indicates how many MC-Lag control packets were transmitted from this system to the peer.
peerConfigPacketsReceived [Peer Config Packets Received] (tmnxMcLagPeerStatsPktsRxPeerCfg)	long	The value of tmnxMcLagPeerStatsPktsRxPeerCfg indicates how many valid MC-Lag control packets of type peer config were received on this system from the peer.
peerConfigPacketsTransmitted [Peer Config Packets Transmitted] (tmnxMcLagPeerStatsPktsTxPeerCfg)	long	The value of tmnxMcLagPeerStatsPktsTxPeerCfg indicates how many MC-Lag control packets of type peer config were transmitted from this system to the peer.
stateDisabledPacketsDropped [State Disabled Packets Dropped] (tmnxMcLagPeerStatsDropStateDsblD)	long	The value of tmnxMcLagPeerStatsDropStateDsblD indicates how many MC-Lag control packets were dropped on this system from the peer because the peer was administratively disabled.

Table 170 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statePacketsReceived [State Packets Received] (tmnxMcLagPeerStatsPktsRxState)	long	The value of tmnxMcLagPeerStatsPktsRxState indicates how many valid MC-Lag control packets of type lag state were received on this system from the peer.
tooShortPacketsDropped [Too Short Packets Dropped] (tmnxMcLagPeerStatsDropPktTooShrt)	long	The value of tmnxMcLagPeerStatsDropPktTooShrt indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was too short.
unknownTlvPacketsDropped [Unknown Tlv Packets Dropped] (tmnxMcLagPeerStatsDropUnknownTlv)	long	The value of tmnxMcLagPeerStatsDropUnknownTlv indicates how many MC-Lag control packets were dropped on this system from the peer because the packet contained an unknown TLV.
<p>PeerSynchronizationProtocolStats MIB entry name: tmnxMcPeerSyncStatsEntry Entry description: Each row entry represents a collection of statistics for a multi-chassis synchronization protocol entry. Entries cannot be created and deleted via SNMP SET operations. Table description (for tmnxMcPeerSyncStatsTable): The tmnxMcPeerSyncStatsTable has an entry for each multi-chassis peer synchronization protocol entry. Supports realtime plotting Supports scheduled collection Monitored class: multichassis.PeerSynchronizationProtocol</p>		
bodyDecodeErrorPacketsReceived [Body Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrBody)	long	The value of tmnxMcPeerSyncPktsRxErrBody indicates the number of packets with body decode errors received from the multi-chassis peer.
dataPacketsReceived [Data Packets Received] (tmnxMcPeerSyncPktsRxData)	long	The value of tmnxMcPeerSyncPktsRxData indicates the number of hello packets received from the multi-chassis peer.
dataPacketsTransmitted [Data Packets Transmitted] (tmnxMcPeerSyncPktsTxData)	long	The value of tmnxMcPeerSyncPktsTxData indicates the number of data packets transmitted to the multi-chassis peer.

Table 170 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
erroneousPacketsReceived [Erroneous Packets Received] (tmnxMcPeerSyncPktsRxErr)	long	The value of tmnxMcPeerSyncPktsRxErr indicates the number of erroneous packets received from the multi-chassis peer.
headerDecodeErrorPacketsReceived [Header Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrHeader)	long	The value of tmnxMcPeerSyncPktsRxErrHeader indicates the number of packets with header decode errors received from the multi-chassis peer.
helloPacketsReceived [Hello Packets Received] (tmnxMcPeerSyncPktsRxHello)	long	The value of tmnxMcPeerSyncPktsRxHello indicates the number of hello packets received from the multi-chassis peer.
helloPacketsTransmitted [Hello Packets Transmitted] (tmnxMcPeerSyncPktsTxHello)	long	The value of tmnxMcPeerSyncPktsTxHello indicates the number of hello packets transmitted to the multi-chassis peer.
otherPacketsReceived [Other Packets Received] (tmnxMcPeerSyncPktsRxOther)	long	The value of tmnxMcPeerSyncPktsRxOther indicates the number of all other packet types received from the multi-chassis peer.
otherPacketsTransmitted [Other Packets Transmitted] (tmnxMcPeerSyncPktsTxOther)	long	The value of tmnxMcPeerSyncPktsTxOther indicates the number of all other packet types transmitted to the multi-chassis peer.
packetTransmissionErrors [Packet Transmission Errors] (tmnxMcPeerSyncPktsTxErr)	long	The value of tmnxMcPeerSyncPktsTxErr indicates the number of packet transmission errors.
sequenceNumberErrorPacketsReceived [Sequence Number Error Packets Received] (tmnxMcPeerSyncPktsRxErrSeqNum)	long	The value of tmnxMcPeerSyncPktsRxErrSeqNum indicates the number of packets with sequence number errors received from the multi-chassis peer.

Table 170 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPacketsReceived [Total Packets Received] (tmnxMcPeerSyncPktsRxAll)	long	The value of tmnxMcPeerSyncPktsRxAll indicates the total number of packets received from the multi-chassis peer.
totalPacketsTransmitted [Total Packets Transmitted] (tmnxMcPeerSyncPktsTxAll)	long	The value of tmnxMcPeerSyncPktsTxAll indicates the total number of packets transmitted to the multi-chassis peer.

Table 171 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
sgiSnmpInGetBulks [Sgi Snmp In Get Bulks] (sgiSnmpInGetBulks)	long	The value of sgiSnmpInGetBulks indicates the total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmpInASNParseErrs [Snmp In ASNParse Errs] (snmpInASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmpInBadCommunityNames [Snmp In Bad Community Names] (snmpInBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.

Table 171 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.

Table 171 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 172 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: tmnxOspfAreaEntry</p> <p>Entry description: The tmnxOspfAreaEntry contains information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for tmnxOspfAreaTable): The tmnxOspfAreaTable contains information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
nssaTranslatorEvents [Nssa Translator Events] (tmnxOspfAreaNssaTranslatorEvents)	long	The value of tmnxOspfAreaNssaTranslatorEvents indicates the number of Translator State changes that have occurred since the last boot-up.
totalLSACount [Total LSACount] (tmnxOspfAreaScopeLsaCount)	long	The value of tmnxOspfAreaScopeLsaCount indicates the total number of Area-Scope link state advertisements in this area's link-state database.
totalSpfRuns [Total Spf Runs] (tmnxOspfAreaSpfRuns)	long	The value of tmnxOspfAreaSpfRuns indicates the number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
totalUnknownLSACount [Total Unknown LSACount] (tmnxOspfAreaScopeUnkLsaCount)	long	The value of tmnxOspfAreaScopeUnkLsaCount indicates the total number of unknown Area-Scope link-state advertisements in this area's link-state database.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaSiteLfaStats</p> <p>MIB entry name: tmnxOspfLfaStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfLfaStatsTable represents information on LFA coverage for a given OSPF area</p> <p>Table description (for tmnxOspfLfaStatsTable): The tmnxOspfLfaStatsTable maintains information on loopfree-alternate (LFA) coverage for each instance of OSPF protocol.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
ospfLfaCoverage [Ospf Lfa Coverage] (tmnxOspfLfaCoverage)	long	The value of tmnxOspfLfaCoverage indicates how much LFA coverage is being obtained for the set of available LFA eligible nodes.
ospfLfaNodesCovered [Ospf Lfa Nodes Covered] (tmnxOspfLfaNodesCovered)	long	The value of tmnxOspfLfaNodesCovered indicates in absolute numbers the number of nodes for which an LFA is found.
ospfLfaPrefixCoverage [Ospf Lfa Prefix Coverage] (tmnxOspfLfaPfxCoverage)	long	The value of tmnxOspfLfaPfxCoverage indicates how much LFA prefix coverage is being obtained for the set of available LFA eligible prefixes.
ospfLfaPrefixCovered [Ospf Lfa Prefix Covered] (tmnxOspfLfaPfxCovered)	long	The value of tmnxOspfLfaPfxCovered indicates in absolute numbers the number of prefixes for which an LFA is found.
ospfLfaTotalNodes [Ospf Lfa Total Nodes] (tmnxOspfLfaTotalNodes)	long	The value of tmnxOspfLfaTotalNodes indicates in absolute numbers the number of nodes eligible for LFA calculation.
ospfLfaTotalPrefix [Ospf Lfa Total Prefix] (tmnxOspfLfaTotalPfx)	long	The value of tmnxOspfLfaTotalPfx indicates in absolute numbers the number of prefixes eligible for LFA calculation.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceGeneralStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (tmnxOspfNgIfEvents)	long	The value of tmnxOspfNgIfEvents indicates the number of times this OSPF interface has changed its state, or an error has occurred.
<p>InterfaceReceiveStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfNgIfRxBadChecksums)	long	The value of tmnxOspfNgIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
InterfaceStatusStats MIB entry name: tmnxOspfNgIfStatsEntry Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface. Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface. Supports realtime plotting Supports scheduled collection Monitored class: ospf.Interface		
authorizationFailures [Authorization Failures] (tmnxOspfNgIfAuthFailures)	long	The value of tmnxOspfNgIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfNglfBadAreas)	long	The value of tmnxOspfNglfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfNglfBadAuthTypes)	long	The value of tmnxOspfNglfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfNglfBadDeadIntervals)	long	The value of tmnxOspfNglfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfNglfBadDstAddrs)	long	The value of tmnxOspfNglfBadDstAddrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfNglfBadHelloIntervals)	long	The value of tmnxOspfNglfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfNglfBadLengths)	long	The value of tmnxOspfNglfBadLengths indicates the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfNglfBadNeighbors)	long	The value of tmnxOspfNglfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNetworks [Bad Networks] (tmnxOspfNgIfBadNetworks)	long	The value of tmnxOspfNgIfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfNgIfBadOptions)	long	The value of tmnxOspfNgIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this interface or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfNgIfBadPacketTypes)	long	The value of tmnxOspfNgIfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfNgIfBadVersions)	long	The value of tmnxOspfNgIfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
badVirtualLinks [Bad Virtual Links] (tmnxOspfNgIfBadVirtualLinks)	long	The value of tmnxOspfNgIfBadVirtualLinks indicates the total number of OSPF packets received on this interface that are destined to a virtual link that does not exist since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfNgIfDiscardPackets)	long	The value of tmnxOspfNgIfDiscardPackets indicates the total number of OSPF packets discarded on this interface since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfNgIfRetransmitOuts)	long	The value of tmnxOspfNgIfRetransmitOuts indicates the total number of OSPF Retransmits sent on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceTransmitStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

<p>NeighborGeneralStats</p> <p>MIB entry name: tmnxOspfNgNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgNbrStatsTable represents additional columns for statistics for an OSPF neighbor.</p> <p>Table description (for tmnxOspfNgNbrStatsTable): The tmnxOspfNgNbrStatsTable provides an extension of the tmnxOspfNgNbrTable for statistics for an OSPF neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ospf.Neighbor • ospf.OspfNeighbor 		
events [Events] (tmnxOspfNgNbrEvents)	long	The value of tmnxOspfNgNbrEvents indicates the number of times this neighbor relationship has changed state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfNgNbrLsRetransQLen)	long	The value of tmnxOspfNgNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>NeighborStatusStats</p> <p>MIB entry name: tmnxOspfNgNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgNbrStatsTable represents additional columns for statistics for an OSPF neighbor.</p> <p>Table description (for tmnxOspfNgNbrStatsTable): The tmnxOspfNgNbrStatsTable provides an extension of the tmnxOspfNgNbrTable for statistics for an OSPF neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Neighbor</p>		

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badMtus [Bad Mtus] (tmnxOspfNgNbrBadMTUs)	long	The value of tmnxOspfNgNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badNeighborStates [Bad Neighbor States] (tmnxOspfNgNbrBadNbrStates)	long	The value of tmnxOspfNgNbrBadNbrStates indicates the total number of OSPF packets received when the neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfNgNbrBadPackets)	long	The value of tmnxOspfNgNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfNgNbrBadSeqNums)	long	The value of tmnxOspfNgNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfNgNbrDuplicates)	long	The value of tmnxOspfNgNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfNgNbrLsaInstallFailed)	long	The value of tmnxOspfNgNbrLsaInstallFailed indicates the total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfNgNbrLsaNotInLsdb)	long	The value of tmnxOspfNgNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfNgNbrNumRestarts)	long	The value of tmnxOspfNgNbrNumRestarts indicates the number of times the neighbor has attempted restart.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
optionMismatches [Option Mismatches] (tmnxOspfNgNbrOptionMismatches)	long	The value of tmnxOspfNgNbrOptionMismatches indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
<p>ShamLinkGeneralStats</p> <p>MIB entry name: tmnxOspfShamLfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamLfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamLfStatsTable): The tmnxOspfShamLfStatsTable provides an extension of the tmnxOspfShamLfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
events [Events] (tmnxOspfShamLfEvents)	long	The value of tmnxOspfShamLfEvents indicates the number of state changes or error events on this sham link.
<p>ShamLinkReceiveStats</p> <p>MIB entry name: tmnxOspfShamLfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamLfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamLfStatsTable): The tmnxOspfShamLfStatsTable provides an extension of the tmnxOspfShamLfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamLfRxDBDs)	long	The value of tmnxOspfShamLfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfShamIfRxBadChecksums)	long	The value of tmnxOspfShamIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
<p>ShamLinkStatusStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authorizationFailures [Authorization Failures] (tmnxOspfShamIfAuthFailures)	long	The value of tmnxOspfShamIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.
badAreas [Bad Areas] (tmnxOspfShamIfBadAreas)	long	The value of tmnxOspfShamIfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfShamIfBadAuthTypes)	long	The value of tmnxOspfShamIfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfShamIfBadDeadIntervals)	long	The value of tmnxOspfShamIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfShamIfBadDstAddrs)	long	The value of tmnxOspfShamIfBadDstAddrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfShamIfBadHelloIntervals)	long	The value of tmnxOspfShamIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfShamIfBadLengths)	long	The value of tmnxOspfShamIfBadLengths indicates the total number of OSPF packets received on this sham link with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNeighbors [Bad Neighbors] (tmnxOspfShamIfBadNeighbors)	long	The value of tmnxOspfShamIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.
badNetworks [Bad Networks] (tmnxOspfShamIfBadNetworks)	long	The value of tmnxOspfShamIfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfShamIfBadOptions)	long	The value of tmnxOspfShamIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this sham link or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfShamIfBadPacketTypes)	long	The value of tmnxOspfShamIfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfShamIfBadVersions)	long	The value of tmnxOspfShamIfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfShamIfDiscardPackets)	long	The value of tmnxOspfShamIfDiscardPackets indicates the total number of OSPF packets discarded on this sham link since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfShamIfRetransmitOuts)	long	The value of tmnxOspfShamIfRetransmitOuts indicates the total number of OSPF Retransmits sent on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>ShamLinkTransmitStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamIfRxDBDs)	long	The value of tmnxOspfShamIfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteStats</p> <p>MIB entry name: tmnxOspfStatisticsEntry</p> <p>Entry description: Each row entry in the tmnxOspfStatisticsTable represents additional columns for statistics for an OSPF instance.</p> <p>Table description (for tmnxOspfStatisticsTable): The tmnxOspfStatisticsTable provides an extension of the tmnxOspfGeneralTable for statistics for an OSPF instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Site</p>		
addRouteFailed [Add Route Failed] (tmnxOspfRoutesAddsFailed)	long	The value of tmnxOspfRoutesAddsFailed indicates the number of times an attempt to add a route to the Route Table Manager (RTM) failed for this OSPF instance.
cspfDroppedRequests [Cspf Dropped Requests] (tmnxOspfCSPFDroppedRequests)	long	The value of tmnxOspfCSPFDroppedRequests indicates the number of dropped CSPF requests made by the OSPF protocol.
cspfPathsFound [Cspf Paths Found] (tmnxOspfCSPFPathsFound)	long	The value of tmnxOspfCSPFPathsFound indicates the number of of paths found for the requests made to OSPF protocol.
cspfPathsNotFound [Cspf Paths Not Found] (tmnxOspfCSPFPathsNotFound)	long	The value of tmnxOspfCSPFPathsNotFound indicates the number of of paths not found for the requests made to OSPF protocol.
cspfRequests [Cspf Requests] (tmnxOspfCSPFRequests)	long	The value of tmnxOspfCSPFRequests indicates the number of CSPF requests made to the OSPF protocol.
deleteRouteFailed [Delete Route Failed] (tmnxOspfRoutesDelsFailed)	long	The value of tmnxOspfRoutesDelsFailed indicates the number of times an attempt to delete a route from the Route Table Manager (RTM) failed for this instance of OSPF.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inOverflowCount [In Overflow Count] (tmnxOspfNumTimesInOverflow)	long	The value of tmnxOspfNumTimesInOverflow indicates the count of the number of times the system was in the overflow state.
inOverloadCount [In Overload Count] (tmnxOspfNumTimesInOverload)	long	The value of tmnxOspfNumTimesInOverload indicates the count of the number of times the system was overloaded.
modifyRouteFailed [Modify Route Failed] (tmnxOspfRoutesModsFailed)	long	The value of tmnxOspfRoutesModsFailed indicates the number of times an attempt to modify a route in the Route Table Manager (RTM) failed for this instance of OSPF.
newLsasOriginated [New Lsas Originated] (tmnxOspfOriginateNewLsas)	long	The value of tmnxOspfOriginateNewLsas indicates the number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
newLsasReceived [New Lsas Received] (tmnxOspfRxNewLsas)	long	The value of tmnxOspfRxNewLsas indicates the number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
spfAttemptsFailed [Spf Attempts Failed] (tmnxOspfSpfAttemptsFailed)	long	The value of tmnxOspfSpfAttemptsFailed indicates the number of times an attempt to run SPF has failed because SPF runs have been stopped as a result of insufficient memory resources.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualLinkGeneralStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
events [Events] (tmnxOspfVirtIfEvents)	long	The value of tmnxOspfVirtIfEvents indicates the number of state changes or error events on this Virtual Link
<p>VirtualLinkReceiveStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfVirtIfRxBadChecksums)	long	The value of tmnxOspfVirtIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
VirtualLinkStatusStats MIB entry name: tmnxOspfVirtIfStatsEntry Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface. Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualLink		
authorizationFailures [Authorization Failures] (tmnxOspfVirtIfAuthFailures)	long	The value of tmnxOspfVirtIfAuthFailures indicates the total number of OSPF packets received on this virtual interface with invalid authentication keys.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfVirtIfBadAreas)	long	The value of tmnxOspfVirtIfBadAreas indicates the total number of OSPF packets received on this virtual interface with area mismatches.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfVirtIfBadAuthTypes)	long	The value of tmnxOspfVirtIfBadAuthTypes indicates the total number of OSPF packets received on this virtual interface with invalid authentication types.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfVirtIfBadDeadIntervals)	long	The value of tmnxOspfVirtIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfVirtIfBadDstAdrs)	long	The value of tmnxOspfVirtIfBadDstAdrs indicates the total number of OSPF packets received on this virtual interface with invalid destination IP address.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfVirtIfBadHelloIntervals)	long	The value of tmnxOspfVirtIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfVirtIfBadLengths)	long	The value of tmnxOspfVirtIfBadLengths indicates the total number of OSPF packets received on this virtual interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfVirtIfBadNeighbors)	long	The value of tmnxOspfVirtIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the configuration this router has for the neighbor.
badNetworks [Bad Networks] (tmnxOspfVirtIfBadNetworks)	long	The value of tmnxOspfVirtIfBadNetworks indicates the total number of OSPF packets received on this virtual interface with invalid network or mask fields.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badOptions [Bad Options] (tmnxOspfVirtIfBadOptions)	long	The value of tmnxOspfVirtIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this virtual interface or transit-area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfVirtIfBadPacketTypes)	long	The value of tmnxOspfVirtIfBadPacketTypes indicates the total number of OSPF packets received on this virtual interface with invalid OSPF packet types.
badVersions [Bad Versions] (tmnxOspfVirtIfBadVersions)	long	The value of tmnxOspfVirtIfBadVersions indicates the total number of OSPF packets received on this virtual interface with invalid OSPF version numbers.
discardPackets [Discard Packets] (tmnxOspfVirtIfDiscardPackets)	long	The value of tmnxOspfVirtIfDiscardPackets indicates the total number of OSPF packets discarded on this virtual interface.
retransmitOuts [Retransmit Outs] (tmnxOspfVirtIfRetransmitOuts)	long	The value of tmnxOspfVirtIfRetransmitOuts indicates the total number of OSPF packets retransmitted on this virtual interface.
<p>VirtualLinkTransmitStats MIB entry name: tmnxOspfVirtIfStatsEntry Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface. Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualLink</p>		

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
VirtualNeighborGeneralStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor		

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
events [Events] (tmnxOspfVirtNbrEvents)	long	The value of tmnxOspfVirtNbrEvents indicates the number of times this virtual link has changed its state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfVirtNbrLsRetransQLen)	long	The value of tmnxOspfVirtNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>VirtualNeighborStatusStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
badMtus [Bad Mtus] (tmnxOspfVirtNbrBadMTUs)	long	The value of tmnxOspfVirtNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfVirtNbrBadPackets)	long	The value of tmnxOspfVirtNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfVirtNbrBadSeqNums)	long	The value of tmnxOspfVirtNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 172 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badVirtualNeighborStates [Bad Virtual Neighbor States] (tmnxOspfVirtNbrBadNbrStates)	long	The value of tmnxOspfVirtNbrBadNbrStates indicates the total number of OSPF packets received when the virtual neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfVirtNbrDuplicates)	long	The value of tmnxOspfVirtNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfVirtNbrLsaInstallFail)	long	The value of tmnxOspfVirtNbrLsaInstallFail indicates the total number of times when an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfVirtNbrLsaNotInLsdb)	long	The value of tmnxOspfVirtNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfVirtNbrNumRestarts)	long	The value of tmnxOspfVirtNbrNumRestarts indicates the number of times the virtual neighbor has attempted restart since tmnxOspfAdminState was last set to 'enabled'.
optionMismatches [Option Mismatches] (tmnxOspfVirtNbrOptionMismatch)	long	The value of tmnxOspfVirtNbrOptionMismatch indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 173 pae802_1x statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PaePortAuthenticatorDiagStats</p> <p>MIB entry name: dot1xAuthDiagEntry</p> <p>Entry description: The diagnostics information for an Authenticator PAE.</p> <p>Table description (for dot1xAuthDiagTable): A table that contains the diagnostics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort 		
dot1xAuthAuthEapLogoffWhileAuthenticated [Dot 1 x Auth Auth Eap Logoff While Authenticated] (dot1xAuthAuthEapLogoffWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to DISCONNECTED, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapLogoffWhileAuthenticating [Dot 1 x Auth Auth Eap Logoff While Authenticating] (dot1xAuthAuthEapLogoffWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticated [Dot 1 x Auth Auth Eap Starts While Authenticated] (dot1xAuthAuthEapStartsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of an EAPOL-Start message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticating [Dot 1 x Auth Auth Eap Starts While Authenticating] (dot1xAuthAuthEapStartsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Start message being received from the Supplicant.

Table 173 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthAuthFailWhileAuthenticating [Dot 1 x Auth Auth Fail While Authenticating] (dot1xAuthAuthFailWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to HELD, as a result of the Backend Authentication state machine indicating authentication failure (authFail = TRUE).
dot1xAuthAuthReauthsWhileAuthenticated [Dot 1 x Auth Auth Reauths While Authenticated] (dot1xAuthAuthReauthsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthReauthsWhileAuthenticating [Dot 1 x Auth Auth Reauths While Authenticating] (dot1xAuthAuthReauthsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthSuccessWhileAuthenticating [Dot 1 x Auth Auth Success While Authenticating] (dot1xAuthAuthSuccessWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to AUTHENTICATED, as a result of the Backend Authentication state machine indicating successful authentication of the Supplicant (authSuccess = TRUE).
dot1xAuthAuthTimeoutsWhileAuthenticating [Dot 1 x Auth Auth Timeouts While Authenticating] (dot1xAuthAuthTimeoutsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of the Backend Authentication state machine indicating authentication timeout (authTimeout = TRUE).
dot1xAuthBackendAccessChallenges [Dot 1 x Auth Backend Access Challenges] (dot1xAuthBackendAccessChallenges)	long	Counts the number of times that the state machine receives an initial Access-Challenge packet from the Authentication server (i.e., aReq becomes TRUE, causing exit from the RESPONSE state). Indicates that the Authentication Server has communication with the Authenticator.
dot1xAuthBackendAuthFails [Dot 1 x Auth Backend Auth Fails] (dot1xAuthBackendAuthFails)	long	Counts the number of times that the state machine receives an EAP-Failure message from the Authentication Server (i.e., aFail becomes TRUE, causing a transition from RESPONSE to FAIL). Indicates that the Supplicant has not authenticated to the Authentication Server.

Table 173 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthBackendAuthSuccesses [Dot 1 x Auth Backend Auth Successes] (dot1xAuthBackendAuthSuccesses)	long	Counts the number of times that the state machine receives an EAP-Success message from the Authentication Server (i.e., aSuccess becomes TRUE, causing a transition from RESPONSE to SUCCESS). Indicates that the Supplicant has successfully authenticated to the Authentication Server.
dot1xAuthBackendNonNakResponsesFromSupplicant [Dot 1 x Auth Backend Non Nak Responses From Supplicant] (dot1xAuthBackendNonNakResponsesFromSupplicant)	long	Counts the number of times that the state machine receives a response from the Supplicant to an initial EAP-Request, and the response is something other than EAP-NAK (i.e., rxResp becomes TRUE, causing the state machine to transition from REQUEST to RESPONSE, and the response is not an EAP-NAK). Indicates that the Supplicant can respond to the Authenticator's chosen EAP-method.
dot1xAuthBackendOtherRequestsToSupplicant [Dot 1 x Auth Backend Other Requests To Supplicant] (dot1xAuthBackendOtherRequestsToSupplicant)	long	Counts the number of times that the state machine sends an EAP-Request packet (other than an Identity, Notification, Failure or Success message) to the Supplicant (i.e., executes txReq on entry to the REQUEST state). Indicates that the Authenticator chose an EAP-method.
dot1xAuthBackendResponses [Dot 1 x Auth Backend Responses] (dot1xAuthBackendResponses)	long	Counts the number of times that the state machine sends an initial Access-Request packet to the Authentication server (i.e., executes sendRespToServer on entry to the RESPONSE state). Indicates that the Authenticator attempted communication with the Authentication Server.
dot1xAuthEapLogoffsWhileConnecting [Dot 1 x Auth Eap Logoffs While Connecting] (dot1xAuthEapLogoffsWhileConnecting)	long	Counts the number of times that the state machine transitions from CONNECTING to DISCONNECTED as a result of receiving an EAPOL-Logoff message.
dot1xAuthEntersAuthenticating [Dot 1 x Auth Enters Authenticating] (dot1xAuthEntersAuthenticating)	long	Counts the number of times that the state machine transitions from CONNECTING to AUTHENTICATING, as a result of an EAP-Response/Identity message being received from the Supplicant.

Table 173 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEntersConnecting [Dot 1 x Auth Enters Connecting] (dot1xAuthEntersConnecting)	long	Counts the number of times that the state machine transitions to the CONNECTING state from any other state.
<p>PaePortAuthenticatorSessionStats MIB entry name: dot1xAuthSessionStatsEntry Entry description: The session statistics information for an Authenticator PAE. This shows the current values being collected for each session that is still in progress, or the final values for the last valid session on each port where there is no session currently active. Table description (for dot1xAuthSessionStatsTable): A table that contains the session statistics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself. Supports realtime plotting Supports scheduled collection Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort 		
dot1xAuthSessionAuthenticMethod [Dot 1 x Auth Session Authentic Method] (dot1xAuthSessionAuthenticMethod)	int	The authentication method used to establish the session.
dot1xAuthSessionFramesRx [Dot 1 x Auth Session Frames Rx] (dot1xAuthSessionFramesRx)	long	The number of user data frames received on this Port during the session.
dot1xAuthSessionFramesTx [Dot 1 x Auth Session Frames Tx] (dot1xAuthSessionFramesTx)	long	The number of user data frames transmitted on this Port during the session.
dot1xAuthSessionOctetsRx [Dot 1 x Auth Session Octets Rx] (dot1xAuthSessionOctetsRx)	java. math. BigInteger	The number of octets received in user data frames on this Port during the session.

Table 173 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthSessionOctetsTx [Dot 1 x Auth Session Octets Tx] (dot1xAuthSessionOctetsTx)	java. math. BigInteger	The number of octets transmitted in user data frames on this Port during the session.
dot1xAuthSessionTerminateCause [Dot 1 x Auth Session Terminate Cause] (dot1xAuthSessionTerminateCause)	int	The reason for the session termination.
dot1xAuthSessionTime [Dot 1 x Auth Session Time] (dot1xAuthSessionTime)	long	The duration of the session in seconds.
<p>PaePortAuthenticatorStats</p> <p>MIB entry name: dot1xAuthStatsEntry</p> <p>Entry description: The statistics information for an Authenticator PAE.</p> <p>Table description (for dot1xAuthStatsTable): A table that contains the statistics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort 		
dot1xAuthEapLengthErrorFramesRx [Dot 1 x Auth Eap Length Error Frames Rx] (dot1xAuthEapLengthErrorFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the Packet Body Length field is invalid.
dot1xAuthEapolFramesRx [Dot 1 x Auth Eapol Frames Rx] (dot1xAuthEapolFramesRx)	long	The number of valid EAPOL frames of any type that have been received by this Authenticator.

Table 173 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEapolFramesTx [Dot 1 x Auth Eapol Frames Tx] (dot1xAuthEapolFramesTx)	long	The number of EAPOL frames of any type that have been transmitted by this Authenticator.
dot1xAuthEapolLogoffFramesRx [Dot 1 x Auth Eapol Logoff Frames Rx] (dot1xAuthEapolLogoffFramesRx)	long	The number of EAPOL Logoff frames that have been received by this Authenticator.
dot1xAuthEapolReqFramesTx [Dot 1 x Auth Eapol Req Frames Tx] (dot1xAuthEapolReqFramesTx)	long	The number of EAP Request frames (other than Rq/Id frames) that have been transmitted by this Authenticator.
dot1xAuthEapolReqIdFramesTx [Dot 1 x Auth Eapol Req Id Frames Tx] (dot1xAuthEapolReqIdFramesTx)	long	The number of EAP Req/Id frames that have been transmitted by this Authenticator.
dot1xAuthEapolRespFramesRx [Dot 1 x Auth Eapol Resp Frames Rx] (dot1xAuthEapolRespFramesRx)	long	The number of valid EAP Response frames (other than Resp/Id frames) that have been received by this Authenticator.
dot1xAuthEapolRespIdFramesRx [Dot 1 x Auth Eapol Resp Id Frames Rx] (dot1xAuthEapolRespIdFramesRx)	long	The number of EAP Resp/Id frames that have been received by this Authenticator.
dot1xAuthEapolStartFramesRx [Dot 1 x Auth Eapol Start Frames Rx] (dot1xAuthEapolStartFramesRx)	long	The number of EAPOL Start frames that have been received by this Authenticator.
dot1xAuthInvalidEapolFramesRx [Dot 1 x Auth Invalid Eapol Frames Rx] (dot1xAuthInvalidEapolFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the frame type is not recognized.
dot1xAuthLastEapolFrameVersion [Dot 1 x Auth Last Eapol Frame Version] (dot1xAuthLastEapolFrameVersion)	long	The protocol version number carried in the most recently received EAPOL frame.

Table 174 pim statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
InterfaceAdditionalStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface		
bootstrapExpPolicyDrops [Bootstrap Exp Policy Drops] (vRtrPimNgIfBtrExpPolicyDrops)	long	The value of vRtrPimNgIfBtrExpPolicyDrops indicates the number of Bootstrap Messages that were not transmitted on this interface because of Bootstrap export policy. PIM Bootstrap export policies are configured using bootstrap export policy objects in vRtrPimNgGenPolicyTable.
bootstrapImpPolicyDrops [Bootstrap Imp Policy Drops] (vRtrPimNgIfBtrImpPolicyDrops)	long	The value of vRtrPimNgIfBtrImpPolicyDrops indicates the number of Bootstrap Messages received on this interface but were dropped because of Bootstrap import policy. PIM Bootstrap import policies are configured using bootstrap import policy objects in vRtrPimNgGenPolicyTable.
joinPolicyDrops [Join Policy Drops] (vRtrPimNgIfJoinPolicyDrops)	long	The value of vRtrPimNgIfJoinPolicyDrops indicates the number of times the join policy match resulted in dropping PIM Join-Prune Message or one of the source group contained in the message. PIM Join policies are configured using join policy objects in vRtrPimNgGenPolicyTable.
registerPolicyDrops [Register Policy Drops] (vRtrPimNgIfRegisterPolicyDrops)	long	The value of vRtrPimNgIfRegisterPolicyDrops indicates the number of times the register policy match resulted in dropping PIM Register Message. PIM Register policies are configured using the register policy objects in vRtrPimNgGenPolicyTable.
rxBSMNoRouterAlertDrops [Rx BSMNo Router Alert Drops] (vRtrPimNgIfRxBSMNoRouterAlertDrops)	long	The value of vRtrPimNgIfRxBSMNoRouterAlertDrops indicates the number of BSM messages that were dropped because router alert option was not present.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBSMWrongIfDrops [Rx BSMWrong If Drops] (vRtrPimNgIfRxBSMWrongIfDrops)	long	The value of vRtrPimNgIfRxBSMWrongIfDrops indicates the number of BSM messages that were dropped either because they were not sent by the correct RPF neighbor or because they arrived on the wrong interface.
rxInvalidJoinPrunes [Rx Invalid Join Prunes] (vRtrPimNgIfRxInvalidJoinPrunes)	long	The value of vRtrPimNgIfRxInvalidJoinPrunes indicates the number of invalid PIM Join Prune messages received on this interface. A Join Prune message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidJoinPrune notification is sent.
rxInvalidRegisters [Rx Invalid Registers] (vRtrPimNgIfRxInvalidRegisters)	long	The value of vRtrPimNgIfRxInvalidRegisters indicates the number of invalid PIM Register messages received on this interface. A Register message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidRegister notification is sent.
rxJoinPruneErrs [Rx Join Prune Errs] (vRtrPimNgIfRxJoinPruneErrs)	long	The value of vRtrPimNgIfRxJoinPruneErrs indicates the number of errors while processing Join-Prune messages received on this interface.
rxJoinPrunes [Rx Join Prunes] (vRtrPimNgIfRxJoinPrunes)	long	The value of vRtrPimNgIfRxJoinPrunes indicates the number of PIM Join Prune messages received on this interface.
txJoinPrunes [Tx Join Prunes] (vRtrPimNgIfTxJoinPrunes)	long	The value of vRtrPimNgIfTxJoinPrunes indicates the number of PIM Join Prune messages transmitted on this interface.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface</p>		
bsmErrs [Bsm Errs] (vRtrPimNgIfTxBsmErrs)	long	The value of vRtrPimNgIfTxBsmErrs indicates the number of errors while transmitting PIM Bootstrap Messages (BSM) on this interface.
bsmPdus [Bsm Pdus] (vRtrPimNgIfTxBsmPdus)	long	The value of vRtrPimNgIfTxBsmPdus indicates the number of PIM Bootstrap Messages (BSM) transmitted on this interface.
mcacPolicyDrops [Mcac Policy Drops] (vRtrPimNgIfMcacPolicyDrops)	long	The value of the object vRtrPimNgIfMcacPolicyDrops indicates the number times a PIM Group is dropped because of applying a multicast CAC policy on this interface.
registerStopErrs [Register Stop Errs] (vRtrPimNgIfTxRegisterStopErrs)	long	The value of vRtrPimNgIfTxRegisterStopErrs indicates the number of PIM errors while trasmitting PIM Register Stop messages on this interface.
registerStops [Register Stops] (vRtrPimNgIfTxRegisterStops)	long	The value of vRtrPimNgIfTxRegisterStops indicates the number of PIM Register Stop messages transmitted on this interface.
rxAssertErrs [Rx Assert Errs] (vRtrPimNgIfRxAssertErrs)	long	The value of vRtrPimNgIfRxAssertErrs indicates the number of errors while processing Assert messages received on this interface.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxAsserts [Rx Asserts] (vRtrPimNgIfRxAsserts)	long	The value of vRtrPimNgIfRxAsserts indicates the number of PIM Assert messages received on this interface.
rxAutoRpAnnounce [Rx Auto Rp Announce] (vRtrPimNgIfRxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounce indicates the number Auto-RP announcements received on this interface.
rxAutoRpAnnounceErrs [Rx Auto Rp Announce Errs] (vRtrPimNgIfRxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounceErrs indicates the number of errors while processing Auto-RP announcements received on this interface.
rxAutoRpGenErrs [Rx Auto Rp Gen Errs] (vRtrPimNgIfRxAutoRpGenErrs)	long	The value of the object vRtrPimNgIfRxAutoRpGenErrs indicates the number of errors while processing Auto-RP messages received on this interface.
rxAutoRpMapping [Rx Auto Rp Mapping] (vRtrPimNgIfRxAutoRpMapping)	long	The value of the object vRtrPimNgIfRxAutoRpMapping indicates the number of Auto-RP mappings received on this interface.
rxAutoRpMappingErrs [Rx Auto Rp Mapping Errs] (vRtrPimNgIfRxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfRxAutoRpMappingErrs indicates the number of errors while processing Auto-RP mappings received on this interface.
rxBadChecksumDiscards [Rx Bad Checksum Discards] (vRtrPimNgIfRxBadChecksumDiscard)	long	The value of vRtrPimNgIfRxBadChecksumDiscard indicates the number of PIM messages received on this interface which were discarded because of bad checksum.
rxBadEncodings [Rx Bad Encodings] (vRtrPimNgIfRxBadEncodings)	long	The value of vRtrPimNgIfRxBadEncodings indicates the number of PIM messages with bad encodings received on this interface.
rxBadVersionDiscards [Rx Bad Version Discards] (vRtrPimNgIfRxBadVersionDiscard)	long	The value of vRtrPimNgIfRxBadVersionDiscard indicates the number of PIM messages with bad versions received on this interface.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBsmPduDrops [Rx Bsm Pdu Drops] (vRtrPimNgIfRxBsmPduDrops)	long	The value of vRtrPimNgIfRxBsmPduDrops indicates the number of Bootstrap Messages received on this interface but were dropped.
rxBsmPdus [Rx Bsm Pdus] (vRtrPimNgIfRxBsmPdus)	long	The value of vRtrPimNgIfRxBsmPdus indicates the number of Bootstrap Messages received on this interface.
rxCRPAdvNoRouterAlert [Rx CRPAdv No Router Alert] (vRtrPimNgIfRxCRPAdvNoRtrAlert)	long	The value of vRtrPimNgIfRxCRPAdvNoRtrAlert indicates the number of Candidate-RP Advertizements(C-RP-Adv) received on this interface which had no router alert option set.
rxHellos [Rx Hellos] (vRtrPimNgIfRxHellos)	long	The value of vRtrPimNgIfRxHellos indicates the number of PIM hello messages received on this interface.
rxHellosDropped [Rx Hellos Dropped] (vRtrPimNgIfRxHellosDropped)	long	The value of vRtrPimNgIfRxHellosDropped indicates the number of PIM Hello messages which were received on this interface but were dropped.
rxNbrUnknown [Rx Nbr Unknown] (vRtrPimNgIfRxNbrUnknown)	long	The value of vRtrPimNgIfRxNbrUnknown indicates the number of PIM messages (other than Hello messages) which were received on this interface and were rejected because the adjacency with the neighbor router was not already established.
rxNullRegisters [Rx Null Registers] (vRtrPimNgIfRxNullRegisters)	long	The value of vRtrPimNgIfRxNullRegisters indicates the number of PIM Null Register messages received on this interface.
rxPkts [Rx Pkts] (vRtrPimNgIfRxPkts)	long	The value of vRtrPimNgIfRxPkts indicates the number of multicast data packets received on this interface.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxRegisterErrs [Rx Register Errs] (vRtrPimNgIfRxRegisterErrs)	long	The value of vRtrPimNgIfRxRegisterErrs indicates the number of errors while processing Register messages received on this interface.
rxRegisterStopErrs [Rx Register Stop Errs] (vRtrPimNgIfRxRegisterStopErrs)	long	The value of vRtrPimNgIfRxRegisterStopErrs indicates the number of errors while processing Register Stop messages received on this interface.
rxRegisterStops [Rx Register Stops] (vRtrPimNgIfRxRegisterStops)	long	The value of vRtrPimNgIfRxRegisterStops indicates the number of PIM Register Stop messages received on this interface.
rxRegisters [Rx Registers] (vRtrPimNgIfRxRegisters)	long	The value of vRtrPimNgIfRxRegisters indicates the number of PIM Register messages received on this interface.
rxUnknownPdus [Rx Unknown Pdus] (vRtrPimNgIfRxUnknownPdus)	long	The value of vRtrPimNgIfRxUnknownPdus indicates the number of packets received with an unsupported PIM type.
sgTypes [Sg Types] (vRtrPimNgIfSGTypes)	long	The value of vRtrPimNgIfSGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'sg'.
starGTypes [Star GTypes] (vRtrPimNgIfStarGTypes)	long	The value of vRtrPimNgIfStarGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgIfStarStarRPTypes)	long	The value of vRtrPimNgIfStarStarRPTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIfGrpSrcType is 'starStarRP'.
txAsserts [Tx Asserts] (vRtrPimNgIfTxAsserts)	long	The value of vRtrPimNgIfTxAsserts indicates the number of PIM Assert messages transmitted on this interface.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txAutoRpAnnounce [Tx Auto Rp Announce] (vRtrPimNgIfTxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounce indicates the number of Auto-RP announcements transmitted on this interface.
txAutoRpAnnounceErrs [Tx Auto Rp Announce Errs] (vRtrPimNgIfTxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounceErrs indicates the number of errors while transmitting Auto-RP announcements on this interface.
txAutoRpMapping [Tx Auto Rp Mapping] (vRtrPimNgIfTxAutoRpMapping)	long	The value of the object vRtrPimNgIfTxAutoRpMapping indicates the number of Auto-RP mappings transmitted on this interface.
txAutoRpMappingErrs [Tx Auto Rp Mapping Errs] (vRtrPimNgIfTxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfTxAutoRpMappingErrs indicates the number of errors while transmitting Auto-RP mappings on this interface.
txHellos [Tx Hellos] (vRtrPimNgIfTxHellos)	long	The value of vRtrPimNgIfTxHellos indicates the number of PIM Hello messages transmitted on this interface.
txPkts [Tx Pkts] (vRtrPimNgIfTxPkts)	long	The value of vRtrPimNgIfTxPkts indicates the number of multicast data packets transmitted on this interface.
PimGenSiteStats MIB entry name: vRtrPimNgGenStatEntry Entry description: An entry in the vRtrPimNgGenStatTable. Table description (for vRtrPimNgGenStatTable): vRtrPimNgGenStatTable lists PIM statistics for a particular PIM instance. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • pim.Site • pim.SiteExtension 		

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardCrpaDrops [Forward Crpa Drops] (vRtrPimNgGenStatFwdCrpaDrops)	long	The value of vRtrPimNgGenStatFwdCrpaDrops indicates the number of times the Candidate-RP Advertizements(C-RP-Adv) could not be forwarded by the router.
forwardCrpaPdus [Forward Crpa Pdup] (vRtrPimNgGenStatForwardCrpaPdup)	long	The value of vRtrPimNgGenStatForwardCrpaPdup indicates the number of Candidate-RP Advertizements(C-RP-Adv) that were forwarded by the router. C-RP-Adv's are forwarded when the received advertizement has a router alert set and the destination address is not the router's local address.
rxActiveMdts [Rx Active Mdts] (vRtrPimNgGenStatRxActiveMdts)	long	The value of vRtrPimNgGenStatRxActiveMdts indicates number of active Mdts on which the PE is receiving packets. This object is applicable to VPRNs only.
rxCrpaPduDrops [Rx Crpa Pdu Drops] (vRtrPimNgGenStatRxCrpaPduDrops)	long	The value of vRtrPimNgGenStatRxCrpaPduDrops indicates the number of PIM Candidate-RP Advertizements (C-RP-Adv) received by this instance, but were dropped.
rxCrpaPdup [Rx Crpa Pdup] (vRtrPimNgGenStatRxCrpaPdup)	long	The value of vRtrPimNgGenStatRxCrpaPdup indicates the number of PIM Candidate-RP Advertizements (C-RP-Adv) received by this instance.
rxMdtJoinTlvErrs [Rx Mdt Join Tlv Errs] (vRtrPimNgGenStatRxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatRxMdtJnTlvErrs indicates indicates number of times MDT Join TLVs were dropped due to errors in the received TLV.
rxMdtJoinTlvs [Rx Mdt Join Tlvs] (vRtrPimNgGenStatRxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatRxMdtJoinTlvs indicates the number of times MDT Join TLV were received.
sgTypes [Sg Types] (vRtrPimNgGenStatSGTypes)	long	The value of vRtrPimNgGenStatSGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'sg'.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
starGTypes [Star GTypes] (vRtrPimNgGenStatStarGTypes)	long	The value of vRtrPimNgGenStatStarGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgGenStatStarStarRPTypes)	long	The value of vRtrPimNgGenStatStarStarRPTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starStarRP'.
txActiveMdts [Tx Active Mdts] (vRtrPimNgGenStatTxActiveMdts)	long	The value of vRtrPimNgGenStatTxActiveMdts indicates the number of active MDTs on which the PE is forwarding packets. This object is applicable to VPRNs only.
txCrpaPduErrs [Tx Crpa Pdu Errs] (vRtrPimNgGenStatTxCrpaPduErrs)	long	The value of vRtrPimNgGenStatTxCrpaPduErrs indicates the number of errors while transmitting PIM Candidate-RP Advertisements (C-RP-Adv).
txCrpaPdus [Tx Crpa Pdus] (vRtrPimNgGenStatTxCrpaPdus)	long	The value of vRtrPimNgGenStatTxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) transmitted by this router instance.
txMdtJoinTlvErrs [Tx Mdt Join Tlv Errs] (vRtrPimNgGenStatTxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatTxMdtJnTlvErrs indicates the number of times MDT Join TLV could not be transmitted.
txMdtJoinTlvs [Tx Mdt Join Tlvs] (vRtrPimNgGenStatTxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatTxMdtJoinTlvs indicates the number of times MDT Join TLV were transmitted.
txNullRegisters [Tx Null Registers] (vRtrPimNgGenStatTxNullRegisters)	long	The value of vRtrPimNgGenStatTxNullRegisters indicates the number of PIM Null Register messages transmitted by this instance.
txRegisterErrs [Tx Register Errs] (vRtrPimNgGenStatTxRegisterErrs)	long	The value of vRtrPimNgGenStatTxRegisterErrs indicates the number the times there was an error while transmitting PIM Register messages by this instance.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txRegisterTTL Drops [Tx Register TTL Drops] (vRtrPimNgGenStatTxRegTTL Drops)	long	The value of vRtrPimNgGenStatTxRegTTL Drops indicates the number of multicast data packets which could not be encapsulated in Register messages because the Time To Live (TTL) was zero.
txRegisters [Tx Registers] (vRtrPimNgGenStatTxRegisters)	long	The value of vRtrPimNgGenStatTxRegisters indicates the number of PIM Register messages transmitted by this instance.
<p>PimGroupStats MIB entry name: vRtrPimNgGrpSrcStatEntry Entry description: An entry in the vRtrPimNgGrpSrcStatTable. Table description (for vRtrPimNgGrpSrcStatTable): vRtrPimNgGrpSrcStatTable contains statistics for the entries in the vRtrPimNgGrpSrcTable. These statistics are collected by the forwarding engine. Supports realtime plotting Supports scheduled collection Monitored class: pim.Groups</p>		
discardedPkts [Discarded Pkts] (vRtrPimNgGrpSrcStatDscrdPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatDscrdPkts indicates the number of multicast packets that matched this source group entry but were discarded. For (S,G) entries, if the traffic is getting forwarded on the SPT, the packets arriving from the RPT will be discarded.
forwardedOctets [Forwarded Octets] (vRtrPimNgGrpSrcStatFrdedOct)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrdedOct indicates the number of multicast octets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list.
forwardedPkts [Forwarded Pkts] (vRtrPimNgGrpSrcStatFrwdedPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrwdedPkts indicates the number of multicast packets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list. This packet count is calculated before ingress QoS policing or shaping is applied.

Table 174 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rpfMismatches [Rpf Mismatches] (vRtrPimNgGrpSrcStatRPFMsmtch)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatRPFMsmtch indicates the number of multicast packets that matched this source group entry but they did not arrive on the the interface indicated by vRtrPimNgGrpSrcRpflIndex.

Table 175 ptp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPClockPacketStats</p> <p>MIB entry name: tmnxPtpClockPacketStatsEntry</p> <p>Entry description: The tmnxPtpClockPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpClockPacketStatsTable): The tmnxPtpClockPacketStatsTable consists of the packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPClock</p>		
ptpClkPktStatsAnnounce [Ptp Clk Pkt Stats Announce] (tmnxPtpClkPktStatsAnnounce)	long	The value of tmnxPtpClkPktStatsAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpClkPktStatsDelayRequest [Ptp Clk Pkt Stats Delay Request] (tmnxPtpClkPktStatsDelayRequest)	long	The value of tmnxPtpClkPktStatsDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpClkPktStatsDelayResp [Ptp Clk Pkt Stats Delay Resp] (tmnxPtpClkPktStatsDelayResp)	long	The value of tmnxPtpClkPktStatsDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpClkPktStatsDirection [Ptp Clk Pkt Stats Direction] (tmnxPtpClkPktStatsDirection)	int	The value of tmnxPtpClkPktStatsDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpClkPktStatsDropAltMaster [Ptp Clk Pkt Stats Drop Alt Master] (tmnxPtpClkPktStatsDropAltMaster)	long	The value of tmnxPtpClkPktStatsDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsDropBadDomain [Ptp Clk Pkt Stats Drop Bad Domain] (tmnxPtpClkPktStatsDropBadDomain)	long	The value of tmnxPtpClkPktStatsDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOther [Ptp Clk Pkt Stats Drop Other] (tmnxPtpClkPktStatsDropOther)	long	The value of tmnxPtpClkPktStatsDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpClkPktStatsDropBadDomain', 'tmnxPtpClkPktStatsDropAltMaster', 'tmnxPtpClkPktStatsDropOutOfSeq', and 'tmnxPtpClkPktStatsDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOutOfSeq [Ptp Clk Pkt Stats Drop Out Of Seq] (tmnxPtpClkPktStatsDropOutOfSeq)	long	The value of tmnxPtpClkPktStatsDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropPeerShut [Ptp Clk Pkt Stats Drop Peer Shut] (tmnxPtpClkPktStatsDropPeerShut)	long	The value of tmnxPtpClkPktStatsDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsFollowUp [Ptp Clk Pkt Stats Follow Up] (tmnxPtpClkPktStatsFollowUp)	long	The value of tmnxPtpClkPktStatsFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpClkPktStatsOther [Ptp Clk Pkt Stats Other] (tmnxPtpClkPktStatsOther)	long	The value of tmnxPtpClkPktStatsOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpClkPktStatsOtherTLVs [Ptp Clk Pkt Stats Other TLVs] (tmnxPtpClkPktStatsOtherTLVs)	long	The value of tmnxPtpClkPktStatsOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsSignaling [Ptp Clk Pkt Stats Signaling] (tmnxPtpClkPktStatsSignaling)	long	The value of tmnxPtpClkPktStatsSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpClkPktStatsSync [Ptp Clk Pkt Stats Sync] (tmnxPtpClkPktStatsSync)	long	The value of tmnxPtpClkPktStatsSync indicates the accumulated packet statistics for PTP Sync messages.
ptpClkPktStatsUniAckCnclAnno [Ptp Clk Pkt Stats Uni Ack Cncl Anno] (tmnxPtpClkPktStatsUniAckCnclAnno)	long	The value of tmnxPtpClkPktStatsUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpClkPktStatsUniAckCnclDly [Ptp Clk Pkt Stats Uni Ack Cncl Dly] (tmnxPtpClkPktStatsUniAckCnclDly)	long	The value of tmnxPtpClkPktStatsUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpClkPktStatsUniAckCnclSync [Ptp Clk Pkt Stats Uni Ack Cncl Sync] (tmnxPtpClkPktStatsUniAckCnclSync)	long	The value of tmnxPtpClkPktStatsUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpClkPktStatsUniCancelAnno [Ptp Clk Pkt Stats Uni Cancel Anno] (tmnxPtpClkPktStatsUniCancelAnno)	long	The value of tmnxPtpClkPktStatsUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpClkPktStatsUniCancelDelay [Ptp Clk Pkt Stats Uni Cancel Delay] (tmnxPtpClkPktStatsUniCancelDelay)	long	The value of tmnxPtpClkPktStatsUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpClkPktStatsUniCancelSync [Ptp Clk Pkt Stats Uni Cancel Sync] (tmnxPtpClkPktStatsUniCancelSync)	long	The value of tmnxPtpClkPktStatsUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniDenyAnno [Ptp Clk Pkt Stats Uni Deny Anno] (tmnxPtpClkPktStatsUniDenyAnno)	long	The value of tmnxPtpClkPktStatsUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenyDelRsp [Ptp Clk Pkt Stats Uni Deny Del Rsp] (tmnxPtpClkPktStatsUniDenyDelRsp)	long	The value of tmnxPtpClkPktStatsUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenySync [Ptp Clk Pkt Stats Uni Deny Sync] (tmnxPtpClkPktStatsUniDenySync)	long	The value of tmnxPtpClkPktStatsUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniGrantAnno [Ptp Clk Pkt Stats Uni Grant Anno] (tmnxPtpClkPktStatsUniGrantAnno)	long	The value of tmnxPtpClkPktStatsUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantDelRsp [Ptp Clk Pkt Stats Uni Grant Del Rsp] (tmnxPtpClkPktStatsUniGrantDelRsp)	long	The value of tmnxPtpClkPktStatsUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantSync [Ptp Clk Pkt Stats Uni Grant Sync] (tmnxPtpClkPktStatsUniGrantSync)	long	The value of tmnxPtpClkPktStatsUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniReqAnno [Ptp Clk Pkt Stats Uni Req Anno] (tmnxPtpClkPktStatsUniReqAnno)	long	The value of tmnxPtpClkPktStatsUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpClkPktStatsUniReqDelayRsp [Ptp Clk Pkt Stats Uni Req Delay Rsp] (tmnxPtpClkPktStatsUniReqDelayRsp)	long	The value of tmnxPtpClkPktStatsUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniReqSync [Ptp Clk Pkt Stats Uni Req Sync] (tmnxPtpClkPktStatsUniReqSync)	long	The value of tmnxPtpClkPktStatsUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
PTPClockRecoveryStateStats MIB entry name: tmnxPtpClockRecoveryStatistics Supports realtime plotting Supports scheduled collection Monitored class: ptp.IEEEPTPClock		
tmnxPtpClockRecStatsAcquiring [Tmnx Ptp Clock Rec Stats Acquiring] (tmnxPtpClockRecStatsAcquiring)	java. math. BigInteger	The value of tmnxPtpClockRecStatsAcquiring indicate the number of seconds that the clock recovery system has been in the acquiring state.
tmnxPtpClockRecStatsHoldover [Tmnx Ptp Clock Rec Stats Holdover] (tmnxPtpClockRecStatsHoldover)	java. math. BigInteger	The value of tmnxPtpClockRecStatsHoldover indicate the number of seconds that the clock recovery system has been in the hold-over state.
tmnxPtpClockRecStatsInitial [Tmnx Ptp Clock Rec Stats Initial] (tmnxPtpClockRecStatsInitial)	java. math. BigInteger	The value of tmnxPtpClockRecStatsInitial indicates the number of seconds that the clock recovery system has been in the initial state.
tmnxPtpClockRecStatsLocked [Tmnx Ptp Clock Rec Stats Locked] (tmnxPtpClockRecStatsLocked)	java. math. BigInteger	The value of tmnxPtpClockRecStatsLocked indicate the number of seconds that the clock recovery system has been in the locked state.
tmnxPtpClockRecStatsPhaseTrack [Tmnx Ptp Clock Rec Stats Phase Track] (tmnxPtpClockRecStatsPhaseTrack)	java. math. BigInteger	The value of tmnxPtpClockRecStatsPhaseTrack indicate the number of seconds that the clock recovery system has been in the phase tracking state.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPPeerPacketStats</p> <p>MIB entry name: tmnxPtpPeerPacketStatsEntry</p> <p>Entry description: The tmnxPtpPeerPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpPeerPacketStatsTable): The tmnxPtpPeerPacketStatsTable consists of the per peer packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEEPTPPeer</p>		
ptpPeerPktStatAnnounce [Ptp Peer Pkt Stat Announce] (tmnxPtpPeerPktStatAnnounce)	long	The value of tmnxPtpPeerPktStatAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpPeerPktStatDelayRequest [Ptp Peer Pkt Stat Delay Request] (tmnxPtpPeerPktStatDelayRequest)	long	The value of tmnxPtpPeerPktStatDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpPeerPktStatDelayResp [Ptp Peer Pkt Stat Delay Resp] (tmnxPtpPeerPktStatDelayResp)	long	The value of tmnxPtpPeerPktStatDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpPeerPktStatDirection [Ptp Peer Pkt Stat Direction] (tmnxPtpPeerPktStatDirection)	int	The value of tmnxPtpPeerPktStatDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpPeerPktStatDropAltMaster [Ptp Peer Pkt Stat Drop Alt Master] (tmnxPtpPeerPktStatDropAltMaster)	long	The value of tmnxPtpPeerPktStatDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatDropBadDomain [Ptp Peer Pkt Stat Drop Bad Domain] (tmnxPtpPeerPktStatDropBadDomain)	long	The value of tmnxPtpPeerPktStatDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOther [Ptp Peer Pkt Stat Drop Other] (tmnxPtpPeerPktStatDropOther)	long	The value of tmnxPtpPeerPktStatDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpPeerPktStatDropBadDomain', 'tmnxPtpPeerPktStatDropAltMaster', 'tmnxPtpPeerPktStatDropOutOfSeq', and 'tmnxPtpPeerPktStatDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOutOfSeq [Ptp Peer Pkt Stat Drop Out Of Seq] (tmnxPtpPeerPktStatDropOutOfSeq)	long	The value of tmnxPtpPeerPktStatDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropPeerShut [Ptp Peer Pkt Stat Drop Peer Shut] (tmnxPtpPeerPktStatDropPeerShut)	long	The value of tmnxPtpPeerPktStatDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatFollowUp [Ptp Peer Pkt Stat Follow Up] (tmnxPtpPeerPktStatFollowUp)	long	The value of tmnxPtpPeerPktStatFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpPeerPktStatOther [Ptp Peer Pkt Stat Other] (tmnxPtpPeerPktStatOther)	long	The value of tmnxPtpPeerPktStatOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpPeerPktStatOtherTLVs [Ptp Peer Pkt Stat Other TLVs] (tmnxPtpPeerPktStatOtherTLVs)	long	The value of tmnxPtpPeerPktStatOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatSignaling [Ptp Peer Pkt Stat Signaling] (tmnxPtpPeerPktStatSignaling)	long	The value of tmnxPtpPeerPktStatSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpPeerPktStatSync [Ptp Peer Pkt Stat Sync] (tmnxPtpPeerPktStatSync)	long	The value of tmnxPtpPeerPktStatSync indicates the accumulated packet statistics for PTP Sync messages.
ptpPeerPktStatUniAckCnclAnno [Ptp Peer Pkt Stat Uni Ack Cncl Anno] (tmnxPtpPeerPktStatUniAckCnclAnno)	long	The value of tmnxPtpPeerPktStatUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpPeerPktStatUniAckCnclDly [Ptp Peer Pkt Stat Uni Ack Cncl Dly] (tmnxPtpPeerPktStatUniAckCnclDly)	long	The value of tmnxPtpPeerPktStatUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpPeerPktStatUniAckCnclSync [Ptp Peer Pkt Stat Uni Ack Cncl Sync] (tmnxPtpPeerPktStatUniAckCnclSync)	long	The value of tmnxPtpPeerPktStatUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpPeerPktStatUniCancelAnno [Ptp Peer Pkt Stat Uni Cancel Anno] (tmnxPtpPeerPktStatUniCancelAnno)	long	The value of tmnxPtpPeerPktStatUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpPeerPktStatUniCancelDelay [Ptp Peer Pkt Stat Uni Cancel Delay] (tmnxPtpPeerPktStatUniCancelDelay)	long	The value of tmnxPtpPeerPktStatUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpPeerPktStatUniCancelSync [Ptp Peer Pkt Stat Uni Cancel Sync] (tmnxPtpPeerPktStatUniCancelSync)	long	The value of tmnxPtpPeerPktStatUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniDenyAnno [Ptp Peer Pkt Stat Uni Deny Anno] (tmnxPtpPeerPktStatUniDenyAnno)	long	The value of tmnxPtpPeerPktStatUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenyDelRsp [Ptp Peer Pkt Stat Uni Deny Del Rsp] (tmnxPtpPeerPktStatUniDenyDelRsp)	long	The value of tmnxPtpPeerPktStatUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenySync [Ptp Peer Pkt Stat Uni Deny Sync] (tmnxPtpPeerPktStatUniDenySync)	long	The value of tmnxPtpPeerPktStatUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniGrantAnno [Ptp Peer Pkt Stat Uni Grant Anno] (tmnxPtpPeerPktStatUniGrantAnno)	long	The value of tmnxPtpPeerPktStatUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantDelRsp [Ptp Peer Pkt Stat Uni Grant Del Rsp] (tmnxPtpPeerPktStatUniGrantDelRsp)	long	The value of tmnxPtpPeerPktStatUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantSync [Ptp Peer Pkt Stat Uni Grant Sync] (tmnxPtpPeerPktStatUniGrantSync)	long	The value of tmnxPtpPeerPktStatUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniReqAnno [Ptp Peer Pkt Stat Uni Req Anno] (tmnxPtpPeerPktStatUniReqAnno)	long	The value of tmnxPtpPeerPktStatUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpPeerPktStatUniReqDelayRsp [Ptp Peer Pkt Stat Uni Req Delay Rsp] (tmnxPtpPeerPktStatUniReqDelayRsp)	long	The value of tmnxPtpPeerPktStatUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.

Table 175 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniReqSync [Ptp Peer Pkt Stat Uni Req Sync] (tmnxPtpPeerPktStatUniReqSync)	long	The value of tmnxPtpPeerPktStatUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
ptpPeerPktStatsTimeStampCpm [Ptp Peer Pkt Stats Time Stamp Cpm] (tmnxPtpPeerPktStatTimeStampCpm)	long	The value of tmnxPtpPeerPktStatTimeStampCpm indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the operating system kernel.
ptpPeerPktStatsTimeStampPort [Ptp Peer Pkt Stats Time Stamp Port] (tmnxPtpPeerPktStatTimeStampPort)	long	The value of tmnxPtpPeerPktStatTimeStampPort indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the physical layer.

Table 176 rsvp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AuthenticationKeyStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Entries in this table cannot be created and deleted via SNMP SET operations. An entry in this table is created by the agent when the RSVP protocol is configured on a virtual router interface. The entry is destroyed when RSVP is removed from the interface.</p> <p>Table description (for vRtrRsvplfStatTable): The vRtrRsvplfStatTable contains objects for reporting statistics associated with an interface running RSVP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.AuthenticationKey</p>		
errorPacketsReceived [Error Packets Received] (vRtrRsvplfStatRxAuthErrors)	java. math. BigInteger	The total number of RSVP packets with MD5 errors received on this RSVP interface.
errorPacketsTransmitted [Error Packets Transmitted] (vRtrRsvplfStatTxAuthErrors)	java. math. BigInteger	The total number of RSVP packets with MD5 errors sent by this RSVP interface.
<p>RsvpInterfaceReceiveStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. The entry is destroyed when RSVP is removed from the interface.</p> <p>Table description (for vRtrRsvplfStatTable): The vRtrRsvplfStatTable contains objects for reporting statistics associated with an interface running RSVP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Interface</p>		

Table 176 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
acks [Acks] (vRtrRsvplfStatRxAcks)	java. math. BigInteger	The total number of RSVP ACK messages received when refresh reduction is enabled on this RSVP interface.
bundles [Bundles] (vRtrRsvplfStatRxBundles)	java. math. BigInteger	The total number of RSVP bundled packets received on this RSVP interface. Bundled packets are sent when refresh reduction is enabled.
errorPackets [Error Packets] (vRtrRsvplfStatRxErrorPkts)	java. math. BigInteger	The total number of RSVP packets with errors received on this RSVP interface.
helloTimeout [Hello Timeout] (vRtrRsvplfStatHelloTimeout)	long	The total number of hello messages that timed out on this RSVP interface.
hellos [Hellos] (vRtrRsvplfStatRxHelloReqs)	java. math. BigInteger	The total number of RSVP HELLO REQ messages received on this RSVP interface.
packets [Packets] (vRtrRsvplfStatRxPkts)	java. math. BigInteger	The total number of error free RSVP packets received on this RSVP interface.
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.

Table 176 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.
totalPackets [Total Packets] (vRtrRsvplfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.

Table 176 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
RsvpInterfaceStats MIB entry name: vRtrRsvplfEntry Entry description: Each row entry in the vRtrRsvplfTable represents additional columns for attributes specific to the Nokia 7x50 SR RSVP implementation. Table description (for vRtrRsvplfTable): The vRtrRsvplfTable provides an extension of the rsvplfTable in the RSVP-MIB. Supports realtime plotting Supports scheduled collection Monitored class: rsvp.Interface		
activeReservations [Active Reservations] (vRtrRsvplfActiveReservationCount)	long	The total number of active RSVP sessions that have reserved bandwidth.
activeSessions [Active Sessions] (vRtrRsvplfActiveSessionCount)	long	The total number of active RSVP sessions on this interface. This count includes sessions that have requested bandwidth as well as sessions that have not requested any bandwidth.
bandwidth [Bandwidth] (vRtrRsvplfBandwidth)	long	The value of vRtrRsvplfBandwidth indicates the interface bandwidth in mega-bits per second (Mbps) for the RSVP protocol on this interface. This is typically the port Speed.
reservedBandwidth [Reserved Bandwidth] (vRtrRsvplfReservedBandwidth)	long	The value of vRtrRsvplfReservedBandwidth specifies the amount of bandwidth in mega-bits per second (Mbps) to reserved by the RSVP sessions on this interface. A value of zero (0) indicates that no bandwidth is reserved.
totalSessions [Total Sessions] (vRtrRsvplfTotalSessionCount)	long	The total number of RSVP sessions on this interface. This count includes sessions that are active as well as sessions that have been signalled but a response has not yet been received.

Table 176 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.

Table 176 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPackets [Total Packets] (vRtrRsvpIfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.
<p>RsvpSessionStats</p> <p>MIB entry name: vRtrRsvpSessionStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an RSVP session. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrRsvpSessionStatTable): The vRtrRsvpSessionStatTable contains statistics for an RSVP session.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Session</p>		
detourAge [Detour Age] (vRtrRsvpSessionDetourAge)	long	vRtrRsvpSessionDetourAge is the age (i.e., time from creation till now) of this detour LSP in 10-millisecond periods.
detourTimeUp [Detour Time Up] (vRtrRsvpSessionDetourTimeUp)	long	vRtrRsvpSessionDetourTimeUp is the total time in 10-millisecond units that the detour LSP has been operational.
pathsReceived [Paths Received] (vRtrRsvpSessionRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages received for this RSVP session.
pathsTransmitted [Paths Transmitted] (vRtrRsvpSessionTxPaths)	java. math. BigInteger	The total number of RSVP PATH messages transmitted for this RSVP session.

Table 176 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
refreshPathsReceived [Refresh Paths Received] (vRtrRsvpSessionRxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshPaths indicates the number of times PATH was refreshed using message ID from full PATH refresh or Srefresh message for this RSVP session.
refreshPathsTransmitted [Refresh Paths Transmitted] (vRtrRsvpSessionTxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshPaths indicates the number of times PATH refresh for the session was sent as a part of a Srefresh message.
refreshReservesReceived [Refresh Reserves Received] (vRtrRsvpSessionRxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshResvs indicates the number of times RESV was refreshed using message ID from full RESV refresh or Srefresh message for this RSVP session.
refreshReservesTransmitted [Refresh Reserves Transmitted] (vRtrRsvpSessionTxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshResvs indicates the number of times RESV refresh for the session was sent as a part of a Srefresh message.
reservesReceived [Reserves Received] (vRtrRsvpSessionRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages received for this RSVP session.
reservesTransmitted [Reserves Transmitted] (vRtrRsvpSessionTxResvs)	java. math. BigInteger	The total number of RSVP RESV messages transmitted for this RSVP session.

Table 177 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DhcpRelayStats</p> <p>MIB entry name: vRtrIfDHCPRelayStatsEntry</p> <p>Entry description: Each row entry represents information related to DHCP Relay statistics for a virtual router interface in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrIfDHCPRelayStatsTable): The vRtrIfDHCPRelayStatsTable contains the statistics for the DHCP Relay agent.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.DhcpRelayConfiguration • rtr.GrplfDhcpRelayCfg • rtr.SublIfDhcpRelayCfg 		
authPktsDiscarded [Auth Pkts Discarded] (vRtrIfDHCPRelayAuthPktsDiscarded)	long	vRtrIfDHCPRelayAuthPktsDiscarded indicates the total number of packets discarded because authentication was not successful.
authPktsSuccess [Auth Pkts Success] (vRtrIfDHCPRelayAuthPktsSuccess)	long	vRtrIfDHCPRelayAuthPktsSuccess indicates the total number of packets for which authentication was successful.
clientPacketsDiscarded [Client Packets Discarded] (vRtrIfDHCPRelayClientPktsDiscarded)	long	vRtrIfDHCPRelayClientPktsDiscarded indicates the total number of client packets discarded by the DHCP relay agent.
clientPacketsRelayed [Client Packets Relayed] (vRtrIfDHCPRelayClientPktsRelayed)	long	vRtrIfDHCPRelayClientPktsRelayed indicates the total number of client packets relayed by the DHCP relay agent.

Table 177 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
clientPktsProxLS [Client Pkts Prox LS] (vRtrIfDHCPRelayClientPktsProxLS)	long	vRtrIfDHCPRelayClientPktsProxLS indicates the total number of client packets proxied by the DHCP relay agent based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
clientPktsProxRad [Client Pkts Prox Rad] (vRtrIfDHCPRelayClientPktsProxRad)	long	vRtrIfDHCPRelayClientPktsProxRad indicates the total number of client packets proxied by the DHCP relay agent based on data received from a RADIUS server.
pktsGenForceRenew [Pkts Gen Force Renew] (vRtrIfDHCPRelayPktsGenForceRenew)	long	vRtrIfDHCPRelayPktsGenForceRenew indicates the total number of DHCP FORCERENEW messages spoofed by the DHCP relay agent to the DHCP clients.
pktsGenRelease [Pkts Gen Release] (vRtrIfDHCPRelayPktsGenRelease)	long	vRtrIfDHCPRelayPktsGenRelease indicates the total number of DHCP RELEASE messages spoofed by the DHCP relay agent to the DHCP server.
receivedMalformedPackets [Received Malformed Packets] (vRtrIfDHCPRelayRxMalformedPkts)	long	vRtrIfDHCPRelayRxMalformedPkts indicates the total number of malformed packets received by the DHCP relay agent.
receivedPackets [Received Packets] (vRtrIfDHCPRelayRxPkts)	long	vRtrIfDHCPRelayRxPkts indicates the total number of packets received by the DHCP relay agent.
receivedUntrustedPackets [Received Untrusted Packets] (vRtrIfDHCPRelayRxUntrustedPkts)	long	vRtrIfDHCPRelayRxUntrustedPkts indicates the total number of untrusted packets received by the DHCP relay agent.
serverPacketsDiscarded [Server Packets Discarded] (vRtrIfDHCPRelayServerPktsDiscarded)	long	vRtrIfDHCPRelayServerPktsDiscarded indicates the total number of server packets discarded by the DHCP relay agent.

Table 177 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
serverPacketsRelayed [Server Packets Relayed] (vRtrIfDHCPRelayServerPktsRelayed)	long	vRtrIfDHCPRelayServerPktsRelayed indicates the total number of server packets relayed by the DHCP relay agent.
serverPktsSnooped [Server Pkts Snooped] (vRtrIfDHCPRelayServerPktsSnooped)	long	vRtrIfDHCPRelayServerPktsSnooped indicates the total number of server packets snooped by the DHCP relay agent.
transmittedPackets [Transmitted Packets] (vRtrIfDHCPRelayTxPkts)	long	vRtrIfDHCPRelayTxPkts indicates the total number of packets transmitted by the DHCP relay agent.
<p>NetworkInterfaceIngressStats MIB entry name: vRtrNetIfIngressStatsEntry Entry description: Each row entry has statistics information for each router interface for each meter configured in the system. Table description (for vRtrNetIfIngressStatsTable): The vRtrNetIfIngressStatsTable has statistics entry for each router interface for each meter configured in the system. Supports realtime plotting Does not support scheduled collection Monitored class: rtr.NetworkInterface</p>		
ingressFwdInProfPkts [Ingress Fwd In Prof Pkts] (vRtrNetIfIngressFwdInProfPkts)	java. math. BigInteger	vRtrNetIfIngressFwdInProfPkts indicates the number of conforming network interface ingress packets forwarded on this router interface using this meter.
ingressFwdOutProfPkts [Ingress Fwd Out Prof Pkts] (vRtrNetIfIngressFwdOutProfPkts)	java. math. BigInteger	vRtrNetIfIngressFwdOutProfPkts indicates the number of exceeding network interface ingress packets forwarded on this router interface using this meter.

Table 177 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressMeterIndex [Ingress Meter Index] (vRtrNetIfIngressMeterIndex)	long	vRtrNetIfIngressMeterIndex serves as the tertiary index. When used in conjunction with vRtrID and vRtrIfIndex, it uniquely identifies a network ingress meter for the specified router interface in the managed system.
<p>RouteStats</p> <p>MIB entry name: vRtrStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrStatTable): The vRtrStatTable has an entry for each virtual router configured in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.VirtualRouter • vprn.DVRSSite • vprn.RoutingInstanceSite • vprn.Site 		
activeARPEntries [Active ARPEntries] (vRtrStatActiveARPEntries)	long	vRtrStatActiveARPEntries indicates the number of active ARP entries for the specified virtual router in the system.
aggregateActiveRoutes [Aggregate Active Routes] (vRtrAggregateActiveRoutes)	long	vRtrAggregateActiveRoutes indicates the current number of active aggregate routes for this instance of the route table.
aggregateRoutes [Aggregate Routes] (vRtrAggregateRoutes)	long	vRtrAggregateRoutes indicates the current number of aggregate routes for this instance of the route table.
bgpActiveRoutes [Bgp Active Routes] (vRtrBGPActiveRoutes)	long	vRtrBGPActiveRoutes indicates the current number of active bgp routes for this instance of the route table.

Table 177 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
bgpRoutes [Bgp Routes] (vRtrBGPRoutes)	long	vRtrBGPRoutes indicates the current number of bgp routes for this instance of the route table.
bgpVpnActiveRoutes [Bgp Vpn Active Routes] (vRtrStatBGPVpnActiveRoutes)	long	vRtrStatBGPVpnActiveRoutes indicates the current number of active VPN-IPV4 routes learned by MP-BGP for this virtual router.
bgpVpnRoutes [Bgp Vpn Routes] (vRtrStatBGPVpnRoutes)	long	vRtrStatBGPVpnRoutes indicates the current number of VPN-IPV4 routes learned by MP-BGP for this virtual router.
directActiveRoutes [Direct Active Routes] (vRtrDirectActiveRoutes)	long	vRtrDirectActiveRoutes indicates the current number of active direct routes for this instance of the route table.
directRoutes [Direct Routes] (vRtrDirectRoutes)	long	vRtrDirectRoutes indicates the current number of direct routes for this instance of the route table.
illegalLabelsReceived [Illegal Labels Received] (vRtrStatIllegalLabels)	long	vRtrStatIllegalLabels indicates the number of illegally received labels on this virtual router.
isisActiveRoutes [Isis Active Routes] (vRtrISISActiveRoutes)	long	vRtrISISActiveRoutes indicates the current number of active isis routes for this instance of the route table.
isisRoutes [Isis Routes] (vRtrISISRoutes)	long	vRtrISISRoutes indicates the current number of isis routes for this instance of the route table.
ldpActiveTunnels [Ldp Active Tunnels] (vRtrStatActiveLdpTunnels)	long	vRtrStatActiveLdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'ldp'.

Table 177 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ldpTunnels [Ldp Tunnels] (vRtrStatTotalLdpTunnels)	long	vRtrStatTotalLdpTunnels indicates the current number of both active and inactive LDP tunnels.
ospfActiveRoutes [Ospf Active Routes] (vRtrOSPFActiveRoutes)	long	vRtrOSPFActiveRoutes indicates the current number of active ospf routes for this instance of the route table.
ospfRoutes [Ospf Routes] (vRtrOSPFRoutes)	long	vRtrOSPFRoutes indicates the current number of ospf routes for this instance of the route table.
routerInterfacesActive [Router Interfaces Active] (vRtrStatActiveIfs)	long	vRtrStatActiveIfs indicates the current number of router interfaces with vRtrIfAdminState equal 'inService' on this virtual router.
routerInterfacesConfigured [Router Interfaces Configured] (vRtrStatConfiguredIfs)	long	vRtrStatConfiguredIfs indicates the current number of router interfaces configured on this virtual router.
routesInVrf [Routes In Vrf] (vRtrStatCurrNumRoutes)	long	vRtrStatCurrNumRoutes indicates the current number of routes in the VRF for this virtual router.
sdpActiveTunnels [Sdp Active Tunnels] (vRtrStatActiveSdpTunnels)	long	vRtrStatActiveSdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'sdp'.
sdpTunnels [Sdp Tunnels] (vRtrStatTotalSdpTunnels)	long	vRtrStatTotalSdpTunnels indicates the current number of both active and inactive SDP tunnels.
staticActiveRoutes [Static Active Routes] (vRtrStaticActiveRoutes)	long	vRtrStaticActiveRoutes indicates the current number of active static routes for this instance of the route table.

Table 177 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
staticRoutes [Static Routes] (vRtrStaticRoutes)	long	vRtrStaticRoutes indicates the current number of static routes for this instance of the route table.
totalARPEntries [Total ARPEntries] (vRtrStatTotalARPEntries)	long	vRtrStatTotalARPEntries indicates the total number of active and inactive ARP entries for the specified virtual router in the system.

Table 178 sas statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DelayTCAStats</p> <p>MIB entry name: tmnxOamPmStsTcaDelayEntry</p> <p>Entry description: tmnxOamPmStsTcaDelayEntry contains the OAM-PM delay TCA statistics for the combination of an OAM-PM session name, test type, bin type, and direction (e.g. {'oam_pm_sess_1', 'dmm(1)', 'ifdv(3)', 'twoWay(3)}'). Nine rows are created/destroyed in this table when a delay test is created/destroyed. A delay test is created/destroyed using tmnxOamPmCfgDelayDmmRowStatus or tmnxOamPmCfgTwampLtRowStatus. The nine rows are indexed by the session name, the test type, and the nine combinations of bin type and direction.</p> <p>Table description (for tmnxOamPmStsTcaDelayTable): tmnxOamPmStsTcaDelayTable contains statistics for delay-based OAM-PM Threshold Crossing Alerts (TCAs).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ethernetOam.CfmDmmSession • sas.TWLSession 		
active [Active] (tmnxOamPmStsTcaDelayOperState)	int	The value of tmnxOamPmStsTcaDelayOperState indicates the operational state of delay-based TCAs for the specified indices.
direction [Direction] (tmnxOamPmCfgForwardBackward2Way)	int	The value of tmnxOamPmCfgForwardBackward2Way specifies the direction of the row to be configured or read.
lastTime [Last Time] (tmnxOamPmStsTcaDelayLastTime)	String	The value of tmnxOamPmStsTcaDelayLastTime indicates the UTC date and time at the start of the measurement interval which generated the most recent delay-based Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no TCAs have been generated for the specified indices since system start up.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>LossTCAAgStats</p> <p>MIB entry name: tmnxOamPmStsTcaLossFwBwAgEntry</p> <p>Entry description: tmnxOamPmStsTcaLossFwBwAgEntry contains the TCA statistics for the forward, backward, or aggregate direction of one OAM-PM loss test. For example, a row may contain TCA statistics for the forward direction for the SLM test belonging to OAM-PM session OAM_PM_Eth_session_1.</p> <p>Table description (for tmnxOamPmStsTcaLossFwBwAgTable): tmnxOamPmStsTcaLossFwBwAgTable contains statistics for loss-based OAM-PM Threshold Crossing Alerts (TCAs). flrLastTime [Flr Last Time] (tmnxOamPmStsTcaLossAvgFlrLstTime)	String	The value of tmnxOamPmStsTcaLossAvgFlrLstTime indicates the UTC date and time at the start of the measurement interval which generated the most recent Average Frame Loss Ratio (FLR) Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no Average FLR TCAs have been generated for the specified indices since system start up.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PmSessionBaseStats</p>		
<p>MIB entry name: tmnxOamPmStsBaseEntry</p>		
<p>Entry description: tmnxOamPmStsBaseEntry contains the base statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a test is started (e.g. using tmnxOamPmCfgDelayDmmAdminStatus and tmnxOamPmCfgDelayDmmOnDmndStatus). At that time, a row for the current interval (with the index value tmnxOamPmStsIntvlNum=1) is created for each row with a matching session name in tmnxOamPmCfgMeasIntvlTable. In addition, a row is created in this table for the test's 'miRaw(1)' interval. After that, the timed creation and destruction of rows in this table is explained using the following example. Suppose the configured number of intervals to be retained is as follows (where index columns are underlined with octothorpes, and 'tmnxOamPm' is abbreviated as '_'): <u>_CfgSessName</u> <u>_CfgMeasIntvlDuration</u> <u>_CfgMeasIntvlsStored</u> ##### ##### 'mySess1' 'mi15Minutes(2)' 3 Suppose statistics collection started at t = 0 (minutes). Suppose the following rows exist in tmnxOamPmStsBaseTable at t = 59 (minutes): <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 1 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 The interval numbers are assigned as follows: 1 - the historical interval ended at t = 15 minutes 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the current interval Then, after the next 15 minute interval ends (e.g. at t = 61 minutes), the following rows will exist: <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 5 The interval numbers are assigned as follows: 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the historical interval ended at t = 60 minutes 5 - the current interval The row with interval number 1 was destroyed, because tmnxOamPmCfgMeasIntvlsStored=3 specifies that at most three historical intervals be retained. Rows are also destroyed in this table when the corresponding tmnxOamPmCfgMeasIntvlTable row is destroyed. When the index value tmnxOamPmStsMeasIntvlDuration is 'miRaw(1)', only one interval is available (i.e. tmnxOamPmStsIntvlNum = 1). When a test is running, the measurement interval data set for a test's 'miRaw(1)' measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. The change to the objects in the specified row is as follows. Object Change on Clear Operation tmnxOamPmStsBaseOperStatus No change tmnxOamPmStsBaseSuspect Set to 'true(1)' tmnxOamPmStsBaseStartTime Set to UTC time of the clear operation tmnxOamPmStsBaseElapsedTime Set to zero tmnxOamPmStsBaseTestFramesTx Set to zero tmnxOamPmStsBaseTestFramesRx Set to zero Measurement interval data sets for measurement interval durations other than 'miRaw(1)' cannot be cleared.</p>		
<p>Table description (for tmnxOamPmStsBaseTable): tmnxOamPmStsBaseTable contains the base statistics for OAM Performance Monitoring Measurement Interval Data Sets. The statistics in this table are common to all test types (e.g. DMM and SLM tests).</p>		
<p>Supports realtime plotting</p>		
<p>Supports scheduled collection</p>		
<p>Monitored classes:</p>		
<ul style="list-style-type: none"> • ethernetoam.CfmDmmSession • ethernetoam.CfmLmmSession • ethernetoam.CfmSlmSession 		

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmStatsElapsedTime [Pm Stats Elapsed Time] (tmnxOamPmStsBaseElapsedTime)	long	The value of tmnxOamPmStsBaseElapsedTime indicates the time elapsed since data collection started for the specified measurement interval data set.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
pmStatsOperStatus [Pm Stats Oper Status] (tmnxOamPmStsBaseOperStatus)	int	The value of tmnxOamPmStsBaseOperStatus indicates the operational status of the specified measurement interval data set. If the interval is historical and the operational status is 'inprogress(1)', the interval is closing (i.e. waiting for a response for the final test request sent).
pmStatsPduRx [Pm Stats Pdu Rx] (tmnxOamPmStsBaseTestFramesRx)	long	The value of tmnxOamPmStsBaseTestFramesRx indicates the number of test frames received for the specified measurement interval data set.
pmStatsPduTx [Pm Stats Pdu Tx] (tmnxOamPmStsBaseTestFramesTx)	long	The value of tmnxOamPmStsBaseTestFramesTx indicates the number of test frames sent for the specified measurement interval data set.
pmStatsStartTime [Pm Stats Start Time] (tmnxOamPmStsBaseStartTime)	String	The value of tmnxOamPmStsBaseStartTime indicates the start time (in UTC) of the specified measurement interval data set.
pmStatsSuspect [Pm Stats Suspect] (tmnxOamPmStsBaseSuspect)	boolean	The value of tmnxOamPmStsBaseSuspect indicates whether or not the specified measurement interval data set contains suspect information.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsTestType [Pm Stats Test Type] (tmnxOamPmStsBaseTestType)	int	The value of tmnxOamPmStsBaseTestType specifies the type of test for which statistics are to be read (e.g. 'dmm(1)').
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>PrefixSrvStats</p> <p>MIB entry name: tmnxTwampSrvPrefixEntry</p> <p>Entry description: tmnxTwampSrvPrefixEntry contains the TWAMP server configuration information for the IP prefix specified by the index values. Rows in this table are created and destroyed using the tmnxTwampSrvPrefixRowStatus object.</p> <p>Table description (for tmnxTwampSrvPrefixTable): tmnxTwampSrvPrefixTable contains per-prefix TWAMP server configuration information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
srvPfxConnCount [Srv Pfx Conn Count] (tmnxTwampSrvPfxConnCount)	long	The value of tmnxTwampSrvPfxConnCount indicates, for the prefix specified by the index values, the number of control connections currently managed by the TWAMP server.
srvPfxConnsRejected [Srv Pfx Conns Rejected] (tmnxTwampSrvPfxConnsRejected)	long	The value of tmnxTwampSrvPfxConnsRejected indicates, for the prefix specified by the index values, the number of control connection requests which have been rejected by the TWAMP server. An example reject reason: the prefix's limit on the number of active connections has been reached.
srvPfxSessionCount [Srv Pfx Session Count] (tmnxTwampSrvPfxSessionCount)	long	The value of tmnxTwampSrvPfxSessionCount indicates, for the prefix specified by the index values, the number of currently in-progress TWAMP test sessions.
srvPfxTestPacketsRx [Srv Pfx Test Packets Rx] (tmnxTwampSrvPfxTestPacketsRx)	long	The value of tmnxTwampSrvPfxTestPacketsRx indicates, for the prefix specified by the index values, the number of TWAMP test packets received by the TWAMP server.
srvPfxTestPacketsTx [Srv Pfx Test Packets Tx] (tmnxTwampSrvPfxTestPacketsTx)	long	The value of tmnxTwampSrvPfxTestPacketsTx indicates, for the prefix specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
srvPfxTestSessAbort [Srv Pfx Test Sess Abort] (tmnxTwampSrvPfxTestSessAbort)	long	The value of tmnxTwampSrvPfxTestSessAbort indicates, for the prefix specified by the index values, the number of test sessions aborted by the TWAMP server.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
srvPfxTestSessCompleted [Srv Pfx Test Sess Completed] (tmnxTwampSrvPfxTestSessCompleted)	long	The value of tmnxTwampSrvPfxTestSessCompleted indicates, for the prefix specified by the index values, the number of test sessions completed by the TWAMP server.
srvPfxTestSessRejected [Srv Pfx Test Sess Rejected] (tmnxTwampSrvPfxTestSessRejected)	long	The value of tmnxTwampSrvPfxTestSessRejected indicates, for the prefix specified by the index values, the number of test sessions rejected by the TWAMP server.
<p>SrvConnsStats</p> <p>MIB entry name: tmnxTwampSrvConnStatsEntry</p> <p>Entry description: tmnxTwampSrvConnStatsEntry contains the statistics for the TWAMP control connection specified by the index values. A row is created by the system when a TWAMP control connection is established.</p> <p>Table description (for tmnxTwampSrvConnStatsTable): tmnxTwampSrvConnStatsTable contains the statistics for each active control connection managed by the TWAMP server.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
clientAddr [Client Addr] (tmnxTwampSrvConnClientAddr)	String	The value of tmnxTwampSrvConnClientAddr specifies the TWAMP client's address. This is the fifth index for tmnxTwampSrvConnStatsTable.
clientAddrType [Client Addr Type] (tmnxTwampSrvConnClientAddrType)	int	The value of tmnxTwampSrvConnClientAddrType specifies the type of tmnxTwampSrvConnClientAddr. This is the fourth index for tmnxTwampSrvConnStatsTable.
connIdleTime [Conn Idle Time] (tmnxTwampSrvConnIdleTime)	long	The value of tmnxTwampSrvConnIdleTime specifies the elapsed time, in seconds, since a TWAMP message was received on this control connection. When this value exceeds tmnxTwampSrvInactTimeout, the connection will be torn down.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
connSessionCount [Conn Session Count] (tmnxTwampSrvConnSessionCount)	long	The value of tmnxTwampSrvConnSessionCount indicates, for the connection specified by the index values, the number of currently in-progress TWAMP test sessions.
connState [Conn State] (tmnxTwampSrvConnState)	int	The value of tmnxTwampSrvConnState indicates the operational state of a control connection managed by the TWAMP server. Code points: setUp(1) - the connection is being established ready(2) - the connection is ready to accept test sessions running(3) - the connection is running a test.
connTestPacketsRx [Conn Test Packets Rx] (tmnxTwampSrvConnTestPacketsRx)	long	The value of tmnxTwampSrvConnTestPacketsRx indicates, for the connection specified by the index values, the number of TWAMP test packets received by the TWAMP server.
connTestPacketsTx [Conn Test Packets Tx] (tmnxTwampSrvConnTestPacketsTx)	long	The value of tmnxTwampSrvConnTestPacketsTx indicates, for the connection specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
connTestSessComplete [Conn Test Sess Complete] (tmnxTwampSrvConnTestSessComplete)	long	The value of tmnxTwampSrvConnTestSessComplete indicates, for the connection specified by the index values, the number of test sessions completed by the TWAMP server.
connTestSessRejected [Conn Test Sess Rejected] (tmnxTwampSrvConnTestSessRejected)	long	The value of tmnxTwampSrvConnTestSessRejected indicates, for the connection specified by the index values, the number of test sessions rejected by the TWAMP server.
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
seqNum [Seq Num] (tmnxTwampSrvConnSeqNum)	int	The value of tmnxTwampSrvConnSeqNum specifies this control connection's sequence number. This is the sixth index for tmnxTwampSrvConnStatsTable - it allows n>1 rows (i.e. n>1 connections) for one client.
<p>TWLBinStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlBinEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlBinEntry contains the TWAMP-Light frame delay per-bin statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a corresponding row is created in tmnxOamPmStsDelayTwlTable. If the tmnxOamPmStsDelayTwlTable row is created with the index value tmnxOamPmCfgBinType = 'fd(1)', then the the number of rows created in this table is tmnxOamPmCfgBinGroupFdBinCount. Similarly, 'fdr(2)' and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsDelayTwlTable row is destroyed. When a test is running, the TWAMP-Light statistics for a test's raw (i.e. 'miRaw(1)') measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session..</p> <p>Table description (for tmnxOamPmStsDelayTwlBinTable): tmnxOamPmStsDelayTwlBinTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay per-bin statistics. The frame delay per-bin statistics kept for TWAMP-Light tests are the same as the frame delay per-bin statistics specified for Ethernet DMM (Delay Measurement Message) tests in MEF-35 requirement R66.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TWLBin</p>		

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBinBwdCount [Delay Twl Bin Bwd Count] (tmnxOamPmStsDelayTwlBinBwdCount)	long	The value of tmnxOamPmStsDelayTwlBinBwdCount indicates the number of TWAMP-Light frame delay measurements in the backward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the backward direction in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinFwdCount [Delay Twl Bin Fwd Count] (tmnxOamPmStsDelayTwlBinFwdCount)	long	The value of tmnxOamPmStsDelayTwlBinFwdCount indicates the number of TWAMP-Light frame delay measurements in the forward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 9 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the forward direction in the first interval of 'twlSess1' that fit in the highest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinNum [Delay Twl Bin Num] (tmnxOamPmStsDelayTwlBinNum)	long	The value of tmnxOamPmStsDelayTwlBinNum specifies the bin number of the statistics to be read.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBintwowayCount [Delay Twl Bintwoway Count] (tmnxOamPmStsDelayTwlBin2wyCount)	long	The value of tmnxOamPmStsDelayTwlBin2wyCount indicates the number of TWAMP-Light two-way frame delay measurements that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light two-way frame delay measurements (in microseconds) in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TWLSessionStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlEntry contains the TWAMP-Light frame delay summary statistics for one OAM Performance Monitoring Measurement Interval Data Set. When a row is created in tmnxOamPmStsBaseTable with tmnxOamPmStsBaseTestType = 'twampLight(3)' (provided tmnxOamPmCfgTwampLtCollectStats is 'collectDelayStats(1)' or 'collectDelayAndLossStats(3)'), three rows are created in this table. The three rows have the following values in the tmnxOamPmCfgBinType index column: 'fd(1)', 'fdr(2)', and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsBaseTable row is destroyed. When a TWAMP-Light test is running, all the test's raw statistics can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsDelayTwlTable): tmnxOamPmStsDelayTwlTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay summary statistics. delayTwl2wyAvg [Delay Twl 2 wy Avg] (tmnxOamPmStsDelayTwl2wyAvg)	long	The value of tmnxOamPmStsDelayTwl2wyAvg indicates the average two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMax [Delay Twl 2 wy Max] (tmnxOamPmStsDelayTwl2wyMax)	long	The value of tmnxOamPmStsDelayTwl2wyMax indicates the maximum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMin [Delay Twl 2 wy Min] (tmnxOamPmStsDelayTwl2wyMin)	long	The value of tmnxOamPmStsDelayTwl2wyMin indicates the minimum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBwdAvg [Delay Twl Bwd Avg] (tmnxOamPmStsDelayTwlBwdAvg)	long	The value of tmnxOamPmStsDelayTwlBwdAvg indicates the average delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMax [Delay Twl Bwd Max] (tmnxOamPmStsDelayTwlBwdMax)	long	The value of tmnxOamPmStsDelayTwlBwdMax indicates the maximum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMin [Delay Twl Bwd Min] (tmnxOamPmStsDelayTwlBwdMin)	long	The value of tmnxOamPmStsDelayTwlBwdMin indicates the minimum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdAvg [Delay Twl Fwd Avg] (tmnxOamPmStsDelayTwlFwdAvg)	long	The value of tmnxOamPmStsDelayTwlFwdAvg indicates the average delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMax [Delay Twl Fwd Max] (tmnxOamPmStsDelayTwlFwdMax)	long	The value of tmnxOamPmStsDelayTwlFwdMax indicates the maximum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMin [Delay Twl Fwd Min] (tmnxOamPmStsDelayTwlFwdMin)	long	The value of tmnxOamPmStsDelayTwlFwdMin indicates the minimum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
TwampSrvStats MIB entry name: tmnxTwampStatisticsScalarObjs Supports realtime plotting Supports scheduled collection Monitored class: sas.TwampSrv		
twampSrvConnectionCount [Twamp Srv Connection Count] (tmnxTwampSrvConnectionCount)	long	The value of tmnxTwampSrvConnectionCount indicates the number of control connections currently managed by the TWAMP server.
twampSrvConnectionsRejected [Twamp Srv Connections Rejected] (tmnxTwampSrvConnectionsRejected)	long	The value of tmnxTwampSrvConnectionsRejected indicates the total number of control connection requests which have been rejected by the TWAMP server. Example reject reasons: the server's limit on the number of active connections has been reached; the client's IP address does not match any of the prefixes configured on the TWAMP server.
twampSrvOperStat [Twamp Srv Oper Stat] (tmnxTwampSrvOperState)	long	The value of tmnxTwampSrvOperState indicates if the TWAMP server is operationally 'inService(2)', or 'outOfService(3)'.
twampSrvSessionCount [Twamp Srv Session Count] (tmnxTwampSrvSessionCount)	long	The value of tmnxTwampSrvSessionCount indicates the number of currently in-progress TWAMP test sessions.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
twampSrvTestPacketsRx [Twamp Srv Test Packets Rx] (tmnxTwampSrvTestPacketsRx)	long	The value of tmnxTwampSrvTestPacketsRx indicates the total number of TWAMP test packets received by the TWAMP server.
twampSrvTestPacketsTx [Twamp Srv Test Packets Tx] (tmnxTwampSrvTestPacketsTx)	long	The value of tmnxTwampSrvTestPacketsTx indicates the total number of TWAMP test packets sent by the TWAMP server.
twampSrvTestSessAborted [Twamp Srv Test Sess Aborted] (tmnxTwampSrvTestSessAborted)	long	The value of tmnxTwampSrvTestSessAborted indicates the total number of test sessions aborted by the TWAMP server.
twampSrvTestSessCompleted [Twamp Srv Test Sess Completed] (tmnxTwampSrvTestSessCompleted)	long	The value of tmnxTwampSrvTestSessCompleted indicates the total number of test sessions completed by the TWAMP server.
twampSrvTestSessRejected [Twamp Srv Test Sess Rejected] (tmnxTwampSrvTestSessRejected)	long	The value of tmnxTwampSrvTestSessRejected indicates the total number of test sessions rejected by the TWAMP server.
twampSrvUpTime [Twamp Srv Up Time] (tmnxTwampSrvUpTime)	long	The value of tmnxTwampSrvUpTime indicates the time elapsed, in seconds, since the most recent transition of tmnxTwampSrvOperState to 'inService(2)'. If tmnxTwampSrvOperState is not 'inService(2)', zero is returned.

Table 178 sas statistics (continued)

pmTwAvailIndBwd [Pm Twl Avail Ind Bwd] (tmnxOamPmStsLossTwAvailIndBwd)	long	The value of tmnxOamPmStsLossTwAvailIndBwd indicates the number of availability indicators evaluated as Available in the backward direction for the specified measurement interval data set.
pmTwAvailIndFwd [Pm Twl Avail Ind Fwd] (tmnxOamPmStsLossTwAvailIndFwd)	long	The value of tmnxOamPmStsLossTwAvailIndFwd indicates the number of availability indicators evaluated as Available in the forward direction for the specified measurement interval data set.
pmTwAvgFlrBwd [Pm Twl Avg Flr Bwd] (tmnxOamPmStsLossTwAvgFlrBwd)	float	The value of tmnxOamPmStsLossTwAvgFlrBwd indicates the average Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwAvgFlrFwd [Pm Twl Avg Flr Fwd] (tmnxOamPmStsLossTwAvgFlrFwd)	float	The value of tmnxOamPmStsLossTwAvgFlrFwd indicates the average Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwlChliBwd [Pm Twl Chli Bwd] (tmnxOamPmStsLossTwlChliBwd)	long	The value of tmnxOamPmStsLossTwlChliBwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the backward direction for the specified measurement interval data set.
pmTwlChliFwd [Pm Twl Chli Fwd] (tmnxOamPmStsLossTwlChliFwd)	long	The value of tmnxOamPmStsLossTwlChliFwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the forward direction for the specified measurement interval data set.
pmTwlHliBwd [Pm Twl Hli Bwd] (tmnxOamPmStsLossTwlHliBwd)	long	The value of tmnxOamPmStsLossTwlHliBwd indicates the number of High Loss Intervals (HLIs) in the backward direction for the specified measurement interval data set.
pmTwlHliFwd [Pm Twl Hli Fwd] (tmnxOamPmStsLossTwlHliFwd)	long	The value of tmnxOamPmStsLossTwlHliFwd indicates the number of High Loss Intervals (HLIs) in the forward direction for the specified measurement interval data set.
pmTwlMaxFlrBwd [Pm Twl Max Flr Bwd] (tmnxOamPmStsLossTwlMaxFlrBwd)	float	The value of tmnxOamPmStsLossTwlMaxFlrBwd indicates the maximum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlMaxFlrFwd [Pm Twl Max Flr Fwd] (tmnxOamPmStsLossTwlMaxFlrFwd)	float	The value of tmnxOamPmStsLossTwlMaxFlrFwd indicates the maximum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmTwlMinFlrBwd [Pm Twl Min Flr Bwd] (tmnxOamPmStsLossTwlMinFlrBwd)	float	The value of tmnxOamPmStsLossTwlMinFlrBwd indicates the minimum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlMinFlrFwd [Pm Twl Min Flr Fwd] (tmnxOamPmStsLossTwlMinFlrFwd)	float	The value of tmnxOamPmStsLossTwlMinFlrFwd indicates the minimum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwIRxBwd [Pm Twl Rx Bwd] (tmnxOamPmStsLossTwIRxBwd)	long	The value of tmnxOamPmStsLossTwIRxBwd indicates the number of TWAMP-Light reply frames received in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwIRxFwd [Pm Twl Rx Fwd] (tmnxOamPmStsLossTwIRxFwd)	long	The value of tmnxOamPmStsLossTwIRxFwd indicates the number of TWAMP-Light request frames received in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwITxBwd [Pm Twl Tx Bwd] (tmnxOamPmStsLossTwITxBwd)	long	The value of tmnxOamPmStsLossTwITxBwd indicates the number of TWAMP-Light reply frames transmitted in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwITxFwd [Pm Twl Tx Fwd] (tmnxOamPmStsLossTwITxFwd)	long	The value of tmnxOamPmStsLossTwITxFwd indicates the number of TWAMP-Light request frames transmitted in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwIUnavailIndBwd [Pm Twl Unavail Ind Bwd] (tmnxOamPmStsLossTwIUnavailIndBwd)	long	The value of tmnxOamPmStsLossTwIUnavailIndBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction for the specified measurement interval data set.

Table 178 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiUnavailIndFwd [Pm Twl Unavail Ind Fwd] (tmnxOamPmStsLossTwiUnavlIndFwd)	long	The value of tmnxOamPmStsLossTwiUnavlIndFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction for the specified measurement interval data set.
pmTwiUndtAvlBwd [Pm Twl Undt Avl Bwd] (tmnxOamPmStsLossTwiUndtAvlBwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlBwd indicates the number of availability indicators evaluated as Available in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtAvlFwd [Pm Twl Undt Avl Fwd] (tmnxOamPmStsLossTwiUndtAvlFwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlFwd indicates the number of availability indicators evaluated as Available in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CpmFilterQueueStats</p> <p>MIB entry name: tCpmFilterQueueStatsEntry</p> <p>Entry description: Each row entry represents the statistics related to the tCpmFilterQueueEntry indexed by the same tCpmFilterQueueId. Entries are created when tCpmFilterQueueEntry rows are created.</p> <p>Table description (for tCpmFilterQueueStatsTable): The tCpmFilterQueueStatsTable has a stats entry for each CPM filter queue configured on this system. This table is not supported on SR-1 and ESS-1, where the value of TIMETRA-CHASSIS-MIB::tmnxChassisType is '5'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sitesec.CpmFilterQueue</p>		
droppedInOctets [Dropped In Octets] (tCpmFilterQInProfileDropOctets)	java. math. BigInteger	The value of tCpmFilterQInProfileDropOctets indicates the number of octets complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedInPackets [Dropped In Packets] (tCpmFilterQInProfileDropPkts)	java. math. BigInteger	The value of tCpmFilterQInProfileDropPkts indicates the number of packets complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedOutOctets [Dropped Out Octets] (tCpmFilterQOutProfileDropOctets)	java. math. BigInteger	The value of tCpmFilterQOutProfileDropOctets indicates the number of octets not complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
droppedOutPackets [Dropped Out Packets] (tCpmFilterQOutProfileDropPkts)	java. math. BigInteger	The value of tCpmFilterQOutProfileDropPkts indicates the number of packets not complying to the queue Qos profile dropped from the tCpmFilterQueueEntry with the same index.
forwardedInOctets [Forwarded In Octets] (tCpmFilterQInProfileFwdOctets)	java. math. BigInteger	The value of tCpmFilterQInProfileFwdOctets indicates the number of octets complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.

Table 180 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardedInPackets [Forwarded In Packets] (tCpmFilterQInProfileFwdPkts)	java. math. BigInteger	The value of tCpmFilterQInProfileFwdPkts indicates the number of packets complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.
forwardedOutOctets [Forwarded Out Octets] (tCpmFilterQOutProfileFwdOctets)	java. math. BigInteger	The value of tCpmFilterQOutProfileFwdOctets indicates the number of octets not complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.
forwardedOutPackets [Forwarded Out Packets] (tCpmFilterQOutProfileFwdPkts)	java. math. BigInteger	The value of tCpmFilterQOutProfileFwdPkts indicates the number of packets not complying to the queue Qos profile forwarded from the tCpmFilterQueueEntry with the same index.
<p>CpmlpFilterStats MIB entry name: tCpmlpFilterStatsEntry Entry description: Each row entry represents the statistics related to the tCpmlpFilterEntry indexed by the same tCpmlpFilterEntryId. Entries are created when tCpmlpFilterEntry rows are created. Table description (for tCpmlpFilterStatsTable): The tCpmlpFilterStatsTable has a stats entry for each entry in each CPM filter configured on this system. This table is not supported on SR-1 and ESS-1, where the value of TIMETRA-CHASSIS-MIB::tmnxChassisType is '5'. Supports realtime plotting Supports scheduled collection Monitored class: sitesec.CpmlpFilterEntry</p>		
droppedPackets [Dropped Packets] (tCpmlpFilterStatsDroppedPkts)	java. math. BigInteger	The value of tCpmlpFilterStatsDroppedPkts indicates the number of packets dropped due to the tCpmlpFilterEntry with the same index.
forwardedPackets [Forwarded Packets] (tCpmlpFilterStatsForwardedPkts)	java. math. BigInteger	The value of tCpmlpFilterStatsForwardedPkts indicates the number of packets forwarded due to the tCpmlpFilterEntry with the same index.

Table 180 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MafEntryStats</p> <p>MIB entry name: tmnxIPMafMatchEntry</p> <p>Entry description: Each row entry contains information about a management access filter entry associated with a specific Management Access Filter (MAF). The filter criter is applied in order according to the value of tmnxIPMafMatchIndex. The match algorithm is exited upon the first match found and then the action specified is executed. For this reason, entries must be sequenced from most to least explicit. An entry where tmnxIPMafMatchAction has a value of 'none' is not active. Rows can only be created for tmnxGenMafType's: - ipv4 (1), and. - ipv6 (2). For mac Maf filters a dedicated table is provided (tmnxMacMafMatchTable).</p> <p>Table description (for tmnxIPMafMatchTable): This table replaces the tmnxMafMatchTable. It allows to define both IPv4 and IPv6 MAF IP entries. The tmnxIPMafMatchTable contains ipvx filter match criteria associated with Management Access Filters (MAFs) configured on the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sitesec.MafEntry</p>		
matchCount [Match Count] (tmnxIPMafMatchCount)	java. math. BigInteger	The value of tmnxIPMafMatchCount indicates the number of times a management packet has matched this filter entry.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
saplgmpSnpgrxBadLenPkts [Sap Igmp SnpgrxBadLenPkts] (saplgmpSnpgrxBadLenPkts)	long	The value of the object saplgmpSnpgrxBadLenPkts indicates the number of IGMP packets dropped on this SAP because of a bad length.
saplgmpSnpgrxNoRtrAlertPkts [Sap Igmp SnpgrxNoRtrAlertPkts] (saplgmpSnpgrxNoRtrAlertPkts)	long	The value of the object saplgmpSnpgrxNoRtrAlertPkts indicates the number of IGMP packets dropped on this SAP because the Router Alert Option in the IP packet is not set.
saplgmpSnpgrxWrongVersionPkts [Sap Igmp SnpgrxWrongVersionPkts] (saplgmpSnpgrxWrongVersionPkts)	long	The value of the object saplgmpSnpgrxWrongVersionPkts indicates the total number of IGMP packets with a wrong version received on this SAP.
saplgmpSnpgrxZeroSrcAdrPkts [Sap Igmp SnpgrxZeroSrcAdrPkts] (saplgmpSnpgrxZeroSrcAdrPkts)	long	The value of the object saplgmpSnpgrxZeroSrcAdrPkts indicates the number of IGMP packets dropped on this SAP because they contain a zero source IPv4 address.
saplgmpSnpgrSendQueryCfgDrops [Sap Igmp SnpgrSendQueryCfgDrops] (saplgmpSnpgrSendQueryCfgDrops)	long	The value of the object saplgmpSnpgrSendQueryCfgDrops indicates the number of times an IGMP Query is dropped because the object saplgmpSnpgrCfgSendQueries for this SAP is set to 'enabled(1)'. L2AccessInterfaceIgmprSnpgrStats MIB entry name: saplgmpSnpgrStatsEntry Entry description: saplgmpSnpgrStatsEntry is an entry in the saplgmpSnpgrStatsTable. Each entry contains IGMP snooping statistics for a SAP in a TIs. Table description (for saplgmpSnpgrStatsTable): saplgmpSnpgrStatsTable contains statistics on IGMP snooping per SAP. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • mvpls.IL2AccessInterface • vpls.AbstractL2AccessInterface • vpls.IL2AccessInterface

Table 182 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapIgmPsnpgFwdGenQueries [Sap Igmp Snpg Fwd Gen Queries] (sapIgmPsnpgFwdGenQueries)	long	The value of the object sapIgmPsnpgFwdGenQueries indicates the number of IGMP General Queries forwarded on this SAP.
sapIgmPsnpgFwdGrpSpecQueries [Sap Igmp Snpg Fwd Grp Spec Queries] (sapIgmPsnpgFwdGrpSpecQueries)	long	The value of the object sapIgmPsnpgFwdGrpSpecQueries indicates the number of IGMP Group-Specific Queries forwarded on this SAP.
sapIgmPsnpgFwdUnknownType [Sap Igmp Snpg Fwd Unknown Type] (sapIgmPsnpgFwdUnknownType)	long	The value of the object sapIgmPsnpgFwdUnknownType indicates the number of IGMP unknown type packets forwarded on this SAP.
sapIgmPsnpgFwdV1Reports [Sap Igmp Snpg Fwd V1 Reports] (sapIgmPsnpgFwdV1Reports)	long	The value of the object sapIgmPsnpgFwdV1Reports indicates the number of IGMPv1 Reports forwarded on this SAP.
sapIgmPsnpgFwdV2Leaves [Sap Igmp Snpg Fwd V2 Leaves] (sapIgmPsnpgFwdV2Leaves)	long	The value of the object sapIgmPsnpgFwdV2Leaves indicates the number of IGMPv2 Leaves forwarded on this SAP.
sapIgmPsnpgFwdV2Reports [Sap Igmp Snpg Fwd V2 Reports] (sapIgmPsnpgFwdV2Reports)	long	The value of the object sapIgmPsnpgFwdV2Reports indicates the number of IGMPv2 Reports forwarded on this SAP.
sapIgmPsnpgFwdV3Reports [Sap Igmp Snpg Fwd V3 Reports] (sapIgmPsnpgFwdV3Reports)	long	The value of the object sapIgmPsnpgFwdV3Reports indicates the number of IGMPv3 Reports forwarded on this SAP.
sapIgmPsnpgRxGenQueries [Sap Igmp Snpg Rx Gen Queries] (sapIgmPsnpgRxGenQueries)	long	The value of the object sapIgmPsnpgRxGenQueries indicates the number of IGMP General Queries received on this SAP.
sapIgmPsnpgRxGrpSpecQueries [Sap Igmp Snpg Rx Grp Spec Queries] (sapIgmPsnpgRxGrpSpecQueries)	long	The value of the object sapIgmPsnpgRxGrpSpecQueries indicates the number of IGMP Group-Specific Queries received on this SAP.

Table 182 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
saplgmpSnpgrxSrcSpecQueries [Sap Igmp Snpgrx Src Spec Queries] (saplgmpSnpgrxSrcSpecQueries)	long	The value of the object saplgmpSnpgrxSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries received on this SAP.
saplgmpSnpgrxUnknownType [Sap Igmp Snpgrx Unknown Type] (saplgmpSnpgrxUnknownType)	long	The value of the object saplgmpSnpgrxUnknownType indicates the number of IGMP unknown type packets received on this SAP.
saplgmpSnpgrxV1Reports [Sap Igmp Snpgrx V1 Reports] (saplgmpSnpgrxV1Reports)	long	The value of the object saplgmpSnpgrxV1Reports indicates the number of IGMPv1 Reports received on this SAP.
saplgmpSnpgrxV2Leaves [Sap Igmp Snpgrx V2 Leaves] (saplgmpSnpgrxV2Leaves)	long	The value of the object saplgmpSnpgrxV2Leaves indicates the number of IGMPv2 Leaves received on this SAP.
saplgmpSnpgrxV2Reports [Sap Igmp Snpgrx V2 Reports] (saplgmpSnpgrxV2Reports)	long	The value of the object saplgmpSnpgrxV2Reports indicates the number of IGMPv2 Reports received on this SAP.
saplgmpSnpgrxV3Reports [Sap Igmp Snpgrx V3 Reports] (saplgmpSnpgrxV3Reports)	long	The value of the object saplgmpSnpgrxV3Reports indicates the number of IGMPv3 Reports received on this SAP.
saplgmpSnpgrxTxGenQueries [Sap Igmp Snpgrx Tx Gen Queries] (saplgmpSnpgrxTxGenQueries)	long	The value of the object saplgmpSnpgrxTxGenQueries indicates the number of IGMP General Queries transmitted on this SAP.
saplgmpSnpgrxTxGrpSpecQueries [Sap Igmp Snpgrx Tx Grp Spec Queries] (saplgmpSnpgrxTxGrpSpecQueries)	long	The value of the object saplgmpSnpgrxTxGrpSpecQueries indicates the number of IGMP Group-Specific Queries transmitted on this SAP.
saplgmpSnpgrxTxSrcSpecQueries [Sap Igmp Snpgrx Tx Src Spec Queries] (saplgmpSnpgrxTxSrcSpecQueries)	long	The value of the object saplgmpSnpgrxTxSrcSpecQueries indicates the number of IGMP Group-And-Source-Specific Queries transmitted on this SAP.

Table 182 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapIgmPsnpgTxV1Reports [Sap Igmp Snpg Tx V1 Reports] (sapIgmPsnpgTxV1Reports)	long	The value of the object sapIgmPsnpgTxV1Reports indicates the number of IGMPv1 Reports transmitted on this SAP.
sapIgmPsnpgTxV2Leaves [Sap Igmp Snpg Tx V2 Leaves] (sapIgmPsnpgTxV2Leaves)	long	The value of the object sapIgmPsnpgTxV2Leaves indicates the number of IGMPv2 Leaves transmitted on this SAP.
sapIgmPsnpgTxV2Reports [Sap Igmp Snpg Tx V2 Reports] (sapIgmPsnpgTxV2Reports)	long	The value of the object sapIgmPsnpgTxV2Reports indicates the number of IGMPv2 Reports transmitted on this SAP.
sapIgmPsnpgTxV3Reports [Sap Igmp Snpg Tx V3 Reports] (sapIgmPsnpgTxV3Reports)	long	The value of the object sapIgmPsnpgTxV3Reports indicates the number of IGMPv3 Reports transmitted on this SAP.
L2AccessInterfaceMvrStats MIB entry name: sapIgmPsnpgStatsEntry Entry description: sapIgmPsnpgStatsEntry is an entry in the sapIgmPsnpgStatsTable. Each entry contains IGMP snooping statics for a SAP in a TIs. Table description (for sapIgmPsnpgStatsTable): sapIgmPsnpgStatsTable contains statistics on IGMP snooping per SAP. Supports realtime plotting Supports scheduled collection Monitored class: vpls.AbstractL2AccessInterface		
sapIgmPsnpgMvrFromVplsCfgDrops [Sap Igmp Snpg Mvr From Vpls Cfg Drops] (sapIgmPsnpgMvrFromVplsCfgDrops)	long	The value of the object sapIgmPsnpgMvrFromVplsCfgDrops indicates the number of times an IGMP Group or Query is dropped because of applying the sapIgmPsnpgCfgMvrFromVplsId configuration on this SAP.
sapIgmPsnpgMvrToSapCfgDrops [Sap Igmp Snpg Mvr To Sap Cfg Drops] (sapIgmPsnpgMvrToSapCfgDrops)	long	The value of the object sapIgmPsnpgMvrToSapCfgDrops indicates the number times an IGMP Report or Query is dropped because of applying the sapIgmPsnpgCfgMvrToSapPortId and sapIgmPsnpgCfgMvrToSapEncapVal configuration on this SAP.

Table 182 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>L2AccessIfDhcpRelayCfgStats</p> <p>MIB entry name: sapTlsDhcpStatsEntry</p> <p>Entry description: DHCP statistics for a TLS SAP.</p> <p>Table description (for sapTlsDhcpStatsTable): sapTlsDhcpStatsTable contains DHCP statistics related to a TLS SAP. This table complements sapTlsInfoTable, and contains an entry for each Tls SAP. Rows in this table are created and deleted automatically by the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vpls.AbstractL2AccessInterface</p>		
sapTlsDhcpStatsClntDropdPckts [Sap Tls Dhcp Stats Clnt Dropd Pckts] (sapTlsDhcpStatsClntDropdPckts)	long	The value of the object sapTlsDhcpStatsClntDropdPckts indicates the number of DHCP client packets that have been dropped on this SAP.
sapTlsDhcpStatsClntForwdPckts [Sap Tls Dhcp Stats Clnt Forwd Pckts] (sapTlsDhcpStatsClntForwdPckts)	long	The value of the object sapTlsDhcpStatsClntForwdPckts indicates the number of DHCP client packets that have been forwarded on this SAP.
sapTlsDhcpStatsClntProxLSPckts [Sap Tls Dhcp Stats Clnt Prox LSPckts] (sapTlsDhcpStatsClntProxLSPckts)	long	The value of the object sapTlsDhcpStatsClntProxLSPckts indicates the number of DHCP client packets that have been proxied on this SAP based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
sapTlsDhcpStatsClntProxRadPckts [Sap Tls Dhcp Stats Clnt Prox Rad Pckts] (sapTlsDhcpStatsClntProxRadPckts)	long	The value of the object sapTlsDhcpStatsClntProxRadPckts indicates the number of DHCP client packets that have been proxied on this SAP based on data received from a RADIUS server.
sapTlsDhcpStatsClntSnoopdPckts [Sap Tls Dhcp Stats Clnt Snoopd Pckts] (sapTlsDhcpStatsClntSnoopdPckts)	long	The value of the object sapTlsDhcpStatsClntSnoopdPckts indicates the number of DHCP client packets that have been snooped on this SAP.

Table 182 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapTlsDhcpStatsGenForceRenPckts [Sap Tls Dhcp Stats Gen Force Ren Pckts] (sapTlsDhcpStatsGenForceRenPckts)	long	The value of the object sapTlsDhcpStatsGenForceRenPckts indicates the number of DHCP FORCERENEW messages spoofed on this SAP to the DHCP clients.
sapTlsDhcpStatsGenReleasePckts [Sap Tls Dhcp Stats Gen Release Pckts] (sapTlsDhcpStatsGenReleasePckts)	long	The value of the object sapTlsDhcpStatsGenReleasePckts indicates the number of DHCP RELEASE messages spoofed on this SAP to the DHCP server.
sapTlsDhcpStatsSrvrDropdPckts [Sap Tls Dhcp Stats Srvr Dropd Pckts] (sapTlsDhcpStatsSrvrDropdPckts)	long	The value of the object sapTlsDhcpStatsSrvrDropdPckts indicates the number of DHCP server packets that have been dropped on this SAP.
sapTlsDhcpStatsSrvrForwdPckts [Sap Tls Dhcp Stats Srvr Forwd Pckts] (sapTlsDhcpStatsSrvrForwdPckts)	long	The value of the object sapTlsDhcpStatsSrvrForwdPckts indicates the number of DHCP server packets that have been forwarded on this SAP.
sapTlsDhcpStatsSrvrSnoopdPckts [Sap Tls Dhcp Stats Srvr Snoopd Pckts] (sapTlsDhcpStatsSrvrSnoopdPckts)	long	The value of the object sapTlsDhcpStatsSrvrSnoopdPckts indicates the number of DHCP server packets that have been snooped on this SAP.

Table 183 vrrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InstanceAdditionalStats</p> <p>MIB entry name: tmnxVrrpRouterStatsEntry</p> <p>Entry description: Each row entry in the tmnxVrrpRouterStatsTable represents additional columns in the vrrpRouterStatsTable for statistics specific to the Nokia SROS series VRRP implementation.</p> <p>Table description (for tmnxVrrpRouterStatsTable): The tmnxVrrpRouterStatsTable provides an extension of the vrrpRouterStatsTable in the VRRP-MIB. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vrrpRouterStatsTable, and the augmenting table, tmnxVrrpRouterStatsTable. This in effect extends the vrrpRouterStatsTable with additional columns.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vrrp.Instance</p>		
addressListDiscards [Address List Discards] (tmnxVrrpStatsAddressListDiscards)	long	The total number of VRRP advertisement packets discarded because the address list did not match the locally configured list for the virtual router.
advertiseIntervalDiscards [Advertise Interval Discards] (tmnxVrrpStatsAdvertiseIntervalDiscards)	long	The total number of VRRP advertisement packets discarded because the advertisement interval in the received packet was different than the one configured for the local virtual router.
advertiseSent [Advertise Sent] (tmnxVrrpStatsAdvertiseSent)	long	The total number of VRRP advertisements sent by this virtual router.
masterChanges [Master Changes] (tmnxVrrpStatsMasterChanges)	long	The value for tmnxVrrpStatsMasterChanges specifies the total number of times the virtual router has seen the master virtual router change.
preemptEvents [Preempt Events] (tmnxVrrpStatsPreemptEvents)	long	The value for tmnxVrrpStatsPreemptEvents specifies the total number of times the virtual router has preempted another non-owner master with lower priority.

Table 183 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
preemptedEvents [Preempted Events] (tmnxVrrpStatsPreemptedEvents)	long	The value for tmnxVrrpStatsPreemptedEvents specifies the total number of times the virtual router has been preempted by another non-owner master with higher priority.
totalDiscards [Total Discards] (tmnxVrrpStatsTotalDiscards)	long	The total number of VRRP advertisement packets discarded for any reason. This includes the packets discarded due to advertise interval mismatch and address list mismatch.
InstanceStats MIB entry name: vrrpRouterStatsEntry Entry description: An entry in the table, containing statistics information about a given virtual router. Table description (for vrrpRouterStatsTable): Table of virtual router statistics. Supports realtime plotting Supports scheduled collection Monitored class: vrrp.Instance		
addressListErrors [Address List Errors] (vrrpStatsAddressListErrors)	long	The total number of packets received for which the address list does not match the locally configured list for the virtual router.
advertiseIntervalErrors [Advertise Interval Errors] (vrrpStatsAdvertiseIntervalErrors)	long	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
advertiseRcvd [Advertise Rcvd] (vrrpStatsAdvertiseRcvd)	long	The total number of VRRP advertisements received by this virtual router.
authFailures [Auth Failures] (vrrpStatsAuthFailures)	long	The total number of VRRP packets received that do not pass the authentication check.

Table 183 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authTypeMismatch [Auth Type Mismatch] (vrrpStatsAuthTypeMismatch)	long	The total number of packets received with 'Auth Type' not equal to the locally configured authentication method ('vrrpOperAuthType').
becomeMaster [Become Master] (vrrpStatsBecomeMaster)	long	The total number of times that this virtual router's state has transitioned to MASTER.
invalidAuthType [Invalid Auth Type] (vrrpStatsInvalidAuthType)	long	The total number of packets received with an unknown authentication type.
invalidTypePktsRcvd [Invalid Type Pkts Rcvd] (vrrpStatsInvalidTypePktsRcvd)	long	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
ipTtlErrors [Ip Ttl Errors] (vrrpStatsIpTtlErrors)	long	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
packetLengthErrors [Packet Length Errors] (vrrpStatsPacketLengthErrors)	long	The total number of packets received with a packet length less than the length of the VRRP header.
priorityZeroPktsRcvd [Priority Zero Pkts Rcvd] (vrrpStatsPriorityZeroPktsRcvd)	long	The total number of VRRP packets received by the virtual router with a priority of '0'.
priorityZeroPktsSent [Priority Zero Pkts Sent] (vrrpStatsPriorityZeroPktsSent)	long	The total number of VRRP packets sent by the virtual router with a priority of '0'.

Table 184 acfilter statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>HitCountStats</p> <p>MIB entry name: tIPFilterParamsEntry</p> <p>Entry description: Information about a particular IP Filter entry. Every IP Filter can have zero or more IP Filter match entries. a filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. Additional parameters can be found in tIPFilterParamsExtTable. There is no StorageType object, entries have a presumed StorageType of nonVolatile.</p> <p>Table description (for tIPFilterParamsTable): A table of all IP filter match entries for all IP filters.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilter.IpFilterEntry</p>		
egressHitCount [Egress Hit Count] (tIPFilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.
ingressHitCount [Ingress Hit Count] (tIPFilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.
<p>Ipv6HitCountStats</p> <p>MIB entry name: tIPv6FilterParamsEntry</p> <p>Entry description: Information about a particular IPv6 Filter entry. Every IPv6 Filter can have zero or more IPv6 Filter match entries. A filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. Additional match criteria can be found in tIPv6FilterParamsExtTable. There is no StorageType object, entries have a presumed StorageType of nonVolatile.</p> <p>Table description (for tIPv6FilterParamsTable): A table of all IPv6 filter match entries for all IPv6 filters</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilter.Ipv6FilterEntry</p>		

Table 184 acfilter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egressHitByteCount [Egress Hit Byte Count] (tIPv6FilterParamsEgrHitByteCount)	java. math. BigInteger	This tIPv6FilterParamsEgrHitByteCount indicates the number of bytes of all egress packets that matched this entry.
egressHitCount [Egress Hit Count] (tIPv6FilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.
ingressHitByteCount [Ingress Hit Byte Count] (tIPv6FilterParamsIngrHitByteCount)	java. math. BigInteger	The value of tIPv6FilterParamsIngrHitByteCount indicates the number of bytes of all ingress packets that matched this entry.
ingressHitCount [Ingress Hit Count] (tIPv6FilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.
MacHitCountStats MIB entry name: tMacFilterParamsEntry Entry description: Information about a particular MAC Filter entry. Every MAC Filter can have zero or more MAC Filter match entries. A filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. There is no StorageType object, entries have a presumed StorageType of nonVolatile. Table description (for tMacFilterParamsTable): A table of all MAC filter match entries for all MAC filters. Supports realtime plotting Supports scheduled collection Monitored class: acfilter.MacFilterEntry		
egressHitCount [Egress Hit Count] (tMacFilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.

Table 184 acfilter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressHitCount [Ingress Hit Count] (tMacFilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.

Table 185 bgp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerAdditionalStats</p> <p>MIB entry name: bgpPeerEntry</p> <p>Entry description: Entry containing information about the connection with a BGP peer.</p> <p>Table description (for bgpPeerTable): BGP peer table. This table contains, one entry per BGP peer, information about the connections with BGP peers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
fsmEstablishedTime [Fsm Established Time] (bgpPeerFsmEstablishedTime)	long	This timer indicates how long (in seconds) this peer has been in the Established state or how long since this peer was last in the Established state. It is set to zero when a new peer is configured or the router is booted.
<p>PeerStats</p> <p>MIB entry name: tBgpPeerNgOperEntry</p> <p>Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable.</p> <p>Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
flaps [Flaps] (tBgpPeerNgOperFlaps)	long	The value of tBgpPeerNgOperFlaps indicates the number of flaps of updates from this peer.
inputQueueMessages [Input Queue Messages] (tBgpPeerNgOperInputQueueMsgs)	long	The value of tBgpPeerNgOperInputQueueMsgs indicates the number of unprocessed messages in the queue, from this peer.

Table 185 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lastEvent [Last Event] (tBgpPeerNgOperLastEvent)	long	The value of tBgpPeerNgOperLastEvent indicates the last BGP event of this peer.
lastRestartTime [Last Restart Time] (tBgpPeerNgOperLastRestartTime)	long	The value of tBgpPeerNgOperLastRestartTime indicates the last time the peer attempted restart.
lastState [Last State] (tBgpPeerNgOperLastState)	long	The value of tBgpPeerNgOperLastState indicates the last BGP state of this peer.
messageOctetsReceived [Message Octets Received] (tBgpPeerNgOperMsgOctetsRcvd)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsRcvd indicates the number of octets received from this peer.
messageOctetsSent [Message Octets Sent] (tBgpPeerNgOperMsgOctetsSent)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsSent indicates the number of octets transmitted to this peer.
numberOfRestarts [Number Of Restarts] (tBgpPeerNgOperNumRestarts)	long	The value of tBgpPeerNgOperNumRestarts indicates the number of times the peer has attempted restart.
outputQueueMessages [Output Queue Messages] (tBgpPeerNgOperOutputQueueMsgs)	long	The value of tBgpPeerNgOperOutputQueueMsgs indicates the number of untransmitted messages in the queue, to this peer.
pathsReceived [Paths Received] (tBgpPeerNgOperReceivedPaths)	long	The value of tBgpPeerNgOperReceivedPaths indicates the number of paths received from this peer.

Table 185 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixesActive [Prefixes Active] (tBgpPeerNgOperActivePrefixes)	long	The value of tBgpPeerNgOperActivePrefixes indicates the number of active prefixes from this peer.
prefixesReceived [Prefixes Received] (tBgpPeerNgOperReceivedPrefixes)	long	The value of tBgpPeerNgOperReceivedPrefixes indicates the number of prefixes received from this peer.
prefixesSent [Prefixes Sent] (tBgpPeerNgOperSentPrefixes)	long	The value of tBgpPeerNgOperSentPrefixes indicates the number of prefixes transmitted to this peer.
prefixesSuppressedByDamping [Prefixes Suppressed By Damping] (tBgpPeerNgOperV4SuppPfxDamp)	long	The value of tBgpPeerNgOperV4SuppPfxDamp indicates the number of IPv6 prefixes from this peer, which have been suppressed by damping.
vpnActivePrefixes [Vpn Active Prefixes] (tBgpPeerNgOperVpnActivePrefixes)	long	The value of tBgpPeerNgOperVpnActivePrefixes indicates the number of active VPN prefixes from this BGP peer.
vpnPrefixesSuppressedByDamping [Vpn Prefixes Suppressed By Damping] (tBgpPeerNgOperVpnSuppPfxDamp)	long	The value of tBgpPeerNgOperVpnSuppPfxDamp indicates the number of VPN IPv4 prefixes from this peer, which have been suppressed by damping.
vpnReceivedPrefixes [Vpn Received Prefixes] (tBgpPeerNgOperVpnRecvPrefixes)	long	The value of tBgpPeerNgOperVpnRecvPrefixes indicates the number of received VPN prefixes.
vpnSentPrefixes [Vpn Sent Prefixes] (tBgpPeerNgOperVpnSentPrefixes)	long	The value of tBgpPeerNgOperVpnSentPrefixes indicates the number of transmitted VPN prefixes.

Table 186 equipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AllocatedMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
allocatedMemory [Allocated Memory] (sgiMemoryPoolAllocated)	long	The value of sgiMemoryPoolAllocated indicates the total memory currently allocated in memory-pools on the system. This memory may or may not be currently in use, but is pre-allocated should the software need to use it. If the value is greater than the maximum value reportable by this object then this object reports its maximum value (4,294,967,295) and sgiKbMemoryPoolAllocated must be used to determine the total memory allocated in memory-pools.
<p>AvailableMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
availableMemory [Available Memory] (sgiMemoryAvailable)	long	The value of sgiMemoryAvailable indicates the amount of free memory in the overall system that is not allocated to memory pools, but is available in case a memory pool needs to grow.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DDMStats</p> <p>MIB entry name: tmnxDigitalDiagMonitorEntry</p> <p>Entry description: Each row represents a particular SFF that supports Digital Diagnostic Monitoring. Entries are created and deleted internally by the system.</p> <p>Table description (for tmnxDigitalDiagMonitorTable): The tmnxDigitalDiagMonitorTable has an entry for each SFF in the system that supports Digital Diagnostic Monitoring (DDM). The table is indexed by TmnxPortID. Each row in this table is dynamically added and removed internally by the system based on the presence or absence of DDM capable SFF components.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.DigitalDiagnosticMonitoring</p>		
aux1 [Aux 1] (tmnxDDMAux1)	float	The value of tmnxDDMAux1 indicates the Manufacturer specific Auxiliary 1 information of the XFP.
aux1Type [Aux 1 Type] (tmnxDDMAux1Type)	int	The value of tmnxDDMAux1Type indicates the measurement type of the Manufacturer specific Auxiliary 1 information of the XFP: none (0) - not specified. adp-bias-voltage (1) - LSB is 10mV. reserved-2 (2) - reserved for future use. tec-current (3) - LSB is 100uA. laser-temp (4) - degrees Celsius. laser-wavelength (5) - LSB is 0.05 nm. voltage-50 (6) - 5.0 supply voltage, LSB=100uV. voltage-33 (7) - 3.3 supply voltage, LSB=100uV. voltage-18 (8) - 1.8 supply voltage, LSB=100uV, voltage-52 (9) - -5.2 supply voltage, LSB=100uV. current-50 (10) - 5.0V supply current, LSB=100uA. reserved-11 (11) - reserved for future use. reserved-12 (12) - reserved for future use. current-33 (13) - 3.3V supply current, LSB=100uA. current-18 (14) - 1.8V supply current, LSB=100uA. current-52 (15) - -5.2V supply current, LSB=100uA.
aux2 [Aux 2] (tmnxDDMAux2)	float	The value of tmnxDDMAux2 indicates the Manufacturer specific Auxiliary 2 information of the SFF.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aux2Type [Aux 2 Type] (tmnxDDMAux2Type)	int	The value of tmnxDDMAux2Type indicates the measurement type of the Manufacturer specific Auxiliary 2 information of the XFP: none (0) - not specified. adp-bias-voltage (1) - LSB is 10mV. reserved-2 (2) - reserved for future use. tec-current (3) - LSB is 100uA. laser-temp (4) - degrees Celsius(C). laser-wavelength (5) - LSB is 0.05 nm. voltage-50 (6) - 5.0 supply voltage, LSB=100uV. voltage-33 (7) - 3.3 supply voltage, LSB=100uV. voltage-18 (8) - 1.8 supply voltage, LSB=100uV, voltage-52 (9) - -5.2 supply voltage, LSB=100uV. current-50 (10) - 5.0V supply current, LSB=100uA. reserved-11 (11) - reserved for future use. reserved-12 (12) - reserved for future use. current-33 (13) - 3.3V supply current, LSB=100uA. current-18 (14) - 1.8V supply current, LSB=100uA. current-52 (15) - -5.2V supply current, LSB=100uA.
rxOpticalPower [Rx Optical Power] (tmnxDDMRxOpticalPower)	float	The value of tmnxDDMRxOpticalPower indicates the current Received Optical Power of the SFF in one tenths of a microwatt (uW). If the SFF is externally calibrated, the objects tmnxDDMExtCalRxPower4, tmnxDDMExtCalRxPower3, tmnxDDMExtCalRxPower2, tmnxDDMExtCalRxPower1 and tmnxDDMExtCalRxPower0 affect the output power calculation. For example (internally calibrated SFF): Using the SNMP value of 790, and using units of tenths of microwatt, 790 becomes 79 microwatts or 0.079 milliwatts. Converting to dBm: $10 \times \log_{10}(0.079) = -11.0$ dBm
rxOpticalPowerType [Rx Optical Power Type] (tmnxDDMRxOpticalPowerType)	int	The value of tmnxDDMRxOpticalPowerType indicates whether the tmnxDDMRxOpticalPower was taken as an average, or as an Optical Modulation Amplitude (OMA).

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
supplyVoltage [Supply Voltage] (tmnxDDMSupplyVoltage)	float	The value of tmnxDDMSupplyVoltage indicates the current supply voltage of the SFF in 1/10000 of a Volt(V). If the SFF is externally calibrated, the objects tmnxDDMExtCalVoltageSlope and tmnxDDMExtCalVoltageOffset affect the voltage calculation. The formula for translating between the value of tmnxDDMSupplyVoltage and Voltage is: Internally Calibrated only: $\text{tmnxDDMSupplyVoltage} / 10000$ Externally Calibrated: $(\text{tmnxDDMSupplyVoltage} * (\text{tmnxDDMExtCalVoltageSlope} / 256) + \text{tmnxDDMExtCalVoltageOffset}) / 10000$ For example (internally calibrated SFF): The SNMP value 32851 is 3.2851 Volts (V).
temperature [Temperature] (tmnxDDMTemperature)	float	The value of tmnxDDMTemperature indicates the current temperature of the SFF in 1/256th degrees Celsius. If the SFF is externally calibrated, the objects tmnxDDMExtCalTemperatureSlope and tmnxDDMExtCalTemperatureOffset affect the temperature calculation. The formula for translating between the value of tmnxDDMTemperature and degrees Celsius is: Internally Calibrated only: $\text{tmnxDDMTemperature} / 256$ Externally Calibrated: $(\text{tmnxDDMTemperature} * (\text{tmnxDDMExtCalTemperatureSlope} / 256) + \text{tmnxDDMExtCalTemperatureOffset}) / 256$ For example (internally calibrated SFF): The SNMP value 5734 is 22.4 degrees Celsius.
txBiasCurrent [Tx Bias Current] (tmnxDDMTxBiasCurrent)	float	The value of tmnxDDMTxBiasCurrent indicates the current Transmit Bias Current of the SFF in 1/500 milliamperes (mA). If the SFF is externally calibrated, the objects tmnxDDMExtCalTxLaserBiasSlope and tmnxDDMExtCalTxLaserBiasOffset affect the ampere calculation. The formula for translating between the value of tmnxDDMTxBiasCurrent and amperes is: Internally Calibrated only: $\text{tmnxDDMTxBiasCurrent} / 500$ Externally Calibrated: $(\text{tmnxDDMTxBiasCurrent} * (\text{tmnxDDMExtCalTxLaserBiasSlope} / 256) + \text{tmnxDDMExtCalTxLaserBiasOffset}) / 500$ For example (internally calibrated SFF): The SNMP value 2565 is 5.1 milliamperes (mA).

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txOutputPower [Tx Output Power] (tmnxDDMTxOutputPower)	float	The value of tmnxDDMTxOutputPower indicates the current Output Power of the SFF in one tenths of a microwatt (uW). If the SFF is externally calibrated, the objects tmnxDDMExtCalTemperatureSlope and tmnxDDMExtCalTemperatureOffset affect the output power calculation. For example (internally calibrated SFF): Using the SNMP value of 790, and using units of tenths of microwatt, 790 becomes 79 microwatts or 0.079 milliwatts. Converting to dBm: $10 \times \log_{10}(0.079) = -11.0$ dBm

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>HardwareTemperature</p> <p>MIB entry name: tmnxHwEntry</p> <p>Entry description: Each row entry represents an Nokia SROS series manufactured hardware component. Entries cannot be created and deleted via SNMP SET operations. When an entry is created in one of the card tables, IOM, CPM, Fabric or MDA, a tmnxHwEntry is created for the common hardware management information for that card in that chassis. When the card is removed from the chassis, its corresponding tmnxHwEntry is deleted. The tmnxHwIndex is bitmapped. The tmnxPhysChassisClass is used to indicate a sub-class of a TmnxHwClass type. A value of 0 instead of 'routerChassis (3)' is used to represent router chassis: 32 25 24 17 16 9 8 1 +-----+----- +-----+-----+ TmnxHwClass TmnxPhysChassisClass Slot number +-----+----- +-----+-----+ The Slot field is only used for components on cards in slots. It is zero for all others. The number field starts from 1 and indicates which component. E.g. Power supply 1 or 2.</p> <p>Table description (for tmnxHwTable): The tmnxHwTable has an entry for each managed hardware component in the Nokia SROS series system's chassis. Examples of these hardware component types are IOM, Fabric, and CPM cards, MCM and CCM, and MDA modules. Similar information for physical ports is in the tmnxPortObjs.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.BaseCard • equipment.CCM • equipment.CardSlot • equipment.ControlProcessor • equipment.DaughterCard • equipment.FanTray • equipment.MCMCard • equipment.PowerSupplyTray • equipment.SwitchFabricProcessor 		
temperature [Temperature] (tmnxHwTemperature)	int	The current temperature reading in degrees celsius from this hardware component's temperature sensor. If this component does not contain a temperature sensor, then the value -1 is returned.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 186 equipment statistics (continued)

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
<p>MediaIndependentStats</p> <p>MIB entry name: mediaIndependentEntry</p> <p>Entry description: Media independent statistics for promiscuous monitoring of any media.</p> <p>Table description (for mediaIndependentTable): Media independent statistics for promiscuous monitoring of any media. The following table defines media independent statistics that provide information for full and/or half-duplex links as well as high capacity links. For half-duplex links, or full-duplex-capable links operating in half-duplex mode, the mediaIndependentIn* objects shall be used and the mediaIndependentOut* objects shall not increment. For full-duplex links, the mediaIndependentOut* objects shall be present and shall increment. Whenever possible, the probe should count packets moving away from the closest terminating equipment as output packets. Failing that, the probe should count packets moving away from the DTE as output packets.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
dropEvents [Drop Events] (mediaIndependentDropEvents)	long	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
droppedFrames [Dropped Frames] (mediaIndependentDroppedFrames)	long	The total number of frames which were received by the probe and therefore not accounted for in the mediaIndependent-DropEvents, but for which the probe chose not to count for this entry for whatever reason. Most often, this event occurs when the probe is out of some resources and decides to shed load from this collection. This count does not include packets that were not counted because they had MAC-layer errors. Note that, unlike the dropEvents counter, this number is the exact number of frames dropped.
duplex [Duplex] (mediaIndependentDuplexMode)	int	The current mode of this link. Note that if the link has full-duplex capabilities but is operating in half-duplex mode, this value will be halfduplex(1).
duplexChanges [Duplex Changes] (mediaIndependentDuplexChanges)	long	The number of times this link has changed from full-duplex mode to half-duplex mode or from half-duplex mode to full-duplex mode.
inputSpeed [Input Speed] (mediaIndependentInputSpeed)	long	The nominal maximum speed in kilobits per second of this half-duplex link or on the inbound connection of this full-duplex link. If the speed is unknown or there is no fixed maximum (e.g. a compressed link), this value shall be zero.
outputSpeed [Output Speed] (mediaIndependentOutputSpeed)	long	The nominal maximum speed in kilobits per second of this full-duplex link in the direction of the network. If the speed is unknown, the link is half-duplex, or there is no fixed maximum (e.g. a compressed link), this value shall be zero.
receivedBadPackets [Received Bad Packets] (mediaIndependentInErrors)	long	The total number of bad packets received on a half-duplex link or on the inbound connection of a full-duplex link.
receivedNonUnicastPackets [Received Non Unicast Packets] (mediaIndependentInNUCastHigh-CapacityPkts)	java. math. BigInteger	The total number of non-unicast packets (including bad packets) received on a half-duplex link or on the inbound connection of a full-duplex link.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedOctets [Received Octets] (mediaIndependentInHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received (excluding framing bits but including FCS octets) on a half-duplex link or on the inbound connection of a full-duplex link.
receivedPackets [Received Packets] (mediaIndependentInHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received on a half-duplex link or on the inbound connection of a full-duplex link.
transmittedBadPackets [Transmitted Bad Packets] (mediaIndependentOutErrors)	long	The total number of bad packets received on a full-duplex link in the direction of the network.
transmittedNonUnicastPackets [Transmitted Non Unicast Packets] (mediaIndependentOutNUC- astHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets) received on a full-duplex link in the direction of the network.
transmittedOctets [Transmitted Octets] (mediaIndependentOutHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received on a full-duplex link in the direction of the network (excluding framing bits but including FCS octets).
transmittedPackets [Transmitted Packets] (mediaIndependentOutHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received on a full-duplex link in the direction of the network.

inProfileOctetsForwarded [In Profile Octets Forwarded] (tmnxPortNetIngressFwdInProfOcts)	java. math. BigInteger	tmnxPortNetIngressFwdInProfOcts indicates the number of conforming network ingress octets forwarded on this port using this queue.
inProfilePacketsDropped [In Profile Packets Dropped] (tmnxPortNetIngressDroInProfPkts)	java. math. BigInteger	tmnxPortNetIngressDroInProfPkts indicates the number of conforming network ingress packets dropped on this port using this queue.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inProfilePacketsForwarded [In Profile Packets Forwarded] (tmnxPortNetIngressFwdInProfPkts)	java. math. BigInteger	tmnxPortNetIngressFwdInProfPkts indicates the number of conforming network ingress packets forwarded on this port using this queue.
outOfProfileOctetsDropped [Out Of Profile Octets Dropped] (tmnxPortNetIngressDroOutProfOcts)	java. math. BigInteger	tmnxPortNetIngressDroOutProfOcts indicates the number of exceeding network ingress octets dropped on this port using this queue.
outOfProfileOctetsForwarded [Out Of Profile Octets Forwarded] (tmnxPortNetIngressFwdOutProfOcts)	java. math. BigInteger	tmnxPortNetIngressFwdOutProfOcts indicates the number of exceeding network ingress octets forwarded on this port using this queue.
outOfProfilePacketsDropped [Out Of Profile Packets Dropped] (tmnxPortNetIngressDroOutProfPkts)	java. math. BigInteger	tmnxPortNetIngressDroOutProfPkts indicates the number of exceeding network ingress packets dropped on this port using this queue.
outOfProfilePacketsForwarded [Out Of Profile Packets Forwarded] (tmnxPortNetIngressFwdOutProfPkts)	java. math. BigInteger	tmnxPortNetIngressFwdOutProfPkts indicates the number of exceeding network ingress packets forwarded on this port using this queue.
portNetIngressMeterId [Port Net Ingress Meter Id] (tmnxPortNetIngressQueueIndex)	long	tmnxPortNetIngressQueueIndex serves as the tertiary index. When used in conjunction with tmnxChassisIndex and tmnxPortPortID, it uniquely identifies a network ingress queue for the specified port in the managed system.
SystemCpuStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder		

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
systemCpuUsage [System Cpu Usage] (sgiCpuUsage)	long	The value of sgiCpuUsage indicates the current CPU utilization for the system.
SystemMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder		
systemMemoryUsage [System Memory Usage] (sgiMemoryUsed)	long	The value of sgiMemoryUsed indicates the total pre-allocated pool memory currently in use on the system. If the value is greater than the maximum value reportable by this object then this object reports its maximum value (4,294,967,295) and sgiKbMemoryUsed must be used to determine the total pre-allocated pool memory.
UplinkPortNetIngressStats MIB entry name: tmnxSASPortNetIngressStatsEntry Entry description: Defines an entry in tmnxSASPortNetIngressStatsTable. Entries are created and deleted by the system depending on the meter policy being used at the specific port. Table description (for tmnxSASPortNetIngressStatsTable): Defines the Nokia SAS series network port ingress statistics table for providing, via SNMP, the capability of retrieving the traffic statistics for the physical Meters being used for the ports to forward the network ingress traffic. Supports realtime plotting Does not support scheduled collection Monitored class: equipment.PhysicalPort		
portNetIngressFwdInProfOcts [Port Net Ingress Fwd In Prof Octs] (tmnxSASPortNetIngressFwdInProfOcts)	java. math. BigInteger	tmnxSASPortNetIngressFwdInProfOcts indicates the number of conforming network ingress octets forwarded on this port using this meter.

Table 186 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portNetIngressFwdInProfPkts [Port Net Ingress Fwd In Prof Pkts] (tmnxSASPortNetIngressFwdInProfPkts)	java. math. BigInteger	tmnxSASPortNetIngressFwdInProfPkts indicates the number of conforming network ingress packets forwarded on this port using this meter.
portNetIngressFwdOutProfOcts [Port Net Ingress Fwd Out Prof Octs] (tmnxSASPortNetIngressFwdOutProfOcts)	java. math. BigInteger	tmnxSASPortNetIngressFwdOutProfOcts indicates the number of exceeding network ingress octets forwarded on this port using this meter.
portNetIngressFwdOutProfPkts [Port Net Ingress Fwd Out Prof Pkts] (tmnxSASPortNetIngressFwdOutProfPkts)	java. math. BigInteger	tmnxSASPortNetIngressFwdOutProfPkts indicates the number of exceeding network ingress packets forwarded on this port using this meter.
portNetIngressMeterIndex [Port Net Ingress Meter Index] (tmnxSASPortNetIngressMeterIndex)	long	'tmnxSASPortNetIngressQueueIndex' serves as the tertiary index. When used in conjunction with tmnxChassisIndex and tmnxPortPortID, it uniquely identifies a network ingress meter for the specified port in the managed system.

Table 187 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AdditionalEthernetStats</p> <p>MIB entry name: tmnxPortEtherEntry</p> <p>Entry description: Each row entry represents an Ethernet port on a IOM card in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. Before an IOM card entry can be deleted from the tmnxMDATable, its supported tmnxPortEntry and tmnxPortEtherEntry rows must be in the proper state for removal. The tmnxPortEtherEntry contains attributes that are unique to the Ethernet TmnxPortType.</p> <p>Table description (for tmnxPortEtherTable): The tmnxPortEtherTable has an entry for each Ethernet (faste, gige, xcme or xgige) port on each IOM card in each chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
highCapacityPackets1519toMaxFrameSize [High Capacity Packets 1519 to Max Frame Size] (tmnxPortEtherHCPkts1519toMax)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 octets in length and the maximum frame size, usually 12287 octets inclusive (excluding framing bits but including FCS octets). The lower 32-bits of this 64-bit counter will equal the value of tmnxPortEtherHCPkts1519toMax. The high 32-bits of this counter will equal the value of tmnxPortEtherHCOverPkts1519toMax.
packets1519toMaxFrameSize [Packets 1519 to Max Frame Size] (tmnxPortEtherPkts1519toMax)	long	The total number of packets received that were longer than 1518 octets but less than the maximum frame size for the particular medium, usually 12287 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
<p>alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)</p>	<p>long</p>	<p>A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for group encoding schemes greater than 4 bits per group. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsAlignmentErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.</p>

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
carrierSenseErrors [Carrier Sense Errors] (dot3StatsCarrierSenseErrors)	long	The number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular interface. The count represented by an instance of this object is incremented at most once per transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsFCSErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. For interfaces operating at 10 Gb/s, this counter can roll over in less than 80 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsFrameTooLongs object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalMacReceiveErrors [Internal Mac Receive Errors] (dot3StatsInternalMacReceiveErrors)	long	A count of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsFrameTooLongs object, the dot3StatsAlignmentErrors object, or the dot3StatsFCSErrors object. The precise meaning of the count represented by an instance of this object is implementation- specific. In particular, an instance of this object may represent a count of receive errors on a particular interface that are not otherwise counted. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsInternalMacReceiveErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalMacTransmitErrors [Internal Mac Transmit Errors] (dot3StatsInternalMacTransmitErrors)	long	A count of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object. The precise meaning of the count represented by an instance of this object is implementation- specific. In particular, an instance of this object may represent a count of transmission errors on a particular interface that are not otherwise counted. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsInternalMacTransmitErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of frames that are involved in more than one collision and are subsequently transmitted successfully. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of frames that are involved in a single collision, and are subsequently transmitted successfully. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
sqeTestErrors [Sqe Test Errors] (dot3StatsSQETestErrors)	long	A count of times that the SQE TEST ERROR is received on a particular interface. The SQE TEST ERROR is set in accordance with the rules for verification of the SQE detection mechanism in the PLS Carrier Sense Function as described in IEEE Std. 802.3, 2000 Edition, section 7.2.4.6. This counter does not increment on interfaces operating at speeds greater than 10 Mb/s, or on interfaces operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
symbolErrors [Symbol Errors] (dot3StatsSymbolErrors)	long	<p>For an interface operating at 100 Mb/s, the number of times there was an invalid data symbol when a valid carrier was present. For an interface operating in half-duplex mode at 1000 Mb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than slotTime, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Data reception error' or 'carrier extend error' on the GMII. For an interface operating in full-duplex mode at 1000 Mb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than minFrameSize, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Data reception error' on the GMII. For an interface operating at 10 Gb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than minFrameSize, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Receive Error' on the XGMII. The count represented by an instance of this object is incremented at most once per carrier event, even if multiple symbol errors occur during the carrier event. This count does not increment if a collision is present. This counter does not increment when the interface is operating at 10 Mb/s. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsSymbolErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.</p>

packets1024to1518Octets [Packets 1024 to 1518 Octets] (etherStatsHighCapacityPkts1024to1518Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).
packets128to255Octets [Packets 128 to 255 Octets] (etherStatsHighCapacityPkts128to255Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).
packets256to511Octets [Packets 256 to 511 Octets] (etherStatsHighCapacityPkts256to511Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets512to1023Octets [Packets 512 to 1023 Octets] (etherStatsHighCapacityPkts512to1023Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets64Octets [Packets 64 Octets] (etherStatsHighCapacityPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (etherStatsHighCapacityPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalOctets [Total Octets] (etherStatsHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). If the network is half-duplex Fast Ethernet, this object can be used as a reasonable estimate of utilization. If greater precision is desired, the etherStatsHighCapacityPkts and etherStatsHighCapacityOctets objects should be sampled before and after a common interval. The differences in the sampled values are Pkts and Octets, respectively, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows: $Pkts * (.96 + .64) + (Octets * .08)$ Utilization = - Interval * 10,000 The result of this equation is the value Utilization which is the percent utilization of the ethernet segment on a scale of 0 to 100 percent. This table is not appropriate for monitoring full-duplex ethernets. If the network is a full-duplex ethernet and the mediaIndependentTable is monitoring that network, the utilization can be calculated as follows: 1) Determine the utilization of the inbound path by using the appropriate equation (for ethernet or fast ethernet) to determine the utilization, substituting mediaIndependentInPkts for etherStatsHighCapacityPkts, and mediaIndependentInOctets for etherStatsHighCapacityOctets. Call the resulting utilization inUtilization. 2) Determine the utilization of the outbound path by using the same equation to determine the utilization, substituting mediaIndependentOutPkts for etherStatsHighCapacityPkts, and mediaIndependentOutOctets for etherStatsHighCapacityOctets. Call the resulting utilization outUtilization. 3) The utilization is the maximum of inUtilization and outUtilization. This metric shows the amount of percentage of bandwidth that is left before congestion will be experienced on the link.
totalPackets [Total Packets] (etherStatsHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetStats</p> <p>MIB entry name: etherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. As an example, an instance of the etherStatsPkts object might be named etherStatsPkts.1</p> <p>Table description (for etherStatsTable): A list of Ethernet statistics entries.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
broadcastPackets [Broadcast Packets] (etherStatsBroadcastPkts)	long	The total number of good packets received that were directed to the broadcast address. Note that this does not include multicast packets.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
collisions [Collisions] (etherStatsCollisions)	long	The best estimate of the total number of collisions on this Ethernet segment. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
crcAlignErrors [Crc Align Errors] (etherStatsCRCAAlignErrors)	long	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
dropEvents [Drop Events] (etherStatsDropEvents)	long	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragments [Fragments] (etherStatsFragments)	long	The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that it is entirely normal for etherStatsFragments to increment. This is because it counts both runts (which are normal occurrences due to collisions) and noise hits.
jabbers [Jabbers] (etherStatsJabbers)	long	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
multicastPackets [Multicast Packets] (etherStatsMulticastPkts)	long	The total number of good packets received that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address.
oversizePackets [Oversize Packets] (etherStatsOversizePkts)	long	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.
packets1024to1518Octets [Packets 1024 to 1518 Octets] (etherStatsPkts1024to1518Octets)	long	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).
packets128to255Octets [Packets 128 to 255 Octets] (etherStatsPkts128to255Octets)	long	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets256to511Octets [Packets 256 to 511 Octets] (etherStatsPkts256to511Octets)	long	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets512to1023Octets [Packets 512 to 1023 Octets] (etherStatsPkts512to1023Octets)	long	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (etherStatsPkts64Octets)	long	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (etherStatsPkts65to127Octets)	long	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).
totalOctets [Total Octets] (etherStatsOctets)	long	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). This object can be used as a reasonable estimate of 10-Megabit ethernet utilization. If greater precision is desired, the etherStatsPkts and etherStatsOctets objects should be sampled before and after a common interval. The differences in the sampled values are Pkts and Octets, respectively, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows: $Pkts * (9.6 + 6.4) + (Octets * .8)$ Utilization = - Interval * 10,000 The result of this equation is the value Utilization which is the percent utilization of the ethernet segment on a scale of 0 to 100 percent.
totalPackets [Total Packets] (etherStatsPkts)	long	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.

Table 187 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
undersizePackets [Undersize Packets] (etherStatsUndersizePkts)	long	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.
<p>QosDroppedOctetStats MIB entry name: tmnxPortIngrMdaQosStatEntry Entry description: Each row indicates the MDA QoS discard statistics on an ethernet or SONET/SDH port located on an oversubscribed MDA. For ethernet ports, the tmnxPortEtherIngressRate object indicates the ingress shaping rate configured. Table description (for tmnxPortIngrMdaQosStatTable): The table tmnxPortIngrMdaQosStatTable contains a row for each ethernet or SONET/SDH port located on an oversubscribed MDA. Each object in a row refers to a QoS priority and forwarding class, which is a decimal value between 00 and 15 inclusive. The following table describes each decimal value: Priority ----- Forwarding Class High Low NC (Network Control) 00 01 H1 (Voice) 02 03 EF (Premium) 04 05 H2 (Video) 06 07 L1 (Management) 08 09 AF (Assured) 10 11 L2 (Priority) 12 13 BE (Best Effort) 14 15 Supports realtime plotting Supports scheduled collection Monitored class: equipment.PhysicalPort</p>		
qosClassifier0DroppedOctets [Qos Classifier 0 Dropped Octets] (tmnxPortIngrMdaQos00StatDropOcts)	java. math. BigInteger	tmnxPortIngrMdaQos00StatDropOcts indicates the number of octets dropped on the oversubscribed MDA for QoS classifier result threshold 00 because of an overload condition on the MDA.
qosClassifier10DroppedOctets [Qos Classifier 10 Dropped Octets] (tmnxPortIngrMdaQos10StatDropOcts)	java. math. BigInteger	tmnxPortIngrMdaQos10StatDropOcts indicates the number of octets dropped on the oversubscribed MDA for QoS classifier result threshold 10 because of an overload condition on the MDA.

delayDmm2wyAvg [Delay Dmm 2 wy Avg] (tmnxOamPmStsDelayDmm2wyAvg)	long	The value of tmnxOamPmStsDelayDmm2wyAvg indicates the average two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 188 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayDmm2wyMax [Delay Dmm 2 wy Max] (tmnxOamPmStsDelayDmm2wyMax)	long	The value of tmnxOamPmStsDelayDmm2wyMax indicates the maximum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmm2wyMin [Delay Dmm 2 wy Min] (tmnxOamPmStsDelayDmm2wyMin)	long	The value of tmnxOamPmStsDelayDmm2wyMin indicates the minimum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdAvg [Delay Dmm Bwd Avg] (tmnxOamPmStsDelayDmmBwdAvg)	long	The value of tmnxOamPmStsDelayDmmBwdAvg indicates the average delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdMax [Delay Dmm Bwd Max] (tmnxOamPmStsDelayDmmBwdMax)	long	The value of tmnxOamPmStsDelayDmmBwdMax indicates the maximum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdMin [Delay Dmm Bwd Min] (tmnxOamPmStsDelayDmmBwdMin)	long	The value of tmnxOamPmStsDelayDmmBwdMin indicates the minimum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdAvg [Delay Dmm Fwd Avg] (tmnxOamPmStsDelayDmmFwdAvg)	long	The value of tmnxOamPmStsDelayDmmFwdAvg indicates the average delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdMax [Delay Dmm Fwd Max] (tmnxOamPmStsDelayDmmFwdMax)	long	The value of tmnxOamPmStsDelayDmmFwdMax indicates the maximum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdMin [Delay Dmm Fwd Min] (tmnxOamPmStsDelayDmmFwdMin)	long	The value of tmnxOamPmStsDelayDmmFwdMin indicates the minimum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 188 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 188 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CfmSlmSessionStats</p> <p>MIB entry name: tmnxOamPmStsBaseEntry</p> <p>Entry description: tmnxOamPmStsBaseEntry contains the base statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a test is started (e.g. using tmnxOamPmCfgDelayDmmAdminStatus and tmnxOamPmCfgDelayDmmOnDmndStatus). At that time, a row for the current interval (with the index value tmnxOamPmStsIntvlNum=1) is created for each row with a matching session name in tmnxOamPmCfgMeasIntvlTable. In addition, a row is created in this table for the test's 'miRaw(1)' interval. After that, the timed creation and destruction of rows in this table is explained using the following example. Suppose the configured number of intervals to be retained is as follows (where index columns are underlined with octothorpes, and 'tmnxOamPm' is abbreviated as '_'): <u>_CfgSessName</u> <u>_CfgMeasIntvlDuration</u> <u>_CfgMeasIntvlsStored</u> ##### ##### 'mySess1' 'mi15Minutes(2)' 3 Suppose statistics collection started at t = 0 (minutes). Suppose the following rows exist in tmnxOamPmStsBaseTable at t = 59 (minutes): <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 1 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 The interval numbers are assigned as follows: 1 - the historical interval ended at t = 15 minutes 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the current interval Then, after the next 15 minute interval ends (e.g. at t = 61 minutes), the following rows will exist: <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 5 The interval numbers are assigned as follows: 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the historical interval ended at t = 60 minutes 5 - the current interval The row with interval number 1 was destroyed, because tmnxOamPmCfgMeasIntvlsStored=3 specifies that at most three historical intervals be retained. Rows are also destroyed in this table when the corresponding tmnxOamPmCfgMeasIntvlTable row is destroyed. When the index value tmnxOamPmStsMeasIntvlDuration is 'miRaw(1)', only one interval is available (i.e. tmnxOamPmStsIntvlNum = 1). When a test is running, the measurement interval data set for a test's 'miRaw(1)' measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. The change to the objects in the specified row is as follows. Object Change on Clear Operation tmnxOamPmStsBaseOperStatus No change tmnxOamPmStsBaseSuspect Set to 'true(1)' tmnxOamPmStsBaseStartTime Set to UTC time of the clear operation tmnxOamPmStsBaseElapsedTime Set to zero tmnxOamPmStsBaseTestFramesTx Set to zero tmnxOamPmStsBaseTestFramesRx Set to zero Measurement interval data sets for measurement interval durations other than 'miRaw(1)' cannot be cleared.</p> <p>Table description (for tmnxOamPmStsBaseTable): tmnxOamPmStsBaseTable contains the base statistics for OAM Performance Monitoring Measurement Interval Data Sets. The statistics in this table are common to all test types (e.g. DMM and SLM tests).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethernetoam.CfmSlmSession</p>		

Table 188 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmSlmAvailIndBwd [Pm Slm Avail Ind Bwd] (tmnxOamPmStsLossSlmAvailIndBwd)	long	The value of tmnxOamPmStsLossSlmAvailIndBwd indicates the number of availability indicators evaluated as Available in the backward direction for the specified measurement interval data set.
pmSlmAvailIndFwd [Pm Slm Avail Ind Fwd] (tmnxOamPmStsLossSlmAvailIndFwd)	long	The value of tmnxOamPmStsLossSlmAvailIndFwd indicates the number of availability indicators evaluated as Available in the forward direction for the specified measurement interval data set.
pmSlmAvgFlrBwd [Pm Slm Avg Flr Bwd] (tmnxOamPmStsLossSlmAvgFlrBwd)	float	The value of tmnxOamPmStsLossSlmAvgFlrBwd indicates the average Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmAvgFlrFwd [Pm Slm Avg Flr Fwd] (tmnxOamPmStsLossSlmAvgFlrFwd)	float	The value of tmnxOamPmStsLossSlmAvgFlrFwd indicates the average Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmChliBwd [Pm Slm Chli Bwd] (tmnxOamPmStsLossSlmChliBwd)	long	The value of tmnxOamPmStsLossSlmChliBwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the backward direction for the specified measurement interval data set.
pmSlmChliFwd [Pm Slm Chli Fwd] (tmnxOamPmStsLossSlmChliFwd)	long	The value of tmnxOamPmStsLossSlmChliFwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the forward direction for the specified measurement interval data set.
pmSlmHliBwd [Pm Slm Hli Bwd] (tmnxOamPmStsLossSlmHliBwd)	long	The value of tmnxOamPmStsLossSlmHliBwd indicates the number of High Loss Intervals (HLIs) in the backward direction for the specified measurement interval data set.

Table 188 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmHliFwd [Pm Slm Hli Fwd] (tmnxOamPmStsLossSlmHliFwd)	long	The value of tmnxOamPmStsLossSlmHliFwd indicates the number of High Loss Intervals (HLIs) in the forward direction for the specified measurement interval data set.
pmSlmMaxFlrBwd [Pm Slm Max Flr Bwd] (tmnxOamPmStsLossSlmMaxFlrBwd)	float	The value of tmnxOamPmStsLossSlmMaxFlrBwd indicates the maximum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmMaxFlrFwd [Pm Slm Max Flr Fwd] (tmnxOamPmStsLossSlmMaxFlrFwd)	float	The value of tmnxOamPmStsLossSlmMaxFlrFwd indicates the maximum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmMinFlrBwd [Pm Slm Min Flr Bwd] (tmnxOamPmStsLossSlmMinFlrBwd)	float	The value of tmnxOamPmStsLossSlmMinFlrBwd indicates the minimum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmMinFlrFwd [Pm Slm Min Flr Fwd] (tmnxOamPmStsLossSlmMinFlrFwd)	float	The value of tmnxOamPmStsLossSlmMinFlrFwd indicates the minimum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmRxBwd [Pm Slm Rx Bwd] (tmnxOamPmStsLossSlmRxBwd)	long	The value of tmnxOamPmStsLossSlmRxBwd indicates the number of SLR reply frames received in the backward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmSlmRxFwd [Pm Slm Rx Fwd] (tmnxOamPmStsLossSlmRxFwd)	long	The value of tmnxOamPmStsLossSlmRxFwd indicates the number of SLM request frames received in the forward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.

Table 188 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmTxBwd [Pm Slm Tx Bwd] (tmnxOamPmStsLossSlmTxBwd)	long	The value of tmnxOamPmStsLossSlmTxBwd indicates the number of SLR reply frames transmitted in the backward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmSlmTxFwd [Pm Slm Tx Fwd] (tmnxOamPmStsLossSlmTxFwd)	long	The value of tmnxOamPmStsLossSlmTxFwd indicates the number of SLM request frames transmitted in the forward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmSlmUnavailIndBwd [Pm Slm Unavail Ind Bwd] (tmnxOamPmStsLossSlmUnavlIndBwd)	long	The value of tmnxOamPmStsLossSlmUnavlIndBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction for the specified measurement interval data set.
pmSlmUnavailIndFwd [Pm Slm Unavail Ind Fwd] (tmnxOamPmStsLossSlmUnavlIndFwd)	long	The value of tmnxOamPmStsLossSlmUnavlIndFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction for the specified measurement interval data set.
pmSlmUndtAvlBwd [Pm Slm Undt Avl Bwd] (tmnxOamPmStsLossSlmUndtAvlBwd)	long	The value of tmnxOamPmStsLossSlmUndtAvlBwd indicates the number of availability indicators evaluated as Available in the backward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 188 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmUndtAvlFwd [Pm Slm Undt Avl Fwd] (tmnxOamPmStsLossSlmUndtAvlFwd)	long	The value of tmnxOamPmStsLossSlmUndtAvlFwd indicates the number of availability indicators evaluated as Available in the forward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmSlmUndtUnavlBwd [Pm Slm Undt Unavl Bwd] (tmnxOamPmStsLossSlmUndtUnavlBwd)	long	The value of tmnxOamPmStsLossSlmUndtUnavlBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmSlmUndtUnavlFwd [Pm Slm Undt Unavl Fwd] (tmnxOamPmStsLossSlmUndtUnavlFwd)	long	The value of tmnxOamPmStsLossSlmUndtUnavlFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 188 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 189 igmp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats MIB entry name: vRtrIgmplfStatsEntry Entry description: An entry in the vRtrIgmplfStatsTable. Table description (for vRtrIgmplfStatsTable): The table listing the IGMP statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: igmp.Interface</p>		
importPolicyDrops [Import Policy Drops] (vRtrIgmplfImportPolicyDrops)	long	The value of vRtrIgmplfImportPolicyDrops indicates the total number of times IGMP protocol instance matched the host IP address or group/source addresses specified in the import policy vRtrIgmplfImportPolicy.
mcacPolicyDrops [Mcac Policy Drops] (vRtrIgmplfStatsMcacPolicyDrops)	long	The value of the object vRtrIgmplfStatsMcacPolicyDrops indicates the number times an IGMP Group is dropped because of applying a multicast CAC policy on this interface.
rxBadChecksumPkts [Rx Bad Checksum Pkts] (vRtrIgmplfRxBadChecksumPkts)	long	The value of vRtrIgmplfRxBadChecksumPkts indicates the total number of IGMP packets with bad checksum received on this interface.
rxBadEncodings [Rx Bad Encodings] (vRtrIgmplfRxBadEncodings)	long	The value of vRtrIgmplfRxBadEncodings indicates the total number of IGMP packets received on this interface which were not encoded correctly.
rxBadLenPkts [Rx Bad Len Pkts] (vRtrIgmplfRxBadLenPkts)	long	The value of vRtrIgmplfRxBadLenPkts indicates the total number of IGMP packets with bad length received on this interface.
rxBadReceiveIfPkts [Rx Bad Receive If Pkts] (vRtrIgmplfRxBadReceiveIfPkts)	long	The value of vRtrIgmplfRxBadReceiveIfPkts indicates the total number of IGMP packets incorrectly received on this interface.

Table 189 igmp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxGenQueries [Rx Gen Queries] (vRtrIgmplfRxGenQueries)	long	The value of vRtrIgmplfRxGenQueries indicates the total number of IGMP General Queries received on this interface.
rxGrpQueries [Rx Grp Queries] (vRtrIgmplfRxGrpQueries)	long	The value of vRtrIgmplfRxGrpQueries indicates the number of IGMP Group Specific Queries received on this interface.
rxGrpSrcQueries [Rx Grp Src Queries] (vRtrIgmplfRxGrpSrcQueries)	long	The value of vRtrIgmplfRxGrpSrcQueries indicates the number of IGMP Group and Source Specific Queries received on this interface.
rxLeaves [Rx Leaves] (vRtrIgmplfRxLeaves)	long	The value of vRtrIgmplfRxLeaves indicates the total number of IGMP V2 Leaves received on this interface.
rxNoRtrAlertPkts [Rx No Rtr Alert Pkts] (vRtrIgmplfRxNoRtrAlertPkts)	long	The value of vRtrIgmplfRxNoRtrAlertPkts indicates the total number of IGMPv3 packets received on this interface which did not have the router alert flag set.
rxNonLocal [Rx Non Local] (vRtrIgmplfRxNonLocal)	long	The value of vRtrIgmplfRxNonLocal indicates the total number of IGMP packets received from a non-local sender.
rxPktDrops [Rx Pkt Drops] (vRtrIgmplfRxPktDrops)	long	The value of vRtrIgmplfRxPktDrops indicates the total number of IGMP packets that were received on this interface but were dropped.
rxUnknownTypePkts [Rx Unknown Type Pkts] (vRtrIgmplfRxUnknownTypePkts)	long	The value of vRtrIgmplfRxUnknownTypePkts indicates the total number of IGMP packets with unknown type received on this interface.
rxV1Reports [Rx V1 Reports] (vRtrIgmplfRxV1Reports)	long	The value of vRtrIgmplfRxV1Reports indicates the total number of IGMP V1 Reports received on this interface.

Table 189 igmp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxV2Reports [Rx V2 Reports] (vRtrIgmplfRxV2Reports)	long	The value of vRtrIgmplfRxV2Reports indicates the total number of IGMP V2 Reports received on this interface.
rxV3Reports [Rx V3 Reports] (vRtrIgmplfRxV3Reports)	long	The value of vRtrIgmplfRxV3Reports indicates the total number of IGMP V3 Reports received on this interface.
rxWrongVersions [Rx Wrong Versions] (vRtrIgmplfRxWrongVersions)	long	The value of vRtrIgmplfRxWrongVersions indicates the total number of IGMP packets with wrong versions received on this interface.
statsSGTypes [Stats SGTypes] (vRtrIgmplfStatsSGTypes)	long	The value of vRtrIgmplfStatsSGTypes indicates the number of entries on this interface for which the source type is 'sg'.
statsStarGTypes [Stats Star GTypes] (vRtrIgmplfStatsStarGTypes)	long	vRtrIgmplfStatsStarGTypes indicates the number of entries on this interface for which the source type is 'starG'.
txErrors [Tx Errors] (vRtrIgmplfTxErrors)	long	The value of vRtrIgmplfTxErrors indicates the total number of times there was an error transmitting IGMP packets on this interface..
txGenQueries [Tx Gen Queries] (vRtrIgmplfTxGenQueries)	long	The value of vRtrIgmplfTxGenQueries indicates the number of IGMP General Queries transmitted on this interface.
txGrpQueries [Tx Grp Queries] (vRtrIgmplfTxGrpQueries)	long	The value of vRtrIgmplfTxGrpQueries indicates the number of IGMP Group Specific Queries transmitted on this interface.
txGrpSrcQueries [Tx Grp Src Queries] (vRtrIgmplfTxGrpSrcQueries)	long	The value of vRtrIgmplfTxGrpSrcQueries indicates the number of IGMP Group and Source Specific Queries transmitted on this interface.

Table 189 igmp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txLeaves [Tx Leaves] (vRtrIgmplfTxLeaves)	long	The value of vRtrIgmplfTxLeaves indicates the total number of IGMP Leaves transmitted on this interface.
txV1Reports [Tx V1 Reports] (vRtrIgmplfTxV1Reports)	long	The value of vRtrIgmplfTxV1Reports indicates the total number of IGMP V1 Reports transmitted on this interface.
txV2Reports [Tx V2 Reports] (vRtrIgmplfTxV2Reports)	long	The value of vRtrIgmplfTxV2Reports indicates the total number of IGMP V2 Reports transmitted on this interface.
txV3Reports [Tx V3 Reports] (vRtrIgmplfTxV3Reports)	long	The value of vRtrIgmplfTxV3Reports indicates the total number of IGMP V3 Reports transmitted on this interface.
InterfaceStatsExtension MIB entry name: vRtrIgmplfStatsEntry Entry description: An entry in the vRtrIgmplfStatsTable. Table description (for vRtrIgmplfStatsTable): The table listing the IGMP statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: igmp.Interface		
rxLocalScopePkts [Rx Local Scope Pkts] (vRtrIgmplfRxLocalScopePkts)	long	The value of the object vRtrIgmplfRxLocalScopePkts indicates the number of IGMP packets received on the link-local scope IPv4 multicast address.
rxRsvdScopePkts [Rx Rsvd Scope Pkts] (vRtrIgmplfRxRsvdScopePkts)	long	The value of the object vRtrIgmplfRxRsvdScopePkts indicates the number of IGMP packets received on the reserved scope IPv4 multicast address.

Table 190 isis statistics

<p>SiteLfaStats</p> <p>MIB entry name: tmnxIsisLfaEntry</p> <p>Entry description: Each row entry in the tmnxIsisLfaTable represents information on LFA coverage for various topologies of the system.</p> <p>Table description (for tmnxIsisLfaTable): The tmnxIsisLfaTable maintains information on loopfree-alternate (LFA) coverage for each instance of IS-IS protocol.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: isis.Site</p>		
isisLfalpv4Coverage [Isis Lfa Ipv 4 Coverage] (tmnxIsisLfalIpv4Coverage)	long	The value of the object tmnxIsisLfalIpv4Coverage indicates how much LFA coverage is being obtained for the available IPv4 routes.
isisLfalpv4NodesCovered [Isis Lfa Ipv 4 Nodes Covered] (tmnxIsisLfalIpv4NodesCovered)	long	The value of the object tmnxIsisLfalIpv4NodesCovered indicates in absolute numbers how much LFA coverage is being obtained for the available IPv4 routes.
isisLfalpv4TotalNodes [Isis Lfa Ipv 4 Total Nodes] (tmnxIsisLfalIpv4TotalNodes)	long	The value of the object tmnxIsisLfalIpv4TotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available IPv4 routes.
isisLfalpv6Coverage [Isis Lfa Ipv 6 Coverage] (tmnxIsisLfalIpv6Coverage)	long	The value of the object tmnxIsisLfalIpv6Coverage indicates how much LFA coverage is being obtained for the available IPv6 routes.
isisLfalpv6NodesCovered [Isis Lfa Ipv 6 Nodes Covered] (tmnxIsisLfalIpv6NodesCovered)	long	The value of the object tmnxIsisLfalIpv6NodesCovered indicates in absolute numbers how much LFA coverage is being obtained for available IPv6 routes.
isisLfalpv6TotalNodes [Isis Lfa Ipv 6 Total Nodes] (tmnxIsisLfalIpv6TotalNodes)	long	The value of the object tmnxIsisLfalIpv6TotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available IPv6 routes.

Table 190 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
isisLfaNodeCoverage [Isis Lfa Node Coverage] (tmnxIsisLfaNodeCoverage)	long	The value of the object tmnxIsisLfaNodeCoverage indicates how much LFA coverage is being obtained for the set of available nodes.
isisLfaNodesCovered [Isis Lfa Nodes Covered] (tmnxIsisLfaNodesCovered)	long	The value of the object tmnxIsisLfaNodesCovered indicates in absolute numbers how much LFA coverage is being obtained for the available routes.
isisLfaTotalNodes [Isis Lfa Total Nodes] (tmnxIsisLfaTotalNodes)	long	The value of the object tmnxIsisLfaTotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available routes.
SiteStats MIB entry name: tmnxIsisStatsEntry Entry description: Each row entry in the tmnxIsisStatsTable stores statistics for an instance of IS-IS protocol configured. Table description (for tmnxIsisStatsTable): The tmnxIsisStatsTable provides statistics for each instance of IS-IS protocol configured. There is a one-to-one dependent relationship between the tables tmnxIsisTable and tmnxIsisStatsTable. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • isis.Site • spb.Site 		
cspfDroppedRequests [Cspf Dropped Requests] (tmnxIsisStatsCSPFDroppedRequests)	long	The value of the object tmnxIsisStatsCSPFDroppedRequests indicates the number of dropped CSPF requests by the protocol.
cspfPathsFound [Cspf Paths Found] (tmnxIsisStatsCSPFPathsFound)	long	The value of the object tmnxIsisStatsCSPFPathsFound indicates the number of responses to CSPF requests for which paths satisfying the constraints were found.

Table 190 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cspfPathsNotFound [Cspf Paths Not Found] (tmnxIsisStatsCSPFPathsNotFound)	long	The value of the object tmnxIsisStatsCSPFPathsFound indicates the number of responses to CSPF requests for which no paths satisfying the constraints were found.
cspfRequests [Cspf Requests] (tmnxIsisStatsCSPFRequests)	long	The value of the object tmnxIsisStatsCSPFRequests indicates the number of CSPF requests made to the protocol.
initiatedPurges [Initiated Purges] (tmnxIsisStatsInitiatedPurges)	long	The value of the object tmnxIsisStatsInitiatedPurges indicates the number of times purges have been initiated.
lspRegenerations [Lsp Regenerations] (tmnxIsisStatsLSPRegenerations)	long	The value of the object tmnxIsisStatsLSPRegenerations indicates the count of LSP regenerations.
spfRuns [Spf Runs] (tmnxIsisStatsSpfRuns)	long	The value of the object tmnxIsisStatsSpfRuns indicates the number of times shortest path first calculations have been made.

Table 191 I2fwd statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
AccessInterfaceStpStats MIB entry name: sapTlsInfoEntry Entry description: TLS specific information about a SAP. Table description (for sapTlsInfoTable): A table that contains TLS SAP information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.AccessInterfaceStp		
forwardTransitions [Forward Transitions] (sapTlsStpForwardTransitions)	long	The value of the object sapTlsStpForwardTransitions indicates the number of times this port has transitioned from the Learning state to the Forwarding state.
inBadBpdus [In Bad Bpdus] (sapTlsStpInBadBpdus)	long	This object specifies the number of bad BPDUs received on this SAP.
inConfigBpdus [In Config Bpdus] (sapTlsStpInConfigBpdus)	long	The value of the object sapTlsStpInConfigBpdus indicates the number of Configuration BPDUs received on this SAP.
inRapidSpanningTreeBpdus [In Rapid Spanning Tree Bpdus] (sapTlsStpInRstBpdus)	long	The value of the object sapTlsStpInRstBpdus indicates the number of Rapid Spanning Tree (RST) BPDUs received on this SAP.
inTcnBpdus [In Tcn Bpdus] (sapTlsStpInTcnBpdus)	long	The value of the object sapTlsStpInTcnBpdus indicates the number of Topology Change Notification BPDUs received on this SAP.
outConfigBpdus [Out Config Bpdus] (sapTlsStpOutConfigBpdus)	long	The value of the object sapTlsStpOutConfigBpdus indicates the number of Configuration BPDUs sent out this SAP.

Table 191 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outRapidSpanningTreeBpdus [Out Rapid Spanning Tree Bpdus] (sapTlsStpOutRstBpdus)	long	The value of the object sapTlsStpOutRstBpdus indicates the number of Rapid Spanning Tree (RST) BPDUs sent out on this SAP.
outTcnBpdus [Out Tcn Bpdus] (sapTlsStpOutTcnBpdus)	long	This object specifies the number of Topology Change Notification BPDUs sent out this SAP.
CircuitStpStats MIB entry name: sdpBindTlsEntry Entry description: TLS specific information about an SDP Bind. Table description (for sdpBindTlsTable): A table that contains TLS spoke SDP Bind information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.CircuitStp		
forwardTransitions [Forward Transitions] (sdpBindTlsStpForwardTransitions)	long	The value of the object sdpBindTlsStpForwardTransitions indicates the number of times this port has transitioned from the Learning state to the Forwarding state.
inBadBpdus [In Bad Bpdus] (sdpBindTlsStpInBadBpdus)	long	The value of the object sdpBindTlsStpInBadBpdus indicates the number of bad BPDUs received on this SDP Bind.
inConfigBpdus [In Config Bpdus] (sdpBindTlsStpInConfigBpdus)	long	The value of the object sdpBindTlsStpInConfigBpdus indicates the number of Configuration BPDUs received on this SDP Bind.
inRapidSpanningTreeBpdus [In Rapid Spanning Tree Bpdus] (sdpBindTlsStpInRstBpdus)	long	The value of the object sdpBindTlsStpInRstBpdus indicates the number of Rapid Spanning Tree (Rst) BPDUs received on this SDP.

Table 191 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTcnBpdus [In Tcn Bpdus] (sdpBindTlsStpInTcnBpdus)	long	The value of the object sdpBindTlsStpInTcnBpdus indicates the number of Topology Change Notification BPDUs received on this SDP Bind.
outConfigBpdus [Out Config Bpdus] (sdpBindTlsStpOutConfigBpdus)	long	The value of the object sdpBindTlsStpOutConfigBpdus indicates the number of Configuration BPDUs sent out this SDP Bind.
outRapidSpanningTreeBpdus [Out Rapid Spanning Tree Bpdus] (sdpBindTlsStpOutRstBpdus)	long	The value of the object sdpBindTlsStpOutRstBpdus indicates the number of Rapid Spanning Tree (Rstp) BPDUs sent out on this SDP.
outTcnBpdus [Out Tcn Bpdus] (sdpBindTlsStpOutTcnBpdus)	long	The value of the object sdpBindTlsStpOutTcnBpdus indicates the number of Topology Change Notification BPDUs sent out this SDP Bind.
SiteFibStats MIB entry name: svcTlsInfoEntry Entry description: TLS specific information about a service. Table description (for svcTlsInfoTable): A table that contains TLS service information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.SiteFib		
entries [Entries] (svcTlsFdbNumEntries)	long	The value of the object svcTlsFdbNumEntries indicates the current number of entries in the FDB of this service.

Table 191 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
provisionedSize [Provisioned Size] (svcTlsFdbTableSize)	long	The value of the object svcTlsFdbTableSize specifies the maximum number of learned and static entries allowed in the FDB of this service. The maximum value of svcTlsFdbTableSize is '511999', when the the value of TIMETRA-CHASSIS-MIB::tmnxChassisOperMode is 'd'. The maximum value of svcTlsFdbTableSize is '196607', when the the value of TIMETRA-CHASSIS-MIB::tmnxChassisOperMode is 'c'. In other cases, the maximum value of svcTlsFdbTableSize is '131071'.
staticEntries [Static Entries] (svcTlsFdbNumStaticEntries)	long	The value of the object svcTlsFdbNumStaticEntries indicates the current number of static entries in the FDB of this service.
SiteStpStats MIB entry name: svcTlsInfoEntry Entry description: TLS specific information about a service. Table description (for svcTlsInfoTable): A table that contains TLS service information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.SiteStp		
timeSinceTopologyChange [Time Since Topology Change] (svcTlsStpTimeSinceTopologyChange)	long	The value of the object svcTlsStpTimeSinceTopologyChange indicates the time (in hundredths of a second) since the last time a topology change was detected by the Spanning Tree Protocol instance associated with this service.
topologyChanges [Topology Changes] (svcTlsStpTopologyChanges)	long	The value of the object svcTlsStpTopologyChanges indicates the total number of topology changes detected by the Spanning Tree Protocol instance associated with this service since the management entity was last reset or initialized.

Table 192 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagStats</p> <p>MIB entry name: tLagOperationEntry</p> <p>Entry description: An entry (conceptual row) in the tLagOperationTable. Each entry represents an active Link Aggregation Group.</p> <p>Table description (for tLagOperationTable): Operational information about each Link Aggregation Group.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.Interface</p>		
portThresholdFalling [Port Threshold Falling] (tLagPortThresholdFalling)	long	counts the number of linkDown or dynamicCost events for the Link Aggregation Group caused by the number of physical ports being less than or equal to tLagPortThreshold value.
portThresholdRising [Port Threshold Rising] (tLagPortThresholdRising)	long	counts the number of linkUp or dynamicCost events for the Link Aggregation Group caused by the number of physical ports being greater than tLagPortThreshold value.
<p>MultiChassisLagMemberStats</p> <p>MIB entry name: tmnxMcLagLagStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a lag that participates in a multi-chassis configuration with a given peer. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcLagLagStatsTable): The tmnxMcLagLagStatsTable has an entry for each lag that participates in a multi-chassis configuration for the indicated peer.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • lag.MultiChassisLagMember • multichassis.MultiChassisLagMember 		
configPacketsReceived [Config Packets Received] (tmnxMcLagLagStatsPktsRxConfig)	long	The value of tmnxMcLagLagStatsPktsRxConfig indicates how many MC-Lag control packets of type lag config were received on this system from the peer for this lag.

Table 192 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
configPacketsTransmitted [Config Packets Transmitted] (tmnxMcLagLagStatsPktsTxConfig)	long	The value of tmnxMcLagLagStatsPktsTxConfig indicates how many MC-Lag control packets of type lag config were sent on this system to the peer for this lag.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagLagStatsPktsTxFailed)	long	The value of tmnxMcLagLagStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted on this system to the peer for this lag.
statePacketsReceived [State Packets Received] (tmnxMcLagLagStatsPktsRxState)	long	The value of tmnxMcLagLagStatsPktsRxState indicates how many MC-Lag control packets of type lag state were received on this system from the peer for this lag.
statePacketsTransmitted [State Packets Transmitted] (tmnxMcLagLagStatsPktsTxState)	long	The value of tmnxMcLagLagStatsPktsTxState indicates how many MC-Lag control packets of type lag state were sent on this system to the peer for this lag.

Table 193 Ldp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats</p> <p>MIB entry name: vRtrLdpNgInetIfStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Interface for given Inet address family. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpNgSessionStatsEntry.</p> <p>Table description (for vRtrLdpNgInetIfStatsTable): The vRtrLdpNgInetIfStatsTable is a read-only table. The purpose of this table is to keep statistical information about the LDP Interfaces for given Inet address family on this LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgInetIfTable, and the augmenting table, vRtrLdpNgInetIfStatsTable. This in effect extends the vRtrLdpNgInetIfTable with additional columns. Creation or deletion of a row in the vRtrLdpNgInetIfTable results in the same fate for the row in the vRtrLdpNgInetIfStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ldp.Interface</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpNgInetIfStatsExistingAdj)	long	The value of vRtrLdpNgInetIfStatsExistingAdj indicates a count of the total active adjacencies on this LDP interface for given Inet address family.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SessionStats</p> <p>MIB entry name: vRtrLdpNgSessionStatsEntry</p> <p>Entry description: A row in this table represents statistical information about a single session between an LDP entity and an LDP Peer.</p> <p>Table description (for vRtrLdpNgSessionStatsTable): The vRtrLdpNgSessionStatsTable is a read-only table. The purpose of this table is to keep statistical information about a single session between an LDP entity and an LDP Peer. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgSessionTable, and the augmenting table, vRtrLdpNgSessionStatsTable. This in effect extends the vRtrLdpNgSessionTable with additional columns. Creation or deletion of a row in the vRtrLdpNgSessionTable results in the same fate for the row in the vRtrLdpNgSessionStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ldp.Session</p>		
addressMessagesReceived [Address Messages Received] (vRtrLdpNgSessStatsAddrIn)	long	The value of vRtrLdpNgSessStatsAddrIn counts the number of Address Messages that have been received during this session.
addressMessagesSent [Address Messages Sent] (vRtrLdpNgSessStatsAddrOut)	long	The value of vRtrLdpNgSessStatsAddrOut counts the number of Address Messages that have been sent during this session.
addressWithdrawMessagesReceived [Address Withdraw Messages Received] (vRtrLdpNgSessStatsAddrWithdrIn)	long	The value of vRtrLdpNgSessStatsAddrWithdrIn counts the number of Address Withdraw Messages that have been received during this session.
addressWithdrawMessagesSent [Address Withdraw Messages Sent] (vRtrLdpNgSessStatsAddrWithdrOut)	long	The value of vRtrLdpNgSessStatsAddrWithdrOut counts the number of Address Withdraw Messages that have been sent during this session.
capabilityMessageIn [Capability Message In] (vRtrLdpNgSessStatsCapabilityIn)	long	The value of vRtrLdpNgSessStatsCapabilityIn counts the number of Capability Messages that have been received during this session.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
capabilityMessageOut [Capability Message Out] (vRtrLdpNgSessStatsCapabilityOut)	long	The value of vRtrLdpNgSessStatsCapabilityOut counts the number of Capability Messages that have been sent during this session.
helloMessagesReceived [Hello Messages Received] (vRtrLdpNgSessStatsHelloIn)	long	The value of vRtrLdpNgSessStatsHelloIn counts the number of Hello Messages that have been received during this session.
helloMessagesSent [Hello Messages Sent] (vRtrLdpNgSessStatsHelloOut)	long	The value of vRtrLdpNgSessStatsHelloOut counts the number of Hello Messages that have been sent during this session.
initMessagesReceived [Init Messages Received] (vRtrLdpNgSessStatsInitIn)	long	The value of vRtrLdpNgSessStatsInitIn counts the number of Init Messages that have been received during this session.
initMessagesSent [Init Messages Sent] (vRtrLdpNgSessStatsInitOut)	long	The value of vRtrLdpNgSessStatsInitOut counts the number of Init Messages that have been sent during this session.
ipv4AddrReceived [Ipv 4 Addr Received] (vRtrLdpNgSessStatsIPv4AddrRcv)	long	The value of vRtrLdpNgSessStatsIPv4AddrRcv counts the number of IPv4 local addresses received for this session.
ipv4AddrSent [Ipv 4 Addr Sent] (vRtrLdpNgSessStatsIPv4AddrSent)	long	The value of vRtrLdpNgSessStatsIPv4AddrSent counts the number of IPv4 local addresses sent for this session.
ipv4P2mpFecReceived [Ipv 4 P2 mp Fec Received] (vRtrLdpNgSessStatsIPv4P2MPFecRcv)	long	The value of vRtrLdpNgSessStatsIPv4P2MPFecRcv counts the number of IPv4 P2MP FECs received for this session.
ipv4P2mpFecSent [Ipv 4 P2 mp Fec Sent] (vRtrLdpNgSessStatsIPv4P2MPFecSnt)	long	The value of vRtrLdpNgSessStatsIPv4P2MPFecSnt counts the number of IPv4 P2MP FECs sent for this session.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ipv4PfxFecReceived [Ipv 4 Pfx Fec Received] (vRtrLdpNgSessStatsIPv4PfxFecRcv)	long	The value of vRtrLdpNgSessStatsIPv4PfxFecRcv counts the number of IPv4 prefix FECs received for this session.
ipv4PfxFecSent [Ipv 4 Pfx Fec Sent] (vRtrLdpNgSessStatsIPv4PfxFecSnt)	long	The value of vRtrLdpNgSessStatsIPv4PfxFecSnt counts the number of IPv4 prefix FECs sent for this session.
ipv6AddrReceived [Ipv 6 Addr Received] (vRtrLdpNgSessStatsIPv6AddrRcv)	long	The value of vRtrLdpNgSessStatsIPv6AddrRcv counts the number of IPv6 local addresses received for this session.
ipv6AddrSent [Ipv 6 Addr Sent] (vRtrLdpNgSessStatsIPv6AddrSent)	long	The value of vRtrLdpNgSessStatsIPv6AddrSent counts the number of IPv6 local addresses sent for this session.
ipv6P2mpFecReceived [Ipv 6 P2 mp Fec Received] (vRtrLdpNgSessStatsIPv6P2MPFecRcv)	long	The value of vRtrLdpNgSessStatsIPv6P2MPFecRcv counts the number of IPv6 P2MP FECs received for this session.
ipv6P2mpFecSent [Ipv 6 P2 mp Fec Sent] (vRtrLdpNgSessStatsIPv6P2MPFecSnt)	long	The value of vRtrLdpNgSessStatsIPv6P2MPFecSnt counts the number of IPv6 P2MP FECs sent for this session.
ipv6PfxFecReceived [Ipv 6 Pfx Fec Received] (vRtrLdpNgSessStatsIPv6PfxFecRcv)	long	The value of vRtrLdpNgSessStatsIPv6PfxFecRcv counts the number of IPv6 prefix FECs received for this session.
ipv6PfxFecSent [Ipv 6 Pfx Fec Sent] (vRtrLdpNgSessStatsIPv6PfxFecSnt)	long	The value of vRtrLdpNgSessStatsIPv6PfxFecSnt counts the number of IPv6 prefix FECs sent for this session.
keepAliveMessagesReceived [Keep Alive Messages Received] (vRtrLdpNgSessStatsKeepaliveIn)	long	The value of vRtrLdpNgSessStatsKeepaliveIn counts the number of Keepalive Messages that have been received during this session.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAliveMessagesSent [Keep Alive Messages Sent] (vRtrLdpNgSessStatsKeepaliveOut)	long	The value of vRtrLdpNgSessStatsKeepaliveOut counts the number of Keepalive Messages that have been sent during this session.
labelAbortsReceived [Label Aborts Received] (vRtrLdpNgSessStatsLblAbortIn)	long	The value of vRtrLdpNgSessStatsLblAbortIn counts the number of Label Abort Messages that have been received during this session.
labelAbortsSent [Label Aborts Sent] (vRtrLdpNgSessStatsLblAbortOut)	long	The value of vRtrLdpNgSessStatsLblAbortOut counts the number of Label Abort Messages that have been sent during this session.
labelMappingsReceived [Label Mappings Received] (vRtrLdpNgSessStatsLblMappingIn)	long	The value of vRtrLdpNgSessStatsLblMappingIn counts the number of Label Mapping Messages that have been received during this session.
labelMappingsSent [Label Mappings Sent] (vRtrLdpNgSessStatsLblMappingOut)	long	The value of vRtrLdpNgSessStatsLblMappingOut counts the number of Label Mapping Messages that have been sent during this session.
labelReleasesReceived [Label Releases Received] (vRtrLdpNgSessStatsLblReleaseIn)	long	The value of vRtrLdpNgSessStatsLblReleaseIn counts the number of Label Release Messages that have been received during this session.
labelReleasesSent [Label Releases Sent] (vRtrLdpNgSessStatsLblReleaseOut)	long	The value of vRtrLdpNgSessStatsLblReleaseOut counts the number of Label Release Messages that have been sent during this session.
labelRequestsReceived [Label Requests Received] (vRtrLdpNgSessStatsLblRequestIn)	long	The value of vRtrLdpNgSessStatsLblRequestIn counts the number of Label Request Messages that have been received during this session.
labelRequestsSent [Label Requests Sent] (vRtrLdpNgSessStatsLblRequestOut)	long	The value of vRtrLdpNgSessStatsLblRequestOut counts the number of Label Request Messages that have been sent during this session.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
labelWithdrawsReceived [Label Withdraws Received] (vRtrLdpNgSessStatsLblWithdrawIn)	long	The value of vRtrLdpNgSessStatsLblWithdrawIn counts the number of Label Withdraw Messages that have been received during this session.
labelWithdrawsSent [Label Withdraws Sent] (vRtrLdpNgSessStatsLblWithdrawOut)	long	The value of vRtrLdpNgSessStatsLblWithdrawOut counts the number of Label Withdraw Messages that have been sent during this session.
linkAdjacencies [Link Adjacencies] (vRtrLdpNgSessStatsLinkAdj)	long	The value of vRtrLdpNgSessStatsLinkAdj indicates the number of link adjacencies for this session.
notificationMessagesReceived [Notification Messages Received] (vRtrLdpNgSessStatsNotifIn)	long	The value of vRtrLdpNgSessStatsNotifIn counts the number of Notification Messages that have been received during this session.
notificationMessagesSent [Notification Messages Sent] (vRtrLdpNgSessStatsNotifOut)	long	The value of vRtrLdpNgSessStatsNotifOut counts the number of Notification Messages that have been sent during this session.
svcFec128Received [Svc Fec 128 Received] (vRtrLdpNgSessStatsSvcFec128Recv)	long	The value of vRtrLdpNgSessStatsSvcFec128Recv counts the number of service FEC 128 received for this session.
svcFec128Sent [Svc Fec 128 Sent] (vRtrLdpNgSessStatsSvcFec128Sent)	long	The value of vRtrLdpNgSessStatsSvcFec128Sent counts the number of service FEC 128 sent for this session.
svcFec129Received [Svc Fec 129 Received] (vRtrLdpNgSessStatsSvcFec129Recv)	long	The value of vRtrLdpNgSessStatsSvcFec129Recv counts the number of service FEC 129 received for this session.
svcFec129Sent [Svc Fec 129 Sent] (vRtrLdpNgSessStatsSvcFec129Sent)	long	The value of vRtrLdpNgSessStatsSvcFec129Sent counts the number of service FEC 129 sent for this session.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
targetedAdjacencies [Targeted Adjacencies] (vRtrLdpNgSessStatsTargAdj)	long	The value of vRtrLdpNgSessStatsTargAdj indicates the number of targeted adjacencies for this session.
<p>SiteStats</p> <p>MIB entry name: vLdpNgStatsEntry</p> <p>Entry description: A row in this table represents statistical information about an LDP instance.</p> <p>Table description (for vLdpNgStatsTable): vLdpNgStatsTable is a read-only table. The purpose of this table is to keep statistical information about an LDP Instance. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgGeneralTable, and the augmenting table, vLdpNgStatsTable. This in effect extends the vRtrLdpNgGeneralTable with additional columns. activeAdjacencies [Active Adjacencies] (vLdpNgStatsIPv4ActiveLinkAdj)	long	The value of vLdpNgStatsIPv4ActiveLinkAdj specifies the number of active IPv4 link adjacencies (i.e. established adjacencies) associated with the LDP instance.
activeInterfaces [Active Interfaces] (vLdpNgStatsIPv4ActiveIf)	long	The value of vLdpNgStatsIPv4ActiveIf specifies the number of active (i.e. operationally up) IPv4 interfaces associated with the LDP instance.
activeSessions [Active Sessions] (vLdpNgStatsIPv4ActiveSess)	long	The value of vLdpNgStatsIPv4ActiveSess specifies the number of active IPv4 sessions (i.e. session in some form of creation) associated with the LDP instance.
activeTargetedSessions [Active Targeted Sessions] (vLdpNgStatsIPv4ActiveTargPeers)	long	The value of vLdpNgStatsIPv4ActiveTargPeers specifies the number of configured IPv4 targeted peers that are administratively up in an LDP instance.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
addressFECsReceived [Address FECs Received] (vLdpNgStatsIPv4PfxFecRecv)	long	The value of vLdpNgStatsIPv4PfxFecRecv specifies the number of IPv4 Address FECs received by the LDP instance from its neighbors.
addressFECsSent [Address FECs Sent] (vLdpNgStatsIPv4PfxFecSent)	long	The value of vLdpNgStatsIPv4PfxFecSent specifies the number of IPv4 Address FECs sent by the LDP instance to its neighbors.
attemptedSessions [Attempted Sessions] (vLdpNgStatsIPv4AttemptedSessions)	long	The value of vLdpNgStatsIPv4AttemptedSessions specifies the total number of attempted IPv4 sessions for this LDP instance.
badLdpIdentifierErrors [Bad Ldp Identifier Errors] (vLdpNgStatsBadLdpIdErrors)	long	The value of vLdpNgStatsBadLdpIdErrors gives the number of Bad LDP Identifier Fatal Errors detected for sessions associated with this LDP instance.
badMessageLengthErrors [Bad Message Length Errors] (vLdpNgStatsBadMsgLengthErrors)	long	The value of vLdpNgStatsBadMsgLengthErrors gives the number of Bad Message Length Fatal Errors detected for sessions associated with this LDP instance.
badPduLengthErrors [Bad Pdu Length Errors] (vLdpNgStatsBadPduLengthErrors)	long	The value of vLdpNgStatsBadPduLengthErrors gives the number of Bad Pdu Length Fatal Errors detected for sessions associated with this LDP instance.
badTlvLengthErrors [Bad Tlv Length Errors] (vLdpNgStatsBadTlvLengthErrors)	long	The value of vLdpNgStatsBadTlvLengthErrors gives the number of Bad TLV Length Fatal Errors detected for sessions associated with this LDP instance.
inactiveInterfaces [Inactive Interfaces] (vLdpNgStatsIPv4Inactifef)	long	The value of vLdpNgStatsIPv4Inactifef specifies the number of inactive (i.e. operationally down) IPv4 interfaces associated with the LDP instance.
inactiveTargetedSessions [Inactive Targeted Sessions] (vLdpNgStatsIPv6ActiveTargPeers)	long	The value of vLdpNgStatsIPv6ActiveTargPeers specifies the number of configured IPv6 targeted peers that are administratively up in an LDP instance.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAliveExpiredErrors [Keep Alive Expired Errors] (vLdpNgStatsKeepAliveExpErrors)	long	The value of vLdpNgStatsKeepAliveExpErrors gives the number of Session Keep Alive Timer Expired Errors detected for sessions associated with this LDP instance.
malformedTlvValueErrors [Malformed Tlv Value Errors] (vLdpNgStatsMalformedTlvErrors)	long	The value of vLdpNgStatsMalformedTlvErrors gives the number of Malformed TLV Value Fatal Errors detected for sessions associated with this LDP instance.
operDownEvents [Oper Down Events] (vLdpNgStatsIPv4OperDownEvents)	long	The value of vLdpNgStatsIPv4OperDownEvents specifies the number of times the IPv4 LDP instance has gone operationally down since the instance was created.
serviceFECsReceived [Service FECs Received] (vLdpNgStatsFec128FecRecv)	long	The value of vLdpNgStatsFec128FecRecv specifies the number of Pseudo wire ID FECs received by the LDP instance from its neighbors.
serviceFECsSent [Service FECs Sent] (vLdpNgStatsFec128FecSent)	long	The value of vLdpNgStatsFec128FecSent specifies the number of Pseudo wire ID FECs sent by the LDP instance to its neighbors.
sessionRejectedAdvertisementModeErrors [Session Rejected Advertisement Mode Errors] (vLdpNgStatsSessRejAdvErrors)	long	The value of vLdpNgStatsSessRejAdvErrors gives the total number of Session Rejected/Parameters Advertisement Mode Error Notification Messages sent or received by this LDP instance.
sessionRejectedLabelRangeErrors [Session Rejected Label Range Errors] (vLdpNgStatsSessRejLblRngeErrs)	long	The value of vLdpNgStatsSessRejLblRngeErrs gives the total number of Session Rejected/Parameters Label Range Error Notification Messages sent or received by this LDP instance.
sessionRejectedMaxPduLengthErrors [Session Rejected Max Pdu Length Errors] (vLdpNgStatsSessRejMaxPduErrs)	long	The value of vLdpNgStatsSessRejMaxPduErrs gives the total number of Session Rejected/Parameters Max Pdu Length Error Notification Messages sent or received by this LDP instance.

Table 193 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionRejectedNoHelloErrors [Session Rejected No Hello Errors] (vLdpNgStatsSessRejNoHelloErrs)	long	The value of vLdpNgStatsSessRejNoHelloErrs gives the total number of Session Rejected/No Hello Error Notification Messages sent or received by this LDP instance.
shutdownNotificationsReceived [Shutdown Notifications Received] (vLdpNgStatsShutdownNotifRecv)	long	The value of vLdpNgStatsShutdownNotifRecv gives the number of Shutdown Notifications received related to sessions associated with this LDP instance.
shutdownNotificationsSent [Shutdown Notifications Sent] (vLdpNgStatsShutdownNotifSent)	long	The value of vLdpNgStatsShutdownNotifSent gives the number of Shutdown Notifications sent related to sessions associated with this LDP instance.
<p>TargetedPeerStats</p> <p>MIB entry name: vRtrLdpNgTargPeerStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Targeted peer. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpNgSessionStatsEntry.</p> <p>Table description (for vRtrLdpNgTargPeerStatsTable): The vRtrLdpNgTargPeerStatsTable is a read-only table. The purpose of this table is to keep statistical information about the Targeted peers on the LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgTargPeerTable, and the augmenting table, vRtrLdpNgTargPeerStatsTable. This in effect extends the vRtrLdpNgTargPeerTable with additional columns. Creation or deletion of a row in the vRtrLdpNgTargPeerTable results in the same fate for the row in the vRtrLdpNgTargPeerTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.TargetedPeer</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpNgTargPeerStatExistingAdj)	long	The value of vRtrLdpNgTargPeerStatExistingAdj indicates a count of the total active adjacencies with this targeted peer.

Table 194 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 194 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: tmnxLldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports and destination MAC addresses. Entries are not required to exist in this table while the tmnxLldpPortCfgAdminStatus object is equal to 'disabled(4)'. Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration</p>		

Table 194 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (tmnxLldpStatsRxPortAgeouts)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in tmnxLldpRemoteSystemsData and lldpExtensions objects because the information timeliness interval has expired. This counter is similar to lldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the tmnxLldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial ageing is not allowed, and thus, should not change the value of this counter.
lldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (tmnxLldpStatsRxPortFrameDiscard)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
lldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (tmnxLldpStatsRxPortFrameErrs)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
lldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (tmnxLldpStatsRxPortFrames)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 194 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (tmnxLldpStatsRxPortTLVDiscard)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
IldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (tmnxLldpStatsRxPortTLVUnknown)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2004. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats MIB entry name: tmnxLldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port and destination MAC address. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsTxPortTable): A table containing LLDP transmission statistics for individual port/destination address combinations. Entries are not required to exist in this table while the tmnxLldpPortConfigEntry object is equal to 'disabled(4)'. Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration</p>		
IldpStatsTxLLDPDULengthErrs [Lldp Stats Tx LLDPDULength Errs] (tmnxLldpStatsTxLLDPDULengthErrs)	long	The number of LLDPD Length Errors recorded for the Port.
IldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (tmnxLldpStatsTxPortFrames)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 195 mpls statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DynamicLspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp 		
configuredPaths [Configured Paths] (vRtrMplsLspConfiguredPaths)	long	The number of paths configured for this LSP.
operationalPaths [Operational Paths] (vRtrMplsLspOperationalPaths)	long	The number of operational paths for this LSP. This includes the path currently active, as well as operational standby paths.
pathChanges [Path Changes] (vRtrMplsLspPathChanges)	long	The number of path changes this LSP has had. For every path change (path down, path up, path change), a corresponding syslog/trap (if enabled) is generated for it.
standbyPaths [Standby Paths] (vRtrMplsLspStandbyPaths)	long	The number of standby paths configured for this LSP.
timeSinceLastPathChange [Time Since Last Path Change] (vRtrMplsLspLastPathChange)	long	The time in 10-millisecond units since the last change occurred on this LSP.

Table 195 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastPrimaryUpState [Time Since Last Primary Up State] (vRtrMplsLspPrimaryTimeUp)	long	The total time in 10-millisecond units that this LSP's primary path has been operational. For example, the percentage contribution of the primary path to the operational time is given by (vRtrMplsLspPrimaryTimeUp/vRtrMplsLspTimeUp * 100) %.
<p>LspPathStats</p> <p>MIB entry name: vRtrMplsLspPathStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspPathStatTable): The vRtrMplsLspPathStatTable has an entry for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.LspPath</p>		
cspfQueries [Cspf Queries] (vRtrMplsLspPathCspfQueries)	long	The value of vRtrMplsLspPathCspfQueries specifies the number of CSPF queries that have been made for this LSP path.
retryAttempts [Retry Attempts] (vRtrMplsLspPathRetryAttempts)	long	The number of unsuccessful attempts which have been made to signal this path. As soon as the path gets signalled, this is set to 0.
timeDown [Time Down] (vRtrMplsLspPathTimeDown)	long	The total time in 10-millisecond units that this LSP Path has not been operational.
timeUp [Time Up] (vRtrMplsLspPathTimeUp)	long	The total time in 10-millisecond units that this LSP path has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspPathTimeUp/vRtrMplsLspAge * 100 %).

Table 195 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitionCount [Transition Count] (vRtrMplsLspPathTransitionCount)	long	The object vRtrMplsLspPathTransitionCount maintains the number of transitions that have occurred for this LSP.
<p>LspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.BypassOnlyLsp • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp • mpls.StaticLsp 		
age [Age] (vRtrMplsLspAge)	long	The age (i.e., time from creation till now) of this LSP in 10-millisecond periods.
timeSinceLastDownState [Time Since Last Down State] (vRtrMplsLspTimeDown)	long	The total time in 10-millisecond units that this LSP has not been operational.
timeSinceLastTransition [Time Since Last Transition] (vRtrMplsLspLastTransition)	long	The time in 10-millisecond units since the last transition occurred on this LSP.
timeSinceLastUpState [Time Since Last Up State] (vRtrMplsLspTimeUp)	long	The total time in 10-millisecond units that this LSP has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspTimeUp/ vRtrMplsLspAge * 100 %).

Table 195 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitions [Transitions] (vRtrMplsLspTransitions)	long	The number of state transitions (up -> down and down -> up) this LSP has undergone.
<p>MplsInterfaceStats</p> <p>MIB entry name: vRtrMplsIfStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an interface on this virtual router that participates in the MPLS protocol. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsIfStatTable): The vRtrMplsIfStatTable has an entry for each router interface configured for MPLS in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.Interface</p>		
receiveOctets [Receive Octets] (vRtrMplsIfRxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets received on this interface.
receivePackets [Receive Packets] (vRtrMplsIfRxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets received on this interface.
transmitOctets [Transmit Octets] (vRtrMplsIfTxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets transmitted on this interface.
transmitPackets [Transmit Packets] (vRtrMplsIfTxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets transmitted from this interface.

Table 195 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteStats</p> <p>MIB entry name: vRtrMplsGeneralStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an instance of the MPLS protocol running within a virtual router. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsGeneralStatTable): The vRtrMplsGeneralStatTable contains statistics for an MPLS protocol instance within a virtual router.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.Site</p>		
detourOriginate [Detour Originate] (vRtrMplsGeneralDetourLspOriginate)	long	The value of vRtrMplsGeneralDetourLspOriginate indicates the number of detour LSPs that originate at this virtual router.
detourTerminate [Detour Terminate] (vRtrMplsGeneralDetourLspTerminate)	long	The value of vRtrMplsGeneralDetourLspTerminate indicates the number of detour LSPs that terminate at this virtual router.
detourTransit [Detour Transit] (vRtrMplsGeneralDetourLspTransit)	long	The value of vRtrMplsGeneralDetourLspTransit indicates the number of detour LSPs that transit through this virtual router.
dynamicOriginate [Dynamic Originate] (vRtrMplsGeneralDynamicLspOriginate)	long	The value of vRtrMplsGeneralDynamicLspOriginate indicates the number of dynamic LSPs that originate at this virtual router.
dynamicTerminate [Dynamic Terminate] (vRtrMplsGeneralDynamicLspTerminate)	long	The value of vRtrMplsGeneralDynamicLspTerminate indicates the number of dynamic LSPs that terminate at this virtual router.
dynamicTransit [Dynamic Transit] (vRtrMplsGeneralDynamicLspTransit)	long	The value of vRtrMplsGeneralDynamicLspTransit indicates the number of dynamic LSPs that transit through this virtual router.

Table 195 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
staticOriginate [Static Originate] (vRtrMplsGeneralStaticLspOriginate)	long	The value of vRtrMplsGeneralStaticLspOriginate indicates the number of static LSPs that originate at this virtual router.
staticTerminate [Static Terminate] (vRtrMplsGeneralStaticLspTerminate)	long	The value of vRtrMplsGeneralStaticLspTerminate indicates the number of static LSPs that terminate at this virtual router.
staticTransit [Static Transit] (vRtrMplsGeneralStaticLspTransit)	long	The value of vRtrMplsGeneralStaticLspTransit indicates the number of static LSPs that transit through this virtual router.

Table 196 mplsTp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PathMepStats</p> <p>MIB entry name: vRtrMplsTpLspPtPathMepStatEntry</p> <p>Entry description: The vRtrMplsTpLspPathMepEntry represents a Maintenance Endpoint for a MPLS-TP LSP protection Path. Rows are created and destroyed by the system based on the configuration of the MEP protection-type.</p> <p>Table description (for vRtrMplsTpLspPtPathMepStatTable): The vRtrMplsTpLspPtPathMepStatTable maintains the Maintenance End Points (MEPs) statistics for MPLS-TP LSP protection paths.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: mplsTp.PathMep</p>		
wtrTimer [Wtr Timer] (vRtrMplsTpLspPtPathMepWTRTimer)	long	The value of vRtrMplsTpLspPtPathMepWTRTimer indicates the remaining Wait-To-Restore time, in seconds, before the protection path can switch back to the working path. A value of zero (0) indicates that there is no WTR timer in effect.
<p>SiteStats</p> <p>MIB entry name: vRtrMplsGeneralStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an instance of the MPLS protocol running within a virtual router. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsGeneralStatTable): The vRtrMplsGeneralStatTable contains statistics for an MPLS protocol instance within a virtual router.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mplsTp.Site</p>		
mplsTpLspOriginate [Mpls Tp Lsp Originate] (vRtrMplsGenMplsTpLspOriginate)	long	The value of vRtrMplsGenMplsTpLspOriginate indicates the number of MPLS TP LSPs that originate at this virtual router.
mplsTpLspTerminate [Mpls Tp Lsp Terminate] (vRtrMplsGenMplsTpLspTerminate)	long	The value of vRtrMplsGenMplsTpLspTerminate indicates the number of MPLS TP LSPs that terminate at this virtual router.

Table 196 mplstp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mplsTpLspTransit [Mpls Tp Lsp Transit] (vRtrMplsGenMplsTpLspTransit)	long	The value of vRtrMplsGenMplsTpLspTransit indicates the number of MPLS TP LSPs that transit through this virtual router.
mplsTpOrigPathInst [Mpls Tp Orig Path Inst] (vRtrMplsGenMplsTpOrigPathInst)	long	The value of vRtrMplsGenMplsTpOrigPathInst indicates the number of MPLS TP LSPs originate path instances.
mplsTpTermPathInst [Mpls Tp Term Path Inst] (vRtrMplsGenMplsTpTermPathInst)	long	The value of vRtrMplsGenMplsTpTermPathInst indicates the number of MPLS TP LSPs terminated path instances.
mplsTpTranPathInst [Mpls Tp Tran Path Inst] (vRtrMplsGenMplsTpTranPathInst)	long	The value of vRtrMplsGenMplsTpTranPathInst indicates the number of MPLS TP LSPs transit path instances.

Table 197 multichassis statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerStats</p> <p>MIB entry name: tmnxMcLagPeerStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a multi-chassis peer. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcLagPeerStatsTable): The tmnxMcLagPeerStatsTable has an entry for each multi-chassis peer configured on this system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • multichassis.PSSPeer • multichassis.Peer 		
configPacketsReceived [Config Packets Received] (tmnxMcLagPeerStatsPktsRxConfig)	long	The value of tmnxMcLagPeerStatsPktsRxConfig indicates how many valid MC-Lag control packets of type lag config were received on this system from the peer.
failedMD5AuthenticationPacketsDropped [Failed MD5 Authentication Packets Dropped] (tmnxMcLagPeerStatsDropMD5)	long	The value of tmnxMcLagPeerStatsDropMD5 indicates how many MC-Lag control packets were dropped on this system from the peer because the packet failed MD5 authentication.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagPeerStatsPktsTxFailed)	long	The value of tmnxMcLagPeerStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted from this system to the peer.
invalidLagIdPacketsDropped [Invalid Lag Id Packets Dropped] (tmnxMcLagPeerStatsDropTlvInvlId)	long	The value of tmnxMcLagPeerStatsDropTlvInvlId indicates how many MC-Lag control packets were dropped on this system from the peer because the packet referred to an invalid or non multi-chassis lag.
invalidSizePacketsDropped [Invalid Size Packets Dropped] (tmnxMcLagPeerStatsDropTlvInvlSz)	long	The value of tmnxMcLagPeerStatsDropTlvInvlSz indicates how many MC-Lag control packets were dropped on this system from the peer because the packet size was invalid.

Table 197 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAlivePacketsReceived [Keep Alive Packets Received] (tmnxMcLagPeerStatsPktsRxKpalive)	long	The value of tmnxMcLagPeerStatsPktsRxKpalive indicates how many valid MC-Lag control packets of type keepalive were received on this system from the peer.
keepalivePacketsTransmitted [Keepalive Packets Transmitted] (tmnxMcLagPeerStatsPktsTxKpalive)	long	The value of tmnxMcLagPeerStatsPktsTxKpalive indicates how many MC-Lag control packets of type keepalive were transmitted from this system to the peer.
outOfSequencePacketsDropped [Out Of Sequence Packets Dropped] (tmnxMcLagPeerStatsDropOutOfSeq)	long	The value of tmnxMcLagPeerStatsDropOutOfSeq indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was out of sequence.
packetsReceived [Packets Received] (tmnxMcLagPeerStatsPktsRx)	long	The value of tmnxMcLagPeerStatsPktsRx indicates how many valid MC-Lag control packets were received on this system from the peer.
packetsTransmitted [Packets Transmitted] (tmnxMcLagPeerStatsPktsTx)	long	The value of tmnxMcLagPeerStatsPktsTx indicates how many MC-Lag control packets were transmitted from this system to the peer.
peerConfigPacketsReceived [Peer Config Packets Received] (tmnxMcLagPeerStatsPktsRxPeerCfg)	long	The value of tmnxMcLagPeerStatsPktsRxPeerCfg indicates how many valid MC-Lag control packets of type peer config were received on this system from the peer.
peerConfigPacketsTransmitted [Peer Config Packets Transmitted] (tmnxMcLagPeerStatsPktsTxPeerCfg)	long	The value of tmnxMcLagPeerStatsPktsTxPeerCfg indicates how many MC-Lag control packets of type peer config were transmitted from this system to the peer.
stateDisabledPacketsDropped [State Disabled Packets Dropped] (tmnxMcLagPeerStatsDropStateDsblid)	long	The value of tmnxMcLagPeerStatsDropStateDsblid indicates how many MC-Lag control packets were dropped on this system from the peer because the peer was administratively disabled.

Table 197 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statePacketsReceived [State Packets Received] (tmnxMcLagPeerStatsPktsRxState)	long	The value of tmnxMcLagPeerStatsPktsRxState indicates how many valid MC-Lag control packets of type lag state were received on this system from the peer.
tooShortPacketsDropped [Too Short Packets Dropped] (tmnxMcLagPeerStatsDropPktTooShrt)	long	The value of tmnxMcLagPeerStatsDropPktTooShrt indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was too short.
unknownTlvPacketsDropped [Unknown Tlv Packets Dropped] (tmnxMcLagPeerStatsDropUnknownTlv)	long	The value of tmnxMcLagPeerStatsDropUnknownTlv indicates how many MC-Lag control packets were dropped on this system from the peer because the packet contained an unknown TLV.
<p>PeerSynchronizationProtocolStats</p> <p>MIB entry name: tmnxMcPeerSyncStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a multi-chassis synchronization protocol entry. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcPeerSyncStatsTable): The tmnxMcPeerSyncStatsTable has an entry for each multi-chassis peer synchronization protocol entry.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: multichassis.PeerSynchronizationProtocol</p>		
bodyDecodeErrorPacketsReceived [Body Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrBody)	long	The value of tmnxMcPeerSyncPktsRxErrBody indicates the number of packets with body decode errors received from the multi-chassis peer.
dataPacketsReceived [Data Packets Received] (tmnxMcPeerSyncPktsRxData)	long	The value of tmnxMcPeerSyncPktsRxData indicates the number of hello packets received from the multi-chassis peer.
dataPacketsTransmitted [Data Packets Transmitted] (tmnxMcPeerSyncPktsTxData)	long	The value of tmnxMcPeerSyncPktsTxData indicates the number of data packets transmitted to the multi-chassis peer.

Table 197 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
erroneousPacketsReceived [Erroneous Packets Received] (tmnxMcPeerSyncPktsRxErr)	long	The value of tmnxMcPeerSyncPktsRxErr indicates the number of erroneous packets received from the multi-chassis peer.
headerDecodeErrorPacketsReceived [Header Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrHeader)	long	The value of tmnxMcPeerSyncPktsRxErrHeader indicates the number of packets with header decode errors received from the multi-chassis peer.
helloPacketsReceived [Hello Packets Received] (tmnxMcPeerSyncPktsRxHello)	long	The value of tmnxMcPeerSyncPktsRxHello indicates the number of hello packets received from the multi-chassis peer.
helloPacketsTransmitted [Hello Packets Transmitted] (tmnxMcPeerSyncPktsTxHello)	long	The value of tmnxMcPeerSyncPktsTxHello indicates the number of hello packets transmitted to the multi-chassis peer.
otherPacketsReceived [Other Packets Received] (tmnxMcPeerSyncPktsRxOther)	long	The value of tmnxMcPeerSyncPktsRxOther indicates the number of all other packet types received from the multi-chassis peer.
otherPacketsTransmitted [Other Packets Transmitted] (tmnxMcPeerSyncPktsTxOther)	long	The value of tmnxMcPeerSyncPktsTxOther indicates the number of all other packet types transmitted to the multi-chassis peer.
packetTransmissionErrors [Packet Transmission Errors] (tmnxMcPeerSyncPktsTxErr)	long	The value of tmnxMcPeerSyncPktsTxErr indicates the number of packet transmission errors.
sequenceNumberErrorPacketsReceived [Sequence Number Error Packets Received] (tmnxMcPeerSyncPktsRxErrSeqNum)	long	The value of tmnxMcPeerSyncPktsRxErrSeqNum indicates the number of packets with sequence number errors received from the multi-chassis peer.

Table 197 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPacketsReceived [Total Packets Received] (tmnxMcPeerSyncPktsRxAll)	long	The value of tmnxMcPeerSyncPktsRxAll indicates the total number of packets received from the multi-chassis peer.
totalPacketsTransmitted [Total Packets Transmitted] (tmnxMcPeerSyncPktsTxAll)	long	The value of tmnxMcPeerSyncPktsTxAll indicates the total number of packets transmitted to the multi-chassis peer.

Table 198 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
sgiSnmplnGetBulks [Sgi Snmp In Get Bulks] (sgiSnmplnGetBulks)	long	The value of sgiSnmplnGetBulks indicates the total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmplnASNParseErrs [Snmp In ASNParse Errs] (snmplnASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmplnBadCommunityNames [Snmp In Bad Community Names] (snmplnBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.

Table 198 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.

Table 198 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 199 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: tmnxOspfAreaEntry</p> <p>Entry description: The tmnxOspfAreaEntry contains information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for tmnxOspfAreaTable): The tmnxOspfAreaTable contains information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
nssaTranslatorEvents [Nssa Translator Events] (tmnxOspfAreaNssaTranslatorEvents)	long	The value of tmnxOspfAreaNssaTranslatorEvents indicates the number of Translator State changes that have occurred since the last boot-up.
totalLSACount [Total LSACount] (tmnxOspfAreaScopeLsaCount)	long	The value of tmnxOspfAreaScopeLsaCount indicates the total number of Area-Scope link state advertisements in this area's link-state database.
totalSpfRuns [Total Spf Runs] (tmnxOspfAreaSpfRuns)	long	The value of tmnxOspfAreaSpfRuns indicates the number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
totalUnknownLSACount [Total Unknown LSACount] (tmnxOspfAreaScopeUnkLsaCount)	long	The value of tmnxOspfAreaScopeUnkLsaCount indicates the total number of unknown Area-Scope link-state advertisements in this area's link-state database.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaSiteLfaStats MIB entry name: tmnxOspfLfaStatsEntry Entry description: Each row entry in the tmnxOspfLfaStatsTable represents information on LFA coverage for a given OSPF area Table description (for tmnxOspfLfaStatsTable): The tmnxOspfLfaStatsTable maintains information on loopfree-alternate (LFA) coverage for each instance of OSPF protocol. Supports realtime plotting Supports scheduled collection Monitored class: ospf.AreaSite</p>		
ospfLfaCoverage [Ospf Lfa Coverage] (tmnxOspfLfaCoverage)	long	The value of tmnxOspfLfaCoverage indicates how much LFA coverage is being obtained for the set of available LFA eligible nodes.
ospfLfaNodesCovered [Ospf Lfa Nodes Covered] (tmnxOspfLfaNodesCovered)	long	The value of tmnxOspfLfaNodesCovered indicates in absolute numbers the number of nodes for which an LFA is found.
ospfLfaPrefixCoverage [Ospf Lfa Prefix Coverage] (tmnxOspfLfaPfxCoverage)	long	The value of tmnxOspfLfaPfxCoverage indicates how much LFA prefix coverage is being obtained for the set of available LFA eligible prefixes.
ospfLfaPrefixCovered [Ospf Lfa Prefix Covered] (tmnxOspfLfaPfxCovered)	long	The value of tmnxOspfLfaPfxCovered indicates in absolute numbers the number of prefixes for which an LFA is found.
ospfLfaTotalNodes [Ospf Lfa Total Nodes] (tmnxOspfLfaTotalNodes)	long	The value of tmnxOspfLfaTotalNodes indicates in absolute numbers the number of nodes eligible for LFA calculation.
ospfLfaTotalPrefix [Ospf Lfa Total Prefix] (tmnxOspfLfaTotalPfx)	long	The value of tmnxOspfLfaTotalPfx indicates in absolute numbers the number of prefixes eligible for LFA calculation.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceGeneralStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (tmnxOspfNgIfEvents)	long	The value of tmnxOspfNgIfEvents indicates the number of times this OSPF interface has changed its state, or an error has occurred.
<p>InterfaceReceiveStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfNgIfRxBadChecksums)	long	The value of tmnxOspfNgIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
<p>InterfaceStatusStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
authorizationFailures [Authorization Failures] (tmnxOspfNgIfAuthFailures)	long	The value of tmnxOspfNgIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfNglfBadAreas)	long	The value of tmnxOspfNglfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfNglfBadAuthTypes)	long	The value of tmnxOspfNglfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfNglfBadDeadIntervals)	long	The value of tmnxOspfNglfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfNglfBadDstAddrs)	long	The value of tmnxOspfNglfBadDstAddrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfNglfBadHelloIntervals)	long	The value of tmnxOspfNglfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfNglfBadLengths)	long	The value of tmnxOspfNglfBadLengths indicates the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfNglfBadNeighbors)	long	The value of tmnxOspfNglfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNetworks [Bad Networks] (tmnxOspfNglfBadNetworks)	long	The value of tmnxOspfNglfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfNglfBadOptions)	long	The value of tmnxOspfNglfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this interface or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfNglfBadPacketTypes)	long	The value of tmnxOspfNglfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfNglfBadVersions)	long	The value of tmnxOspfNglfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
badVirtualLinks [Bad Virtual Links] (tmnxOspfNglfBadVirtualLinks)	long	The value of tmnxOspfNglfBadVirtualLinks indicates the total number of OSPF packets received on this interface that are destined to a virtual link that does not exist since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfNglfDiscardPackets)	long	The value of tmnxOspfNglfDiscardPackets indicates the total number of OSPF packets discarded on this interface since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfNglfRetransmitOuts)	long	The value of tmnxOspfNglfRetransmitOuts indicates the total number of OSPF Retransmits sent on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceTransmitStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

events [Events] (tmnxOspfNgNbrEvents)	long	The value of tmnxOspfNgNbrEvents indicates the number of times this neighbor relationship has changed state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfNgNbrLsRetransQLen)	long	The value of tmnxOspfNgNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>NeighborStatusStats</p> <p>MIB entry name: tmnxOspfNgNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgNbrStatsTable represents additional columns for statistics for an OSPF neighbor.</p> <p>Table description (for tmnxOspfNgNbrStatsTable): The tmnxOspfNgNbrStatsTable provides an extension of the tmnxOspfNgNbrTable for statistics for an OSPF neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Neighbor</p>		

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badMtus [Bad Mtus] (tmnxOspfNgNbrBadMTUs)	long	The value of tmnxOspfNgNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badNeighborStates [Bad Neighbor States] (tmnxOspfNgNbrBadNbrStates)	long	The value of tmnxOspfNgNbrBadNbrStates indicates the total number of OSPF packets received when the neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfNgNbrBadPackets)	long	The value of tmnxOspfNgNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfNgNbrBadSeqNums)	long	The value of tmnxOspfNgNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfNgNbrDuplicates)	long	The value of tmnxOspfNgNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfNgNbrLsaInstallFailed)	long	The value of tmnxOspfNgNbrLsaInstallFailed indicates the total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfNgNbrLsaNotInLsdb)	long	The value of tmnxOspfNgNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfNgNbrNumRestarts)	long	The value of tmnxOspfNgNbrNumRestarts indicates the number of times the neighbor has attempted restart.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
optionMismatches [Option Mismatches] (tmnxOspfNgNbrOptionMismatches)	long	The value of tmnxOspfNgNbrOptionMismatches indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
ShamLinkGeneralStats MIB entry name: tmnxOspfShamLfStatsEntry Entry description: Each row entry in the tmnxOspfShamLfStatsTable represents additional columns for statistics for an OSPF sham link. Table description (for tmnxOspfShamLfStatsTable): The tmnxOspfShamLfStatsTable provides an extension of the tmnxOspfShamLfTable for statistics for an OSPF sham link. Supports realtime plotting Supports scheduled collection Monitored class: ospf.ShamLink		
events [Events] (tmnxOspfShamLfEvents)	long	The value of tmnxOspfShamLfEvents indicates the number of state changes or error events on this sham link.
ShamLinkReceiveStats MIB entry name: tmnxOspfShamLfStatsEntry Entry description: Each row entry in the tmnxOspfShamLfStatsTable represents additional columns for statistics for an OSPF sham link. Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authorizationFailures [Authorization Failures] (tmnxOspfShamIfAuthFailures)	long	The value of tmnxOspfShamIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.
badAreas [Bad Areas] (tmnxOspfShamIfBadAreas)	long	The value of tmnxOspfShamIfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfShamIfBadAuthTypes)	long	The value of tmnxOspfShamIfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfShamIfBadDeadIntervals)	long	The value of tmnxOspfShamIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfShamIfBadDstAdrs)	long	The value of tmnxOspfShamIfBadDstAdrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfShamIfBadHelloIntervals)	long	The value of tmnxOspfShamIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfShamIfBadLengths)	long	The value of tmnxOspfShamIfBadLengths indicates the total number of OSPF packets received on this sham link with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNeighbors [Bad Neighbors] (tmnxOspfShamIfBadNeighbors)	long	The value of tmnxOspfShamIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.
badNetworks [Bad Networks] (tmnxOspfShamIfBadNetworks)	long	The value of tmnxOspfShamIfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfShamIfBadOptions)	long	The value of tmnxOspfShamIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this sham link or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfShamIfBadPacketTypes)	long	The value of tmnxOspfShamIfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfShamIfBadVersions)	long	The value of tmnxOspfShamIfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfShamIfDiscardPackets)	long	The value of tmnxOspfShamIfDiscardPackets indicates the total number of OSPF packets discarded on this sham link since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfShamIfRetransmitOuts)	long	The value of tmnxOspfShamIfRetransmitOuts indicates the total number of OSPF Retransmits sent on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>ShamLinkTransmitStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamIfRxDBDs)	long	The value of tmnxOspfShamIfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteStats</p> <p>MIB entry name: tmnxOspfStatisticsEntry</p> <p>Entry description: Each row entry in the tmnxOspfStatisticsTable represents additional columns for statistics for an OSPF instance.</p> <p>Table description (for tmnxOspfStatisticsTable): The tmnxOspfStatisticsTable provides an extension of the tmnxOspfGeneralTable for statistics for an OSPF instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Site</p>		
addRouteFailed [Add Route Failed] (tmnxOspfRoutesAddsFailed)	long	The value of tmnxOspfRoutesAddsFailed indicates the number of times an attempt to add a route to the Route Table Manager (RTM) failed for this OSPF instance.
cspfDroppedRequests [Cspf Dropped Requests] (tmnxOspfCSPFDroppedRequests)	long	The value of tmnxOspfCSPFDroppedRequests indicates the number of dropped CSPF requests made by the OSPF protocol.
cspfPathsFound [Cspf Paths Found] (tmnxOspfCSPFPathsFound)	long	The value of tmnxOspfCSPFPathsFound indicates the number of of paths found for the requests made to OSPF protocol.
cspfPathsNotFound [Cspf Paths Not Found] (tmnxOspfCSPFPathsNotFound)	long	The value of tmnxOspfCSPFPathsNotFound indicates the number of of paths not found for the requests made to OSPF protocol.
cspfRequests [Cspf Requests] (tmnxOspfCSPFRequests)	long	The value of tmnxOspfCSPFRequests indicates the number of CSPF requests made to the OSPF protocol.
deleteRouteFailed [Delete Route Failed] (tmnxOspfRoutesDelsFailed)	long	The value of tmnxOspfRoutesDelsFailed indicates the number of times an attempt to delete a route from the Route Table Manager (RTM) failed for this instance of OSPF.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inOverflowCount [In Overflow Count] (tmnxOspfNumTimesInOverflow)	long	The value of tmnxOspfNumTimesInOverflow indicates the count of the number of times the system was in the overflow state.
inOverloadCount [In Overload Count] (tmnxOspfNumTimesInOverload)	long	The value of tmnxOspfNumTimesInOverload indicates the count of the number of times the system was overloaded.
modifyRouteFailed [Modify Route Failed] (tmnxOspfRoutesModsFailed)	long	The value of tmnxOspfRoutesModsFailed indicates the number of times an attempt to modify a route in the Route Table Manager (RTM) failed for this instance of OSPF.
newLsasOriginated [New Lsas Originated] (tmnxOspfOriginateNewLsas)	long	The value of tmnxOspfOriginateNewLsas indicates the number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
newLsasReceived [New Lsas Received] (tmnxOspfRxNewLsas)	long	The value of tmnxOspfRxNewLsas indicates the number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
spfAttemptsFailed [Spf Attempts Failed] (tmnxOspfSpfAttemptsFailed)	long	The value of tmnxOspfSpfAttemptsFailed indicates the number of times an attempt to run SPF has failed because SPF runs have been stopped as a result of insufficient memory resources.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualLinkGeneralStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
events [Events] (tmnxOspfVirtIfEvents)	long	The value of tmnxOspfVirtIfEvents indicates the number of state changes or error events on this Virtual Link
<p>VirtualLinkReceiveStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfVirtIfRxBadChecksums)	long	The value of tmnxOspfVirtIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
<p>VirtualLinkStatusStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		
authorizationFailures [Authorization Failures] (tmnxOspfVirtIfAuthFailures)	long	The value of tmnxOspfVirtIfAuthFailures indicates the total number of OSPF packets received on this virtual interface with invalid authentication keys.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfVirtIfBadAreas)	long	The value of tmnxOspfVirtIfBadAreas indicates the total number of OSPF packets received on this virtual interface with area mismatches.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfVirtIfBadAuthTypes)	long	The value of tmnxOspfVirtIfBadAuthTypes indicates the total number of OSPF packets received on this virtual interface with invalid authentication types.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfVirtIfBadDeadIntervals)	long	The value of tmnxOspfVirtIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfVirtIfBadDstAddrs)	long	The value of tmnxOspfVirtIfBadDstAddrs indicates the total number of OSPF packets received on this virtual interface with invalid destination IP address.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfVirtIfBadHelloIntervals)	long	The value of tmnxOspfVirtIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfVirtIfBadLengths)	long	The value of tmnxOspfVirtIfBadLengths indicates the total number of OSPF packets received on this virtual interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfVirtIfBadNeighbors)	long	The value of tmnxOspfVirtIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the configuration this router has for the neighbor.
badNetworks [Bad Networks] (tmnxOspfVirtIfBadNetworks)	long	The value of tmnxOspfVirtIfBadNetworks indicates the total number of OSPF packets received on this virtual interface with invalid network or mask fields.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badOptions [Bad Options] (tmnxOspfVirtIfBadOptions)	long	The value of tmnxOspfVirtIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this virtual interface or transit-area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfVirtIfBadPacketTypes)	long	The value of tmnxOspfVirtIfBadPacketTypes indicates the total number of OSPF packets received on this virtual interface with invalid OSPF packet types.
badVersions [Bad Versions] (tmnxOspfVirtIfBadVersions)	long	The value of tmnxOspfVirtIfBadVersions indicates the total number of OSPF packets received on this virtual interface with invalid OSPF version numbers.
discardPackets [Discard Packets] (tmnxOspfVirtIfDiscardPackets)	long	The value of tmnxOspfVirtIfDiscardPackets indicates the total number of OSPF packets discarded on this virtual interface.
retransmitOuts [Retransmit Outs] (tmnxOspfVirtIfRetransmitOuts)	long	The value of tmnxOspfVirtIfRetransmitOuts indicates the total number of OSPF packets retransmitted on this virtual interface.
<p>VirtualLinkTransmitStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
VirtualNeighborGeneralStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor		

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
events [Events] (tmnxOspfVirtNbrEvents)	long	The value of tmnxOspfVirtNbrEvents indicates the number of times this virtual link has changed its state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfVirtNbrLsRetransQLen)	long	The value of tmnxOspfVirtNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>VirtualNeighborStatusStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
badMtus [Bad Mtus] (tmnxOspfVirtNbrBadMTUs)	long	The value of tmnxOspfVirtNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfVirtNbrBadPackets)	long	The value of tmnxOspfVirtNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfVirtNbrBadSeqNums)	long	The value of tmnxOspfVirtNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 199 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badVirtualNeighborStates [Bad Virtual Neighbor States] (tmnxOspfVirtNbrBadNbrStates)	long	The value of tmnxOspfVirtNbrBadNbrStates indicates the total number of OSPF packets received when the virtual neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfVirtNbrDuplicates)	long	The value of tmnxOspfVirtNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfVirtNbrLsaInstallFail)	long	The value of tmnxOspfVirtNbrLsaInstallFail indicates the total number of times when an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfVirtNbrLsaNotInLsdb)	long	The value of tmnxOspfVirtNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfVirtNbrNumRestarts)	long	The value of tmnxOspfVirtNbrNumRestarts indicates the number of times the virtual neighbor has attempted restart since tmnxOspfAdminState was last set to 'enabled'.
optionMismatches [Option Mismatches] (tmnxOspfVirtNbrOptionMismatch)	long	The value of tmnxOspfVirtNbrOptionMismatch indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 200 pae802_1x statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PaePortAuthenticatorDiagStats</p> <p>MIB entry name: dot1xAuthDiagEntry</p> <p>Entry description: The diagnostics information for an Authenticator PAE.</p> <p>Table description (for dot1xAuthDiagTable): A table that contains the diagnostics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort 		
dot1xAuthAuthEapLogoffWhileAuthenticated [Dot 1 x Auth Auth Eap Logoff While Authenticated] (dot1xAuthAuthEapLogoffWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to DISCONNECTED, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapLogoffWhileAuthenticating [Dot 1 x Auth Auth Eap Logoff While Authenticating] (dot1xAuthAuthEapLogoffWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticated [Dot 1 x Auth Auth Eap Starts While Authenticated] (dot1xAuthAuthEapStartsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of an EAPOL-Start message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticating [Dot 1 x Auth Auth Eap Starts While Authenticating] (dot1xAuthAuthEapStartsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Start message being received from the Supplicant.

Table 200 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthAuthFailWhileAuthenticating [Dot 1 x Auth Auth Fail While Authenticating] (dot1xAuthAuthFailWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to HELD, as a result of the Backend Authentication state machine indicating authentication failure (authFail = TRUE).
dot1xAuthAuthReauthsWhileAuthenticated [Dot 1 x Auth Auth Reauths While Authenticated] (dot1xAuthAuthReauthsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthReauthsWhileAuthenticating [Dot 1 x Auth Auth Reauths While Authenticating] (dot1xAuthAuthReauthsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthSuccessWhileAuthenticating [Dot 1 x Auth Auth Success While Authenticating] (dot1xAuthAuthSuccessWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to AUTHENTICATED, as a result of the Backend Authentication state machine indicating successful authentication of the Supplicant (authSuccess = TRUE).
dot1xAuthAuthTimeoutsWhileAuthenticating [Dot 1 x Auth Auth Timeouts While Authenticating] (dot1xAuthAuthTimeoutsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of the Backend Authentication state machine indicating authentication timeout (authTimeout = TRUE).
dot1xAuthBackendAccessChallenges [Dot 1 x Auth Backend Access Challenges] (dot1xAuthBackendAccessChallenges)	long	Counts the number of times that the state machine receives an initial Access-Challenge packet from the Authentication server (i.e., aReq becomes TRUE, causing exit from the RESPONSE state). Indicates that the Authentication Server has communication with the Authenticator.
dot1xAuthBackendAuthFails [Dot 1 x Auth Backend Auth Fails] (dot1xAuthBackendAuthFails)	long	Counts the number of times that the state machine receives an EAP-Failure message from the Authentication Server (i.e., aFail becomes TRUE, causing a transition from RESPONSE to FAIL). Indicates that the Supplicant has not authenticated to the Authentication Server.

Table 200 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthBackendAuthSuccesses [Dot 1 x Auth Backend Auth Successes] (dot1xAuthBackendAuthSuccesses)	long	Counts the number of times that the state machine receives an EAP-Success message from the Authentication Server (i.e., aSuccess becomes TRUE, causing a transition from RESPONSE to SUCCESS). Indicates that the Supplicant has successfully authenticated to the Authentication Server.
dot1xAuthBackendNonNakResponsesFromSupplicant [Dot 1 x Auth Backend Non Nak Responses From Supplicant] (dot1xAuthBackendNonNakResponsesFromSupplicant)	long	Counts the number of times that the state machine receives a response from the Supplicant to an initial EAP-Request, and the response is something other than EAP-NAK (i.e., rxResp becomes TRUE, causing the state machine to transition from REQUEST to RESPONSE, and the response is not an EAP-NAK). Indicates that the Supplicant can respond to the Authenticator's chosen EAP-method.
dot1xAuthBackendOtherRequestsToSupplicant [Dot 1 x Auth Backend Other Requests To Supplicant] (dot1xAuthBackendOtherRequestsToSupplicant)	long	Counts the number of times that the state machine sends an EAP-Request packet (other than an Identity, Notification, Failure or Success message) to the Supplicant (i.e., executes txReq on entry to the REQUEST state). Indicates that the Authenticator chose an EAP-method.
dot1xAuthBackendResponses [Dot 1 x Auth Backend Responses] (dot1xAuthBackendResponses)	long	Counts the number of times that the state machine sends an initial Access-Request packet to the Authentication server (i.e., executes sendRespToServer on entry to the RESPONSE state). Indicates that the Authenticator attempted communication with the Authentication Server.
dot1xAuthEapLogoffsWhileConnecting [Dot 1 x Auth Eap Logoffs While Connecting] (dot1xAuthEapLogoffsWhileConnecting)	long	Counts the number of times that the state machine transitions from CONNECTING to DISCONNECTED as a result of receiving an EAPOL-Logoff message.
dot1xAuthEntersAuthenticating [Dot 1 x Auth Enters Authenticating] (dot1xAuthEntersAuthenticating)	long	Counts the number of times that the state machine transitions from CONNECTING to AUTHENTICATING, as a result of an EAP-Response/Identity message being received from the Supplicant.

Table 200 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEntersConnecting [Dot 1 x Auth Enters Connecting] (dot1xAuthEntersConnecting)	long	Counts the number of times that the state machine transitions to the CONNECTING state from any other state.
<p>PaePortAuthenticatorSessionStats MIB entry name: dot1xAuthSessionStatsEntry Entry description: The session statistics information for an Authenticator PAE. This shows the current values being collected for each session that is still in progress, or the final values for the last valid session on each port where there is no session currently active. Table description (for dot1xAuthSessionStatsTable): A table that contains the session statistics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself. Supports realtime plotting Supports scheduled collection Monitored classes: • equipment.ManagementPort • equipment.PhysicalPort</p>		
dot1xAuthSessionAuthenticMethod [Dot 1 x Auth Session Authentic Method] (dot1xAuthSessionAuthenticMethod)	int	The authentication method used to establish the session.
dot1xAuthSessionFramesRx [Dot 1 x Auth Session Frames Rx] (dot1xAuthSessionFramesRx)	long	The number of user data frames received on this Port during the session.
dot1xAuthSessionFramesTx [Dot 1 x Auth Session Frames Tx] (dot1xAuthSessionFramesTx)	long	The number of user data frames transmitted on this Port during the session.
dot1xAuthSessionOctetsRx [Dot 1 x Auth Session Octets Rx] (dot1xAuthSessionOctetsRx)	java. math. BigInte- ger	The number of octets received in user data frames on this Port during the session.

Table 200 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthSessionOctetsTx [Dot 1 x Auth Session Octets Tx] (dot1xAuthSessionOctetsTx)	java. math. BigInteger	The number of octets transmitted in user data frames on this Port during the session.
dot1xAuthSessionTerminateCause [Dot 1 x Auth Session Terminate Cause] (dot1xAuthSessionTerminateCause)	int	The reason for the session termination.
dot1xAuthSessionTime [Dot 1 x Auth Session Time] (dot1xAuthSessionTime)	long	The duration of the session in seconds.
<p>PaePortAuthenticatorStats MIB entry name: dot1xAuthStatsEntry Entry description: The statistics information for an Authenticator PAE. Table description (for dot1xAuthStatsTable): A table that contains the statistics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort </p>		
dot1xAuthEapLengthErrorFramesRx [Dot 1 x Auth Eap Length Error Frames Rx] (dot1xAuthEapLengthErrorFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the Packet Body Length field is invalid.
dot1xAuthEapolFramesRx [Dot 1 x Auth Eapol Frames Rx] (dot1xAuthEapolFramesRx)	long	The number of valid EAPOL frames of any type that have been received by this Authenticator.

Table 200 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEapolFramesTx [Dot 1 x Auth Eapol Frames Tx] (dot1xAuthEapolFramesTx)	long	The number of EAPOL frames of any type that have been transmitted by this Authenticator.
dot1xAuthEapolLogoffFramesRx [Dot 1 x Auth Eapol Logoff Frames Rx] (dot1xAuthEapolLogoffFramesRx)	long	The number of EAPOL Logoff frames that have been received by this Authenticator.
dot1xAuthEapolReqFramesTx [Dot 1 x Auth Eapol Req Frames Tx] (dot1xAuthEapolReqFramesTx)	long	The number of EAP Request frames (other than Rq/Id frames) that have been transmitted by this Authenticator.
dot1xAuthEapolReqIdFramesTx [Dot 1 x Auth Eapol Req Id Frames Tx] (dot1xAuthEapolReqIdFramesTx)	long	The number of EAP Req/Id frames that have been transmitted by this Authenticator.
dot1xAuthEapolRespFramesRx [Dot 1 x Auth Eapol Resp Frames Rx] (dot1xAuthEapolRespFramesRx)	long	The number of valid EAP Response frames (other than Resp/Id frames) that have been received by this Authenticator.
dot1xAuthEapolRespIdFramesRx [Dot 1 x Auth Eapol Resp Id Frames Rx] (dot1xAuthEapolRespIdFramesRx)	long	The number of EAP Resp/Id frames that have been received by this Authenticator.
dot1xAuthEapolStartFramesRx [Dot 1 x Auth Eapol Start Frames Rx] (dot1xAuthEapolStartFramesRx)	long	The number of EAPOL Start frames that have been received by this Authenticator.
dot1xAuthInvalidEapolFramesRx [Dot 1 x Auth Invalid Eapol Frames Rx] (dot1xAuthInvalidEapolFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the frame type is not recognized.
dot1xAuthLastEapolFrameVersion [Dot 1 x Auth Last Eapol Frame Version] (dot1xAuthLastEapolFrameVersion)	long	The protocol version number carried in the most recently received EAPOL frame.

Table 201 pim statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceAdditionalStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface</p>		
bootstrapExpPolicyDrops [Bootstrap Exp Policy Drops] (vRtrPimNgIfBtrExpPolicyDrops)	long	The value of vRtrPimNgIfBtrExpPolicyDrops indicates the number of Bootstrap Messages that were not transmitted on this interface because of Bootstrap export policy. PIM Bootstrap export policies are configured using bootstrap export policy objects in vRtrPimNgGenPolicyTable.
bootstrapImpPolicyDrops [Bootstrap Imp Policy Drops] (vRtrPimNgIfBtrImpPolicyDrops)	long	The value of vRtrPimNgIfBtrImpPolicyDrops indicates the number of Bootstrap Messages received on this interface but were dropped because of Bootstrap import policy. PIM Bootstrap import policies are configured using bootstrap import policy objects in vRtrPimNgGenPolicyTable.
joinPolicyDrops [Join Policy Drops] (vRtrPimNgIfJoinPolicyDrops)	long	The value of vRtrPimNgIfJoinPolicyDrops indicates the number of times the join policy match resulted in dropping PIM Join-Prune Message or one of the source group contained in the message. PIM Join policies are configured using join policy objects in vRtrPimNgGenPolicyTable.
registerPolicyDrops [Register Policy Drops] (vRtrPimNgIfRegisterPolicyDrops)	long	The value of vRtrPimNgIfRegisterPolicyDrops indicates the number of times the register policy match resulted in dropping PIM Register Message. PIM Register policies are configured using the register policy objects in vRtrPimNgGenPolicyTable.
rxBSMNoRouterAlertDrops [Rx BSMNo Router Alert Drops] (vRtrPimNgIfRxBSMNoRouterAlertDrops)	long	The value of vRtrPimNgIfRxBSMNoRouterAlertDrops indicates the number of BSM messages that were dropped because router alert option was not present.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBSMWrongIfDrops [Rx BSMWrong If Drops] (vRtrPimNgIfRxBSMWrongIfDrops)	long	The value of vRtrPimNgIfRxBSMWrongIfDrops indicates the number of BSM messages that were dropped either because they were not sent by the correct RPF neighbor or because they arrived on the wrong interface.
rxInvalidJoinPrunes [Rx Invalid Join Prunes] (vRtrPimNgIfRxInvalidJoinPrunes)	long	The value of vRtrPimNgIfRxInvalidJoinPrunes indicates the number of invalid PIM Join Prune messages received on this interface. A Join Prune message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidJoinPrune notification is sent.
rxInvalidRegisters [Rx Invalid Registers] (vRtrPimNgIfRxInvalidRegisters)	long	The value of vRtrPimNgIfRxInvalidRegisters indicates the number of invalid PIM Register messages received on this interface. A Register message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidRegister notification is sent.
rxJoinPruneErrs [Rx Join Prune Errs] (vRtrPimNgIfRxJoinPruneErrs)	long	The value of vRtrPimNgIfRxJoinPruneErrs indicates the number of errors while processing Join-Prune messages received on this interface.
rxJoinPrunes [Rx Join Prunes] (vRtrPimNgIfRxJoinPrunes)	long	The value of vRtrPimNgIfRxJoinPrunes indicates the number of PIM Join Prune messages received on this interface.
txJoinPrunes [Tx Join Prunes] (vRtrPimNgIfTxJoinPrunes)	long	The value of vRtrPimNgIfTxJoinPrunes indicates the number of PIM Join Prune messages transmitted on this interface.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats</p> <p>MIB entry name: vRtrPimNgIfStatsEntry</p> <p>Entry description: An entry in the vRtrPimNgIfStatsTable.</p> <p>Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: pim.Interface</p>		
bsmErrs [Bsm Errs] (vRtrPimNgIfTxBsmErrs)	long	The value of vRtrPimNgIfTxBsmErrs indicates the number of errors while transmitting PIM Bootstrap Messages (BSM) on this interface.
bsmPdus [Bsm Pdus] (vRtrPimNgIfTxBsmPdus)	long	The value of vRtrPimNgIfTxBsmPdus indicates the number of PIM Bootstrap Messages (BSM) transmitted on this interface.
mcacPolicyDrops [Mcac Policy Drops] (vRtrPimNgIfMcacPolicyDrops)	long	The value of the object vRtrPimNgIfMcacPolicyDrops indicates the number times a PIM Group is dropped because of applying a multicast CAC policy on this interface.
registerStopErrs [Register Stop Errs] (vRtrPimNgIfTxRegisterStopErrs)	long	The value of vRtrPimNgIfTxRegisterStopErrs indicates the number of PIM errors while trasmitting PIM Register Stop messages on this interface.
registerStops [Register Stops] (vRtrPimNgIfTxRegisterStops)	long	The value of vRtrPimNgIfTxRegisterStops indicates the number of PIM Register Stop messages transmitted on this interface.
rxAssertErrs [Rx Assert Errs] (vRtrPimNgIfRxAssertErrs)	long	The value of vRtrPimNgIfRxAssertErrs indicates the number of errors while processing Assert messages received on this interface.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxAsserts [Rx Asserts] (vRtrPimNgIfRxAsserts)	long	The value of vRtrPimNgIfRxAsserts indicates the number of PIM Assert messages received on this interface.
rxAutoRpAnnounce [Rx Auto Rp Announce] (vRtrPimNgIfRxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounce indicates the number Auto-RP announcements received on this interface.
rxAutoRpAnnounceErrs [Rx Auto Rp Announce Errs] (vRtrPimNgIfRxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounceErrs indicates the number of errors while processing Auto-RP announcements received on this interface.
rxAutoRpGenErrs [Rx Auto Rp Gen Errs] (vRtrPimNgIfRxAutoRpGenErrs)	long	The value of the object vRtrPimNgIfRxAutoRpGenErrs indicates the number of errors while processing Auto-RP messages received on this interface.
rxAutoRpMapping [Rx Auto Rp Mapping] (vRtrPimNgIfRxAutoRpMapping)	long	The value of the object vRtrPimNgIfRxAutoRpMapping indicates the number of Auto-RP mappings received on this interface.
rxAutoRpMappingErrs [Rx Auto Rp Mapping Errs] (vRtrPimNgIfRxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfRxAutoRpMappingErrs indicates the number of errors while processing Auto-RP mappings received on this interface.
rxBadChecksumDiscards [Rx Bad Checksum Discards] (vRtrPimNgIfRxBadChecksumDiscard)	long	The value of vRtrPimNgIfRxBadChecksumDiscard indicates the number of PIM messages received on this interface which were discarded because of bad checksum.
rxBadEncodings [Rx Bad Encodings] (vRtrPimNgIfRxBadEncodings)	long	The value of vRtrPimNgIfRxBadEncodings indicates the number of PIM messages with bad encodings received on this interface.
rxBadVersionDiscards [Rx Bad Version Discards] (vRtrPimNgIfRxBadVersionDiscard)	long	The value of vRtrPimNgIfRxBadVersionDiscard indicates the number of PIM messages with bad versions received on this interface.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBsmPduDrops [Rx Bsm Pdu Drops] (vRtrPimNgIfRxBsmPduDrops)	long	The value of vRtrPimNgIfRxBsmPduDrops indicates the number of Bootstrap Messages received on this interface but were dropped.
rxBsmPdus [Rx Bsm Pdus] (vRtrPimNgIfRxBsmPdus)	long	The value of vRtrPimNgIfRxBsmPdus indicates the number of Bootstrap Messages received on this interface.
rxCRPAdvNoRouterAlert [Rx CRPAdv No Router Alert] (vRtrPimNgIfRxCRPAdvNoRtrAlert)	long	The value of vRtrPimNgIfRxCRPAdvNoRtrAlert indicates the number of Candidate-RP Advertizements(C-RP-Adv) received on this interface which had no router alert option set.
rxHellos [Rx Hellos] (vRtrPimNgIfRxHellos)	long	The value of vRtrPimNgIfRxHellos indicates the number of PIM hello messages received on this interface.
rxHellosDropped [Rx Hellos Dropped] (vRtrPimNgIfRxHellosDropped)	long	The value of vRtrPimNgIfRxHellosDropped indicates the number of PIM Hello messages which were received on this interface but were dropped.
rxNbrUnknown [Rx Nbr Unknown] (vRtrPimNgIfRxNbrUnknown)	long	The value of vRtrPimNgIfRxNbrUnknown indicates the number of PIM messages (other than Hello messages) which were received on this interface and were rejected because the adjacency with the neighbor router was not already established.
rxNullRegisters [Rx Null Registers] (vRtrPimNgIfRxNullRegisters)	long	The value of vRtrPimNgIfRxNullRegisters indicates the number of PIM Null Register messages received on this interface.
rxPkts [Rx Pkts] (vRtrPimNgIfRxPkts)	long	The value of vRtrPimNgIfRxPkts indicates the number of multicast data packets received on this interface.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxRegisterErrs [Rx Register Errs] (vRtrPimNgIfRxRegisterErrs)	long	The value of vRtrPimNgIfRxRegisterErrs indicates the number of errors while processing Register messages received on this interface.
rxRegisterStopErrs [Rx Register Stop Errs] (vRtrPimNgIfRxRegisterStopErrs)	long	The value of vRtrPimNgIfRxRegisterStopErrs indicates the number of errors while processing Register Stop messages received on this interface.
rxRegisterStops [Rx Register Stops] (vRtrPimNgIfRxRegisterStops)	long	The value of vRtrPimNgIfRxRegisterStops indicates the number of PIM Register Stop messages received on this interface.
rxRegisters [Rx Registers] (vRtrPimNgIfRxRegisters)	long	The value of vRtrPimNgIfRxRegisters indicates the number of PIM Register messages received on this interface.
rxUnknownPdus [Rx Unknown Pdus] (vRtrPimNgIfRxUnknownPdus)	long	The value of vRtrPimNgIfRxUnknownPdus indicates the number of packets received with an unsupported PIM type.
sgTypes [Sg Types] (vRtrPimNgIfSGTypes)	long	The value of vRtrPimNgIfSGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'sg'.
starGTypes [Star GTypes] (vRtrPimNgIfStarGTypes)	long	The value of vRtrPimNgIfStarGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgIfStarStarRPTypes)	long	The value of vRtrPimNgIfStarStarRPTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIfGrpSrcType is 'starStarRP'.
txAsserts [Tx Asserts] (vRtrPimNgIfTxAsserts)	long	The value of vRtrPimNgIfTxAsserts indicates the number of PIM Assert messages transmitted on this interface.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txAutoRpAnnounce [Tx Auto Rp Announce] (vRtrPimNgIfTxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounce indicates the number of Auto-RP announcements transmitted on this interface.
txAutoRpAnnounceErrs [Tx Auto Rp Announce Errs] (vRtrPimNgIfTxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounceErrs indicates the number of errors while transmitting Auto-RP announcements on this interface.
txAutoRpMapping [Tx Auto Rp Mapping] (vRtrPimNgIfTxAutoRpMapping)	long	The value of the object vRtrPimNgIfTxAutoRpMapping indicates the number of Auto-RP mappings transmitted on this interface.
txAutoRpMappingErrs [Tx Auto Rp Mapping Errs] (vRtrPimNgIfTxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfTxAutoRpMappingErrs indicates the number of errors while transmitting Auto-RP mappings on this interface.
txHellos [Tx Hellos] (vRtrPimNgIfTxHellos)	long	The value of vRtrPimNgIfTxHellos indicates the number of PIM Hello messages transmitted on this interface.
txPkts [Tx Pkts] (vRtrPimNgIfTxPkts)	long	The value of vRtrPimNgIfTxPkts indicates the number of multicast data packets transmitted on this interface.
<p>PimGenSiteStats</p> <p>MIB entry name: vRtrPimNgGenStatEntry</p> <p>Entry description: An entry in the vRtrPimNgGenStatTable.</p> <p>Table description (for vRtrPimNgGenStatTable): vRtrPimNgGenStatTable lists PIM statistics for a particular PIM instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • pim.Site • pim.SiteExtension 		

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardCrpaDrops [Forward Crpa Drops] (vRtrPimNgGenStatFwdCrpaDrops)	long	The value of vRtrPimNgGenStatFwdCrpaDrops indicates the number of times the Candidate-RP Advertisements(C-RP-Adv) could not be forwarded by the router.
forwardCrpaPdus [Forward Crpa Pdu] (vRtrPimNgGenStatForwardCrpaPdus)	long	The value of vRtrPimNgGenStatForwardCrpaPdus indicates the number of Candidate-RP Advertisements(C-RP-Adv) that were forwarded by the router. C-RP-Adv's are forwarded when the received advertisement has a router alert set and the destination address is not the router's local address.
rxActiveMdts [Rx Active Mdts] (vRtrPimNgGenStatRxActiveMdts)	long	The value of vRtrPimNgGenStatRxActiveMdts indicates number of active Mdts on which the PE is receiving packets. This object is applicable to VPRNs only.
rxCrpaPduDrops [Rx Crpa Pdu Drops] (vRtrPimNgGenStatRxCrpaPduDrops)	long	The value of vRtrPimNgGenStatRxCrpaPduDrops indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) received by this instance, but were dropped.
rxCrpaPdus [Rx Crpa Pdu] (vRtrPimNgGenStatRxCrpaPdus)	long	The value of vRtrPimNgGenStatRxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) received by this instance.
rxMdtJoinTlvErrs [Rx Mdt Join Tlv Errs] (vRtrPimNgGenStatRxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatRxMdtJnTlvErrs indicates indicates number of times MDT Join TLVs were dropped due to errors in the received TLV.
rxMdtJoinTlvs [Rx Mdt Join Tlvs] (vRtrPimNgGenStatRxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatRxMdtJoinTlvs indicates the number of times MDT Join TLV were received.
sgTypes [Sg Types] (vRtrPimNgGenStatSGTypes)	long	The value of vRtrPimNgGenStatSGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'sg'.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
starGTypes [Star GTypes] (vRtrPimNgGenStatStarGTypes)	long	The value of vRtrPimNgGenStatStarGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgGenStatStarStarRPTypes)	long	The value of vRtrPimNgGenStatStarStarRPTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starStarRP'.
txActiveMdts [Tx Active Mdts] (vRtrPimNgGenStatTxActiveMdts)	long	The value of vRtrPimNgGenStatTxActiveMdts indicates the number of active MDTs on which the PE is forwarding packets. This object is applicable to VPRNs only.
txCrpaPduErrs [Tx Crpa Pdu Errs] (vRtrPimNgGenStatTxCrpaPduErrs)	long	The value of vRtrPimNgGenStatTxCrpaPduErrs indicates the number of errors while transmitting PIM Candidate-RP Advertisements (C-RP-Adv).
txCrpaPdus [Tx Crpa Pdus] (vRtrPimNgGenStatTxCrpaPdus)	long	The value of vRtrPimNgGenStatTxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) transmitted by this router instance.
txMdtJoinTlvErrs [Tx Mdt Join Tlv Errs] (vRtrPimNgGenStatTxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatTxMdtJnTlvErrs indicates the number of times MDT Join TLV could not be transmitted.
txMdtJoinTlvs [Tx Mdt Join Tlvs] (vRtrPimNgGenStatTxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatTxMdtJoinTlvs indicates the number of times MDT Join TLV were transmitted.
txNullRegisters [Tx Null Registers] (vRtrPimNgGenStatTxNullRegisters)	long	The value of vRtrPimNgGenStatTxNullRegisters indicates the number of PIM Null Register messages transmitted by this instance.
txRegisterErrs [Tx Register Errs] (vRtrPimNgGenStatTxRegisterErrs)	long	The value of vRtrPimNgGenStatTxRegisterErrs indicates the number the times there was an error while transmitting PIM Register messages by this instance.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txRegisterTTL Drops [Tx Register TTL Drops] (vRtrPimNgGenStatTxRegTTL Drops)	long	The value of vRtrPimNgGenStatTxRegTTL Drops indicates the number of multicast data packets which could not be encapsulated in Register messages because the Time To Live (TTL) was zero.
txRegisters [Tx Registers] (vRtrPimNgGenStatTxRegisters)	long	The value of vRtrPimNgGenStatTxRegisters indicates the number of PIM Register messages transmitted by this instance.
<p>PimGroupStats MIB entry name: vRtrPimNgGrpSrcStatEntry Entry description: An entry in the vRtrPimNgGrpSrcStatTable. Table description (for vRtrPimNgGrpSrcStatTable): vRtrPimNgGrpSrcStatTable contains statistics for the entries in the vRtrPimNgGrpSrcTable. These statistics are collected by the forwarding engine. Supports realtime plotting Supports scheduled collection Monitored class: pim.Groups</p>		
discardedPkts [Discarded Pkts] (vRtrPimNgGrpSrcStatDscrdPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatDscrdPkts indicates the number of multicast packets that matched this source group entry but were discarded. For (S,G) entries, if the traffic is getting forwarded on the SPT, the packets arriving from the RPT will be discarded.
forwardedOctets [Forwarded Octets] (vRtrPimNgGrpSrcStatFrddedOct)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrddedOct indicates the number of multicast octets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list.
forwardedPkts [Forwarded Pkts] (vRtrPimNgGrpSrcStatFrwddedPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrwddedPkts indicates the number of multicast packets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list. This packet count is calculated before ingress QoS policing or shaping is applied.

Table 201 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rpfMismatches [Rpf Mismatches] (vRtrPimNgGrpSrcStatRPFMsmatch)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatRPFMsmatch indicates the number of multicast packets that matched this source group entry but they did not arrive on the the interface indicated by vRtrPimNgGrpSrcRpfIndex.

Table 202 ptp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPClockPacketStats</p> <p>MIB entry name: tmnxPtpClockPacketStatsEntry</p> <p>Entry description: The tmnxPtpClockPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpClockPacketStatsTable): The tmnxPtpClockPacketStatsTable consists of the packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPClock</p>		
ptpClkPktStatsAnnounce [Ptp Clk Pkt Stats Announce] (tmnxPtpClkPktStatsAnnounce)	long	The value of tmnxPtpClkPktStatsAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpClkPktStatsDelayRequest [Ptp Clk Pkt Stats Delay Request] (tmnxPtpClkPktStatsDelayRequest)	long	The value of tmnxPtpClkPktStatsDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpClkPktStatsDelayResp [Ptp Clk Pkt Stats Delay Resp] (tmnxPtpClkPktStatsDelayResp)	long	The value of tmnxPtpClkPktStatsDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpClkPktStatsDirection [Ptp Clk Pkt Stats Direction] (tmnxPtpClkPktStatsDirection)	int	The value of tmnxPtpClkPktStatsDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpClkPktStatsDropAltMaster [Ptp Clk Pkt Stats Drop Alt Master] (tmnxPtpClkPktStatsDropAltMaster)	long	The value of tmnxPtpClkPktStatsDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsDropBadDomain [Ptp Clk Pkt Stats Drop Bad Domain] (tmnxPtpClkPktStatsDropBadDomain)	long	The value of tmnxPtpClkPktStatsDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOther [Ptp Clk Pkt Stats Drop Other] (tmnxPtpClkPktStatsDropOther)	long	The value of tmnxPtpClkPktStatsDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpClkPktStatsDropBadDomain', 'tmnxPtpClkPktStatsDropAltMaster', 'tmnxPtpClkPktStatsDropOutOfSeq', and 'tmnxPtpClkPktStatsDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOutOfSeq [Ptp Clk Pkt Stats Drop Out Of Seq] (tmnxPtpClkPktStatsDropOutOfSeq)	long	The value of tmnxPtpClkPktStatsDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropPeerShut [Ptp Clk Pkt Stats Drop Peer Shut] (tmnxPtpClkPktStatsDropPeerShut)	long	The value of tmnxPtpClkPktStatsDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsFollowUp [Ptp Clk Pkt Stats Follow Up] (tmnxPtpClkPktStatsFollowUp)	long	The value of tmnxPtpClkPktStatsFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpClkPktStatsOther [Ptp Clk Pkt Stats Other] (tmnxPtpClkPktStatsOther)	long	The value of tmnxPtpClkPktStatsOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpClkPktStatsOtherTLVs [Ptp Clk Pkt Stats Other TLVs] (tmnxPtpClkPktStatsOtherTLVs)	long	The value of tmnxPtpClkPktStatsOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsSignaling [Ptp Clk Pkt Stats Signaling] (tmnxPtpClkPktStatsSignaling)	long	The value of tmnxPtpClkPktStatsSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpClkPktStatsSync [Ptp Clk Pkt Stats Sync] (tmnxPtpClkPktStatsSync)	long	The value of tmnxPtpClkPktStatsSync indicates the accumulated packet statistics for PTP Sync messages.
ptpClkPktStatsUniAckCnclAnno [Ptp Clk Pkt Stats Uni Ack Cncl Anno] (tmnxPtpClkPktStatsUniAckCnclAnno)	long	The value of tmnxPtpClkPktStatsUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpClkPktStatsUniAckCnclDly [Ptp Clk Pkt Stats Uni Ack Cncl Dly] (tmnxPtpClkPktStatsUniAckCnclDly)	long	The value of tmnxPtpClkPktStatsUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpClkPktStatsUniAckCnclSync [Ptp Clk Pkt Stats Uni Ack Cncl Sync] (tmnxPtpClkPktStatsUniAckCnclSync)	long	The value of tmnxPtpClkPktStatsUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpClkPktStatsUniCancelAnno [Ptp Clk Pkt Stats Uni Cancel Anno] (tmnxPtpClkPktStatsUniCancelAnno)	long	The value of tmnxPtpClkPktStatsUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpClkPktStatsUniCancelDelay [Ptp Clk Pkt Stats Uni Cancel Delay] (tmnxPtpClkPktStatsUniCancelDelay)	long	The value of tmnxPtpClkPktStatsUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpClkPktStatsUniCancelSync [Ptp Clk Pkt Stats Uni Cancel Sync] (tmnxPtpClkPktStatsUniCancelSync)	long	The value of tmnxPtpClkPktStatsUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniDenyAnno [Ptp Clk Pkt Stats Uni Deny Anno] (tmnxPtpClkPktStatsUniDenyAnno)	long	The value of tmnxPtpClkPktStatsUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenyDelRsp [Ptp Clk Pkt Stats Uni Deny Del Rsp] (tmnxPtpClkPktStatsUniDenyDelRsp)	long	The value of tmnxPtpClkPktStatsUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenySync [Ptp Clk Pkt Stats Uni Deny Sync] (tmnxPtpClkPktStatsUniDenySync)	long	The value of tmnxPtpClkPktStatsUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniGrantAnno [Ptp Clk Pkt Stats Uni Grant Anno] (tmnxPtpClkPktStatsUniGrantAnno)	long	The value of tmnxPtpClkPktStatsUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantDelRsp [Ptp Clk Pkt Stats Uni Grant Del Rsp] (tmnxPtpClkPktStatsUniGrantDelRsp)	long	The value of tmnxPtpClkPktStatsUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantSync [Ptp Clk Pkt Stats Uni Grant Sync] (tmnxPtpClkPktStatsUniGrantSync)	long	The value of tmnxPtpClkPktStatsUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniReqAnno [Ptp Clk Pkt Stats Uni Req Anno] (tmnxPtpClkPktStatsUniReqAnno)	long	The value of tmnxPtpClkPktStatsUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpClkPktStatsUniReqDelayRsp [Ptp Clk Pkt Stats Uni Req Delay Rsp] (tmnxPtpClkPktStatsUniReqDelayRsp)	long	The value of tmnxPtpClkPktStatsUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniReqSync [Ptp Clk Pkt Stats Uni Req Sync] (tmnxPtpClkPktStatsUniReqSync)	long	The value of tmnxPtpClkPktStatsUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
PTPClockRecoveryStateStats MIB entry name: tmnxPtpClockRecoveryStatistics Supports realtime plotting Supports scheduled collection Monitored class: ptp.IEEEPTPClock		
tmnxPtpClockRecStatsAcquiring [Tmnx Ptp Clock Rec Stats Acquiring] (tmnxPtpClockRecStatsAcquiring)	java. math. BigInteger	The value of tmnxPtpClockRecStatsAcquiring indicate the number of seconds that the clock recovery system has been in the acquiring state.
tmnxPtpClockRecStatsHoldover [Tmnx Ptp Clock Rec Stats Holdover] (tmnxPtpClockRecStatsHoldover)	java. math. BigInteger	The value of tmnxPtpClockRecStatsHoldover indicate the number of seconds that the clock recovery system has been in the hold-over state.
tmnxPtpClockRecStatsInitial [Tmnx Ptp Clock Rec Stats Initial] (tmnxPtpClockRecStatsInitial)	java. math. BigInteger	The value of tmnxPtpClockRecStatsInitial indicates the number of seconds that the clock recovery system has been in the initial state.
tmnxPtpClockRecStatsLocked [Tmnx Ptp Clock Rec Stats Locked] (tmnxPtpClockRecStatsLocked)	java. math. BigInteger	The value of tmnxPtpClockRecStatsLocked indicate the number of seconds that the clock recovery system has been in the locked state.
tmnxPtpClockRecStatsPhaseTrack [Tmnx Ptp Clock Rec Stats Phase Track] (tmnxPtpClockRecStatsPhaseTrack)	java. math. BigInteger	The value of tmnxPtpClockRecStatsPhaseTrack indicate the number of seconds that the clock recovery system has been in the phase tracking state.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPPeerPacketStats</p> <p>MIB entry name: tmnxPtpPeerPacketStatsEntry</p> <p>Entry description: The tmnxPtpPeerPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpPeerPacketStatsTable): The tmnxPtpPeerPacketStatsTable consists of the per peer packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEEPTPPeer</p>		
ptpPeerPktStatAnnounce [Ptp Peer Pkt Stat Announce] (tmnxPtpPeerPktStatAnnounce)	long	The value of tmnxPtpPeerPktStatAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpPeerPktStatDelayRequest [Ptp Peer Pkt Stat Delay Request] (tmnxPtpPeerPktStatDelayRequest)	long	The value of tmnxPtpPeerPktStatDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpPeerPktStatDelayResp [Ptp Peer Pkt Stat Delay Resp] (tmnxPtpPeerPktStatDelayResp)	long	The value of tmnxPtpPeerPktStatDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpPeerPktStatDirection [Ptp Peer Pkt Stat Direction] (tmnxPtpPeerPktStatDirection)	int	The value of tmnxPtpPeerPktStatDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpPeerPktStatDropAltMaster [Ptp Peer Pkt Stat Drop Alt Master] (tmnxPtpPeerPktStatDropAltMaster)	long	The value of tmnxPtpPeerPktStatDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatDropBadDomain [Ptp Peer Pkt Stat Drop Bad Domain] (tmnxPtpPeerPktStatDropBadDomain)	long	The value of tmnxPtpPeerPktStatDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOther [Ptp Peer Pkt Stat Drop Other] (tmnxPtpPeerPktStatDropOther)	long	The value of tmnxPtpPeerPktStatDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpPeerPktStatDropBadDomain', 'tmnxPtpPeerPktStatDropAltMaster', 'tmnxPtpPeerPktStatDropOutOfSeq', and 'tmnxPtpPeerPktStatDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOutOfSeq [Ptp Peer Pkt Stat Drop Out Of Seq] (tmnxPtpPeerPktStatDropOutOfSeq)	long	The value of tmnxPtpPeerPktStatDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropPeerShut [Ptp Peer Pkt Stat Drop Peer Shut] (tmnxPtpPeerPktStatDropPeerShut)	long	The value of tmnxPtpPeerPktStatDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatFollowUp [Ptp Peer Pkt Stat Follow Up] (tmnxPtpPeerPktStatFollowUp)	long	The value of tmnxPtpPeerPktStatFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpPeerPktStatOther [Ptp Peer Pkt Stat Other] (tmnxPtpPeerPktStatOther)	long	The value of tmnxPtpPeerPktStatOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpPeerPktStatOtherTLVs [Ptp Peer Pkt Stat Other TLVs] (tmnxPtpPeerPktStatOtherTLVs)	long	The value of tmnxPtpPeerPktStatOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatSignaling [Ptp Peer Pkt Stat Signaling] (tmnxPtpPeerPktStatSignaling)	long	The value of tmnxPtpPeerPktStatSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpPeerPktStatSync [Ptp Peer Pkt Stat Sync] (tmnxPtpPeerPktStatSync)	long	The value of tmnxPtpPeerPktStatSync indicates the accumulated packet statistics for PTP Sync messages.
ptpPeerPktStatUniAckCnclAnno [Ptp Peer Pkt Stat Uni Ack Cncl Anno] (tmnxPtpPeerPktStatUniAckCnclAnno)	long	The value of tmnxPtpPeerPktStatUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpPeerPktStatUniAckCnclDly [Ptp Peer Pkt Stat Uni Ack Cncl Dly] (tmnxPtpPeerPktStatUniAckCnclDly)	long	The value of tmnxPtpPeerPktStatUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpPeerPktStatUniAckCnclSync [Ptp Peer Pkt Stat Uni Ack Cncl Sync] (tmnxPtpPeerPktStatUniAckCnclSync)	long	The value of tmnxPtpPeerPktStatUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpPeerPktStatUniCancelAnno [Ptp Peer Pkt Stat Uni Cancel Anno] (tmnxPtpPeerPktStatUniCancelAnno)	long	The value of tmnxPtpPeerPktStatUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpPeerPktStatUniCancelDelay [Ptp Peer Pkt Stat Uni Cancel Delay] (tmnxPtpPeerPktStatUniCancelDelay)	long	The value of tmnxPtpPeerPktStatUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpPeerPktStatUniCancelSync [Ptp Peer Pkt Stat Uni Cancel Sync] (tmnxPtpPeerPktStatUniCancelSync)	long	The value of tmnxPtpPeerPktStatUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniDenyAnno [Ptp Peer Pkt Stat Uni Deny Anno] (tmnxPtpPeerPktStatUniDenyAnno)	long	The value of tmnxPtpPeerPktStatUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenyDelRsp [Ptp Peer Pkt Stat Uni Deny Del Rsp] (tmnxPtpPeerPktStatUniDenyDelRsp)	long	The value of tmnxPtpPeerPktStatUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenySync [Ptp Peer Pkt Stat Uni Deny Sync] (tmnxPtpPeerPktStatUniDenySync)	long	The value of tmnxPtpPeerPktStatUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniGrantAnno [Ptp Peer Pkt Stat Uni Grant Anno] (tmnxPtpPeerPktStatUniGrantAnno)	long	The value of tmnxPtpPeerPktStatUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantDelRsp [Ptp Peer Pkt Stat Uni Grant Del Rsp] (tmnxPtpPeerPktStatUniGrantDelRsp)	long	The value of tmnxPtpPeerPktStatUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantSync [Ptp Peer Pkt Stat Uni Grant Sync] (tmnxPtpPeerPktStatUniGrantSync)	long	The value of tmnxPtpPeerPktStatUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniReqAnno [Ptp Peer Pkt Stat Uni Req Anno] (tmnxPtpPeerPktStatUniReqAnno)	long	The value of tmnxPtpPeerPktStatUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpPeerPktStatUniReqDelayRsp [Ptp Peer Pkt Stat Uni Req Delay Rsp] (tmnxPtpPeerPktStatUniReqDelayRsp)	long	The value of tmnxPtpPeerPktStatUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.

Table 202 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniReqSync [Ptp Peer Pkt Stat Uni Req Sync] (tmnxPtpPeerPktStatUniReqSync)	long	The value of tmnxPtpPeerPktStatUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
ptpPeerPktStatsTimeStampCpm [Ptp Peer Pkt Stats Time Stamp Cpm] (tmnxPtpPeerPktStatTimeStampCpm)	long	The value of tmnxPtpPeerPktStatTimeStampCpm indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the operating system kernel.
ptpPeerPktStatsTimeStampPort [Ptp Peer Pkt Stats Time Stamp Port] (tmnxPtpPeerPktStatTimeStampPort)	long	The value of tmnxPtpPeerPktStatTimeStampPort indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the physical layer.

Table 203 rsvp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AuthenticationKeyStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Entries in this table cannot be created and deleted via SNMP SET operations. An entry in this table is created by the agent when the RSVP protocol is configured on a virtual router interface. The entry is destroyed when RSVP is removed from the interface.</p> <p>Table description (for vRtrRsvplfStatTable): The vRtrRsvplfStatTable contains objects for reporting statistics associated with an interface running RSVP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.AuthenticationKey</p>		
errorPacketsReceived [Error Packets Received] (vRtrRsvplfStatRxAuthErrors)	java. math. BigInteger	The total number of RSVP packets with MD5 errors received on this RSVP interface.
errorPacketsTransmitted [Error Packets Transmitted] (vRtrRsvplfStatTxAuthErrors)	java. math. BigInteger	The total number of RSVP packets with MD5 errors sent by this RSVP interface.
<p>RsvpInterfaceReceiveStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Entries in this table cannot be created and deleted via SNMP SET operations. An entry in this table is created by the agent when the RSVP protocol is configured on a virtual router interface. The entry is destroyed when RSVP is removed from the interface.</p> <p>Table description (for vRtrRsvplfStatTable): The vRtrRsvplfStatTable contains objects for reporting statistics associated with an interface running RSVP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Interface</p>		

Table 203 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
acks [Acks] (vRtrRsvplfStatRxAcks)	java. math. BigInteger	The total number of RSVP ACK messages received when refresh reduction is enabled on this RSVP interface.
bundles [Bundles] (vRtrRsvplfStatRxBundles)	java. math. BigInteger	The total number of RSVP bundled packets received on this RSVP interface. Bundled packets are sent when refresh reduction is enabled.
errorPackets [Error Packets] (vRtrRsvplfStatRxErrorPkts)	java. math. BigInteger	The total number of RSVP packets with errors received on this RSVP interface.
helloTimeout [Hello Timeout] (vRtrRsvplfStatHelloTimeout)	long	The total number of hello messages that timed out on this RSVP interface.
hellos [Hellos] (vRtrRsvplfStatRxHelloReqs)	java. math. BigInteger	The total number of RSVP HELLO REQ messages received on this RSVP interface.
packets [Packets] (vRtrRsvplfStatRxPkts)	java. math. BigInteger	The total number of error free RSVP packets received on this RSVP interface.
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.

Table 203 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.
totalPackets [Total Packets] (vRtrRsvplfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.

Table 203 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>RsvpInterfaceStats</p> <p>MIB entry name: vRtrRsvplfEntry</p> <p>Entry description: Each row entry in the vRtrRsvplfTable represents additional columns for attributes specific to the Nokia 7x50 SR RSVP implementation.</p> <p>Table description (for vRtrRsvplfTable): The vRtrRsvplfTable provides an extension of the rsvplfTable in the RSVP-MIB.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Interface</p>		
activeReservations [Active Reservations] (vRtrRsvplfActiveReservationCount)	long	The total number of active RSVP sessions that have reserved bandwidth.
activeSessions [Active Sessions] (vRtrRsvplfActiveSessionCount)	long	The total number of active RSVP sessions on this interface. This count includes sessions that have requested bandwidth as well as sessions that have not requested any bandwidth.
bandwidth [Bandwidth] (vRtrRsvplfBandwidth)	long	The value of vRtrRsvplfBandwidth indicates the interface bandwidth in mega-bits per second (Mbps) for the RSVP protocol on this interface. This is typically the port Speed.
reservedBandwidth [Reserved Bandwidth] (vRtrRsvplfReservedBandwidth)	long	The value of vRtrRsvplfReservedBandwidth specifies the amount of bandwidth in mega-bits per second (Mbps) to reserved by the RSVP sessions on this interface. A value of zero (0) indicates that no bandwidth is reserved.
totalSessions [Total Sessions] (vRtrRsvplfTotalSessionCount)	long	The total number of RSVP sessions on this interface. This count includes sessions that are active as well as sessions that have been signalled but a response has not yet been received.

Table 203 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>RsvpInterfaceTransmitStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Entries in this table cannot be created and deleted via SNMP SET operations. An entry in this table is created by the agent when the RSVP protocol is configured on a virtual router interface. acks [Acks] (vRtrRsvplfStatRxAcks)	java. math. BigInteger	The total number of RSVP ACK messages received when refresh reduction is enabled on this RSVP interface.
bundles [Bundles] (vRtrRsvplfStatRxBundles)	java. math. BigInteger	The total number of RSVP bundled packets received on this RSVP interface. Bundled packets are sent when refresh reduction is enabled.
errorPackets [Error Packets] (vRtrRsvplfStatRxErrorPkts)	java. math. BigInteger	The total number of RSVP packets with errors received on this RSVP interface.
hellos [Hellos] (vRtrRsvplfStatRxHelloReqs)	java. math. BigInteger	The total number of RSVP HELLO REQ messages received on this RSVP interface.
packets [Packets] (vRtrRsvplfStatRxPkts)	java. math. BigInteger	The total number of error free RSVP packets received on this RSVP interface.

Table 203 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.

Table 203 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPackets [Total Packets] (vRtrRsvpIpfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.
<p>RsvpSessionStats</p> <p>MIB entry name: vRtrRsvpSessionStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an RSVP session. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrRsvpSessionStatTable): The vRtrRsvpSessionStatTable contains statistics for an RSVP session.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Session</p>		
detourAge [Detour Age] (vRtrRsvpSessionDetourAge)	long	vRtrRsvpSessionDetourAge is the age (i.e., time from creation till now) of this detour LSP in 10-millisecond periods.
detourTimeUp [Detour Time Up] (vRtrRsvpSessionDetourTimeUp)	long	vRtrRsvpSessionDetourTimeUp is the total time in 10-millisecond units that the detour LSP has been operational.
pathsReceived [Paths Received] (vRtrRsvpSessionRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages received for this RSVP session.
pathsTransmitted [Paths Transmitted] (vRtrRsvpSessionTxPaths)	java. math. BigInteger	The total number of RSVP PATH messages transmitted for this RSVP session.

Table 203 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
refreshPathsReceived [Refresh Paths Received] (vRtrRsvpSessionRxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshPaths indicates the number of times PATH was refreshed using message ID from full PATH refresh or Srefresh message for this RSVP session.
refreshPathsTransmitted [Refresh Paths Transmitted] (vRtrRsvpSessionTxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshPaths indicates the number of times PATH refresh for the session was sent as a part of a Srefresh message.
refreshReservesReceived [Refresh Reserves Received] (vRtrRsvpSessionRxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshResvs indicates the number of times RESV was refreshed using message ID from full RESV refresh or Srefresh message for this RSVP session.
refreshReservesTransmitted [Refresh Reserves Transmitted] (vRtrRsvpSessionTxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshResvs indicates the number of times RESV refresh for the session was sent as a part of a Srefresh message.
reservesReceived [Reserves Received] (vRtrRsvpSessionRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages received for this RSVP session.
reservesTransmitted [Reserves Transmitted] (vRtrRsvpSessionTxResvs)	java. math. BigInteger	The total number of RSVP RESV messages transmitted for this RSVP session.

Table 204 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DhcpRelayStats</p> <p>MIB entry name: vRtrIfDHCPRelayStatsEntry</p> <p>Entry description: Each row entry represents information related to DHCP Relay statistics for a virtual router interface in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrIfDHCPRelayStatsTable): The vRtrIfDHCPRelayStatsTable contains the statistics for the DHCP Relay agent.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.DhcpRelayConfiguration • rtr.GrpIfDhcpRelayCfg • rtr.SubIfDhcpRelayCfg 		
authPktsDiscarded [Auth Pkts Discarded] (vRtrIfDHCPRelayAuthPktsDiscarded)	long	vRtrIfDHCPRelayAuthPktsDiscarded indicates the total number of packets discarded because authentication was not successful.
authPktsSuccess [Auth Pkts Success] (vRtrIfDHCPRelayAuthPktsSuccess)	long	vRtrIfDHCPRelayAuthPktsSuccess indicates the total number of packets for which authentication was successful.
clientPacketsDiscarded [Client Packets Discarded] (vRtrIfDHCPRelayClientPktsDiscarded)	long	vRtrIfDHCPRelayClientPktsDiscarded indicates the total number of client packets discarded by the DHCP relay agent.
clientPacketsRelayed [Client Packets Relayed] (vRtrIfDHCPRelayClientPktsRelayed)	long	vRtrIfDHCPRelayClientPktsRelayed indicates the total number of client packets relayed by the DHCP relay agent.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
clientPktsProxLS [Client Pkts Prox LS] (vRtrIfDHCPRelayClientPktsProxLS)	long	vRtrIfDHCPRelayClientPktsProxLS indicates the total number of client packets proxied by the DHCP relay agent based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
clientPktsProxRad [Client Pkts Prox Rad] (vRtrIfDHCPRelayClientPktsProxRad)	long	vRtrIfDHCPRelayClientPktsProxRad indicates the total number of client packets proxied by the DHCP relay agent based on data received from a RADIUS server.
pktsGenForceRenew [Pkts Gen Force Renew] (vRtrIfDHCPRelayPktsGenForceRenew)	long	vRtrIfDHCPRelayPktsGenForceRenew indicates the total number of DHCP FORCERENEW messages spoofed by the DHCP relay agent to the DHCP clients.
pktsGenRelease [Pkts Gen Release] (vRtrIfDHCPRelayPktsGenRelease)	long	vRtrIfDHCPRelayPktsGenRelease indicates the total number of DHCP RELEASE messages spoofed by the DHCP relay agent to the DHCP server.
receivedMalformedPackets [Received Malformed Packets] (vRtrIfDHCPRelayRxMalformedPkts)	long	vRtrIfDHCPRelayRxMalformedPkts indicates the total number of malformed packets received by the DHCP relay agent.
receivedPackets [Received Packets] (vRtrIfDHCPRelayRxPkts)	long	vRtrIfDHCPRelayRxPkts indicates the total number of packets received by the DHCP relay agent.
receivedUntrustedPackets [Received Untrusted Packets] (vRtrIfDHCPRelayRxUntrustedPkts)	long	vRtrIfDHCPRelayRxUntrustedPkts indicates the total number of untrusted packets received by the DHCP relay agent.
serverPacketsDiscarded [Server Packets Discarded] (vRtrIfDHCPRelayServerPktsDiscarded)	long	vRtrIfDHCPRelayServerPktsDiscarded indicates the total number of server packets discarded by the DHCP relay agent.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
serverPacketsRelayed [Server Packets Relayed] (vRtrIfDHCPRelayServerPktsRelayed)	long	vRtrIfDHCPRelayServerPktsRelayed indicates the total number of server packets relayed by the DHCP relay agent.
serverPktsSnooped [Server Pkts Snooped] (vRtrIfDHCPRelayServerPktsSnooped)	long	vRtrIfDHCPRelayServerPktsSnooped indicates the total number of server packets snooped by the DHCP relay agent.
transmittedPackets [Transmitted Packets] (vRtrIfDHCPRelayTxPkts)	long	vRtrIfDHCPRelayTxPkts indicates the total number of packets transmitted by the DHCP relay agent.
<p>NetworkInterfaceIngressStats MIB entry name: vRtrNetIfIngressStatsEntry Entry description: Each row entry has statistics information for each router interface for each meter configured in the system. Table description (for vRtrNetIfIngressStatsTable): The vRtrNetIfIngressStatsTable has statistics entry for each router interface for each meter configured in the system. Supports realtime plotting Does not support scheduled collection Monitored class: rtr.NetworkInterface</p>		
ingressFwdInProfPkts [Ingress Fwd In Prof Pkts] (vRtrNetIfIngressFwdInProfPkts)	java. math. BigInteger	vRtrNetIfIngressFwdInProfPkts indicates the number of conforming network interface ingress packets forwarded on this router interface using this meter.
ingressFwdOutProfPkts [Ingress Fwd Out Prof Pkts] (vRtrNetIfIngressFwdOutProfPkts)	java. math. BigInteger	vRtrNetIfIngressFwdOutProfPkts indicates the number of exceeding network interface ingress packets forwarded on this router interface using this meter.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressMeterIndex [Ingress Meter Index] (vRtrNetIfIngressMeterIndex)	long	vRtrNetIfIngressMeterIndex serves as the tertiary index. When used in conjunction with vRtrID and vRtrIfIndex, it uniquely identifies a network ingress meter for the specified router interface in the managed system.
<p>RouteStats</p> <p>MIB entry name: vRtrStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrStatTable): The vRtrStatTable has an entry for each virtual router configured in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.VirtualRouter • vprn.DVRSSite • vprn.RoutingInstanceSite • vprn.Site 		
activeARPEntries [Active ARPEntries] (vRtrStatActiveARPEntries)	long	vRtrStatActiveARPEntries indicates the number of active ARP entries for the specified virtual router in the system.
aggregateActiveRoutes [Aggregate Active Routes] (vRtrAggregateActiveRoutes)	long	vRtrAggregateActiveRoutes indicates the current number of active aggregate routes for this instance of the route table.
aggregateRoutes [Aggregate Routes] (vRtrAggregateRoutes)	long	vRtrAggregateRoutes indicates the current number of aggregate routes for this instance of the route table.
bgpActiveRoutes [Bgp Active Routes] (vRtrBGPActiveRoutes)	long	vRtrBGPActiveRoutes indicates the current number of active bgp routes for this instance of the route table.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
bgpRoutes [Bgp Routes] (vRtrBGPRoutes)	long	vRtrBGPRoutes indicates the current number of bgp routes for this instance of the route table.
bgpVpnActiveRoutes [Bgp Vpn Active Routes] (vRtrStatBGPVpnActiveRoutes)	long	vRtrStatBGPVpnActiveRoutes indicates the current number of active VPN-IPV4 routes learned by MP-BGP for this virtual router.
bgpVpnRoutes [Bgp Vpn Routes] (vRtrStatBGPVpnRoutes)	long	vRtrStatBGPVpnRoutes indicates the current number of VPN-IPV4 routes learned by MP-BGP for this virtual router.
directActiveRoutes [Direct Active Routes] (vRtrDirectActiveRoutes)	long	vRtrDirectActiveRoutes indicates the current number of active direct routes for this instance of the route table.
directRoutes [Direct Routes] (vRtrDirectRoutes)	long	vRtrDirectRoutes indicates the current number of direct routes for this instance of the route table.
illegalLabelsReceived [Illegal Labels Received] (vRtrStatIllegalLabels)	long	vRtrStatIllegalLabels indicates the number of illegally received labels on this virtual router.
isisActiveRoutes [Isis Active Routes] (vRtrISISActiveRoutes)	long	vRtrISISActiveRoutes indicates the current number of active isis routes for this instance of the route table.
isisRoutes [Isis Routes] (vRtrISISRoutes)	long	vRtrISISRoutes indicates the current number of isis routes for this instance of the route table.
ldpActiveTunnels [Ldp Active Tunnels] (vRtrStatActiveLdpTunnels)	long	vRtrStatActiveLdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'ldp'.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ldpTunnels [Ldp Tunnels] (vRtrStatTotalLdpTunnels)	long	vRtrStatTotalLdpTunnels indicates the current number of both active and inactive LDP tunnels.
ospfActiveRoutes [Ospf Active Routes] (vRtrOSPFActiveRoutes)	long	vRtrOSPFActiveRoutes indicates the current number of active ospf routes for this instance of the route table.
ospfRoutes [Ospf Routes] (vRtrOSPFRoutes)	long	vRtrOSPFRoutes indicates the current number of ospf routes for this instance of the route table.
routerInterfacesActive [Router Interfaces Active] (vRtrStatActiveIfs)	long	vRtrStatActiveIfs indicates the current number of router interfaces with vRtrIfAdminState equal 'inService' on this virtual router.
routerInterfacesConfigured [Router Interfaces Configured] (vRtrStatConfiguredIfs)	long	vRtrStatConfiguredIfs indicates the current number of router interfaces configured on this virtual router.
routesInVrf [Routes In Vrf] (vRtrStatCurrNumRoutes)	long	vRtrStatCurrNumRoutes indicates the current number of routes in the VRF for this virtual router.
sdpActiveTunnels [Sdp Active Tunnels] (vRtrStatActiveSdpTunnels)	long	vRtrStatActiveSdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'sdp'.
sdpTunnels [Sdp Tunnels] (vRtrStatTotalSdpTunnels)	long	vRtrStatTotalSdpTunnels indicates the current number of both active and inactive SDP tunnels.
staticActiveRoutes [Static Active Routes] (vRtrStaticActiveRoutes)	long	vRtrStaticActiveRoutes indicates the current number of active static routes for this instance of the route table.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
staticRoutes [Static Routes] (vRtrStaticRoutes)	long	vRtrStaticRoutes indicates the current number of static routes for this instance of the route table.
totalARPEntries [Total ARPEntries] (vRtrStatTotalARPEntries)	long	vRtrStatTotalARPEntries indicates the total number of active and inactive ARP entries for the specified virtual router in the system.
<p>VirtualInterfaceIcmp6InStats MIB entry name: vRtrIfIcmp6Entry Entry description: Each row entry represents the ICMP statistics of a virtual router interface. Entries are created and deleted when entries in the vRtrIfTable are created and deleted. Table description (for vRtrIfIcmp6Table): The vRtrIfIcmp6Table table contains statistics of ICMPv6 messages that are received and sourced by a router interface. Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualInterfaceIcmp6Configuration</p>		
inDestinationUnreachable [In Destination Unreachable] (vRtrIfIcmp6InDestUnreachs)	long	The value of vRtrIfIcmp6InDestUnreachs indicates the number of ICMP Destination Unreachable messages received by this interface.
inEchoReplies [In Echo Replies] (vRtrIfIcmp6InEchoReplies)	long	The value of vRtrIfIcmp6InEchoReplies indicates the number of ICMP Echo Reply messages received by this interface.
inEchoRequests [In Echo Requests] (vRtrIfIcmp6InEchos)	long	The value of vRtrIfIcmp6InEchos indicates the number of ICMP Echo (request) messages received by this interface.
inErrors [In Errors] (vRtrIfIcmp6InErrors)	long	The value of vRtrIfIcmp6InErrors indicates the number of ICMP messages which this interface received but determined as having ICMP-specific errors (bad ICMP checksums, bad length , etc.).

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inNeighborAdvertisements [In Neighbor Advertisements] (vRtrIfIcmp6InNbrAdvertisements)	long	The value of vRtrIfIcmp6InNbrAdvertisements indicates the number of ICMP Neighbor Advertisement messages received by this interface.
inNeighborSolicits [In Neighbor Solicits] (vRtrIfIcmp6InNbrSolicits)	long	The value of vRtrIfIcmp6InNbrSolicits indicates the number of ICMP Neighbor Solicit messages received by this interface.
inPacketTooBig [In Packet Too Big] (vRtrIfIcmp6InPktTooBigs)	long	The value of vRtrIfIcmp6InPktTooBigs indicates the number of ICMP Packet Too Big messages received by this interface.
inRedirects [In Redirects] (vRtrIfIcmp6InRedirects)	long	The value of vRtrIfIcmp6InRedirects indicates number of ICMP Redirect messages received by this interface.
inRouterAdvertisements [In Router Advertisements] (vRtrIfIcmp6InRtrAdvertisements)	long	The value of vRtrIfIcmp6InRtrAdvertisements indicates the number of ICMP Router Advertisement messages received by this interface.
inRouterSolicits [In Router Solicits] (vRtrIfIcmp6InRtrSolicits)	long	The value of vRtrIfIcmp6InRtrSolicits indicates the number of ICMP Router Solicit messages received by this interface.
inTimeExceeded [In Time Exceeded] (vRtrIfIcmp6InTimeExcds)	long	The value of vRtrIfIcmp6InTimeExcds indicates the number of ICMP Time Exceeded messages received by this interface.
inTotalMessages [In Total Messages] (vRtrIfIcmp6InMsgs)	long	The value of vRtrIfIcmp6InMsgs indicates the total number of ICMP messages received by this interface which includes all those counted by vRtrIfIcmp6InErrors. Note that this interface is the interface to which the ICMP messages were addressed which may not be necessarily the input interface for the messages.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualInterfaceIcmp6OutStats</p> <p>MIB entry name: vRtrIflcmp6Entry</p> <p>Entry description: Each row entry represents the ICMP statistics of a virtual router interface. Entries are created and deleted when entries in the vRtrIfTable are created and deleted.</p> <p>Table description (for vRtrIflcmp6Table): The vRtrIflcmp6Table table contains statistics of ICMPv6 messages that are received and sourced by a router interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rtr.VirtualInterfaceIcmp6Configuration</p>		
outDestinationUnreachable [Out Destination Unreachable] (vRtrIflcmp6OutDestUnreachs)	long	The value of vRtrIflcmp6OutDestUnreachs indicates the number of ICMP Destination Unreachable messages sent by this interface.
outEchoReplies [Out Echo Replies] (vRtrIflcmp6OutEchoReplies)	long	The value of vRtrIflcmp6OutEchoReplies indicates the number of ICMP Echo Reply messages sent by this interface.
outEchoRequests [Out Echo Requests] (vRtrIflcmp6OutEchos)	long	The value of vRtrIflcmp6OutEchos indicates the number of ICMP Echo Request messages sent by this interface.
outErrors [Out Errors] (vRtrIflcmp6OutErrors)	long	The value of vRtrIflcmp6OutErrors indicates the number of ICMP messages which this interface did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of VRtr IPv6 to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter's value.
outGrpMembQueries [Out Grp Memb Queries] (vRtrIflcmp6OutGrpMembQueries)	long	The value of vRtrIflcmp6OutGrpMembQueries indicates the number of ICMP Group Membership Query messages sent by this interface.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outGrpMembReductions [Out Grp Memb Reductions] (vRtrIfIcmp6OutGrpMembReductions)	long	The value of vRtrIfIcmp6OutGrpMembReductions indicates the number of ICMP Group Membership Reduction messages sent by this interface.
outGrpMembResponses [Out Grp Memb Responses] (vRtrIfIcmp6OutGrpMembResponses)	long	The value of vRtrIfIcmp6OutGrpMembResponses indicates the number of ICMP Group Membership Response messages sent by this interface.
outNeighborAdvertisements [Out Neighbor Advertisements] (vRtrIfIcmp6OutNbrAdvertisements)	long	The value of vRtrIfIcmp6OutNbrAdvertisements indicates the number of ICMP Neighbor Advertisement messages sent by this interface.
outNeighborSolicits [Out Neighbor Solicits] (vRtrIfIcmp6OutNbrSolicits)	long	The value of vRtrIfIcmp6OutNbrSolicits indicates the number of ICMP Neighbor Solicitation messages sent by this interface.
outPacketTooBig [Out Packet Too Big] (vRtrIfIcmp6OutPktTooBigs)	long	The value of vRtrIfIcmp6OutPktTooBigs indicates the number of ICMP Packet Too Big messages sent by this interface.
outRedirects [Out Redirects] (vRtrIfIcmp6OutRedirects)	long	The value of vRtrIfIcmp6OutRedirects indicates the number of ICMP Redirect messages sent by this interface.
outRouterAdvertisements [Out Router Advertisements] (vRtrIfIcmp6OutRtrAdvertisements)	long	The value of vRtrIfIcmp6OutRtrAdvertisements indicates the number of ICMP Router Advertisement messages sent by this interface.
outRouterSolicits [Out Router Solicits] (vRtrIfIcmp6OutRtrSolicits)	long	The value of vRtrIfIcmp6OutRtrSolicits indicates the number of ICMP Router Solicitation messages sent by this interface.
outTimeExceeded [Out Time Exceeded] (vRtrIfIcmp6OutTimeExcds)	long	The value of vRtrIfIcmp6OutTimeExcds indicates the number of ICMP Time Exceeded messages sent by this interface.

Table 204 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outTotalMessages [Out Total Messages] (vRtrIcmp6OutMsgs)	long	The value of vRtrIcmp6OutMsgs indicates the total number of ICMP messages which this interface attempted to send. Note that this counter includes all those counted by icmpOutErrors.

Table 205 sas statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DelayTCAStats</p> <p>MIB entry name: tmnxOamPmStsTcaDelayEntry</p> <p>Entry description: tmnxOamPmStsTcaDelayEntry contains the OAM-PM delay TCA statistics for the combination of an OAM-PM session name, test type, bin type, and direction (e.g. {'oam_pm_sess_1', 'dmm(1)', 'ifdv(3)', 'twoWay(3)'}). Nine rows are created/destroyed in this table when a delay test is created/destroyed. A delay test is created/destroyed using tmnxOamPmCfgDelayDmmRowStatus or tmnxOamPmCfgTwampLtRowStatus. The nine rows are indexed by the session name, the test type, and the nine combinations of bin type and direction.</p> <p>Table description (for tmnxOamPmStsTcaDelayTable): tmnxOamPmStsTcaDelayTable contains statistics for delay-based OAM-PM Threshold Crossing Alerts (TCAs).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ethernetOam.CfmDmmSession • sas.TWLSession 		
active [Active] (tmnxOamPmStsTcaDelayOperState)	int	The value of tmnxOamPmStsTcaDelayOperState indicates the operational state of delay-based TCAs for the specified indices.
direction [Direction] (tmnxOamPmCfgForwardBackward2Way)	int	The value of tmnxOamPmCfgForwardBackward2Way specifies the direction of the row to be configured or read.
lastTime [Last Time] (tmnxOamPmStsTcaDelayLastTime)	String	The value of tmnxOamPmStsTcaDelayLastTime indicates the UTC date and time at the start of the measurement interval which generated the most recent delay-based Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no TCAs have been generated for the specified indices since system start up.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>LossTCAAgStats</p> <p>MIB entry name: tmnxOamPmStsTcaLossFwBwAgEntry</p> <p>Entry description: tmnxOamPmStsTcaLossFwBwAgEntry contains the TCA statistics for the forward, backward, or aggregate direction of one OAM-PM loss test. For example, a row may contain TCA statistics for the forward direction for the SLM test belonging to OAM-PM session OAM_PM_Eth_session_1.</p> <p>Table description (for tmnxOamPmStsTcaLossFwBwAgTable): tmnxOamPmStsTcaLossFwBwAgTable contains statistics for loss-based OAM-PM Threshold Crossing Alerts (TCAs). DateAndTime.year = 0 is returned if no Average FLR TCAs have been generated for the specified indices since system start up.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PmSessionBaseStats</p>		
<p>MIB entry name: tmnxOamPmStsBaseEntry</p>		
<p>Entry description: tmnxOamPmStsBaseEntry contains the base statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a test is started (e.g. using tmnxOamPmCfgDelayDmmAdminStatus and tmnxOamPmCfgDelayDmmOnDmndStatus). At that time, a row for the current interval (with the index value tmnxOamPmStsIntvlNum=1) is created for each row with a matching session name in tmnxOamPmCfgMeasIntvlTable. In addition, a row is created in this table for the test's 'miRaw(1)' interval. After that, the timed creation and destruction of rows in this table is explained using the following example. Suppose the configured number of intervals to be retained is as follows (where index columns are underlined with octothorpes, and 'tmnxOamPm' is abbreviated as '_'): <u>_CfgSessName</u> <u>_CfgMeasIntvlDuration</u> <u>_CfgMeasIntvlStored</u> ##### ##### 'mySess1' 'mi15Minutes(2)' 3 Suppose statistics collection started at t = 0 (minutes). Suppose the following rows exist in tmnxOamPmStsBaseTable at t = 59 (minutes): <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 1 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 The interval numbers are assigned as follows: 1 - the historical interval ended at t = 15 minutes 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the current interval Then, after the next 15 minute interval ends (e.g. at t = 61 minutes), the following rows will exist: <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 5 The interval numbers are assigned as follows: 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the historical interval ended at t = 60 minutes 5 - the current interval The row with interval number 1 was destroyed, because tmnxOamPmCfgMeasIntvlStored=3 specifies that at most three historical intervals be retained. Rows are also destroyed in this table when the corresponding tmnxOamPmCfgMeasIntvlTable row is destroyed. When the index value tmnxOamPmStsMeasIntvlDuration is 'miRaw(1)', only one interval is available (i.e. tmnxOamPmStsIntvlNum = 1). When a test is running, the measurement interval data set for a test's 'miRaw(1)' measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. The change to the objects in the specified row is as follows. Object Change on Clear Operation tmnxOamPmStsBaseOperStatus No change tmnxOamPmStsBaseSuspect Set to 'true(1)' tmnxOamPmStsBaseStartTime Set to UTC time of the clear operation tmnxOamPmStsBaseElapsedTime Set to zero tmnxOamPmStsBaseTestFramesTx Set to zero tmnxOamPmStsBaseTestFramesRx Set to zero Measurement interval data sets for measurement interval durations other than 'miRaw(1)' cannot be cleared.</p>		
<p>Table description (for tmnxOamPmStsBaseTable): tmnxOamPmStsBaseTable contains the base statistics for OAM Performance Monitoring Measurement Interval Data Sets. The statistics in this table are common to all test types (e.g. DMM and SLM tests).</p>		
<p>Supports realtime plotting</p>		
<p>Supports scheduled collection</p>		
<p>Monitored classes:</p> <ul style="list-style-type: none"> • ethernetOam.CfmDmmSession 		

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmStatsElapsedTime [Pm Stats Elapsed Time] (tmnxOamPmStsBaseElapsedTime)	long	The value of tmnxOamPmStsBaseElapsedTime indicates the time elapsed since data collection started for the specified measurement interval data set.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
pmStatsOperStatus [Pm Stats Oper Status] (tmnxOamPmStsBaseOperStatus)	int	The value of tmnxOamPmStsBaseOperStatus indicates the operational status of the specified measurement interval data set. If the interval is historical and the operational status is 'inprogress(1)', the interval is closing (i.e. waiting for a response for the final test request sent).
pmStatsPduRx [Pm Stats Pdu Rx] (tmnxOamPmStsBaseTestFramesRx)	long	The value of tmnxOamPmStsBaseTestFramesRx indicates the number of test frames received for the specified measurement interval data set.
pmStatsPduTx [Pm Stats Pdu Tx] (tmnxOamPmStsBaseTestFramesTx)	long	The value of tmnxOamPmStsBaseTestFramesTx indicates the number of test frames sent for the specified measurement interval data set.
pmStatsStartTime [Pm Stats Start Time] (tmnxOamPmStsBaseStartTime)	String	The value of tmnxOamPmStsBaseStartTime indicates the start time (in UTC) of the specified measurement interval data set.
pmStatsSuspect [Pm Stats Suspect] (tmnxOamPmStsBaseSuspect)	boolean	The value of tmnxOamPmStsBaseSuspect indicates whether or not the specified measurement interval data set contains suspect information.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsTestType [Pm Stats Test Type] (tmnxOamPmStsBaseTestType)	int	The value of tmnxOamPmStsBaseTestType specifies the type of test for which statistics are to be read (e.g. 'dmm(1)').
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>PrefixSrvStats</p> <p>MIB entry name: tmnxTwampSrvPrefixEntry</p> <p>Entry description: tmnxTwampSrvPrefixEntry contains the TWAMP server configuration information for the IP prefix specified by the index values. Rows in this table are created and destroyed using the tmnxTwampSrvPrefixRowStatus object.</p> <p>Table description (for tmnxTwampSrvPrefixTable): tmnxTwampSrvPrefixTable contains per-prefix TWAMP server configuration information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
srvPfxConnCount [Srv Pfx Conn Count] (tmnxTwampSrvPfxConnCount)	long	The value of tmnxTwampSrvPfxConnCount indicates, for the prefix specified by the index values, the number of control connections currently managed by the TWAMP server.
srvPfxConnsRejected [Srv Pfx Conns Rejected] (tmnxTwampSrvPfxConnsRejected)	long	The value of tmnxTwampSrvPfxConnsRejected indicates, for the prefix specified by the index values, the number of control connection requests which have been rejected by the TWAMP server. An example reject reason: the prefix's limit on the number of active connections has been reached.
srvPfxSessionCount [Srv Pfx Session Count] (tmnxTwampSrvPfxSessionCount)	long	The value of tmnxTwampSrvPfxSessionCount indicates, for the prefix specified by the index values, the number of currently in-progress TWAMP test sessions.
srvPfxTestPacketsRx [Srv Pfx Test Packets Rx] (tmnxTwampSrvPfxTestPacketsRx)	long	The value of tmnxTwampSrvPfxTestPacketsRx indicates, for the prefix specified by the index values, the number of TWAMP test packets received by the TWAMP server.
srvPfxTestPacketsTx [Srv Pfx Test Packets Tx] (tmnxTwampSrvPfxTestPacketsTx)	long	The value of tmnxTwampSrvPfxTestPacketsTx indicates, for the prefix specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
srvPfxTestSessAbort [Srv Pfx Test Sess Abort] (tmnxTwampSrvPfxTestSessAbort)	long	The value of tmnxTwampSrvPfxTestSessAbort indicates, for the prefix specified by the index values, the number of test sessions aborted by the TWAMP server.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
srvPfxTestSessCompleted [Srv Pfx Test Sess Completed] (tmnxTwampSrvPfxTestSessCompleted)	long	The value of tmnxTwampSrvPfxTestSessCompleted indicates, for the prefix specified by the index values, the number of test sessions completed by the TWAMP server.
srvPfxTestSessRejected [Srv Pfx Test Sess Rejected] (tmnxTwampSrvPfxTestSessRejected)	long	The value of tmnxTwampSrvPfxTestSessRejected indicates, for the prefix specified by the index values, the number of test sessions rejected by the TWAMP server.
<p>SrvConnsStats</p> <p>MIB entry name: tmnxTwampSrvConnStatsEntry</p> <p>Entry description: tmnxTwampSrvConnStatsEntry contains the statistics for the TWAMP control connection specified by the index values. A row is created by the system when a TWAMP control connection is established.</p> <p>Table description (for tmnxTwampSrvConnStatsTable): tmnxTwampSrvConnStatsTable contains the statistics for each active control connection managed by the TWAMP server.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
clientAddr [Client Addr] (tmnxTwampSrvConnClientAddr)	String	The value of tmnxTwampSrvConnClientAddr specifies the TWAMP client's address. This is the fifth index for tmnxTwampSrvConnStatsTable.
clientAddrType [Client Addr Type] (tmnxTwampSrvConnClientAddrType)	int	The value of tmnxTwampSrvConnClientAddrType specifies the type of tmnxTwampSrvConnClientAddr. This is the fourth index for tmnxTwampSrvConnStatsTable.
connIdleTime [Conn Idle Time] (tmnxTwampSrvConnIdleTime)	long	The value of tmnxTwampSrvConnIdleTime specifies the elapsed time, in seconds, since a TWAMP message was received on this control connection. When this value exceeds tmnxTwampSrvInactTimeout, the connection will be torn down.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
connSessionCount [Conn Session Count] (tmnxTwampSrvConnSessionCount)	long	The value of tmnxTwampSrvConnSessionCount indicates, for the connection specified by the index values, the number of currently in-progress TWAMP test sessions.
connState [Conn State] (tmnxTwampSrvConnState)	int	The value of tmnxTwampSrvConnState indicates the operational state of a control connection managed by the TWAMP server. Code points: setUp(1) - the connection is being established ready(2) - the connection is ready to accept test sessions running(3) - the connection is running a test.
connTestPacketsRx [Conn Test Packets Rx] (tmnxTwampSrvConnTestPacketsRx)	long	The value of tmnxTwampSrvConnTestPacketsRx indicates, for the connection specified by the index values, the number of TWAMP test packets received by the TWAMP server.
connTestPacketsTx [Conn Test Packets Tx] (tmnxTwampSrvConnTestPacketsTx)	long	The value of tmnxTwampSrvConnTestPacketsTx indicates, for the connection specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
connTestSessComplete [Conn Test Sess Complete] (tmnxTwampSrvConnTestSessComplete)	long	The value of tmnxTwampSrvConnTestSessComplete indicates, for the connection specified by the index values, the number of test sessions completed by the TWAMP server.
connTestSessRejected [Conn Test Sess Rejected] (tmnxTwampSrvConnTestSessRejected)	long	The value of tmnxTwampSrvConnTestSessRejected indicates, for the connection specified by the index values, the number of test sessions rejected by the TWAMP server.
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
seqNum [Seq Num] (tmnxTwampSrvConnSeqNum)	int	The value of tmnxTwampSrvConnSeqNum specifies this control connection's sequence number. This is the sixth index for tmnxTwampSrvConnStatsTable - it allows n>1 rows (i.e. n>1 connections) for one client.
<p>TWLBInStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlBinEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlBinEntry contains the TWAMP-Light frame delay per-bin statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a corresponding row is created in tmnxOamPmStsDelayTwlTable. If the tmnxOamPmStsDelayTwlTable row is created with the index value tmnxOamPmCfgBinType = 'fd(1)', then the the number of rows created in this table is tmnxOamPmCfgBinGroupFdBInCount. Similarly, 'fdr(2)' and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsDelayTwlTable row is destroyed. When a test is running, the TWAMP-Light statistics for a test's raw (i.e. 'miRaw(1)') measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session..</p> <p>Table description (for tmnxOamPmStsDelayTwlBinTable): tmnxOamPmStsDelayTwlBinTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay per-bin statistics. The frame delay per-bin statistics kept for TWAMP-Light tests are the same as the frame delay per-bin statistics specified for Ethernet DMM (Delay Measurement Message) tests in MEF-35 requirement R66.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TWLBIn</p>		

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBinBwdCount [Delay Twl Bin Bwd Count] (tmnxOamPmStsDelayTwlBinBwdCount)	long	The value of tmnxOamPmStsDelayTwlBinBwdCount indicates the number of TWAMP-Light frame delay measurements in the backward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the backward direction in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinFwdCount [Delay Twl Bin Fwd Count] (tmnxOamPmStsDelayTwlBinFwdCount)	long	The value of tmnxOamPmStsDelayTwlBinFwdCount indicates the number of TWAMP-Light frame delay measurements in the forward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 9 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the forward direction in the first interval of 'twlSess1' that fit in the highest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinNum [Delay Twl Bin Num] (tmnxOamPmStsDelayTwlBinNum)	long	The value of tmnxOamPmStsDelayTwlBinNum specifies the bin number of the statistics to be read.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBintwowayCount [Delay Twl Bintwoway Count] (tmnxOamPmStsDelayTwlBin2wyCount)	long	The value of tmnxOamPmStsDelayTwlBin2wyCount indicates the number of TWAMP-Light two-way frame delay measurements that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light two-way frame delay measurements (in microseconds) in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TWLSessionStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlEntry contains the TWAMP-Light frame delay summary statistics for one OAM Performance Monitoring Measurement Interval Data Set. When a row is created in tmnxOamPmStsBaseTable with tmnxOamPmStsBaseTestType = 'twampLight(3)' (provided tmnxOamPmCfgTwampLtCollectStats is 'collectDelayStats(1)' or 'collectDelayAndLossStats(3)'), three rows are created in this table. The three rows have the following values in the tmnxOamPmCfgBinType index column: 'fd(1)', 'fdr(2)', and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsBaseTable row is destroyed. When a TWAMP-Light test is running, all the test's raw statistics can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsDelayTwlTable): tmnxOamPmStsDelayTwlTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay summary statistics. delayTwl2wyAvg [Delay Twl 2 wy Avg] (tmnxOamPmStsDelayTwl2wyAvg)	long	The value of tmnxOamPmStsDelayTwl2wyAvg indicates the average two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMax [Delay Twl 2 wy Max] (tmnxOamPmStsDelayTwl2wyMax)	long	The value of tmnxOamPmStsDelayTwl2wyMax indicates the maximum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMin [Delay Twl 2 wy Min] (tmnxOamPmStsDelayTwl2wyMin)	long	The value of tmnxOamPmStsDelayTwl2wyMin indicates the minimum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBwdAvg [Delay Twl Bwd Avg] (tmnxOamPmStsDelayTwlBwdAvg)	long	The value of tmnxOamPmStsDelayTwlBwdAvg indicates the average delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMax [Delay Twl Bwd Max] (tmnxOamPmStsDelayTwlBwdMax)	long	The value of tmnxOamPmStsDelayTwlBwdMax indicates the maximum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMin [Delay Twl Bwd Min] (tmnxOamPmStsDelayTwlBwdMin)	long	The value of tmnxOamPmStsDelayTwlBwdMin indicates the minimum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdAvg [Delay Twl Fwd Avg] (tmnxOamPmStsDelayTwlFwdAvg)	long	The value of tmnxOamPmStsDelayTwlFwdAvg indicates the average delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMax [Delay Twl Fwd Max] (tmnxOamPmStsDelayTwlFwdMax)	long	The value of tmnxOamPmStsDelayTwlFwdMax indicates the maximum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMin [Delay Twl Fwd Min] (tmnxOamPmStsDelayTwlFwdMin)	long	The value of tmnxOamPmStsDelayTwlFwdMin indicates the minimum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStatsIntvlNum)	long	The value of tmnxOamPmStatsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStatsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
TwampSrvStats MIB entry name: tmnxTwampStatisticsScalarObjs Supports realtime plotting Supports scheduled collection Monitored class: sas.TwampSrv		
twampSrvConnectionCount [Twamp Srv Connection Count] (tmnxTwampSrvConnectionCount)	long	The value of tmnxTwampSrvConnectionCount indicates the number of control connections currently managed by the TWAMP server.
twampSrvConnectionsRejected [Twamp Srv Connections Rejected] (tmnxTwampSrvConnectionsRejected)	long	The value of tmnxTwampSrvConnectionsRejected indicates the total number of control connection requests which have been rejected by the TWAMP server. Example reject reasons: the server's limit on the number of active connections has been reached; the client's IP address does not match any of the prefixes configured on the TWAMP server.
twampSrvOperStat [Twamp Srv Oper Stat] (tmnxTwampSrvOperState)	long	The value of tmnxTwampSrvOperState indicates if the TWAMP server is operationally 'inService(2)', or 'outOfService(3)'.
twampSrvSessionCount [Twamp Srv Session Count] (tmnxTwampSrvSessionCount)	long	The value of tmnxTwampSrvSessionCount indicates the number of currently in-progress TWAMP test sessions.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
twampSrvTestPacketsRx [Twamp Srv Test Packets Rx] (tmnxTwampSrvTestPacketsRx)	long	The value of tmnxTwampSrvTestPacketsRx indicates the total number of TWAMP test packets received by the TWAMP server.
twampSrvTestPacketsTx [Twamp Srv Test Packets Tx] (tmnxTwampSrvTestPacketsTx)	long	The value of tmnxTwampSrvTestPacketsTx indicates the total number of TWAMP test packets sent by the TWAMP server.
twampSrvTestSessAborted [Twamp Srv Test Sess Aborted] (tmnxTwampSrvTestSessAborted)	long	The value of tmnxTwampSrvTestSessAborted indicates the total number of test sessions aborted by the TWAMP server.
twampSrvTestSessCompleted [Twamp Srv Test Sess Completed] (tmnxTwampSrvTestSessCompleted)	long	The value of tmnxTwampSrvTestSessCompleted indicates the total number of test sessions completed by the TWAMP server.
twampSrvTestSessRejected [Twamp Srv Test Sess Rejected] (tmnxTwampSrvTestSessRejected)	long	The value of tmnxTwampSrvTestSessRejected indicates the total number of test sessions rejected by the TWAMP server.
twampSrvUpTime [Twamp Srv Up Time] (tmnxTwampSrvUpTime)	long	The value of tmnxTwampSrvUpTime indicates the time elapsed, in seconds, since the most recent transition of tmnxTwampSrvOperState to 'inService(2)'. If tmnxTwampSrvOperState is not 'inService(2)', zero is returned.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TwLossSessionStats</p> <p>MIB entry name: tmnxOamPmStsLossTwlEntry</p> <p>Entry description: tmnxOamPmStsLossTwlEntry contains the TWAMP-Light loss test statistics for one OAM Performance Monitoring Measurement Interval Data Set. A row is created in this table when a tmnxOamPmSts-BaseTable row is created with tmnxOamPmStsBaseTestType = 'twampLight(3)' (provided tmnxOamPmCfgTwampLtCollectStats is 'collectLossStats(2)' or 'collectDelayAndLossStats(3)'). A row is destroyed in this table when the corresponding tmnxOamPmStsBaseTable row is destroyed. When a TWAMP-Light test is running, all the test's raw statistics can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwlChliBwd [Pm Twl Chli Bwd] (tmnxOamPmStsLossTwlChliBwd)	long	The value of tmnxOamPmStsLossTwlChliBwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the backward direction for the specified measurement interval data set.
pmTwlChliFwd [Pm Twl Chli Fwd] (tmnxOamPmStsLossTwlChliFwd)	long	The value of tmnxOamPmStsLossTwlChliFwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the forward direction for the specified measurement interval data set.
pmTwlHliBwd [Pm Twl Hli Bwd] (tmnxOamPmStsLossTwlHliBwd)	long	The value of tmnxOamPmStsLossTwlHliBwd indicates the number of High Loss Intervals (HLIs) in the backward direction for the specified measurement interval data set.
pmTwlHliFwd [Pm Twl Hli Fwd] (tmnxOamPmStsLossTwlHliFwd)	long	The value of tmnxOamPmStsLossTwlHliFwd indicates the number of High Loss Intervals (HLIs) in the forward direction for the specified measurement interval data set.
pmTwlMaxFlrBwd [Pm Twl Max Flr Bwd] (tmnxOamPmStsLossTwlMaxFlrBwd)	float	The value of tmnxOamPmStsLossTwlMaxFlrBwd indicates the maximum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlMaxFlrFwd [Pm Twl Max Flr Fwd] (tmnxOamPmStsLossTwlMaxFlrFwd)	float	The value of tmnxOamPmStsLossTwlMaxFlrFwd indicates the maximum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmTwlMinFlrBwd [Pm Twl Min Flr Bwd] (tmnxOamPmStsLossTwlMinFlrBwd)	float	The value of tmnxOamPmStsLossTwlMinFlrBwd indicates the minimum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlMinFlrFwd [Pm Twl Min Flr Fwd] (tmnxOamPmStsLossTwlMinFlrFwd)	float	The value of tmnxOamPmStsLossTwlMinFlrFwd indicates the minimum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwIRxBwd [Pm Twl Rx Bwd] (tmnxOamPmStsLossTwIRxBwd)	long	The value of tmnxOamPmStsLossTwIRxBwd indicates the number of TWAMP-Light reply frames received in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwIRxFwd [Pm Twl Rx Fwd] (tmnxOamPmStsLossTwIRxFwd)	long	The value of tmnxOamPmStsLossTwIRxFwd indicates the number of TWAMP-Light request frames received in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwITxBwd [Pm Twl Tx Bwd] (tmnxOamPmStsLossTwITxBwd)	long	The value of tmnxOamPmStsLossTwITxBwd indicates the number of TWAMP-Light reply frames transmitted in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwITxFwd [Pm Twl Tx Fwd] (tmnxOamPmStsLossTwITxFwd)	long	The value of tmnxOamPmStsLossTwITxFwd indicates the number of TWAMP-Light request frames transmitted in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwUnavailIndBwd [Pm Twl Unavail Ind Bwd] (tmnxOamPmStsLossTwUnavlIndBwd)	long	The value of tmnxOamPmStsLossTwUnavlIndBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction for the specified measurement interval data set.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiUnavailIndFwd [Pm Twl Unavail Ind Fwd] (tmnxOamPmStsLossTwiUnavlIndFwd)	long	The value of tmnxOamPmStsLossTwiUnavlIndFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction for the specified measurement interval data set.
pmTwiUndtAvlBwd [Pm Twl Undt Avl Bwd] (tmnxOamPmStsLossTwiUndtAvlBwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlBwd indicates the number of availability indicators evaluated as Available in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtAvlFwd [Pm Twl Undt Avl Fwd] (tmnxOamPmStsLossTwiUndtAvlFwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlFwd indicates the number of availability indicators evaluated as Available in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiUndtUnavlBwd [Pm Twl Undt Unavl Bwd] (tmnxOamPmStsLossTwiUndtUnavlBwd)	long	The value of tmnxOamPmStsLossTwiUndtUnavlBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtUnavlFwd [Pm Twl Undt Unavl Fwd] (tmnxOamPmStsLossTwiUndtUnavlFwd)	long	The value of tmnxOamPmStsLossTwiUndtUnavlFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 205 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TwlReflectorStats</p> <p>MIB entry name: tmnxOamPmStsTwlRflEntry</p> <p>Entry description: tmnxOamPmStsTwlRflEntry contains the statistics for the specified OAM Performance Monitoring TWAMP-Light reflector. SROS creates a row in this table when a corresponding row is created in tmnxOamPmCfgTwlRflTable. SROS destroys a row in this table when a corresponding row is destroyed in tmnxOamPmCfgTwlRflTable. The encoding of the index is explained in the DESCRIPTION clause for tmnxOamPmCfgTwlRflEntry.</p> <p>Table description (for tmnxOamPmStsTwlRflTable): tmnxOamPmStsTwlRflTable contains the statistics for OAM Performance Monitoring TWAMP-Light reflectors.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TwlReflector</p>		
framesRx [Frames Rx] (tmnxOamPmStsTwlRflFramesRx)	long	The value of tmnxOamPmStsTwlRflFramesRx indicates the number of TWAMP-Test frames received by the specified reflector.
framesTx [Frames Tx] (tmnxOamPmStsTwlRflFramesTx)	long	The value of tmnxOamPmStsTwlRflFramesTx indicates the number of TWAMP-Test frames transmitted by the specified reflector.
upTime [Up Time] (tmnxOamPmStsTwlRflUpTime)	long	The value of tmnxOamPmStsTwlRflUpTime indicates the time elapsed since the most recent transition of the reflector's administrative status to 'enabled(1)'. Zero is returned if the reflector's administrative status is 'disabled(2)'.

Table 206 service statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CemSapStats MIB entry name: sapCemStatsEntry Entry description: Statistics for a specific CEM SAP. Table description (for sapCemStatsTable): A table that contains CEM SAP statistics. Supports realtime plotting Supports scheduled collection Monitored class: service.L2AccessInterface</p>		
cemStatsEgressDroppedPkts [Cem Stats Egress Dropped Pkts] (sapCemStatsEgressDroppedPkts)	long	The value of sapCemStatsEgressDroppedPkts indicates the total number of packets that were dropped due to errors.
cemStatsEgressESs [Cem Stats Egress ESs] (sapCemStatsEgressESs)	long	The value of sapCemStatsEgressESs indicates the number of Error Seconds (ESs) encountered. Any malformed packet, seq. error, LOPS and similar are considered as error seconds.
cemStatsEgressFailureCounts [Cem Stats Egress Failure Counts] (sapCemStatsEgressFailureCounts)	long	The value of sapCemStatsEgressFailureCounts indicates the number failure events. A failure event begins when the LOPS failure is declared, and ends when the failure is cleared.
cemStatsEgressForwardedPkts [Cem Stats Egress Forwarded Pkts] (sapCemStatsEgressForwardedPkts)	long	The value of sapCemStatsEgressForwardedPkts indicates the number of packets that were successfully forwarded.
cemStatsEgressJtrBfrDepth [Cem Stats Egress Jtr Bfr Depth] (sapCemStatsEgressJtrBfrDepth)	long	The value of sapCemStatsEgressJtrBfrDepth indicates the current packet depth of the jitter buffer.
cemStatsEgressJtrBfrOverruns [Cem Stats Egress Jtr Bfr Overruns] (sapCemStatsEgressJtrBfrOverruns)	long	The value of sapCemStatsEgressJtrBfrOverruns indicates the number of times a packet was dropped because it could not fit in the jitter buffer.

Table 206 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cemStatsEgressJtrBfrUnderruns [Cem Stats Egress Jtr Bfr Underruns] (sapCemStatsEgressJtrBfrUnderruns)	long	The value of sapCemStatsEgressJtrBfrUnderruns indicates the number of times a packet needed to be played out and the jitter buffer was empty.
cemStatsEgressLBitDropped [Cem Stats Egress LBit Dropped] (sapCemStatsEgressLBitDropped)	long	The value of sapCemStatsEgressLBitDropped indicates the number of packets dropped due to the L bit set by the far end.
cemStatsEgressMalformedPkts [Cem Stats Egress Malformed Pkts] (sapCemStatsEgressMalformedPkts)	long	The value of sapCemStatsEgressMalformedPkts indicates the number of packets detected with unexpected size, or bad headers' stack.
cemStatsEgressMisOrderDropped [Cem Stats Egress Mis Order Dropped] (sapCemStatsEgressMisOrderDropped)	long	The value of sapCemStatsEgressMisOrderDropped indicates the number of packets detected out of order (via control word sequence numbers), and could not be re-ordered, or could not be placed in the jitter buffer because it was out of the current window.
cemStatsEgressMissingPkts [Cem Stats Egress Missing Pkts] (sapCemStatsEgressMissingPkts)	long	The value of sapCemStatsEgressMissingPkts indicates the number of missing packets (as detected via control word sequence number gaps).
cemStatsEgressMultipleDropped [Cem Stats Egress Multiple Dropped] (sapCemStatsEgressMultipleDropped)	long	The value of sapCemStatsEgressMultipleDropped indicates the number of packets dropped due to multiple sequence numbers.
cemStatsEgressOverrunCounts [Cem Stats Egress Overrun Counts] (sapCemStatsEgressOverrunCounts)	long	The value of sapCemStatsEgressOverrunCounts indicates the number of times the jitter buffer went into an overrun state.
cemStatsEgressPktsReOrder [Cem Stats Egress Pkts Re Order] (sapCemStatsEgressPktsReOrder)	long	The value of sapCemStatsEgressPktsReOrder indicates the number of packets detected out of sequence (via control word sequence number), but successfully re-ordered.

Table 206 service statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cemStatsEgressSESSs [Cem Stats Egress SESSs] (sapCemStatsEgressSESSs)	long	The value of sapCemStatsEgressSESSs indicates the number of Severely Error Seconds (SESSs) encountered. This is when more than 30 percent of the packets within a one second window are missing.
cemStatsEgressUASs [Cem Stats Egress UASs] (sapCemStatsEgressUASs)	long	The value of sapCemStatsEgressUASs indicates the number of Unavailable Seconds (UASs) encountered. Any consecutive ten seconds of SESSs are counted as one UAS.
cemStatsEgressUnderrunCounts [Cem Stats Egress Underrun Counts] (sapCemStatsEgressUnderrunCounts)	long	The value of sapCemStatsEgressUnderrunCounts indicates the number of times the jitter buffer went into an underrun state.
cemStatsIngressDroppedPkts [Cem Stats Ingress Dropped Pkts] (sapCemStatsIngressDroppedPkts)	long	The value of sapCemStatsIngressDroppedPkts indicates the total number of packets that were dropped due to errors.
cemStatsIngressForwardedPkts [Cem Stats Ingress Forwarded Pkts] (sapCemStatsIngressForwardedPkts)	long	The value of sapCemStatsIngressForwardedPkts indicates the number of packets that were successfully forwarded.
<p>SapBaseStats MIB entry name: sapBaseStatsEntry Entry description: Basic statistics about a specific SAP. Table description (for sapBaseStatsTable): A table that contains basic SAP statistics. In the descriptions below 'Pchip' refers to the Nokia SROS series Packet Processing chip, while 'Qchip' refers to the Nokia SROS series QoS Queueing Engine chip. sdpBndIgmPsnpgFwdV2Reports [Sdp Bnd IgmP Snpg Fwd V2 Reports] (sdpBndIgmPsnpgFwdV2Reports)	long	The value of the object sdpBndIgmPsnpgFwdV2Reports indicates the number of IGMPv2 Reports forwarded on this SDP Bind.
sdpBndIgmPsnpgRxGenQueries [Sdp Bnd IgmP Snpg Rx Gen Queries] (sdpBndIgmPsnpgRxGenQueries)	long	The value of the object sdpBndIgmPsnpgRxGenQueries indicates the number of IGMP General Queries received on this SDP Bind.
sdpBndIgmPsnpgRxGrpSpecQueries [Sdp Bnd IgmP Snpg Rx Grp Spec Queries] (sdpBndIgmPsnpgRxGrpSpecQueries)	long	The value of the object sdpBndIgmPsnpgRxGrpSpecQueries indicates the number of IGMP Group-Specific Queries received on this SDP Bind.
sdpBndIgmPsnpgRxUnknownType [Sdp Bnd IgmP Snpg Rx Unknown Type] (sdpBndIgmPsnpgRxUnknownType)	long	The value of the object sdpBndIgmPsnpgRxUnknownType indicates the number of IGMP unknown type packets received on this SDP Bind.
sdpBndIgmPsnpgRxV1Reports [Sdp Bnd IgmP Snpg Rx V1 Reports] (sdpBndIgmPsnpgRxV1Reports)	long	The value of the object sdpBndIgmPsnpgRxV1Reports indicates the number of IGMPv1 Reports received on this SDP Bind.
sdpBndIgmPsnpgRxV2Leaves [Sdp Bnd IgmP Snpg Rx V2 Leaves] (sdpBndIgmPsnpgRxV2Leaves)	long	The value of the object sdpBndIgmPsnpgRxV2Leaves indicates the number of IGMPv2 Leaves received on this SDP Bind.
sdpBndIgmPsnpgRxV2Reports [Sdp Bnd IgmP Snpg Rx V2 Reports] (sdpBndIgmPsnpgRxV2Reports)	long	The value of the object sdpBndIgmPsnpgRxV2Reports indicates the number of IGMPv2 Reports received on this SDP Bind.
sdpBndIgmPsnpgTxGenQueries [Sdp Bnd IgmP Snpg Tx Gen Queries] (sdpBndIgmPsnpgTxGenQueries)	long	The value of the object sdpBndIgmPsnpgTxGenQueries indicates the number of IGMP General Queries transmitted on this SDP Bind.
sdpBndIgmPsnpgTxGrpSpecQueries [Sdp Bnd IgmP Snpg Tx Grp Spec Queries] (sdpBndIgmPsnpgTxGrpSpecQueries)	long	The value of the object sdpBndIgmPsnpgTxGrpSpecQueries indicates the number of IGMP Group-Specific Queries transmitted on this SDP Bind.

Table 208 svt statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sdpBndIgmPsnpgTxV1Reports [Sdp Bnd IgmP Snpg Tx V1 Reports] (sdpBndIgmPsnpgTxV1Reports)	long	The value of the object sdpBndIgmPsnpgTxV1Reports indicates the number of IGMPv1 Reports transmitted on this SDP Bind.
sdpBndIgmPsnpgTxV2Leaves [Sdp Bnd IgmP Snpg Tx V2 Leaves] (sdpBndIgmPsnpgTxV2Leaves)	long	The value of the object sdpBndIgmPsnpgTxV2Leaves indicates the number of IGMPv2 Leaves transmitted on this SDP Bind.
sdpBndIgmPsnpgTxV2Reports [Sdp Bnd IgmP Snpg Tx V2 Reports] (sdpBndIgmPsnpgTxV2Reports)	long	The value of the object sdpBndIgmPsnpgTxV2Reports indicates the number of IGMPv2 Reports transmitted on this SDP Bind.
TunnelKeepAliveStats MIB entry name: sdpInfoEntry Entry description: Information about a specific SDP. Table description (for sdpInfoTable): A table that contains SDP information. Supports realtime plotting Supports scheduled collection Monitored class: svt.Tunnel		
lateHelloResponses [Late Hello Responses] (sdpKeepAliveNumLateHelloResponseMessages)	long	The number of SDP Echo Response messages received after the corresponding Request timeout timer expired.
receivedHelloMessages [Received Hello Messages] (sdpKeepAliveNumHelloResponseMessages)	long	The number of SDP Echo Response messages received since the keep-alive was administratively enabled or the counter was cleared.
transmittedHelloMessages [Transmitted Hello Messages] (sdpKeepAliveNumHelloRequestMessages)	long	The number of SDP Echo Request messages transmitted since the keep-alive was administratively enabled or the counter was cleared.

Table 209 tdmequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AdaptiveClockRecoveryStats</p> <p>MIB entry name: aluPortAcrClkStatsEntry</p> <p>Entry description: Defines an entry in aluPortAcrClkStatsTable. Entries are created and deleted by the system depending port configuration.</p> <p>Table description (for aluPortAcrClkStatsTable): Defines the Nokia SAR series port adaptive clock recovery (ACR) statistics table for providing, via SNMP, the capability of retrieving statistical information relating to clock that is derived from the ACR CPIPE PW.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: tdmequipment.DS1E1Channel</p>		
freqOffsetMeanPastDay [Freq Offset Mean Past Day] (aluCurrent24HourFreqOffsetMeanPpb)	long	aluCurrent24HourFreqOffsetMeanPpb indicates the mean frequency offset from the local oscillator clock in parts per billion for up to the last 24 hour.
freqOffsetMeanPastMinute [Freq Offset Mean Past Minute] (aluCurrent1MinFreqOffsetMeanPpb)	long	The mean frequency offset from the local oscillator clock in parts per billion during the first interval.
freqOffsetStdDevPastDay [Freq Offset Std Dev Past Day] (aluCurrent24HourFreqOffsetStdDevPpb)	long	aluCurrent24HourFreqOffsetStdDevPpb indicates the standard deviation of the frequency offset from the local oscillator clock in parts per billion for up to the last 24 hour.
freqOffsetStdDevPastMinute [Freq Offset Std Dev Past Minute] (aluCurrent1MinFreqOffsetStdDevPpb)	long	The standard deviation of the frequency offset from the local oscillator clock in nano seconds during the first interval.
phaseErrorMeanPastMinuteTime [Phase Error Mean Past Minute Time] (aluCurrent1MinPhaseErrorMeanNs)	long	The mean of the phase error from the local oscillator clock in nano seconds during the first interval.

Table 209 tdmequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
phaseErrorStdDevPastMinute [Phase Error Std Dev Past Minute] (aluCurrent1MinPhaseErrorStdDevNs)	long	The standard deviation of the phase error from the local oscillator clock in nano seconds during the first interval.
<p>DS1CurrentStats MIB entry name: dsx1CurrentEntry Entry description: An entry in the DS1 Current table. Table description (for dsx1CurrentTable): The DS1 current table contains various statistics being collected for the current 15 minute interval. Supports realtime plotting Supports scheduled collection Monitored class: tdmequipment.DS1E1Channel</p>		
burstyErroredSeconds [Bursty Errored Seconds] (dsx1CurrentBESs)	long	The number of Bursty Errored Seconds.
controlledSlipSeconds [Controlled Slip Seconds] (dsx1CurrentCSSs)	long	The number of Controlled Slip Seconds.
degradedMinutes [Degraded Minutes] (dsx1CurrentDMs)	long	The number of Degraded Minutes.
erroredSeconds [Errored Seconds] (dsx1CurrentESs)	long	The number of Errored Seconds.
lineCodingViolations [Line Coding Violations] (dsx1CurrentLCVs)	long	The number of Line Code Violations (LCVs).

Table 209 tdmequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lineErroredSeconds [Line Errored Seconds] (dsx1CurrentLESs)	long	The number of Line Errored Seconds.
pBitCodingViolations [PBit Coding Violations] (dsx1CurrentPCVs)	long	The number of Path Coding Violations.
severelyErroredFramingSeconds [Severely Errored Framing Seconds] (dsx1CurrentSEFSs)	long	The number of Severely Errored Framing Seconds.
severelyErroredSeconds [Severely Errored Seconds] (dsx1CurrentSESSs)	long	The number of Severely Errored Seconds.
unavailableSeconds [Unavailable Seconds] (dsx1CurrentUASs)	long	The number of Unavailable Seconds.
DS1IntervalStats MIB entry name: dsx1IntervalEntry Entry description: An entry in the DS1 Interval table. Table description (for dsx1IntervalTable): The DS1 Interval Table contains various statistics collected by each DS1 Interface over the previous 24 hours of operation. The past 24 hours are broken into 96 completed 15 minute intervals. Each row in this table represents one such interval (identified by dsx1IntervalNumber) for one specific instance (identified by dsx1IntervalIndex). Supports realtime plotting Supports scheduled collection Monitored class: tdmequipment.DS1E1Channel		
burstyErroredSeconds [Bursty Errored Seconds] (dsx1IntervalBESs)	long	The number of Bursty Errored Seconds.

Table 209 tdmequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
controlledSlipSeconds [Controlled Slip Seconds] (dsx1IntervalCSSs)	long	The number of Controlled Slip Seconds.
degradedMinutes [Degraded Minutes] (dsx1IntervalDMs)	long	The number of Degraded Minutes.
erroredSeconds [Errored Seconds] (dsx1IntervalESs)	long	The number of Errored Seconds.
intervalNumber [Interval Number] (dsx1IntervalNumber)	int	A number between 1 and 96, where 1 is the most recently completed 15 minute interval and 96 is the 15 minutes interval completed 23 hours and 45 minutes prior to interval 1.
lineCodingViolations [Line Coding Violations] (dsx1IntervalLCVs)	long	The number of Line Code Violations.
lineErroredSeconds [Line Errored Seconds] (dsx1IntervalLESs)	long	The number of Line Errored Seconds.
pBitCodingViolations [PBit Coding Violations] (dsx1IntervalPCVs)	long	The number of Path Coding Violations.
severelyErroredFramingSeconds [Severely Errored Framing Seconds] (dsx1IntervalSEFSs)	long	The number of Severely Errored Framing Seconds.
severelyErroredSeconds [Severely Errored Seconds] (dsx1IntervalSESSs)	long	The number of Severely Errored Seconds.

Table 209 tdmequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
unavailableSeconds [Unavailable Seconds] (dsx1IntervalUASs)	long	The number of Unavailable Seconds. This object may decrease if the occurrence of unavailable seconds occurs across an interval boundary.
DS1TotalStats MIB entry name: dsx1TotalEntry Entry description: An entry in the DS1 Total table. Table description (for dsx1TotalTable): The DS1 Total Table contains the cumulative sum of the various statistics for the 24 hour period preceding the current interval. Supports realtime plotting Supports scheduled collection Monitored class: tdmequipment.DS1E1Channel		
burstyErroredSeconds [Bursty Errored Seconds] (dsx1TotalBESs)	long	The number of Bursty Errored Seconds (BESs) encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
controlledSlipSeconds [Controlled Slip Seconds] (dsx1TotalCSSs)	long	The number of Controlled Slip Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
degradedMinutes [Degraded Minutes] (dsx1TotalDMs)	long	The number of Degraded Minutes (DMs) encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
erroredSeconds [Errored Seconds] (dsx1TotalESs)	long	The sum of Errored Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
lineCodingViolations [Line Coding Violations] (dsx1TotalLCVs)	long	The number of Line Code Violations (LCVs) encountered by a DS1 interface in the current 15 minute interval. Invalid 15 minute intervals count as 0.

Table 209 tdmequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lineErroredSeconds [Line Errored Seconds] (dsx1TotalLESSs)	long	The number of Line Errored Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
pBitCodingViolations [PBit Coding Violations] (dsx1TotalPCVs)	long	The number of Path Coding Violations encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
severelyErroredFramingSeconds [Severely Errored Framing Seconds] (dsx1TotalSEFSs)	long	The number of Severely Errored Framing Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
severelyErroredSeconds [Severely Errored Seconds] (dsx1TotalSESs)	long	The number of Severely Errored Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.
unavailableSeconds [Unavailable Seconds] (dsx1TotalUASs)	long	The number of Unavailable Seconds encountered by a DS1 interface in the previous 24 hour interval. Invalid 15 minute intervals count as 0.

Table 210 vpls statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>L2AccessInterfaceIgmppSnpgErrorStats</p> <p>MIB entry name: saplgmpSnpgStatsEntry</p> <p>Entry description: saplgmpSnpgStatsEntry is an entry in the saplgmpSnpgStatsTable. Each entry contains IGMP snooping statics for a SAP in a TIs.</p> <p>Table description (for saplgmpSnpgStatsTable): saplgmpSnpgStatsTable contains statistics on IGMP snooping per SAP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mvpls.IL2AccessInterface • vpls.AbstractL2AccessInterface • vpls.IL2AccessInterface 		
saplgmpSnpgImportPolicyDrops [Sap Igmp Snpg Import Policy Drops] (saplgmpSnpgImportPolicyDrops)	long	The value of the object saplgmpSnpgImportPolicyDrops indicates the number of times an IGMP Group or Source is dropped because of applying an import policy on this SAP.
saplgmpSnpgMaxNumGroupsDrops [Sap Igmp Snpg Max Num Groups Drops] (saplgmpSnpgMaxNumGroupsDrops)	long	The value of the object saplgmpSnpgMaxNumGroupsDrops indicates the number of times an IGMP Group is dropped because of exceeding the configured maximum number of groups on this SAP.
saplgmpSnpgRxBadEncodedPkts [Sap Igmp Snpg Rx Bad Encoded Pkts] (saplgmpSnpgRxBadEncodedPkts)	long	The value of the object saplgmpSnpgRxBadEncodedPkts indicates the number of IGMP packets dropped on this SAP because of a bad encoding.
saplgmpSnpgRxBadIgmppChksumPkts [Sap Igmp Snpg Rx Bad Igmp Chksum Pkts] (saplgmpSnpgRxBadIgmppChksumPkts)	long	The value of the object saplgmpSnpgRxBadIgmppChksumPkts indicates the number of dropped IGMP packets on this SAP because of a bad IGMP header checksum.
saplgmpSnpgRxBadIppChksumPkts [Sap Igmp Snpg Rx Bad Ip Chksum Pkts] (saplgmpSnpgRxBadIppChksumPkts)	long	The value of the object saplgmpSnpgRxBadIppChksumPkts indicates the number of dropped IGMP packets on this SAP because of a bad IPv4 header checksum.

Table 210 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
saplgmpSnpgrxBadLenPkts [Sap Igmp SnpgrxBadLenPkts] (saplgmpSnpgrxBadLenPkts)	long	The value of the object saplgmpSnpgrxBadLenPkts indicates the number of IGMP packets dropped on this SAP because of a bad length.
saplgmpSnpgrxNoRtrAlertPkts [Sap Igmp SnpgrxNoRtrAlertPkts] (saplgmpSnpgrxNoRtrAlertPkts)	long	The value of the object saplgmpSnpgrxNoRtrAlertPkts indicates the number of IGMP packets dropped on this SAP because the Router Alert Option in the IP packet is not set.
saplgmpSnpgrxWrongVersionPkts [Sap Igmp SnpgrxWrongVersionPkts] (saplgmpSnpgrxWrongVersionPkts)	long	The value of the object saplgmpSnpgrxWrongVersionPkts indicates the total number of IGMP packets with a wrong version received on this SAP.
saplgmpSnpgrxZeroSrcAdrPkts [Sap Igmp SnpgrxZeroSrcAdrPkts] (saplgmpSnpgrxZeroSrcAdrPkts)	long	The value of the object saplgmpSnpgrxZeroSrcAdrPkts indicates the number of IGMP packets dropped on this SAP because they contain a zero source IPv4 address.
saplgmpSnpgrSendQueryCfgDrops [Sap Igmp SnpgrSendQueryCfgDrops] (saplgmpSnpgrSendQueryCfgDrops)	long	The value of the object saplgmpSnpgrSendQueryCfgDrops indicates the number of times an IGMP Query is dropped because the object saplgmpSnpgrCfgSendQueries for this SAP is set to 'enabled(1)'. L2AccessInterfaceIgmprSnpgrStats MIB entry name: saplgmpSnpgrStatsEntry Entry description: saplgmpSnpgrStatsEntry is an entry in the saplgmpSnpgrStatsTable. Each entry contains IGMP snooping statistics for a SAP in a TIs. Table description (for saplgmpSnpgrStatsTable): saplgmpSnpgrStatsTable contains statistics on IGMP snooping per SAP. sapIgmPsnpgTxV1Reports [Sap Igmp Snpg Tx V1 Reports] (sapIgmPsnpgTxV1Reports)	long	The value of the object sapIgmPsnpgTxV1Reports indicates the number of IGMPv1 Reports transmitted on this SAP.
sapIgmPsnpgTxV2Leaves [Sap Igmp Snpg Tx V2 Leaves] (sapIgmPsnpgTxV2Leaves)	long	The value of the object sapIgmPsnpgTxV2Leaves indicates the number of IGMPv2 Leaves transmitted on this SAP.
sapIgmPsnpgTxV2Reports [Sap Igmp Snpg Tx V2 Reports] (sapIgmPsnpgTxV2Reports)	long	The value of the object sapIgmPsnpgTxV2Reports indicates the number of IGMPv2 Reports transmitted on this SAP.
sapIgmPsnpgTxV3Reports [Sap Igmp Snpg Tx V3 Reports] (sapIgmPsnpgTxV3Reports)	long	The value of the object sapIgmPsnpgTxV3Reports indicates the number of IGMPv3 Reports transmitted on this SAP.
L2AccessInterfaceMvrStats MIB entry name: sapIgmPsnpgStatsEntry Entry description: sapIgmPsnpgStatsEntry is an entry in the sapIgmPsnpgStatsTable. Each entry contains IGMP snooping statics for a SAP in a TIs. Table description (for sapIgmPsnpgStatsTable): sapIgmPsnpgStatsTable contains statistics on IGMP snooping per SAP. Supports realtime plotting Supports scheduled collection Monitored class: vpls.AbstractL2AccessInterface		
sapIgmPsnpgMvrFromVplsCfgDrops [Sap Igmp Snpg Mvr From Vpls Cfg Drops] (sapIgmPsnpgMvrFromVplsCfgDrops)	long	The value of the object sapIgmPsnpgMvrFromVplsCfgDrops indicates the number of times an IGMP Group or Query is dropped because of applying the sapIgmPsnpgCfgMvrFromVplsId configuration on this SAP.
sapIgmPsnpgMvrToSapCfgDrops [Sap Igmp Snpg Mvr To Sap Cfg Drops] (sapIgmPsnpgMvrToSapCfgDrops)	long	The value of the object sapIgmPsnpgMvrToSapCfgDrops indicates the number times an IGMP Report or Query is dropped because of applying the sapIgmPsnpgCfgMvrToSapPortId and sapIgmPsnpgCfgMvrToSapEncapVal configuration on this SAP.

Table 210 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>L2AccessIfDhcpRelayCfgStats</p> <p>MIB entry name: sapTlsDhcpStatsEntry</p> <p>Entry description: DHCP statistics for a TLS SAP.</p> <p>Table description (for sapTlsDhcpStatsTable): sapTlsDhcpStatsTable contains DHCP statistics related to a TLS SAP. This table complements sapTlsInfoTable, and contains an entry for each Tls SAP. Rows in this table are created and deleted automatically by the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vpls.AbstractL2AccessInterface</p>		
sapTlsDhcpStatsCIntDropdPckts [Sap Tls Dhcp Stats CInt Dropd Pckts] (sapTlsDhcpStatsCIntDropdPckts)	long	The value of the object sapTlsDhcpStatsCIntDropdPckts indicates the number of DHCP client packets that have been dropped on this SAP.
sapTlsDhcpStatsCIntForwdPckts [Sap Tls Dhcp Stats CInt Forwd Pckts] (sapTlsDhcpStatsCIntForwdPckts)	long	The value of the object sapTlsDhcpStatsCIntForwdPckts indicates the number of DHCP client packets that have been forwarded on this SAP.
sapTlsDhcpStatsCIntProxLSPckts [Sap Tls Dhcp Stats CInt Prox LSPckts] (sapTlsDhcpStatsCIntProxLSPckts)	long	The value of the object sapTlsDhcpStatsCIntProxLSPckts indicates the number of DHCP client packets that have been proxied on this SAP based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
sapTlsDhcpStatsCIntProxRadPckts [Sap Tls Dhcp Stats CInt Prox Rad Pckts] (sapTlsDhcpStatsCIntProxRadPckts)	long	The value of the object sapTlsDhcpStatsCIntProxRadPckts indicates the number of DHCP client packets that have been proxied on this SAP based on data received from a RADIUS server.
sapTlsDhcpStatsCIntSnoopdPckts [Sap Tls Dhcp Stats CInt Snoopd Pckts] (sapTlsDhcpStatsCIntSnoopdPckts)	long	The value of the object sapTlsDhcpStatsCIntSnoopdPckts indicates the number of DHCP client packets that have been snooped on this SAP.

Table 210 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapTlsDhcpStatsGenForceRenPckts [Sap Tls Dhcp Stats Gen Force Ren Pckts] (sapTlsDhcpStatsGenForceRenPckts)	long	The value of the object sapTlsDhcpStatsGenForceRenPckts indicates the number of DHCP FORCERENEW messages spoofed on this SAP to the DHCP clients.
sapTlsDhcpStatsGenReleasePckts [Sap Tls Dhcp Stats Gen Release Pckts] (sapTlsDhcpStatsGenReleasePckts)	long	The value of the object sapTlsDhcpStatsGenReleasePckts indicates the number of DHCP RELEASE messages spoofed on this SAP to the DHCP server.
sapTlsDhcpStatsSvrDropdPckts [Sap Tls Dhcp Stats Svr Dropd Pckts] (sapTlsDhcpStatsSvrDropdPckts)	long	The value of the object sapTlsDhcpStatsSvrDropdPckts indicates the number of DHCP server packets that have been dropped on this SAP.
sapTlsDhcpStatsSvrForwdPckts [Sap Tls Dhcp Stats Svr Forwd Pckts] (sapTlsDhcpStatsSvrForwdPckts)	long	The value of the object sapTlsDhcpStatsSvrForwdPckts indicates the number of DHCP server packets that have been forwarded on this SAP.
sapTlsDhcpStatsSvrSnoopdPckts [Sap Tls Dhcp Stats Svr Snoopd Pckts] (sapTlsDhcpStatsSvrSnoopdPckts)	long	The value of the object sapTlsDhcpStatsSvrSnoopdPckts indicates the number of DHCP server packets that have been snooped on this SAP.

Table 211 vrrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InstanceAdditionalStats</p> <p>MIB entry name: tmnxVrrpRouterStatsEntry</p> <p>Entry description: Each row entry in the tmnxVrrpRouterStatsTable represents additional columns in the vrrpRouterStatsTable for statistics specific to the Nokia SROS series VRRP implementation.</p> <p>Table description (for tmnxVrrpRouterStatsTable): The tmnxVrrpRouterStatsTable provides an extension of the vrrpRouterStatsTable in the VRRP-MIB. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vrrpRouterStatsTable, and the augmenting table, tmnxVrrpRouterStatsTable. This in effect extends the vrrpRouterStatsTable with additional columns.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vrrp.Instance</p>		
addressListDiscards [Address List Discards] (tmnxVrrpStatsAddressListDiscards)	long	The total number of VRRP advertisement packets discarded because the address list did not match the locally configured list for the virtual router.
advertiseIntervalDiscards [Advertise Interval Discards] (tmnxVrrpStatsAdvertiseIntervalDiscards)	long	The total number of VRRP advertisement packets discarded because the advertisement interval in the received packet was different than the one configured for the local virtual router.
advertiseSent [Advertise Sent] (tmnxVrrpStatsAdvertiseSent)	long	The total number of VRRP advertisements sent by this virtual router.
masterChanges [Master Changes] (tmnxVrrpStatsMasterChanges)	long	The value for tmnxVrrpStatsMasterChanges specifies the total number of times the virtual router has seen the master virtual router change.
preemptEvents [Preempt Events] (tmnxVrrpStatsPreemptEvents)	long	The value for tmnxVrrpStatsPreemptEvents specifies the total number of times the virtual router has preempted another non-owner master with lower priority.

Table 211 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
preemptedEvents [Preempted Events] (tmnxVrrpStatsPreemptedEvents)	long	The value for tmnxVrrpStatsPreemptedEvents specifies the total number of times the virtual router has been preempted by another non-owner master with higher priority.
totalDiscards [Total Discards] (tmnxVrrpStatsTotalDiscards)	long	The total number of VRRP advertisement packets discarded for any reason. This includes the packets discarded due to advertise interval mismatch and address list mismatch.
InstanceStats MIB entry name: vrrpRouterStatsEntry Entry description: An entry in the table, containing statistics information about a given virtual router. Table description (for vrrpRouterStatsTable): Table of virtual router statistics. Supports realtime plotting Supports scheduled collection Monitored class: vrrp.Instance		
addressListErrors [Address List Errors] (vrrpStatsAddressListErrors)	long	The total number of packets received for which the address list does not match the locally configured list for the virtual router.
advertiseIntervalErrors [Advertise Interval Errors] (vrrpStatsAdvertiseIntervalErrors)	long	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
advertiseRcvd [Advertise Rcvd] (vrrpStatsAdvertiseRcvd)	long	The total number of VRRP advertisements received by this virtual router.
authFailures [Auth Failures] (vrrpStatsAuthFailures)	long	The total number of VRRP packets received that do not pass the authentication check.

Table 211 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authTypeMismatch [Auth Type Mismatch] (vrrpStatsAuthTypeMismatch)	long	The total number of packets received with 'Auth Type' not equal to the locally configured authentication method ('vrrpOperAuthType').
becomeMaster [Become Master] (vrrpStatsBecomeMaster)	long	The total number of times that this virtual router's state has transitioned to MASTER.
invalidAuthType [Invalid Auth Type] (vrrpStatsInvalidAuthType)	long	The total number of packets received with an unknown authentication type.
invalidTypePktsRcvd [Invalid Type Pkts Rcvd] (vrrpStatsInvalidTypePktsRcvd)	long	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
ipTtlErrors [Ip Ttl Errors] (vrrpStatsIpTtlErrors)	long	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
packetLengthErrors [Packet Length Errors] (vrrpStatsPacketLengthErrors)	long	The total number of packets received with a packet length less than the length of the VRRP header.
priorityZeroPktsRcvd [Priority Zero Pkts Rcvd] (vrrpStatsPriorityZeroPktsRcvd)	long	The total number of VRRP packets received by the virtual router with a priority of '0'.
priorityZeroPktsSent [Priority Zero Pkts Sent] (vrrpStatsPriorityZeroPktsSent)	long	The total number of VRRP packets sent by the virtual router with a priority of '0'.

Table 212 acfilter statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>HitCountStats</p> <p>MIB entry name: tIPFilterParamsEntry</p> <p>Entry description: Information about a particular IP Filter entry. Every IP Filter can have zero or more IP Filter match entries. a filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. Additional parameters can be found in tIPFilterParamsExtTable. There is no StorageType object, entries have a presumed StorageType of nonVolatile.</p> <p>Table description (for tIPFilterParamsTable): A table of all IP filter match entries for all IP filters.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilter.IpFilterEntry</p>		
egressHitCount [Egress Hit Count] (tIPFilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.
ingressHitCount [Ingress Hit Count] (tIPFilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.
<p>Ipv6HitCountStats</p> <p>MIB entry name: tIPv6FilterParamsEntry</p> <p>Entry description: Information about a particular IPv6 Filter entry. Every IPv6 Filter can have zero or more IPv6 Filter match entries. A filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. Additional match criteria can be found in tIPv6FilterParamsExtTable. There is no StorageType object, entries have a presumed StorageType of nonVolatile.</p> <p>Table description (for tIPv6FilterParamsTable): A table of all IPv6 filter match entries for all IPv6 filters</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilter.Ipv6FilterEntry</p>		

Table 212 acfilter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egressHitByteCount [Egress Hit Byte Count] (tIPv6FilterParamsEgrHitByteCount)	java. math. BigInteger	This tIPv6FilterParamsEgrHitByteCount indicates the number of bytes of all egress packets that matched this entry.
egressHitCount [Egress Hit Count] (tIPv6FilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.
ingressHitByteCount [Ingress Hit Byte Count] (tIPv6FilterParamsIngrHitByteCount)	java. math. BigInteger	The value of tIPv6FilterParamsIngrHitByteCount indicates the number of bytes of all ingress packets that matched this entry.
ingressHitCount [Ingress Hit Count] (tIPv6FilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.
<p>MacHitCountStats</p> <p>MIB entry name: tMacFilterParamsEntry</p> <p>Entry description: Information about a particular MAC Filter entry. Every MAC Filter can have zero or more MAC Filter match entries. A filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. There is no StorageType object, entries have a presumed StorageType of nonVolatile.</p> <p>Table description (for tMacFilterParamsTable): A table of all MAC filter match entries for all MAC filters.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilter.MacFilterEntry</p>		
egressHitCount [Egress Hit Count] (tMacFilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.

Table 212 acfilter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressHitCount [Ingress Hit Count] (tMacFilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.

Table 213 bgp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerAdditionalStats</p> <p>MIB entry name: bgpPeerEntry</p> <p>Entry description: Entry containing information about the connection with a BGP peer.</p> <p>Table description (for bgpPeerTable): BGP peer table. This table contains, one entry per BGP peer, information about the connections with BGP peers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
fsmEstablishedTime [Fsm Established Time] (bgpPeerFsmEstablishedTime)	long	This timer indicates how long (in seconds) this peer has been in the Established state or how long since this peer was last in the Established state. It is set to zero when a new peer is configured or the router is booted.
<p>PeerStats</p> <p>MIB entry name: tBgpPeerNgOperEntry</p> <p>Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable.</p> <p>Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
flaps [Flaps] (tBgpPeerNgOperFlaps)	long	The value of tBgpPeerNgOperFlaps indicates the number of flaps of updates from this peer.
inputQueueMessages [Input Queue Messages] (tBgpPeerNgOperInputQueueMsgs)	long	The value of tBgpPeerNgOperInputQueueMsgs indicates the number of unprocessed messages in the queue, from this peer.

Table 213 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lastEvent [Last Event] (tBgpPeerNgOperLastEvent)	long	The value of tBgpPeerNgOperLastEvent indicates the last BGP event of this peer.
lastRestartTime [Last Restart Time] (tBgpPeerNgOperLastRestartTime)	long	The value of tBgpPeerNgOperLastRestartTime indicates the last time the peer attempted restart.
lastState [Last State] (tBgpPeerNgOperLastState)	long	The value of tBgpPeerNgOperLastState indicates the last BGP state of this peer.
messageOctetsReceived [Message Octets Received] (tBgpPeerNgOperMsgOctetsRcvd)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsRcvd indicates the number of octets received from this peer.
messageOctetsSent [Message Octets Sent] (tBgpPeerNgOperMsgOctetsSent)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsSent indicates the number of octets transmitted to this peer.
numberOfRestarts [Number Of Restarts] (tBgpPeerNgOperNumRestarts)	long	The value of tBgpPeerNgOperNumRestarts indicates the number of times the peer has attempted restart.
outputQueueMessages [Output Queue Messages] (tBgpPeerNgOperOutputQueueMsgs)	long	The value of tBgpPeerNgOperOutputQueueMsgs indicates the number of untransmitted messages in the queue, to this peer.
pathsReceived [Paths Received] (tBgpPeerNgOperReceivedPaths)	long	The value of tBgpPeerNgOperReceivedPaths indicates the number of paths received from this peer.

Table 213 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixesActive [Prefixes Active] (tBgpPeerNgOperActivePrefixes)	long	The value of tBgpPeerNgOperActivePrefixes indicates the number of active prefixes from this peer.
prefixesReceived [Prefixes Received] (tBgpPeerNgOperReceivedPrefixes)	long	The value of tBgpPeerNgOperReceivedPrefixes indicates the number of prefixes received from this peer.
prefixesSent [Prefixes Sent] (tBgpPeerNgOperSentPrefixes)	long	The value of tBgpPeerNgOperSentPrefixes indicates the number of prefixes transmitted to this peer.
prefixesSuppressedByDamping [Prefixes Suppressed By Damping] (tBgpPeerNgOperV4SuppPfxDamp)	long	The value of tBgpPeerNgOperV4SuppPfxDamp indicates the number of IPv6 prefixes from this peer, which have been suppressed by damping.
vpnActivePrefixes [Vpn Active Prefixes] (tBgpPeerNgOperVpnActivePrefixes)	long	The value of tBgpPeerNgOperVpnActivePrefixes indicates the number of active VPN prefixes from this BGP peer.
vpnPrefixesSuppressedByDamping [Vpn Prefixes Suppressed By Damping] (tBgpPeerNgOperVpnSuppPfxDamp)	long	The value of tBgpPeerNgOperVpnSuppPfxDamp indicates the number of VPN IPv4 prefixes from this peer, which have been suppressed by damping.
vpnReceivedPrefixes [Vpn Received Prefixes] (tBgpPeerNgOperVpnRecvPrefixes)	long	The value of tBgpPeerNgOperVpnRecvPrefixes indicates the number of received VPN prefixes.
vpnSentPrefixes [Vpn Sent Prefixes] (tBgpPeerNgOperVpnSentPrefixes)	long	The value of tBgpPeerNgOperVpnSentPrefixes indicates the number of transmitted VPN prefixes.

Table 214 equipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AllocatedMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
allocatedMemory [Allocated Memory] (sgiMemoryPoolAllocated)	long	The value of sgiMemoryPoolAllocated indicates the total memory currently allocated in memory-pools on the system. This memory may or may not be currently in use, but is pre-allocated should the software need to use it. If the value is greater than the maximum value reportable by this object then this object reports its maximum value (4,294,967,295) and sgiKbMemoryPoolAllocated must be used to determine the total memory allocated in memory-pools.
<p>AvailableMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
availableMemory [Available Memory] (sgiMemoryAvailable)	long	The value of sgiMemoryAvailable indicates the amount of free memory in the overall system that is not allocated to memory pools, but is available in case a memory pool needs to grow.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DDMStats</p> <p>MIB entry name: tmnxDigitalDiagMonitorEntry</p> <p>Entry description: Each row represents a particular SFF that supports Digital Diagnostic Monitoring. Entries are created and deleted internally by the system.</p> <p>Table description (for tmnxDigitalDiagMonitorTable): The tmnxDigitalDiagMonitorTable has an entry for each SFF in the system that supports Digital Diagnostic Monitoring (DDM). The table is indexed by TmnxPortID. Each row in this table is dynamically added and removed internally by the system based on the presence or absence of DDM capable SFF components.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.DigitalDiagnosticMonitoring</p>		
aux1 [Aux 1] (tmnxDDMAux1)	float	The value of tmnxDDMAux1 indicates the Manufacturer specific Auxiliary 1 information of the XFP.
aux1Type [Aux 1 Type] (tmnxDDMAux1Type)	int	The value of tmnxDDMAux1Type indicates the measurement type of the Manufacturer specific Auxiliary 1 information of the XFP: none (0) - not specified. adp-bias-voltage (1) - LSB is 10mV. reserved-2 (2) - reserved for future use. tec-current (3) - LSB is 100uA. laser-temp (4) - degrees Celsius. laser-wavelength (5) - LSB is 0.05 nm. voltage-50 (6) - 5.0 supply voltage, LSB=100uV. voltage-33 (7) - 3.3 supply voltage, LSB=100uV. voltage-18 (8) - 1.8 supply voltage, LSB=100uV. voltage-52 (9) - -5.2 supply voltage, LSB=100uV. current-50 (10) - 5.0V supply current, LSB=100uA. reserved-11 (11) - reserved for future use. reserved-12 (12) - reserved for future use. current-33 (13) - 3.3V supply current, LSB=100uA. current-18 (14) - 1.8V supply current, LSB=100uA. current-52 (15) - -5.2V supply current, LSB=100uA.
aux2 [Aux 2] (tmnxDDMAux2)	float	The value of tmnxDDMAux2 indicates the Manufacturer specific Auxiliary 2 information of the SFF.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aux2Type [Aux 2 Type] (tmnxDDMAux2Type)	int	The value of tmnxDDMAux2Type indicates the measurement type of the Manufacturer specific Auxiliary 2 information of the XFP: none (0) - not specified. adp-bias-voltage (1) - LSB is 10mV. reserved-2 (2) - reserved for future use. tec-current (3) - LSB is 100uA. laser-temp (4) - degrees Celsius(C). laser-wavelength (5) - LSB is 0.05 nm. voltage-50 (6) - 5.0 supply voltage, LSB=100uV. voltage-33 (7) - 3.3 supply voltage, LSB=100uV. voltage-18 (8) - 1.8 supply voltage, LSB=100uV, voltage-52 (9) - -5.2 supply voltage, LSB=100uV. current-50 (10) - 5.0V supply current, LSB=100uA. reserved-11 (11) - reserved for future use. reserved-12 (12) - reserved for future use. current-33 (13) - 3.3V supply current, LSB=100uA. current-18 (14) - 1.8V supply current, LSB=100uA. current-52 (15) - -5.2V supply current, LSB=100uA.
rxOpticalPower [Rx Optical Power] (tmnxDDMRxOpticalPower)	float	The value of tmnxDDMRxOpticalPower indicates the current Received Optical Power of the SFF in one tenths of a microwatt (uW). If the SFF is externally calibrated, the objects tmnxDDMExtCalRxPower4, tmnxDDMExtCalRxPower3, tmnxDDMExtCalRxPower2, tmnxDDMExtCalRxPower1 and tmnxDDMExtCalRxPower0 affect the output power calculation. For example (internally calibrated SFF): Using the SNMP value of 790, and using units of tenths of microwatt, 790 becomes 79 microwatts or 0.079 milliwatts. Converting to dBm: $10 \times \log_{10}(0.079) = -11.0$ dBm
rxOpticalPowerType [Rx Optical Power Type] (tmnxDDMRxOpticalPowerType)	int	The value of tmnxDDMRxOpticalPowerType indicates whether the tmnxDDMRxOpticalPower was taken as an average, or as an Optical Modulation Amplitude (OMA).

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
supplyVoltage [Supply Voltage] (tmnxDDMSupplyVoltage)	float	The value of tmnxDDMSupplyVoltage indicates the current supply voltage of the SFF in 1/10000 of a Volt(V). If the SFF is externally calibrated, the objects tmnxDDMExtCalVoltageSlope and tmnxDDMExtCalVoltageOffset affect the voltage calculation. The formula for translating between the value of tmnxDDMSupplyVoltage and Voltage is: Internally Calibrated only: $\text{tmnxDDMSupplyVoltage} / 10000$ Externally Calibrated: $(\text{tmnxDDMSupplyVoltage} * (\text{tmnxDDMExtCalVoltageSlope} / 256) + \text{tmnxDDMExtCalVoltageOffset}) / 10000$ For example (internally calibrated SFF): The SNMP value 32851 is 3.2851 Volts (V).
temperature [Temperature] (tmnxDDMTemperature)	float	The value of tmnxDDMTemperature indicates the current temperature of the SFF in 1/256th degrees Celsius. If the SFF is externally calibrated, the objects tmnxDDMExtCalTemperatureSlope and tmnxDDMExtCalTemperatureOffset affect the temperature calculation. The formula for translating between the value of tmnxDDMTemperature and degrees Celsius is: Internally Calibrated only: $\text{tmnxDDMTemperature} / 256$ Externally Calibrated: $(\text{tmnxDDMTemperature} * (\text{tmnxDDMExtCalTemperatureSlope} / 256) + \text{tmnxDDMExtCalTemperatureOffset}) / 256$ For example (internally calibrated SFF): The SNMP value 5734 is 22.4 degrees Celsius.
txBiasCurrent [Tx Bias Current] (tmnxDDMTxBiasCurrent)	float	The value of tmnxDDMTxBiasCurrent indicates the current Transmit Bias Current of the SFF in 1/500 milliamperes (mA). If the SFF is externally calibrated, the objects tmnxDDMExtCalTxLaserBiasSlope and tmnxDDMExtCalTxLaserBiasOffset affect the ampere calculation. The formula for translating between the value of tmnxDDMTxBiasCurrent and amperes is: Internally Calibrated only: $\text{tmnxDDMTxBiasCurrent} / 500$ Externally Calibrated: $(\text{tmnxDDMTxBiasCurrent} * (\text{tmnxDDMExtCalTxLaserBiasSlope} / 256) + \text{tmnxDDMExtCalTxLaserBiasOffset}) / 500$ For example (internally calibrated SFF): The SNMP value 2565 is 5.1 milliamperes (mA).

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txOutputPower [Tx Output Power] (tmnxDDMTxOutputPower)	float	The value of tmnxDDMTxOutputPower indicates the current Output Power of the SFF in one tenths of a microwatt (uW). If the SFF is externally calibrated, the objects tmnxDDMExtCalTemperatureSlope and tmnxDDMExtCalTemperatureOffset affect the output power calculation. For example (internally calibrated SFF): Using the SNMP value of 790, and using units of tenths of microwatt, 790 becomes 79 microwatts or 0.079 milliwatts. Converting to dBm: $10 \times \log_{10}(0.079) = -11.0$ dBm

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>HardwareTemperature</p> <p>MIB entry name: tmnxHwEntry</p> <p>Entry description: Each row entry represents an Nokia SROS series manufactured hardware component. Entries cannot be created and deleted via SNMP SET operations. When an entry is created in one of the card tables, IOM, CPM, Fabric or MDA, a tmnxHwEntry is created for the common hardware management information for that card in that chassis. When the card is removed from the chassis, its corresponding tmnxHwEntry is deleted. The tmnxHwIndex is bitmapped. The tmnxPhysChassisClass is used to indicate a sub-class of a TmnxHwClass type. A value of 0 instead of 'routerChassis (3)' is used to represent router chassis: 32 25 24 17 16 9 8 1 +-----+-----+ +-----+-----+ TmnxHwClass TmnxPhysChassisClass Slot number +-----+-----+ +-----+-----+ The Slot field is only used for components on cards in slots. It is zero for all others. The number field starts from 1 and indicates which component. E.g. Power supply 1 or 2.</p> <p>Table description (for tmnxHwTable): The tmnxHwTable has an entry for each managed hardware component in the Nokia SROS series system's chassis. Examples of these hardware component types are IOM, Fabric, and CPM cards, MCM and CCM, and MDA modules. Similar information for physical ports is in the tmnxPortObjs.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.BaseCard • equipment.CCM • equipment.CardSlot • equipment.ControlProcessor • equipment.DaughterCard • equipment.FanTray • equipment.MCMCard • equipment.PowerSupplyTray • equipment.SwitchFabricProcessor 		
temperature [Temperature] (tmnxHwTemperature)	int	The current temperature reading in degrees celsius from this hardware component's temperature sensor. If this component does not contain a temperature sensor, then the value -1 is returned.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceAdditionalStats</p> <p>MIB entry name: ifXEntry</p> <p>Entry description: An entry containing additional management information applicable to a particular interface.</p> <p>Table description (for ifXTable): A list of interface entries. Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedBroadcastPackets [Received Broadcast Packets] (ifHCInBroadcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedMulticastPackets [Received Multicast Packets] (ifHCInMulticastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedTotalOctets [Received Total Octets] (ifHCInOctets)	java. math. BigInteger	The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifHCInUcastPkts)	java. math. BigInteger	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedBroadcastPackets [Transmitted Broadcast Packets] (ifHCOutBroadcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedMulticastPackets [Transmitted Multicast Packets] (ifHCOutMulticastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedTotalOctets [Transmitted Total Octets] (ifHCOutOctets)	java. math. BigInteger	The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedUnicastPackets [Transmitted Unicast Packets] (ifHCOutUcastPkts)	java. math. BigInteger	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats</p> <p>MIB entry name: ifEntry</p> <p>Entry description: An entry containing management information applicable to a particular interface.</p> <p>Table description (for ifTable): A list of interface entries. The number of entries is given by the value of ifNumber.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • bundle.Interface • ccag.CcagPathCcNetSap • ccag.CcagPathCcSapNet • ccag.CcagPathCcSapSap • equipment.ManagementPort • equipment.PhysicalPort • equipment.ScadaBranch • equipment.ScadaMddb • ies.L3AccessInterface • lag.Interface • pxc.PortCrossConnectSubPort • rtr.NetworkInterface • sonetequipment.Sts12Channel • sonetequipment.Sts192Channel • sonetequipment.Sts1Channel • sonetequipment.Sts3Channel • sonetequipment.Sts48Channel • sonetequipment.TributaryChannel • sonetequipment.Tu3Channel • tdmequipment.DS0ChannelGroup • tdmequipment.DS1E1Channel • tdmequipment.DS3E3Channel • vprn.L3AccessInterface 		

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outboundBadPackets [Outbound Bad Packets] (ifOutErrors)	long	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
outboundPacketsDiscarded [Outbound Packets Discarded] (ifOutDiscards)	long	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedBadPackets [Received Bad Packets] (ifInErrors)	long	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedOctets [Received Octets] (ifInOctets)	long	The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedPacketsDiscarded [Received Packets Discarded] (ifInDiscards)	long	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnicastPackets [Received Unicast Packets] (ifInUcastPkts)	long	The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
receivedUnknownProtocolPackets [Received Unknown Protocol Packets] (ifInUnknownProtos)	long	For packet-oriented interfaces, the number of packets received via the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
transmittedOctets [Transmitted Octets] (ifOutOctets)	long	The total number of octets transmitted out of the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transmittedUnicastPackets [Transmitted Unicast Packets] (ifOutUcastPkts)	long	The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
<p>MediaIndependentStats</p> <p>MIB entry name: mediaIndependentEntry</p> <p>Entry description: Media independent statistics for promiscuous monitoring of any media.</p> <p>Table description (for mediaIndependentTable): Media independent statistics for promiscuous monitoring of any media. The following table defines media independent statistics that provide information for full and/or half-duplex links as well as high capacity links. For half-duplex links, or full-duplex-capable links operating in half-duplex mode, the mediaIndependentIn* objects shall be used and the mediaIndependentOut* objects shall not increment. For full-duplex links, the mediaIndependentOut* objects shall be present and shall increment. Whenever possible, the probe should count packets moving away from the closest terminating equipment as output packets. Failing that, the probe should count packets moving away from the DTE as output packets.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
dropEvents [Drop Events] (mediaIndependentDropEvents)	long	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
droppedFrames [Dropped Frames] (mediaIndependentDroppedFrames)	long	The total number of frames which were received by the probe and therefore not accounted for in the mediaIndependent-DropEvents, but for which the probe chose not to count for this entry for whatever reason. Most often, this event occurs when the probe is out of some resources and decides to shed load from this collection. This count does not include packets that were not counted because they had MAC-layer errors. Note that, unlike the dropEvents counter, this number is the exact number of frames dropped.
duplex [Duplex] (mediaIndependentDuplexMode)	int	The current mode of this link. Note that if the link has full-duplex capabilities but is operating in half-duplex mode, this value will be halfduplex(1).
duplexChanges [Duplex Changes] (mediaIndependentDuplexChanges)	long	The number of times this link has changed from full-duplex mode to half-duplex mode or from half-duplex mode to full-duplex mode.
inputSpeed [Input Speed] (mediaIndependentInputSpeed)	long	The nominal maximum speed in kilobits per second of this half-duplex link or on the inbound connection of this full-duplex link. If the speed is unknown or there is no fixed maximum (e.g. a compressed link), this value shall be zero.
outputSpeed [Output Speed] (mediaIndependentOutputSpeed)	long	The nominal maximum speed in kilobits per second of this full-duplex link in the direction of the network. If the speed is unknown, the link is half-duplex, or there is no fixed maximum (e.g. a compressed link), this value shall be zero.
receivedBadPackets [Received Bad Packets] (mediaIndependentInErrors)	long	The total number of bad packets received on a half-duplex link or on the inbound connection of a full-duplex link.
receivedNonUnicastPackets [Received Non Unicast Packets] (mediaIndependentInNUCastHigh-CapacityPkts)	java. math. BigInteger	The total number of non-unicast packets (including bad packets) received on a half-duplex link or on the inbound connection of a full-duplex link.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedOctets [Received Octets] (mediaIndependentInHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received (excluding framing bits but including FCS octets) on a half-duplex link or on the inbound connection of a full-duplex link.
receivedPackets [Received Packets] (mediaIndependentInHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received on a half-duplex link or on the inbound connection of a full-duplex link.
transmittedBadPackets [Transmitted Bad Packets] (mediaIndependentOutErrors)	long	The total number of bad packets received on a full-duplex link in the direction of the network.
transmittedNonUnicastPackets [Transmitted Non Unicast Packets] (mediaIndependentOutNUC- astHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets) received on a full-duplex link in the direction of the network.
transmittedOctets [Transmitted Octets] (mediaIndependentOutHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received on a full-duplex link in the direction of the network (excluding framing bits but including FCS octets).
transmittedPackets [Transmitted Packets] (mediaIndependentOutHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received on a full-duplex link in the direction of the network.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortAccessEgressQueueStats</p> <p>MIB entry name: tmnxPortAccessEgressQueueStatsEntry</p> <p>Entry description: Defines an entry in tmnxPortAccessEgressQueueStatsTable. Entries are created and deleted by the system depending on the queue policy being used at the specific port.</p> <p>Table description (for tmnxPortAccessEgressQueueStatsTable): Defines the Nokia SAS series access port egress statistics table for providing, via SNMP, the capability of retrieving the traffic statistics for the physical queues being used for the ports to forward the access egress traffic.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: equipment.PhysicalPort</p>		
portAccessEgressQueueStatsDroOcts [Port Access Egress Queue Stats Dro Octs] (tmnxPortAccessEgress-QueueStatsDroOcts)	java. math. BigInteger	tmnxPortAccessEgressQueueStatsDroOcts indicates the number of dropped network egress octets on this port using this queue.
portAccessEgressQueueStatsDroPkts [Port Access Egress Queue Stats Dro Pkts] (tmnxPortAccessEgress-QueueStatsDroPkts)	java. math. BigInteger	tmnxPortAccessEgressQueueStatsDroPkts indicates the number of dropped access egress packets on this port using this queue.
portAccessEgressQueueStatsFwdOcts [Port Access Egress Queue Stats Fwd Octs] (tmnxPortAccessEgress-QueueStatsFwdOcts)	java. math. BigInteger	tmnxPortAccessEgressQueueStatsFwdOcts indicates the number of forward access egress octets forwarded on this port using this queue.
portAccessEgressQueueStatsFwdPkts [Port Access Egress Queue Stats Fwd Pkts] (tmnxPortAccessEgress-QueueStatsFwdPkts)	java. math. BigInteger	tmnxPortAccessEgressQueueStatsFwdPkts indicates the number of forwarded access egress packets forwarded on this port using this queue.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portAccessEgressQueueStatsIndex [Port Access Egress Queue Stats Index] (tmnxPortAccessEgressQueueStatsIndex)	long	'tmnxPortAccessEgressQueueIndex' serves as the tertiary index. When used in conjunction with tmnxChassisIndex and tmnxPortPortID, it uniquely identifies a access egress queue for the specified port in the managed system.
<p>PortNetEgressQueueStats</p> <p>MIB entry name: tmnxPortNetEgressQueueStatsEntry</p> <p>Entry description: Defines an entry in tmnxPortNetEgressQueueStatsTable. Entries are created and deleted by the system depending on the queue policy being used at the specific port.</p> <p>Table description (for tmnxPortNetEgressQueueStatsTable): Defines the Nokia SAS series network port egress statistics table for providing, via SNMP, the capability of retrieving the traffic statistics for the physical queues being used for the ports to forward the network egress traffic.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: equipment.PhysicalPort</p>		
portNetEgressQueueStatsDroOcts [Port Net Egress Queue Stats Dro Octs] (tmnxPortNetEgressQueueStatsDroOcts)	java. math. BigInteger	tmnxPortNetEgressQueueStatsDroOcts indicates the number of dropped network egress octets on this port using this queue.
portNetEgressQueueStatsDroPkts [Port Net Egress Queue Stats Dro Pkts] (tmnxPortNetEgressQueueStatsDroPkts)	java. math. BigInteger	tmnxPortNetEgressQueueStatsDroPkts indicates the number of dropped network egress packets on this port using this queue.
portNetEgressQueueStatsFwdOcts [Port Net Egress Queue Stats Fwd Octs] (tmnxPortNetEgressQueueStatsFwdOcts)	java. math. BigInteger	tmnxPortNetEgressQueueStatsFwdOcts indicates the number of forwarded network egress octets on this port using this queue.
portNetEgressQueueStatsFwdPkts [Port Net Egress Queue Stats Fwd Pkts] (tmnxPortNetEgressQueueStatsFwdPkts)	java. math. BigInteger	tmnxPortNetEgressQueueStatsFwdPkts indicates the number of forwarded network egress packets on this port using this queue.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portNetEgressQueueStatsInProfDroOcts [Port Net Egress Queue Stats In Prof Dro Octs] (tmnxPortNetEgress- QueueStatsInProfDroOcts)	java. math. BigInteger	tmnxPortNetEgressQueueStatsInProfDroOcts indicates the number of dropped network egress octets on this port using this in-profile queue.
portNetEgressQueueStatsInProfDroPkts [Port Net Egress Queue Stats In Prof Dro Pkts] (tmnxPortNetEgress- QueueStatsInProfDroPkts)	java. math. BigInteger	tmnxPortNetEgressQueueStatsInProfDroPkts indicates the number of dropped network egress octets on this port using this in-profile queue.
portNetEgressQueueStatsIndex [Port Net Egress Queue Stats Index] (tmnxPortNetEgressQueueStatsIndex)	long	tmnxPortNetEgressQueueStatsIndex serves as the tertiary index. When used in conjunction with tmnxChassisIndex and tmnxPortPortID, it uniquely identifies a network egress queue for the specified port in the managed system.
portNetEgressQueueStatsOutProfDroOcts [Port Net Egress Queue Stats Out Prof Dro Octs] (tmnxPortNetEgressQueueStats- OutProfDroOcts)	java. math. BigInteger	tmnxPortNetEgressQueueStatsOutProfDroOcts indicates the number of dropped network egress octets on this port using this out-profile queue.
portNetEgressQueueStatsOutProfDroPkts [Port Net Egress Queue Stats Out Prof Dro Pkts] (tmnxPortNetEgressQueueStats- OutProfDroPkts)	java. math. BigInteger	tmnxPortNetEgressQueueStatsOutProfDroPkts indicates the number of dropped network egress octets on this port using this out-profile queue.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PortNetIngressStats</p> <p>MIB entry name: tmnxPortNetIngressStatsEntry</p> <p>Entry description: Defines an entry in tmnxPortNetIngressStatsTable. Entries are created and deleted by the system depending on the queue policy being used at the specific port.</p> <p>Table description (for tmnxPortNetIngressStatsTable): Defines the Nokia SROS series network port ingress statistics table for providing, via SNMP, the capability of retrieving the traffic statistics for the physical queues being used for the ports to forward the network ingress traffic.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • bundle.Interface • equipment.PhysicalPort 		
inProfileOctetsDropped [In Profile Octets Dropped] (tmnxPortNetIngressDroInProfOcts)	java. math. BigInteger	tmnxPortNetIngressDroInProfOcts indicates the number of conforming network ingress octets dropped on this port using this queue.
inProfileOctetsForwarded [In Profile Octets Forwarded] (tmnxPortNetIngressFwdInProfOcts)	java. math. BigInteger	tmnxPortNetIngressFwdInProfOcts indicates the number of conforming network ingress octets forwarded on this port using this queue.
inProfilePacketsDropped [In Profile Packets Dropped] (tmnxPortNetIngressDroInProfPkts)	java. math. BigInteger	tmnxPortNetIngressDroInProfPkts indicates the number of conforming network ingress packets dropped on this port using this queue.
inProfilePacketsForwarded [In Profile Packets Forwarded] (tmnxPortNetIngressFwdInProfPkts)	java. math. BigInteger	tmnxPortNetIngressFwdInProfPkts indicates the number of conforming network ingress packets forwarded on this port using this queue.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outOfProfileOctetsDropped [Out Of Profile Octets Dropped] (tmnxPortNetIngressDroOutProfOcts)	java. math. BigInteger	tmnxPortNetIngressDroOutProfOcts indicates the number of exceeding network ingress octets dropped on this port using this queue.
outOfProfileOctetsForwarded [Out Of Profile Octets Forwarded] (tmnxPortNetIngressFwdOutProfOcts)	java. math. BigInteger	tmnxPortNetIngressFwdOutProfOcts indicates the number of exceeding network ingress octets forwarded on this port using this queue.
outOfProfilePacketsDropped [Out Of Profile Packets Dropped] (tmnxPortNetIngressDroOutProfPkts)	java. math. BigInteger	tmnxPortNetIngressDroOutProfPkts indicates the number of exceeding network ingress packets dropped on this port using this queue.
outOfProfilePacketsForwarded [Out Of Profile Packets Forwarded] (tmnxPortNetIngressFwdOutProfPkts)	java. math. BigInteger	tmnxPortNetIngressFwdOutProfPkts indicates the number of exceeding network ingress packets forwarded on this port using this queue.
portNetIngressMeterId [Port Net Ingress Meter Id] (tmnxPortNetIngressQueueIndex)	long	tmnxPortNetIngressQueueIndex serves as the tertiary index. When used in conjunction with tmnxChassisIndex and tmnxPortPortID, it uniquely identifies a network ingress queue for the specified port in the managed system.
SystemCpuStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder		
systemCpuUsage [System Cpu Usage] (sgiCpuUsage)	long	The value of sgiCpuUsage indicates the current CPU utilization for the system.

Table 214 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SystemMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
systemMemoryUsage [System Memory Usage] (sgiMemoryUsed)	long	The value of sgiMemoryUsed indicates the total pre-allocated pool memory currently in use on the system. If the value is greater than the maximum value reportable by this object then this object reports its maximum value (4,294,967,295) and sgiKbMemoryUsed must be used to determine the total pre-allocated pool memory.

Table 215 ethernetequipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AdditionalEthernetStats</p> <p>MIB entry name: tmnxPortEtherEntry</p> <p>Entry description: Each row entry represents an Ethernet port on a IOM card in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. Before an IOM card entry can be deleted from the tmnxMDATable, its supported tmnxPortEntry and tmnxPortEtherEntry rows must be in the proper state for removal. The tmnxPortEtherEntry contains attributes that are unique to the Ethernet TmnxPortType.</p> <p>Table description (for tmnxPortEtherTable): The tmnxPortEtherTable has an entry for each Ethernet (faste, gige, xcme or xgige) port on each IOM card in each chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
highCapacityPackets1519toMaxFrameSize [High Capacity Packets 1519 to Max Frame Size] (tmnxPortEtherHCPkts1519toMax)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 1519 octets in length and the maximum frame size, usually 12287 octets inclusive (excluding framing bits but including FCS octets). The lower 32-bits of this 64-bit counter will equal the value of tmnxPortEtherHCPkts1519toMax. The high 32-bits of this counter will equal the value of tmnxPortEtherHCOverPkts1519toMax.
packets1519toMaxFrameSize [Packets 1519 to Max Frame Size] (tmnxPortEtherPkts1519toMax)	long	The total number of packets received that were longer than 1518 octets but less than the maximum frame size for the particular medium, usually 12287 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Dot3Stats</p> <p>MIB entry name: dot3StatsEntry</p> <p>Entry description: Statistics for a particular interface to an ethernet-like medium.</p> <p>Table description (for dot3StatsTable): Statistics for a collection of ethernet-like interfaces attached to a particular system. There will be one row in this table for each ethernet-like interface in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.PhysicalPort • pxc.PortCrossConnectSubPort 		
<p>alignmentErrors [Alignment Errors] (dot3StatsAlignmentErrors)</p>	<p>long</p>	<p>A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the FCS check. The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. This counter does not increment for group encoding schemes greater than 4 bits per group. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsAlignmentErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.</p>

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
carrierSenseErrors [Carrier Sense Errors] (dot3StatsCarrierSenseErrors)	long	The number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular interface. The count represented by an instance of this object is incremented at most once per transmission attempt, even if the carrier sense condition fluctuates during a transmission attempt. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
deferredTransmissions [Deferred Transmissions] (dot3StatsDeferredTransmissions)	long	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium is busy. The count represented by an instance of this object does not include frames involved in collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
duplex [Duplex] (dot3StatsDuplexStatus)	int	The current mode of operation of the MAC entity. 'unknown' indicates that the current duplex mode could not be determined. Management control of the duplex mode is accomplished through the MAU MIB. When an interface does not support autonegotiation, or when autonegotiation is not enabled, the duplex mode is controlled using ifMauDefaultType. When autonegotiation is supported and enabled, duplex mode is controlled using ifMauAutoNegAdvertisedBits. In either case, the currently operating duplex mode is reflected both in this object and in ifMauType. Note that this object provides redundant information with ifMauType. Normally, redundant objects are discouraged. However, in this instance, it allows a management application to determine the duplex status of an interface without having to know every possible value of ifMauType. This was felt to be sufficiently valuable to justify the redundancy.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
excessiveCollisions [Excessive Collisions] (dot3StatsExcessiveCollisions)	long	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
fcsErrors [Fcs Errors] (dot3StatsFCSErrors)	long	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error. The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. Note: Coding errors detected by the physical layer for speeds above 10 Mb/s will cause the frame to fail the FCS check. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsFCSErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
frameTooLongs [Frame Too Longs] (dot3StatsFrameTooLongs)	long	A count of frames received on a particular interface that exceed the maximum permitted frame size. The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions pertain are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC. For interfaces operating at 10 Gb/s, this counter can roll over in less than 80 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsFrameTooLongs object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalMacReceiveErrors [Internal Mac Receive Errors] (dot3StatsInternalMacReceiveErrors)	long	A count of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsFrameTooLongs object, the dot3StatsAlignmentErrors object, or the dot3StatsFCSErrors object. The precise meaning of the count represented by an instance of this object is implementation- specific. In particular, an instance of this object may represent a count of receive errors on a particular interface that are not otherwise counted. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsInternalMacReceiveErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalMacTransmitErrors [Internal Mac Transmit Errors] (dot3StatsInternalMacTransmitErrors)	long	A count of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object. The precise meaning of the count represented by an instance of this object is implementation- specific. In particular, an instance of this object may represent a count of transmission errors on a particular interface that are not otherwise counted. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsInternalMacTransmitErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
lateCollisions [Late Collisions] (dot3StatsLateCollisions)	long	The number of times that a collision is detected on a particular interface later than one slotTime into the transmission of a packet. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
multipleCollisionFrames [Multiple Collision Frames] (dot3StatsMultipleCollisionFrames)	long	A count of frames that are involved in more than one collision and are subsequently transmitted successfully. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
singleCollisionFrames [Single Collision Frames] (dot3StatsSingleCollisionFrames)	long	A count of frames that are involved in a single collision, and are subsequently transmitted successfully. A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrames object. This counter does not increment when the interface is operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
sqeTestErrors [Sqe Test Errors] (dot3StatsSQETestErrors)	long	A count of times that the SQE TEST ERROR is received on a particular interface. The SQE TEST ERROR is set in accordance with the rules for verification of the SQE detection mechanism in the PLS Carrier Sense Function as described in IEEE Std. 802.3, 2000 Edition, section 7.2.4.6. This counter does not increment on interfaces operating at speeds greater than 10 Mb/s, or on interfaces operating in full-duplex mode. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
symbolErrors [Symbol Errors] (dot3StatsSymbolErrors)	long	For an interface operating at 100 Mb/s, the number of times there was an invalid data symbol when a valid carrier was present. For an interface operating in half-duplex mode at 1000 Mb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than slotTime, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Data reception error' or 'carrier extend error' on the GMII. For an interface operating in full-duplex mode at 1000 Mb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than minFrameSize, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Data reception error' on the GMII. For an interface operating at 10 Gb/s, the number of times the receiving media is non-idle (a carrier event) for a period of time equal to or greater than minFrameSize, and during which there was at least one occurrence of an event that causes the PHY to indicate 'Receive Error' on the XGMII. The count represented by an instance of this object is incremented at most once per carrier event, even if multiple symbol errors occur during the carrier event. This count does not increment if a collision is present. This counter does not increment when the interface is operating at 10 Mb/s. For interfaces operating at 10 Gb/s, this counter can roll over in less than 5 minutes if it is incrementing at its maximum rate. Since that amount of time could be less than a management station's poll cycle time, in order to avoid a loss of information, a management station is advised to poll the dot3HCStatsSymbolErrors object for 10 Gb/s or faster interfaces. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.

packets64Octets [Packets 64 Octets] (etherStatsHighCapacityPkts64Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (etherStatsHighCapacityPkts65to127Octets)	java. math. BigInteger	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalOctets [Total Octets] (etherStatsHighCapacityOctets)	java. math. BigInteger	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). If the network is half-duplex Fast Ethernet, this object can be used as a reasonable estimate of utilization. If greater precision is desired, the etherStatsHighCapacityPkts and etherStatsHighCapacityOctets objects should be sampled before and after a common interval. The differences in the sampled values are Pkts and Octets, respectively, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows: $Pkts * (.96 + .64) + (Octets * .08)$ Utilization = - Interval * 10,000 The result of this equation is the value Utilization which is the percent utilization of the ethernet segment on a scale of 0 to 100 percent. This table is not appropriate for monitoring full-duplex ethernets. If the network is a full-duplex ethernet and the mediaIndependentTable is monitoring that network, the utilization can be calculated as follows: 1) Determine the utilization of the inbound path by using the appropriate equation (for ethernet or fast ethernet) to determine the utilization, substituting mediaIndependentInPkts for etherStatsHighCapacityPkts, and mediaIndependentInOctets for etherStatsHighCapacityOctets. Call the resulting utilization inUtilization. 2) Determine the utilization of the outbound path by using the same equation to determine the utilization, substituting mediaIndependentOutPkts for etherStatsHighCapacityPkts, and mediaIndependentOutOctets for etherStatsHighCapacityOctets. Call the resulting utilization outUtilization. 3) The utilization is the maximum of inUtilization and outUtilization. This metric shows the amount of percentage of bandwidth that is left before congestion will be experienced on the link.
totalPackets [Total Packets] (etherStatsHighCapacityPkts)	java. math. BigInteger	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EthernetStats</p> <p>MIB entry name: etherStatsEntry</p> <p>Entry description: A collection of statistics kept for a particular Ethernet interface. broadcastPackets [Broadcast Packets] (etherStatsBroadcastPkts)	long	The total number of good packets received that were directed to the broadcast address. Note that this does not include multicast packets.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
collisions [Collisions] (etherStatsCollisions)	long	The best estimate of the total number of collisions on this Ethernet segment. The value returned will depend on the location of the RMON probe. Section 8.2.1.3 (10BASE-5) and section 10.3.1.3 (10BASE-2) of IEEE standard 802.3 states that a station must detect a collision, in the receive mode, if three or more stations are transmitting simultaneously. A repeater port must detect a collision when two or more stations are transmitting simultaneously. Thus a probe placed on a repeater port could record more collisions than a probe connected to a station on the same segment would. Probe location plays a much smaller role when considering 10BASE-T. 14.2.1.4 (10BASE-T) of IEEE standard 802.3 defines a collision as the simultaneous presence of signals on the DO and RD circuits (transmitting and receiving at the same time). A 10BASE-T station can only detect collisions when it is transmitting. Thus probes placed on a station and a repeater, should report the same number of collisions. Note also that an RMON probe inside a repeater should ideally report collisions between the repeater and one or more other hosts (transmit collisions as defined by IEEE 802.3k) plus receiver collisions observed on any coax segments to which the repeater is connected.
crcAlignErrors [Crc Align Errors] (etherStatsCRCAAlignErrors)	long	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
dropEvents [Drop Events] (etherStatsDropEvents)	long	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fragments [Fragments] (etherStatsFragments)	long	The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that it is entirely normal for etherStatsFragments to increment. This is because it counts both runts (which are normal occurrences due to collisions) and noise hits.
jabbers [Jabbers] (etherStatsJabbers)	long	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
multicastPackets [Multicast Packets] (etherStatsMulticastPkts)	long	The total number of good packets received that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address.
oversizePackets [Oversize Packets] (etherStatsOversizePkts)	long	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.
packets1024to1518Octets [Packets 1024 to 1518 Octets] (etherStatsPkts1024to1518Octets)	long	The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).
packets128to255Octets [Packets 128 to 255 Octets] (etherStatsPkts128to255Octets)	long	The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
packets256to511Octets [Packets 256 to 511 Octets] (etherStatsPkts256to511Octets)	long	The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).
packets512to1023Octets [Packets 512 to 1023 Octets] (etherStatsPkts512to1023Octets)	long	The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).
packets64Octets [Packets 64 Octets] (etherStatsPkts64Octets)	long	The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).
packets65to127Octets [Packets 65 to 127 Octets] (etherStatsPkts65to127Octets)	long	The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).
totalOctets [Total Octets] (etherStatsOctets)	long	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). This object can be used as a reasonable estimate of 10-Megabit ethernet utilization. If greater precision is desired, the etherStatsPkts and etherStatsOctets objects should be sampled before and after a common interval. The differences in the sampled values are Pkts and Octets, respectively, and the number of seconds in the interval is Interval. These values are used to calculate the Utilization as follows: $Pkts * (9.6 + 6.4) + (Octets * .8)$ Utilization = - Interval * 10,000 The result of this equation is the value Utilization which is the percent utilization of the ethernet segment on a scale of 0 to 100 percent.
totalPackets [Total Packets] (etherStatsPkts)	long	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.

Table 215 ethernetequipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
undersizePackets [Undersize Packets] (etherStatsUndersizePkts)	long	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed.
<p>QosDroppedOctetStats MIB entry name: tmnxPortIngrMdaQosStatEntry Entry description: Each row indicates the MDA QoS discard statistics on an ethernet or SONET/SDH port located on an oversubscribed MDA. For ethernet ports, the tmnxPortEtherIngressRate object indicates the ingress shaping rate configured. NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CfmDmmBinStats</p> <p>MIB entry name: tmnxOamPmStsDelayDmmBinEntry</p> <p>Entry description: tmnxOamPmStsDelayDmmBinEntry contains the per-bin DMM (Delay Measurement Message) statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a corresponding row is created in tmnxOamPmStsDelayDmmTable. If the tmnxOamPmStsDelayDmmTable row is created with the index value tmnxOamPmCfgBinType = 'fd(1)', then the the number of rows created in this table is tmnxOamPmCfgBinGroupFdBinCount. Similarly, 'fdr(2)' and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsDelayDmmTable row is destroyed. When a test is running, the DMM statistics for a test's raw (i.e. 'miRaw(1)') measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros all the raw DMM statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsDelayDmmBinTable): tmnxOamPmStsDelayDmmBinTable contains the per-bin DMM (Delay Measurement Message) statistics for OAM Performance Monitoring Measurement Interval Data Sets.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethernetoam.CfmDmmBin</p>		
<p>delayDmmBinBwdCount [Delay Dmm Bin Bwd Count] (tmnxOamPmStsDelayDmmBinBwdCount)</p>	<p>long</p>	<p>The value of tmnxOamPmStsDelayDmmBinBwdCount indicates the number of measurements in the backward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'dmmSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of DMM measurements (in microseconds) in the backward direction in the first interval of 'dmmSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).</p>

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayDmmBinFwdCount [Delay Dmm Bin Fwd Count] (tmnxOamPmStsDelayDmmBinFwdCount)	long	The value of tmnxOamPmStsDelayDmmBinFwdCount indicates the number of measurements in the forward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'dmmSess1' 'mi15Minutes(2)' 1 'fd(1)' 9 Then, the value of this object indicates the number of DMM measurements (in microseconds) in the forward direction in the first interval of 'dmmSess1' that fit in the highest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayDmmBinNum [Delay Dmm Bin Num] (tmnxOamPmStsDelayDmmBinNum)	long	The value of tmnxOamPmStsDelayDmmBinNum specifies the bin number of the statistics to be read.
delayDmmBintwoWayCount [Delay Dmm BintwoWay Count] (tmnxOamPmStsDelayDmmBin2wyCount)	long	The value of tmnxOamPmStsDelayDmmBin2wyCount indicates the number of two-way measurements that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'dmmSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of two-way DMM measurements (in microseconds) in the first interval of 'dmmSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>CfmDmmSessionStats</p> <p>MIB entry name: tmnxOamPmStsDelayDmmEntry</p> <p>Entry description: tmnxOamPmStsDelayDmmEntry contains the summarized DMM (Delay Measurement Message) statistics for one OAM Performance Monitoring Measurement Interval Data Set. When a row is created in tmnxOamPmStsBaseTable with tmnxOamPmStsBaseTestType = 'dmm(1)', three rows are created in this table. The three rows have the following values in the tmnxOamPmCfgBinType index column: 'fd(1)', 'fdr(2)', and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsBaseTable row is destroyed. When a test is running, the DMM statistics for a test's raw (i.e. 'miRaw(1)') measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros all the raw DMM statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsDelayDmmTable): tmnxOamPmStsDelayDmmTable contains the summarized DMM (Delay Measurement Message) statistics for OAM Performance Monitoring Measurement Interval Data Sets.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethernetoam.CfmDmmSession</p>		
delayDmm2wyAvg [Delay Dmm 2 wy Avg] (tmnxOamPmStsDelayDmm2wyAvg)	long	The value of tmnxOamPmStsDelayDmm2wyAvg indicates the average two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayDmm2wyMax [Delay Dmm 2 wy Max] (tmnxOamPmStsDelayDmm2wyMax)	long	The value of tmnxOamPmStsDelayDmm2wyMax indicates the maximum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmm2wyMin [Delay Dmm 2 wy Min] (tmnxOamPmStsDelayDmm2wyMin)	long	The value of tmnxOamPmStsDelayDmm2wyMin indicates the minimum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdAvg [Delay Dmm Bwd Avg] (tmnxOamPmStsDelayDmmBwdAvg)	long	The value of tmnxOamPmStsDelayDmmBwdAvg indicates the average delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdMax [Delay Dmm Bwd Max] (tmnxOamPmStsDelayDmmBwdMax)	long	The value of tmnxOamPmStsDelayDmmBwdMax indicates the maximum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmBwdMin [Delay Dmm Bwd Min] (tmnxOamPmStsDelayDmmBwdMin)	long	The value of tmnxOamPmStsDelayDmmBwdMin indicates the minimum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdAvg [Delay Dmm Fwd Avg] (tmnxOamPmStsDelayDmmFwdAvg)	long	The value of tmnxOamPmStsDelayDmmFwdAvg indicates the average delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdMax [Delay Dmm Fwd Max] (tmnxOamPmStsDelayDmmFwdMax)	long	The value of tmnxOamPmStsDelayDmmFwdMax indicates the maximum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayDmmFwdMin [Delay Dmm Fwd Min] (tmnxOamPmStsDelayDmmFwdMin)	long	The value of tmnxOamPmStsDelayDmmFwdMin indicates the minimum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CfmSlmSessionStats</p> <p>MIB entry name: tmnxOamPmStsBaseEntry</p> <p>Entry description: tmnxOamPmStsBaseEntry contains the base statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a test is started (e.g. using tmnxOamPmCfgDelayDmmAdminStatus and tmnxOamPmCfgDelayDmmOnDmndStatus). At that time, a row for the current interval (with the index value tmnxOamPmStsIntvlNum=1) is created for each row with a matching session name in tmnxOamPmCfgMeasIntvlTable. In addition, a row is created in this table for the test's 'miRaw(1)' interval. After that, the timed creation and destruction of rows in this table is explained using the following example. Suppose the configured number of intervals to be retained is as follows (where index columns are underlined with octothorpes, and 'tmnxOamPm' is abbreviated as '_'): <u>_CfgSessName</u> <u>_CfgMeasIntvlDuration</u> <u>_CfgMeasIntvlsStored</u> ##### ##### 'mySess1' 'mi15Minutes(2)' 3 Suppose statistics collection started at t = 0 (minutes). Suppose the following rows exist in tmnxOamPmStsBaseTable at t = 59 (minutes): <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 1 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 The interval numbers are assigned as follows: 1 - the historical interval ended at t = 15 minutes 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the current interval Then, after the next 15 minute interval ends (e.g. at t = 61 minutes), the following rows will exist: <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 5 The interval numbers are assigned as follows: 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the historical interval ended at t = 60 minutes 5 - the current interval The row with interval number 1 was destroyed, because tmnxOamPmCfgMeasIntvlsStored=3 specifies that at most three historical intervals be retained. Rows are also destroyed in this table when the corresponding tmnxOamPmCfgMeasIntvlTable row is destroyed. When the index value tmnxOamPmStsMeasIntvlDuration is 'miRaw(1)', only one interval is available (i.e. tmnxOamPmStsIntvlNum = 1). When a test is running, the measurement interval data set for a test's 'miRaw(1)' measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. The change to the objects in the specified row is as follows. Object Change on Clear Operation tmnxOamPmStsBaseOperStatus No change tmnxOamPmStsBaseSuspect Set to 'true(1)' tmnxOamPmStsBaseStartTime Set to UTC time of the clear operation tmnxOamPmStsBaseElapsedTime Set to zero tmnxOamPmStsBaseTestFramesTx Set to zero tmnxOamPmStsBaseTestFramesRx Set to zero Measurement interval data sets for measurement interval durations other than 'miRaw(1)' cannot be cleared.</p> <p>Table description (for tmnxOamPmStsBaseTable): tmnxOamPmStsBaseTable contains the base statistics for OAM Performance Monitoring Measurement Interval Data Sets. The statistics in this table are common to all test types (e.g. DMM and SLM tests).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ethernetoam.CfmSlmSession</p>		

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmSlmAvailIndBwd [Pm Slm Avail Ind Bwd] (tmnxOamPmStsLossSlmAvailIndBwd)	long	The value of tmnxOamPmStsLossSlmAvailIndBwd indicates the number of availability indicators evaluated as Available in the backward direction for the specified measurement interval data set.
pmSlmAvailIndFwd [Pm Slm Avail Ind Fwd] (tmnxOamPmStsLossSlmAvailIndFwd)	long	The value of tmnxOamPmStsLossSlmAvailIndFwd indicates the number of availability indicators evaluated as Available in the forward direction for the specified measurement interval data set.
pmSlmAvgFlrBwd [Pm Slm Avg Flr Bwd] (tmnxOamPmStsLossSlmAvgFlrBwd)	float	The value of tmnxOamPmStsLossSlmAvgFlrBwd indicates the average Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmAvgFlrFwd [Pm Slm Avg Flr Fwd] (tmnxOamPmStsLossSlmAvgFlrFwd)	float	The value of tmnxOamPmStsLossSlmAvgFlrFwd indicates the average Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmChliBwd [Pm Slm Chli Bwd] (tmnxOamPmStsLossSlmChliBwd)	long	The value of tmnxOamPmStsLossSlmChliBwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the backward direction for the specified measurement interval data set.
pmSlmChliFwd [Pm Slm Chli Fwd] (tmnxOamPmStsLossSlmChliFwd)	long	The value of tmnxOamPmStsLossSlmChliFwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the forward direction for the specified measurement interval data set.
pmSlmHliBwd [Pm Slm Hli Bwd] (tmnxOamPmStsLossSlmHliBwd)	long	The value of tmnxOamPmStsLossSlmHliBwd indicates the number of High Loss Intervals (HLIs) in the backward direction for the specified measurement interval data set.

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmHliFwd [Pm Slm Hli Fwd] (tmnxOamPmStsLossSlmHliFwd)	long	The value of tmnxOamPmStsLossSlmHliFwd indicates the number of High Loss Intervals (HLIs) in the forward direction for the specified measurement interval data set.
pmSlmMaxFlrBwd [Pm Slm Max Flr Bwd] (tmnxOamPmStsLossSlmMaxFlrBwd)	float	The value of tmnxOamPmStsLossSlmMaxFlrBwd indicates the maximum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmMaxFlrFwd [Pm Slm Max Flr Fwd] (tmnxOamPmStsLossSlmMaxFlrFwd)	float	The value of tmnxOamPmStsLossSlmMaxFlrFwd indicates the maximum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmMinFlrBwd [Pm Slm Min Flr Bwd] (tmnxOamPmStsLossSlmMinFlrBwd)	float	The value of tmnxOamPmStsLossSlmMinFlrBwd indicates the minimum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmSlmMinFlrFwd [Pm Slm Min Flr Fwd] (tmnxOamPmStsLossSlmMinFlrFwd)	float	The value of tmnxOamPmStsLossSlmMinFlrFwd indicates the minimum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmSlmRxBwd [Pm Slm Rx Bwd] (tmnxOamPmStsLossSlmRxBwd)	long	The value of tmnxOamPmStsLossSlmRxBwd indicates the number of SLR reply frames received in the backward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmSlmRxFwd [Pm Slm Rx Fwd] (tmnxOamPmStsLossSlmRxFwd)	long	The value of tmnxOamPmStsLossSlmRxFwd indicates the number of SLM request frames received in the forward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmTxBwd [Pm Slm Tx Bwd] (tmnxOamPmStsLossSlmTxBwd)	long	The value of tmnxOamPmStsLossSlmTxBwd indicates the number of SLR reply frames transmitted in the backward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmSlmTxFwd [Pm Slm Tx Fwd] (tmnxOamPmStsLossSlmTxFwd)	long	The value of tmnxOamPmStsLossSlmTxFwd indicates the number of SLM request frames transmitted in the forward direction for the specified measurement interval data set. A frame is counted if the SLM Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmSlmUnavailIndBwd [Pm Slm Unavail Ind Bwd] (tmnxOamPmStsLossSlmUnavailIndBwd)	long	The value of tmnxOamPmStsLossSlmUnavailIndBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction for the specified measurement interval data set.
pmSlmUnavailIndFwd [Pm Slm Unavail Ind Fwd] (tmnxOamPmStsLossSlmUnavailIndFwd)	long	The value of tmnxOamPmStsLossSlmUnavailIndFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction for the specified measurement interval data set.
pmSlmUndtAvlBwd [Pm Slm Undt Avl Bwd] (tmnxOamPmStsLossSlmUndtAvlBwd)	long	The value of tmnxOamPmStsLossSlmUndtAvlBwd indicates the number of availability indicators evaluated as Available in the backward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmSlmUndtAvlFwd [Pm Slm Undt Avl Fwd] (tmnxOamPmStsLossSlmUndtAvlFwd)	long	The value of tmnxOamPmStsLossSlmUndtAvlFwd indicates the number of availability indicators evaluated as Available in the forward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmSlmUndtUnavlBwd [Pm Slm Undt Unavl Bwd] (tmnxOamPmStsLossSlmUndtUnavlBwd)	long	The value of tmnxOamPmStsLossSlmUndtUnavlBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmSlmUndtUnavlFwd [Pm Slm Undt Unavl Fwd] (tmnxOamPmStsLossSlmUndtUnavlFwd)	long	The value of tmnxOamPmStsLossSlmUndtUnavlFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 216 ethernetoam statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 217 igmp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats MIB entry name: vRtrIgmplfStatsEntry Entry description: An entry in the vRtrIgmplfStatsTable. Table description (for vRtrIgmplfStatsTable): The table listing the IGMP statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: igmp.Interface</p>		
importPolicyDrops [Import Policy Drops] (vRtrIgmplfImportPolicyDrops)	long	The value of vRtrIgmplfImportPolicyDrops indicates the total number of times IGMP protocol instance matched the host IP address or group/source addresses specified in the import policy vRtrIgmplfImportPolicy.
mcacPolicyDrops [Mcac Policy Drops] (vRtrIgmplfStatsMcacPolicyDrops)	long	The value of the object vRtrIgmplfStatsMcacPolicyDrops indicates the number times an IGMP Group is dropped because of applying a multicast CAC policy on this interface.
rxBadChecksumPkts [Rx Bad Checksum Pkts] (vRtrIgmplfRxBadChecksumPkts)	long	The value of vRtrIgmplfRxBadChecksumPkts indicates the total number of IGMP packets with bad checksum received on this interface.
rxBadEncodings [Rx Bad Encodings] (vRtrIgmplfRxBadEncodings)	long	The value of vRtrIgmplfRxBadEncodings indicates the total number of IGMP packets received on this interface which were not encoded correctly.
rxBadLenPkts [Rx Bad Len Pkts] (vRtrIgmplfRxBadLenPkts)	long	The value of vRtrIgmplfRxBadLenPkts indicates the total number of IGMP packets with bad length received on this interface.
rxBadReceiveIfPkts [Rx Bad Receive If Pkts] (vRtrIgmplfRxBadReceiveIfPkts)	long	The value of vRtrIgmplfRxBadReceiveIfPkts indicates the total number of IGMP packets incorrectly received on this interface.

Table 217 igmp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxGenQueries [Rx Gen Queries] (vRtrIgmplfRxGenQueries)	long	The value of vRtrIgmplfRxGenQueries indicates the total number of IGMP General Queries received on this interface.
rxGrpQueries [Rx Grp Queries] (vRtrIgmplfRxGrpQueries)	long	The value of vRtrIgmplfRxGrpQueries indicates the number of IGMP Group Specific Queries received on this interface.
rxGrpSrcQueries [Rx Grp Src Queries] (vRtrIgmplfRxGrpSrcQueries)	long	The value of vRtrIgmplfRxGrpSrcQueries indicates the number of IGMP Group and Source Specific Queries received on this interface.
rxLeaves [Rx Leaves] (vRtrIgmplfRxLeaves)	long	The value of vRtrIgmplfRxLeaves indicates the total number of IGMP V2 Leaves received on this interface.
rxNoRtrAlertPkts [Rx No Rtr Alert Pkts] (vRtrIgmplfRxNoRtrAlertPkts)	long	The value of vRtrIgmplfRxNoRtrAlertPkts indicates the total number of IGMPv3 packets received on this interface which did not have the router alert flag set.
rxNonLocal [Rx Non Local] (vRtrIgmplfRxNonLocal)	long	The value of vRtrIgmplfRxNonLocal indicates the total number of IGMP packets received from a non-local sender.
rxPktDrops [Rx Pkt Drops] (vRtrIgmplfRxPktDrops)	long	The value of vRtrIgmplfRxPktDrops indicates the total number of IGMP packets that were received on this interface but were dropped.
rxUnknownTypePkts [Rx Unknown Type Pkts] (vRtrIgmplfRxUnknownTypePkts)	long	The value of vRtrIgmplfRxUnknownTypePkts indicates the total number of IGMP packets with unknown type received on this interface.
rxV1Reports [Rx V1 Reports] (vRtrIgmplfRxV1Reports)	long	The value of vRtrIgmplfRxV1Reports indicates the total number of IGMP V1 Reports received on this interface.

Table 217 igmp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxV2Reports [Rx V2 Reports] (vRtrIgmplfRxV2Reports)	long	The value of vRtrIgmplfRxV2Reports indicates the total number of IGMP V2 Reports received on this interface.
rxV3Reports [Rx V3 Reports] (vRtrIgmplfRxV3Reports)	long	The value of vRtrIgmplfRxV3Reports indicates the total number of IGMP V3 Reports received on this interface.
rxWrongVersions [Rx Wrong Versions] (vRtrIgmplfRxWrongVersions)	long	The value of vRtrIgmplfRxWrongVersions indicates the total number of IGMP packets with wrong versions received on this interface.
statsSGTypes [Stats SGTypes] (vRtrIgmplfStatsSGTypes)	long	The value of vRtrIgmplfStatsSGTypes indicates the number of entries on this interface for which the source type is 'sg'.
statsStarGTypes [Stats Star GTypes] (vRtrIgmplfStatsStarGTypes)	long	vRtrIgmplfStatsStarGTypes indicates the number of entries on this interface for which the source type is 'starG'.
txErrors [Tx Errors] (vRtrIgmplfTxErrors)	long	The value of vRtrIgmplfTxErrors indicates the total number of times there was an error transmitting IGMP packets on this interface..
txGenQueries [Tx Gen Queries] (vRtrIgmplfTxGenQueries)	long	The value of vRtrIgmplfTxGenQueries indicates the number of IGMP General Queries transmitted on this interface.
txGrpQueries [Tx Grp Queries] (vRtrIgmplfTxGrpQueries)	long	The value of vRtrIgmplfTxGrpQueries indicates the number of IGMP Group Specific Queries transmitted on this interface.
txGrpSrcQueries [Tx Grp Src Queries] (vRtrIgmplfTxGrpSrcQueries)	long	The value of vRtrIgmplfTxGrpSrcQueries indicates the number of IGMP Group and Source Specific Queries transmitted on this interface.

Table 217 igmp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txLeaves [Tx Leaves] (vRtrIgmplfTxLeaves)	long	The value of vRtrIgmplfTxLeaves indicates the total number of IGMP Leaves transmitted on this interface.
txV1Reports [Tx V1 Reports] (vRtrIgmplfTxV1Reports)	long	The value of vRtrIgmplfTxV1Reports indicates the total number of IGMP V1 Reports transmitted on this interface.
txV2Reports [Tx V2 Reports] (vRtrIgmplfTxV2Reports)	long	The value of vRtrIgmplfTxV2Reports indicates the total number of IGMP V2 Reports transmitted on this interface.
txV3Reports [Tx V3 Reports] (vRtrIgmplfTxV3Reports)	long	The value of vRtrIgmplfTxV3Reports indicates the total number of IGMP V3 Reports transmitted on this interface.
InterfaceStatsExtension MIB entry name: vRtrIgmplfStatsEntry Entry description: An entry in the vRtrIgmplfStatsTable. Table description (for vRtrIgmplfStatsTable): The table listing the IGMP statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: igmp.Interface		
rxLocalScopePkts [Rx Local Scope Pkts] (vRtrIgmplfRxLocalScopePkts)	long	The value of the object vRtrIgmplfRxLocalScopePkts indicates the number of IGMP packets received on the link-local scope IPv4 multicast address.
rxRsvdScopePkts [Rx Rsvd Scope Pkts] (vRtrIgmplfRxRsvdScopePkts)	long	The value of the object vRtrIgmplfRxRsvdScopePkts indicates the number of IGMP packets received on the reserved scope IPv4 multicast address.

Table 218 isis statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceLevelOneReceivingStats MIB entry name: isisPacketCountEntry Entry description: Information about IS-IS protocol traffic at one level on one circuit in one direction Table description (for isisPacketCountTable): Information about IS-IS packets sent and received Supports realtime plotting Supports scheduled collection Monitored class: isis.InterfaceLevelOneConfig</p>		
cnsnpCount [Cnsnp Count] (isisPacketCountCSNP)	long	The number of IS-IS CSNPs seen in this direction at this level.
helloCount [Hello Count] (isisPacketCountHello)	long	The number of IS-IS Hello PDUs seen in this direction at this level.
lspCount [Lsp Count] (isisPacketCountLSP)	long	The number of IS-IS LSPs seen in this direction at this level.
psnpCount [Psnp Count] (isisPacketCountPSNP)	long	The number of IS-IS PSNPs seen in this direction at this level.
<p>InterfaceLevelOneSendingStats MIB entry name: isisPacketCountEntry Entry description: Information about IS-IS protocol traffic at one level on one circuit in one direction Table description (for isisPacketCountTable): Information about IS-IS packets sent and received Supports realtime plotting Supports scheduled collection Monitored class: isis.InterfaceLevelOneConfig</p>

unknownSent [Unknown Sent] (tmnxIsisStatsUnknownSent)	long	The value of the object tmnxIsisStatsUnknownSent indicates the count of link state PDUs sent out by this instance of the protocol is maintained by tmnxIsisStatsUnknownSent.

Table 218 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteLfaStats</p> <p>MIB entry name: tmnxIsisLfaEntry</p> <p>Entry description: Each row entry in the tmnxIsisLfaTable represents information on LFA coverage for various topologies of the system.</p> <p>Table description (for tmnxIsisLfaTable): The tmnxIsisLfaTable maintains information on loopfree-alternate (LFA) coverage for each instance of IS-IS protocol.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: isis.Site</p>		
isisLfalpv4Coverage [Isis Lfa Ipv 4 Coverage] (tmnxIsisLfalPv4Coverage)	long	The value of the object tmnxIsisLfalPv4Coverage indicates how much LFA coverage is being obtained for the available IPv4 routes.
isisLfalpv4NodesCovered [Isis Lfa Ipv 4 Nodes Covered] (tmnxIsisLfalPv4NodesCovered)	long	The value of the object tmnxIsisLfalPv4NodesCovered indicates in absolute numbers how much LFA coverage is being obtained for the available IPv4 routes.
isisLfalpv4TotalNodes [Isis Lfa Ipv 4 Total Nodes] (tmnxIsisLfalPv4TotalNodes)	long	The value of the object tmnxIsisLfalPv4TotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available IPv4 routes.
isisLfalpv6Coverage [Isis Lfa Ipv 6 Coverage] (tmnxIsisLfalPv6Coverage)	long	The value of the object tmnxIsisLfalPv6Coverage indicates how much LFA coverage is being obtained for the available IPv6 routes.
isisLfalpv6NodesCovered [Isis Lfa Ipv 6 Nodes Covered] (tmnxIsisLfalPv6NodesCovered)	long	The value of the object tmnxIsisLfalPv6NodesCovered indicates in absolute numbers how much LFA coverage is being obtained for available IPv6 routes.
isisLfalpv6TotalNodes [Isis Lfa Ipv 6 Total Nodes] (tmnxIsisLfalPv6TotalNodes)	long	The value of the object tmnxIsisLfalPv6TotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available IPv6 routes.

Table 218 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
isisLfaNodeCoverage [Isis Lfa Node Coverage] (tmnxIsisLfaNodeCoverage)	long	The value of the object tmnxIsisLfaNodeCoverage indicates how much LFA coverage is being obtained for the set of available nodes.
isisLfaNodesCovered [Isis Lfa Nodes Covered] (tmnxIsisLfaNodesCovered)	long	The value of the object tmnxIsisLfaNodesCovered indicates in absolute numbers how much LFA coverage is being obtained for the available routes.
isisLfaTotalNodes [Isis Lfa Total Nodes] (tmnxIsisLfaTotalNodes)	long	The value of the object tmnxIsisLfaTotalNodes indicates in absolute numbers how much LFA coverage can be obtained for the available routes.
SiteStats MIB entry name: tmnxIsisStatsEntry Entry description: Each row entry in the tmnxIsisStatsTable stores statistics for an instance of IS-IS protocol configured. Table description (for tmnxIsisStatsTable): The tmnxIsisStatsTable provides statistics for each instance of IS-IS protocol configured. There is a one-to-one dependent relationship between the tables tmnxIsisTable and tmnxIsisStatsTable. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • isis.Site • spb.Site 		
cspfDroppedRequests [Cspf Dropped Requests] (tmnxIsisStatsCSPFDroppedRequests)	long	The value of the object tmnxIsisStatsCSPFDroppedRequests indicates the number of dropped CSPF requests by the protocol.
cspfPathsFound [Cspf Paths Found] (tmnxIsisStatsCSPFPathsFound)	long	The value of the object tmnxIsisStatsCSPFPathsFound indicates the number of responses to CSPF requests for which paths satisfying the constraints were found.

Table 218 isis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
cspfPathsNotFound [Cspf Paths Not Found] (tmnxIsisStatsCSPFPathsNotFound)	long	The value of the object tmnxIsisStatsCSPFPathsFound indicates the number of responses to CSPF requests for which no paths satisfying the constraints were found.
cspfRequests [Cspf Requests] (tmnxIsisStatsCSPFRequests)	long	The value of the object tmnxIsisStatsCSPFRequests indicates the number of CSPF requests made to the protocol.
initiatedPurges [Initiated Purges] (tmnxIsisStatsInitiatedPurges)	long	The value of the object tmnxIsisStatsInitiatedPurges indicates the number of times purges have been initiated.
lspRegenerations [Lsp Regenerations] (tmnxIsisStatsLSPRegenerations)	long	The value of the object tmnxIsisStatsLSPRegenerations indicates the count of LSP regenerations.
spfRuns [Spf Runs] (tmnxIsisStatsSpfRuns)	long	The value of the object tmnxIsisStatsSpfRuns indicates the number of times shortest path first calculations have been made.

Table 219 I2fwd statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
AccessInterfaceStpStats MIB entry name: sapTlsInfoEntry Entry description: TLS specific information about a SAP. Table description (for sapTlsInfoTable): A table that contains TLS SAP information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.AccessInterfaceStp		
forwardTransitions [Forward Transitions] (sapTlsStpForwardTransitions)	long	The value of the object sapTlsStpForwardTransitions indicates the number of times this port has transitioned from the Learning state to the Forwarding state.
inBadBpdus [In Bad Bpdus] (sapTlsStpInBadBpdus)	long	This object specifies the number of bad BPDUs received on this SAP.
inConfigBpdus [In Config Bpdus] (sapTlsStpInConfigBpdus)	long	The value of the object sapTlsStpInConfigBpdus indicates the number of Configuration BPDUs received on this SAP.
inRapidSpanningTreeBpdus [In Rapid Spanning Tree Bpdus] (sapTlsStpInRstBpdus)	long	The value of the object sapTlsStpInRstBpdus indicates the number of Rapid Spanning Tree (RST) BPDUs received on this SAP.
inTcnBpdus [In Tcn Bpdus] (sapTlsStpInTcnBpdus)	long	The value of the object sapTlsStpInTcnBpdus indicates the number of Topology Change Notification BPDUs received on this SAP.
outConfigBpdus [Out Config Bpdus] (sapTlsStpOutConfigBpdus)	long	The value of the object sapTlsStpOutConfigBpdus indicates the number of Configuration BPDUs sent out this SAP.

Table 219 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outRapidSpanningTreeBpdus [Out Rapid Spanning Tree Bpdus] (sapTlsStpOutRstBpdus)	long	The value of the object sapTlsStpOutRstBpdus indicates the number of Rapid Spanning Tree (RST) BPDUs sent out on this SAP.
outTcnBpdus [Out Tcn Bpdus] (sapTlsStpOutTcnBpdus)	long	This object specifies the number of Topology Change Notification BPDUs sent out this SAP.
CircuitStpStats MIB entry name: sdpBindTlsEntry Entry description: TLS specific information about an SDP Bind. Table description (for sdpBindTlsTable): A table that contains TLS spoke SDP Bind information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.CircuitStp		
forwardTransitions [Forward Transitions] (sdpBindTlsStpForwardTransitions)	long	The value of the object sdpBindTlsStpForwardTransitions indicates the number of times this port has transitioned from the Learning state to the Forwarding state.
inBadBpdus [In Bad Bpdus] (sdpBindTlsStpInBadBpdus)	long	The value of the object sdpBindTlsStpInBadBpdus indicates the number of bad BPDUs received on this SDP Bind.
inConfigBpdus [In Config Bpdus] (sdpBindTlsStpInConfigBpdus)	long	The value of the object sdpBindTlsStpInConfigBpdus indicates the number of Configuration BPDUs received on this SDP Bind.
inRapidSpanningTreeBpdus [In Rapid Spanning Tree Bpdus] (sdpBindTlsStpInRstBpdus)	long	The value of the object sdpBindTlsStpInRstBpdus indicates the number of Rapid Spanning Tree (Rst) BPDUs received on this SDP.

Table 219 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTcnBpdus [In Tcn Bpdus] (sdpBindTlsStpInTcnBpdus)	long	The value of the object sdpBindTlsStpInTcnBpdus indicates the number of Topology Change Notification BPDUs received on this SDP Bind.
outConfigBpdus [Out Config Bpdus] (sdpBindTlsStpOutConfigBpdus)	long	The value of the object sdpBindTlsStpOutConfigBpdus indicates the number of Configuration BPDUs sent out this SDP Bind.
outRapidSpanningTreeBpdus [Out Rapid Spanning Tree Bpdus] (sdpBindTlsStpOutRstBpdus)	long	The value of the object sdpBindTlsStpOutRstBpdus indicates the number of Rapid Spanning Tree (Rstp) BPDUs sent out on this SDP.
outTcnBpdus [Out Tcn Bpdus] (sdpBindTlsStpOutTcnBpdus)	long	The value of the object sdpBindTlsStpOutTcnBpdus indicates the number of Topology Change Notification BPDUs sent out this SDP Bind.
SiteFibStats MIB entry name: svcTlsInfoEntry Entry description: TLS specific information about a service. Table description (for svcTlsInfoTable): A table that contains TLS service information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.SiteFib		
entries [Entries] (svcTlsFdbNumEntries)	long	The value of the object svcTlsFdbNumEntries indicates the current number of entries in the FDB of this service.

Table 219 I2fwd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
provisionedSize [Provisioned Size] (svcTlsFdbTableSize)	long	The value of the object svcTlsFdbTableSize specifies the maximum number of learned and static entries allowed in the FDB of this service. The maximum value of svcTlsFdbTableSize is '511999', when the the value of TIMETRA-CHASSIS-MIB::tmnxChassisOperMode is 'd'. The maximum value of svcTlsFdbTableSize is '196607', when the the value of TIMETRA-CHASSIS-MIB::tmnxChassisOperMode is 'c'. In other cases, the maximum value of svcTlsFdbTableSize is '131071'.
staticEntries [Static Entries] (svcTlsFdbNumStaticEntries)	long	The value of the object svcTlsFdbNumStaticEntries indicates the current number of static entries in the FDB of this service.
SiteStpStats MIB entry name: svcTlsInfoEntry Entry description: TLS specific information about a service. Table description (for svcTlsInfoTable): A table that contains TLS service information. Supports realtime plotting Supports scheduled collection Monitored class: I2fwd.SiteStp		
timeSinceTopologyChange [Time Since Topology Change] (svcTlsStpTimeSinceTopologyChange)	long	The value of the object svcTlsStpTimeSinceTopologyChange indicates the time (in hundredths of a second) since the last time a topology change was detected by the Spanning Tree Protocol instance associated with this service.
topologyChanges [Topology Changes] (svcTlsStpTopologyChanges)	long	The value of the object svcTlsStpTopologyChanges indicates the total number of topology changes detected by the Spanning Tree Protocol instance associated with this service since the management entity was last reset or initialized.

Table 220 lag statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LagStats</p> <p>MIB entry name: tLagOperationEntry</p> <p>Entry description: An entry (conceptual row) in the tLagOperationTable. Each entry represents an active Link Aggregation Group.</p> <p>Table description (for tLagOperationTable): Operational information about each Link Aggregation Group.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: lag.Interface</p>		
portThresholdFalling [Port Threshold Falling] (tLagPortThresholdFalling)	long	counts the number of linkDown or dynamicCost events for the Link Aggregation Group caused by the number of physical ports being less than or equal to tLagPortThreshold value.
portThresholdRising [Port Threshold Rising] (tLagPortThresholdRising)	long	counts the number of linkUp or dynamicCost events for the Link Aggregation Group caused by the number of physical ports being greater than tLagPortThreshold value.
<p>MultiChassisLagMemberStats</p> <p>MIB entry name: tmnxMcLagLagStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a lag that participates in a multi-chassis configuration with a given peer. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcLagLagStatsTable): The tmnxMcLagLagStatsTable has an entry for each lag that participates in a multi-chassis configuration for the indicated peer.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • lag.MultiChassisLagMember • multichassis.MultiChassisLagMember 		
configPacketsReceived [Config Packets Received] (tmnxMcLagLagStatsPktsRxConfig)	long	The value of tmnxMcLagLagStatsPktsRxConfig indicates how many MC-Lag control packets of type lag config were received on this system from the peer for this lag.

Table 220 lag statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
configPacketsTransmitted [Config Packets Transmitted] (tmnxMcLagLagStatsPktsTxConfig)	long	The value of tmnxMcLagLagStatsPktsTxConfig indicates how many MC-Lag control packets of type lag config were sent on this system to the peer for this lag.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagLagStatsPktsTxFailed)	long	The value of tmnxMcLagLagStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted on this system to the peer for this lag.
statePacketsReceived [State Packets Received] (tmnxMcLagLagStatsPktsRxState)	long	The value of tmnxMcLagLagStatsPktsRxState indicates how many MC-Lag control packets of type lag state were received on this system from the peer for this lag.
statePacketsTransmitted [State Packets Transmitted] (tmnxMcLagLagStatsPktsTxState)	long	The value of tmnxMcLagLagStatsPktsTxState indicates how many MC-Lag control packets of type lag state were sent on this system to the peer for this lag.

Table 221 Ldp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceStats</p> <p>MIB entry name: vRtrLdpNgInetIfStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Interface for given Inet address family. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpNgSessionStatsEntry.</p> <p>Table description (for vRtrLdpNgInetIfStatsTable): The vRtrLdpNgInetIfStatsTable is a read-only table. The purpose of this table is to keep statistical information about the LDP Interfaces for given Inet address family on this LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgInetIfTable, and the augmenting table, vRtrLdpNgInetIfStatsTable. This in effect extends the vRtrLdpNgInetIfTable with additional columns. Creation or deletion of a row in the vRtrLdpNgInetIfTable results in the same fate for the row in the vRtrLdpNgInetIfStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.Interface</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpNgInetIfStatsExistingAdj)	long	The value of vRtrLdpNgInetIfStatsExistingAdj indicates a count of the total active adjacencies on this LDP interface for given Inet address family.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SessionStats</p> <p>MIB entry name: vRtrLdpNgSessionStatsEntry</p> <p>Entry description: A row in this table represents statistical information about a single session between an LDP entity and an LDP Peer.</p> <p>Table description (for vRtrLdpNgSessionStatsTable): The vRtrLdpNgSessionStatsTable is a read-only table. The purpose of this table is to keep statistical information about a single session between an LDP entity and an LDP Peer. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgSessionTable, and the augmenting table, vRtrLdpNgSessionStatsTable. This in effect extends the vRtrLdpNgSessionTable with additional columns. Creation or deletion of a row in the vRtrLdpNgSessionTable results in the same fate for the row in the vRtrLdpNgSessionStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.Session</p>		
addressMessagesReceived [Address Messages Received] (vRtrLdpNgSessStatsAddrIn)	long	The value of vRtrLdpNgSessStatsAddrIn counts the number of Address Messages that have been received during this session.
addressMessagesSent [Address Messages Sent] (vRtrLdpNgSessStatsAddrOut)	long	The value of vRtrLdpNgSessStatsAddrOut counts the number of Address Messages that have been sent during this session.
addressWithdrawMessagesReceived [Address Withdraw Messages Received] (vRtrLdpNgSessStatsAddrWithdrIn)	long	The value of vRtrLdpNgSessStatsAddrWithdrIn counts the number of Address Withdraw Messages that have been received during this session.
addressWithdrawMessagesSent [Address Withdraw Messages Sent] (vRtrLdpNgSessStatsAddrWithdrOut)	long	The value of vRtrLdpNgSessStatsAddrWithdrOut counts the number of Address Withdraw Messages that have been sent during this session.
capabilityMessageIn [Capability Message In] (vRtrLdpNgSessStatsCapabilityIn)	long	The value of vRtrLdpNgSessStatsCapabilityIn counts the number of Capability Messages that have been received during this session.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
capabilityMessageOut [Capability Message Out] (vRtrLdpNgSessStatsCapabilityOut)	long	The value of vRtrLdpNgSessStatsCapabilityOut counts the number of Capability Messages that have been sent during this session.
helloMessagesReceived [Hello Messages Received] (vRtrLdpNgSessStatsHelloIn)	long	The value of vRtrLdpNgSessStatsHelloIn counts the number of Hello Messages that have been received during this session.
helloMessagesSent [Hello Messages Sent] (vRtrLdpNgSessStatsHelloOut)	long	The value of vRtrLdpNgSessStatsHelloOut counts the number of Hello Messages that have been sent during this session.
initMessagesReceived [Init Messages Received] (vRtrLdpNgSessStatsInitIn)	long	The value of vRtrLdpNgSessStatsInitIn counts the number of Init Messages that have been received during this session.
initMessagesSent [Init Messages Sent] (vRtrLdpNgSessStatsInitOut)	long	The value of vRtrLdpNgSessStatsInitOut counts the number of Init Messages that have been sent during this session.
ipv4AddrReceived [Ipv 4 Addr Received] (vRtrLdpNgSessStatsIPv4AddrRcv)	long	The value of vRtrLdpNgSessStatsIPv4AddrRcv counts the number of IPv4 local addresses received for this session.
ipv4AddrSent [Ipv 4 Addr Sent] (vRtrLdpNgSessStatsIPv4AddrSent)	long	The value of vRtrLdpNgSessStatsIPv4AddrSent counts the number of IPv4 local addresses sent for this session.
ipv4P2mpFecReceived [Ipv 4 P2 mp Fec Received] (vRtrLdpNgSessStatsIPv4P2MPFecRcv)	long	The value of vRtrLdpNgSessStatsIPv4P2MPFecRcv counts the number of IPv4 P2MP FECs received for this session.
ipv4P2mpFecSent [Ipv 4 P2 mp Fec Sent] (vRtrLdpNgSessStatsIPv4P2MPFecSnt)	long	The value of vRtrLdpNgSessStatsIPv4P2MPFecSnt counts the number of IPv4 P2MP FECs sent for this session.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ipv4PfxFecReceived [Ipv 4 Pfx Fec Received] (vRtrLdpNgSessStatsIPv4PfxFecRcv)	long	The value of vRtrLdpNgSessStatsIPv4PfxFecRcv counts the number of IPv4 prefix FECs received for this session.
ipv4PfxFecSent [Ipv 4 Pfx Fec Sent] (vRtrLdpNgSessStatsIPv4PfxFecSnt)	long	The value of vRtrLdpNgSessStatsIPv4PfxFecSnt counts the number of IPv4 prefix FECs sent for this session.
ipv6AddrReceived [Ipv 6 Addr Received] (vRtrLdpNgSessStatsIPv6AddrRcv)	long	The value of vRtrLdpNgSessStatsIPv6AddrRcv counts the number of IPv6 local addresses received for this session.
ipv6AddrSent [Ipv 6 Addr Sent] (vRtrLdpNgSessStatsIPv6AddrSent)	long	The value of vRtrLdpNgSessStatsIPv6AddrSent counts the number of IPv6 local addresses sent for this session.
ipv6P2mpFecReceived [Ipv 6 P2 mp Fec Received] (vRtrLdpNgSessStatsIPv6P2MPFecRcv)	long	The value of vRtrLdpNgSessStatsIPv6P2MPFecRcv counts the number of IPv6 P2MP FECs received for this session.
ipv6P2mpFecSent [Ipv 6 P2 mp Fec Sent] (vRtrLdpNgSessStatsIPv6P2MPFecSnt)	long	The value of vRtrLdpNgSessStatsIPv6P2MPFecSnt counts the number of IPv6 P2MP FECs sent for this session.
ipv6PfxFecReceived [Ipv 6 Pfx Fec Received] (vRtrLdpNgSessStatsIPv6PfxFecRcv)	long	The value of vRtrLdpNgSessStatsIPv6PfxFecRcv counts the number of IPv6 prefix FECs received for this session.
ipv6PfxFecSent [Ipv 6 Pfx Fec Sent] (vRtrLdpNgSessStatsIPv6PfxFecSnt)	long	The value of vRtrLdpNgSessStatsIPv6PfxFecSnt counts the number of IPv6 prefix FECs sent for this session.
keepAliveMessagesReceived [Keep Alive Messages Received] (vRtrLdpNgSessStatsKeepaliveIn)	long	The value of vRtrLdpNgSessStatsKeepaliveIn counts the number of Keepalive Messages that have been received during this session.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAliveMessagesSent [Keep Alive Messages Sent] (vRtrLdpNgSessStatsKeepaliveOut)	long	The value of vRtrLdpNgSessStatsKeepaliveOut counts the number of Keepalive Messages that have been sent during this session.
labelAbortsReceived [Label Aborts Received] (vRtrLdpNgSessStatsLblAbortIn)	long	The value of vRtrLdpNgSessStatsLblAbortIn counts the number of Label Abort Messages that have been received during this session.
labelAbortsSent [Label Aborts Sent] (vRtrLdpNgSessStatsLblAbortOut)	long	The value of vRtrLdpNgSessStatsLblAbortOut counts the number of Label Abort Messages that have been sent during this session.
labelMappingsReceived [Label Mappings Received] (vRtrLdpNgSessStatsLblMappingIn)	long	The value of vRtrLdpNgSessStatsLblMappingIn counts the number of Label Mapping Messages that have been received during this session.
labelMappingsSent [Label Mappings Sent] (vRtrLdpNgSessStatsLblMappingOut)	long	The value of vRtrLdpNgSessStatsLblMappingOut counts the number of Label Mapping Messages that have been sent during this session.
labelReleasesReceived [Label Releases Received] (vRtrLdpNgSessStatsLblReleaseIn)	long	The value of vRtrLdpNgSessStatsLblReleaseIn counts the number of Label Release Messages that have been received during this session.
labelReleasesSent [Label Releases Sent] (vRtrLdpNgSessStatsLblReleaseOut)	long	The value of vRtrLdpNgSessStatsLblReleaseOut counts the number of Label Release Messages that have been sent during this session.
labelRequestsReceived [Label Requests Received] (vRtrLdpNgSessStatsLblRequestIn)	long	The value of vRtrLdpNgSessStatsLblRequestIn counts the number of Label Request Messages that have been received during this session.
labelRequestsSent [Label Requests Sent] (vRtrLdpNgSessStatsLblRequestOut)	long	The value of vRtrLdpNgSessStatsLblRequestOut counts the number of Label Request Messages that have been sent during this session.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
labelWithdrawsReceived [Label Withdraws Received] (vRtrLdpNgSessStatsLblWithdrawIn)	long	The value of vRtrLdpNgSessStatsLblWithdrawIn counts the number of Label Withdraw Messages that have been received during this session.
labelWithdrawsSent [Label Withdraws Sent] (vRtrLdpNgSessStatsLblWithdrawOut)	long	The value of vRtrLdpNgSessStatsLblWithdrawOut counts the number of Label Withdraw Messages that have been sent during this session.
linkAdjacencies [Link Adjacencies] (vRtrLdpNgSessStatsLinkAdj)	long	The value of vRtrLdpNgSessStatsLinkAdj indicates the number of link adjacencies for this session.
notificationMessagesReceived [Notification Messages Received] (vRtrLdpNgSessStatsNotifIn)	long	The value of vRtrLdpNgSessStatsNotifIn counts the number of Notification Messages that have been received during this session.
notificationMessagesSent [Notification Messages Sent] (vRtrLdpNgSessStatsNotifOut)	long	The value of vRtrLdpNgSessStatsNotifOut counts the number of Notification Messages that have been sent during this session.
svcFec128Received [Svc Fec 128 Received] (vRtrLdpNgSessStatsSvcFec128Recv)	long	The value of vRtrLdpNgSessStatsSvcFec128Recv counts the number of service FEC 128 received for this session.
svcFec128Sent [Svc Fec 128 Sent] (vRtrLdpNgSessStatsSvcFec128Sent)	long	The value of vRtrLdpNgSessStatsSvcFec128Sent counts the number of service FEC 128 sent for this session.
svcFec129Received [Svc Fec 129 Received] (vRtrLdpNgSessStatsSvcFec129Recv)	long	The value of vRtrLdpNgSessStatsSvcFec129Recv counts the number of service FEC 129 received for this session.
svcFec129Sent [Svc Fec 129 Sent] (vRtrLdpNgSessStatsSvcFec129Sent)	long	The value of vRtrLdpNgSessStatsSvcFec129Sent counts the number of service FEC 129 sent for this session.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
targetedAdjacencies [Targeted Adjacencies] (vRtrLdpNgSessStatsTargAdj)	long	The value of vRtrLdpNgSessStatsTargAdj indicates the number of targeted adjacencies for this session.
<p>SiteStats</p> <p>MIB entry name: vLdpNgStatsEntry</p> <p>Entry description: A row in this table represents statistical information about an LDP instance.</p> <p>Table description (for vLdpNgStatsTable): vLdpNgStatsTable is a read-only table. The purpose of this table is to keep statistical information about an LDP Instance. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgGeneralTable, and the augmenting table, vLdpNgStatsTable. This in effect extends the vRtrLdpNgGeneralTable with additional columns. Creation or deletion of a row in the vRtrLdpNgGeneralTable results in the same fate for the row in the vLdpNgStatsTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: Ldp.Site</p>		
activeAdjacencies [Active Adjacencies] (vLdpNgStatsIPv4ActiveLinkAdj)	long	The value of vLdpNgStatsIPv4ActiveLinkAdj specifies the number of active IPv4 link adjacencies (i.e. established adjacencies) associated with the LDP instance.
activeInterfaces [Active Interfaces] (vLdpNgStatsIPv4ActiveIf)	long	The value of vLdpNgStatsIPv4ActiveIf specifies the number of active (i.e. operationally up) IPv4 interfaces associated with the LDP instance.
activeSessions [Active Sessions] (vLdpNgStatsIPv4ActiveSess)	long	The value of vLdpNgStatsIPv4ActiveSess specifies the number of active IPv4 sessions (i.e. session in some form of creation) associated with the LDP instance.
activeTargetedSessions [Active Targeted Sessions] (vLdpNgStatsIPv4ActiveTargPeers)	long	The value of vLdpNgStatsIPv4ActiveTargPeers specifies the number of configured IPv4 targeted peers that are administratively up in an LDP instance.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
addressFECsReceived [Address FECs Received] (vLdpNgStatsIPv4PfxFecRecv)	long	The value of vLdpNgStatsIPv4PfxFecRecv specifies the number of IPv4 Address FECs received by the LDP instance from its neighbors.
addressFECsSent [Address FECs Sent] (vLdpNgStatsIPv4PfxFecSent)	long	The value of vLdpNgStatsIPv4PfxFecSent specifies the number of IPv4 Address FECs sent by the LDP instance to its neighbors.
attemptedSessions [Attempted Sessions] (vLdpNgStatsIPv4AttemptedSessions)	long	The value of vLdpNgStatsIPv4AttemptedSessions specifies the total number of attempted IPv4 sessions for this LDP instance.
badLdpIdentifierErrors [Bad Ldp Identifier Errors] (vLdpNgStatsBadLdpIdErrors)	long	The value of vLdpNgStatsBadLdpIdErrors gives the number of Bad LDP Identifier Fatal Errors detected for sessions associated with this LDP instance.
badMessageLengthErrors [Bad Message Length Errors] (vLdpNgStatsBadMsgLengthErrors)	long	The value of vLdpNgStatsBadMsgLengthErrors gives the number of Bad Message Length Fatal Errors detected for sessions associated with this LDP instance.
badPduLengthErrors [Bad Pdu Length Errors] (vLdpNgStatsBadPduLengthErrors)	long	The value of vLdpNgStatsBadPduLengthErrors gives the number of Bad Pdu Length Fatal Errors detected for sessions associated with this LDP instance.
badTlvLengthErrors [Bad Tlv Length Errors] (vLdpNgStatsBadTlvLengthErrors)	long	The value of vLdpNgStatsBadTlvLengthErrors gives the number of Bad TLV Length Fatal Errors detected for sessions associated with this LDP instance.
inactiveInterfaces [Inactive Interfaces] (vLdpNgStatsIPv4Inactifelf)	long	The value of vLdpNgStatsIPv4Inactifelf specifies the number of inactive (i.e. operationally down) IPv4 interfaces associated with the LDP instance.
inactiveTargetedSessions [Inactive Targeted Sessions] (vLdpNgStatsIPv6ActiveTargPeers)	long	The value of vLdpNgStatsIPv6ActiveTargPeers specifies the number of configured IPv6 targeted peers that are administratively up in an LDP instance.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAliveExpiredErrors [Keep Alive Expired Errors] (vLdpNgStatsKeepAliveExpErrors)	long	The value of vLdpNgStatsKeepAliveExpErrors gives the number of Session Keep Alive Timer Expired Errors detected for sessions associated with this LDP instance.
malformedTlvValueErrors [Malformed Tlv Value Errors] (vLdpNgStatsMalformedTlvErrors)	long	The value of vLdpNgStatsMalformedTlvErrors gives the number of Malformed TLV Value Fatal Errors detected for sessions associated with this LDP instance.
operDownEvents [Oper Down Events] (vLdpNgStatsIPv4OperDownEvents)	long	The value of vLdpNgStatsIPv4OperDownEvents specifies the number of times the IPv4 LDP instance has gone operationally down since the instance was created.
serviceFECsReceived [Service FECs Received] (vLdpNgStatsFec128FecRecv)	long	The value of vLdpNgStatsFec128FecRecv specifies the number of Pseudo wire ID FECs received by the LDP instance from its neighbors.
serviceFECsSent [Service FECs Sent] (vLdpNgStatsFec128FecSent)	long	The value of vLdpNgStatsFec128FecSent specifies the number of Pseudo wire ID FECs sent by the LDP instance to its neighbors.
sessionRejectedAdvertisementModeErrors [Session Rejected Advertisement Mode Errors] (vLdpNgStatsSessRejAdvErrors)	long	The value of vLdpNgStatsSessRejAdvErrors gives the total number of Session Rejected/Parameters Advertisement Mode Error Notification Messages sent or received by this LDP instance.
sessionRejectedLabelRangeErrors [Session Rejected Label Range Errors] (vLdpNgStatsSessRejLblRngeErrs)	long	The value of vLdpNgStatsSessRejLblRngeErrs gives the total number of Session Rejected/Parameters Label Range Error Notification Messages sent or received by this LDP instance.
sessionRejectedMaxPduLengthErrors [Session Rejected Max Pdu Length Errors] (vLdpNgStatsSessRejMaxPduErrs)	long	The value of vLdpNgStatsSessRejMaxPduErrs gives the total number of Session Rejected/Parameters Max Pdu Length Error Notification Messages sent or received by this LDP instance.

Table 221 Ldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionRejectedNoHelloErrors [Session Rejected No Hello Errors] (vLdpNgStatsSessRejNoHelloErrs)	long	The value of vLdpNgStatsSessRejNoHelloErrs gives the total number of Session Rejected/No Hello Error Notification Messages sent or received by this LDP instance.
shutdownNotificationsReceived [Shutdown Notifications Received] (vLdpNgStatsShutdownNotifRecv)	long	The value of vLdpNgStatsShutdownNotifRecv gives the number of Shutdown Notifications received related to sessions associated with this LDP instance.
shutdownNotificationsSent [Shutdown Notifications Sent] (vLdpNgStatsShutdownNotifSent)	long	The value of vLdpNgStatsShutdownNotifSent gives the number of Shutdown Notifications sent related to sessions associated with this LDP instance.
<p>TargetedPeerStats</p> <p>MIB entry name: vRtrLdpNgTargPeerStatsEntry</p> <p>Entry description: A row in this table contains statistical information about an LDP Targeted peer. Some counters contained in a row are for fatal errors received during a former LDP Session associated with this entry. For example, an LDP Pdu received on a TCP connection during an LDP Session contains a fatal error. That error is counted here, because the session is terminated. If the error is NOT fatal (i.e. and the Session remains), then the error is counted in the vRtrLdpNgSessionStatsEntry.</p> <p>Table description (for vRtrLdpNgTargPeerStatsTable): The vRtrLdpNgTargPeerStatsTable is a read-only table. The purpose of this table is to keep statistical information about the Targeted peers on the LSR. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vRtrLdpNgTargPeerTable, and the augmenting table, vRtrLdpNgTargPeerStatsTable. This in effect extends the vRtrLdpNgTargPeerTable with additional columns. Creation or deletion of a row in the vRtrLdpNgTargPeerTable results in the same fate for the row in the vRtrLdpNgTargPeerTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ldp.TargetedPeer</p>		
existingAdjacencies [Existing Adjacencies] (vRtrLdpNgTargPeerStatExistingAdj)	long	The value of vRtrLdpNgTargPeerStatExistingAdj indicates a count of the total active adjacencies with this targeted peer.

Table 222 Ildp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
LLDPRemoteSystemStats MIB entry name: IldpStatistics Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration		
remTablesAgeouts [Rem Tables Ageouts] (IldpStatsRemTablesAgeouts)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter should be incremented only once when the complete set of information is completely invalidated (aged out) from all related tables. Partial aging, similar to deletion case, is not allowed, and thus, should not change the value of this counter.
remTablesDeletes [Rem Tables Deletes] (IldpStatsRemTablesDeletes)	long	The number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in IldpRemoteSystemsData and IldpExtensions objects. This counter should be incremented only once when the complete set of information is completely deleted from all related tables. Partial deletions, such as deletion of rows associated with a particular MSAP from some tables, but not from all tables are not allowed, thus should not change the value of this counter.
remTablesDrops [Rem Tables Drops] (IldpStatsRemTablesDrops)	long	The number of times the complete set of information advertised by a particular MSAP could not be entered into tables contained in IldpRemoteSystemsData and IldpExtensions objects because of insufficient resources.

Table 222 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remTablesInserts [Rem Tables Inserts] (IldpStatsRemTablesInserts)	long	The number of times the complete set of information advertised by a particular MSAP has been inserted into tables contained in IldpRemoteSystemsData and IldpExtensions objects. The complete set of information received from a particular MSAP should be inserted into related tables. If partial information cannot be inserted for a reason such as lack of resources, all of the complete set of information should be removed. This counter should be incremented only once after the complete set of information is successfully recorded in all related tables. Any failures during inserting information set which result in deletion of previously inserted information should not trigger any changes in IldpStatsRemTablesInserts since the insert is not completed yet or or in IldpStatsRemTablesDeletes, since the deletion would only be a partial deletion. If the failure was the result of lack of resources, the IldpStatsRemTablesDrops counter should be incremented once.
<p>LLDPRxPortStats</p> <p>MIB entry name: tnmxLldpStatsRxPortEntry</p> <p>Entry description: LLDP frame reception statistics for a particular port. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tnmxLldpStatsRxPortTable): A table containing LLDP reception statistics for individual ports and destination MAC addresses. Entries are not required to exist in this table while the tnmxLldpPortCfgAdminStatus object is equal to 'disabled(4)'. Supports realtime plotting Supports scheduled collection Monitored class: Ildp.LLDPConfiguration</p>		

Table 222 Ildp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
IldpStatsRxPortAgeouts [Lldp Stats Rx Port Ageouts] (tmnxLldpStatsRxPortAgeouts)	long	The counter that represents the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MSAP has been deleted from tables contained in tmnxLldpRemoteSystemsData and IldpExtensions objects because the information timeliness interval has expired. This counter is similar to IldpStatsRemTablesAgeouts, except that the counter is on a per port basis. This enables NMS to poll tables associated with the tmnxLldpRemoteSystemsData objects and all LLDP extension objects associated with remote systems on the indicated port only. This counter should be set to zero during agent initialization and its value should not be saved in non-volatile storage. When a port's admin status changes from 'disabled' to 'rxOnly', 'txOnly' or 'txAndRx', the counter associated with the same port should reset to 0. The agent should also flush all remote system information associated with the same port. This counter should be incremented only once when the complete set of information is invalidated (aged out) from all related tables on a particular port. Partial ageing is not allowed, and thus, should not change the value of this counter.
IldpStatsRxPortFrameDiscard [Lldp Stats Rx Port Frame Discard] (tmnxLldpStatsRxPortFrameDiscard)	long	The number of LLDP frames received by this LLDP agent on the indicated port, and then discarded for any reason. This counter can provide an indication that LLDP header formatting problems may exist with the local LLDP agent in the sending system or that LLDPDU validation problems may exist with the local LLDP agent in the receiving system.
IldpStatsRxPortFrameErrs [Lldp Stats Rx Port Frame Errs] (tmnxLldpStatsRxPortFrameErrs)	long	The number of invalid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.
IldpStatsRxPortFrames [Lldp Stats Rx Port Frames] (tmnxLldpStatsRxPortFrames)	long	The number of valid LLDP frames received by this LLDP agent on the indicated port, while this LLDP agent is enabled.

Table 222 lldp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lldpStatsRxPortTLVDiscard [Lldp Stats Rx Port TLVDiscard] (tmnxLldpStatsRxPortTLVDiscard)	long	The number of LLDP TLVs discarded for any reason by this LLDP agent on the indicated port.
lldpStatsRxPortTLVUnknown [Lldp Stats Rx Port TLVUnknown] (tmnxLldpStatsRxPortTLVUnknown)	long	The number of LLDP TLVs received on the given port that are not recognized by this LLDP agent on the indicated port. An unrecognized TLV is referred to as the TLV whose type value is in the range of reserved TLV types (000 1001 - 111 1110) in Table 9.1 of IEEE Std 802.1AB-2004. An unrecognized TLV may be a basic management TLV from a later LLDP version.
<p>LLDPTxPortStats MIB entry name: tmnxLldpStatsTxPortEntry</p> <p>Entry description: LLDP frame transmission statistics for a particular port and destination MAC address. The port must be contained in the same chassis as the LLDP agent. All counter values in a particular entry shall be maintained on a continuing basis and shall not be deleted upon expiration of rx Info TTL timing counters in the LLDP remote systems MIB of the receipt of a shutdown frame from a remote LLDP agent. All statistical counters associated with a particular port on the local LLDP agent become frozen whenever the admin status is disabled for the same port. Rows in this table can only be created for MAC addresses that can validly be used in association with the type of interface concerned, as defined by table 8-2. The contents of this table is persistent across re-initializations or re-boots.</p> <p>Table description (for tmnxLldpStatsTxPortTable): A table containing LLDP transmission statistics for individual port/destination address combinations. Entries are not required to exist in this table while the tmnxLldpPortConfigEntry object is equal to 'disabled(4)'.</p> <p>Supports realtime plotting Supports scheduled collection Monitored class: lldp.LLDPConfiguration</p>		
lldpStatsTxLLDPDULengthErrs [Lldp Stats Tx LLDPDULength Errs] (tmnxLldpStatsTxLLDPDULengthErrs)	long	The number of LLDPD Length Errors recorded for the Port.
lldpStatsTxPortFrames [Lldp Stats Tx Port Frames] (tmnxLldpStatsTxPortFrames)	long	The number of LLDP frames transmitted by this LLDP agent on the indicated port.

Table 223 mpls statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DynamicLspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp 		
configuredPaths [Configured Paths] (vRtrMplsLspConfiguredPaths)	long	The number of paths configured for this LSP.
operationalPaths [Operational Paths] (vRtrMplsLspOperationalPaths)	long	The number of operational paths for this LSP. This includes the path currently active, as well as operational standby paths.
pathChanges [Path Changes] (vRtrMplsLspPathChanges)	long	The number of path changes this LSP has had. For every path change (path down, path up, path change), a corresponding syslog/trap (if enabled) is generated for it.
standbyPaths [Standby Paths] (vRtrMplsLspStandbyPaths)	long	The number of standby paths configured for this LSP.
timeSinceLastPathChange [Time Since Last Path Change] (vRtrMplsLspLastPathChange)	long	The time in 10-millisecond units since the last change occurred on this LSP.

Table 223 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastPrimaryUpState [Time Since Last Primary Up State] (vRtrMplsLspPrimaryTimeUp)	long	The total time in 10-millisecond units that this LSP's primary path has been operational. For example, the percentage contribution of the primary path to the operational time is given by (vRtrMplsLspPrimaryTimeUp/vRtrMplsLspTimeUp * 100) %.
<p>LspPathStats</p> <p>MIB entry name: vRtrMplsLspPathStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspPathStatTable): The vRtrMplsLspPathStatTable has an entry for an association between a Labeled Switch Path (LSP) in the vRtrMplsLspTable and a path (or tunnel) entry in the mplsTunnelTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.LspPath</p>		
cspfQueries [Cspf Queries] (vRtrMplsLspPathCspfQueries)	long	The value of vRtrMplsLspPathCspfQueries specifies the number of CSPF queries that have been made for this LSP path.
retryAttempts [Retry Attempts] (vRtrMplsLspPathRetryAttempts)	long	The number of unsuccessful attempts which have been made to signal this path. As soon as the path gets signalled, this is set to 0.
timeDown [Time Down] (vRtrMplsLspPathTimeDown)	long	The total time in 10-millisecond units that this LSP Path has not been operational.
timeUp [Time Up] (vRtrMplsLspPathTimeUp)	long	The total time in 10-millisecond units that this LSP path has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspPathTimeUp/vRtrMplsLspAge * 100 %).

Table 223 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitionCount [Transition Count] (vRtrMplsLspPathTransitionCount)	long	The object vRtrMplsLspPathTransitionCount maintains the number of transitions that have occurred for this LSP.
<p>LspStats</p> <p>MIB entry name: vRtrMplsLspStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a Labeled Switch Path (LSP) configured for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsLspStatTable): The vRtrMplsLspStatTable has an entry for each Labeled Switch Path (LSP) configured for a virtual router in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • mpls.BypassOnlyLsp • mpls.DynamicLsp • mpls.SegmentRoutingTeLsp • mpls.StaticLsp 		
age [Age] (vRtrMplsLspAge)	long	The age (i.e., time from creation till now) of this LSP in 10-millisecond periods.
timeSinceLastDownState [Time Since Last Down State] (vRtrMplsLspTimeDown)	long	The total time in 10-millisecond units that this LSP has not been operational.
timeSinceLastTransition [Time Since Last Transition] (vRtrMplsLspLastTransition)	long	The time in 10-millisecond units since the last transition occurred on this LSP.
timeSinceLastUpState [Time Since Last Up State] (vRtrMplsLspTimeUp)	long	The total time in 10-millisecond units that this LSP has been operational. For example, the percentage up time can be determined by computing (vRtrMplsLspTimeUp/ vRtrMplsLspAge * 100 %).

Table 223 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
transitions [Transitions] (vRtrMplsLspTransitions)	long	The number of state transitions (up -> down and down -> up) this LSP has undergone.
<p>MplsInterfaceStats MIB entry name: vRtrMplsIfStatEntry Entry description: Each row entry represents a collection of statistics for an interface on this virtual router that participates in the MPLS protocol. Entries cannot be created and deleted via SNMP SET operations. Table description (for vRtrMplsIfStatTable): The vRtrMplsIfStatTable has an entry for each router interface configured for MPLS in the system. Supports realtime plotting Supports scheduled collection Monitored class: mpls.Interface</p>		
receiveOctets [Receive Octets] (vRtrMplsIfRxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets received on this interface.
receivePackets [Receive Packets] (vRtrMplsIfRxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets received on this interface.
transmitOctets [Transmit Octets] (vRtrMplsIfTxOctetCount)	java. math. BigInteger	The total number of bytes in MPLS labeled packets transmitted on this interface.
transmitPackets [Transmit Packets] (vRtrMplsIfTxPktCount)	java. math. BigInteger	The total number of MPLS labeled packets transmitted from this interface.

Table 223 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteStats</p> <p>MIB entry name: vRtrMplsGeneralStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an instance of the MPLS protocol running within a virtual router. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrMplsGeneralStatTable): The vRtrMplsGeneralStatTable contains statistics for an MPLS protocol instance within a virtual router.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: mpls.Site</p>		
detourOriginate [Detour Originate] (vRtrMplsGeneralDetourLspOriginate)	long	The value of vRtrMplsGeneralDetourLspOriginate indicates the number of detour LSPs that originate at this virtual router.
detourTerminate [Detour Terminate] (vRtrMplsGeneralDetourLspTerminate)	long	The value of vRtrMplsGeneralDetourLspTerminate indicates the number of detour LSPs that terminate at this virtual router.
detourTransit [Detour Transit] (vRtrMplsGeneralDetourLspTransit)	long	The value of vRtrMplsGeneralDetourLspTransit indicates the number of detour LSPs that transit through this virtual router.
dynamicOriginate [Dynamic Originate] (vRtrMplsGeneralDynamicLspOriginate)	long	The value of vRtrMplsGeneralDynamicLspOriginate indicates the number of dynamic LSPs that originate at this virtual router.
dynamicTerminate [Dynamic Terminate] (vRtrMplsGeneralDynamicLspTerminate)	long	The value of vRtrMplsGeneralDynamicLspTerminate indicates the number of dynamic LSPs that terminate at this virtual router.
dynamicTransit [Dynamic Transit] (vRtrMplsGeneralDynamicLspTransit)	long	The value of vRtrMplsGeneralDynamicLspTransit indicates the number of dynamic LSPs that transit through this virtual router.

Table 223 mpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
staticOriginate [Static Originate] (vRtrMplsGeneralStaticLspOriginate)	long	The value of vRtrMplsGeneralStaticLspOriginate indicates the number of static LSPs that originate at this virtual router.
staticTerminate [Static Terminate] (vRtrMplsGeneralStaticLspTerminate)	long	The value of vRtrMplsGeneralStaticLspTerminate indicates the number of static LSPs that terminate at this virtual router.
staticTransit [Static Transit] (vRtrMplsGeneralStaticLspTransit)	long	The value of vRtrMplsGeneralStaticLspTransit indicates the number of static LSPs that transit through this virtual router.

Table 224 multichassis statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerStats</p> <p>MIB entry name: tmnxMcLagPeerStatsEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a multi-chassis peer. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for tmnxMcLagPeerStatsTable): The tmnxMcLagPeerStatsTable has an entry for each multi-chassis peer configured on this system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • multichassis.PSSPeer • multichassis.Peer 		
configPacketsReceived [Config Packets Received] (tmnxMcLagPeerStatsPktsRxConfig)	long	The value of tmnxMcLagPeerStatsPktsRxConfig indicates how many valid MC-Lag control packets of type lag config were received on this system from the peer.
failedMD5AuthenticationPacketsDropped [Failed MD5 Authentication Packets Dropped] (tmnxMcLagPeerStatsDropMD5)	long	The value of tmnxMcLagPeerStatsDropMD5 indicates how many MC-Lag control packets were dropped on this system from the peer because the packet failed MD5 authentication.
failedPacketsTransmitted [Failed Packets Transmitted] (tmnxMcLagPeerStatsPktsTxFailed)	long	The value of tmnxMcLagPeerStatsPktsTxFailed indicates how many MC-Lag control packets failed to be transmitted from this system to the peer.
invalidLagIdPacketsDropped [Invalid Lag Id Packets Dropped] (tmnxMcLagPeerStatsDropTlvInvlId)	long	The value of tmnxMcLagPeerStatsDropTlvInvlId indicates how many MC-Lag control packets were dropped on this system from the peer because the packet referred to an invalid or non multi-chassis lag.
invalidSizePacketsDropped [Invalid Size Packets Dropped] (tmnxMcLagPeerStatsDropTlvInvlSz)	long	The value of tmnxMcLagPeerStatsDropTlvInvlSz indicates how many MC-Lag control packets were dropped on this system from the peer because the packet size was invalid.

Table 224 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
keepAlivePacketsReceived [Keep Alive Packets Received] (tmnxMcLagPeerStatsPktsRxKpalive)	long	The value of tmnxMcLagPeerStatsPktsRxKpalive indicates how many valid MC-Lag control packets of type keepalive were received on this system from the peer.
keepalivePacketsTransmitted [Keepalive Packets Transmitted] (tmnxMcLagPeerStatsPktsTxKpalive)	long	The value of tmnxMcLagPeerStatsPktsTxKpalive indicates how many MC-Lag control packets of type keepalive were transmitted from this system to the peer.
outOfSequencePacketsDropped [Out Of Sequence Packets Dropped] (tmnxMcLagPeerStatsDropOutOfSeq)	long	The value of tmnxMcLagPeerStatsDropOutOfSeq indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was out of sequence.
packetsReceived [Packets Received] (tmnxMcLagPeerStatsPktsRx)	long	The value of tmnxMcLagPeerStatsPktsRx indicates how many valid MC-Lag control packets were received on this system from the peer.
packetsTransmitted [Packets Transmitted] (tmnxMcLagPeerStatsPktsTx)	long	The value of tmnxMcLagPeerStatsPktsTx indicates how many MC-Lag control packets were transmitted from this system to the peer.
peerConfigPacketsReceived [Peer Config Packets Received] (tmnxMcLagPeerStatsPktsRxPeerCfg)	long	The value of tmnxMcLagPeerStatsPktsRxPeerCfg indicates how many valid MC-Lag control packets of type peer config were received on this system from the peer.
peerConfigPacketsTransmitted [Peer Config Packets Transmitted] (tmnxMcLagPeerStatsPktsTxPeerCfg)	long	The value of tmnxMcLagPeerStatsPktsTxPeerCfg indicates how many MC-Lag control packets of type peer config were transmitted from this system to the peer.
stateDisabledPacketsDropped [State Disabled Packets Dropped] (tmnxMcLagPeerStatsDropStateDsblid)	long	The value of tmnxMcLagPeerStatsDropStateDsblid indicates how many MC-Lag control packets were dropped on this system from the peer because the peer was administratively disabled.

Table 224 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statePacketsReceived [State Packets Received] (tmnxMcLagPeerStatsPktsRxState)	long	The value of tmnxMcLagPeerStatsPktsRxState indicates how many valid MC-Lag control packets of type lag state were received on this system from the peer.
tooShortPacketsDropped [Too Short Packets Dropped] (tmnxMcLagPeerStatsDropPktTooShrt)	long	The value of tmnxMcLagPeerStatsDropPktTooShrt indicates how many MC-Lag control packets were dropped on this system from the peer because the packet was too short.
unknownTlvPacketsDropped [Unknown Tlv Packets Dropped] (tmnxMcLagPeerStatsDropUnknownTlv)	long	The value of tmnxMcLagPeerStatsDropUnknownTlv indicates how many MC-Lag control packets were dropped on this system from the peer because the packet contained an unknown TLV.
<p>PeerSynchronizationProtocolStats MIB entry name: tmnxMcPeerSyncStatsEntry Entry description: Each row entry represents a collection of statistics for a multi-chassis synchronization protocol entry. Entries cannot be created and deleted via SNMP SET operations. Table description (for tmnxMcPeerSyncStatsTable): The tmnxMcPeerSyncStatsTable has an entry for each multi-chassis peer synchronization protocol entry. Supports realtime plotting Supports scheduled collection Monitored class: multichassis.PeerSynchronizationProtocol</p>		
bodyDecodeErrorPacketsReceived [Body Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrBody)	long	The value of tmnxMcPeerSyncPktsRxErrBody indicates the number of packets with body decode errors received from the multi-chassis peer.
dataPacketsReceived [Data Packets Received] (tmnxMcPeerSyncPktsRxData)	long	The value of tmnxMcPeerSyncPktsRxData indicates the number of hello packets received from the multi-chassis peer.
dataPacketsTransmitted [Data Packets Transmitted] (tmnxMcPeerSyncPktsTxData)	long	The value of tmnxMcPeerSyncPktsTxData indicates the number of data packets transmitted to the multi-chassis peer.

Table 224 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
erroneousPacketsReceived [Erroneous Packets Received] (tmnxMcPeerSyncPktsRxErr)	long	The value of tmnxMcPeerSyncPktsRxErr indicates the number of erroneous packets received from the multi-chassis peer.
headerDecodeErrorPacketsReceived [Header Decode Error Packets Received] (tmnxMcPeerSyncPktsRxErrHeader)	long	The value of tmnxMcPeerSyncPktsRxErrHeader indicates the number of packets with header decode errors received from the multi-chassis peer.
helloPacketsReceived [Hello Packets Received] (tmnxMcPeerSyncPktsRxHello)	long	The value of tmnxMcPeerSyncPktsRxHello indicates the number of hello packets received from the multi-chassis peer.
helloPacketsTransmitted [Hello Packets Transmitted] (tmnxMcPeerSyncPktsTxHello)	long	The value of tmnxMcPeerSyncPktsTxHello indicates the number of hello packets transmitted to the multi-chassis peer.
otherPacketsReceived [Other Packets Received] (tmnxMcPeerSyncPktsRxOther)	long	The value of tmnxMcPeerSyncPktsRxOther indicates the number of all other packet types received from the multi-chassis peer.
otherPacketsTransmitted [Other Packets Transmitted] (tmnxMcPeerSyncPktsTxOther)	long	The value of tmnxMcPeerSyncPktsTxOther indicates the number of all other packet types transmitted to the multi-chassis peer.
packetTransmissionErrors [Packet Transmission Errors] (tmnxMcPeerSyncPktsTxErr)	long	The value of tmnxMcPeerSyncPktsTxErr indicates the number of packet transmission errors.
sequenceNumberErrorPacketsReceived [Sequence Number Error Packets Received] (tmnxMcPeerSyncPktsRxErrSeqNum)	long	The value of tmnxMcPeerSyncPktsRxErrSeqNum indicates the number of packets with sequence number errors received from the multi-chassis peer.

Table 224 multichassis statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPacketsReceived [Total Packets Received] (tmnxMcPeerSyncPktsRxAll)	long	The value of tmnxMcPeerSyncPktsRxAll indicates the total number of packets received from the multi-chassis peer.
totalPacketsTransmitted [Total Packets Transmitted] (tmnxMcPeerSyncPktsTxAll)	long	The value of tmnxMcPeerSyncPktsTxAll indicates the total number of packets transmitted to the multi-chassis peer.

Table 225 netw statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
SnmpAgentStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: netw.NetworkElement		
sgiSnmplnGetBulks [Sgi Snmp In Get Bulks] (sgiSnmplnGetBulks)	long	The value of sgiSnmplnGetBulks indicates the total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
snmplnASNParseErrs [Snmp In ASNParse Errs] (snmplnASNParseErrs)	long	The total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.
snmplnBadCommunityNames [Snmp In Bad Community Names] (snmplnBadCommunityNames)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which used an SNMP community name not known to said entity. Also, implementations which authenticate community-based SNMP messages using check(s) in addition to matching the community name (for example, by also checking whether the message originated from a transport address allowed to use a specified community name) MAY include in this value the number of messages which failed the additional check(s). It is strongly RECOMMENDED that the documentation for any security model which is used to authenticate community-based SNMP messages specify the precise conditions that contribute to this value.

Table 225 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpInBadCommunityUses [Snmp In Bad Community Uses] (snmpInBadCommunityUses)	long	The total number of community-based SNMP messages (for example, SNMPv1) delivered to the SNMP entity which represented an SNMP operation that was not allowed for the SNMP community named in the message. The precise conditions under which this counter is incremented (if at all) depend on how the SNMP entity implements its access control mechanism and how its applications interact with that access control mechanism. It is strongly RECOMMENDED that the documentation for any access control mechanism which is used to control access to and visibility of MIB instrumentation specify the precise conditions that contribute to this value.
snmpInBadVersions [Snmp In Bad Versions] (snmpInBadVersions)	long	The total number of SNMP messages which were delivered to the SNMP entity and were for an unsupported SNMP version.
snmpInPkts [Snmp In Pkts] (snmpInPkts)	long	The total number of messages delivered to the SNMP entity from the transport service.
snmpProxyDrops [Snmp Proxy Drops] (snmpProxyDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a time-out) such that no Response Class PDU (such as a Response-PDU) could be returned.

Table 225 netw statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
snmpSilentDrops [Snmp Silent Drops] (snmpSilentDrops)	long	The total number of Confirmed Class PDUs (such as GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs) delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response Class PDU (such as a Response-PDU) with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.

Table 226 ospf statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaBasicStats</p> <p>MIB entry name: tmnxOspfAreaEntry</p> <p>Entry description: The tmnxOspfAreaEntry contains information describing the configured parameters and cumulative statistics of one of the router's attached areas.</p> <p>Table description (for tmnxOspfAreaTable): The tmnxOspfAreaTable contains information describing the configured parameters and cumulative statistics of the router's attached areas.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.AreaSite</p>		
nssaTranslatorEvents [Nssa Translator Events] (tmnxOspfAreaNssaTranslatorEvents)	long	The value of tmnxOspfAreaNssaTranslatorEvents indicates the number of Translator State changes that have occurred since the last boot-up.
totalLSACount [Total LSACount] (tmnxOspfAreaScopeLsaCount)	long	The value of tmnxOspfAreaScopeLsaCount indicates the total number of Area-Scope link state advertisements in this area's link-state database.
totalSpfRuns [Total Spf Runs] (tmnxOspfAreaSpfRuns)	long	The value of tmnxOspfAreaSpfRuns indicates the number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.
totalUnknownLSACount [Total Unknown LSACount] (tmnxOspfAreaScopeUnkLsaCount)	long	The value of tmnxOspfAreaScopeUnkLsaCount indicates the total number of unknown Area-Scope link-state advertisements in this area's link-state database.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AreaSiteLfaStats MIB entry name: tmnxOspfLfaStatsEntry Entry description: Each row entry in the tmnxOspfLfaStatsTable represents information on LFA coverage for a given OSPF area Table description (for tmnxOspfLfaStatsTable): The tmnxOspfLfaStatsTable maintains information on loopfree-alternate (LFA) coverage for each instance of OSPF protocol. Supports realtime plotting Supports scheduled collection Monitored class: ospf.AreaSite</p>		
ospfLfaCoverage [Ospf Lfa Coverage] (tmnxOspfLfaCoverage)	long	The value of tmnxOspfLfaCoverage indicates how much LFA coverage is being obtained for the set of available LFA eligible nodes.
ospfLfaNodesCovered [Ospf Lfa Nodes Covered] (tmnxOspfLfaNodesCovered)	long	The value of tmnxOspfLfaNodesCovered indicates in absolute numbers the number of nodes for which an LFA is found.
ospfLfaPrefixCoverage [Ospf Lfa Prefix Coverage] (tmnxOspfLfaPfxCoverage)	long	The value of tmnxOspfLfaPfxCoverage indicates how much LFA prefix coverage is being obtained for the set of available LFA eligible prefixes.
ospfLfaPrefixCovered [Ospf Lfa Prefix Covered] (tmnxOspfLfaPfxCovered)	long	The value of tmnxOspfLfaPfxCovered indicates in absolute numbers the number of prefixes for which an LFA is found.
ospfLfaTotalNodes [Ospf Lfa Total Nodes] (tmnxOspfLfaTotalNodes)	long	The value of tmnxOspfLfaTotalNodes indicates in absolute numbers the number of nodes eligible for LFA calculation.
ospfLfaTotalPrefix [Ospf Lfa Total Prefix] (tmnxOspfLfaTotalPfx)	long	The value of tmnxOspfLfaTotalPfx indicates in absolute numbers the number of prefixes eligible for LFA calculation.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceGeneralStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
events [Events] (tmnxOspfNgIfEvents)	long	The value of tmnxOspfNgIfEvents indicates the number of times this OSPF interface has changed its state, or an error has occurred.
<p>InterfaceReceiveStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfNgIfRxBadChecksums)	long	The value of tmnxOspfNgIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
<p>InterfaceStatusStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
authorizationFailures [Authorization Failures] (tmnxOspfNgIfAuthFailures)	long	The value of tmnxOspfNgIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfNglfBadAreas)	long	The value of tmnxOspfNglfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfNglfBadAuthTypes)	long	The value of tmnxOspfNglfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfNglfBadDeadIntervals)	long	The value of tmnxOspfNglfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfNglfBadDstAddr)	long	The value of tmnxOspfNglfBadDstAddr indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfNglfBadHelloIntervals)	long	The value of tmnxOspfNglfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfNglfBadLengths)	long	The value of tmnxOspfNglfBadLengths indicates the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfNglfBadNeighbors)	long	The value of tmnxOspfNglfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNetworks [Bad Networks] (tmnxOspfNglfBadNetworks)	long	The value of tmnxOspfNglfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfNglfBadOptions)	long	The value of tmnxOspfNglfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this interface or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfNglfBadPacketTypes)	long	The value of tmnxOspfNglfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfNglfBadVersions)	long	The value of tmnxOspfNglfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
badVirtualLinks [Bad Virtual Links] (tmnxOspfNglfBadVirtualLinks)	long	The value of tmnxOspfNglfBadVirtualLinks indicates the total number of OSPF packets received on this interface that are destined to a virtual link that does not exist since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfNglfDiscardPackets)	long	The value of tmnxOspfNglfDiscardPackets indicates the total number of OSPF packets discarded on this interface since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfNglfRetransmitOuts)	long	The value of tmnxOspfNglfRetransmitOuts indicates the total number of OSPF Retransmits sent on this interface since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceTransmitStats</p> <p>MIB entry name: tmnxOspfNgIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgIfStatsTable represents additional columns for statistics for an OSPF interface.</p> <p>Table description (for tmnxOspfNgIfStatsTable): The tmnxOspfNgIfStatsTable provides an extension of the tmnxOspfNgIfTable for statistics for an OSPF interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Interface</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfNgIfRxDBDs)	long	The value of tmnxOspfNgIfRxDBDs indicates the total number of OSPF Database Description packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfNgIfRxHellos)	long	The value of tmnxOspfNgIfRxHellos indicates the total number of OSPF Hello packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfNgIfRxLSAcks)	long	The value of tmnxOspfNgIfRxLSAcks indicates the total number of Link State Acknowledgements received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfNgIfRxLSRs)	long	The value of tmnxOspfNgIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfNgIfRxLSUs)	long	The value of tmnxOspfNgIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this interface since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfNgIfRxPackets)	long	The value of tmnxOspfNgIfRxPackets indicates the total number of OSPF packets received on this interface since tmnxOspfAdminState was last set to 'enabled'.

events [Events] (tmnxOspfNgNbrEvents)	long	The value of tmnxOspfNgNbrEvents indicates the number of times this neighbor relationship has changed state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfNgNbrLsRetransQLen)	long	The value of tmnxOspfNgNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>NeighborStatusStats</p> <p>MIB entry name: tmnxOspfNgNbrStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfNgNbrStatsTable represents additional columns for statistics for an OSPF neighbor.</p> <p>Table description (for tmnxOspfNgNbrStatsTable): The tmnxOspfNgNbrStatsTable provides an extension of the tmnxOspfNgNbrTable for statistics for an OSPF neighbor.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Neighbor</p>		

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badMtus [Bad Mtus] (tmnxOspfNgNbrBadMTUs)	long	The value of tmnxOspfNgNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badNeighborStates [Bad Neighbor States] (tmnxOspfNgNbrBadNbrStates)	long	The value of tmnxOspfNgNbrBadNbrStates indicates the total number of OSPF packets received when the neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfNgNbrBadPackets)	long	The value of tmnxOspfNgNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfNgNbrBadSeqNums)	long	The value of tmnxOspfNgNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfNgNbrDuplicates)	long	The value of tmnxOspfNgNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfNgNbrLsaInstallFailed)	long	The value of tmnxOspfNgNbrLsaInstallFailed indicates the total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfNgNbrLsaNotInLsdb)	long	The value of tmnxOspfNgNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfNgNbrNumRestarts)	long	The value of tmnxOspfNgNbrNumRestarts indicates the number of times the neighbor has attempted restart.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
optionMismatches [Option Mismatches] (tmnxOspfNgNbrOptionMismatches)	long	The value of tmnxOspfNgNbrOptionMismatches indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
<p>ShamLinkGeneralStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
events [Events] (tmnxOspfShamIfEvents)	long	The value of tmnxOspfShamIfEvents indicates the number of state changes or error events on this sham link.
<p>ShamLinkReceiveStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamIfRxDBDs)	long	The value of tmnxOspfShamIfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfShamIfRxBadChecksums)	long	The value of tmnxOspfShamIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
<p>ShamLinkStatusStats MIB entry name: tmnxOspfShamIfStatsEntry Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link. Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link. Supports realtime plotting Supports scheduled collection Monitored class: ospf.ShamLink</p>		

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authorizationFailures [Authorization Failures] (tmnxOspfShamIfAuthFailures)	long	The value of tmnxOspfShamIfAuthFailures indicates the total number of OSPF packets received with an invalid authorization key since tmnxOspfAdminState was last set to 'enabled'.
badAreas [Bad Areas] (tmnxOspfShamIfBadAreas)	long	The value of tmnxOspfShamIfBadAreas indicates the total number of OSPF packets received with an area mismatch since tmnxOspfAdminState was last set to 'enabled'.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfShamIfBadAuthTypes)	long	The value of tmnxOspfShamIfBadAuthTypes indicates the total number of OSPF packets received with an invalid authorization type since tmnxOspfAdminState was last set to 'enabled'.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfShamIfBadDeadIntervals)	long	The value of tmnxOspfShamIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfShamIfBadDstAdrs)	long	The value of tmnxOspfShamIfBadDstAdrs indicates the total number of OSPF packets received with the incorrect IP destination address since tmnxOspfAdminState was last set to 'enabled'.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfShamIfBadHelloIntervals)	long	The value of tmnxOspfShamIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this sham link since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfShamIfBadLengths)	long	The value of tmnxOspfShamIfBadLengths indicates the total number of OSPF packets received on this sham link with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badNeighbors [Bad Neighbors] (tmnxOspfShamIfBadNeighbors)	long	The value of tmnxOspfShamIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since tmnxOspfAdminState was last set to 'enabled'.
badNetworks [Bad Networks] (tmnxOspfShamIfBadNetworks)	long	The value of tmnxOspfShamIfBadNetworks indicates the total number of OSPF packets received with invalid network or mask since tmnxOspfAdminState was last set to 'enabled'.
badOptions [Bad Options] (tmnxOspfShamIfBadOptions)	long	The value of tmnxOspfShamIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this sham link or area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfShamIfBadPacketTypes)	long	The value of tmnxOspfShamIfBadPacketTypes indicates the total number of OSPF packets received with an invalid OSPF packet type since tmnxOspfAdminState was last set to 'enabled'.
badVersions [Bad Versions] (tmnxOspfShamIfBadVersions)	long	The value of tmnxOspfShamIfBadVersions indicates the total number of OSPF packets received with bad OSPF version numbers since tmnxOspfAdminState was last set to 'enabled'.
discardPackets [Discard Packets] (tmnxOspfShamIfDiscardPackets)	long	The value of tmnxOspfShamIfDiscardPackets indicates the total number of OSPF packets discarded on this sham link since tmnxOspfAdminState was last set to 'enabled'.
retransmitOuts [Retransmit Outs] (tmnxOspfShamIfRetransmitOuts)	long	The value of tmnxOspfShamIfRetransmitOuts indicates the total number of OSPF Retransmits sent on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>ShamLinkTransmitStats</p> <p>MIB entry name: tmnxOspfShamIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfShamIfStatsTable represents additional columns for statistics for an OSPF sham link.</p> <p>Table description (for tmnxOspfShamIfStatsTable): The tmnxOspfShamIfStatsTable provides an extension of the tmnxOspfShamIfTable for statistics for an OSPF sham link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.ShamLink</p>		
databaseDescriptionPackets [Database Description Packets] (tmnxOspfShamIfRxDBDs)	long	The value of tmnxOspfShamIfRxDBDs indicates the total number of OSPF Database Description packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
helloPackets [Hello Packets] (tmnxOspfShamIfRxHellos)	long	The value of tmnxOspfShamIfRxHellos indicates the total number of OSPF Hello packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfShamIfRxLSAcks)	long	The value of tmnxOspfShamIfRxLSAcks indicates the total number of Link State Acknowledgements received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateRequests [Link State Requests] (tmnxOspfShamIfRxLSRs)	long	The value of tmnxOspfShamIfRxLSRs indicates the total number of Link State Requests (LSRs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
linkStateUpdates [Link State Updates] (tmnxOspfShamIfRxLSUs)	long	The value of tmnxOspfShamIfRxLSUs indicates the total number of Link State Updates (LSUs) received on this sham link since tmnxOspfAdminState was last set to 'enabled'.
totalPackets [Total Packets] (tmnxOspfShamIfRxPackets)	long	The value of tmnxOspfShamIfRxPackets indicates the total number of OSPF packets received on this sham link since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SiteStats</p> <p>MIB entry name: tmnxOspfStatisticsEntry</p> <p>Entry description: Each row entry in the tmnxOspfStatisticsTable represents additional columns for statistics for an OSPF instance.</p> <p>Table description (for tmnxOspfStatisticsTable): The tmnxOspfStatisticsTable provides an extension of the tmnxOspfGeneralTable for statistics for an OSPF instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.Site</p>		
addRouteFailed [Add Route Failed] (tmnxOspfRoutesAddsFailed)	long	The value of tmnxOspfRoutesAddsFailed indicates the number of times an attempt to add a route to the Route Table Manager (RTM) failed for this OSPF instance.
cspfDroppedRequests [Cspf Dropped Requests] (tmnxOspfCSPFDroppedRequests)	long	The value of tmnxOspfCSPFDroppedRequests indicates the number of dropped CSPF requests made by the OSPF protocol.
cspfPathsFound [Cspf Paths Found] (tmnxOspfCSPFPathsFound)	long	The value of tmnxOspfCSPFPathsFound indicates the number of of paths found for the requests made to OSPF protocol.
cspfPathsNotFound [Cspf Paths Not Found] (tmnxOspfCSPFPathsNotFound)	long	The value of tmnxOspfCSPFPathsNotFound indicates the number of of paths not found for the requests made to OSPF protocol.
cspfRequests [Cspf Requests] (tmnxOspfCSPFRequests)	long	The value of tmnxOspfCSPFRequests indicates the number of CSPF requests made to the OSPF protocol.
deleteRouteFailed [Delete Route Failed] (tmnxOspfRoutesDelsFailed)	long	The value of tmnxOspfRoutesDelsFailed indicates the number of times an attempt to delete a route from the Route Table Manager (RTM) failed for this instance of OSPF.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inOverflowCount [In Overflow Count] (tmnxOspfNumTimesInOverflow)	long	The value of tmnxOspfNumTimesInOverflow indicates the count of the number of times the system was in the overflow state.
inOverloadCount [In Overload Count] (tmnxOspfNumTimesInOverload)	long	The value of tmnxOspfNumTimesInOverload indicates the count of the number of times the system was overloaded.
modifyRouteFailed [Modify Route Failed] (tmnxOspfRoutesModsFailed)	long	The value of tmnxOspfRoutesModsFailed indicates the number of times an attempt to modify a route in the Route Table Manager (RTM) failed for this instance of OSPF.
newLsasOriginated [New Lsas Originated] (tmnxOspfOriginateNewLsas)	long	The value of tmnxOspfOriginateNewLsas indicates the number of new link-state advertisements that have been originated. This number is incremented each time the router originates a new LSA.
newLsasReceived [New Lsas Received] (tmnxOspfRxNewLsas)	long	The value of tmnxOspfRxNewLsas indicates the number of link-state advertisements received determined to be new instantiations. This number does not include newer instantiations of self-originated link-state advertisements.
spfAttemptsFailed [Spf Attempts Failed] (tmnxOspfSpfAttemptsFailed)	long	The value of tmnxOspfSpfAttemptsFailed indicates the number of times an attempt to run SPF has failed because SPF runs have been stopped as a result of insufficient memory resources.

databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
lsasWithBadChecksums [Lsas With Bad Checksums] (tmnxOspfVirtIfRxBadChecksums)	long	The value of tmnxOspfVirtIfRxBadChecksums indicates the count of LSAs received with bad checksums.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
VirtualLinkStatusStats MIB entry name: tmnxOspfVirtIfStatsEntry Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface. Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualLink		
authorizationFailures [Authorization Failures] (tmnxOspfVirtIfAuthFailures)	long	The value of tmnxOspfVirtIfAuthFailures indicates the total number of OSPF packets received on this virtual interface with invalid authentication keys.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badAreas [Bad Areas] (tmnxOspfVirtIfBadAreas)	long	The value of tmnxOspfVirtIfBadAreas indicates the total number of OSPF packets received on this virtual interface with area mismatches.
badAuthorizationTypes [Bad Authorization Types] (tmnxOspfVirtIfBadAuthTypes)	long	The value of tmnxOspfVirtIfBadAuthTypes indicates the total number of OSPF packets received on this virtual interface with invalid authentication types.
badDeadIntervals [Bad Dead Intervals] (tmnxOspfVirtIfBadDeadIntervals)	long	The value of tmnxOspfVirtIfBadDeadIntervals indicates the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badDestinationAddresses [Bad Destination Addresses] (tmnxOspfVirtIfBadDstAddrs)	long	The value of tmnxOspfVirtIfBadDstAddrs indicates the total number of OSPF packets received on this virtual interface with invalid destination IP address.
badHelloIntervals [Bad Hello Intervals] (tmnxOspfVirtIfBadHelloIntervals)	long	The value of tmnxOspfVirtIfBadHelloIntervals indicates the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this virtual interface since tmnxOspfAdminState was last set to 'enabled'.
badLengths [Bad Lengths] (tmnxOspfVirtIfBadLengths)	long	The value of tmnxOspfVirtIfBadLengths indicates the total number of OSPF packets received on this virtual interface with a total length not equal to the length given in the packet itself since tmnxOspfAdminState was last set to 'enabled'.
badNeighbors [Bad Neighbors] (tmnxOspfVirtIfBadNeighbors)	long	The value of tmnxOspfVirtIfBadNeighbors indicates the total number of OSPF packets received where the neighbor information does not match the configuration this router has for the neighbor.
badNetworks [Bad Networks] (tmnxOspfVirtIfBadNetworks)	long	The value of tmnxOspfVirtIfBadNetworks indicates the total number of OSPF packets received on this virtual interface with invalid network or mask fields.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badOptions [Bad Options] (tmnxOspfVirtIfBadOptions)	long	The value of tmnxOspfVirtIfBadOptions indicates the total number of OSPF packets received with an option that does not match those configured for this virtual interface or transit-area since tmnxOspfAdminState was last set to 'enabled'.
badPacketTypes [Bad Packet Types] (tmnxOspfVirtIfBadPacketTypes)	long	The value of tmnxOspfVirtIfBadPacketTypes indicates the total number of OSPF packets received on this virtual interface with invalid OSPF packet types.
badVersions [Bad Versions] (tmnxOspfVirtIfBadVersions)	long	The value of tmnxOspfVirtIfBadVersions indicates the total number of OSPF packets received on this virtual interface with invalid OSPF version numbers.
discardPackets [Discard Packets] (tmnxOspfVirtIfDiscardPackets)	long	The value of tmnxOspfVirtIfDiscardPackets indicates the total number of OSPF packets discarded on this virtual interface.
retransmitOuts [Retransmit Outs] (tmnxOspfVirtIfRetransmitOuts)	long	The value of tmnxOspfVirtIfRetransmitOuts indicates the total number of OSPF packets retransmitted on this virtual interface.
<p>VirtualLinkTransmitStats</p> <p>MIB entry name: tmnxOspfVirtIfStatsEntry</p> <p>Entry description: Each row entry in the tmnxOspfVirtIfStatsTable represents additional columns for statistics for an OSPF virtual interface.</p> <p>Table description (for tmnxOspfVirtIfStatsTable): The tmnxOspfVirtIfStatsTable provides an extension of the tmnxOspfVirtIfTable for statistics for an OSPF virtual interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ospf.VirtualLink</p>		

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
databaseDescriptionPackets [Database Description Packets] (tmnxOspfVirtIfRxDBDs)	long	The value of tmnxOspfVirtIfRxDBDs indicates the total number of OSPF Database Description packets received on this virtual interface.
helloPackets [Hello Packets] (tmnxOspfVirtIfRxHellos)	long	The value of tmnxOspfVirtIfRxHellos indicates the total number of OSPF Hello packets received on this virtual interface.
linkStateAcknowledgements [Link State Acknowledgements] (tmnxOspfVirtIfRxLSAcks)	long	The value of tmnxOspfVirtIfRxLSAcks indicates the total number of Link State Acknowledgements received on this virtual interface.
linkStateRequests [Link State Requests] (tmnxOspfVirtIfRxLSRs)	long	The value of tmnxOspfVirtIfRxLSRs indicates the total number of OSPF Link State Requests (LSRs) received on this virtual interface.
linkStateUpdates [Link State Updates] (tmnxOspfVirtIfRxLSUs)	long	The value of tmnxOspfVirtIfRxLSUs indicates the total number of OSPF Link State Updates (LSUs) received on this virtual interface.
totalPackets [Total Packets] (tmnxOspfVirtIfRxPackets)	long	The value of tmnxOspfVirtIfRxPackets indicates the total number of OSPF packets received on this virtual interface since it was created.
VirtualNeighborGeneralStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor		

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
events [Events] (tmnxOspfVirtNbrEvents)	long	The value of tmnxOspfVirtNbrEvents indicates the number of times this virtual link has changed its state, or an error has occurred.
retransmissionQueueLength [Retransmission Queue Length] (tmnxOspfVirtNbrLsRetransQLen)	long	The value of tmnxOspfVirtNbrLsRetransQLen indicates the current length of the retransmission queue.
<p>VirtualNeighborStatusStats MIB entry name: tmnxOspfVirtNbrStatsEntry Entry description: Each row entry in the tmnxOspfVirtNbrStatsTable represents additional columns for statistics for an OSPF virtual neighbor. Table description (for tmnxOspfVirtNbrStatsTable): The tmnxOspfVirtNbrStatsTable provides an extension of the tmnxOspfVirtNbrTable for statistics for an OSPF virtual neighbor. Supports realtime plotting Supports scheduled collection Monitored class: ospf.VirtualNeighbor</p>		
badMtus [Bad Mtus] (tmnxOspfVirtNbrBadMTUs)	long	The value of tmnxOspfVirtNbrBadMTUs indicates the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since tmnxOspfAdminState was last set to 'enabled'.
badPackets [Bad Packets] (tmnxOspfVirtNbrBadPackets)	long	The value of tmnxOspfVirtNbrBadPackets indicates the total number of times when an LS update was received with an illegal LS type or an option mismatch since tmnxOspfAdminState was last set to 'enabled'.
badSequenceNumbers [Bad Sequence Numbers] (tmnxOspfVirtNbrBadSeqNums)	long	The value of tmnxOspfVirtNbrBadSeqNums indicates the total number of times when a database description packet was received with a sequence number mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 226 ospf statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
badVirtualNeighborStates [Bad Virtual Neighbor States] (tmnxOspfVirtNbrBadNbrStates)	long	The value of tmnxOspfVirtNbrBadNbrStates indicates the total number of OSPF packets received when the virtual neighbor state was not expecting to receive this packet type since tmnxOspfAdminState was last set to 'enabled'.
duplicates [Duplicates] (tmnxOspfVirtNbrDuplicates)	long	The value of tmnxOspfVirtNbrDuplicates indicates the total number of times when a duplicate database description packet was received during the Exchange state since tmnxOspfAdminState was last set to 'enabled'.
lsaInstallFailed [Lsa Install Failed] (tmnxOspfVirtNbrLsaInstallFail)	long	The value of tmnxOspfVirtNbrLsaInstallFail indicates the total number of times when an LSA could not be installed into the LSDB due to a resource allocation issue since tmnxOspfAdminState was last set to 'enabled'.
lsaNotInLSDB [Lsa Not In LSDB] (tmnxOspfVirtNbrLsaNotInLsdb)	long	The value of tmnxOspfVirtNbrLsaNotInLsdb indicates the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since tmnxOspfAdminState was last set to 'enabled'.
numberOfRestarts [Number Of Restarts] (tmnxOspfVirtNbrNumRestarts)	long	The value of tmnxOspfVirtNbrNumRestarts indicates the number of times the virtual neighbor has attempted restart since tmnxOspfAdminState was last set to 'enabled'.
optionMismatches [Option Mismatches] (tmnxOspfVirtNbrOptionMismatch)	long	The value of tmnxOspfVirtNbrOptionMismatch indicates the total number of times when a LS update was received with an option mismatch since tmnxOspfAdminState was last set to 'enabled'.

Table 227 pae802_1x statistics

<p>PaePortAuthenticatorDiagStats</p> <p>MIB entry name: dot1xAuthDiagEntry</p> <p>Entry description: The diagnostics information for an Authenticator PAE.</p> <p>Table description (for dot1xAuthDiagTable): A table that contains the diagnostics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort 		
dot1xAuthAuthEapLogoffWhileAuthenticated [Dot 1 x Auth Auth Eap Logoff While Authenticated] (dot1xAuthAuthEapLogoffWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to DISCONNECTED, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapLogoffWhileAuthenticating [Dot 1 x Auth Auth Eap Logoff While Authenticating] (dot1xAuthAuthEapLogoffWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Logoff message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticated [Dot 1 x Auth Auth Eap Starts While Authenticated] (dot1xAuthAuthEapStartsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of an EAPOL-Start message being received from the Supplicant.
dot1xAuthAuthEapStartsWhileAuthenticating [Dot 1 x Auth Auth Eap Starts While Authenticating] (dot1xAuthAuthEapStartsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Start message being received from the Supplicant.

Table 227 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthAuthFailWhileAuthenticating [Dot 1 x Auth Auth Fail While Authenticating] (dot1xAuthAuthFailWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to HELD, as a result of the Backend Authentication state machine indicating authentication failure (authFail = TRUE).
dot1xAuthAuthReauthsWhileAuthenticated [Dot 1 x Auth Auth Reauths While Authenticated] (dot1xAuthAuthReauthsWhileAuthenticated)	long	Counts the number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthReauthsWhileAuthenticating [Dot 1 x Auth Auth Reauths While Authenticating] (dot1xAuthAuthReauthsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of a reauthentication request (reAuthenticate = TRUE).
dot1xAuthAuthSuccessWhileAuthenticating [Dot 1 x Auth Auth Success While Authenticating] (dot1xAuthAuthSuccessWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to AUTHENTICATED, as a result of the Backend Authentication state machine indicating successful authentication of the Supplicant (authSuccess = TRUE).
dot1xAuthAuthTimeoutsWhileAuthenticating [Dot 1 x Auth Auth Timeouts While Authenticating] (dot1xAuthAuthTimeoutsWhileAuthenticating)	long	Counts the number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of the Backend Authentication state machine indicating authentication timeout (authTimeout = TRUE).
dot1xAuthBackendAccessChallenges [Dot 1 x Auth Backend Access Challenges] (dot1xAuthBackendAccessChallenges)	long	Counts the number of times that the state machine receives an initial Access-Challenge packet from the Authentication server (i.e., aReq becomes TRUE, causing exit from the RESPONSE state). Indicates that the Authentication Server has communication with the Authenticator.
dot1xAuthBackendAuthFails [Dot 1 x Auth Backend Auth Fails] (dot1xAuthBackendAuthFails)	long	Counts the number of times that the state machine receives an EAP-Failure message from the Authentication Server (i.e., aFail becomes TRUE, causing a transition from RESPONSE to FAIL). Indicates that the Supplicant has not authenticated to the Authentication Server.

Table 227 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthBackendAuthSuccesses [Dot 1 x Auth Backend Auth Successes] (dot1xAuthBackendAuthSuccesses)	long	Counts the number of times that the state machine receives an EAP-Success message from the Authentication Server (i.e., aSuccess becomes TRUE, causing a transition from RESPONSE to SUCCESS). Indicates that the Supplicant has successfully authenticated to the Authentication Server.
dot1xAuthBackendNonNakResponsesFromSupplicant [Dot 1 x Auth Backend Non Nak Responses From Supplicant] (dot1xAuthBackendNonNakResponsesFromSupplicant)	long	Counts the number of times that the state machine receives a response from the Supplicant to an initial EAP-Request, and the response is something other than EAP-NAK (i.e., rxResp becomes TRUE, causing the state machine to transition from REQUEST to RESPONSE, and the response is not an EAP-NAK). Indicates that the Supplicant can respond to the Authenticator's chosen EAP-method.
dot1xAuthBackendOtherRequestsToSupplicant [Dot 1 x Auth Backend Other Requests To Supplicant] (dot1xAuthBackendOtherRequestsToSupplicant)	long	Counts the number of times that the state machine sends an EAP-Request packet (other than an Identity, Notification, Failure or Success message) to the Supplicant (i.e., executes txReq on entry to the REQUEST state). Indicates that the Authenticator chose an EAP-method.
dot1xAuthBackendResponses [Dot 1 x Auth Backend Responses] (dot1xAuthBackendResponses)	long	Counts the number of times that the state machine sends an initial Access-Request packet to the Authentication server (i.e., executes sendRespToServer on entry to the RESPONSE state). Indicates that the Authenticator attempted communication with the Authentication Server.
dot1xAuthEapLogoffsWhileConnecting [Dot 1 x Auth Eap Logoffs While Connecting] (dot1xAuthEapLogoffsWhileConnecting)	long	Counts the number of times that the state machine transitions from CONNECTING to DISCONNECTED as a result of receiving an EAPOL-Logoff message.
dot1xAuthEntersAuthenticating [Dot 1 x Auth Enters Authenticating] (dot1xAuthEntersAuthenticating)	long	Counts the number of times that the state machine transitions from CONNECTING to AUTHENTICATING, as a result of an EAP-Response/Identity message being received from the Supplicant.

Table 227 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEntersConnecting [Dot 1 x Auth Enters Connecting] (dot1xAuthEntersConnecting)	long	Counts the number of times that the state machine transitions to the CONNECTING state from any other state.
<p>PaePortAuthenticatorSessionStats MIB entry name: dot1xAuthSessionStatsEntry Entry description: The session statistics information for an Authenticator PAE. This shows the current values being collected for each session that is still in progress, or the final values for the last valid session on each port where there is no session currently active. Table description (for dot1xAuthSessionStatsTable): A table that contains the session statistics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself. Supports realtime plotting Supports scheduled collection Monitored classes: • equipment.ManagementPort • equipment.PhysicalPort</p>		
dot1xAuthSessionAuthenticMethod [Dot 1 x Auth Session Authentic Method] (dot1xAuthSessionAuthenticMethod)	int	The authentication method used to establish the session.
dot1xAuthSessionFramesRx [Dot 1 x Auth Session Frames Rx] (dot1xAuthSessionFramesRx)	long	The number of user data frames received on this Port during the session.
dot1xAuthSessionFramesTx [Dot 1 x Auth Session Frames Tx] (dot1xAuthSessionFramesTx)	long	The number of user data frames transmitted on this Port during the session.
dot1xAuthSessionOctetsRx [Dot 1 x Auth Session Octets Rx] (dot1xAuthSessionOctetsRx)	java. math. BigInteger	The number of octets received in user data frames on this Port during the session.

Table 227 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthSessionOctetsTx [Dot 1 x Auth Session Octets Tx] (dot1xAuthSessionOctetsTx)	java. math. BigInteger	The number of octets transmitted in user data frames on this Port during the session.
dot1xAuthSessionTerminateCause [Dot 1 x Auth Session Terminate Cause] (dot1xAuthSessionTerminateCause)	int	The reason for the session termination.
dot1xAuthSessionTime [Dot 1 x Auth Session Time] (dot1xAuthSessionTime)	long	The duration of the session in seconds.
<p>PaePortAuthenticatorStats MIB entry name: dot1xAuthStatsEntry Entry description: The statistics information for an Authenticator PAE. Table description (for dot1xAuthStatsTable): A table that contains the statistics objects for the Authenticator PAE associated with each Port. An entry appears in this table for each port that may authenticate access to itself. Supports realtime plotting Supports scheduled collection Monitored classes: <ul style="list-style-type: none"> • equipment.ManagementPort • equipment.PhysicalPort </p>		
dot1xAuthEapLengthErrorFramesRx [Dot 1 x Auth Eap Length Error Frames Rx] (dot1xAuthEapLengthErrorFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the Packet Body Length field is invalid.
dot1xAuthEapolFramesRx [Dot 1 x Auth Eapol Frames Rx] (dot1xAuthEapolFramesRx)	long	The number of valid EAPOL frames of any type that have been received by this Authenticator.

Table 227 pae802_1x statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dot1xAuthEapolFramesTx [Dot 1 x Auth Eapol Frames Tx] (dot1xAuthEapolFramesTx)	long	The number of EAPOL frames of any type that have been transmitted by this Authenticator.
dot1xAuthEapolLogoffFramesRx [Dot 1 x Auth Eapol Logoff Frames Rx] (dot1xAuthEapolLogoffFramesRx)	long	The number of EAPOL Logoff frames that have been received by this Authenticator.
dot1xAuthEapolReqFramesTx [Dot 1 x Auth Eapol Req Frames Tx] (dot1xAuthEapolReqFramesTx)	long	The number of EAP Request frames (other than Rq/Id frames) that have been transmitted by this Authenticator.
dot1xAuthEapolReqIdFramesTx [Dot 1 x Auth Eapol Req Id Frames Tx] (dot1xAuthEapolReqIdFramesTx)	long	The number of EAP Req/Id frames that have been transmitted by this Authenticator.
dot1xAuthEapolRespFramesRx [Dot 1 x Auth Eapol Resp Frames Rx] (dot1xAuthEapolRespFramesRx)	long	The number of valid EAP Response frames (other than Resp/Id frames) that have been received by this Authenticator.
dot1xAuthEapolRespIdFramesRx [Dot 1 x Auth Eapol Resp Id Frames Rx] (dot1xAuthEapolRespIdFramesRx)	long	The number of EAP Resp/Id frames that have been received by this Authenticator.
dot1xAuthEapolStartFramesRx [Dot 1 x Auth Eapol Start Frames Rx] (dot1xAuthEapolStartFramesRx)	long	The number of EAPOL Start frames that have been received by this Authenticator.
dot1xAuthInvalidEapolFramesRx [Dot 1 x Auth Invalid Eapol Frames Rx] (dot1xAuthInvalidEapolFramesRx)	long	The number of EAPOL frames that have been received by this Authenticator in which the frame type is not recognized.
dot1xAuthLastEapolFrameVersion [Dot 1 x Auth Last Eapol Frame Version] (dot1xAuthLastEapolFrameVersion)	long	The protocol version number carried in the most recently received EAPOL frame.

Table 228 pim statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InterfaceAdditionalStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface</p>		
bootstrapExpPolicyDrops [Bootstrap Exp Policy Drops] (vRtrPimNgIfBtrExpPolicyDrops)	long	The value of vRtrPimNgIfBtrExpPolicyDrops indicates the number of Bootstrap Messages that were not transmitted on this interface because of Bootstrap export policy. PIM Bootstrap export policies are configured using bootstrap export policy objects in vRtrPimNgGenPolicyTable.
bootstrapImpPolicyDrops [Bootstrap Imp Policy Drops] (vRtrPimNgIfBtrImpPolicyDrops)	long	The value of vRtrPimNgIfBtrImpPolicyDrops indicates the number of Bootstrap Messages received on this interface but were dropped because of Bootstrap import policy. PIM Bootstrap import policies are configured using bootstrap import policy objects in vRtrPimNgGenPolicyTable.
joinPolicyDrops [Join Policy Drops] (vRtrPimNgIfJoinPolicyDrops)	long	The value of vRtrPimNgIfJoinPolicyDrops indicates the number of times the join policy match resulted in dropping PIM Join-Prune Message or one of the source group contained in the message. PIM Join policies are configured using join policy objects in vRtrPimNgGenPolicyTable.
registerPolicyDrops [Register Policy Drops] (vRtrPimNgIfRegisterPolicyDrops)	long	The value of vRtrPimNgIfRegisterPolicyDrops indicates the number of times the register policy match resulted in dropping PIM Register Message. PIM Register policies are configured using the register policy objects in vRtrPimNgGenPolicyTable.
rxBSMNoRouterAlertDrops [Rx BSMNo Router Alert Drops] (vRtrPimNgIfRxBSMNoRouterAlertDrops)	long	The value of vRtrPimNgIfRxBSMNoRouterAlertDrops indicates the number of BSM messages that were dropped because router alert option was not present.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBSMWrongIfDrops [Rx BSMWrong If Drops] (vRtrPimNgIfRxBSMWrongIfDrops)	long	The value of vRtrPimNgIfRxBSMWrongIfDrops indicates the number of BSM messages that were dropped either because they were not sent by the correct RPF neighbor or because they arrived on the wrong interface.
rxInvalidJoinPrunes [Rx Invalid Join Prunes] (vRtrPimNgIfRxInvalidJoinPrunes)	long	The value of vRtrPimNgIfRxInvalidJoinPrunes indicates the number of invalid PIM Join Prune messages received on this interface. A Join Prune message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidJoinPrune notification is sent.
rxInvalidRegisters [Rx Invalid Registers] (vRtrPimNgIfRxInvalidRegisters)	long	The value of vRtrPimNgIfRxInvalidRegisters indicates the number of invalid PIM Register messages received on this interface. A Register message is invalid when the RP address in the message is not the RP for the group specified in the message. If such a message arrives, a vRtrPimNgInvalidRegister notification is sent.
rxJoinPruneErrs [Rx Join Prune Errs] (vRtrPimNgIfRxJoinPruneErrs)	long	The value of vRtrPimNgIfRxJoinPruneErrs indicates the number of errors while processing Join-Prune messages received on this interface.
rxJoinPrunes [Rx Join Prunes] (vRtrPimNgIfRxJoinPrunes)	long	The value of vRtrPimNgIfRxJoinPrunes indicates the number of PIM Join Prune messages received on this interface.
txJoinPrunes [Tx Join Prunes] (vRtrPimNgIfTxJoinPrunes)	long	The value of vRtrPimNgIfTxJoinPrunes indicates the number of PIM Join Prune messages transmitted on this interface.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
InterfaceStats MIB entry name: vRtrPimNgIfStatsEntry Entry description: An entry in the vRtrPimNgIfStatsTable. Table description (for vRtrPimNgIfStatsTable): The table listing the PIM statistics for a particular interface. Supports realtime plotting Supports scheduled collection Monitored class: pim.Interface		
bsmErrs [Bsm Errs] (vRtrPimNgIfTxBsmErrs)	long	The value of vRtrPimNgIfTxBsmErrs indicates the number of errors while transmitting PIM Bootstrap Messages (BSM) on this interface.
bsmPdus [Bsm Pdus] (vRtrPimNgIfTxBsmPdus)	long	The value of vRtrPimNgIfTxBsmPdus indicates the number of PIM Bootstrap Messages (BSM) transmitted on this interface.
mcacPolicyDrops [Mcac Policy Drops] (vRtrPimNgIfMcacPolicyDrops)	long	The value of the object vRtrPimNgIfMcacPolicyDrops indicates the number times a PIM Group is dropped because of applying a multicast CAC policy on this interface.
registerStopErrs [Register Stop Errs] (vRtrPimNgIfTxRegisterStopErrs)	long	The value of vRtrPimNgIfTxRegisterStopErrs indicates the number of PIM errors while trasmitting PIM Register Stop messages on this interface.
registerStops [Register Stops] (vRtrPimNgIfTxRegisterStops)	long	The value of vRtrPimNgIfTxRegisterStops indicates the number of PIM Register Stop messages transmitted on this interface.
rxAssertErrs [Rx Assert Errs] (vRtrPimNgIfRxAssertErrs)	long	The value of vRtrPimNgIfRxAssertErrs indicates the number of errors while processing Assert messages received on this interface.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxAsserts [Rx Asserts] (vRtrPimNgIfRxAsserts)	long	The value of vRtrPimNgIfRxAsserts indicates the number of PIM Assert messages received on this interface.
rxAutoRpAnnounce [Rx Auto Rp Announce] (vRtrPimNgIfRxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounce indicates the number Auto-RP announcements received on this interface.
rxAutoRpAnnounceErrs [Rx Auto Rp Announce Errs] (vRtrPimNgIfRxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfRxAutoRpAnnounceErrs indicates the number of errors while processing Auto-RP announcements received on this interface.
rxAutoRpGenErrs [Rx Auto Rp Gen Errs] (vRtrPimNgIfRxAutoRpGenErrs)	long	The value of the object vRtrPimNgIfRxAutoRpGenErrs indicates the number of errors while processing Auto-RP messages received on this interface.
rxAutoRpMapping [Rx Auto Rp Mapping] (vRtrPimNgIfRxAutoRpMapping)	long	The value of the object vRtrPimNgIfRxAutoRpMapping indicates the number of Auto-RP mappings received on this interface.
rxAutoRpMappingErrs [Rx Auto Rp Mapping Errs] (vRtrPimNgIfRxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfRxAutoRpMappingErrs indicates the number of errors while processing Auto-RP mappings received on this interface.
rxBadChecksumDiscards [Rx Bad Checksum Discards] (vRtrPimNgIfRxBadChecksumDiscard)	long	The value of vRtrPimNgIfRxBadChecksumDiscard indicates the number of PIM messages received on this interface which were discarded because of bad checksum.
rxBadEncodings [Rx Bad Encodings] (vRtrPimNgIfRxBadEncodings)	long	The value of vRtrPimNgIfRxBadEncodings indicates the number of PIM messages with bad encodings received on this interface.
rxBadVersionDiscards [Rx Bad Version Discards] (vRtrPimNgIfRxBadVersionDiscard)	long	The value of vRtrPimNgIfRxBadVersionDiscard indicates the number of PIM messages with bad versions received on this interface.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxBsmPduDrops [Rx Bsm Pdu Drops] (vRtrPimNgIfRxBsmPduDrops)	long	The value of vRtrPimNgIfRxBsmPduDrops indicates the number of Bootstrap Messages received on this interface but were dropped.
rxBsmPdus [Rx Bsm Pdus] (vRtrPimNgIfRxBsmPdus)	long	The value of vRtrPimNgIfRxBsmPdus indicates the number of Bootstrap Messages received on this interface.
rxCRPAdvNoRouterAlert [Rx CRPAdv No Router Alert] (vRtrPimNgIfRxCRPAdvNoRtrAlert)	long	The value of vRtrPimNgIfRxCRPAdvNoRtrAlert indicates the number of Candidate-RP Advertizements(C-RP-Adv) received on this interface which had no router alert option set.
rxHellos [Rx Hellos] (vRtrPimNgIfRxHellos)	long	The value of vRtrPimNgIfRxHellos indicates the number of PIM hello messages received on this interface.
rxHellosDropped [Rx Hellos Dropped] (vRtrPimNgIfRxHellosDropped)	long	The value of vRtrPimNgIfRxHellosDropped indicates the number of PIM Hello messages which were received on this interface but were dropped.
rxNbrUnknown [Rx Nbr Unknown] (vRtrPimNgIfRxNbrUnknown)	long	The value of vRtrPimNgIfRxNbrUnknown indicates the number of PIM messages (other than Hello messages) which were received on this interface and were rejected because the adjacency with the neighbor router was not already established.
rxNullRegisters [Rx Null Registers] (vRtrPimNgIfRxNullRegisters)	long	The value of vRtrPimNgIfRxNullRegisters indicates the number of PIM Null Register messages received on this interface.
rxPkts [Rx Pkts] (vRtrPimNgIfRxPkts)	long	The value of vRtrPimNgIfRxPkts indicates the number of multicast data packets received on this interface.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rxRegisterErrs [Rx Register Errs] (vRtrPimNgIfRxRegisterErrs)	long	The value of vRtrPimNgIfRxRegisterErrs indicates the number of errors while processing Register messages received on this interface.
rxRegisterStopErrs [Rx Register Stop Errs] (vRtrPimNgIfRxRegisterStopErrs)	long	The value of vRtrPimNgIfRxRegisterStopErrs indicates the number of errors while processing Register Stop messages received on this interface.
rxRegisterStops [Rx Register Stops] (vRtrPimNgIfRxRegisterStops)	long	The value of vRtrPimNgIfRxRegisterStops indicates the number of PIM Register Stop messages received on this interface.
rxRegisters [Rx Registers] (vRtrPimNgIfRxRegisters)	long	The value of vRtrPimNgIfRxRegisters indicates the number of PIM Register messages received on this interface.
rxUnknownPdus [Rx Unknown Pdus] (vRtrPimNgIfRxUnknownPdus)	long	The value of vRtrPimNgIfRxUnknownPdus indicates the number of packets received with an unsupported PIM type.
sgTypes [Sg Types] (vRtrPimNgIfSGTypes)	long	The value of vRtrPimNgIfSGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'sg'.
starGTypes [Star GTypes] (vRtrPimNgIfStarGTypes)	long	The value of vRtrPimNgIfStarGTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIf-GrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgIfStarStarRPTypes)	long	The value of vRtrPimNgIfStarStarRPTypes indicates the number of entries in vRtrPimNgIfGrpSrcTable for which vRtrPimNgIfGrpSrcType is 'starStarRP'.
txAsserts [Tx Asserts] (vRtrPimNgIfTxAsserts)	long	The value of vRtrPimNgIfTxAsserts indicates the number of PIM Assert messages transmitted on this interface.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txAutoRpAnnounce [Tx Auto Rp Announce] (vRtrPimNgIfTxAutoRpAnnounce)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounce indicates the number of Auto-RP announcements transmitted on this interface.
txAutoRpAnnounceErrs [Tx Auto Rp Announce Errs] (vRtrPimNgIfTxAutoRpAnnounceErrs)	long	The value of the object vRtrPimNgIfTxAutoRpAnnounceErrs indicates the number of errors while transmitting Auto-RP announcements on this interface.
txAutoRpMapping [Tx Auto Rp Mapping] (vRtrPimNgIfTxAutoRpMapping)	long	The value of the object vRtrPimNgIfTxAutoRpMapping indicates the number of Auto-RP mappings transmitted on this interface.
txAutoRpMappingErrs [Tx Auto Rp Mapping Errs] (vRtrPimNgIfTxAutoRpMappingErrs)	long	The value of the object vRtrPimNgIfTxAutoRpMappingErrs indicates the number of errors while transmitting Auto-RP mappings on this interface.
txHellos [Tx Hellos] (vRtrPimNgIfTxHellos)	long	The value of vRtrPimNgIfTxHellos indicates the number of PIM Hello messages transmitted on this interface.
txPkts [Tx Pkts] (vRtrPimNgIfTxPkts)	long	The value of vRtrPimNgIfTxPkts indicates the number of multicast data packets transmitted on this interface.
<p>PimGenSiteStats</p> <p>MIB entry name: vRtrPimNgGenStatEntry</p> <p>Entry description: An entry in the vRtrPimNgGenStatTable.</p> <p>Table description (for vRtrPimNgGenStatTable): vRtrPimNgGenStatTable lists PIM statistics for a particular PIM instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • pim.Site • pim.SiteExtension 		

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
forwardCrpaDrops [Forward Crpa Drops] (vRtrPimNgGenStatFwdCrpaDrops)	long	The value of vRtrPimNgGenStatFwdCrpaDrops indicates the number of times the Candidate-RP Advertisements(C-RP-Adv) could not be forwarded by the router.
forwardCrpaPdus [Forward Crpa Pdu] (vRtrPimNgGenStatForwardCrpaPdus)	long	The value of vRtrPimNgGenStatForwardCrpaPdus indicates the number of Candidate-RP Advertisements(C-RP-Adv) that were forwarded by the router. C-RP-Adv's are forwarded when the received advertisement has a router alert set and the destination address is not the router's local address.
rxActiveMdts [Rx Active Mdts] (vRtrPimNgGenStatRxActiveMdts)	long	The value of vRtrPimNgGenStatRxActiveMdts indicates number of active Mdts on which the PE is receiving packets. This object is applicable to VPRNs only.
rxCrpaPduDrops [Rx Crpa Pdu Drops] (vRtrPimNgGenStatRxCrpaPduDrops)	long	The value of vRtrPimNgGenStatRxCrpaPduDrops indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) received by this instance, but were dropped.
rxCrpaPdus [Rx Crpa Pdu] (vRtrPimNgGenStatRxCrpaPdus)	long	The value of vRtrPimNgGenStatRxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) received by this instance.
rxMdtJoinTlvErrs [Rx Mdt Join Tlv Errs] (vRtrPimNgGenStatRxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatRxMdtJnTlvErrs indicates indicates number of times MDT Join TLVs were dropped due to errors in the received TLV.
rxMdtJoinTlvs [Rx Mdt Join Tlvs] (vRtrPimNgGenStatRxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatRxMdtJoinTlvs indicates the number of times MDT Join TLV were received.
sgTypes [Sg Types] (vRtrPimNgGenStatSGTypes)	long	The value of vRtrPimNgGenStatSGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'sg'.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
starGTypes [Star GTypes] (vRtrPimNgGenStatStarGTypes)	long	The value of vRtrPimNgGenStatStarGTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starG'.
starStarRPTypes [Star Star RPTypes] (vRtrPimNgGenStatStarStarRPTypes)	long	The value of vRtrPimNgGenStatStarStarRPTypes indicates the number of entries in vRtrPimNgGrpSrcTable for which vRtrPimNgGrpSrcType is 'starStarRP'.
txActiveMdts [Tx Active Mdts] (vRtrPimNgGenStatTxActiveMdts)	long	The value of vRtrPimNgGenStatTxActiveMdts indicates the number of active MDTs on which the PE is forwarding packets. This object is applicable to VPRNs only.
txCrpaPduErrs [Tx Crpa Pdu Errs] (vRtrPimNgGenStatTxCrpaPduErrs)	long	The value of vRtrPimNgGenStatTxCrpaPduErrs indicates the number of errors while transmitting PIM Candidate-RP Advertisements (C-RP-Adv).
txCrpaPdus [Tx Crpa Pdus] (vRtrPimNgGenStatTxCrpaPdus)	long	The value of vRtrPimNgGenStatTxCrpaPdus indicates the number of PIM Candidate-RP Advertisements (C-RP-Adv) transmitted by this router instance.
txMdtJoinTlvErrs [Tx Mdt Join Tlv Errs] (vRtrPimNgGenStatTxMdtJnTlvErrs)	long	The value of vRtrPimNgGenStatTxMdtJnTlvErrs indicates the number of times MDT Join TLV could not be transmitted.
txMdtJoinTlvs [Tx Mdt Join Tlvs] (vRtrPimNgGenStatTxMdtJoinTlvs)	long	The value of vRtrPimNgGenStatTxMdtJoinTlvs indicates the number of times MDT Join TLV were transmitted.
txNullRegisters [Tx Null Registers] (vRtrPimNgGenStatTxNullRegisters)	long	The value of vRtrPimNgGenStatTxNullRegisters indicates the number of PIM Null Register messages transmitted by this instance.
txRegisterErrs [Tx Register Errs] (vRtrPimNgGenStatTxRegisterErrs)	long	The value of vRtrPimNgGenStatTxRegisterErrs indicates the number the times there was an error while transmitting PIM Register messages by this instance.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txRegisterTTL Drops [Tx Register TTL Drops] (vRtrPimNgGenStatTxRegTTL Drops)	long	The value of vRtrPimNgGenStatTxRegTTL Drops indicates the number of multicast data packets which could not be encapsulated in Register messages because the Time To Live (TTL) was zero.
txRegisters [Tx Registers] (vRtrPimNgGenStatTxRegisters)	long	The value of vRtrPimNgGenStatTxRegisters indicates the number of PIM Register messages transmitted by this instance.
PimGroupStats MIB entry name: vRtrPimNgGrpSrcStatEntry Entry description: An entry in the vRtrPimNgGrpSrcStatTable. Table description (for vRtrPimNgGrpSrcStatTable): vRtrPimNgGrpSrcStatTable contains statistics for the entries in the vRtrPimNgGrpSrcTable. These statistics are collected by the forwarding engine. Supports realtime plotting Supports scheduled collection Monitored class: pim.Groups		
discardedPkts [Discarded Pkts] (vRtrPimNgGrpSrcStatDscrdPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatDscrdPkts indicates the number of multicast packets that matched this source group entry but were discarded. For (S,G) entries, if the traffic is getting forwarded on the SPT, the packets arriving from the RPT will be discarded.
forwardedOctets [Forwarded Octets] (vRtrPimNgGrpSrcStatFrddedOct)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrddedOct indicates the number of multicast octets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list.
forwardedPkts [Forwarded Pkts] (vRtrPimNgGrpSrcStatFrwdedPkts)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatFrwdedPkts indicates the number of multicast packets that were forwarded to the interfaces in the outgoing interface list. vRtrPimNgGrpSrcIfTable lists all the interfaces in the outgoing interface list. This packet count is calculated before ingress QoS policing or shaping is applied.

Table 228 pim statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rpfMismatches [Rpf Mismatches] (vRtrPimNgGrpSrcStatRPFMsmatch)	java. math. BigInteger	The value of vRtrPimNgGrpSrcStatRPFMsmatch indicates the number of multicast packets that matched this source group entry but they did not arrive on the the interface indicated by vRtrPimNgGrpSrcRpfIndex.

Table 229 ptp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PTPClockPacketStats</p> <p>MIB entry name: tmnxPtpClockPacketStatsEntry</p> <p>Entry description: The tmnxPtpClockPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpClockPacketStatsTable): The tmnxPtpClockPacketStatsTable consists of the packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPClock</p>		
ptpClkPktStatsAnnounce [Ptp Clk Pkt Stats Announce] (tmnxPtpClkPktStatsAnnounce)	long	The value of tmnxPtpClkPktStatsAnnounce indicates the accumulated packet statistics for PTP Announce messages.
ptpClkPktStatsDelayRequest [Ptp Clk Pkt Stats Delay Request] (tmnxPtpClkPktStatsDelayRequest)	long	The value of tmnxPtpClkPktStatsDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpClkPktStatsDelayResp [Ptp Clk Pkt Stats Delay Resp] (tmnxPtpClkPktStatsDelayResp)	long	The value of tmnxPtpClkPktStatsDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpClkPktStatsDirection [Ptp Clk Pkt Stats Direction] (tmnxPtpClkPktStatsDirection)	int	The value of tmnxPtpClkPktStatsDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpClkPktStatsDropAltMaster [Ptp Clk Pkt Stats Drop Alt Master] (tmnxPtpClkPktStatsDropAltMaster)	long	The value of tmnxPtpClkPktStatsDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsDropBadDomain [Ptp Clk Pkt Stats Drop Bad Domain] (tmnxPtpClkPktStatsDropBadDomain)	long	The value of tmnxPtpClkPktStatsDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOther [Ptp Clk Pkt Stats Drop Other] (tmnxPtpClkPktStatsDropOther)	long	The value of tmnxPtpClkPktStatsDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpClkPktStatsDropBadDomain', 'tmnxPtpClkPktStatsDropAltMaster', 'tmnxPtpClkPktStatsDropOutOfSeq', and 'tmnxPtpClkPktStatsDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropOutOfSeq [Ptp Clk Pkt Stats Drop Out Of Seq] (tmnxPtpClkPktStatsDropOutOfSeq)	long	The value of tmnxPtpClkPktStatsDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsDropPeerShut [Ptp Clk Pkt Stats Drop Peer Shut] (tmnxPtpClkPktStatsDropPeerShut)	long	The value of tmnxPtpClkPktStatsDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpClkPktStatsFollowUp [Ptp Clk Pkt Stats Follow Up] (tmnxPtpClkPktStatsFollowUp)	long	The value of tmnxPtpClkPktStatsFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpClkPktStatsOther [Ptp Clk Pkt Stats Other] (tmnxPtpClkPktStatsOther)	long	The value of tmnxPtpClkPktStatsOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpClkPktStatsOtherTLVs [Ptp Clk Pkt Stats Other TLVs] (tmnxPtpClkPktStatsOtherTLVs)	long	The value of tmnxPtpClkPktStatsOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsSignaling [Ptp Clk Pkt Stats Signaling] (tmnxPtpClkPktStatsSignaling)	long	The value of tmnxPtpClkPktStatsSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpClkPktStatsSync [Ptp Clk Pkt Stats Sync] (tmnxPtpClkPktStatsSync)	long	The value of tmnxPtpClkPktStatsSync indicates the accumulated packet statistics for PTP Sync messages.
ptpClkPktStatsUniAckCnclAnno [Ptp Clk Pkt Stats Uni Ack Cncl Anno] (tmnxPtpClkPktStatsUniAckCnclAnno)	long	The value of tmnxPtpClkPktStatsUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpClkPktStatsUniAckCnclDly [Ptp Clk Pkt Stats Uni Ack Cncl Dly] (tmnxPtpClkPktStatsUniAckCnclDly)	long	The value of tmnxPtpClkPktStatsUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.
ptpClkPktStatsUniAckCnclSync [Ptp Clk Pkt Stats Uni Ack Cncl Sync] (tmnxPtpClkPktStatsUniAckCnclSync)	long	The value of tmnxPtpClkPktStatsUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpClkPktStatsUniCancelAnno [Ptp Clk Pkt Stats Uni Cancel Anno] (tmnxPtpClkPktStatsUniCancelAnno)	long	The value of tmnxPtpClkPktStatsUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpClkPktStatsUniCancelDelay [Ptp Clk Pkt Stats Uni Cancel Delay] (tmnxPtpClkPktStatsUniCancelDelay)	long	The value of tmnxPtpClkPktStatsUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpClkPktStatsUniCancelSync [Ptp Clk Pkt Stats Uni Cancel Sync] (tmnxPtpClkPktStatsUniCancelSync)	long	The value of tmnxPtpClkPktStatsUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniDenyAnno [Ptp Clk Pkt Stats Uni Deny Anno] (tmnxPtpClkPktStatsUniDenyAnno)	long	The value of tmnxPtpClkPktStatsUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenyDelRsp [Ptp Clk Pkt Stats Uni Deny Del Rsp] (tmnxPtpClkPktStatsUniDenyDelRsp)	long	The value of tmnxPtpClkPktStatsUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniDenySync [Ptp Clk Pkt Stats Uni Deny Sync] (tmnxPtpClkPktStatsUniDenySync)	long	The value of tmnxPtpClkPktStatsUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpClkPktStatsUniGrantAnno [Ptp Clk Pkt Stats Uni Grant Anno] (tmnxPtpClkPktStatsUniGrantAnno)	long	The value of tmnxPtpClkPktStatsUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantDelRsp [Ptp Clk Pkt Stats Uni Grant Del Rsp] (tmnxPtpClkPktStatsUniGrantDelRsp)	long	The value of tmnxPtpClkPktStatsUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniGrantSync [Ptp Clk Pkt Stats Uni Grant Sync] (tmnxPtpClkPktStatsUniGrantSync)	long	The value of tmnxPtpClkPktStatsUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpClkPktStatsUniReqAnno [Ptp Clk Pkt Stats Uni Req Anno] (tmnxPtpClkPktStatsUniReqAnno)	long	The value of tmnxPtpClkPktStatsUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpClkPktStatsUniReqDelayRsp [Ptp Clk Pkt Stats Uni Req Delay Rsp] (tmnxPtpClkPktStatsUniReqDelayRsp)	long	The value of tmnxPtpClkPktStatsUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpClkPktStatsUniReqSync [Ptp Clk Pkt Stats Uni Req Sync] (tmnxPtpClkPktStatsUniReqSync)	long	The value of tmnxPtpClkPktStatsUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
PTPClockRecoveryEventStats MIB entry name: tmnxPtpClockRecoveryStatistics Supports realtime plotting Supports scheduled collection Monitored class: ptp.IEEEPTPClock		
tmnxPtpClockRecStatsDlyHiPktLss [Tmnx Ptp Clock Rec Stats Dly Hi Pkt Lss] (tmnxPtpClockRecStatsDlyHiPktLss)	long	The value of tmnxPtpClockRecStatsDlyHiPktLss indicates the number of times that the clock recovery process detected a large amount of packet loss in the delay request/response flow from the remote master clock. When this event occurs, the clock recovery process restarts.
tmnxPtpClockRecStatsDlyHighPDV [Tmnx Ptp Clock Rec Stats Dly High PDV] (tmnxPtpClockRecStatsDlyHighPDV)	long	The value of tmnxPtpClockRecStatsDlyHighPDV indicates the number of times that the clock recovery process has determined that a sample of delay request packets to the best master clock had too much packet delay variation to be useful in recovering the clock from the best master. When this event occurs, the entire sample of packets is not used in the clock recovery process.
tmnxPtpClockRecStatsDlyPktLoss [Tmnx Ptp Clock Rec Stats Dly Pkt Loss] (tmnxPtpClockRecStatsDlyPktLoss)	long	The value of tmnxPtpClockRecStatsDlyPktLoss indicates the number of times that the clock recovery process detected packet loss in the delay request/response packet flow from the best master clock.
tmnxPtpClockRecStatsDlyStep [Tmnx Ptp Clock Rec Stats Dly Step] (tmnxPtpClockRecStatsDlyStep)	long	The value of tmnxPtpClockRecStatsDlyStep indicates the number of times that the clock recovery process detected a large change in the amount of time taken for delay request packets to be sent to the best master clock. This normally occurs if the route taken by packets to the best master changes.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tmnxPtpClockRecStatsSyncHiPktLss [Tmnx Ptp Clock Rec Stats Sync Hi Pkt Lss] (tmnxPtpClockRecStatsSyncHiPktLss)	long	The value of tmnxPtpClockRecStatsSyncHiPktLss indicates the number of times that the clock recovery process detected a large amount of packet loss in the sync flow from the remote master clock. When this event occurs, the clock recovery process restarts.
tmnxPtpClockRecStatsSyncHighPDV [Tmnx Ptp Clock Rec Stats Sync High PDV] (tmnxPtpClockRecStatsSyncHighPDV)	long	The value of tmnxPtpClockRecStatsSyncHighPDV indicates the number of times that the clock recovery process has determined that a sample of sync packets from the best master clock had too much packet delay variation to be useful in recovering the clock from the best master. When this event occurs, the entire sample of packets is not used in the clock recovery process.
tmnxPtpClockRecStatsSyncPktLoss [Tmnx Ptp Clock Rec Stats Sync Pkt Loss] (tmnxPtpClockRecStatsSyncPktLoss)	long	The value of tmnxPtpClockRecStatsSyncPktLoss indicates the number of times that the clock recovery process detected packet loss in the sync packet flow from the best master clock.
tmnxPtpClockRecStatsSyncStep [Tmnx Ptp Clock Rec Stats Sync Step] (tmnxPtpClockRecStatsSyncStep)	long	The value of tmnxPtpClockRecStatsSyncStep indicates the number of times that the clock recovery process detected a large change in the amount of time taken for sync packets to be sent from the best master clock. This normally occurs if the route taken by packets from the best master changes.
PTPClockRecoveryStateStats MIB entry name: tmnxPtpClockRecoveryStatistics Supports realtime plotting Supports scheduled collection Monitored class: ptp.IEEEPTPClock		
tmnxPtpClockRecStatsAcquiring [Tmnx Ptp Clock Rec Stats Acquiring] (tmnxPtpClockRecStatsAcquiring)	java. math. BigInteger	The value of tmnxPtpClockRecStatsAcquiring indicate the number of seconds that the clock recovery system has been in the acquiring state.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tmnxPtpClockRecStatsHoldover [Tmnx Ptp Clock Rec Stats Holdover] (tmnxPtpClockRecStatsHoldover)	java. math. BigInteger	The value of tmnxPtpClockRecStatsHoldover indicate the number of seconds that the clock recovery system has been in the hold-over state.
tmnxPtpClockRecStatsInitial [Tmnx Ptp Clock Rec Stats Initial] (tmnxPtpClockRecStatsInitial)	java. math. BigInteger	The value of tmnxPtpClockRecStatsInitial indicates the number of seconds that the clock recovery system has been in the initial state.
tmnxPtpClockRecStatsLocked [Tmnx Ptp Clock Rec Stats Locked] (tmnxPtpClockRecStatsLocked)	java. math. BigInteger	The value of tmnxPtpClockRecStatsLocked indicate the number of seconds that the clock recovery system has been in the locked state.
tmnxPtpClockRecStatsPhaseTrack [Tmnx Ptp Clock Rec Stats Phase Track] (tmnxPtpClockRecStatsPhaseTrack)	java. math. BigInteger	The value of tmnxPtpClockRecStatsPhaseTrack indicate the number of seconds that the clock recovery system has been in the phase tracking state.
<p>PTPPeerPacketStats</p> <p>MIB entry name: tmnxPtpPeerPacketStatsEntry</p> <p>Entry description: The tmnxPtpPeerPacketStatsEntry contain the directional packet statistics for the Precision Time Protocol (PTP). Rows are created and destroyed by the system.</p> <p>Table description (for tmnxPtpPeerPacketStatsTable): The tmnxPtpPeerPacketStatsTable consists of the per peer packet statistics associated with the Precision Time Protocol (PTP).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ptp.IEEEPTPPeer</p>		
ptpPeerPktStatAnnounce [Ptp Peer Pkt Stat Announce] (tmnxPtpPeerPktStatAnnounce)	long	The value of tmnxPtpPeerPktStatAnnounce indicates the accumulated packet statistics for PTP Announce messages.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatDelayRequest [Ptp Peer Pkt Stat Delay Request] (tmnxPtpPeerPktStatDelayRequest)	long	The value of tmnxPtpPeerPktStatDelayRequest indicates the accumulated packet statistics for PTP Delay Request messages.
ptpPeerPktStatDelayResp [Ptp Peer Pkt Stat Delay Resp] (tmnxPtpPeerPktStatDelayResp)	long	The value of tmnxPtpPeerPktStatDelayResp indicates the accumulated packet statistics for PTP Delay Response messages.
ptpPeerPktStatDirection [Ptp Peer Pkt Stat Direction] (tmnxPtpPeerPktStatDirection)	int	The value of tmnxPtpPeerPktStatDirection specifies which direction the packet statistics for the particular row are accumulated.
ptpPeerPktStatDropAltMaster [Ptp Peer Pkt Stat Drop Alt Master] (tmnxPtpPeerPktStatDropAltMaster)	long	The value of tmnxPtpPeerPktStatDropAltMaster indicates the accumulated packet statistics for PTP packets dropped because the PTP header has the 'alternateMasterFlag' set. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropBadDomain [Ptp Peer Pkt Stat Drop Bad Domain] (tmnxPtpPeerPktStatDropBadDomain)	long	The value of tmnxPtpPeerPktStatDropBadDomain indicates the accumulated packet statistics for PTP packets dropped because the PTP domain indicated in the packet does not match the configured PTP domain. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOther [Ptp Peer Pkt Stat Drop Other] (tmnxPtpPeerPktStatDropOther)	long	The value of tmnxPtpPeerPktStatDropOther indicates the accumulated packet statistics for PTP packets dropped and not counted in the 'tmnxPtpPeerPktStatDropBadDomain', 'tmnxPtpPeerPktStatDropAltMaster', 'tmnxPtpPeerPktStatDropOutOfSeq', and 'tmnxPtpPeerPktStatDropPeerShut' objects. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatDropOutOfSeq [Ptp Peer Pkt Stat Drop Out Of Seq] (tmnxPtpPeerPktStatDropOutOfSeq)	long	The value of tmnxPtpPeerPktStatDropOutOfSeq indicates the accumulated packet statistics for PTP packets dropped because the packets were received out of sequence. This object is accumulated for the 'rx' direction only.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatDropPeerShut [Ptp Peer Pkt Stat Drop Peer Shut] (tmnxPtpPeerPktStatDropPeerShut)	long	The value of tmnxPtpPeerPktStatDropPeerShut indicates the accumulated packet statistics for PTP packets dropped because the packets were received from a PTP peer that has been administratively disabled. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatFollowUp [Ptp Peer Pkt Stat Follow Up] (tmnxPtpPeerPktStatFollowUp)	long	The value of tmnxPtpPeerPktStatFollowUp indicates the accumulated packet statistics for PTP Follow Up messages.
ptpPeerPktStatOther [Ptp Peer Pkt Stat Other] (tmnxPtpPeerPktStatOther)	long	The value of tmnxPtpPeerPktStatOther indicates the accumulated packet statistics for all other PTP messages. This object is accumulated in the 'rx' direction only.
ptpPeerPktStatOtherTLVs [Ptp Peer Pkt Stat Other TLVs] (tmnxPtpPeerPktStatOtherTLVs)	long	The value of tmnxPtpPeerPktStatOtherTLVs indicates the accumulated packet statistics for other PTP TLV signaling messages. This object is accumulated for the 'rx' direction only.
ptpPeerPktStatSignaling [Ptp Peer Pkt Stat Signaling] (tmnxPtpPeerPktStatSignaling)	long	The value of tmnxPtpPeerPktStatSignaling indicates the accumulated packet statistics for PTP signaling messages.
ptpPeerPktStatSync [Ptp Peer Pkt Stat Sync] (tmnxPtpPeerPktStatSync)	long	The value of tmnxPtpPeerPktStatSync indicates the accumulated packet statistics for PTP Sync messages.
ptpPeerPktStatUniAckCnclAnno [Ptp Peer Pkt Stat Uni Ack Cncl Anno] (tmnxPtpPeerPktStatUniAckCnclAnno)	long	The value of tmnxPtpPeerPktStatUniAckCnclAnno indicates the accumulated packet statistics for Unicast Acknowledge Cancel Announce TLVs.
ptpPeerPktStatUniAckCnclDly [Ptp Peer Pkt Stat Uni Ack Cncl Dly] (tmnxPtpPeerPktStatUniAckCnclDly)	long	The value of tmnxPtpPeerPktStatUniAckCnclDly indicates the accumulated packet statistics for Unicast Acknowledge Cancel Delay Response TLVs.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniAckCnclSync [Ptp Peer Pkt Stat Uni Ack Cncl Sync] (tmnxPtpPeerPktStatUniAckCnclSync)	long	The value of tmnxPtpPeerPktStatUniAckCnclSync indicates the accumulated packet statistics for Unicast Acknowledge Cancel Sync TLVs.
ptpPeerPktStatUniCancelAnno [Ptp Peer Pkt Stat Uni Cancel Anno] (tmnxPtpPeerPktStatUniCancelAnno)	long	The value of tmnxPtpPeerPktStatUniCancelAnno indicates the accumulated packet statistics for Unicast Cancel Announce TLVs.
ptpPeerPktStatUniCancelDelay [Ptp Peer Pkt Stat Uni Cancel Delay] (tmnxPtpPeerPktStatUniCancelDelay)	long	The value of tmnxPtpPeerPktStatUniCancelDelay indicates the accumulated packet statistics for Unicast Cancel Delay TLVs.
ptpPeerPktStatUniCancelSync [Ptp Peer Pkt Stat Uni Cancel Sync] (tmnxPtpPeerPktStatUniCancelSync)	long	The value of tmnxPtpPeerPktStatUniCancelSync indicates the accumulated packet statistics for Unicast Cancel Sync TLVs.
ptpPeerPktStatUniDenyAnno [Ptp Peer Pkt Stat Uni Deny Anno] (tmnxPtpPeerPktStatUniDenyAnno)	long	The value of tmnxPtpPeerPktStatUniDenyAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenyDelRsp [Ptp Peer Pkt Stat Uni Deny Del Rsp] (tmnxPtpPeerPktStatUniDenyDelRsp)	long	The value of tmnxPtpPeerPktStatUniDenyDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniDenySync [Ptp Peer Pkt Stat Uni Deny Sync] (tmnxPtpPeerPktStatUniDenySync)	long	The value of tmnxPtpPeerPktStatUniDenySync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was denied. The request was denied if the duration indicated in the TLV was zero.
ptpPeerPktStatUniGrantAnno [Ptp Peer Pkt Stat Uni Grant Anno] (tmnxPtpPeerPktStatUniGrantAnno)	long	The value of tmnxPtpPeerPktStatUniGrantAnno indicates the accumulated packet statistics for Unicast Grant Announce TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.

Table 229 ptp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ptpPeerPktStatUniGrantDelRsp [Ptp Peer Pkt Stat Uni Grant Del Rsp] (tmnxPtpPeerPktStatUniGrantDelRsp)	long	The value of tmnxPtpPeerPktStatUniGrantDelRsp indicates the accumulated packet statistics for Unicast Grant Delay Response TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniGrantSync [Ptp Peer Pkt Stat Uni Grant Sync] (tmnxPtpPeerPktStatUniGrantSync)	long	The value of tmnxPtpPeerPktStatUniGrantSync indicates the accumulated packet statistics for Unicast Grant Sync TLVs, where the request was granted. The request was granted if the duration indicated in the TLV was non-zero.
ptpPeerPktStatUniReqAnno [Ptp Peer Pkt Stat Uni Req Anno] (tmnxPtpPeerPktStatUniReqAnno)	long	The value of tmnxPtpPeerPktStatUniReqAnno indicates the accumulated packet statistics for Unicast Request Announce TLVs.
ptpPeerPktStatUniReqDelayRsp [Ptp Peer Pkt Stat Uni Req Delay Rsp] (tmnxPtpPeerPktStatUniReqDelayRsp)	long	The value of tmnxPtpPeerPktStatUniReqDelayRsp indicates the accumulated packet statistics for Unicast Request Delay Response TLVs.
ptpPeerPktStatUniReqSync [Ptp Peer Pkt Stat Uni Req Sync] (tmnxPtpPeerPktStatUniReqSync)	long	The value of tmnxPtpPeerPktStatUniReqSync indicates the accumulated packet statistics for Unicast Request Sync TLVs.
ptpPeerPktStatsTimeStampCpm [Ptp Peer Pkt Stats Time Stamp Cpm] (tmnxPtpPeerPktStatTimeStampCpm)	long	The value of tmnxPtpPeerPktStatTimeStampCpm indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the operating system kernel.
ptpPeerPktStatsTimeStampPort [Ptp Peer Pkt Stats Time Stamp Port] (tmnxPtpPeerPktStatTimeStampPort)	long	The value of tmnxPtpPeerPktStatTimeStampPort indicates the accumulated packet statistics for PTP event packets where the timestamp point is at the physical layer.

Table 230 rsvp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AuthenticationKeyStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Table 230 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
acks [Acks] (vRtrRsvplfStatRxAcks)	java. math. BigInteger	The total number of RSVP ACK messages received when refresh reduction is enabled on this RSVP interface.
bundles [Bundles] (vRtrRsvplfStatRxBundles)	java. math. BigInteger	The total number of RSVP bundled packets received on this RSVP interface. Bundled packets are sent when refresh reduction is enabled.
errorPackets [Error Packets] (vRtrRsvplfStatRxErrorPkts)	java. math. BigInteger	The total number of RSVP packets with errors received on this RSVP interface.
helloTimeout [Hello Timeout] (vRtrRsvplfStatHelloTimeout)	long	The total number of hello messages that timed out on this RSVP interface.
hellos [Hellos] (vRtrRsvplfStatRxHelloReqs)	java. math. BigInteger	The total number of RSVP HELLO REQ messages received on this RSVP interface.
packets [Packets] (vRtrRsvplfStatRxPkts)	java. math. BigInteger	The total number of error free RSVP packets received on this RSVP interface.
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.

Table 230 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.
totalPackets [Total Packets] (vRtrRsvplfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.

Table 230 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
RsvpInterfaceStats MIB entry name: vRtrRsvplfEntry Entry description: Each row entry in the vRtrRsvplfTable represents additional columns for attributes specific to the Nokia 7x50 SR RSVP implementation. Table description (for vRtrRsvplfTable): The vRtrRsvplfTable provides an extension of the rsvplfTable in the RSVP-MIB. Supports realtime plotting Supports scheduled collection Monitored class: rsvp.Interface		
activeReservations [Active Reservations] (vRtrRsvplfActiveReservationCount)	long	The total number of active RSVP sessions that have reserved bandwidth.
activeSessions [Active Sessions] (vRtrRsvplfActiveSessionCount)	long	The total number of active RSVP sessions on this interface. This count includes sessions that have requested bandwidth as well as sessions that have not requested any bandwidth.
bandwidth [Bandwidth] (vRtrRsvplfBandwidth)	long	The value of vRtrRsvplfBandwidth indicates the interface bandwidth in mega-bits per second (Mbps) for the RSVP protocol on this interface. This is typically the port Speed.
reservedBandwidth [Reserved Bandwidth] (vRtrRsvplfReservedBandwidth)	long	The value of vRtrRsvplfReservedBandwidth specifies the amount of bandwidth in mega-bits per second (Mbps) to reserved by the RSVP sessions on this interface. A value of zero (0) indicates that no bandwidth is reserved.
totalSessions [Total Sessions] (vRtrRsvplfTotalSessionCount)	long	The total number of RSVP sessions on this interface. This count includes sessions that are active as well as sessions that have been signalled but a response has not yet been received.

Table 230 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>RsvpInterfaceTransmitStats</p> <p>MIB entry name: vRtrRsvplfStatEntry</p> <p>Entry description: Each row entry represents an interface running the RSVP protocol within a virtual router. Entries in this table cannot be created and deleted via SNMP SET operations. An entry in this table is created by the agent when the RSVP protocol is configured on a virtual router interface. The entry is destroyed when RSVP is removed from the interface.</p> <p>Table description (for vRtrRsvplfStatTable): The vRtrRsvplfStatTable contains objects for reporting statistics associated with an interface running RSVP.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Interface</p>		
acks [Acks] (vRtrRsvplfStatRxAcks)	java. math. BigInteger	The total number of RSVP ACK messages received when refresh reduction is enabled on this RSVP interface.
bundles [Bundles] (vRtrRsvplfStatRxBundles)	java. math. BigInteger	The total number of RSVP bundled packets received on this RSVP interface. Bundled packets are sent when refresh reduction is enabled.
errorPackets [Error Packets] (vRtrRsvplfStatRxErrorPkts)	java. math. BigInteger	The total number of RSVP packets with errors received on this RSVP interface.
hellos [Hellos] (vRtrRsvplfStatRxHelloReqs)	java. math. BigInteger	The total number of RSVP HELLO REQ messages received on this RSVP interface.
packets [Packets] (vRtrRsvplfStatRxPkts)	java. math. BigInteger	The total number of error free RSVP packets received on this RSVP interface.

Table 230 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pathErrors [Path Errors] (vRtrRsvplfStatRxPathErrors)	java. math. BigInteger	The total number of RSVP PATH ERROR messages that have been transmitted on this RSVP interface.
pathTears [Path Tears] (vRtrRsvplfStatRxPathTears)	java. math. BigInteger	The total number of RSVP PATH TEAR messages that have been received on this RSVP interface.
paths [Paths] (vRtrRsvplfStatRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages that have been received on this RSVP interface.
refreshes [Refreshes] (vRtrRsvplfStatRxSRefreshes)	java. math. BigInteger	The total number of RSVP summary refresh, SREFRESH, messages received on this RSVP interface.
reserveConfirms [Reserve Confirms] (vRtrRsvplfStatRxResvConfirms)	java. math. BigInteger	The total number of RSVP RESV CONFIRM messages that have been received on this RSVP interface.
reserveErrors [Reserve Errors] (vRtrRsvplfStatRxResvErrors)	java. math. BigInteger	The total number of RSVP RESV ERROR messages that have been received on this RSVP interface.
reserveTears [Reserve Tears] (vRtrRsvplfStatRxResvTears)	java. math. BigInteger	The total number of RSVP RESV TEAR messages that have been received on this RSVP interface.
reserves [Reserves] (vRtrRsvplfStatRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages that have been received on this RSVP interface.

Table 230 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
totalPackets [Total Packets] (vRtrRsvpIfStatRxTotalPkts)	java. math. BigInteger	The total number of RSVP packets, including errors, received on this RSVP interface.
<p>RsvpSessionStats</p> <p>MIB entry name: vRtrRsvpSessionStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an RSVP session. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrRsvpSessionStatTable): The vRtrRsvpSessionStatTable contains statistics for an RSVP session.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rsvp.Session</p>		
detourAge [Detour Age] (vRtrRsvpSessionDetourAge)	long	vRtrRsvpSessionDetourAge is the age (i.e., time from creation till now) of this detour LSP in 10-millisecond periods.
detourTimeUp [Detour Time Up] (vRtrRsvpSessionDetourTimeUp)	long	vRtrRsvpSessionDetourTimeUp is the total time in 10-millisecond units that the detour LSP has been operational.
pathsReceived [Paths Received] (vRtrRsvpSessionRxPaths)	java. math. BigInteger	The total number of RSVP PATH messages received for this RSVP session.
pathsTransmitted [Paths Transmitted] (vRtrRsvpSessionTxPaths)	java. math. BigInteger	The total number of RSVP PATH messages transmitted for this RSVP session.

Table 230 rsvp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
refreshPathsReceived [Refresh Paths Received] (vRtrRsvpSessionRxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshPaths indicates the number of times PATH was refreshed using message ID from full PATH refresh or Srefresh message for this RSVP session.
refreshPathsTransmitted [Refresh Paths Transmitted] (vRtrRsvpSessionTxSrefreshPaths)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshPaths indicates the number of times PATH refresh for the session was sent as a part of a Srefresh message.
refreshReservesReceived [Refresh Reserves Received] (vRtrRsvpSessionRxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionRxSrefreshResvs indicates the number of times RESV was refreshed using message ID from full RESV refresh or Srefresh message for this RSVP session.
refreshReservesTransmitted [Refresh Reserves Transmitted] (vRtrRsvpSessionTxSrefreshResvs)	java. math. BigInteger	The value of vRtrRsvpSessionTxSrefreshResvs indicates the number of times RESV refresh for the session was sent as a part of a Srefresh message.
reservesReceived [Reserves Received] (vRtrRsvpSessionRxResvs)	java. math. BigInteger	The total number of RSVP RESV messages received for this RSVP session.
reservesTransmitted [Reserves Transmitted] (vRtrRsvpSessionTxResvs)	java. math. BigInteger	The total number of RSVP RESV messages transmitted for this RSVP session.

Table 231 rtr statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DhcpRelayStats</p> <p>MIB entry name: vRtrIfDHCPRelayStatsEntry</p> <p>Entry description: Each row entry represents information related to DHCP Relay statistics for a virtual router interface in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrIfDHCPRelayStatsTable): The vRtrIfDHCPRelayStatsTable contains the statistics for the DHCP Relay agent.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.DhcpRelayConfiguration • rtr.GrplfDhcpRelayCfg • rtr.SublIfDhcpRelayCfg 		
authPktsDiscarded [Auth Pkts Discarded] (vRtrIfDHCPRelayAuthPktsDiscarded)	long	vRtrIfDHCPRelayAuthPktsDiscarded indicates the total number of packets discarded because authentication was not successful.
authPktsSuccess [Auth Pkts Success] (vRtrIfDHCPRelayAuthPktsSuccess)	long	vRtrIfDHCPRelayAuthPktsSuccess indicates the total number of packets for which authentication was successful.
clientPacketsDiscarded [Client Packets Discarded] (vRtrIfDHCPRelayClientPktsDiscarded)	long	vRtrIfDHCPRelayClientPktsDiscarded indicates the total number of client packets discarded by the DHCP relay agent.
clientPacketsRelayed [Client Packets Relayed] (vRtrIfDHCPRelayClientPktsRelayed)	long	vRtrIfDHCPRelayClientPktsRelayed indicates the total number of client packets relayed by the DHCP relay agent.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
clientPktsProxLS [Client Pkts Prox LS] (vRtrIfDHCPRelayClientPktsProxLS)	long	vRtrIfDHCPRelayClientPktsProxLS indicates the total number of client packets proxied by the DHCP relay agent based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
clientPktsProxRad [Client Pkts Prox Rad] (vRtrIfDHCPRelayClientPktsProxRad)	long	vRtrIfDHCPRelayClientPktsProxRad indicates the total number of client packets proxied by the DHCP relay agent based on data received from a RADIUS server.
pktsGenForceRenew [Pkts Gen Force Renew] (vRtrIfDHCPRelayPktsGenForceRenew)	long	vRtrIfDHCPRelayPktsGenForceRenew indicates the total number of DHCP FORCERENEW messages spoofed by the DHCP relay agent to the DHCP clients.
pktsGenRelease [Pkts Gen Release] (vRtrIfDHCPRelayPktsGenRelease)	long	vRtrIfDHCPRelayPktsGenRelease indicates the total number of DHCP RELEASE messages spoofed by the DHCP relay agent to the DHCP server.
receivedMalformedPackets [Received Malformed Packets] (vRtrIfDHCPRelayRxMalformedPkts)	long	vRtrIfDHCPRelayRxMalformedPkts indicates the total number of malformed packets received by the DHCP relay agent.
receivedPackets [Received Packets] (vRtrIfDHCPRelayRxPkts)	long	vRtrIfDHCPRelayRxPkts indicates the total number of packets received by the DHCP relay agent.
receivedUntrustedPackets [Received Untrusted Packets] (vRtrIfDHCPRelayRxUntrustedPkts)	long	vRtrIfDHCPRelayRxUntrustedPkts indicates the total number of untrusted packets received by the DHCP relay agent.
serverPacketsDiscarded [Server Packets Discarded] (vRtrIfDHCPRelayServerPktsDiscarded)	long	vRtrIfDHCPRelayServerPktsDiscarded indicates the total number of server packets discarded by the DHCP relay agent.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
serverPacketsRelayed [Server Packets Relayed] (vRtrIfDHCPRelayServerPktsRelayed)	long	vRtrIfDHCPRelayServerPktsRelayed indicates the total number of server packets relayed by the DHCP relay agent.
serverPktsSnooped [Server Pkts Snooped] (vRtrIfDHCPRelayServerPktsSnooped)	long	vRtrIfDHCPRelayServerPktsSnooped indicates the total number of server packets snooped by the DHCP relay agent.
transmittedPackets [Transmitted Packets] (vRtrIfDHCPRelayTxPkts)	long	vRtrIfDHCPRelayTxPkts indicates the total number of packets transmitted by the DHCP relay agent.
<p>NetworkInterfaceIngressStats MIB entry name: vRtrNetIfIngressStatsEntry Entry description: Each row entry has statistics information for each router interface for each meter configured in the system. Table description (for vRtrNetIfIngressStatsTable): The vRtrNetIfIngressStatsTable has statistics entry for each router interface for each meter configured in the system. Supports realtime plotting Does not support scheduled collection Monitored class: rtr.NetworkInterface</p>		
ingressFwdInProfPkts [Ingress Fwd In Prof Pkts] (vRtrNetIfIngressFwdInProfPkts)	java. math. BigInteger	vRtrNetIfIngressFwdInProfPkts indicates the number of conforming network interface ingress packets forwarded on this router interface using this meter.
ingressFwdOutProfPkts [Ingress Fwd Out Prof Pkts] (vRtrNetIfIngressFwdOutProfPkts)	java. math. BigInteger	vRtrNetIfIngressFwdOutProfPkts indicates the number of exceeding network interface ingress packets forwarded on this router interface using this meter.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingressMeterIndex [Ingress Meter Index] (vRtrNetIfIngressMeterIndex)	long	vRtrNetIfIngressMeterIndex serves as the tertiary index. When used in conjunction with vRtrID and vRtrIfIndex, it uniquely identifies a network ingress meter for the specified router interface in the managed system.
<p>RouteStats</p> <p>MIB entry name: vRtrStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for a virtual router in the system. Entries cannot be created and deleted via SNMP SET operations.</p> <p>Table description (for vRtrStatTable): The vRtrStatTable has an entry for each virtual router configured in the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • rtr.VirtualRouter • vprn.DVRSSite • vprn.RoutingInstanceSite • vprn.Site 		
activeARPEntries [Active ARPEntries] (vRtrStatActiveARPEntries)	long	vRtrStatActiveARPEntries indicates the number of active ARP entries for the specified virtual router in the system.
aggregateActiveRoutes [Aggregate Active Routes] (vRtrAggregateActiveRoutes)	long	vRtrAggregateActiveRoutes indicates the current number of active aggregate routes for this instance of the route table.
aggregateRoutes [Aggregate Routes] (vRtrAggregateRoutes)	long	vRtrAggregateRoutes indicates the current number of aggregate routes for this instance of the route table.
bgpActiveRoutes [Bgp Active Routes] (vRtrBGPActiveRoutes)	long	vRtrBGPActiveRoutes indicates the current number of active bgp routes for this instance of the route table.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
bgpRoutes [Bgp Routes] (vRtrBGPRoutes)	long	vRtrBGPRoutes indicates the current number of bgp routes for this instance of the route table.
bgpVpnActiveRoutes [Bgp Vpn Active Routes] (vRtrStatBGPVpnActiveRoutes)	long	vRtrStatBGPVpnActiveRoutes indicates the current number of active VPN-IPV4 routes learned by MP-BGP for this virtual router.
bgpVpnRoutes [Bgp Vpn Routes] (vRtrStatBGPVpnRoutes)	long	vRtrStatBGPVpnRoutes indicates the current number of VPN-IPV4 routes learned by MP-BGP for this virtual router.
directActiveRoutes [Direct Active Routes] (vRtrDirectActiveRoutes)	long	vRtrDirectActiveRoutes indicates the current number of active direct routes for this instance of the route table.
directRoutes [Direct Routes] (vRtrDirectRoutes)	long	vRtrDirectRoutes indicates the current number of direct routes for this instance of the route table.
illegalLabelsReceived [Illegal Labels Received] (vRtrStatIllegalLabels)	long	vRtrStatIllegalLabels indicates the number of illegally received labels on this virtual router.
isisActiveRoutes [Isis Active Routes] (vRtrISISActiveRoutes)	long	vRtrISISActiveRoutes indicates the current number of active isis routes for this instance of the route table.
isisRoutes [Isis Routes] (vRtrISISRoutes)	long	vRtrISISRoutes indicates the current number of isis routes for this instance of the route table.
ldpActiveTunnels [Ldp Active Tunnels] (vRtrStatActiveLdpTunnels)	long	vRtrStatActiveLdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'ldp'.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ldpTunnels [Ldp Tunnels] (vRtrStatTotalLdpTunnels)	long	vRtrStatTotalLdpTunnels indicates the current number of both active and inactive LDP tunnels.
ospfActiveRoutes [Ospf Active Routes] (vRtrOSPFActiveRoutes)	long	vRtrOSPFActiveRoutes indicates the current number of active ospf routes for this instance of the route table.
ospfRoutes [Ospf Routes] (vRtrOSPFRoutes)	long	vRtrOSPFRoutes indicates the current number of ospf routes for this instance of the route table.
routerInterfacesActive [Router Interfaces Active] (vRtrStatActiveIfs)	long	vRtrStatActiveIfs indicates the current number of router interfaces with vRtrIfAdminState equal 'inService' on this virtual router.
routerInterfacesConfigured [Router Interfaces Configured] (vRtrStatConfiguredIfs)	long	vRtrStatConfiguredIfs indicates the current number of router interfaces configured on this virtual router.
routesInVrf [Routes In Vrf] (vRtrStatCurrNumRoutes)	long	vRtrStatCurrNumRoutes indicates the current number of routes in the VRF for this virtual router.
sdpActiveTunnels [Sdp Active Tunnels] (vRtrStatActiveSdpTunnels)	long	vRtrStatActiveSdpTunnels indicates the current number of rows in the vRtrInetTunnelTable where vRtrInetTunnelType has a value of 'sdp'.
sdpTunnels [Sdp Tunnels] (vRtrStatTotalSdpTunnels)	long	vRtrStatTotalSdpTunnels indicates the current number of both active and inactive SDP tunnels.
staticActiveRoutes [Static Active Routes] (vRtrStaticActiveRoutes)	long	vRtrStaticActiveRoutes indicates the current number of active static routes for this instance of the route table.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
staticRoutes [Static Routes] (vRtrStaticRoutes)	long	vRtrStaticRoutes indicates the current number of static routes for this instance of the route table.
totalARPEntries [Total ARPEntries] (vRtrStatTotalARPEntries)	long	vRtrStatTotalARPEntries indicates the total number of active and inactive ARP entries for the specified virtual router in the system.
<p>VirtualInterfaceIcmp6InStats MIB entry name: vRtrIflcmp6Entry Entry description: Each row entry represents the ICMP statistics of a virtual router interface. Entries are created and deleted when entries in the vRtrIfTable are created and deleted. Table description (for vRtrIflcmp6Table): The vRtrIflcmp6Table table contains statistics of ICMPv6 messages that are received and sourced by a router interface. Supports realtime plotting Supports scheduled collection Monitored class: rtr.VirtualInterfaceIcmp6Configuration</p>		
inDestinationUnreachable [In Destination Unreachable] (vRtrIflcmp6InDestUnreachs)	long	The value of vRtrIflcmp6InDestUnreachs indicates the number of ICMP Destination Unreachable messages received by this interface.
inEchoReplies [In Echo Replies] (vRtrIflcmp6InEchoReplies)	long	The value of vRtrIflcmp6InEchoReplies indicates the number of ICMP Echo Reply messages received by this interface.
inEchoRequests [In Echo Requests] (vRtrIflcmp6InEchos)	long	The value of vRtrIflcmp6InEchos indicates the number of ICMP Echo (request) messages received by this interface.
inErrors [In Errors] (vRtrIflcmp6InErrors)	long	The value of vRtrIflcmp6InErrors indicates the number of ICMP messages which this interface received but determined as having ICMP-specific errors (bad ICMP checksums, bad length , etc.).

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inNeighborAdvertisements [In Neighbor Advertisements] (vRtrIflcmp6InNbrAdvertisements)	long	The value of vRtrIflcmp6InNbrAdvertisements indicates the number of ICMP Neighbor Advertisement messages received by this interface.
inNeighborSolicits [In Neighbor Solicits] (vRtrIflcmp6InNbrSolicits)	long	The value of vRtrIflcmp6InNbrSolicits indicates the number of ICMP Neighbor Solicit messages received by this interface.
inPacketTooBig [In Packet Too Big] (vRtrIflcmp6InPktTooBigs)	long	The value of vRtrIflcmp6InPktTooBigs indicates the number of ICMP Packet Too Big messages received by this interface.
inRedirects [In Redirects] (vRtrIflcmp6InRedirects)	long	The value of vRtrIflcmp6InRedirects indicates number of ICMP Redirect messages received by this interface.
inRouterAdvertisements [In Router Advertisements] (vRtrIflcmp6InRtrAdvertisements)	long	The value of vRtrIflcmp6InRtrAdvertisements indicates the number of ICMP Router Advertisement messages received by this interface.
inRouterSolicits [In Router Solicits] (vRtrIflcmp6InRtrSolicits)	long	The value of vRtrIflcmp6InRtrSolicits indicates the number of ICMP Router Solicit messages received by this interface.
inTimeExceeded [In Time Exceeded] (vRtrIflcmp6InTimeExcds)	long	The value of vRtrIflcmp6InTimeExcds indicates the number of ICMP Time Exceeded messages received by this interface.
inTotalMessages [In Total Messages] (vRtrIflcmp6InMsgs)	long	The value of vRtrIflcmp6InMsgs indicates the total number of ICMP messages received by this interface which includes all those counted by vRtrIflcmp6InErrors. Note that this interface is the interface to which the ICMP messages were addressed which may not be necessarily the input interface for the messages.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>VirtualInterfaceIcmp6OutStats</p> <p>MIB entry name: vRtrIflcmp6Entry</p> <p>Entry description: Each row entry represents the ICMP statistics of a virtual router interface. Entries are created and deleted when entries in the vRtrIflTable are created and deleted.</p> <p>Table description (for vRtrIflcmp6Table): The vRtrIflcmp6Table table contains statistics of ICMPv6 messages that are received and sourced by a router interface.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: rtr.VirtualInterfaceIcmp6Configuration</p>		
outDestinationUnreachable [Out Destination Unreachable] (vRtrIflcmp6OutDestUnreachs)	long	The value of vRtrIflcmp6OutDestUnreachs indicates the number of ICMP Destination Unreachable messages sent by this interface.
outEchoReplies [Out Echo Replies] (vRtrIflcmp6OutEchoReplies)	long	The value of vRtrIflcmp6OutEchoReplies indicates the number of ICMP Echo Reply messages sent by this interface.
outEchoRequests [Out Echo Requests] (vRtrIflcmp6OutEchos)	long	The value of vRtrIflcmp6OutEchos indicates the number of ICMP Echo Request messages sent by this interface.
outErrors [Out Errors] (vRtrIflcmp6OutErrors)	long	The value of vRtrIflcmp6OutErrors indicates the number of ICMP messages which this interface did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of VRtr IPv6 to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter's value.
outGrpMembQueries [Out Grp Memb Queries] (vRtrIflcmp6OutGrpMembQueries)	long	The value of vRtrIflcmp6OutGrpMembQueries indicates the number of ICMP Group Membership Query messages sent by this interface.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outGrpMembReductions [Out Grp Memb Reductions] (vRtrIfIcmp6OutGrpMembReductions)	long	The value of vRtrIfIcmp6OutGrpMembReductions indicates the number of ICMP Group Membership Reduction messages sent by this interface.
outGrpMembResponses [Out Grp Memb Responses] (vRtrIfIcmp6OutGrpMembResponses)	long	The value of vRtrIfIcmp6OutGrpMembResponses indicates the number of ICMP Group Membership Response messages sent by this interface.
outNeighborAdvertisements [Out Neighbor Advertisements] (vRtrIfIcmp6OutNbrAdvertisements)	long	The value of vRtrIfIcmp6OutNbrAdvertisements indicates the number of ICMP Neighbor Advertisement messages sent by this interface.
outNeighborSolicits [Out Neighbor Solicits] (vRtrIfIcmp6OutNbrSolicits)	long	The value of vRtrIfIcmp6OutNbrSolicits indicates the number of ICMP Neighbor Solicitation messages sent by this interface.
outPacketTooBig [Out Packet Too Big] (vRtrIfIcmp6OutPktTooBigs)	long	The value of vRtrIfIcmp6OutPktTooBigs indicates the number of ICMP Packet Too Big messages sent by this interface.
outRedirects [Out Redirects] (vRtrIfIcmp6OutRedirects)	long	The value of vRtrIfIcmp6OutRedirects indicates the number of ICMP Redirect messages sent by this interface.
outRouterAdvertisements [Out Router Advertisements] (vRtrIfIcmp6OutRtrAdvertisements)	long	The value of vRtrIfIcmp6OutRtrAdvertisements indicates the number of ICMP Router Advertisement messages sent by this interface.
outRouterSolicits [Out Router Solicits] (vRtrIfIcmp6OutRtrSolicits)	long	The value of vRtrIfIcmp6OutRtrSolicits indicates the number of ICMP Router Solicitation messages sent by this interface.
outTimeExceeded [Out Time Exceeded] (vRtrIfIcmp6OutTimeExcds)	long	The value of vRtrIfIcmp6OutTimeExcds indicates the number of ICMP Time Exceeded messages sent by this interface.

Table 231 rtr statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outTotalMessages [Out Total Messages] (vRtrIfIcmp6OutMsgs)	long	The value of vRtrIfIcmp6OutMsgs indicates the total number of ICMP messages which this interface attempted to send. Note that this counter includes all those counted by icmpOutErrors.

Table 232 sas statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DelayTCAStats</p> <p>MIB entry name: tmnxOamPmStsTcaDelayEntry</p> <p>Entry description: tmnxOamPmStsTcaDelayEntry contains the OAM-PM delay TCA statistics for the combination of an OAM-PM session name, test type, bin type, and direction (e.g. {'oam_pm_sess_1', 'dmm(1)', 'ifdv(3)', 'twoWay(3)}'). Nine rows are created/destroyed in this table when a delay test is created/destroyed. A delay test is created/destroyed using tmnxOamPmCfgDelayDmmRowStatus or tmnxOamPmCfgTwampLtRowStatus. The nine rows are indexed by the session name, the test type, and the nine combinations of bin type and direction.</p> <p>Table description (for tmnxOamPmStsTcaDelayTable): tmnxOamPmStsTcaDelayTable contains statistics for delay-based OAM-PM Threshold Crossing Alerts (TCAs).</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ethernetOam.CfmDmmSession • sas.TWLSession 		
active [Active] (tmnxOamPmStsTcaDelayOperState)	int	The value of tmnxOamPmStsTcaDelayOperState indicates the operational state of delay-based TCAs for the specified indices.
direction [Direction] (tmnxOamPmCfgForwardBackward2Way)	int	The value of tmnxOamPmCfgForwardBackward2Way specifies the direction of the row to be configured or read.
lastTime [Last Time] (tmnxOamPmStsTcaDelayLastTime)	String	The value of tmnxOamPmStsTcaDelayLastTime indicates the UTC date and time at the start of the measurement interval which generated the most recent delay-based Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no TCAs have been generated for the specified indices since system start up.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>LossTCAAStats</p> <p>MIB entry name: tmnxOamPmStsTcaLossFwBwAgEntry</p> <p>Entry description: tmnxOamPmStsTcaLossFwBwAgEntry contains the TCA statistics for the forward, backward, or aggregate direction of one OAM-PM loss test. For example, a row may contain TCA statistics for the forward direction for the SLM test belonging to OAM-PM session OAM_PM_Eth_session_1.</p> <p>Table description (for tmnxOamPmStsTcaLossFwBwAgTable): tmnxOamPmStsTcaLossFwBwAgTable contains statistics for loss-based OAM-PM Threshold Crossing Alerts (TCAs). The subset of the TCA loss statistics that are kept in the forward, backward, and aggregate directions is available using this table.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ethernetOam.CfmLmmSession • ethernetOam.CfmSlmSession • sas.TWLSession 		
chliActive [Chli Active] (tmnxOamPmStsTcaLossChliOperState)	int	The value of tmnxOamPmStsTcaLossChliOperState indicates the operational state of Consecutive High Loss Interval (CHLI) TCAs for the specified indices.
chliLastTime [Chli Last Time] (tmnxOamPmStsTcaLossChliLastTime)	String	The value of tmnxOamPmStsTcaLossChliLastTime indicates the UTC date and time at the start of the measurement interval which generated the most recent Consecutive High Loss Interval (CHLI) Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no CHLI TCAs have been generated for the specified indices since system start up.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
hliActive [Hli Active] (tmnxOamPmStsTcaLossHliOperState)	int	The value of tmnxOamPmStsTcaLossHliOperState indicates the operational state of High Loss Interval (HLI) TCAs for the specified indices.
hliLastTime [Hli Last Time] (tmnxOamPmStsTcaLossHliLastTime)	String	The value of tmnxOamPmStsTcaLossHliLastTime indicates the UTC date and time at the start of the measurement interval which generated the most recent High Loss Interval (HLI) Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no HLI TCAs have been generated for the specified indices since system start up.
unavlIndActive [Unavl Ind Active] (tmnxOamPmStsTcaLossUnavlIndOprSt)	int	The value of tmnxOamPmStsTcaLossUnavlIndOprSt indicates the operational state of Unavailability Indicator TCAs for the specified indices.
unavlIndLastTime [Unavl Ind Last Time] (tmnxOamPmStsTcaLossUnavlIndLTime)	String	The value of tmnxOamPmStsTcaLossUnavlIndLTime indicates the UTC date and time at the start of the measurement interval which generated the most recent Unavailability Indicator Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no Unavailability Indicator TCAs have been generated for the specified indices since system start up.
undtAvlActive [Undt Avl Active] (tmnxOamPmStsTcaLossUndtAvlOperSt)	int	The value of tmnxOamPmStsTcaLossUndtAvlOperSt indicates the operational state of Undetermined Availability Indicator TCAs for the specified indices.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
undtAvlLastTime [Undt Avl Last Time] (tmnxOamPmStsTcaLossUndtAvlLTime)	String	The value of tmnxOamPmStsTcaLossUndtAvlLTime indicates the UTC date and time at the start of the measurement interval which generated the most recent Undetermined Availability Indicator Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no Undetermined Availability Indicator TCAs have been generated for the specified indices since system start up.
undtUnavlActive [Undt Unavl Active] (tmnxOamPmStsTcaLossUndtUnavlOpSt)	int	The value of tmnxOamPmStsTcaLossUndtUnavlOpSt indicates the operational state of Undetermined Unavailability Indicator TCAs for the specified indices.
undtUnavlLastTime [Undt Unavl Last Time] (tmnxOamPmStsTcaLossUndtUnavlLTim)	String	The value of tmnxOamPmStsTcaLossUndtUnavlLTim indicates the UTC date and time at the start of the measurement interval which generated the most recent Undetermined Unavailability Indicator Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no Undetermined Unavailability Indicator TCAs have been generated for the specified indices since system start up.

Table 232 sas statistics (continued)

For example, a row may contain TCA statistics for the forward direction for the SLM test belonging to OAM-PM session OAM_PM_Eth_session_1.</p> <p>Table description (for tmnxOamPmStsTcaLossFwBwTable): tmnxOamPmStsTcaLossFwBwTable contains statistics for loss-based OAM-PM Threshold Crossing Alerts (TCAs). The subset of the TCA loss statistics that are kept in the forward and backward directions is available using this table.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ethernetOam.CfmLmmSession • ethernetOam.CfmSlmSession • sas.TWLSession 		
flrActive [Flr Active] (tmnxOamPmStsTcaLossAvgFlrOperSt)	int	The value of tmnxOamPmStsTcaLossAvgFlrOperSt indicates the operational state of Average Frame Loss Ratio (FLR) TCAs for the specified indices.
flrLastTime [Flr Last Time] (tmnxOamPmStsTcaLossAvgFlrLstTime)	String	The value of tmnxOamPmStsTcaLossAvgFlrLstTime indicates the UTC date and time at the start of the measurement interval which generated the most recent Average Frame Loss Ratio (FLR) Raise or Clear TCA for the specified indices. Measurement interval start times are reported using tmnxOamPmStsBaseStartTime. The TCAs are tmnxOamPmThrRaise and tmnxOamPmThrClear. DateAndTime.year = 0 is returned if no Average FLR TCAs have been generated for the specified indices since system start up.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PmSessionBaseStats</p>		
<p>MIB entry name: tmnxOamPmStsBaseEntry</p>		
<p>Entry description: tmnxOamPmStsBaseEntry contains the base statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a test is started (e.g. using tmnxOamPmCfgDelayDmmAdminStatus and tmnxOamPmCfgDelayDmmOnDmndStatus). At that time, a row for the current interval (with the index value tmnxOamPmStsIntvlNum=1) is created for each row with a matching session name in tmnxOamPmCfgMeasIntvlTable. In addition, a row is created in this table for the test's 'miRaw(1)' interval. After that, the timed creation and destruction of rows in this table is explained using the following example. Suppose the configured number of intervals to be retained is as follows (where index columns are underlined with octothorpes, and 'tmnxOamPm' is abbreviated as '_'): <u>_CfgSessName</u> <u>_CfgMeasIntvlDuration</u> <u>_CfgMeasIntvlsStored</u> ##### ##### 'mySess1' 'mi15Minutes(2)' 3 Suppose statistics collection started at t = 0 (minutes). Suppose the following rows exist in tmnxOamPmStsBaseTable at t = 59 (minutes): <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 1 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 The interval numbers are assigned as follows: 1 - the historical interval ended at t = 15 minutes 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the current interval Then, after the next 15 minute interval ends (e.g. at t = 61 minutes), the following rows will exist: <u>_CfgSessName</u> <u>_StsBaseTestType</u> <u>_StsIntvlDuration</u> <u>_StsIntvlNum</u> ##### ##### 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 2 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 3 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 4 'mySess1' 'dmm(1)' 'mi15Minutes(2)' 5 The interval numbers are assigned as follows: 2 - the historical interval ended at t = 30 minutes 3 - the historical interval ended at t = 45 minutes 4 - the historical interval ended at t = 60 minutes 5 - the current interval The row with interval number 1 was destroyed, because tmnxOamPmCfgMeasIntvlsStored=3 specifies that at most three historical intervals be retained. Rows are also destroyed in this table when the corresponding tmnxOamPmCfgMeasIntvlTable row is destroyed. When the index value tmnxOamPmStsMeasIntvlDuration is 'miRaw(1)', only one interval is available (i.e. tmnxOamPmStsIntvlNum = 1). When a test is running, the measurement interval data set for a test's 'miRaw(1)' measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. The change to the objects in the specified row is as follows. Object Change on Clear Operation tmnxOamPmStsBaseOperStatus No change tmnxOamPmStsBaseSuspect Set to 'true(1)' tmnxOamPmStsBaseStartTime Set to UTC time of the clear operation tmnxOamPmStsBaseElapsedTime Set to zero tmnxOamPmStsBaseTestFramesTx Set to zero tmnxOamPmStsBaseTestFramesRx Set to zero Measurement interval data sets for measurement interval durations other than 'miRaw(1)' cannot be cleared.</p>		
<p>Table description (for tmnxOamPmStsBaseTable): tmnxOamPmStsBaseTable contains the base statistics for OAM Performance Monitoring Measurement Interval Data Sets. The statistics in this table are common to all test types (e.g. DMM and SLM tests).</p>		
<p>Supports realtime plotting</p>		
<p>Supports scheduled collection</p>		
<p>Monitored classes:</p>		
<ul style="list-style-type: none"> • ethernetoam.CfmDmmSession • ethernetoam.CfmLmmSession • ethernetoam.CfmSlmSession 		

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmStatsElapsedTime [Pm Stats Elapsed Time] (tmnxOamPmStsBaseElapsedTime)	long	The value of tmnxOamPmStsBaseElapsedTime indicates the time elapsed since data collection started for the specified measurement interval data set.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
pmStatsOperStatus [Pm Stats Oper Status] (tmnxOamPmStsBaseOperStatus)	int	The value of tmnxOamPmStsBaseOperStatus indicates the operational status of the specified measurement interval data set. If the interval is historical and the operational status is 'inprogress(1)', the interval is closing (i.e. waiting for a response for the final test request sent).
pmStatsPduRx [Pm Stats Pdu Rx] (tmnxOamPmStsBaseTestFramesRx)	long	The value of tmnxOamPmStsBaseTestFramesRx indicates the number of test frames received for the specified measurement interval data set.
pmStatsPduTx [Pm Stats Pdu Tx] (tmnxOamPmStsBaseTestFramesTx)	long	The value of tmnxOamPmStsBaseTestFramesTx indicates the number of test frames sent for the specified measurement interval data set.
pmStatsStartTime [Pm Stats Start Time] (tmnxOamPmStsBaseStartTime)	String	The value of tmnxOamPmStsBaseStartTime indicates the start time (in UTC) of the specified measurement interval data set.
pmStatsSuspect [Pm Stats Suspect] (tmnxOamPmStsBaseSuspect)	boolean	The value of tmnxOamPmStsBaseSuspect indicates whether or not the specified measurement interval data set contains suspect information.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsTestType [Pm Stats Test Type] (tmnxOamPmStsBaseTestType)	int	The value of tmnxOamPmStsBaseTestType specifies the type of test for which statistics are to be read (e.g. 'dmm(1)').
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
<p>PrefixSrvStats</p> <p>MIB entry name: tmnxTwampSrvPrefixEntry</p> <p>Entry description: tmnxTwampSrvPrefixEntry contains the TWAMP server configuration information for the IP prefix specified by the index values. Rows in this table are created and destroyed using the tmnxTwampSrvPrefixRowStatus object.</p> <p>Table description (for tmnxTwampSrvPrefixTable): tmnxTwampSrvPrefixTable contains per-prefix TWAMP server configuration information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
srvPfxConnCount [Srv Pfx Conn Count] (tmnxTwampSrvPfxConnCount)	long	The value of tmnxTwampSrvPfxConnCount indicates, for the prefix specified by the index values, the number of control connections currently managed by the TWAMP server.
srvPfxConnsRejected [Srv Pfx Conns Rejected] (tmnxTwampSrvPfxConnsRejected)	long	The value of tmnxTwampSrvPfxConnsRejected indicates, for the prefix specified by the index values, the number of control connection requests which have been rejected by the TWAMP server. An example reject reason: the prefix's limit on the number of active connections has been reached.
srvPfxSessionCount [Srv Pfx Session Count] (tmnxTwampSrvPfxSessionCount)	long	The value of tmnxTwampSrvPfxSessionCount indicates, for the prefix specified by the index values, the number of currently in-progress TWAMP test sessions.
srvPfxTestPacketsRx [Srv Pfx Test Packets Rx] (tmnxTwampSrvPfxTestPacketsRx)	long	The value of tmnxTwampSrvPfxTestPacketsRx indicates, for the prefix specified by the index values, the number of TWAMP test packets received by the TWAMP server.
srvPfxTestPacketsTx [Srv Pfx Test Packets Tx] (tmnxTwampSrvPfxTestPacketsTx)	long	The value of tmnxTwampSrvPfxTestPacketsTx indicates, for the prefix specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
srvPfxTestSessAbort [Srv Pfx Test Sess Abort] (tmnxTwampSrvPfxTestSessAbort)	long	The value of tmnxTwampSrvPfxTestSessAbort indicates, for the prefix specified by the index values, the number of test sessions aborted by the TWAMP server.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
srvPfxTestSessCompleted [Srv Pfx Test Sess Completed] (tmnxTwampSrvPfxTestSessCompleted)	long	The value of tmnxTwampSrvPfxTestSessCompleted indicates, for the prefix specified by the index values, the number of test sessions completed by the TWAMP server.
srvPfxTestSessRejected [Srv Pfx Test Sess Rejected] (tmnxTwampSrvPfxTestSessRejected)	long	The value of tmnxTwampSrvPfxTestSessRejected indicates, for the prefix specified by the index values, the number of test sessions rejected by the TWAMP server.
<p>SrvConnsStats</p> <p>MIB entry name: tmnxTwampSrvConnStatsEntry</p> <p>Entry description: tmnxTwampSrvConnStatsEntry contains the statistics for the TWAMP control connection specified by the index values. A row is created by the system when a TWAMP control connection is established.</p> <p>Table description (for tmnxTwampSrvConnStatsTable): tmnxTwampSrvConnStatsTable contains the statistics for each active control connection managed by the TWAMP server.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.PrefixSrv</p>		
clientAddr [Client Addr] (tmnxTwampSrvConnClientAddr)	String	The value of tmnxTwampSrvConnClientAddr specifies the TWAMP client's address. This is the fifth index for tmnxTwampSrvConnStatsTable.
clientAddrType [Client Addr Type] (tmnxTwampSrvConnClientAddrType)	int	The value of tmnxTwampSrvConnClientAddrType specifies the type of tmnxTwampSrvConnClientAddr. This is the fourth index for tmnxTwampSrvConnStatsTable.
connIdleTime [Conn Idle Time] (tmnxTwampSrvConnIdleTime)	long	The value of tmnxTwampSrvConnIdleTime specifies the elapsed time, in seconds, since a TWAMP message was received on this control connection. When this value exceeds tmnxTwampSrvInactTimeout, the connection will be torn down.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
connSessionCount [Conn Session Count] (tmnxTwampSrvConnSessionCount)	long	The value of tmnxTwampSrvConnSessionCount indicates, for the connection specified by the index values, the number of currently in-progress TWAMP test sessions.
connState [Conn State] (tmnxTwampSrvConnState)	int	The value of tmnxTwampSrvConnState indicates the operational state of a control connection managed by the TWAMP server. Code points: setUp(1) - the connection is being established ready(2) - the connection is ready to accept test sessions running(3) - the connection is running a test.
connTestPacketsRx [Conn Test Packets Rx] (tmnxTwampSrvConnTestPacketsRx)	long	The value of tmnxTwampSrvConnTestPacketsRx indicates, for the connection specified by the index values, the number of TWAMP test packets received by the TWAMP server.
connTestPacketsTx [Conn Test Packets Tx] (tmnxTwampSrvConnTestPacketsTx)	long	The value of tmnxTwampSrvConnTestPacketsTx indicates, for the connection specified by the index values, the number of TWAMP test packets sent by the TWAMP server.
connTestSessComplete [Conn Test Sess Complete] (tmnxTwampSrvConnTestSessComplete)	long	The value of tmnxTwampSrvConnTestSessComplete indicates, for the connection specified by the index values, the number of test sessions completed by the TWAMP server.
connTestSessRejected [Conn Test Sess Rejected] (tmnxTwampSrvConnTestSessRejected)	long	The value of tmnxTwampSrvConnTestSessRejected indicates, for the connection specified by the index values, the number of test sessions rejected by the TWAMP server.
prefixAddr [Prefix Addr] (tmnxTwampSrvPrefixAddr)	String	The value of tmnxTwampSrvPrefixAddr specifies, in conjunction with tmnxTwampSrvPrefixAddrType and tmnxTwampSrvPrefixLen, a prefix to be matched against a TWAMP client address. This is the second index for tmnxTwampSrvPrefixTable.
prefixAddrType [Prefix Addr Type] (tmnxTwampSrvPrefixAddrType)	int	The value of tmnxTwampSrvPrefixAddrType specifies the type of tmnxTwampSrvPrefixAddr. This is the first index for tmnxTwampSrvPrefixTable.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixLen [Prefix Len] (tmnxTwampSrvPrefixLen)	int	The value of tmnxTwampSrvPrefixLen specifies the number of bits to match when comparing a TWAMP client address in an incoming message to tmnxTwampSrvPrefixAddr. This is the third index for tmnxTwampSrvPrefixTable. Best-fit is used when matching a TWAMP client's IP address against the set of configured prefixes. For example, suppose the first row of this table has the prefix 138.120.0.0/16, and the second row has the prefix 138.120.214.0/24. The TWAMP client address 138.120.214.52 matches the second row.
seqNum [Seq Num] (tmnxTwampSrvConnSeqNum)	int	The value of tmnxTwampSrvConnSeqNum specifies this control connection's sequence number. This is the sixth index for tmnxTwampSrvConnStatsTable - it allows n>1 rows (i.e. n>1 connections) for one client.
<p>TWLBinStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlBinEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlBinEntry contains the TWAMP-Light frame delay per-bin statistics for one OAM Performance Monitoring Measurement Interval Data Set. Rows are created in this table when a corresponding row is created in tmnxOamPmStsDelayTwlTable. If the tmnxOamPmStsDelayTwlTable row is created with the index value tmnxOamPmCfgBinType = 'fd(1)', then the the number of rows created in this table is tmnxOamPmCfgBinGroupFdBinCount. Similarly, 'fdr(2)' and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsDelayTwlTable row is destroyed. When a test is running, the TWAMP-Light statistics for a test's raw (i.e. 'miRaw(1)') measurement interval duration can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session..</p> <p>Table description (for tmnxOamPmStsDelayTwlBinTable): tmnxOamPmStsDelayTwlBinTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay per-bin statistics. The frame delay per-bin statistics kept for TWAMP-Light tests are the same as the frame delay per-bin statistics specified for Ethernet DMM (Delay Measurement Message) tests in MEF-35 requirement R66.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TWLBin</p>		

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBinBwdCount [Delay Twl Bin Bwd Count] (tmnxOamPmStsDelayTwlBinBwdCount)	long	The value of tmnxOamPmStsDelayTwlBinBwdCount indicates the number of TWAMP-Light frame delay measurements in the backward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the backward direction in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinFwdCount [Delay Twl Bin Fwd Count] (tmnxOamPmStsDelayTwlBinFwdCount)	long	The value of tmnxOamPmStsDelayTwlBinFwdCount indicates the number of TWAMP-Light frame delay measurements in the forward direction that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 9 Then, the value of this object indicates the number of TWAMP-Light frame delay measurements (in microseconds) in the forward direction in the first interval of 'twlSess1' that fit in the highest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
delayTwlBinNum [Delay Twl Bin Num] (tmnxOamPmStsDelayTwlBinNum)	long	The value of tmnxOamPmStsDelayTwlBinNum specifies the bin number of the statistics to be read.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBintwowayCount [Delay Twl Bintwoway Count] (tmnxOamPmStsDelayTwlBin2wyCount)	long	The value of tmnxOamPmStsDelayTwlBin2wyCount indicates the number of TWAMP-Light two-way frame delay measurements that fall within the configured range (in microseconds) of the specified bin. For example, suppose the index values for this object are as follows (where the index names are abbreviated, and index columns are underlined with octothorpes). <u>_SessName</u> <u>_IntvlDuration</u> <u>_IntvlNum</u> <u>_BinType</u> <u>_BinNum</u> ##### ##### ##### 'twlSess1' 'mi15Minutes(2)' 1 'fd(1)' 0 Then, the value of this object indicates the number of TWAMP-Light two-way frame delay measurements (in microseconds) in the first interval of 'twlSess1' that fit in the lowest configured delay range (as configured using tmnxOamPmCfgBinLowerBound).
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TWLSessionStats</p> <p>MIB entry name: tmnxOamPmStsDelayTwlEntry</p> <p>Entry description: tmnxOamPmStsDelayTwlEntry contains the TWAMP-Light frame delay summary statistics for one OAM Performance Monitoring Measurement Interval Data Set. When a row is created in tmnxOamPmStsBaseTable with tmnxOamPmStsBaseTestType = 'twampLight(3)' (provided tmnxOamPmCfgTwampLtCollectStats is 'collectDelayStats(1)' or 'collectDelayAndLossStats(3)'), three rows are created in this table. The three rows have the following values in the tmnxOamPmCfgBinType index column: 'fd(1)', 'fdr(2)', and 'ifdv(3)'. Rows are destroyed in this table when the corresponding tmnxOamPmStsBaseTable row is destroyed. When a TWAMP-Light test is running, all the test's raw statistics can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsDelayTwlTable): tmnxOamPmStsDelayTwlTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame delay summary statistics. delayTwl2wyAvg [Delay Twl 2 wy Avg] (tmnxOamPmStsDelayTwl2wyAvg)	long	The value of tmnxOamPmStsDelayTwl2wyAvg indicates the average two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMax [Delay Twl 2 wy Max] (tmnxOamPmStsDelayTwl2wyMax)	long	The value of tmnxOamPmStsDelayTwl2wyMax indicates the maximum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwl2wyMin [Delay Twl 2 wy Min] (tmnxOamPmStsDelayTwl2wyMin)	long	The value of tmnxOamPmStsDelayTwl2wyMin indicates the minimum two-way delay for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
delayTwlBwdAvg [Delay Twl Bwd Avg] (tmnxOamPmStsDelayTwlBwdAvg)	long	The value of tmnxOamPmStsDelayTwlBwdAvg indicates the average delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMax [Delay Twl Bwd Max] (tmnxOamPmStsDelayTwlBwdMax)	long	The value of tmnxOamPmStsDelayTwlBwdMax indicates the maximum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlBwdMin [Delay Twl Bwd Min] (tmnxOamPmStsDelayTwlBwdMin)	long	The value of tmnxOamPmStsDelayTwlBwdMin indicates the minimum delay in the backward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdAvg [Delay Twl Fwd Avg] (tmnxOamPmStsDelayTwlFwdAvg)	long	The value of tmnxOamPmStsDelayTwlFwdAvg indicates the average delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMax [Delay Twl Fwd Max] (tmnxOamPmStsDelayTwlFwdMax)	long	The value of tmnxOamPmStsDelayTwlFwdMax indicates the maximum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
delayTwlFwdMin [Delay Twl Fwd Min] (tmnxOamPmStsDelayTwlFwdMin)	long	The value of tmnxOamPmStsDelayTwlFwdMin indicates the minimum delay in the forward direction for the specified session, interval duration (e.g. 'mi15Minutes(2)'), interval number, and bin type (e.g. 'fd(1)').
intervalDuration [Interval Duration] (tmnxOamPmStsMeasIntvlDuration)	int	The value of tmnxOamPmStsMeasIntvlDuration specifies the duration of the interval of the statistics to be read (e.g. 'mi15Minutes(2)').
pmBinType [Pm Bin Type] (tmnxOamPmCfgBinType)	int	The value of tmnxOamPmCfgBinType specifies the type of the bin to be configured or read.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmStatsIntervalNum [Pm Stats Interval Num] (tmnxOamPmStsIntvlNum)	long	The value of tmnxOamPmStsIntvlNum specifies the interval number of the statistics to be read. The system's creation and destruction of interval numbers is described in the tmnxOamPmStsBaseEntry DESCRIPTION clause.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.
TwampSrvStats MIB entry name: tmnxTwampStatisticsScalarObjs Supports realtime plotting Supports scheduled collection Monitored class: sas.TwampSrv		
twampSrvConnectionCount [Twamp Srv Connection Count] (tmnxTwampSrvConnectionCount)	long	The value of tmnxTwampSrvConnectionCount indicates the number of control connections currently managed by the TWAMP server.
twampSrvConnectionsRejected [Twamp Srv Connections Rejected] (tmnxTwampSrvConnectionsRejected)	long	The value of tmnxTwampSrvConnectionsRejected indicates the total number of control connection requests which have been rejected by the TWAMP server. Example reject reasons: the server's limit on the number of active connections has been reached; the client's IP address does not match any of the prefixes configured on the TWAMP server.
twampSrvOperStat [Twamp Srv Oper Stat] (tmnxTwampSrvOperState)	long	The value of tmnxTwampSrvOperState indicates if the TWAMP server is operationally 'inService(2)', or 'outOfService(3)'.
twampSrvSessionCount [Twamp Srv Session Count] (tmnxTwampSrvSessionCount)	long	The value of tmnxTwampSrvSessionCount indicates the number of currently in-progress TWAMP test sessions.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
twampSrvTestPacketsRx [Twamp Srv Test Packets Rx] (tmnxTwampSrvTestPacketsRx)	long	The value of tmnxTwampSrvTestPacketsRx indicates the total number of TWAMP test packets received by the TWAMP server.
twampSrvTestPacketsTx [Twamp Srv Test Packets Tx] (tmnxTwampSrvTestPacketsTx)	long	The value of tmnxTwampSrvTestPacketsTx indicates the total number of TWAMP test packets sent by the TWAMP server.
twampSrvTestSessAborted [Twamp Srv Test Sess Aborted] (tmnxTwampSrvTestSessAborted)	long	The value of tmnxTwampSrvTestSessAborted indicates the total number of test sessions aborted by the TWAMP server.
twampSrvTestSessCompleted [Twamp Srv Test Sess Completed] (tmnxTwampSrvTestSessCompleted)	long	The value of tmnxTwampSrvTestSessCompleted indicates the total number of test sessions completed by the TWAMP server.
twampSrvTestSessRejected [Twamp Srv Test Sess Rejected] (tmnxTwampSrvTestSessRejected)	long	The value of tmnxTwampSrvTestSessRejected indicates the total number of test sessions rejected by the TWAMP server.
twampSrvUpTime [Twamp Srv Up Time] (tmnxTwampSrvUpTime)	long	The value of tmnxTwampSrvUpTime indicates the time elapsed, in seconds, since the most recent transition of tmnxTwampSrvOperState to 'inService(2)'. If tmnxTwampSrvOperState is not 'inService(2)', zero is returned.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TwLossSessionStats</p> <p>MIB entry name: tmnxOamPmStsLossTwEntry</p> <p>Entry description: tmnxOamPmStsLossTwEntry contains the TWAMP-Light loss test statistics for one OAM Performance Monitoring Measurement Interval Data Set. A row is created in this table when a tmnxOamPmSts-BaseTable row is created with tmnxOamPmStsBaseTestType = 'twampLight(3)' (provided tmnxOamPmCfgTwampLtCollectStats is 'collectLossStats(2)' or 'collectDelayAndLossStats(3)'). A row is destroyed in this table when the corresponding tmnxOamPmStsBaseTable row is destroyed. When a TWAMP-Light test is running, all the test's raw statistics can be cleared using TIMETRA-CLEAR-MIB::tmnxClearAction and tmnxClearParams. A successful clear operation zeros the TWAMP-Light delay and TWAMP-Light loss raw statistics for the specified session.</p> <p>Table description (for tmnxOamPmStsLossTwTable): tmnxOamPmStsLossTwTable contains TWAMP-Light (Two-Way Active Measurement Protocol, Light) frame loss statistics. The frame loss statistics kept for TWAMP-Light tests are the same as the frame loss statistics specified for Ethernet SLM (Synthetic Loss Measurement) tests in MEF-35 section 10.2.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TWLSession</p>		
pmTwlAvailIndBwd [Pm Twl Avail Ind Bwd] (tmnxOamPmStsLossTwlAvailIndBwd)	long	The value of tmnxOamPmStsLossTwlAvailIndBwd indicates the number of availability indicators evaluated as Available in the backward direction for the specified measurement interval data set.
pmTwlAvailIndFwd [Pm Twl Avail Ind Fwd] (tmnxOamPmStsLossTwlAvailIndFwd)	long	The value of tmnxOamPmStsLossTwlAvailIndFwd indicates the number of availability indicators evaluated as Available in the forward direction for the specified measurement interval data set.
pmTwlAvgFlrBwd [Pm Twl Avg Flr Bwd] (tmnxOamPmStsLossTwlAvgFlrBwd)	float	The value of tmnxOamPmStsLossTwlAvgFlrBwd indicates the average Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwlAvgFlrFwd [Pm Twl Avg Flr Fwd] (tmnxOamPmStsLossTwlAvgFlrFwd)	float	The value of tmnxOamPmStsLossTwlAvgFlrFwd indicates the average Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiChliBwd [Pm Twl Chli Bwd] (tmnxOamPmStsLossTwiChliBwd)	long	The value of tmnxOamPmStsLossTwiChliBwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the backward direction for the specified measurement interval data set.
pmTwiChliFwd [Pm Twl Chli Fwd] (tmnxOamPmStsLossTwiChliFwd)	long	The value of tmnxOamPmStsLossTwiChliFwd indicates the number of Consecutive High Loss Intervals (CHLIs) in the forward direction for the specified measurement interval data set.
pmTwiHliBwd [Pm Twl Hli Bwd] (tmnxOamPmStsLossTwiHliBwd)	long	The value of tmnxOamPmStsLossTwiHliBwd indicates the number of High Loss Intervals (HLIs) in the backward direction for the specified measurement interval data set.
pmTwiHliFwd [Pm Twl Hli Fwd] (tmnxOamPmStsLossTwiHliFwd)	long	The value of tmnxOamPmStsLossTwiHliFwd indicates the number of High Loss Intervals (HLIs) in the forward direction for the specified measurement interval data set.
pmTwiMaxFlrBwd [Pm Twl Max Flr Bwd] (tmnxOamPmStsLossTwiMaxFlrBwd)	float	The value of tmnxOamPmStsLossTwiMaxFlrBwd indicates the maximum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwiMaxFlrFwd [Pm Twl Max Flr Fwd] (tmnxOamPmStsLossTwiMaxFlrFwd)	float	The value of tmnxOamPmStsLossTwiMaxFlrFwd indicates the maximum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.
pmTwiMinFlrBwd [Pm Twl Min Flr Bwd] (tmnxOamPmStsLossTwiMinFlrBwd)	float	The value of tmnxOamPmStsLossTwiMinFlrBwd indicates the minimum Frame Loss Ratio (FLR) in the backward direction for the specified measurement interval data set.
pmTwiMinFlrFwd [Pm Twl Min Flr Fwd] (tmnxOamPmStsLossTwiMinFlrFwd)	float	The value of tmnxOamPmStsLossTwiMinFlrFwd indicates the minimum Frame Loss Ratio (FLR) in the forward direction for the specified measurement interval data set.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwIRxBwd [Pm Twl Rx Bwd] (tmnxOamPmStsLossTwIRxBwd)	long	The value of tmnxOamPmStsLossTwIRxBwd indicates the number of TWAMP-Light reply frames received in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwIRxFwd [Pm Twl Rx Fwd] (tmnxOamPmStsLossTwIRxFwd)	long	The value of tmnxOamPmStsLossTwIRxFwd indicates the number of TWAMP-Light request frames received in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at receive time (as specified in MEF-35 Section 9.2.5). A simple count of the frames received for the test is available in tmnxOamPmStsBaseTestFramesRx.
pmTwITxBwd [Pm Twl Tx Bwd] (tmnxOamPmStsLossTwITxBwd)	long	The value of tmnxOamPmStsLossTwITxBwd indicates the number of TWAMP-Light reply frames transmitted in the backward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwITxFwd [Pm Twl Tx Fwd] (tmnxOamPmStsLossTwITxFwd)	long	The value of tmnxOamPmStsLossTwITxFwd indicates the number of TWAMP-Light request frames transmitted in the forward direction for the specified measurement interval data set. A frame is counted if the TWAMP-Light Availability state is Available at transmit time (as specified in MEF-35 Section 9.2.5). A simple count of the frames transmitted for the test is available in tmnxOamPmStsBaseTestFramesTx.
pmTwlUnavailIndBwd [Pm Twl Unavail Ind Bwd] (tmnxOamPmStsLossTwlUnavlIndBwd)	long	The value of tmnxOamPmStsLossTwlUnavlIndBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction for the specified measurement interval data set.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiUnavailIndFwd [Pm Twl Unavail Ind Fwd] (tmnxOamPmStsLossTwiUnavlIndFwd)	long	The value of tmnxOamPmStsLossTwiUnavlIndFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction for the specified measurement interval data set.
pmTwiUndtAvlBwd [Pm Twl Undt Avl Bwd] (tmnxOamPmStsLossTwiUndtAvlBwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlBwd indicates the number of availability indicators evaluated as Available in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtAvlFwd [Pm Twl Undt Avl Fwd] (tmnxOamPmStsLossTwiUndtAvlFwd)	long	The value of tmnxOamPmStsLossTwiUndtAvlFwd indicates the number of availability indicators evaluated as Available in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Available. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pmTwiUndtUnavlBwd [Pm Twl Undt Unavl Bwd] (tmnxOamPmStsLossTwiUndtUnavlBwd)	long	The value of tmnxOamPmStsLossTwiUndtUnavlBwd indicates the number of availability indicators evaluated as Unavailable in the backward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the backward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
pmTwiUndtUnavlFwd [Pm Twl Undt Unavl Fwd] (tmnxOamPmStsLossTwiUndtUnavlFwd)	long	The value of tmnxOamPmStsLossTwiUndtUnavlFwd indicates the number of availability indicators evaluated as Unavailable in the forward direction, based on extrapolation from the previous state. For example, this counter will be incremented when: 1. It is time to calculate an availability indicator, and 2. All the probe requests used to calculate the availability indicator have timed out, and 3. The most recently declared availability indicator in the forward direction was Unavailable. In that case, the result is considered undetermined because no information is available to indicate if the problem is in the forward direction or the backward direction.
sessionName [Session Name] (tmnxOamPmCfgSessName)	String	The value of tmnxOamPmCfgSessName specifies the name of the session to be configured or read.

Table 232 sas statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TwIReflectorStats</p> <p>MIB entry name: tmnxOamPmStsTwIRflEntry</p> <p>Entry description: tmnxOamPmStsTwIRflEntry contains the statistics for the specified OAM Performance Monitoring TWAMP-Light reflector. SROS creates a row in this table when a corresponding row is created in tmnxOamPmCfgTwIRflTable. SROS destroys a row in this table when a corresponding row is destroyed in tmnxOamPmCfgTwIRflTable. The encoding of the index is explained in the DESCRIPTION clause for tmnxOamPmCfgTwIRflEntry.</p> <p>Table description (for tmnxOamPmStsTwIRflTable): tmnxOamPmStsTwIRflTable contains the statistics for OAM Performance Monitoring TWAMP-Light reflectors.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sas.TwIReflector</p>		
framesRx [Frames Rx] (tmnxOamPmStsTwIRflFramesRx)	long	The value of tmnxOamPmStsTwIRflFramesRx indicates the number of TWAMP-Test frames received by the specified reflector.
framesTx [Frames Tx] (tmnxOamPmStsTwIRflFramesTx)	long	The value of tmnxOamPmStsTwIRflFramesTx indicates the number of TWAMP-Test frames transmitted by the specified reflector.
upTime [Up Time] (tmnxOamPmStsTwIRflUpTime)	long	The value of tmnxOamPmStsTwIRflUpTime indicates the time elapsed since the most recent transition of the reflector's administrative status to 'enabled(1)'. Zero is returned if the reflector's administrative status is 'disabled(2)'.

Table 233 service statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description

droppedPackets [Dropped Packets] (tCpmlpFilterStatsDroppedPkts)	java. math. BigInteger	The value of tCpmlpFilterStatsDroppedPkts indicates the number of packets dropped due to the tCpmlpFilterEntry with the same index.
forwardedPackets [Forwarded Packets] (tCpmlpFilterStatsForwardedPkts)	java. math. BigInteger	The value of tCpmlpFilterStatsForwardedPkts indicates the number of packets forwarded due to the tCpmlpFilterEntry with the same index.

Table 234 sitesec statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MafEntryStats</p> <p>MIB entry name: tmnxIPMafMatchEntry</p> <p>Entry description: Each row entry contains information about a management access filter entry associated with a specific Management Access Filter (MAF). The filter criter is applied in order according to the value of tmnxIPMafMatchIndex. The match algorithm is exited upon the first match found and then the action specified is executed. For this reason, entries must be sequenced from most to least explicit. An entry where tmnxIPMafMatchAction has a value of 'none' is not active. Rows can only be created for tmnxGenMafType's: - ipv4 (1), and. - ipv6 (2). For mac Maf filters a dedicated table is provided (tmnxMacMafMatchTable).</p> <p>Table description (for tmnxIPMafMatchTable): This table replaces the tmnxMafMatchTable. It allows to define both IPv4 and IPv6 MAF IP entries. The tmnxIPMafMatchTable contains ipvx filter match criteria associated with Management Access Filters (MAFs) configured on the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: sitesec.MafEntry</p>		
matchCount [Match Count] (tmnxIPMafMatchCount)	java. math. BigInteger	The value of tmnxIPMafMatchCount indicates the number of times a management packet has matched this filter entry.

Table 236 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapTlsDhcpStatsClntForwdPckts [Sap Tls Dhcp Stats Clnt Forwd Pckts] (sapTlsDhcpStatsClntForwdPckts)	long	The value of the object sapTlsDhcpStatsClntForwdPckts indicates the number of DHCP client packets that have been forwarded on this SAP.
sapTlsDhcpStatsClntProxLSPckts [Sap Tls Dhcp Stats Clnt Prox LSPckts] (sapTlsDhcpStatsClntProxLSPckts)	long	The value of the object sapTlsDhcpStatsClntProxLSPckts indicates the number of DHCP client packets that have been proxied on this SAP based on a lease state. The lease itself can have been obtained from a DHCP or RADIUS server. This is the so called lease split functionality.
sapTlsDhcpStatsClntProxRadPckts [Sap Tls Dhcp Stats Clnt Prox Rad Pckts] (sapTlsDhcpStatsClntProxRadPckts)	long	The value of the object sapTlsDhcpStatsClntProxRadPckts indicates the number of DHCP client packets that have been proxied on this SAP based on data received from a RADIUS server.
sapTlsDhcpStatsClntSnoopdPckts [Sap Tls Dhcp Stats Clnt Snoopd Pckts] (sapTlsDhcpStatsClntSnoopdPckts)	long	The value of the object sapTlsDhcpStatsClntSnoopdPckts indicates the number of DHCP client packets that have been snooped on this SAP.
sapTlsDhcpStatsGenForceRenPckts [Sap Tls Dhcp Stats Gen Force Ren Pckts] (sapTlsDhcpStatsGenForceRenPckts)	long	The value of the object sapTlsDhcpStatsGenForceRenPckts indicates the number of DHCP FORCERENEW messages spoofed on this SAP to the DHCP clients.
sapTlsDhcpStatsGenReleasePckts [Sap Tls Dhcp Stats Gen Release Pckts] (sapTlsDhcpStatsGenReleasePckts)	long	The value of the object sapTlsDhcpStatsGenReleasePckts indicates the number of DHCP RELEASE messages spoofed on this SAP to the DHCP server.
sapTlsDhcpStatsSrvrDropdPckts [Sap Tls Dhcp Stats Srvr Dropd Pckts] (sapTlsDhcpStatsSrvrDropdPckts)	long	The value of the object sapTlsDhcpStatsSrvrDropdPckts indicates the number of DHCP server packets that have been dropped on this SAP.
sapTlsDhcpStatsSrvrForwdPckts [Sap Tls Dhcp Stats Srvr Forwd Pckts] (sapTlsDhcpStatsSrvrForwdPckts)	long	The value of the object sapTlsDhcpStatsSrvrForwdPckts indicates the number of DHCP server packets that have been forwarded on this SAP.

Table 236 vpls statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapTIsDhcpStatsSrvrSnoopdPckts [Sap Tls Dhcp Stats Srvr Snoopd Pckts] (sapTIsDhcpStatsSrvrSnoopdPckts)	long	The value of the object sapTIsDhcpStatsSrvrSnoopdPckts indicates the number of DHCP server packets that have been snooped on this SAP.

Table 237 vrrp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>InstanceAdditionalStats</p> <p>MIB entry name: tmnxVrrpRouterStatsEntry</p> <p>Entry description: Each row entry in the tmnxVrrpRouterStatsTable represents additional columns in the vrrpRouterStatsTable for statistics specific to the Nokia SROS series VRRP implementation.</p> <p>Table description (for tmnxVrrpRouterStatsTable): The tmnxVrrpRouterStatsTable provides an extension of the vrrpRouterStatsTable in the VRRP-MIB. Use of AUGMENTS clause implies a one-to-one dependent relationship between the base table, vrrpRouterStatsTable, and the augmenting table, tmnxVrrpRouterStatsTable. This in effect extends the vrrpRouterStatsTable with additional columns.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: vrrp.Instance</p>		
addressListDiscards [Address List Discards] (tmnxVrrpStatsAddressListDiscards)	long	The total number of VRRP advertisement packets discarded because the address list did not match the locally configured list for the virtual router.
advertiseIntervalDiscards [Advertise Interval Discards] (tmnxVrrpStatsAdvertiseIntervalDiscards)	long	The total number of VRRP advertisement packets discarded because the advertisement interval in the received packet was different than the one configured for the local virtual router.
advertiseSent [Advertise Sent] (tmnxVrrpStatsAdvertiseSent)	long	The total number of VRRP advertisements sent by this virtual router.
masterChanges [Master Changes] (tmnxVrrpStatsMasterChanges)	long	The value for tmnxVrrpStatsMasterChanges specifies the total number of times the virtual router has seen the master virtual router change.
preemptEvents [Preempt Events] (tmnxVrrpStatsPreemptEvents)	long	The value for tmnxVrrpStatsPreemptEvents specifies the total number of times the virtual router has preempted another non-owner master with lower priority.

Table 237 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
preemptedEvents [Preempted Events] (tmnxVrrpStatsPreemptedEvents)	long	The value for tmnxVrrpStatsPreemptedEvents specifies the total number of times the virtual router has been preempted by another non-owner master with higher priority.
totalDiscards [Total Discards] (tmnxVrrpStatsTotalDiscards)	long	The total number of VRRP advertisement packets discarded for any reason. This includes the packets discarded due to advertise interval mismatch and address list mismatch.
InstanceStats MIB entry name: vrrpRouterStatsEntry Entry description: An entry in the table, containing statistics information about a given virtual router. Table description (for vrrpRouterStatsTable): Table of virtual router statistics. Supports realtime plotting Supports scheduled collection Monitored class: vrrp.Instance		
addressListErrors [Address List Errors] (vrrpStatsAddressListErrors)	long	The total number of packets received for which the address list does not match the locally configured list for the virtual router.
advertiseIntervalErrors [Advertise Interval Errors] (vrrpStatsAdvertiseIntervalErrors)	long	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
advertiseRcvd [Advertise Rcvd] (vrrpStatsAdvertiseRcvd)	long	The total number of VRRP advertisements received by this virtual router.
authFailures [Auth Failures] (vrrpStatsAuthFailures)	long	The total number of VRRP packets received that do not pass the authentication check.

Table 237 vrrp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
authTypeMismatch [Auth Type Mismatch] (vrrpStatsAuthTypeMismatch)	long	The total number of packets received with 'Auth Type' not equal to the locally configured authentication method ('vrrpOperAuthType').
becomeMaster [Become Master] (vrrpStatsBecomeMaster)	long	The total number of times that this virtual router's state has transitioned to MASTER.
invalidAuthType [Invalid Auth Type] (vrrpStatsInvalidAuthType)	long	The total number of packets received with an unknown authentication type.
invalidTypePktsRcvd [Invalid Type Pkts Rcvd] (vrrpStatsInvalidTypePktsRcvd)	long	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
ipTtlErrors [Ip Ttl Errors] (vrrpStatsIpTtlErrors)	long	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
packetLengthErrors [Packet Length Errors] (vrrpStatsPacketLengthErrors)	long	The total number of packets received with a packet length less than the length of the VRRP header.
priorityZeroPktsRcvd [Priority Zero Pkts Rcvd] (vrrpStatsPriorityZeroPktsRcvd)	long	The total number of VRRP packets received by the virtual router with a priority of '0'.
priorityZeroPktsSent [Priority Zero Pkts Sent] (vrrpStatsPriorityZeroPktsSent)	long	The total number of VRRP packets sent by the virtual router with a priority of '0'.

Table 238 aaa statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>IsaRadiusServerStats</p> <p>MIB entry name: tmnxRadIsaSrvStatsEntry</p> <p>Entry description: Each conceptual row represents a type of statistics of a connection with a particular RADIUS server. Rows in this table are automatically created and destroyed by the system.</p> <p>Table description (for tmnxRadIsaSrvStatsTable): The tmnxRadIsaSrvStatsTable contains statistics information about the connections with ISA RADIUS servers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aaa.IsaRadiusServerConnection</p>		
statsName [Stats Name] (tmnxRadIsaSrvStatsName)	String	The value of the object tmnxRadIsaSrvStatsName indicates the human-readable identifier of the statistics contained in this conceptual row.
statsType [Stats Type] (tmnxRadIsaSrvStatsType)	long	The value of tmnxRadIsaSrvStatsType indicates the type of ISA RADIUS server statistics contained in this conceptual row.
statsVal [Stats Val] (tmnxRadIsaSrvStatsValue)	long	The value of the object tmnxRadIsaSrvStatsValue indicates the value of the statistics contained in this conceptual row.
<p>L2tpRadiusEntryStats</p> <p>MIB entry name: tmnxL2tpApServStatsEntry</p> <p>Entry description: Each row represents statistics about a specific server of a specify L2TP accounting policy. Rows in this table are created automatically by the system.</p> <p>Table description (for tmnxL2tpApServStatsTable): The tmnxL2tpApServStatsTable presents statistics of l2tp-accounting-policies' RADIUS servers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aaa.L2tpRadiusEntry</p>		

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
failedRequestsPackets [Failed Requests Packets] (tmnxL2tpApServStatsReqSendFail)	long	The value of tmnxL2tpApServStatsReqSendFail indicates the number of RADIUS request packets that could not be transmitted for this server.
invAuthReponsesPackets [Inv Auth Reponses Packets] (tmnxL2tpApServStatsRespInvAuth)	long	The value of tmnxL2tpApServStatsRespInvAuth indicates the number of RADIUS response packets with an invalid Authenticator received from this server.
pendingRequestsPackets [Pending Requests Packets] (tmnxL2tpApServStatsReqPending)	long	The value of tmnxL2tpApServStatsReqPending indicates the number of RADIUS requests that are currently pending for this server.
reponsesPackets [Reponses Packets] (tmnxL2tpApServStatsRxResponses)	long	The value of tmnxL2tpApServStatsRxResponses indicates the number of RADIUS response packets received from this server.
requestsPackets [Requests Packets] (tmnxL2tpApServStatsTxRequests)	long	The value of tmnxL2tpApServStatsTxRequests indicates the number of RADIUS request packets transmitted for this server.
statRetries [Stat Retries] (tmnxL2tpApServStatsSendRetries)	long	The value of tmnxL2tpApServStatsSendRetries indicates the number of retries to a different server for a single accounting request for this connection with this RADIUS server.
timeOut [Time Out] (tmnxL2tpApServStatsReqTimeout)	long	The value of tmnxL2tpApServStatsReqTimeout indicates the number of RADIUS requests that have timed out for this server.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>RadPSStats</p> <p>MIB entry name: tmnxRadProxSrvEntry</p> <p>Entry description: Each conceptual row represents information about a particular RADIUS Proxy Server. Entries in this table can be created or deleted via SNMP operations.</p> <p>Table description (for tmnxRadProxSrvTable): The tmnxRadProxSrvTable contains objects to configure the RADIUS Proxy Servers of this system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aaa.RadiusProxyServer</p>		
proxSrvName [Prox Srv Name] (tmnxRadProxSrvName)	String	The value of tmnxRadProxSrvName specifies the name of this RADIUS Proxy server.
radPSStatsRxAcctRequest [Rad PSSStats Rx Acct Request] (tmnxRadPSStatsRxAcctRequest)	long	The value of tmnxRadPSStatsRxAcctRequest indicates the number of Accounting-Request packets received by this RADIUS Proxy Server.
radPSStatsRxAdminDown [Rad PSSStats Rx Admin Down] (tmnxRadPSStatsRxAdminDown)	long	The value of tmnxRadPSStatsRxAdminDown indicates the number of packets received by this RADIUS Proxy Server that were rejected because it is administratively shut down.
radPSStatsRxAuthRequest [Rad PSSStats Rx Auth Request] (tmnxRadPSStatsRxAuthRequest)	long	The value of tmnxRadPSStatsRxAuthRequest indicates the number of Access-Request packets received by this RADIUS Proxy Server.
radPSStatsRxDropped [Rad PSSStats Rx Dropped] (tmnxRadPSStatsRxDropped)	long	The value of tmnxRadPSStatsRxDropped indicates the number of packets received by this RADIUS Proxy Server but dropped.
radPSStatsRxDroppedByPython [Rad PSSStats Rx Dropped By Python] (tmnxRadPSStatsRxDroppedByPython)	long	The value of tmnxRadPSStatsRxDroppedByPython indicates the number of packets received by this RADIUS Proxy Server but dropped by Python.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
radPSStatsRxInvAcctAuth [Rad PSSStats Rx Inv Acct Auth] (tmnxRadPSStatsRxInvAcctAuth)	long	The value of tmnxRadPSStatsRxInvAcctAuth indicates the number of accounting packets received by this RADIUS Proxy Server that were rejected because they contained an invalid Authenticator field.
radPSStatsRxInvAcctStatusTyp [Rad PSSStats Rx Inv Acct Status Typ] (tmnxRadPSStatsRxInvAcctStatusTyp)	long	The value of tmnxRadPSStatsRxInvAcctStatusTyp indicates the number of accounting packets received by this RADIUS Proxy Server that were rejected because they contained an invalid Acct-Status-Type attribute.
radPSStatsRxInvAttr [Rad PSSStats Rx Inv Attr] (tmnxRadPSStatsRxInvAttr)	long	The value of tmnxRadPSStatsRxInvAttr indicates the number of packets received by this RADIUS Proxy Server that were rejected because one of the attributes was incorrectly encoded.
radPSStatsRxInvCode [Rad PSSStats Rx Inv Code] (tmnxRadPSStatsRxInvCode)	long	The value of tmnxRadPSStatsRxInvCode indicates the number of packets received by this RADIUS Proxy Server that were rejected because they had an invalid Code field.
radPSStatsRxInvLen [Rad PSSStats Rx Inv Len] (tmnxRadPSStatsRxInvLen)	long	The value of tmnxRadPSStatsRxInvLen indicates the number of packets received by this RADIUS Proxy Server that were rejected because their length was invalid.
radPSStatsRxInvMsgAuth [Rad PSSStats Rx Inv Msg Auth] (tmnxRadPSStatsRxInvMsgAuth)	long	The value of tmnxRadPSStatsRxInvMsgAuth indicates the number of packets received by this RADIUS Proxy Server that were rejected because they contained an invalid Message-Authenticator attribute.
radPSStatsRxInvPassword [Rad PSSStats Rx Inv Password] (tmnxRadPSStatsRxInvPassword)	long	The value of tmnxRadPSStatsRxInvPassword indicates the number of packets received by this RADIUS Proxy Server that were rejected because the User-Password attribute could not be decoded.
radPSStatsRxInvUserName [Rad PSSStats Rx Inv User Name] (tmnxRadPSStatsRxInvUserName)	long	The value of tmnxRadPSStatsRxInvUserName indicates the number of packets received by this RADIUS Proxy Server that were rejected because they contained an invalid User-Name attribute.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
radPSStatsRxNoAaaPol [Rad PSSStats Rx No Aaa Pol] (tmnxRadPSStatsRxNoAaaPol)	long	The value of tmnxRadPSStatsRxNoAaaPol indicates the number of packets received by this RADIUS Proxy Server that were rejected because it has no RADIUS server policy configured for that type of packet.
radPSStatsRxNoAcctStatusTyp [Rad PSSStats Rx No Acct Status Typ] (tmnxRadPSStatsRxNoAcctStatusTyp)	long	The value of tmnxRadPSStatsRxNoAcctStatusTyp indicates the number of accounting packets received by this RADIUS Proxy Server that were rejected because they contained no Acct-Status-Type attribute.
radPSStatsRxNoLoadBKey [Rad PSSStats Rx No Load BKey] (tmnxRadPSStatsRxNoLoadBKey)	long	The value of tmnxRadPSStatsRxNoLoadBKey indicates the number of packets received by this RADIUS Proxy Server that were rejected because the selected RADIUS server policy's algorithm (tmnxRadSrvPlcyAlgorithm) is set to 'hashBased' and no load balance key (tmnxRadProxSrvLoadBalanceKey) is configured.
radPSStatsRxNoMemory [Rad PSSStats Rx No Memory] (tmnxRadPSStatsRxNoMemory)	long	The value of tmnxRadPSStatsRxNoMemory indicates the number of packets that were rejected by this RADIUS server because there was not enough memory to store them.
radPSStatsRxPacket [Rad PSSStats Rx Packet] (tmnxRadPSStatsRxPacket)	long	The value of tmnxRadPSStatsRxPacket indicates the number of packets received by this RADIUS Proxy Server.
radPSStatsRxRetransmit [Rad PSSStats Rx Retransmit] (tmnxRadPSStatsRxRetransmit)	long	The value of tmnxRadPSStatsRxRetransmit indicates the number of packets received by this RADIUS Proxy Server that were rejected because they are retransmitted.
radPSStatsRxUserOverload [Rad PSSStats Rx User Overload] (tmnxRadPSStatsRxUserOverload)	long	The value of tmnxRadPSStatsRxUserOverload indicates the number of packets that were rejected by this RADIUS server because the registered user indicated to be in overload.
radPSStatsTxAcctResponse [Rad PSSStats Tx Acct Response] (tmnxRadPSStatsTxAcctResponse)	long	The value of tmnxRadPSStatsTxAcctResponse indicates the number of Accounting-Response packets transmitted by this RADIUS Proxy Server.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
radPSStatsTxAuthAck [Rad PSSStats Tx Auth Ack] (tmnxRadPSStatsTxAuthAck)	long	The value of tmnxRadPSStatsTxAuthAck indicates the number of Access-Accept packets transmitted by this RADIUS Proxy Server.
radPSStatsTxAuthChallenge [Rad PSSStats Tx Auth Challenge] (tmnxRadPSStatsTxAuthChallenge)	long	The value of tmnxRadPSStatsTxAuthChallenge indicates the number of Access-Challenge packets transmitted by this RADIUS Proxy Server.
radPSStatsTxAuthReject [Rad PSSStats Tx Auth Reject] (tmnxRadPSStatsTxAuthReject)	long	The value of tmnxRadPSStatsTxAuthReject indicates the number of Access-Reject packets transmitted by this RADIUS Proxy Server.
radPSStatsTxCacheAttrTooLong [Rad PSSStats Tx Cache Attr Too Long] (tmnxRadPSStatsTxCacheAttrTooLong)	long	The value of tmnxRadPSStatsTxCacheAttrTooLong indicates the number of packets that could not be cached by this RADIUS Proxy Server because the total length of the attributes is too long.
radPSStatsTxCacheKeyTooLong [Rad PSSStats Tx Cache Key Too Long] (tmnxRadPSStatsTxCacheKeyTooLong)	long	The value of tmnxRadPSStatsTxCacheKeyTooLong indicates the number of packets that could not be cached by this RADIUS Proxy Server because the key information present in the packet was too long.
radPSStatsTxCacheMaxEntries [Rad PSSStats Tx Cache Max Entries] (tmnxRadPSStatsTxCacheMaxEntries)	long	The value of tmnxRadPSStatsTxCacheMaxEntries indicates the number of packets that could not be cached by this RADIUS Proxy Server because the limit has been reached.
radPSStatsTxCacheNoKey [Rad PSSStats Tx Cache No Key] (tmnxRadPSStatsTxCacheNoKey)	long	The value of tmnxRadPSStatsTxCacheNoKey indicates the number of packets that could not be cached by this RADIUS Proxy Server because the key information was not present in the packet.
radPSStatsTxDropped [Rad PSSStats Tx Dropped] (tmnxRadPSStatsTxDropped)	long	The value of tmnxRadPSStatsTxDropped indicates the number of packets dropped by this RADIUS Proxy Server before transmission.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
radPSStatsTxDroppedByPython [Rad PSSStats Tx Dropped By Python] (tmnxRadPSStatsTxDroppedByPython)	long	The value of tmnxRadPSStatsTxDroppedByPython indicates the number of packets that were dropped by this RADIUS server because the packet was dropped by the Python script.
radPSStatsTxNoMemory [Rad PSSStats Tx No Memory] (tmnxRadPSStatsTxNoMemory)	long	The value of tmnxRadPSStatsTxNoMemory indicates the number of packets that could not be transmitted by this RADIUS Proxy Server because there was not enough memory.
radPSStatsTxNoRadiusServer [Rad PSSStats Tx No Radius Server] (tmnxRadPSStatsTxNoRadiusServer)	long	The value of tmnxRadPSStatsTxNoRadiusServer indicates the number of packets that were dropped by this RADIUS server because the RADIUS server policy has no servers configured.
radPSStatsTxSendFailure [Rad PSSStats Tx Send Failure] (tmnxRadPSStatsTxSendFailure)	long	The value of tmnxRadPSStatsTxSendFailure indicates the number of packets that were dropped by this RADIUS server because the packet could not get transmitted to one of the servers in the RADIUS server policy.
radPSStatsTxServerAuthFail [Rad PSSStats Tx Server Auth Fail] (tmnxRadPSStatsTxServerAuthFail)	long	The value of tmnxRadPSStatsTxServerAuthFail indicates the number of packets that were dropped because the RADIUS server replied with a packet which failed authentication (invalid response Authenticator or Message-Authenticator attribute).
radPSStatsTxServerInvAttr [Rad PSSStats Tx Server Inv Attr] (tmnxRadPSStatsTxServerInvAttr)	long	The value of tmnxRadPSStatsTxServerInvAttr indicates the number of packets that were dropped because the RADIUS server replied with a packet with an invalid attribute.
radPSStatsTxServerInvCode [Rad PSSStats Tx Server Inv Code] (tmnxRadPSStatsTxServerInvCode)	long	The value of tmnxRadPSStatsTxServerInvCode indicates the number of packets that were dropped because the RADIUS server replied with a packet with an invalid Code field.
radPSStatsTxServerTimeout [Rad PSSStats Tx Server Timeout] (tmnxRadPSStatsTxServerTimeout)	long	The value of tmnxRadPSStatsTxServerTimeout indicates the number of packets that were dropped because the RADIUS servers have timed out.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
radPSStatsTxUserOverload [Rad PSSStats Tx User Overload] (tmnxRadPSStatsTxUserOverload)	long	The value of tmnxRadPSStatsTxUserOverload indicates the number of packets that were dropped because the registered user indicated to be in overload.
routerId [Router Id] (vRtrID)	int	The unique value which identifies this virtual router in the Tmnx system. The vRtrID value for each virtual router must remain constant at least from one re-initialization of the system management processor (CPM) to the next. There will always be at least one router entry defined by the agent with vRtrID=1 which represents the transport router.
<p>RadPSStatus</p> <p>MIB entry name: tmnxRadProxSrvEntry</p> <p>Entry description: Each conceptual row represents information about a particular RADIUS Proxy Server. Entries in this table can be created or deleted via SNMP operations.</p> <p>Table description (for tmnxRadProxSrvTable): The tmnxRadProxSrvTable contains objects to configure the RADIUS Proxy Servers of this system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aaa.RadiusProxyServer</p>		
proxSrvName [Prox Srv Name] (tmnxRadProxSrvName)	String	The value of tmnxRadProxSrvName specifies the name of this RADIUS Proxy server.
radPSStatusCacheEntries [Rad PSSStatus Cache Entries] (tmnxRadPSStatusCacheEntries)	long	The value of tmnxRadPSStatusCacheEntries indicates the number of entries in the cache of this RADIUS Proxy Server.
radPSStatusCacheEntriesReg [Rad PSSStatus Cache Entries Reg] (tmnxRadPSStatusCacheEntriesReg)	long	The value of tmnxRadPSStatusCacheEntriesReg indicates the number of entries in the cache of this RADIUS Proxy Server. Pending entries have a registered application. An example of an application that could register to a cache entry is Subscriber Management of DHCP clients.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
routerId [Router Id] (vRtrID)	int	The unique value which identifies this virtual router in the Tmnx system. The vRtrID value for each virtual router must remain constant at least from one re-initialization of the system management processor (CPM) to the next. There will always be at least one router entry defined by the agent with vRtrID=1 which represents the transport router.
<p>RadRouteDownloadStats MIB entry name: tmnxRadRDStatsEntry Entry description: Each conceptual row represents statistics about a particular Route Downloader. Rows are created and destroyed automatically by the system. Table description (for tmnxRadRDStatsTable): The tmnxRadRDStatsTable contains statistics about the RADIUS Route Downloaders of this system. Supports realtime plotting Supports scheduled collection Monitored class: aaa.RouteDownloadPolicy</p>		
accessAcceptedPkts [Access Accepted Pkts] (tmnxRadRDStatsRxAccessAccept)	long	The value of tmnxRadRDStatsRxAccessAccept indicates the number of Access-Accept packets received by this Route Downloader.
accessDroppedPkts [Access Dropped Pkts] (tmnxRadRDStatsRxAccessAcceptDrop)	long	The value of tmnxRadRDStatsRxAccessAcceptDrop indicates the number of Access-Accept packets received but dropped by this Route Downloader.
accessRejectedPkts [Access Rejected Pkts] (tmnxRadRDStatsRxAccessReject)	long	The value of tmnxRadRDStatsRxAccessReject indicates the number of Access-Reject packets received by this Route Downloader.
accessRequests [Access Requests] (tmnxRadRDStatsTxAccessRequest)	long	The value of tmnxRadRDStatsTxAccessRequest indicates the number of Access-Requests sent by this Route Downloader.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
accessRetries [Access Retries] (tmnxRadRDStatsTxAccessReqRetry)	long	The value of tmnxRadRDStatsTxAccessReqRetry indicates the number of Access-Requests retries for this Route Downloader.
installingFailures [Installing Failures] (tmnxRadRDStatsRtmFailures)	long	The value of tmnxRadRDStatsRtmFailures indicates the number of times installing received routes failed for this Route Downloader.
lastAccessAccept [Last Access Accept] (tmnxRadRDStatsRxLastAccessAccept)	long	The value of tmnxRadRDStatsRxLastAccessAccept indicates when this Route Downloader last received an Access-Accept packet.
lastAccessReject [Last Access Reject] (tmnxRadRDStatsRxLastAccessReject)	long	The value of tmnxRadRDStatsRxLastAccessReject indicates when this Route Downloader last received an Access-Reject packet.
lastAccessRequest [Last Access Request] (tmnxRadRDStatsTxLastAccessReq)	long	The value of tmnxRadRDStatsTxLastAccessReq indicates when this Route Downloader last sent an Access-Request packet.
lastAccessRetry [Last Access Retry] (tmnxRadRDStatsTxLastAccReqRetry)	long	The value of tmnxRadRDStatsTxLastAccReqRetry indicates the time of the last Access-Request retry.
numOfDownloads [Num Of Downloads] (tmnxRadRDStatsDownloads)	long	The value of tmnxRadRDStatsDownloads indicates the number of downloads started by this Route Downloader.
remainingTime [Remaining Time] (tmnxRadRDStatsRemainingDownlTime)	long	The value of tmnxRadRDStatsRemainingDownlTime indicates the remaining time before the next download attempt.
retryTime [Retry Time] (tmnxRadRDStatsRemainingRetryTime)	long	The value of tmnxRadRDStatsRemainingRetryTime indicates the remaining time before the next download retry.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
routesReceived [Routes Received] (tmnxRadRDStatsRoutesReceived)	long	The value of tmnxRadRDStatsRoutesReceived indicates the number of routes received in the last completed route download process.
<p>RadSrvPlcyMsgBufStats</p> <p>MIB entry name: tmnxRadSrvPlcyEntry</p> <p>Entry description: Each entry represents the configuration for a specific RADIUS servers policy. Entries in this table can be created and deleted via SNMP SET operations to tmnxRadSrvPlcyRowStatus.</p> <p>Table description (for tmnxRadSrvPlcyTable): The tmnxRadSrvPlcyTable allows configuration of how to access a group of RADIUS servers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aaa.RadiusServerPolicy</p>		
bufMsgPlcyName [Buf Msg Plcy Name] (tmnxRadSrvPlcyName)	String	The value of tmnxRadSrvPlcyName specifies a specific RADIUS servers policy.
lastBufClean [Last Buf Clean] (tmnxRadSrvPlcyLastBufClean)	long	The value of tmnxRadSrvPlcyLastBufClean indicates the sysUpTime at the time of the most recent reset (empty) of the message buffer.
lastBufStatsClean [Last Buf Stats Clean] (tmnxRadSrvPlcyLastBufStatsClean)	long	The value of tmnxRadSrvPlcyLastBufStatsClean indicates the sysUpTime at the time of the most recent reset of the message buffer statistics.
nbrAcctInterimBuf [Nbr Acct Interim Buf] (tmnxRadSrvPlcyNbrAcctInterimBuf)	long	The value of tmnxRadSrvPlcyNbrAcctInterimBuf indicates the number of RADIUS accounting interim update messages that are currently buffered for this radius server policy.
nbrAcctInterimDrop [Nbr Acct Interim Drop] (tmnxRadSrvPlcyNbrAcctInterimDrop)	long	The value of tmnxRadSrvPlcyNbrAcctInterimDrop indicates the number of RADIUS accounting interim update messages that were dropped from the buffer because their lifetime expired.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
nbrAcctStopBuf [Nbr Acct Stop Buf] (tmnxRadSrvPlcyNbrAcctStopBuf)	long	The value of tmnxRadSrvPlcyNbrAcctStopBuf indicates the number of RADIUS accounting stop messages that are currently buffered for this radius server policy.
nbrAcctStopDrop [Nbr Acct Stop Drop] (tmnxRadSrvPlcyNbrAcctStopDrop)	long	The value of tmnxRadSrvPlcyNbrAcctStopDrop indicates the number of RADIUS accounting stop messages that were dropped from the buffer because their lifetime expired.
<p>RadSrvPlcyStats MIB entry name: tmnxRadSrvPlcyEntry Entry description: Each entry represents the configuration for a specific RADIUS servers policy. Entries in this table can be created and deleted via SNMP SET operations to tmnxRadSrvPlcyRowStatus. Table description (for tmnxRadSrvPlcyTable): The tmnxRadSrvPlcyTable allows configuration of how to access a group of RADIUS servers. Supports realtime plotting Supports scheduled collection Monitored class: aaa.RadiusServerPolicy</p>		
plcyName [Plcy Name] (tmnxRadSrvPlcyName)	String	The value of tmnxRadSrvPlcyName specifies a specific RADIUS servers policy.
radSrvPlcyStatsAcctFailed [Rad Srv Plcy Stats Acct Failed] (tmnxRadSrvPlcyStatsAcctFailed)	long	The value of tmnxRadSrvPlcyStatsAcctFailed indicates the number of accounting failures for this policy.
radSrvPlcyStatsAuthFailed [Rad Srv Plcy Stats Auth Failed] (tmnxRadSrvPlcyStatsAuthFailed)	long	The value of tmnxRadSrvPlcyStatsAuthFailed indicates the number of authentication failures for this policy.
radSrvPlcyStatsRatioFailure [Rad Srv Plcy Stats Ratio Failure] (tmnxRadSrvPlcyStatsFailureRatio)	int	The value of tmnxRadSrvPlcyStatsFailureRatio indicates the transaction failure ratio for this policy.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
radSrvPlcyStatsRatioReject [Rad Srv Plcy Stats Ratio Reject] (tmnxRadSrvPlcyStatsRejectRatio)	int	The value of tmnxRadSrvPlcyStatsRejectRatio indicates the ratio of access-rejects in the auth responses for this policy.
radSrvPlcyStatsRatioSuccess [Rad Srv Plcy Stats Ratio Success] (tmnxRadSrvPlcyStatsSuccessRatio)	int	The value of tmnxRadSrvPlcyStatsSuccessRatio indicates the transaction success ratio for this policy.
radSrvPlcyStatsReqRejected [Rad Srv Plcy Stats Req Rejected] (tmnxRadSrvPlcyStatsReqRejected)	long	The value of tmnxRadSrvPlcyStatsReqRejected indicates the number of RADIUS transaction requests that were not transmitted due to unacceptable configuration.
radSrvPlcyStatsReqSendFail [Rad Srv Plcy Stats Req Send Fail] (tmnxRadSrvPlcyStatsReqSendFail)	long	The value of tmnxRadSrvPlcyStatsReqSendFail indicates the number of RADIUS transaction requests that could not be transmitted.
radSrvPlcyStatsReqSendRetry [Rad Srv Plcy Stats Req Send Retry] (tmnxRadSrvPlcyStatsReqSendRetry)	long	The value of tmnxRadSrvPlcyStatsReqSendRetry indicates the number of times a RADIUS request packet was retransmitted to a server.
radSrvPlcyStatsReqTimeout [Rad Srv Plcy Stats Req Timeout] (tmnxRadSrvPlcyStatsReqTimeout)	long	The value of tmnxRadSrvPlcyStatsReqTimeout indicates the number of RADIUS transaction requests that have timed out.
radSrvPlcyStatsRxResponses [Rad Srv Plcy Stats Rx Responses] (tmnxRadSrvPlcyStatsRxResponses)	long	The value of tmnxRadSrvPlcyStatsRxResponses indicates the number of RADIUS transaction responses received.
radSrvPlcyStatsTxRequests [Rad Srv Plcy Stats Tx Requests] (tmnxRadSrvPlcyStatsTxRequests)	long	The value of tmnxRadSrvPlcyStatsTxRequests indicates the number of RADIUS transaction requests transmitted.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>RadSrvStats</p> <p>MIB entry name: tmnxRadSrvPlcyEntry</p> <p>Entry description: Each entry represents the configuration for a specific RADIUS servers policy. Entries in this table can be created and deleted via SNMP SET operations to tmnxRadSrvPlcyRowStatus.</p> <p>Table description (for tmnxRadSrvPlcyTable): The tmnxRadSrvPlcyTable allows configuration of how to access a group of RADIUS servers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aaa.ServerEntry</p>		
plcyName [Plcy Name] (tmnxRadSrvPlcyName)	String	The value of tmnxRadSrvPlcyName specifies a specific RADIUS servers policy.
radSrvStatsAcctAvgDelay10 [Rad Srv Stats Acct Avg Delay 10] (tmnxRadSrvStatsAcctAvgDelay10)	long	The value of tmnxRadSrvStatsAcctAvgDelay10 indicates in microseconds, the average response delay for the last 10 accounting packets.
radSrvStatsAcctAvgDelay100 [Rad Srv Stats Acct Avg Delay 100] (tmnxRadSrvStatsAcctAvgDelay100)	long	The value of tmnxRadSrvStatsAcctAvgDelay100 indicates in microseconds, the average response delay for the last 100 accounting packets.
radSrvStatsAcctAvgDelay1000 [Rad Srv Stats Acct Avg Delay 1000] (tmnxRadSrvStatsAcctAvgDelay1000)	long	The value of tmnxRadSrvStatsAcctAvgDelay1000 indicates in microseconds, the average response delay for the last 1000 accounting packets.
radSrvStatsAcctAvgDelay10000 [Rad Srv Stats Acct Avg Delay 10000] (tmnxRadSrvStatsAcctAvgDelay10000)	long	The value of tmnxRadSrvStatsAcctAvgDelay10000 indicates in microseconds, the average response delay for the last 10000 accounting packets.
radSrvStatsAuthAvgDelay10 [Rad Srv Stats Auth Avg Delay 10] (tmnxRadSrvStatsAuthAvgDelay10)	long	The value of tmnxRadSrvStatsAuthAvgDelay10 indicates in microseconds, the average response delay for the last 10 authentication packets.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
radSrvStatsAuthAvgDelay100 [Rad Srv Stats Auth Avg Delay 100] (tmnxRadSrvStatsAuthAvgDelay100)	long	The value of tmnxRadSrvStatsAuthAvgDelay100 indicates in microseconds, the average response delay for the last 100 authentication packets.
radSrvStatsAuthAvgDelay1000 [Rad Srv Stats Auth Avg Delay 1000] (tmnxRadSrvStatsAuthAvgDelay1000)	long	The value of tmnxRadSrvStatsAuthAvgDelay1000 indicates in microseconds, the average response delay for the last 1000 authentication packets.
radSrvStatsAuthAvgDelay10000 [Rad Srv Stats Auth Avg Delay 10000] (tmnxRadSrvStatsAuthAvgDelay10000)	long	The value of tmnxRadSrvStatsAuthAvgDelay10000 indicates in microseconds, the average response delay for the last 10000 authentication packets.
radSrvStatsFailedAcct [Rad Srv Stats Failed Acct] (tmnxRadSrvStatsAcctFailed)	long	The value of tmnxRadSrvStatsAcctFailed indicates the number of accounting failures for this server.
radSrvStatsFailedAuth [Rad Srv Stats Failed Auth] (tmnxRadSrvStatsAuthFailed)	long	The value of tmnxRadSrvStatsAuthFailed indicates the number of authentication failures for this server.
radSrvStatsReqOvrlSendFail [Rad Srv Stats Req Ovr Id Send Fail] (tmnxRadSrvStatsReqOvrlSendFail)	long	The value of tmnxRadSrvStatsReqOvrlSendFail indicates the number of RADIUS request packets that could not be transmitted while the RADIUS server was in overload.
radSrvStatsReqPending [Rad Srv Stats Req Pending] (tmnxRadSrvStatsReqPending)	long	The value of tmnxRadSrvStatsReqPending indicates the number of RADIUS request packets that are currently waiting for reply from this server.
radSrvStatsReqSendFailure [Rad Srv Stats Req Send Failure] (tmnxRadSrvStatsReqSendFailure)	long	The value of tmnxRadSrvStatsReqSendFailure indicates the number of RADIUS request packets that could not be transmitted for this server.
radSrvStatsReqTimeout [Rad Srv Stats Req Timeout] (tmnxRadSrvStatsReqTimeout)	long	The value of tmnxRadSrvStatsReqTimeout indicates the number of RADIUS request packets that have timed out for this server.

Table 238 aaa statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
radSrvStatsRespInvAuth [Rad Srv Stats Resp Inv Auth] (tmnxRadSrvStatsRespInvAuth)	long	The value of tmnxRadSrvStatsRespInvAuth indicates the number of RADIUS response packets with an invalid Authenticator received from this server.
radSrvStatsRespInvMsgAuth [Rad Srv Stats Resp Inv Msg Auth] (tmnxRadSrvStatsRespInvMsgAuth)	long	The value of tmnxRadSrvStatsRespInvMsgAuth indicates the number of RADIUS response packets with an invalid Message-Authenticator attribute received from this server.
radSrvStatsRxResponses [Rad Srv Stats Rx Responses] (tmnxRadSrvStatsRxResponses)	long	The value of tmnxRadSrvStatsRxResponses indicates the number of RADIUS response packets received from this server.
radSrvStatsTxRequests [Rad Srv Stats Tx Requests] (tmnxRadSrvStatsTxRequests)	long	The value of tmnxRadSrvStatsTxRequests indicates the number of RADIUS request packets transmitted for this server.

Table 239 aapolicy statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AAIcapServerStats</p> <p>MIB entry name: tmnxBsxIcapServerStatsEntry</p> <p>Entry description: Each entry represents the statistics for a particular AA URL filter and ICAP server. An index with a valid ICAP server (an existing row in tmnxBsxIcapServerTable) and tmnxChassisIndex set to one with a zero value for each of tmnxBsxCardSlotNum and tmnxMDASlotNum will return the following per group, URL Filter and ICAP server: * the summarized statistics, and * the worst case values for tmnxBsxIcapServerStatsRoundTrip and tmnxBsxIcapServerStatsConnUtil Entries will appears in this table only for equipped ISA-AA MDAs associated with an AA group, URL filter and ICAP server.</p> <p>Table description (for tmnxBsxIcapServerStatsTable): The tmnxBsxIcapServerStatsTable contains operational information related to a particular ICAP server associated with a particular URL filter. Each row contains the status and performance-oriented statistics information per group, URL filter and ICAP server for an ISA-AA uniquely identified by the tmnxChassisIndex, tmnxCardSlotNum, and the tmnxMDASlotNum.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.AAIcapServer</p>		
connEstCount [Conn Est Count] (tmnxBsxIcapServerStatsConnEst)	long	The value of tmnxBsxIcapServerStatsConnEst indicates the current number of TCP connections which are established with the ICAP server.
connTotalCount [Conn Total Count] (tmnxBsxIcapServerStatsConnTotal)	long	The value of tmnxBsxIcapServerStatsConnTotal indicates the number of TCP connections which can be established with the ICAP server.
connUtilCount [Conn Util Count] (tmnxBsxIcapServerStatsConnUtil)	long	The value of tmnxBsxIcapServerStatsConnUtil indicates the percentage of TCP connections utilized over the last 10 second period.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
daughterCardSlotId [Daughter Card Slot Id] (tmnxMDASlotNum)	int	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.
reqErrorsCount [Req Errors Count] (tmnxBsxlcapServerStatsReqErrors)	java. math. BigInteger	The value of tmnxBsxlcapServerStatsReqErrors indicates the number of ICAP requests that were unable to be sent to the ICAP server.
reqRateCount [Req Rate Count] (tmnxBsxlcapServerStatsReqRate)	long	The value of tmnxBsxlcapServerStatsReqRate indicates the average number of ICAP requests sent per second over the last 10 second period.
requestsCount [Requests Count] (tmnxBsxlcapServerStatsRequests)	java. math. BigInteger	The value of tmnxBsxlcapServerStatsRequests indicates the number of ICAP requests which have been sent to this ICAP server.
respAllowCount [Resp Allow Count] (tmnxBsxlcapServerStatsRespAllow)	java. math. BigInteger	The value of tmnxBsxlcapServerStatsRespAllow indicates the number of ICAP allow responses which have been received from the ICAP server.
respBlockCount [Resp Block Count] (tmnxBsxlcapServerStatsRespBlock)	java. math. BigInteger	The value of tmnxBsxlcapServerStatsRespBlock indicates the number of ICAP block responses which have been received from the ICAP server.
respRedirCount [Resp Redir Count] (tmnxBsxlcapServerStatsRespRedir)	java. math. BigInteger	The value of tmnxBsxlcapServerStatsRespRedir indicates the number of ICAP redirect responses which have been received from the ICAP server.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
roundTripCount [Round Trip Count] (tmnxBsxIcapServerStatsRoundTrip)	long	The value of tmnxBsxIcapServerStatsRoundTrip indicates the average amount of time it took to receive ICAP Responses over the last 10 second period.
slotId [Slot Id] (tmnxBsxCardSlotNum)	int	The value of tmnxBsxCardSlotNum indicates the slot number of this ISA-AA MDA.
<p>AAUrlFilterStats</p> <p>MIB entry name: tmnxMDAEntry</p> <p>Entry description: Each row entry represents a MDA slot in an IOM card in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. When a tmnxCardEntry has tmnxCardAssignedType or tmnxCardEquippedType equal to an IOM card type that supports MDA slots, a tmnxMDAEntry is created by the agent for each MDA slot on that IOM card. Before a tmnxCardEntry can be deleted, each tmnxMDAEntry for that card must be in the proper state for removal.</p> <p>Table description (for tmnxMDATable): The tmnxMDATable has an entry for each MDA slot in each IOM card in this chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.AAUrlFilter</p>		
daughterCardSlotId [Daughter Card Slot Id] (tmnxMDASlotNum)	int	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.
httpReqErrorsCount [Http Req Errors Count] (tmnxBsxUrIFltrStatsHttpReqErrors)	java. math. BigInteger	The value of tmnxBsxUrIFltrStatsHttpReqErrors indicates the number of times the HTTP request that were unable to be sent to the ICAP server.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
httpRequestsCount [Http Requests Count] (tmnxBsxUrlFiltrStatsHttpRequests)	java. math. BigInteger	The value of tmnxBsxUrlFiltrStatsHttpRequests indicates the number of HTTP requests received.
httpRespAllowCount [Http Resp Allow Count] (tmnxBsxUrlFiltrStatsHttpRespAllow)	java. math. BigInteger	The value of tmnxBsxUrlFiltrStatsHttpRespAllow indicates the number of times the HTTP response has been allowed.
httpRespBlockCount [Http Resp Block Count] (tmnxBsxUrlFiltrStatsHttpRespBlock)	java. math. BigInteger	The value of tmnxBsxUrlFiltrStatsHttpRespBlock indicates the number of times the HTTP response has been blocked.
httpRespDefCount [Http Resp Def Count] (tmnxBsxUrlFiltrStatsHttpRespDef)	java. math. BigInteger	The value of tmnxBsxUrlFiltrStatsHttpRespDef indicates the number of times the tmnxBsxUrlFilterDefaultAction has been taken on the HTTP response.
httpRespRedirCount [Http Resp Redir Count] (tmnxBsxUrlFiltrStatsHttpRespRedir)	java. math. BigInteger	The value of tmnxBsxUrlFiltrStatsHttpRespRedir indicates the number of times the HTTP response has been redirected.
icapLateRespCount [Icap Late Resp Count] (tmnxBsxUrlFiltrStatsIcapLateResp)	java. math. BigInteger	The value of tmnxBsxUrlFiltrStatsIcapLateResp indicates the number of times the HTTP response was received prior to the ICAP response.
slotId [Slot Id] (tmnxBsxCardSlotNum)	int	The value of tmnxBsxCardSlotNum indicates the slot number of this ISA-AA MDA.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxAARadiusAccountingPolicyStats</p> <p>MIB entry name: tmnxBsxRadApStatEntry</p> <p>Entry description: Each row entry represents a collection of statistics for an AA RADIUS accounting policy. Rows in this table are created automatically by the system.</p> <p>Table description (for tmnxBsxRadApStatTable): The tmnxBsxRadApStatTable presents statistics of AA RADIUS accounting policies.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.AARadiusAccountingPolicy</p>		
reqSendFail [Req Send Fail] (tmnxBsxRadApSendFail)	long	The value of tmnxBsxRadApSendFail indicates how many RADIUS accounting requests failed because the packet could not be sent.
reqTimeouts [Req Timeouts] (tmnxBsxRadApReqTimeouts)	long	The value of tmnxBsxRadApReqTimeouts indicates the number of RADIUS accounting requests which have timed out for this policy.
rxResponses [Rx Responses] (tmnxBsxRadApRxResponses)	long	The value of tmnxBsxRadApRxResponses indicates the number of RADIUS accounting responses received for this policy.
sendRetries [Send Retries] (tmnxBsxRadApSendRetries)	long	The value of tmnxBsxRadApSendRetries indicates the number of retries to a different server for a single RADIUS accounting request for this policy.
txRequests [Tx Requests] (tmnxBsxRadApTxRequests)	long	The value of tmnxBsxRadApTxRequests indicates the number of RADIUS accounting requests transmitted for this policy.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxAARadiusAccountingServerStats</p> <p>MIB entry name: tmnxBsxRadApServStatEntry</p> <p>Entry description: Each row represents statistics about a specific server for a specific AA RADIUS accounting policy. Rows in this table are created automatically by the system.</p> <p>Table description (for tmnxBsxRadApServStatTable): The tmnxBsxRadApServStatTable presents statistics of AA RADIUS accounting policy servers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.AARadiusAccountingServer</p>		
reqSendFail [Req Send Fail] (tmnxBsxRadApServReqSendFail)	long	The value of tmnxBsxRadApServReqSendFail indicates the number of RADIUS accounting requests that failed because the packet could not be sent.
reqTimeouts [Req Timeouts] (tmnxBsxRadApServReqTimeouts)	long	The value of tmnxBsxRadApServReqTimeouts indicates the number of RADIUS accounting requests that have timed out for this server.
rxResponses [Rx Responses] (tmnxBsxRadApServRxResponses)	long	The value of tmnxBsxRadApServRxResponses indicates the number of RADIUS accounting responses received for this server.
txRequests [Tx Requests] (tmnxBsxRadApServTxRequests)	long	The value of tmnxBsxRadApServTxRequests indicates the number of RADIUS accounting requests transmitted for this server.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxAaAccountingStats</p> <p>MIB entry name: tmnxBsxStatAaEntry</p> <p>Entry description: Each tmnxBsxStatAaEntry contains the statistics for a particular group, partition, statistics type and statistics name. A value of 'chargingGroup (4)' is not supported for the tmnxBsxStatAaType.</p> <p>Table description (for tmnxBsxStatAaTable): The tmnxBsxStatAaTable contains an entry for each system wide statistics type and statistics name per group and partition.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • aapolicy.Application • aapolicy.ApplicationGroup • isa.AaGroup • isa.AaPartition 		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaActFlwsFmSb)	long	The value of tmnxBsxStatAaActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaActFlwsToSb)	long	The value of tmnxBsxStatAaActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaMedDurFlws.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyFmSb indicates the total number of flows the dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFlwsDnyToSb.
numOfSubscribers [Num Of Subscribers] (tmnxBsxStatAaNumSubscribers)	long	The value of tmnxBsxStatAaNumSubscribers indicates the number of subscribers at the most recent 5-minute snapshot of statistics.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyToSb.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlws indicates the total number of allowed flows in both directions that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlws.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxAaAppFilterStats</p> <p>MIB entry name: tmnxBsxStatAaAppFilterEntry</p> <p>Entry description: Each tmnxBsxStatAaAppFilterEntry row contains statistics for a specific filter entry.</p> <p>Table description (for tmnxBsxStatAaAppFilterTable): The tmnxBsxStatAaAppFilterTable contains statistics for application filters as defined in the tmnxBsxAppFilterTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.ApplicationFilter</p>		
flows [Flows] (tmnxBsxStatAaAppFilterHCFloWS)	java. math. BigInteger	The value of tmnxBsxStatAaAppFilterHCFloWS indicates the number of flows that have matched this entry.
octets [Octets] (tmnxBsxStatAaAppFilterFlowHCOctC)	java. math. BigInteger	The value of tmnxBsxStatAaAppFilterFlowHCOctC indicates the number of octets in the flows that have matched this entry.
<p>BsxAaEsmHostCustRecAppGrpStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: isa.AaEsmHostInfo</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubActFlwsFmSb)	long	The value of tmnxBsxStatAaSubActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubActFlwsToSb)	long	The value of tmnxBsxStatAaSubActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsDnyFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is the 64-bit version of tmnxBsxStatAaSubFlwsDnyToSb.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>BsxAaEsmHostCustRecAppGrpUsageMonStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: isa.AaEsmHostInfo</p>		
aaSubscriberType [Aa Subscriber Type] (tmnxBsxAaSubscriberType)	int	The value of tmnxBsxAaSubscriberType specifies the format of the Application Assurance Subscriber identifier.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
esmMacName [Esm Mac Name] (tmnxBsxAaSubscriber)	String	The Application Assurance Subscriber identifier. The format of this object is determined by the value of the tmnxBsxAaSubscriberType.
grpPartIndex [Grp Part Index] (tmnxBsxAaGrpPartIndex)	long	The value of tmnxBsxAaGrpPartIndex specifies the partition index within an AA group. The corresponding row for the AA group must have already been created in the tmnxBsxlsaAaGrpTable. Partition index '0' indicates group wide AA policy information, and is automatically created when the AA group is created in the tmnxBsxlsaAaGrpTable.
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
umBothGrantCredit [Um Both Grant Credit] (tmnxBsxAaSubUMBothGrantCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMBothGrantCredit indicates the amount of credits allocated by the policy server for either direction.
umBothUsedCredit [Um Both Used Credit] (tmnxBsxAaSubUMBothUsedCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMBothUsedCredit indicates the amount of credits used by either direction.
umFromSubGrantCredit [Um From Sub Grant Credit] (tmnxBsxAaSubUMFmSubGrantCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMFmSubGrantCredit indicates the amount of credits allocated by the policy server for the subscriber to network direction.
umFromSubUsedCredit [Um From Sub Used Credit] (tmnxBsxAaSubUMFmSubUsedCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMFmSubUsedCredit indicates the amount of credits used by the subscriber to network direction.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
umToSubGrantCredit [Um To Sub Grant Credit] (tmnxBsxAaSubUMToSubGrantCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMToSubGrantCredit indicates the amount of credits allocated by the policy server for the network to subscriber direction.
umToSubUsedCredit [Um To Sub Used Credit] (tmnxBsxAaSubUMToSubUsedCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMToSubUsedCredit indicates the amount of credits used by the network to subscriber direction.
<p>BsxAaEsmHostCustRecAppStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: isa.AaEsmHostInfo</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubActFlwsFmSb)	long	The value of tmnxBsxStatAaSubActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubActFlwsToSb)	long	The value of tmnxBsxStatAaSubActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubLngDurFlws.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is the 64-bit version of tmnxBsxStatAaSubFlwsDnyToSb.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>BsxAaEsmHostCustRecAppUsageMonStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubSdyHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyToSb.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubSdyHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubSdyHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubSdyHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubSdyHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubSdyHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubSdyHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubSdyHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubSdyHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyToSb.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubSdyHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlwDur.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
termFlows [Term Flows] (tmnxBsxStatAaSubSdyHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlws.
<p>BsxAaEsmHostSpecialStudyProtStats</p> <p>MIB entry name: tmnxBsxStatAaSubSdyEntry</p> <p>Entry description: Each tmnxBsxStatAaSubSdyEntry contains the application assurance per-special study subscriber statistics for a combination of group, partition, statistics interval, statistics type, subscriber, and statistics name. A value of 'chargingGroup (4)' is not supported for the tmnxBsxStatAaType.</p> <p>Table description (for tmnxBsxStatAaSubSdyTable): The tmnxBsxStatAaSubSdyTable contains an entry for each application-assurance special study subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the special study subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: isa.AaEsmHostInfo</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubSdyActFlwsFmSb)	long	The value of tmnxBsxStatAaSubSdyActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubSdyActFlwsToSb)	long	The value of tmnxBsxStatAaSubSdyActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubSdyHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyLngDurFlws.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubSdyHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubSdyHCSHrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCSHrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubSdyHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubSdyHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubSdyHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubSdyHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyToSb.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubSdyHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmFmSb.

aaSubscriberType [Aa Subscriber Type] (tmnxBsxAaSubscriberType)	int	The value of tmnxBsxAaSubscriberType specifies the format of the Application Assurance Subscriber identifier.
operationStatus [Operation Status] (tmnxBsxAaSubUMOperStatus)	int	The value of tmnxBsxAaSubUMOperStatus indicates the operational state for the usage monitor. When 'active (2)', a rule has been received and credits have been sent from policy server. When 'inactive (1)', a rule has been received but no credits have been sent from policy server. When 'adminDisabled (0)', a rule has been 'shutdown' on the policy server.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
umBothGrantCredit [Um Both Grant Credit] (tmnxBsxAaSubUMBothGrantCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMBothGrantCredit indicates the amount of credits allocated by the policy server for either direction.
umBothGrantStatus [Um Both Grant Status] (tmnxBsxAaSubUMBothGrantStatus)	int	The value of tmnxBsxAaSubUMBothGrantStatus indicates grant status for the network to subscriber direction.
umBothUsedCredit [Um Both Used Credit] (tmnxBsxAaSubUMBothUsedCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMBothUsedCredit indicates the amount of credits used by either direction.
umFromSubGrantCredit [Um From Sub Grant Credit] (tmnxBsxAaSubUMFmSubGrantCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMFmSubGrantCredit indicates the amount of credits allocated by the policy server for the subscriber to network direction.
umFromSubGrantStatus [Um From Sub Grant Status] (tmnxBsxAaSubUMFmSubGrantStatus)	int	The value of tmnxBsxAaSubUMFmSubGrantStatus indicates grant status for the subscriber to network direction.
umFromSubUsedCredit [Um From Sub Used Credit] (tmnxBsxAaSubUMFmSubUsedCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMFmSubUsedCredit indicates the amount of credits used by the subscriber to network direction.
umToSubGrantCredit [Um To Sub Grant Credit] (tmnxBsxAaSubUMToSubGrantCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMToSubGrantCredit indicates the amount of credits allocated by the policy server for the network to subscriber direction.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
umToSubGrantStatus [Um To Sub Grant Status] (tmnxBsxAaSubUMToSubGrantStatus)	int	The value of tmnxBsxAaSubUMToSubGrantStatus indicates grant status for the network to subscriber direction.
umToSubUsedCredit [Um To Sub Used Credit] (tmnxBsxAaSubUMToSubUsedCredit)	java. math. BigInteger	The value of tmnxBsxAaSubUMToSubUsedCredit indicates the amount of credits used by the network to subscriber direction.
<p>BsxAppGrpStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: aapolicy.ApplicationGroup</p>		
aaName [Aa Name] (tmnxBsxStatAaName)	String	The value of tmnxBsxStatAaName specifies either the ISA-AA protocol, application or app-group name for which statistics are requested. The tmnxBsxStatAaType is used to determine the statistics type.
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaActFlwsFmSb)	long	The value of tmnxBsxStatAaActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaActFlwsToSb)	long	The value of tmnxBsxStatAaActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFIwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFIwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyFmSb indicates the total number of flows the dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFIwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFIwsDnyToSb.
numOfSubscribers [Num Of Subscribers] (tmnxBsxStatAaNumSubscribers)	long	The value of tmnxBsxStatAaNumSubscribers indicates the number of subscribers at the most recent 5-minute snapshot of statistics.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlws indicates the total number of allowed flows in both directions that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlws.
<p>BsxAppQosPolicyStats MIB entry name: tmnxBsxAqpStatsEntry Entry description: Each tmnxBsxAqpStatsEntry indicates statistics available to collect for each application QoS policy entry. Table description (for tmnxBsxAqpStatsTable): The tmnxBsxAqpStatsTable contains the application qos policy statistics. Supports realtime plotting Supports scheduled collection Monitored class: aapolicy.AppQosPolicy</p>		
hcConflicts [Hc Conflicts] (tmnxBsxAqpStatsHCCConflicts)	java. math. BigInteger	The value of tmnxBsxAqpStatsHCCConflicts indicates the number of flows that have hit this AQP entry, but resulted in a conflict with the match criteria.
hcFlows [Hc Flows] (tmnxBsxAqpStatsHCFlows)	java. math. BigInteger	The value of tmnxBsxAqpStatsHCFlows indicates the number of flows that have hit this entry. In certain cases, a flow may change its attributes thus undergoing a second policy evaluation. In these cases, the flow may be counted against two different AQP entries.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxAppStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: aapolicy.Application</p>		
aaName [Aa Name] (tmnxBsxStatAaName)	String	The value of tmnxBsxStatAaName specifies either the ISA-AA protocol, application or app-group name for which statistics are requested. The tmnxBsxStatAaType is used to determine the statistics type.
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaActFlwsFmSb)	long	The value of tmnxBsxStatAaActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaActFlwsToSb)	long	The value of tmnxBsxStatAaActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaMedDurFlws.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyFmSb indicates the total number of flows the dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFlwsDnyToSb.
numOfSubscribers [Num Of Subscribers] (tmnxBsxStatAaNumSubscribers)	long	The value of tmnxBsxStatAaNumSubscribers indicates the number of subscribers at the most recent 5-minute snapshot of statistics.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyToSb.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlws indicates the total number of allowed flows in both directions that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlws.

Table 239 aapolicy statistics (continued)

This object is a 64-bit version of tmnxBsxStatAaShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyFmSb indicates the total number of flows the dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFlwsDnyToSb.
numOfSubscribers [Num Of Subscribers] (tmnxBsxStatAaNumSubscribers)	long	The value of tmnxBsxStatAaNumSubscribers indicates the number of subscribers at the most recent 5-minute snapshot of statistics.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyToSb.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlws indicates the total number of allowed flows in both directions that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlws.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxDnsIpCacheStats</p> <p>MIB entry name: tmnxBsxDnsIpCacheStatEntry</p> <p>Entry description: Each tmnxBsxDnsIpCacheStatEntry specifies Application Assurance DNS IP Cache statistics. An index with a valid DNS IP Cache (an existing row in tmnxBsxDnsIpCacheTable) and tmnxChassisIndex set to one with a zero value for each of tmnxBsxCardSlotNum and tmnxMDASlotNum will return the summarized statistics per group and DNS IP Cache.</p> <p>Table description (for tmnxBsxDnsIpCacheStatTable): The tmnxBsxDnsIpCacheStatTable contains an entry for each configured Application Assurance DNS IP Cache. Rows in this table are automatically created and destroyed when DNS IP Caches are created or destroyed using the tmnxBsxDnsIpCacheTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.DnsIpCache</p>		
alarmClear [Alarm Clear] (tmnxBsxDnsIpCacheStatAlarmClear)	boolean	The value of tmnxBsxDnsIpCacheStatAlarmClear indicates the state of the threshold alarm for this cache. A value of 'true (1)' indicates the alarm is clear, and a value of 'false (2)' indicates the alarm is set.
disconnectTime [Disconnect Time] (tmnxBsxDnsIpCacheStatDiscntTime)	long	The value of tmnxBsxDnsIpCacheStatDiscntTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when the ISA-AA MDA within the group has last changed status.
domainsMatch [Domains Match] (tmnxBsxDnsIpCacheStatDomMtch)	java.math. BigInteger	The value of tmnxBsxDnsIpCacheStatDomMtch indicates the number of DNS response domains that have matched an entry in the tmnxBsxDnsIpCacheDomainTable associated with this cache.
entriesAdd [Entries Add] (tmnxBsxDnsIpCacheStatEntrAdd)	java.math. BigInteger	The value of tmnxBsxDnsIpCacheStatEntrAdd indicates the total number of entries that have been added to this cache.
entriesRemove [Entries Remove] (tmnxBsxDnsIpCacheStatEntrRmvd)	java.math. BigInteger	The value of tmnxBsxDnsIpCacheStatEntrRmvd indicates the total number of entries that have been removed from this cache.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fullCount [Full Count] (tmnxBsxDnsIpCacheStatFullCnt)	java. math. BigInteger	The value of tmnxBsxDnsIpCacheStatFullCnt indicates the number of times an entry could not be added because the cache was full.
hitCount [Hit Count] (tmnxBsxDnsIpCacheStatHitCnt)	java. math. BigInteger	The value of tmnxBsxDnsIpCacheStatHitCnt indicates the number of times an IP address lookup in this cache was successful.
missCount [Miss Count] (tmnxBsxDnsIpCacheStatMissCnt)	java. math. BigInteger	The value of tmnxBsxDnsIpCacheStatMissCnt indicates the number of times an IP address lookup in this cache was unsuccessful.
responsesCount [Responses Count] (tmnxBsxDnsIpCacheStatDnsResp)	java. math. BigInteger	The value of tmnxBsxDnsIpCacheStatDnsResp indicates the number of DNS responses that have been compared to the entries in the tmnxBsxDnsIpCacheDomainTable and the tmnxBsxDnsIpCacheServerTable associated with this cache.
serversMatch [Servers Match] (tmnxBsxDnsIpCacheStatDomSerMtch)	java. math. BigInteger	The value of tmnxBsxDnsIpCacheStatDomSerMtch indicates the number of DNS responses whose domain matched an entry in the tmnxBsxDnsIpCacheDomainTable and server IP address matched an entry in the tmnxBsxDnsIpCacheServerTable associated with this cache.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxGtpFltrStats</p> <p>MIB entry name: tmnxMDAEntry</p> <p>Entry description: Each row entry represents a MDA slot in an IOM card in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. When a tmnxCardEntry has tmnxCardAssignedType or tmnxCardEquippedType equal to an IOM card type that supports MDA slots, a tmnxMDAEntry is created by the agent for each MDA slot on that IOM card. Before a tmnxCardEntry can be deleted, each tmnxMDAEntry for that card must be in the proper state for removal.</p> <p>Table description (for tmnxMDATable): The tmnxMDATable has an entry for each MDA slot in each IOM card in this chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.GtpFilter</p>		
daughterCardSlotId [Daughter Card Slot Id] (tmnxMDASlotNum)	int	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.
discntTime [Discnt Time] (tmnxBsxGtpFltrStatsDiscntTime)	long	The value of tmnxBsxGtpFltrStatsDiscntTime indicates discontinuity time. This is the SNMPv2-MIB::sysUpTime (hundredths of a second) when the ISA-AA MDA within the group last changed status.
pkDndExtHdr [Pk Dnd Ext Hdr] (tmnxBsxGtpFltrStatsPkDndExtHdr)	java. math. BigInteger	The value of tmnxBsxGtpFltrStatsPkDndExtHdr indicates the number of packets denied by the GTP filter due to a missing extension header.
pkDndInfoElem [Pk Dnd Info Elem] (tmnxBsxGtpFltrStatsPkDndInfoElem)	java. math. BigInteger	The value of tmnxBsxGtpFltrStatsPkDndInfoElem indicates the number of packets denied by the GTP filter due to a missing, invalid, or malformed information element.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pkDndMandHdr [Pk Dnd Mand Hdr] (tmnxBsxGtpFiltrStatsPkDndMandHdr)	java. math. BigInteger	The value of tmnxBsxGtpFiltrStatsPkDndMandHdr indicates the number of packets denied by the GTP filter due to a missing mandatory header.
pkDndMsgType [Pk Dnd Msg Type] (tmnxBsxGtpFiltrStatsPkDndMsgType)	java. math. BigInteger	The value of tmnxBsxGtpFiltrStatsPkDndMsgType indicates the number of packets denied by the GTP filter due to message ID configuration in tmnxBsxGtpFiltrMsgTable.
pkDndPaydLen [Pk Dnd Payld Len] (tmnxBsxGtpFiltrStatsPkDndPayldLen)	java. math. BigInteger	The value of tmnxBsxGtpFiltrStatsPkDndPayldLen indicates the number of packets denied by the GTP filter due to the corresponding tmnxBsxGtpFiltrMaxPayloadLength in tmnxBsxGtpFiltrTable.
pkPermitted [Pk Permitted] (tmnxBsxGtpFiltrStatsPkPermitted)	java. math. BigInteger	The value of tmnxBsxGtpFiltrStatsPkPermitted indicates the number of packets permitted through the GTP filter.
slotId [Slot Id] (tmnxBsxCardSlotNum)	int	The value of tmnxBsxCardSlotNum indicates the slot number of this ISA-AA MDA.

Table 239 aapolicy statistics (continued)

pkDndFIPlcrFmSb [Pk Dnd FI Plcr Fm Sb] (tmnxBsxGtpStatsPkDndFIPlcrFmSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndFIPlcrFmSb indicates the number of packets denied in the subscriber to network direction by the policer flow-count limit due to the configuration of tmnxBsxPolicerGtpFlowCountLmt in tmnxBsxPolicerTable.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pkDndGtpFltrFmSb [Pk Dnd Gtp Fltr Fm Sb] (tmnxBsxGtpStatsPkDndGtpFltrFmSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndGtpFltrFmSb indicates the number of packets denied in the subscriber to network direction due to GTP filter configuration in tmnxBsxGtpFltrTable.
pkDndGtpFltrToSb [Pk Dnd Gtp Fltr To Sb] (tmnxBsxGtpStatsPkDndGtpFltrToSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndGtpFltrToSb indicates the number of packets denied in the network to subscriber direction by the policer flow-count limit due to the configuration of tmnxBsxPolicerGtpFlowCountLmt in tmnxBsxPolicerTable.
pkDndGtpLenFmSb [Pk Dnd Gtp Len Fm Sb] (tmnxBsxGtpStatsPkDndGtpLenFmSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndGtpLenFmSb indicates the number of GTP packets denied in the subscriber to network direction due to improper GTP message length.
pkDndGtpLenToSb [Pk Dnd Gtp Len To Sb] (tmnxBsxGtpStatsPkDndGtpLenToSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndGtpLenToSb indicates the number of GTP packets denied in the network to subscriber direction due to improper GTP message length.
pkDndGtpVerFmSb [Pk Dnd Gtp Ver Fm Sb] (tmnxBsxGtpStatsPkDndGtpVerFmSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndGtpVerFmSb indicates the number of GTP packets denied in the subscriber to network direction due to unsupported GTP version.
pkDndGtpVerToSb [Pk Dnd Gtp Ver To Sb] (tmnxBsxGtpStatsPkDndGtpVerToSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndGtpVerToSb indicates the number of packets denied in the network to subscriber direction due to GTP filter configuration in tmnxBsxGtpFltrTable.
pkDndPlcyOthrFmSb [Pk Dnd Plcy Othr Fm Sb] (tmnxBsxGtpStatsPkDndPlcyOthrFmSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndPlcyOthrFmSb indicates the number of packets denied in the subscriber to network direction due to non gtp-traffic policers, session filters, or flow resource exhaustion.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pkDndPlcyOthrToSb [Pk Dnd Plcy Othr To Sb] (tmnxBsxGtpStatsPkDndPlcyOthrToSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndPlcyOthrToSb indicates the number of packets denied in the network to subscriber direction due to non gtp-traffic policers, session filters, or flow resource exhaustion.
pkDndUdpLenFmSb [Pk Dnd Udp Len Fm Sb] (tmnxBsxGtpStatsPkDndUdpLenFmSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndUdpLenFmSb indicates the number of GTP packets denied in the subscriber to network direction due to improper UDP packet length.
pkDndUdpLenToSb [Pk Dnd Udp Len To Sb] (tmnxBsxGtpStatsPkDndUdpLenToSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkDndUdpLenToSb indicates the number of GTP packets denied in the network to subscriber direction due to improper UDP packet length.
pkPermittedFmSb [Pk Permitted Fm Sb] (tmnxBsxGtpStatsPkPermittedFmSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkPermittedFmSb indicates the number of GTP packets permitted in the subscriber to network direction.
pkPermittedToSb [Pk Permitted To Sb] (tmnxBsxGtpStatsPkPermittedToSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkPermittedToSb indicates the number of GTP packets permitted in the network to subscriber direction.
pkPrmtNoFiltrFmSb [Pk Prmt No Filtr Fm Sb] (tmnxBsxGtpStatsPkPrmtNoFiltrFmSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkPrmtNoFiltrFmSb indicates the number of GTP packets permitted in the subscriber to network direction which were not subject to a GTP filter. This value is a subset of tmnxBsxGtpStatsPkPermittedFmSb.
pkPrmtNoFiltrToSb [Pk Prmt No Filtr To Sb] (tmnxBsxGtpStatsPkPrmtNoFiltrToSb)	java. math. BigInteger	The value of tmnxBsxGtpStatsPkPrmtNoFiltrToSb indicates the number of GTP packets permitted in the network to subscriber direction which were not subject to a GTP filter. This value is a subset of tmnxBsxGtpStatsPkPermittedToSb.
slotId [Slot Id] (tmnxBsxCardSlotNum)	int	The value of tmnxBsxCardSlotNum indicates the slot number of this ISA-AA MDA.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxHttpEnrichStats</p> <p>MIB entry name: tmnxBsxHttpEnrichStatEntry</p> <p>Entry description: Each tmnxBsxHttpEnrichStatEntry contains statistics for HTTP enrichment. An index with a valid tmnxBsxAaGrpPartIndex/tmnxBsxHttpEnrichName (an existing row in tmnxBsxHttpEnrichTable), tmnxChassisIndex set to one, and a zero value for each of tmnxBsxCardSlotNum and tmnxMDASlotNum will return the summarized per group and HTTP enrichment template statistics. Entries will appear in this table only for equipped ISA-AA MDAs associated with an AA group and an HTTP enrichment template.</p> <p>Table description (for tmnxBsxHttpEnrichStatTable): The tmnxBsxHttpEnrichStatTable contains statistics for HTTP enrichment. Each row contains the performance-oriented statistics information per group and HTTP enrichment template for an ISA-AA uniquely identified by the tmnxChassisIndex, tmnxCardSlotNum, and the tmnxMDASlotNum.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.AppQosPolicy</p>		
antiSpoofMod [Anti Spoof Mod] (tmnxBsxHttpEnrichAntiSpoofMod)	java. math. BigInteger	The value of tmnxBsxHttpEnrichAntiSpoofMod indicates the number of HTTP header modifications that have been made for anti-spoofing. A value of 0 is returned if the value of tmnxBsxHttpEnrichFieldAntiSpoof is disabled.
antiSpoofShort [Anti Spoof Short] (tmnxBsxHttpEnrichNoAntiSpfShort)	java. math. BigInteger	The value of tmnxBsxHttpEnrichNoAntiSpfShort indicates the number of HTTP header modifications that were not made for anti-spoofing due to an HTTP header field value being short enough to result in a packet size increase if anti-spoofing were applied. A value of 0 is returned if the value of tmnxBsxHttpEnrichFieldAntiSpoof is disabled.
chassisIndex [Chassis Index] (tmnxChassisIndex)	long	The value of tmnxChassisIndex specifies a system identifier. The value of this object cannot be changed. The only supported value is '1'. Different values of TmnxPhysChassisIndex are used to identify different physical chassis (e.g. in an XRS-40 system) in tmnxPhysChassisTable.
disconnectTime [Disconnect Time] (tmnxBsxHttpEnrichStatDiscontTime)	long	The value of tmnxBsxHttpEnrichStatDiscontTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when the ISA-AA MDA within the group has last changed status.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
grpPartIndex [Grp Part Index] (tmnxBsxAaGrpPartIndex)	long	The value of tmnxBsxAaGrpPartIndex specifies the partition index within an AA group. The corresponding row for the AA group must have already been created in the tmnxBsxIsaAaGrpTable. Partition index '0' indicates group wide AA policy information, and is automatically created when the AA group is created in the tmnxBsxIsaAaGrpTable.
maxPacket [Max Packet] (tmnxBsxHttpEnrichHCExceedMaxPkt)	java. math. BigInteger	The value of tmnxBsxHttpEnrichHCExceedMaxPkt indicates the number of HTTP requests not enriched due to the packet size being greater than the maximum HTTP enrichment packet size specified in tmnxBsxIsaAaGrpHttpEnrichMaxPkt.
mdaSlotNum [Mda Slot Num] (tmnxMDASlotNum)	long	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.
msgCount [Msg Count] (tmnxBsxHttpEnrichHCNumEnriched)	java. math. BigInteger	The value of tmnxBsxHttpEnrichHCNumEnriched indicates the number of enriched requests.
noSubData [No Sub Data] (tmnxBsxHttpEnrichHCMissngSubData)	java. math. BigInteger	The value of tmnxBsxHttpEnrichHCMissngSubData indicates the number of HTTP requests not enriched due to missing subscriber data.
outOfResourceCount [Out Of Resource Count] (tmnxBsxHttpEnrichHCNumNoResource)	java. math. BigInteger	The value of tmnxBsxHttpEnrichHCNumNoResource indicates the number of HTTP requests not enriched due to resource issues.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
templateDisabled [Template Disabled] (tmnxBsxHttpEnrichHCTpINotEnabled)	java. math. BigInteger	The value of tmnxBsxHttpEnrichHCTpINotEnabled indicates the number of HTTP requests not enriched due to the template not being enabled.
trafficChar [Traffic Char] (tmnxBsxHttpEnrichHCTrafficChar)	java. math. BigInteger	The value of tmnxBsxHttpEnrichHCTrafficChar indicates the number of HTTP requests not enriched due to traffic characteristics.
<p>BsxHttpErrorRedirectStats MIB entry name: tmnxBsxGrpMdaEntry Entry description: Each tmnxBsxGrpMdaEntry indicates a ISA-AA MDA is associated to a tmnxBsxIsaAaGrpEntry. Table description (for tmnxBsxGrpMdaTable): The tmnxBsxGrpMdaTable contains an entry for each ISA-AA MDA configured within a group. This table is populated when an MDA is configured with an MDA type of ISA-AA, and associated with an ISA-AA group. Supports realtime plotting Supports scheduled collection Monitored class: aapolicy.AppQosPolicy</p>		
cardSlotNum [Card Slot Num] (tmnxBsxCardSlotNum)	long	The value of tmnxBsxCardSlotNum indicates the slot number of this ISA-AA MDA.
chassisIndex [Chassis Index] (tmnxChassisIndex)	long	The value of tmnxChassisIndex specifies a system identifier. The value of this object cannot be changed. The only supported value is '1'. Different values of TmnxPhysChassisIndex are used to identify different physical chassis (e.g. in an XRS-40 system) in tmnxPhysChassisTable.
disconnectTime [Disconnect Time] (tmnxBsxHttpRdStatDiscontTime)	long	The value of tmnxBsxHttpRdStatDiscontTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when the ISA-AA MDA within the group has last changed status.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
errorCode [Error Code] (tmnxBsxHttpRedirErrCode)	long	The value of tmnxBsxHttpRedirErrCode specifies the error code for a HTTP Error Redirect. Error codes are defined in the tmnxBsxTListAttribTable in rows where the index tmnxBsxTListName has a value of 'http-error-redirect-error-code' and the index tmnxBsxTListAttribName has a value of 'code'.
errorCount [Error Count] (tmnxBsxHttpRdStatHCNotRedir)	java. math. BigInteger	The value of tmnxBsxHttpRdStatHCNotRedir indicates the number of message redirects that did not occur due to errors.
fileTypeCount [File Type Count] (tmnxBsxHttpRdStatHCNotRedirFType)	java. math. BigInteger	The value of tmnxBsxHttpRdStatHCNotRedirFType indicates the number of message redirects that did not occur due to the file type.
grpPartIndex [Grp Part Index] (tmnxBsxAaGrpPartIndex)	long	The value of tmnxBsxAaGrpPartIndex specifies the partition index within an AA group. The corresponding row for the AA group must have already been created in the tmnxBsxIsaAaGrpTable. Partition index '0' indicates group wide AA policy information, and is automatically created when the AA group is created in the tmnxBsxIsaAaGrpTable.
httpErrRedirName [Http Err Redir Name] (tmnxBsxHttpRedirErrName)	String	The value of tmnxBsxHttpRedirErrName specifies the name of the HTTP Error Redirect.
mdaSlotNum [Mda Slot Num] (tmnxMDASlotNum)	long	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
msgCount [Msg Count] (tmnxBsxHttpRdStatHCRedir)	java. math. BigInteger	The value of tmnxBsxHttpRdStatHCRedir indicates the number of redirected messages.
outOfResourceCount [Out Of Resource Count] (tmnxBsxHttpRdStatHCOutOfResource)	java. math. BigInteger	The value of tmnxBsxHttpRdStatHCOutOfResource indicates the number of message redirects that did not occur due to lack of resources.
sizeExceededCount [Size Exceeded Count] (tmnxBsxHttpRdStatHCSizeExceeded)	java. math. BigInteger	The value of tmnxBsxHttpRdStatHCSizeExceeded indicates the number of messages that have exceeded the custom message size associated with the error code.
<p>BsxHttpRedirectStats</p> <p>MIB entry name: tmnxBsxGrpMdaEntry</p> <p>Entry description: Each tmnxBsxGrpMdaEntry indicates a ISA-AA MDA is associated to a tmnxBsxIsaAaGrpEntry.</p> <p>Table description (for tmnxBsxGrpMdaTable): The tmnxBsxGrpMdaTable contains an entry for each ISA-AA MDA configured within a group. This table is populated when an MDA is configured with an MDA type of ISA-AA, and associated with an ISA-AA group.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.AppQosPolicy</p>		
cardSlotNum [Card Slot Num] (tmnxBsxCardSlotNum)	long	The value of tmnxBsxCardSlotNum indicates the slot number of this ISA-AA MDA.
chassisIndex [Chassis Index] (tmnxChassisIndex)	long	The value of tmnxChassisIndex specifies a system identifier. The value of this object cannot be changed. The only supported value is '1'. Different values of TmnxPhysChassisIndex are used to identify different physical chassis (e.g. in an XRS-40 system) in tmnxPhysChassisTable.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
disconnectTime [Disconnect Time] (tmnxBsxHttpPcyRdStatDiscontTime)	long	The value of tmnxBsxHttpPcyRdStatDiscontTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when the ISA-AA MDA within the group has last changed status.
errorCount [Error Count] (tmnxBsxHttpPcyRdStatHCNotRedir)	java. math. BigInteger	The value of tmnxBsxHttpPcyRdStatHCNotRedir indicates the number of sessions that were not redirected due to traffic attributes.
grpPartIndex [Grp Part Index] (tmnxBsxAaGrpPartIndex)	long	The value of tmnxBsxAaGrpPartIndex specifies the partition index within an AA group. The corresponding row for the AA group must have already been created in the tmnxBsxIsaAaGrpTable. Partition index '0' indicates group wide AA policy information, and is automatically created when the AA group is created in the tmnxBsxIsaAaGrpTable.
httpRedirName [Http Redir Name] (tmnxBsxHttpRedirName)	String	The value of tmnxBsxHttpRedirName specifies the name of the HTTP Redirect.
mdaSlotNum [Mda Slot Num] (tmnxMDASlotNum)	long	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.
msgCount [Msg Count] (tmnxBsxHttpPcyRdStatHCRedir)	java. math. BigInteger	The value of tmnxBsxHttpPcyRdStatHCRedir indicates the number of redirected sessions.
outOfResourceCount [Out Of Resource Count] (tmnxBsxHttpPcyRdStatHCOutOfRes)	java. math. BigInteger	The value of tmnxBsxHttpPcyRdStatHCOutOfRes indicates the number of sessions that were not redirected due to lack of resources.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pcyRdStatConfigError [Pcy Rd Stat Config Error] (tmnxBsxHttpPcyRdStatConfigError)	java. math. BigInteger	The value of tmnxBsxHttpPcyRdStatConfigError indicates the number of sessions that were not redirected due to configuration errors.
tcpClientResetCount [Tcp Client Reset Count] (tmnxBsxHttpPcyRdStatTcpResets)	java. math. BigInteger	The value of tmnxBsxHttpPcyRdStatTcpResets indicates the number of TCP client resets that have been sent.
<p>BsxProtStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • isa.AaGroup • isa.AaPartition 		
aaName [Aa Name] (tmnxBsxStatAaName)	String	The value of tmnxBsxStatAaName specifies either the ISA-AA protocol, application or app-group name for which statistics are requested. The tmnxBsxStatAaType is used to determine the statistics type.
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaActFlwsFmSb)	long	The value of tmnxBsxStatAaActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaActFlwsToSb)	long	The value of tmnxBsxStatAaActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyFmSb indicates the total number of flows the dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaFlwsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
numOfSubscribers [Num Of Subscribers] (tmnxBsxStatAaNumSubscribers)	long	The value of tmnxBsxStatAaNumSubscribers indicates the number of subscribers at the most recent 5-minute snapshot of statistics.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaPktsDnyToSb.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaHCTermFlws indicates the total number of allowed flows in both directions that have terminated. This object is a 64-bit version of tmnxBsxStatAaTermFlws.
<p>BsxSapCustRecAppGrpStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: service.AccessInterface</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubActFlwsFmSb)	long	The value of tmnxBsxStatAaSubActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubActFlwsToSb)	long	The value of tmnxBsxStatAaSubActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is the 64-bit version of tmnxBsxStatAaSubFlwsDnyToSb.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>BsxSapCustRecAppStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: service.AccessInterface</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubActFlwsFmSb)	long	The value of tmnxBsxStatAaSubActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubActFlwsToSb)	long	The value of tmnxBsxStatAaSubActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is the 64-bit version of tmnxBsxStatAaSubFlwsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>BsxSapCustRecProtStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubActFlwsFmSb)	long	The value of tmnxBsxStatAaSubActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubActFlwsToSb)	long	The value of tmnxBsxStatAaSubActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is the 64-bit version of tmnxBsxStatAaSubFlwsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
protName [Prot Name] (tmnxBsxStatAaName)	String	The value of tmnxBsxStatAaName specifies either the ISA-AA protocol, application or app-group name for which statistics are requested. The tmnxBsxStatAaType is used to determine the statistics type.
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>BsxSapStudyAppStats</p> <p>MIB entry name: tmnxBsxStatAaSubSdyEntry</p> <p>Entry description: Each tmnxBsxStatAaSubSdyEntry contains the application assurance per-special study subscriber statistics for a combination of group, partition, statistics interval, statistics type, subscriber, and statistics name. A value of 'chargingGroup (4)' is not supported for the tmnxBsxStatAaType.</p> <p>Table description (for tmnxBsxStatAaSubSdyTable): The tmnxBsxStatAaSubSdyTable contains an entry for each application-assurance special study subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the special study subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: service.AccessInterface</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubSdyActFlwsFmSb)	long	The value of tmnxBsxStatAaSubSdyActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubSdyActFlwsToSb)	long	The value of tmnxBsxStatAaSubSdyActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubSdyHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubSdyHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubSdyHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubSdyHCFlwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFlwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubSdyHCFlwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFlwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubSdyHCFlwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFlwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubSdyHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyToSb.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubSdyHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubSdyHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubSdyHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubSdyHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubSdyHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubSdyHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubSdyHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubSdyHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyToSb.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubSdyHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubSdyHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlws.
<p>BsxSapStudyProtStats</p> <p>MIB entry name: tmnxBsxStatAaSubSdyEntry</p> <p>Entry description: Each tmnxBsxStatAaSubSdyEntry contains the application assurance per-special study subscriber statistics for a combination of group, partition, statistics interval, statistics type, subscriber, and statistics name. NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubSdyHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubSdyHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubSdyHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubSdyHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubSdyHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubSdyHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubSdyHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubSdyHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
protName [Prot Name] (tmnxBsxStatAaName)	String	The value of tmnxBsxStatAaName specifies either the ISA-AA protocol, application or app-group name for which statistics are requested. The tmnxBsxStatAaType is used to determine the statistics type.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubSdyHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubSdyHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlws.
<p>BsxSctpFiltrStats</p> <p>MIB entry name: tmnxMDAEntry</p> <p>Entry description: Each row entry represents a MDA slot in an IOM card in a chassis in the system. Entries cannot be created and deleted via SNMP SET operations. When a tmnxCardEntry has tmnxCardAssignedType or tmnxCardEquippedType equal to an IOM card type that supports MDA slots, a tmnxMDAEntry is created by the agent for each MDA slot on that IOM card. Before a tmnxCardEntry can be deleted, each tmnxMDAEntry for that card must be in the proper state for removal.</p> <p>Table description (for tmnxMDATable): The tmnxMDATable has an entry for each MDA slot in each IOM card in this chassis in the TMNX system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.SctpFilter</p>		
daughterCardSlotId [Daughter Card Slot Id] (tmnxMDASlotNum)	int	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
discntTime [Discnt Time] (tmnxBsxSctpFltrStatsDiscntTime)	long	The value of tmnxBsxSctpFltrStatsDiscntTime indicates discontinuity time. This is the SNMPv2-MIB::sysUpTime (hundredths of a second) when the ISA-AA MDA within the group last changed status.
pkDndMalfd [Pk Dnd Malfd] (tmnxBsxSctpFltrStatsPkDndMalfd)	java. math. BigInteger	The value of tmnxBsxSctpFltrStatsPkDndMalfd indicates the number of packets denied by the SCTP filter due to the packet being malformed.
pkDndPpidOOR [Pk Dnd Ppid OOR] (tmnxBsxSctpFltrStatsPkDndPpidOOR)	java. math. BigInteger	The value of tmnxBsxSctpFltrStatsPkDndPpidOOR indicates the number of packets denied by the SCTP filter due to PPID being out of range of the corresponding tmnxBsxSctpFltrPpidRangeMin/ tmnxBsxSctpFltrPpidRangeMax in tmnxBsxSctpFltrTable.
pkDndPpidVal [Pk Dnd Ppid Val] (tmnxBsxSctpFltrStatsPkDndPpidVal)	java. math. BigInteger	The value of tmnxBsxSctpFltrStatsPkDndPpidVal indicates the number of packets denied by the SCTP filter due to PPID value configuration in tmnxBsxSctpFltrPpidTable.
pkPermitted [Pk Permitted] (tmnxBsxSctpFltrStatsPkPermitted)	java. math. BigInteger	The value of tmnxBsxSctpFltrStatsPkPermitted indicates the number of packets permitted through the SCTP filter.
slotId [Slot Id] (tmnxBsxCardSlotNum)	int	The value of tmnxBsxCardSlotNum indicates the slot number of this ISA-AA MDA.

lastCleared [Last Cleared] (tmnxBsxTcaStatsTimeLastCleared)	long	The value of tmnxBsxTcaStatsTimeLastCleared indicates the last time, since system startup, when the tmnxBsxTcaStatsTcaState changed from 'raised (1)' to 'cleared (0)'.
lastRaised [Last Raised] (tmnxBsxTcaStatsTimeLastRaised)	long	The value of tmnxBsxTcaStatsTimeLastRaised indicates the last time, since system startup, when the tmnxBsxTcaStatsTcaState changed from 'cleared (0)' to 'raised (1)'.
tcaState [Tca State] (tmnxBsxTcaStatsTcaState)	int	The value of tmnxBsxTcaStatsTcaState indicates the state of the TCA.
triggerType [Trigger Type] (tmnxBsxTcaStatsTcaTrigType)	int	The value of tmnxBsxTcaStatsTcaTrigType indicates the trigger type used.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BsxTcpValStats</p> <p>MIB entry name: tmnxBsxTcpValStatsEntry</p> <p>Entry description: Each tmnxBsxTcpValStatsEntry specifies Application Assurance TCP validation template statistics per group/partition. Rows in this table are automatically created and destroyed when validation templates are created or destroyed in the tmnxBsxTcpValTable. An index with a valid TCP validation template (an existing row in tmnxBsxTcpValTable) and tmnxChassisIndex set to one with a zero value for each of tmnxBsxCardSlotNum and tmnxMDASlotNum will return the summarized statistics per group and TCP validation template.</p> <p>Table description (for tmnxBsxTcpValStatsTable): The tmnxBsxTcpValTcaStatsTable contains an entry for each configured Application Assurance TCP validation template, as configured in tmnxBsxTcpValTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aapolicy.AaTcpValidation</p>		
allowed [Allowed] (tmnxBsxTcpValStatsAllowed)	java. math. BigInteger	The value of tmnxBsxTcpValStatsAllowed indicates the number allowed by the TCP validation template.
daughterCardSlotId [Daughter Card Slot Id] (tmnxMDASlotNum)	int	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.
direction [Direction] (tmnxBsxTcpValStatsDirection)	int	The value of tmnxBsxTcpValStatsDirection indicates the direction of the TCP validation template statistics.
discntTime [Discnt Time] (tmnxBsxTcpValStatsDiscntTime)	long	The value of tmnxBsxTcpValStatsDiscntTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when an ISA-AA MDA within the group last changed status.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dropAfterRST [Drop After RST] (tmnxBsxTcpValStatsDropAfterRST)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropAfterRST indicates the number dropped by the TCP validation template due to use after a reset (RST).
dropAlreadyEst [Drop Already Est] (tmnxBsxTcpValStatsDropAlreadyEst)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropAlreadyEst indicates the number dropped by the TCP validation template due to being already established.
dropAsymmetric [Drop Asymmetric] (tmnxBsxTcpValStatsDropAsymmetric)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropAsymmetric indicates the number dropped by the TCP validation template due to asymmetric routing.
dropBadACK [Drop Bad ACK] (tmnxBsxTcpValStatsDropBadACK)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropBadACK indicates the number dropped by the TCP validation template due to an invalid acknowledgement number (ACK).
dropBadFlag [Drop Bad Flag] (tmnxBsxTcpValStatsDropBadFlag)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropBadFlag indicates the number dropped by the TCP validation template due to an invalid flag.
dropBadOption [Drop Bad Option] (tmnxBsxTcpValStatsDropBadOption)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropBadOption indicates the number dropped by the TCP validation template due to an invalid Option.
dropBadSEQ [Drop Bad SEQ] (tmnxBsxTcpValStatsDropBadSEQ)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropBadSEQ indicates the number dropped by the TCP validation template due to an invalid sequence number (SEQ).
dropFragmented [Drop Fragmented] (tmnxBsxTcpValStatsDropFragmented)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropFragmented indicates the number dropped by the TCP validation template due to fragmentation.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dropNoEstmen [Drop No Estmen] (tmnxBsxTcpValStatsDropNoEstment)	java. math. BigInteger	The value of tmnxBsxTcpValStatsDropNoEstment indicates the number dropped by the TCP validation template due to no establishment.
units [Units] (tmnxBsxTcpValStatsUnits)	int	The value of tmnxBsxTcpValStatsUnits indicates the units of the TCP validation template statistics.
<p>BsxTcpValTcaStats</p> <p>MIB entry name: tmnxBsxTcpValTcaStatsEntry</p> <p>Entry description: Each tmnxBsxTcpValTcaStatsEntry specifies Application Assurance TCP validate TCA statistics per group/partition and TCA. lastCleared [Last Cleared] (tmnxBsxTcpValTcaStatsLastCleared)	long	The value of tmnxBsxTcpValTcaStatsLastCleared indicates the last time, since system startup, when the tmnxBsxTcpValTcaStatsTcaState changed from 'raised (1)' to 'cleared (0)'.
lastRaised [Last Raised] (tmnxBsxTcpValTcaStatsLastRaised)	long	The value of tmnxBsxTcpValTcaStatsLastRaised indicates the last time, since system startup, when the tmnxBsxTcpValTcaStatsTcaState changed from 'cleared (0)' to 'raised (1)'.
tcaState [Tca State] (tmnxBsxTcpValTcaStatsTcaState)	int	The value of tmnxBsxTcpValTcaStatsTcaState indicates the state of the policer TCA.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
triggerType [Trigger Type] (tmnxBsxTcpValTcaStatsTcaTrigType)	int	The value of tmnxBsxTcpValTcaStatsTcaTrigType indicates the trigger type used.
<p>BsxTrafStats</p> <p>MIB entry name: tmnxBsxTrafStatEntry</p> <p>Entry description: Each tmnxBsxTrafStatEntry contains the traffic statistics for a particular group, partition, IP Protocol and IP Family.</p> <p>Table description (for tmnxBsxTrafStatTable): The tmnxBsxTrafStatTable contains an entry for each system wide IP Protocol and IP Family pairing per group and partition.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • isa.AaGroup • isa.AaPartition 		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxTrafStatActFlwsFmSb)	long	The value of tmnxBsxTrafStatActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxTrafStatActFlwsToSb)	long	The value of tmnxBsxTrafStatActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxTrafStatLngDurFlws)	java. math. BigInte- ger	The value of tmnxBsxTrafStatLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxTrafStatMedDurFlws)	java. math. BigInte- ger	The value of tmnxBsxTrafStatMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsShort [Duration Flows Short] (tmnxBsxTrafStatShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxTrafStatShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxTrafStatFlwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxTrafStatFlwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxTrafStatFlwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxTrafStatFlwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxTrafStatFlwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxTrafStatFlwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxTrafStatFlwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxTrafStatFlwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction.
ipFamily [Ip Family] (tmnxBsxTrafStatIpFamily)	int	The value of tmnxBsxTrafStatIpFamily specifies the IP Family for the traffic statistics. IP Family values may be one of: ipv4 (1) - IPv4 ipv6 (2) - IPv6 dsLite (3) - IPv4 tunneled inside IPv6 sixRd (4) - IPv6 tunneled inside IPv4, includes 6rd, 6to4 teredo (5) - IPv6 tunneled inside UDP, tunneled inside IPv4 v4inv4Gtp (6) - IPv4 tunneled inside IPv4 GTP v4inv6Gtp (7) - IPv4 tunneled inside IPv6 GTP v6inv4Gtp (8) - IPv6 tunneled inside IPv4 GTP v6inv6Gtp (9) - IPv6 tunneled inside IPv6 GTP

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ipProtocol [Ip Protocol] (tmnxBsxTrafStatIpProtocol)	int	The value of tmnxBsxTrafStatIpProtocol specifies the IP Protocol for the traffic statistics. IP Protocol values may be one of: other (1) - all IP protocols not listed below tcp (2) - TCP traffic udp (3) - UDP traffic
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxTrafStatOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxTrafStatOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxTrafStatOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxTrafStatOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxTrafStatOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxTrafStatOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxTrafStatOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxTrafStatOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxTrafStatPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxTrafStatPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxTrafStatPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxTrafStatPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxTrafStatPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxTrafStatPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxTrafStatPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxTrafStatPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction.
termFlowDuration [Term Flow Duration] (tmnxBsxTrafStatTermFlwDur)	java. math. BigInteger	The value of tmnxBsxTrafStatTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated.
termFlows [Term Flows] (tmnxBsxTrafStatTermFlws)	java. math. BigInteger	The value of tmnxBsxTrafStatTermFlws indicates the total number of allowed flows in both directions that have terminated.
<p>BsxTransitSubCustRecAppGrpStats MIB entry name: tmnxBsxStatAaSubEntry Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name. Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber. Supports realtime plotting Does not support scheduled collection Monitored class: aapolicy.DbInfoTransitSubscriber</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubActFlwsFmSb)	long	The value of tmnxBsxStatAaSubActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubActFlwsToSb)	long	The value of tmnxBsxStatAaSubActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is the 64-bit version of tmnxBsxStatAaSubFlwsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>BsxTransitSubCustRecAppStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: aapolicy.DbInfoTransitSubscriber</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubActFlwsFmSb)	long	The value of tmnxBsxStatAaSubActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubActFlwsToSb)	long	The value of tmnxBsxStatAaSubActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is the 64-bit version of tmnxBsxStatAaSubFlwsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>BsxTransitSubCustRecProtStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
protName [Prot Name] (tmnxBsxStatAaName)	String	The value of tmnxBsxStatAaName specifies either the ISA-AA protocol, application or app-group name for which statistics are requested. The tmnxBsxStatAaType is used to determine the statistics type.
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>BsxTransitSubStudyAppStats</p> <p>MIB entry name: tmnxBsxStatAaSubSdyEntry</p> <p>Entry description: Each tmnxBsxStatAaSubSdyEntry contains the application assurance per-special study subscriber statistics for a combination of group, partition, statistics interval, statistics type, subscriber, and statistics name. A value of 'chargingGroup (4)' is not supported for the tmnxBsxStatAaType.</p> <p>Table description (for tmnxBsxStatAaSubSdyTable): The tmnxBsxStatAaSubSdyTable contains an entry for each application-assurance special study subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the special study subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: aapolicy.DbInfoTransitSubscriber</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubSdyActFlwsFmSb)	long	The value of tmnxBsxStatAaSubSdyActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubSdyActFlwsToSb)	long	The value of tmnxBsxStatAaSubSdyActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubSdyHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubSdyHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubSdyHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubSdyHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubSdyHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubSdyHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubSdyHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyToSb.
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubSdyHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubSdyHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubSdyHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubSdyHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubSdyHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubSdyHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubSdyHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyFmSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubSdyHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyToSb.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubSdyHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubSdyHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlws.
<p>BsxTransitSubStudyProtStats</p> <p>MIB entry name: tmnxBsxStatAaSubSdyEntry</p> <p>Entry description: Each tmnxBsxStatAaSubSdyEntry contains the application assurance per-special study subscriber statistics for a combination of group, partition, statistics interval, statistics type, subscriber, and statistics name. activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubSdyActFlwsFmSb)	long	The value of tmnxBsxStatAaSubSdyActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubSdyActFlwsToSb)	long	The value of tmnxBsxStatAaSubSdyActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubSdyHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubSdyHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubSdyHCShrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCShrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubSdyShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubSdyHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubSdyHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubSdyHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubSdyHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyFlwsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubSdyHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubSdyHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubSdyHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubSdyHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubSdyHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubSdyHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubSdyHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubSdyHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubSdyPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
protName [Prot Name] (tmnxBsxStatAaName)	String	The value of tmnxBsxStatAaName specifies either the ISA-AA protocol, application or app-group name for which statistics are requested. The tmnxBsxStatAaType is used to determine the statistics type.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubSdyHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubSdyHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubSdyHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubSdyTermFlws.
<p>DbInfoTransitSubscriberSumStats</p> <p>MIB entry name: tmnxBsxStatAaSubEntry</p> <p>Entry description: Each tmnxBsxStatAaSubEntry contains the application assurance per-subscriber statistics for a combination of group, partition, statistics interval, subscriber, statistics type, and statistics name.</p> <p>Table description (for tmnxBsxStatAaSubTable): The tmnxBsxStatAaSubTable contains an entry for each application-assurance subscriber for each statistics type within a group, partition and statistics interval. Each row contains the application assurance per-subscriber statistics collected for the subscriber. A subscriber is uniquely identified by a tmnxBsxAaSubscriberType and tmnxBsxAaSubscriber.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: aapolicy.DbInfoTransitSubscriber</p>		
activeFlowsFromSub [Active Flows From Sub] (tmnxBsxStatAaSubActFlwsFmSb)	long	The value of tmnxBsxStatAaSubActFlwsFmSb indicates the number of allowed flows in the subscriber to network direction that are active.
activeFlowsToSub [Active Flows To Sub] (tmnxBsxStatAaSubActFlwsToSb)	long	The value of tmnxBsxStatAaSubActFlwsToSb indicates the number of allowed flows in the network to subscriber direction that are active.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
durationFlowsLong [Duration Flows Long] (tmnxBsxStatAaSubHCLngDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCLngDurFlws indicates the total number of flows with a duration greater than 180 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubLngDurFlws.
durationFlowsMedium [Duration Flows Medium] (tmnxBsxStatAaSubHCMedDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCMedDurFlws indicates the total number of flows with a duration less than or equal to 180 seconds, but greater than 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubMedDurFlws.
durationFlowsShort [Duration Flows Short] (tmnxBsxStatAaSubHCSHrtDurFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCSHrtDurFlws indicates the total number of flows with a duration less than or equal to 30 seconds, that have completed. This object is a 64-bit version of tmnxBsxStatAaSubShrtDurFlws.
flowsAdmitFromSub [Flows Admit From Sub] (tmnxBsxStatAaSubHCFIwsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmFmSb indicates the total number of flows permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmFmSb.
flowsAdmitToSub [Flows Admit To Sub] (tmnxBsxStatAaSubHCFIwsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsAdmToSb indicates the total number of flows permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsAdmToSb.
flowsDenyFromSub [Flows Deny From Sub] (tmnxBsxStatAaSubHCFIwsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyFmSb indicates the total number of flows that dropped subsequent packets in the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubFlwsDnyFmSb.
flowsDenyToSub [Flows Deny To Sub] (tmnxBsxStatAaSubHCFIwsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCFIwsDnyToSb indicates the total number of flows that dropped subsequent packets in the network to subscriber direction. This object is the 64-bit version of tmnxBsxStatAaSubFlwsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
octsAdmitFromSub [Octs Admit From Sub] (tmnxBsxStatAaSubHCOctsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmFmSb indicates the total number of bytes permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmFmSb.
octsAdmitToSub [Octs Admit To Sub] (tmnxBsxStatAaSubHCOctsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsAdmToSb indicates the total number of bytes permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsAdmToSb.
octsDenyFromSub [Octs Deny From Sub] (tmnxBsxStatAaSubHCOctsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyFmSb indicates the total number of bytes dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyFmSb.
octsDenyToSub [Octs Deny To Sub] (tmnxBsxStatAaSubHCOctsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCOctsDnyToSb indicates the total number of bytes dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubOctsDnyToSb.
pktsAdmitFromSub [Pkts Admit From Sub] (tmnxBsxStatAaSubHCPktsAdmFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmFmSb indicates the total number of packets permitted for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmFmSb.
pktsAdmitToSub [Pkts Admit To Sub] (tmnxBsxStatAaSubHCPktsAdmToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsAdmToSb indicates the total number of packets permitted for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsAdmToSb.
pktsDenyFromSub [Pkts Deny From Sub] (tmnxBsxStatAaSubHCPktsDnyFmSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyFmSb indicates the total number of packets dropped for the subscriber to network direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyFmSb.
pktsDenyToSub [Pkts Deny To Sub] (tmnxBsxStatAaSubHCPktsDnyToSb)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCPktsDnyToSb indicates the total number of packets dropped for the network to subscriber direction. This object is a 64-bit version of tmnxBsxStatAaSubPktsDnyToSb.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statsInterval [Stats Interval] (tmnxBsxAaSubStatsInterval)	int	The tmnxBsxAaSubStatsInterval specifies the interval for the retrieval of application assurance subscriber statistics.
termFlowDuration [Term Flow Duration] (tmnxBsxStatAaSubHCTermFlwDur)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlwDur indicates the sum of all flow durations from first packet seen to last packet seen for flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlwDur.
termFlows [Term Flows] (tmnxBsxStatAaSubHCTermFlws)	java. math. BigInteger	The value of tmnxBsxStatAaSubHCTermFlws indicates the total number of allowed flows that have terminated. This object is a 64-bit version of tmnxBsxStatAaSubTermFlws.
<p>HttpNotifStats MIB entry name: tmnxChassisEntry Entry description: tmnxChassisEntry consists of the system level information pertaining to the hardware present in the system. Only one entry is created and maintained by the system, which is assigned the tmnxChassisIndex value '1'. Once this entry is created, it cannot be destroyed. Additional entries cannot be manually created or destroyed. Support of multiple chassis' are managed through the use of tmnxPhysChassisTable. Table description (for tmnxChassisTable): tmnxChassisTable contains Nokia 7x50 system level information. Supports realtime plotting Supports scheduled collection Monitored class: aapolicy.AppQosPolicy</p>		
chassisIndex [Chassis Index] (tmnxChassisIndex)	long	The value of tmnxChassisIndex specifies a system identifier. The value of this object cannot be changed. The only supported value is '1'. Different values of TmnxPhysChassisIndex are used to identify different physical chassis (e.g. in an XRS-40 system) in tmnxPhysChassisTable.
criteriaNoMatchCount [Criteria No Match Count] (tmnxBsxHttpNotifStatCritNoMtch)	java. math. BigInteger	The value of tmnxBsxHttpNotifStatCritNoMtch indicates the number of messages which did not match the selection criteria for insertion of the script URL.

Table 239 aapolicy statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
failedCount [Failed Count] (tmnxBsxHttpNotifStatFailed)	java. math. BigInteger	The value of tmnxBsxHttpNotifStatFailed indicates the number of times a HTTP notification is known to have failed.
grpPartIndex [Grp Part Index] (tmnxBsxAaGrpPartIndex)	long	The value of tmnxBsxAaGrpPartIndex specifies the partition index within an AA group. The corresponding row for the AA group must have already been created in the tmnxBsxIsaAaGrpTable. Partition index '0' indicates group wide AA policy information, and is automatically created when the AA group is created in the tmnxBsxIsaAaGrpTable.
insertedCount [Inserted Count] (tmnxBsxHttpNotifStatInserted)	java. math. BigInteger	The value of tmnxBsxHttpNotifStatInserted indicates the number of times the script URL was inserted into a message.
mdaSlotNum [Mda Slot Num] (tmnxMDASlotNum)	long	The unique value which identifies this MDA slot within a specific IOM card in the system. Rows with a tmnxMDASlotNum value of zero (0) represent the special case of an IOM card without MDA slots but that instead has its ports directly on the IOM card itself. In that case, there should be only that one row entry in the tmnxMDATable for that IOM card.
statusLastChangedTime [Status Last Changed Time] (tmnxBsxHttpNotifStatDiscntTime)	long	The value of tmnxBsxHttpNotifStatDiscntTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when the ISA-AA MDA within the group has last changed status.
successCount [Success Count] (tmnxBsxHttpNotifStatSuccess)	java. math. BigInteger	The value of tmnxBsxHttpNotifStatSuccess indicates the number of times a HTTP notification success report was received.

Table 240 acfilter statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>HitCountStats</p> <p>MIB entry name: tIPFilterParamsEntry</p> <p>Entry description: Information about a particular IP Filter entry. Every IP Filter can have zero or more IP Filter match entries. A filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. Additional parameters can be found in tIPFilterParamsExtTable. There is no StorageType object, entries have a presumed StorageType of nonVolatile.</p> <p>Table description (for tIPFilterParamsTable): A table of all IP filter match entries for all IP filters.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilter.IpFilterEntry</p>		
egressHitByteCount [Egress Hit Byte Count] (tIPFilterParamsEgrHitByteCount)	java. math. BigInteger	The value of tIPFilterParamsEgrHitByteCount indicates the number of bytes of all egress packets that matched this entry.
egressHitCount [Egress Hit Count] (tIPFilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.
ingressHitByteCount [Ingress Hit Byte Count] (tIPFilterParamsIngrHitByteCount)	java. math. BigInteger	The value of tIPFilterParamsIngrHitByteCount indicates the number of bytes of all ingress packets that matched this entry.
ingressHitCount [Ingress Hit Count] (tIPFilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.

Table 240 acfilter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>Ipv6HitCountStats</p> <p>MIB entry name: tIPv6FilterParamsEntry</p> <p>Entry description: Information about a particular IPv6 Filter entry. Every IPv6 Filter can have zero or more IPv6 Filter match entries. A filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. Additional match criteria can be found in tIPv6FilterParamsExtTable. There is no StorageType object, entries have a presumed StorageType of nonVolatile.</p> <p>Table description (for tIPv6FilterParamsTable): A table of all IPv6 filter match entries for all IPv6 filters</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilter.Ipv6FilterEntry</p>		
egressHitByteCount [Egress Hit Byte Count] (tIPv6FilterParamsEgrHitByteCount)	java. math. BigInteger	This tIPv6FilterParamsEgrHitByteCount indicates the number of bytes of all egress packets that matched this entry.
egressHitCount [Egress Hit Count] (tIPv6FilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.
ingressHitByteCount [Ingress Hit Byte Count] (tIPv6FilterParamsIngrHitByteCount)	java. math. BigInteger	The value of tIPv6FilterParamsIngrHitByteCount indicates the number of bytes of all ingress packets that matched this entry.
ingressHitCount [Ingress Hit Count] (tIPv6FilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.

Table 240 acfilter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>MacHitCountStats</p> <p>MIB entry name: tMacFilterParamsEntry</p> <p>Entry description: Information about a particular MAC Filter entry. Every MAC Filter can have zero or more MAC Filter match entries. A filter entry with no match criteria set will match every packet, and the entry action will be taken. Entries are created/deleted by user. There is no StorageType object, entries have a presumed StorageType of nonVolatile.</p> <p>Table description (for tMacFilterParamsTable): A table of all MAC filter match entries for all MAC filters.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilter.MacFilterEntry</p>		
egressHitByteCount [Egress Hit Byte Count] (tMacFilterParamsEgrHitByteCount)	java. math. BigInteger	The value of tMacFilterParamsEgrHitByteCount indicates the number of bytes of all egress packets that matched this entry.
egressHitCount [Egress Hit Count] (tMacFilterParamsEgressHitCount)	java. math. BigInteger	This object indicates the number of times an egress packet matched this entry.
ingressHitByteCount [Ingress Hit Byte Count] (tMacFilterParamsIngrHitByteCount)	java. math. BigInteger	The value of tMacFilterParamsIngrHitByteCount indicates the number of bytes of all ingress packets that matched this entry.
ingressHitCount [Ingress Hit Count] (tMacFilterParamsIngressHitCount)	java. math. BigInteger	This object indicates the number of times an ingress packet matched this entry.

Table 241 acfilterli statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description

Entries are created and deleted automatically by the system when a corresponding entry in tLilpFilterParamsTable is created / deleted.</p> <p>Table description (for tLilpFilterParamsInfoTable): The table tLilpFilterParamsInfoTable contains read-only information pertaining to LI IP filter match entries of LI IP filters.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • acfilterli.LilpFilterEntry • acfilterli.Lilpv6FilterEntry 		
egressHitBytes [Egress Hit Bytes] (tLilpFltrParamsInfEgrHitBytes)	java. math. BigInteger	The value of the object tLilpFltrParamsInfEgrHitBytes indicates the number of bytes of all egress packets that matched this entry.
egressHitCount [Egress Hit Count] (tLilpFltrParamsInfEgrHitCount)	java. math. BigInteger	The value of the object tLilpFltrParamsInfEgrHitCount indicates the number of times an egress packet matched this entry.
ingressHitBytes [Ingress Hit Bytes] (tLilpFltrParamsInfIngrHitBytes)	java. math. BigInteger	The value of the object tLilpFltrParamsInfIngrHitBytes indicates the number of bytes of all ingress packets that matched this entry.
ingressHitCount [Ingress Hit Count] (tLilpFltrParamsInfIngrHitCount)	java. math. BigInteger	The value of the object tLilpFltrParamsInfIngrHitCount indicates the number of times an ingress packet matched this entry.

Table 241 acfilterli statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LiMacFilterEntryStats</p> <p>MIB entry name: tLiMacFilterParamsEntry</p> <p>Entry description: An LI MAC filter match entry.</p> <p>Table description (for tLiMacFilterParamsTable): The table tLiMacFilterParamsTable contains all LI MAC filter match entries for all LI MAC filters.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: acfilterli.LiMacFilterEntry</p>		
egressHitBytes [Egress Hit Bytes] (tLiMacFilterParamsEgrHitBytes)	java. math. BigInteger	The value of tLiMacFilterParamsEgrHitBytes indicates the number of bytes of all egress packets that matched this entry.
egressHitCount [Egress Hit Count] (tLiMacFilterParamsEgrHitCount)	java. math. BigInteger	This object tLiMacFilterParamsEgrHitCount indicates the number of times an egress packet matched this entry.
ingressHitBytes [Ingress Hit Bytes] (tLiMacFilterParamsIngrHitBytes)	java. math. BigInteger	The value of tLiMacFilterParamsIngrHitBytes indicates the number of bytes of all ingress packets that matched this entry.
ingressHitCount [Ingress Hit Count] (tLiMacFilterParamsIngrHitCount)	java. math. BigInteger	The object tLiMacFilterParamsIngrHitCount indicates the number of times an ingress packet matched this entry.

Table 242 ancp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AncpCustomerStaticMapEgrMonitorStats</p> <p>MIB entry name: tmnxAncpMssEgrMonitorEntry</p> <p>Entry description: Each row contains statistics information about ANCP for every MSS that maps on an known ANCP string. Rows are created/deleted automatically by the system. The table contains read-only information only.</p> <p>Table description (for tmnxAncpMssEgrMonitorTable): The table tmnxAncpMssEgrMonitorTable contains ingress ANCP information for every MSS that maps on an known ANCP string.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ancp.AncpCustomerStaticMap</p>		
ancpString [Ancp String] (tmnxAncpMssEgrMntrAncpString)	String	The value of tmnxAncpMssEgrMntrAncpString indicates the ANCP-string received in the GSMP 'PortUp' message which contains the PIR value as described in tmnxAncpMssEgrMntrQosShedPIR.
qosShedName [Qos Shed Name] (tmnxAncpMssEgrMntrQosShedName)	String	The value of tmnxAncpMssEgrMntrQosShedName indicates the ingress Qos Scheduler name (defined in the table TIMETRA-QOS-MIB::tVirtualSchedulerTable applied to this MSS.
qosShedPIR [Qos Shed PIR] (tmnxAncpMssEgrMntrQosShedPIRLo)	java.math.BigInteger	The value of tmnxAncpMssEgrMntrQosShedPIRLo indicates lower 32 bits of the egress Qos Scheduler PIR (Peak Info rate). This value is received via ANCP, and potentially modified by the system using the ANCP policy. When the value of tmnxAncpMssEgrMntrQosShedPIRHi along with the value of tmnxAncpMssEgrMntrQosShedPIRLo is equal to 4294967295 (0xFFFFFFFF), rate for this scheduler indicates maximum rate. The value of tmnxAncpMssEgrMntrQosShedPIRHi equal to 4294967295 (0xFFFFFFFF) and the value of tmnxAncpMssEgrMntrQosShedPIRLo equal to 4294967294 (0xFFFFFFFFE) indicates no overrides.

Table 242 ancp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
siteName [Site Name] (custMultSvcSiteName)	String	The value of object custMultSvcSiteName specifies the customer's Multi-Service Site name.
subscriberId [Subscriber Id] (custId)	long	Customer identifier. This ID must be unique within a service domain.
<p>AncpCustomerStaticMapIngrMonitorStats MIB entry name: tmnxAncpMssIngMonitorEntry Entry description: Each row contains statistics information about ANCP for every MSS that maps on an known ANCP string. Rows are created/deleted automatically by the system. The table contains read-only information only. Table description (for tmnxAncpMssIngMonitorTable): The table tmnxAncpMssIngMonitorTable contains ingress ANCP information for every MSS that maps on an known ANCP string. Supports realtime plotting Supports scheduled collection Monitored class: ancp.AncpCustomerStaticMap</p>		
ancpString [Ancp String] (tmnxAncpMssIngMntrAncpString)	String	The value of tmnxAncpMssIngMntrAncpString indicates the ANCP-string received in the GSMP 'PortUp' message which contains the PIR value as described in tmnxAncpMssIngMntrQosShedPIR.
qosShedName [Qos Shed Name] (tmnxAncpMssIngMntrQosShedName)	String	The value of tmnxAncpMssIngMntrQosShedName indicates the ingress Qos Scheduler name (defined in the table TIMETRA-QOS-MIB::tVirtualSchedulerTable applied to this MSS.

Table 242 ancp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
qosShedPIR [Qos Shed PIR] (tmnxAncpMssIngMntrQosShedPIRLo)	java. math. BigInteger	The value of tmnxAncpMssIngMntrQosShedPIRLo indicates lower 32 bits of the ingress Qos Scheduler PIR (Peak Info rate). This value is received via ANCP, and potentially modified by the system using the ANCP policy. When the value of tmnxAncpMssIngMntrQosShedPIRHi along with the value of tmnxAncpMssIngMntrQosShedPIRLo is equal to 4294967295 (0xFFFFFFFF), rate for this scheduler indicates maximum rate. The value of tmnxAncpMssIngMntrQosShedPIRHi equal to 4294967295 (0xFFFFFFFF) and the value of tmnxAncpMssIngMntrQosShedPIRLo equal to 4294967294 (0xFFFFFFFFE) indicates no overrides.
siteName [Site Name] (custMultSvcSiteName)	String	The value of object custMultSvcSiteName specifies the customer's Multi-Service Site name.
subscriberId [Subscriber Id] (custId)	long	Customer identifier. This ID must be unique within a service domain.
<p>AncpCustomerStaticMapMonitorStats</p> <p>MIB entry name: tmnxAncpMssMonitorEntry</p> <p>Entry description: Each row contains statistics information about ANCP for every MSS that maps on an known ANCP string. ancpString [Ancp String] (tmnxAncpMssMntrAncpString)	String	The value of tmnxAncpMssMntrAncpString indicates the ANCP-string received in the GSMP 'PortUp' message which contains the Scheduler rate limit as described in tmnxAncpMssMntrEgrAggRateLmt.

Table 242 ancp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egrAggRateLimit [Egr Agg Rate Limit] (tmnxAncpMssMntrEgrAggRateLmt)	long	The value of tmnxAncpMssMntrEgrAggRateLmt indicates the Qos Scheduler aggregate rate limit. This value is received via ANCP, potentially modified by the system using the ANCP policy. The value of 4294967295 (0xFFFFFFFF) specifies max rate and value of 4294967294 (0xFFFFFFFFE) specifies no override.
siteName [Site Name] (custMultSvcSiteName)	String	The value of object custMultSvcSiteName specifies the customer's Multi-Service Site name.
subscriberId [Subscriber Id] (custId)	long	Customer identifier. This ID must be unique within a service domain.
<p>AncpSapEgrSchedMonitorStats</p> <p>MIB entry name: tmnxAncpSapEgrSchedMonitorEntry</p> <p>Entry description: Each row contains statistics information about ANCP for every SAP that maps on an known ANCP string. Rows are created/deleted automatically by the system. The table contains read-only information only.</p> <p>Table description (for tmnxAncpSapEgrSchedMonitorTable): The table tmnxAncpSapEgrSchedMonitorTable contains ANCP ingress information for every SAP that maps on an known ANCP string.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ancp.AncpStaticMap</p>		
ancpString [Ancp String] (tmnxAncpSapEgrMntrAncpString)	String	The value of tmnxAncpSapEgrMntrAncpString indicates the ANCP-string received in the GSMP 'PortUp' message which contains the PIR value as described in tmnxAncpSapEgrMntrQosShedPIR.
portId [Port Id] (sapPortId)	long	The ID of the access port where this SAP is defined.

Table 242 ancp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
qosShedName [Qos Shed Name] (tmnxAncpSapEgrMntrQosShedName)	String	The value of tmnxAncpSapEgrMntrQosShedName indicates the ingress Qos Scheduler name (defined in the table TIMETRA-QOS-MIB::tVirtualSchedulerTable applied to this SAP.
qosShedPIR [Qos Shed PIR] (tmnxAncpSapEgrMntrQosShedPIRLo)	java. math. BigInte- ger	The value of tmnxAncpSapEgrMntrQosShedPIRLo indicates lower 32 bits of the egress Qos Scheduler PIR (Peak Info rate). This value is received via ANCP, and potentially modified by the system using the ANCP policy. When the value of tmnxAncpSapIngMntrQosShedPIRHi along with the value of tmnxAncpSapIngMntrQosShedPIRLo is equal to 4294967295 (0xFFFFFFFF), rate for this scheduler indicates maximum rate. The value of tmnxAncpSapIngMntrQosShedPIRHi equal to 4294967295 (0xFFFFFFFF) and the value of tmnxAncpSapIngMntrQosShedPIRLo equal to 4294967294 (0xFFFFF7FE) indicates no overrides.
sapEncapValue [Sap Encap Value] (sapEncapValue)	long	The value of the label used to identify this SAP on the access port specified by sapPortId.
svclId [Svc Id] (svclId)	long	The value of the object svclId specifies the Service identifier. This value should be unique within the service domain.
<p>AncpSapIngSchedMonitorStats</p> <p>MIB entry name: tmnxAncpSapIngSchedMonitorEntry</p> <p>Entry description: Each row contains statistics information about ANCP for every SAP that maps on an known ANCP string. Rows are created/deleted automatically by the system. The table contains read-only information only.</p> <p>Table description (for tmnxAncpSapIngSchedMonitorTable): The table tmnxAncpSapIngSchedMonitorTable contains ANCP ingress information for every SAP that maps on an known ANCP string.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: ancp.AncpStaticMap</p>		

Table 242 ancp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ancpString [Ancp String] (tmnxAncpSapIngMntrAncpString)	String	The value of tmnxAncpSapIngMntrAncpString indicates the ANCP-string received in the GSMP 'PortUp' message which contains the PIR value as described in tmnxAncpSapIngMntrQosShedPIR.
portId [Port Id] (sapPortId)	long	The ID of the access port where this SAP is defined.
qosShedName [Qos Shed Name] (tmnxAncpSapIngMntrQosShedName)	String	The value of tmnxAncpSapIngMntrQosShedName indicates the ingress Qos Scheduler name (defined in the table TIMETRA-QOS-MIB::tVirtualSchedulerTable applied to this SAP.
qosShedPIR [Qos Shed PIR] (tmnxAncpSapIngMntrQosShedPIRLo)	java. math. BigInteger	The value of tmnxAncpSapIngMntrQosShedPIRLo indicates lower 32 bits of the ingress Qos Scheduler PIR (Peak Info rate). This value is received via ANCP, and potentially modified by the system using the ANCP policy. When the value of tmnxAncpSapIngMntrQosShedPIRHi along with the value of tmnxAncpSapIngMntrQosShedPIRLo is equal to 4294967295 (0xFFFFFFFF), rate for this scheduler indicates maximum rate. The value of tmnxAncpSapIngMntrQosShedPIRHi equal to 4294967295 (0xFFFFFFFF) and the value of tmnxAncpSapIngMntrQosShedPIRLo equal to 4294967294 (0xFFFFFFFEE) indicates no overrides.
sapEncapValue [Sap Encap Value] (sapEncapValue)	long	The value of the label used to identify this SAP on the access port specified by sapPortId.
svcid [Svc Id] (svcid)	long	The value of the object svcId specifies the Service identifier. This value should be unique within the service domain.

Table 242 ancp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AncpSapMonitorStats</p> <p>MIB entry name: tmnxAncpSapMonitorEntry</p> <p>Entry description: Each row contains statistics information about ANCP for every SAP that maps on an known ANCP string. Rows are created/deleted automatically by the system. egrAggRateLimit [Egr Agg Rate Limit] (tmnxAncpSubMntrEgrAggRateLimit)	java. math. BigInteger	The value of tmnxAncpSubMntrEgrAggRateLimit indicates the Qos Scheduler rate limit. This value is received via ANCP, potentially modified by the system using the ANCP policy.
egrQosShedName [Egr Qos Shed Name] (tmnxAncpSubMntrEgrQosShedName)	String	The value of tmnxAncpSubMntrEgrQosShedName indicates the egress Qos Scheduler name (defined in the table TIMETRA-QOS-MIB::tVirtualSchedulerTable applied to this subscriber.
egrQosShedPIR [Egr Qos Shed PIR] (tmnxAncpSubMntrEgrQosShedPIRLo)	java. math. BigInteger	The value of tmnxAncpSubMntrEgrQosShedPIRLo indicates lower 32 bits of the egress Qos Scheduler PIR (Peak Info rate). This value is received via ANCP, and potentially modified by the system using the ANCP policy. When the value of tmnxAncpSubMntrEgrQosShedPIRHi along with the value of tmnxAncpSubMntrEgrQosShedPIRLo is equal to 4294967295 (0xFFFFFFFF), rate for this scheduler indicates maximum rate. The value of tmnxAncpSubMntrEgrQosShedPIRHi equal to 4294967295 (0xFFFFFFFF) and the value of tmnxAncpSubMntrEgrQosShedPIRLo equal to 4294967294 (0xFFFFFFFFE) indicates no overrides.
ingQosShedName [Ing Qos Shed Name] (tmnxAncpSubMntrIngQosShedName)	String	The value of tmnxAncpSubMntrIngQosShedName indicates the ingress Qos Scheduler name (defined in the table TIMETRA-QOS-MIB::tVirtualSchedulerTable applied to this subscriber.

Table 242 ancp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ingQosShedPIR [Ing Qos Shed PIR] (tmnxAncpSubMntrIngQosShedPIRLo)	java. math. BigInteger	The value of tmnxAncpSubMntrIngQosShedPIRLo indicates lower 32 bits of the ingress Qos Scheduler PIR (Peak Info rate). This value is received via ANCP, and potentially modified by the system using the ANCP policy. When the value of tmnxAncpSubMntrIngQosShedPIRHi along with the value of tmnxAncpSubMntrIngQosShedPIRLo is equal to 4294967295 (0xFFFFFFFF), rate for this scheduler indicates maximum rate. The value of tmnxAncpSubMntrIngQosShedPIRHi equal to 4294967295 (0xFFFFFFFF) and the value of tmnxAncpSubMntrIngQosShedPIRLo equal to 4294967294 (0xFFFFF7FE) indicates no overrides.
subscrIdent [Subscr Ident] (tmnxSubInfoSubIdent)	String	The value of tmnxSubInfoSubIdent specifies the subscriber identification of this subscriber.

Table 243 aps statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>ApsChannelStats MIB entry name: apsChanStatusEntry Entry description: A conceptual row in the apsChanStatusTable. Table description (for apsChanStatusTable): This table contains status information for all SONET LTE interfaces that are included in APS groups. Supports realtime plotting Supports scheduled collection Monitored class: aps.ApsChannel</p>		
discontinuityTime [Discontinuity Time] (apsChanStatusDiscontinuityTime)	long	The value of sysUpTime on the most recent occasion at which any one or more of this channel's counters suffered a discontinuity. The relevant counters are the specific instances associated with this channel of any Counter32 object contained in apsChanStatusTable. If no such discontinuities have occurred since the last re-initialization of the local management subsystem, then this object contains a zero value.
lastSwitchover [Last Switchover] (apsChanStatusLastSwitchover)	long	When queried with index value apsChanConfigNumber other than 0, this object will return the value of sysUpTime when this channel last completed a switch to the protection line. If this channel has never switched to the protection line, the value 0 will be returned. When queried with index value apsChanConfigNumber set to 0, which is the protection line, this object will return the value of sysUpTime the last time that a working channel was switched back to the working line from this protection line. If no working channel has ever switched back to the working line from this protection line, the value 0 will be returned.

Table 243 aps statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
signalDegrades [Signal Degrades] (apsChanStatusSignalDegrades)	long	A count of Signal Degrade conditions. This condition occurs when the line Bit Error Rate exceeds the currently configured value of the relevant instance of apsConfigSdBerThreshold. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of apsChanStatusDiscontinuityTime.
signalFailures [Signal Failures] (apsChanStatusSignalFailures)	long	A count of Signal Failure conditions that have been detected on the incoming signal. This condition occurs when a loss of signal, loss of frame, AIS-L or a Line bit error rate exceeding the currently configured value of the relevant instance of apsConfigSfBerThreshold. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of apsChanStatusDiscontinuityTime.
switchoverSeconds [Switchover Seconds] (apsChanStatusSwitchoverSeconds)	long	The cumulative Protection Switching Duration (PSD) time in seconds. For a working channel, this is the cumulative number of seconds that service was carried on the protection line. For the protection line, this is the cumulative number of seconds that the protection line has been used to carry any working channel traffic. This information is only valid if revertive switching is enabled. The value 0 will be returned otherwise. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of apsChanStatusDiscontinuityTime. For example, if the value of an instance of apsChanStatusSwitchoverSeconds changes from a non-zero value to zero due to revertive switching being disabled, it is expected that the corresponding value of apsChanStatusDiscontinuityTime will be updated to reflect the time of the configuration change.

Table 243 aps statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
switchovers [Switchovers] (apsChanStatusSwitchovers)	long	When queried with index value apsChanConfigNumber other than 0, this object will return the number of times this channel has switched to the protection line. When queried with index value apsChanConfigNumber set to 0, which is the protection line, this object will return the number of times that any working channel has been switched back to the working line from this protection line. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of apsChanStatusDiscontinuityTime.
<p>ApsGroupStats</p> <p>MIB entry name: apsStatusEntry</p> <p>Entry description: A conceptual row in the apsStatusTable.</p> <p>Table description (for apsStatusTable): This table provides status information about APS groups that have been configured on the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: aps.ApsGroup</p>		
channelMismatches [Channel Mismatches] (apsStatusChannelMismatches)	long	A count of Channel Mismatch conditions. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of apsStatusDiscontinuityTime.
discontinuityTime [Discontinuity Time] (apsStatusDiscontinuityTime)	long	The value of sysUpTime on the most recent occasion at which any one or more of this APS group's counters suffered a discontinuity. The relevant counters are the specific instances associated with this APS group of any Counter32 object contained in apsStatusTable. If no such discontinuities have occurred since the last re-initialization of the local management subsystem, then this object contains a zero value.

Table 243 aps statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fEPLFs [fEPLFs] (apsStatusfEPLFs)	long	A count of Far-End Protection-Line Failure conditions. This condition is declared based on receiving SF on the protection line in the K1 byte. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of apsStatusDiscontinuityTime.
modeMismatches [Mode Mismatches] (apsStatusModeMismatches)	long	A count of Mode Mismatch conditions. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of apsStatusDiscontinuityTime.
pSBFs [PSBFs] (apsStatusPSBFs)	long	A count of Protection Switch Byte Failure conditions. This condition occurs when either an inconsistent APS byte or an invalid code is detected. An inconsistent APS byte occurs when no three consecutive K1 bytes of the last 12 successive frames are identical, starting with the last frame containing a previously consistent byte. An invalid code occurs when the incoming K1 byte contains an unused code or a code irrelevant for the specific switching operation (e.g., Reverse Request while no switching request is outstanding) in three consecutive frames. An invalid code also occurs when the incoming K1 byte contains an invalid channel number in three consecutive frames. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of apsStatusDiscontinuityTime.

Table 244 arp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>SapArpHostStats</p> <p>MIB entry name: sapArpHostStatEntry</p> <p>Entry description: ARP host specific status and statistics information about a SAP.</p> <p>Table description (for sapArpHostStatTable): A table that contains ARP host status and statistics information about SAP's.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • ies.ServiceAccessPoint • vpls.AbstractL2AccessInterface • vprn.ServiceAccessPoint 		
numAuthReq [Num Auth Req] (sapArpHostStatNumAuthReq)	long	The value of sapArpHostStatNumAuthReq indicates the number of times that the system initiated an authentication request for an ARP host on this SAP since the last re-initialization of the local network management subsystem, or the last time the system statistics were cleared.
numCreated [Num Created] (sapArpHostStatNumCreated)	long	The value of sapArpHostStatNumCreated indicates the number of times that an ARP host was created on this SAP since the last re-initialization of the local network management subsystem, or the last time the system statistics were cleared.
numDeleted [Num Deleted] (sapArpHostStatNumDeleted)	long	The value of sapArpHostStatNumDeleted indicates the number of times that an ARP host was deleted on this SAP since the last re-initialization of the local network management subsystem, or the last time the system statistics were cleared.
numForcedVerif [Num Forced Verif] (sapArpHostStatNumForcedVerif)	long	The value of sapArpHostStatNumForcedVerif indicates the number of times that the system started a forced subscriber host connectivity verification for an ARP host on this SAP since the last re-initialization of the local network management subsystem, or the last time the system statistics were cleared.

Table 244 arp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
numHosts [Num Hosts] (sapArpHostStatNumHosts)	long	The value of sapArpHostStatNumHosts indicates the actual number of ARP hosts on this SAP.
numUpdated [Num Updated] (sapArpHostStatNumUpdated)	long	The value of sapArpHostStatNumUpdated indicates the number of times that an ARP host was updated on this SAP since the last re-initialization of the local network management subsystem, or the last time the system statistics were cleared.
trigIgnQFull [Trig Ign QFull] (sapArpHostStatTrigIgnQFull)	long	The value of sapArpHostStatTrigIgnQFull indicates the number of ARP triggers received on this SAP that did not result in the creation of a new ARP host because the internal ARP trigger event queue of the system was full, since the last re-initialization of the local network management subsystem, or the last time the system statistics were cleared.
triggersIgnored [Triggers Ignored] (sapArpHostStatTriggersIgnored)	long	The value of sapArpHostStatTriggersIgnored indicates the number of ARP triggers received on this SAP that did not result in the creation of a new ARP host since the last re-initialization of the local network management subsystem, or the last time the system statistics were cleared. This number does not include the number indicated by sapArpHostStatTrigIgnQFull.
triggersRx [Triggers Rx] (sapArpHostStatTriggersRx)	long	The value of sapArpHostStatTriggersRx indicates the number of ARP triggers received on this SAP since the last re-initialization of the local network management subsystem, or the last time the system statistics were cleared.

Table 245 atm statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>ATMCpStats</p> <p>MIB entry name: tAtmCpStatisticsEntry</p> <p>Entry description: An entry in the tAtmCpStatisticsTable contains statistics information applicable to a particular connection profile assigned to a particular interface.</p> <p>Table description (for tAtmCpStatisticsTable): The tAtmCpStatisticsTable is used to gather statistics on connection profiles assigned to interfaces.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: atm.Interface</p>		
tAtmCpStatsClp0CellsRxd [TAtm Cp Stats Clp 0 Cells Rxd] (tAtmCpStatsClp0CellsRxd)	java. math. BigInteger	The value of tAtmCpStatsClp0CellsRxd indicates the number of valid ATM CLP=0 cells received by the connection profile.
tAtmCpStatsClp0CellsTxd [TAtm Cp Stats Clp 0 Cells Txd] (tAtmCpStatsClp0CellsTxd)	java. math. BigInteger	The value of tAtmCpStatsClp0CellsTxd indicates the number of valid ATM CLP=0 cells transmitted by the connection profile.
tAtmCpStatsDrpCellsRxd [TAtm Cp Stats Drp Cells Rxd] (tAtmCpStatsDrpCellsRxd)	long	The value of tAtmCpStatsDrpCellsRxd indicates the number of all policer cells discards (CLP=0+1) of the connection profile. This excludes any buffer management discards (if applicable).
tAtmCpStatsDrpClp0CellsRxd [TAtm Cp Stats Drp Clp 0 Cells Rxd] (tAtmCpStatsDrpClp0CellsRxd)	long	The value of tAtmCpStatsDrpClp0CellsRxd indicates the number of all policer CLP=0 cells discards of the connection profile. This excludes any buffer management discards (if applicable).
tAtmCpStatsDrpClp0CellsTxd [TAtm Cp Stats Drp Clp 0 Cells Txd] (tAtmCpStatsDrpClp0CellsTxd)	long	The value of tAtmCpStatsDrpClp0CellsTxd indicates the number of all CLP=0 cells discards of this connection profile. This includes both discards due to buffer management and policer.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tAtmCpStatsTagCells [TAtm Cp Stats Tag Cells] (tAtmCpStatsTagCells)	long	The value of tAtmCpStatsTagCells indicates the number of tagged CLP=0 cells of the connection profile. The egress may or may not discard these cells.
tAtmCpStatsTotalCellsRxd [TAtm Cp Stats Total Cells Rxd] (tAtmCpStatsTotalCellsRxd)	java. math. BigInteger	The value of tAtmCpStatsTotalCellsRxd indicates the number of valid ATM cells received by the connection profile. If traffic policing is implemented, then cells are counted prior to the application of traffic policing. To obtain the byte count multiply tAtmCpStatsTotalCellsRxd by 53.
tAtmCpStatsTotalCellsTxd [TAtm Cp Stats Total Cells Txd] (tAtmCpStatsTotalCellsTxd)	java. math. BigInteger	The value of tAtmCpStatsTotalCellsTxd indicates the number of valid ATM cells transmitted by the connection profile. If traffic policing is implemented, then cells are counted prior to the application of traffic policing. To obtain the byte count multiply tAtmCpStatsTotalCellsTxd by 53.
<p>AtmCellVclStatistics MIB entry name: tAtmCellVclStatisticsEntry Entry description: An entry in the tAtmCellVclStatisticsTable containing statistics information applicable to a particular VCL entry in the AToM MIB. Table description (for tAtmCellVclStatisticsTable): tAtmCellVclStatisticsTable is used to gather cell-level statistics on a particular VCC entry in the RFC 2515 AToM MIB. Supports realtime plotting Supports scheduled collection Monitored class: atm.PvcConnection</p>		
tAtmCellVclStatsClp0CellsRxd [TAtm Cell Vcl Stats Clp 0 Cells Rxd] (tAtmCellVclStatsClp0CellsRxd)	java. math. BigInteger	The value of tAtmCellVclStatsClp0CellsRxd indicates the number of valid ATM CLP=0 cells received by the VCL.
tAtmCellVclStatsClp0CellsTxd [TAtm Cell Vcl Stats Clp 0 Cells Txd] (tAtmCellVclStatsClp0CellsTxd)	java. math. BigInteger	The value of tAtmCellVclStatsClp0CellsTxd indicates the number of valid ATM CLP=0 cells transmitted by the VCL.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tAtmCellVclStatsDrpCellsRxd [TAtm Cell Vcl Stats Drp Cells Rxd] (tAtmCellVclStatsDrpCellsRxd)	long	The value of tAtmCellVclStatsDrpCellsRxd indicates the number of all policer cells discards (CLP=0+1) of the VCL. This excludes any buffer management discards (if applicable).
tAtmCellVclStatsDrpClp0CellsRxd [TAtm Cell Vcl Stats Drp Clp 0 Cells Rxd] (tAtmCellVclStatsDrpClp0CellsRxd)	long	The value of tAtmCellVclStatsDrpClp0CellsRxd indicates the number of all policer CLP=0 cells discards of the VCL. This excludes any buffer management discards (if applicable).
tAtmCellVclStatsDrpClp0CellsTxd [TAtm Cell Vcl Stats Drp Clp 0 Cells Txd] (tAtmCellVclStatsDrpClp0CellsTxd)	long	The value of tAtmCellVclStatsDrpClp0CellsTxd indicates the number of all CLP=0 cells discards of this VCL. This includes both discards due to buffer management and policer.
tAtmCellVclStatsTagCells [TAtm Cell Vcl Stats Tag Cells] (tAtmCellVclStatsTagCells)	long	The value of tAtmCellVclStatsTagCells indicates the number of tagged CLP=0 cells of the VCL. The egress may or may not discard these cells.
<p>AtmIfcStatistics MIB entry name: tAtmIfcStatisticsEntry Entry description: An entry in the tAtmIfcStatisticsTable containing statistics information applicable to a particular IFC entry. Table description (for tAtmIfcStatisticsTable): The tAtmIfcStatisticsTable is used to gather cell-level statistics on a particular IFC entry. Supports realtime plotting Supports scheduled collection Monitored class: atm.IfConnection</p>		
tAtmIfcStatsDrpCellsRxd [TAtm Ifc Stats Drp Cells Rxd] (tAtmIfcStatsDrpCellsRxd)	long	The value of tAtmIfcStatsDrpCellsRxd indicates the number of all policer cells discards (CLP=0+1) of the IFC. This excludes any buffer management discards (if applicable).
tAtmIfcStatsDrpClp0CellsRxd [TAtm Ifc Stats Drp Clp 0 Cells Rxd] (tAtmIfcStatsDrpClp0CellsRxd)	long	The value of tAtmIfcStatsDrpClp0CellsRxd indicates the number of all policer CLP=0 cells discards of the IFC. This excludes any buffer management discards (if applicable).

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tAtmIfcStatsDrpClp0CellsTxd [TAtm Ifc Stats Drp Clp 0 Cells Txd] (tAtmIfcStatsDrpClp0CellsTxd)	long	The value of tAtmIfcStatsDrpClp0CellsTxd indicates the number of all CLP=0 cells discards of this IFC. This includes both discards due to buffer management and policer.
tAtmIfcStatsTagCells [TAtm Ifc Stats Tag Cells] (tAtmIfcStatsTagCells)	long	The value of tAtmIfcStatsTagCells indicates the number of tagged CLP=0 cells of the IFC. The egress may or may not discard these cells.
tAtmIfcStatsTotalBytesRxd [TAtm Ifc Stats Total Bytes Rxd] (tAtmIfcStatsTotalBytesTxd)	java. math. BigInteger	The value of tAtmIfcStatsTotalBytesTxd indicates the number of bytes transmitted by this IFC. This is the number of tAtmIfcStatsTotalCellsTxd multiplied by 53.
tAtmIfcStatsTotalBytesTxd [TAtm Ifc Stats Total Bytes Txd] (tAtmIfcStatsTotalBytesRxd)	java. math. BigInteger	The value of tAtmIfcStatsTotalBytesRxd indicates the number of bytes received by this IFC. This is the number of tAtmIfcStatsTotalCellsRxd multiplied by 53.
tAtmIfcStatsTotalCellsRxd [TAtm Ifc Stats Total Cells Rxd] (tAtmIfcStatsTotalCellsRxd)	java. math. BigInteger	The value of tAtmIfcStatsTotalCellsRxd indicates the number of valid ATM cells received by the IFC including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmIfcStatsTotalCellsTxd [TAtm Ifc Stats Total Cells Txd] (tAtmIfcStatsTotalCellsTxd)	java. math. BigInteger	The value of tAtmIfcStatsTotalCellsTxd indicates the number of valid ATM cells transmitted by the IFC including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmIfcStatsTotalClp0CellsRxd [TAtm Ifc Stats Total Clp 0 Cells Rxd] (tAtmIfcStatsTotalClp0CellsRxd)	java. math. BigInteger	The value of tAtmIfcStatsTotalClp0CellsRxd indicates the number of valid ATM CLP=0 cells received by the IFC. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmIfcStatsTotalClp0CellsTxd [TAtm Ifc Stats Total Clp 0 Cells Txd] (tAtmIfcStatsTotalClp0CellsTxd)	java. math. BigInteger	The value of tAtmIfcStatsTotalClp0CellsTxd indicates the number of valid ATM CLP=0 cells transmitted by the IFC. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AtmOamVplStatistics</p> <p>MIB entry name: tAtmOamVplStatisticsEntry</p> <p>Entry description: An entry in the tAtmVplStatisticsTable containing statistics information applicable to a particular VPL entry in the AToM MIB.</p> <p>Table description (for tAtmOamVplStatisticsTable): The tAtmOamVplStatisticsTable is used to gather oam statistics on a particular VPL entry in the RFC 2515 AToM MIB.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: atm.VPConnection</p>		
tAtmOamVplStatsAISCellsRxd [TAtm Oam Vpl Stats AISCells Rxd] (tAtmOamVplStatsAISCellsRxd)	long	The value of tAtmOamVplStatsAISCellsRxd indicates the number of AIS cells received on this VPL for both end to end and segment.
tAtmOamVplStatsAISCellsTxd [TAtm Oam Vpl Stats AISCells Txd] (tAtmOamVplStatsAISCellsTxd)	long	The value of tAtmOamVplStatsAISCellsTxd indicates the number of AIS cells transmitted on this VPL for both end to end and segment.
tAtmOamVplStatsCrc10Errors [TAtm Oam Vpl Stats Crc 10 Errors] (tAtmOamVplStatsCrc10Errors)	long	The value of tAtmOamVplStatsCrc10Errors indicates the number of OAM cells discarded on this VPL with CRC 10 errors.
tAtmOamVplStatsLoopbackCellsRxd [TAtm Oam Vpl Stats Loopback Cells Rxd] (tAtmOamVplStatsLoopbackCellsRxd)	long	The value of tAtmOamVplStatsLoopbackCellsRxd indicates the number of loopback requests and responses received on this VPL for both end to end and segment.
tAtmOamVplStatsLoopbackCellsTxd [TAtm Oam Vpl Stats Loopback Cells Txd] (tAtmOamVplStatsLoopbackCellsTxd)	long	The value of tAtmOamVplStatsLoopbackCellsTxd indicates the number of loopback requests and responses transmitted on this VPL for both end to end and segment.
tAtmOamVplStatsOtherCellsRxd [TAtm Oam Vpl Stats Other Cells Rxd] (tAtmOamVplStatsOtherCellsRxd)	long	This value of tAtmOamVplStatsOtherCellsRxd indicates the number of OAM cells that are received on this VPL but not identified.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tAtmOamVplStatsRDICellsRxd [TAtm Oam Vpl Stats RDICells Rxd] (tAtmOamVplStatsRDICellsRxd)	long	The value of tAtmOamVplStatsRDICellsRxd indicates the number of RDI cells received on this VPL for both end to end and segment.
tAtmOamVplStatsRDICellsTxd [TAtm Oam Vpl Stats RDICells Txd] (tAtmOamVplStatsRDICellsTxd)	long	The value of tAtmOamVplStatsRDICellsTxd indicates the number of RDI cells transmitted on this VPL for both end to end and segment.
<p>AtmVplStatistics MIB entry name: tAtmVplStatisticsEntry Entry description: An entry in the tAtmVplStatisticsTable containing statistics information applicable to a particular VPL entry in the AToM MIB. Table description (for tAtmVplStatisticsTable): The tAtmVplStatisticsTable is used to gather cell-level statistics on a particular VPL entry in the RFC 2515 AToM MIB. Supports realtime plotting Supports scheduled collection Monitored class: atm.VPConnection</p>		
tAtmVplStatsDrpCellsRxd [TAtm Vpl Stats Drp Cells Rxd] (tAtmVplStatsDrpCellsRxd)	long	The value of tAtmVplStatsDrpCellsRxd indicates the number of all policer cells discards (CLP=0+1) of the VPL. This excludes any buffer management discards (if applicable).
tAtmVplStatsDrpClp0CellsRxd [TAtm Vpl Stats Drp Clp 0 Cells Rxd] (tAtmVplStatsDrpClp0CellsRxd)	long	The value of tAtmVplStatsDrpClp0CellsRxd indicates the number of all policer CLP=0 cells discards of the VPL. This excludes any buffer management discards (if applicable).
tAtmVplStatsDrpClp0CellsTxd [TAtm Vpl Stats Drp Clp 0 Cells Txd] (tAtmVplStatsDrpClp0CellsTxd)	long	The value of tAtmVplStatsDrpClp0CellsTxd indicates the number of all CLP=0 cells discards of this VPL. This includes both discards due to buffer management and policer.
tAtmVplStatsTagCells [TAtm Vpl Stats Tag Cells] (tAtmVplStatsTagCells)	long	The value of tAtmVplStatsTagCells indicates the number of tagged CLP=0 cells of the VPL. The egress may or may not discard these cells.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tAtmVplStatsTotalBytesRxd [TAtm Vpl Stats Total Bytes Rxd] (tAtmVplStatsTotalBytesRxd)	java. math. BigInteger	The value of tAtmVplStatsTotalBytesRxd indicates the number of bytes received by this VPL. This is the number of tAtmVplStatsTotalCellsRxd multiplied by 53.
tAtmVplStatsTotalBytesTxd [TAtm Vpl Stats Total Bytes Txd] (tAtmVplStatsTotalBytesTxd)	java. math. BigInteger	The value of tAtmVplStatsTotalBytesTxd indicates the number of bytes transmitted by this VPL. This is the number of tAtmVplStatsTotalCellsTxd multiplied by 53.
tAtmVplStatsTotalCellsRxd [TAtm Vpl Stats Total Cells Rxd] (tAtmVplStatsTotalCellsRxd)	java. math. BigInteger	The value of tAtmVplStatsTotalCellsRxd indicates the number of valid ATM cells received by the VPL including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmVplStatsTotalCellsTxd [TAtm Vpl Stats Total Cells Txd] (tAtmVplStatsTotalCellsTxd)	java. math. BigInteger	The value of tAtmVplStatsTotalCellsTxd indicates the number of valid ATM cells transmitted by the VPL including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmVplStatsTotalClp0CellsRxd [TAtm Vpl Stats Total Clp 0 Cells Rxd] (tAtmVplStatsTotalClp0CellsRxd)	java. math. BigInteger	The value of tAtmVplStatsTotalClp0CellsRxd indicates the number of valid ATM CLP=0 cells received by the VPL. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmVplStatsTotalClp0CellsTxd [TAtm Vpl Stats Total Clp 0 Cells Txd] (tAtmVplStatsTotalClp0CellsTxd)	java. math. BigInteger	The value of tAtmVplStatsTotalClp0CellsTxd indicates the number of valid ATM CLP=0 cells transmitted by the VPL. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AtmVtlStatistics</p> <p>MIB entry name: tAtmVtlStatisticsEntry</p> <p>Entry description: An entry in the tAtmVtlStatisticsTable containing statistics information applicable to a particular VTL entry.</p> <p>Table description (for tAtmVtlStatisticsTable): The tAtmVtlStatisticsTable is used to gather cell-level statistics on a particular VTL entry.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: atm.VTConnection</p>		
tAtmVtlStatsDrpCellsRxd [TAtm Vtl Stats Drp Cells Rxd] (tAtmVtlStatsDrpCellsRxd)	long	The value of tAtmVtlStatsDrpCellsRxd indicates the number of all policer cells discards (CLP=0+1) of the VTL. This excludes any buffer management discards (if applicable).
tAtmVtlStatsDrpClp0CellsRxd [TAtm Vtl Stats Drp Clp 0 Cells Rxd] (tAtmVtlStatsDrpClp0CellsRxd)	long	The value of tAtmVtlStatsDrpClp0CellsRxd indicates the number of all policer CLP=0 cells discards of the VTL. This excludes any buffer management discards (if applicable).
tAtmVtlStatsDrpClp0CellsTxd [TAtm Vtl Stats Drp Clp 0 Cells Txd] (tAtmVtlStatsDrpClp0CellsTxd)	long	The value of tAtmVtlStatsDrpClp0CellsTxd indicates the number of all CLP=0 cells discards of this VTL. This includes both discards due to buffer management and policer.
tAtmVtlStatsTagCells [TAtm Vtl Stats Tag Cells] (tAtmVtlStatsTagCells)	long	The value of tAtmVtlStatsTagCells indicates the number of tagged CLP=0 cells of the VTL. The egress may or may not discard these cells.
tAtmVtlStatsTotalBytesRxd [TAtm Vtl Stats Total Bytes Rxd] (tAtmVtlStatsTotalBytesTxd)	java. math. BigInteger	The value of tAtmVtlStatsTotalBytesTxd indicates the number of bytes transmitted by this VTL. This is the number of tAtmVtlStatsTotalCellsTxd multiplied by 53.
tAtmVtlStatsTotalBytesTxd [TAtm Vtl Stats Total Bytes Txd] (tAtmVtlStatsTotalBytesRxd)	java. math. BigInteger	The value of tAtmVtlStatsTotalBytesRxd indicates the number of bytes received by this VTL. This is the number of tAtmVtlStatsTotalCellsRxd multiplied by 53.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
tAtmVtlStatsTotalCellsRxd [TAtm Vtl Stats Total Cells Rxd] (tAtmVtlStatsTotalCellsRxd)	java. math. BigInteger	The value of tAtmVtlStatsTotalCellsRxd indicates the number of valid ATM cells received by the VTL including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmVtlStatsTotalCellsTxd [TAtm Vtl Stats Total Cells Txd] (tAtmVtlStatsTotalCellsTxd)	java. math. BigInteger	The value of tAtmVtlStatsTotalCellsTxd indicates the number of valid ATM cells transmitted by the VTL including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmVtlStatsTotalClp0CellsRxd [TAtm Vtl Stats Total Clp 0 Cells Rxd] (tAtmVtlStatsTotalClp0CellsRxd)	java. math. BigInteger	The value of tAtmVtlStatsTotalClp0CellsRxd indicates the number of valid ATM CLP=0 cells received by the VTL. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmVtlStatsTotalClp0CellsTxd [TAtm Vtl Stats Total Clp 0 Cells Txd] (tAtmVtlStatsTotalClp0CellsTxd)	java. math. BigInteger	The value of tAtmVtlStatsTotalClp0CellsTxd indicates the number of valid ATM CLP=0 cells transmitted by the VTL. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
<p>IlmiStatistics</p> <p>MIB entry name: tAtmIlmiLinkStatisticsEntry</p> <p>Entry description: An entry in the tAtmIlmiLinkStatisticsTable containing statistics information applicable to a particular ILMI link on an ATM interface.</p> <p>Table description (for tAtmIlmiLinkStatisticsTable): The tAtmIlmiLinkStatisticsTable is used to gather statistics on a particular ILMI Link.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: atm.IlmiLink</p>		
inBadValueErrors [In Bad Value Errors] (tAtmIlmiLinkInBadValueErrors)	long	The value of tAtmIlmiLinkInBadValueErrors indicates the total number SNMP 'BadValue' error messages received on this ILMI link.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inGeneralErrors [In General Errors] (tAtmIlmiLinkInGeneralErrors)	long	The value of tAtmIlmiLinkInGeneralErrors indicates the total number SNMP 'General' error messages received on this ILMI link.
inGetNextRequest [In Get Next Request] (tAtmIlmiLinkInGetNextRequestPdus)	long	The value of tAtmIlmiLinkInGetNextRequestPdus indicates the total number 'GetNextRequest' SNMP PDUs received on this ILMI link.
inGetRequest [In Get Request] (tAtmIlmiLinkInGetRequestPdus)	long	The value of tAtmIlmiLinkInGetRequestPdus indicates the total number GetRequest SNMP PDUs received on this ILMI link.
inGetResponse [In Get Response] (tAtmIlmiLinkInGetResponsePdus)	long	The value of tAtmIlmiLinkInGetResponsePdus indicates the total number 'GetResponse' SNMP PDUs received on this ILMI link in response to 'GetRequest', 'GetNextRequest' and 'SetRequests' sent.
inNoSuchNameErrors [In No Such Name Errors] (tAtmIlmiLinkInNoSuchNameErrors)	long	The value of tAtmIlmiLinkInNoSuchNameErrors indicates the total number SNMP 'NoSuchName' error messages received on this ILMI link.
inPdu [In Pdu] (tAtmIlmiLinkInPdus)	long	The value of tAtmIlmiLinkInPdus indicates the total number SNMP PDUs received on this ILMI link.
inReadOnlyErrors [In Read Only Errors] (tAtmIlmiLinkInReadOnlyErrors)	long	The value of tAtmIlmiLinkInReadOnlyErrors indicates the total number SNMP 'ReadOnly' error messages received on this ILMI link.
inSetRequestPackets [In Set Request Packets] (tAtmIlmiLinkInSetRequestPdus)	long	The value of tAtmIlmiLinkInSetRequestPdus indicates the total number 'SetRequest' SNMP PDUs received on this ILMI link.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
inTooBigErrors [In Too Big Errors] (tAtmIImiLinkInTooBigErrors)	long	The value of tAtmIImiLinkInTooBigErrors indicates the total number SNMP `TooBig' error messages received on this ILMI link.
inTraps [In Traps] (tAtmIImiLinkInTrapPdus)	long	The value of tAtmIImiLinkInTrapPdus indicates the total number Trap SNMP PDUs received on this ILMI link.
outBadValueErrors [Out Bad Value Errors] (tAtmIImiLinkOutBadValueErrors)	long	The value of tAtmIImiLinkOutBadValueErrors indicates the total number SNMP `BadValue' error messages sent on this ILMI link.
outGeneralErrors [Out General Errors] (tAtmIImiLinkOutGeneralErrors)	long	The value of tAtmIImiLinkOutGeneralErrors indicates the total number SNMP `General' error messages sent on this ILMI link.
outGetNextRequest [Out Get Next Request] (tAtmIImiLinkOutGetNextRequestPdus)	long	The value of tAtmIImiLinkOutGetNextRequestPdus indicates the total number GetNextRequest SNMP PDUs sent on this ILMI link.
outGetRequest [Out Get Request] (tAtmIImiLinkOutGetRequestPdus)	long	The value of tAtmIImiLinkOutGetRequestPdus indicates the total number GetRequest SNMP PDUs sent on this ILMI link.
outGetResponse [Out Get Response] (tAtmIImiLinkOutGetResponsePdus)	long	The value of tAtmIImiLinkOutGetResponsePdus indicates the total number GetResponse SNMP PDUs sent on this ILMI link in response to GetRequest, GetNextRequest and 'SetRequests' received.
outNoSuchNameErrors [Out No Such Name Errors] (tAtmIImiLinkOutNoSuchNameErrors)	long	The value of tAtmIImiLinkOutNoSuchNameErrors indicates the total number SNMP `NoSuchName' error messages sent on this ILMI link.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
outPdu [Out Pdu] (tAtmIImiLinkOutPdus)	long	The value of tAtmIImiLinkOutPdus indicates the total number SNMP PDUs sent on this ILMI link.
outReadOnlyErrors [Out Read Only Errors] (tAtmIImiLinkOutReadOnlyErrors)	long	The value of tAtmIImiLinkOutReadOnlyErrors indicates the total number SNMP 'ReadOnly' error messages sent on this ILMI link.
outSetRequestPackets [Out Set Request Packets] (tAtmIImiLinkOutSetRequestPdus)	long	The value of tAtmIImiLinkOutSetRequestPdus indicates the total number 'SetRequest' SNMP PDUs sent on this ILMI link.
outTooBigErrors [Out Too Big Errors] (tAtmIImiLinkOutTooBigErrors)	long	The value of tAtmIImiLinkOutTooBigErrors indicates the total number SNMP 'TooBig' error messages sent on this ILMI link.
outTraps [Out Traps] (tAtmIImiLinkOutTrapPdus)	long	The value of tAtmIImiLinkOutTrapPdus indicates the total number Trap SNMP PDUs sent on this ILMI link.
snmpCommStringErrors [Snmp Comm String Errors] (tAtmIImiLinkInInvalidSnmpCommunityStringPdus)	long	The value of tAtmIImiLinkInInvalidSnmpCommunityStringPdus indicates the total number SNMP PDUs received with invalid community string on this ILMI link.
snmpFormatErrors [Snmp Format Errors] (tAtmIImiLinkInInvalidSnmpFormatPdus)	long	The value of tAtmIImiLinkInInvalidSnmpFormatPdus indicates the total number SNMP PDUs received with invalid ASN.1 format on this ILMI link.
snmpVersionErrors [Snmp Version Errors] (tAtmIImiLinkInInvalidSnmpVersionPdus)	long	The value of tAtmIImiLinkInInvalidSnmpVersionPdus indicates the total number SNMP PDUs received with invalid version on this ILMI link.

Table 245 atm statistics (continued)

<p>InterfaceAal5Stats</p> <p>MIB entry name: tAtmIntfAal5StatsEntry</p> <p>Entry description: An entry in the tAtmIntfAal5StatsEntry containing statistics information applicable to an ATM interface at the AAL5 Layer.</p> <p>Table description (for tAtmIntfAal5StatsTable): The tAtmIntfAal5StatsTable contains ATM interface stats at the AAL5 Layer.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: atm.Interface</p>		
tAtmInterfaceAal5StatsTotalCrc32Errors [TAtm Interface Aal5 Stats Total Crc 32 Errors] (tAtmIntfAal5StatsTotalCrc32Err)	java. math. BigInteger	The value of tAtmIntfAal5StatsTotalCrc32Err indicates the number of Errors detected by the 32 bit cyclic redundancy check.
tAtmInterfaceAal5StatsTotalPktsDroppedRxd [TAtm Interface Aal5 Stats Total Pkts Dropped Rxd] (tAtmIntfAal5StatsTotalPktsDrpRxd)	java. math. BigInteger	The value of tAtmIntfAal5StatsTotalPktsDrpRxd indicates the number of AAL5 PDUs dropped by the ATM interface in the receive direction. This count does not include crc32 Errors or oversized SDU discards
tAtmInterfaceAal5StatsTotalPktsDroppedTxd [TAtm Interface Aal5 Stats Total Pkts Dropped Txd] (tAtmIntfAal5StatsTotalPktsDrpTxd)	java. math. BigInteger	The value of tAtmIntfAal5StatsTotalPktsDrpTxd indicates the number of AAL5 PDUs dropped in the transmit direction. This count does not include crc32 Errors or oversized SDU discards.
tAtmInterfaceAal5StatsTotalPktsRxd [TAtm Interface Aal5 Stats Total Pkts Rxd] (tAtmIntfAal5StatsTotalPktsRxd)	java. math. BigInteger	The value of tAtmIntfAal5StatsTotalPktsRxd indicates the number of AAL5 PDUs that are received by the ATM interface.
tAtmInterfaceAal5StatsTotalPktsTxd [TAtm Interface Aal5 Stats Total Pkts Txd] (tAtmIntfAal5StatsTotalPktsTxd)	java. math. BigInteger	The value of tAtmIntfAal5StatsTotalPktsTxd indicates the number of AAL5 PDUs that are transmitted by the ATM interface.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
InterfaceStats MIB entry name: tAtmIntfStatsEntry Entry description: An entry in the tAtmIntfStatsEntry containing statistics information applicable to an ATM interface. Table description (for tAtmIntfStatsTable): The tAtmIntfStatsTable contains ATM interface stats at the ATM Layer. Supports realtime plotting Supports scheduled collection Monitored class: atm.Interface		
tAtmInterfaceStatsTotalBytesRxd [TAtm Interface Stats Total Bytes Rxd] (tAtmIntfStatsTotalBytesRxd)	java. math. BigInteger	The value of tAtmIntfStatsTotalBytesRxd indicates the number of bytes received on this interface. This is the number of tAtmIntfStatsTotalCellsRxd multiplied by 53.
tAtmInterfaceStatsTotalBytesTxd [TAtm Interface Stats Total Bytes Txd] (tAtmIntfStatsTotalBytesTxd)	java. math. BigInteger	The value of tAtmIntfStatsTotalBytesTxd indicates the number of bytes transmitted on this interface. This is the number of tAtmIntfStatsTotalCellsTxd multiplied by 53.
tAtmInterfaceStatsTotalCellsRxd [TAtm Interface Stats Total Cells Rxd] (tAtmIntfStatsTotalCellsRxd)	java. math. BigInteger	The value of tAtmIntfStatsTotalCellsRxd indicates the number of valid ATM cells received by the ATM interface including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
tAtmInterfaceStatsTotalCellsTxd [TAtm Interface Stats Total Cells Txd] (tAtmIntfStatsTotalCellsTxd)	java. math. BigInteger	The value of tAtmIntfStatsTotalCellsTxd indicates the number of valid ATM cells transmitted by the ATM interface including both CLP=0 and CLP=1 cells.
tAtmInterfaceStatsTotalUnknownCellsDropped [TAtm Interface Stats Total Unknown Cells Dropped] (tAtmIntfStatsTotalUnknCellsDrp)	long	The value of tAtmIntfStatsTotalUnknCellsDrp indicates the number of cells dropped due to an unknown VPI/VCI.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PvcConnectionAal5PerformanceStats</p> <p>MIB entry name: aal5VccEntry</p> <p>Entry description: This list contains the AAL5 VCC performance parameters and is indexed by ifIndex values of AAL5 interfaces and the associated VPI/VCI values.</p> <p>Table description (for aal5VccTable): This table contains AAL5 VCC performance parameters.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: atm.PvcConnection</p>		
aal5CrcErrors [Aal5 Crc Errors] (aal5VccCrcErrors)	long	The number of AAL5 CPCS PDUs received with CRC-32 errors on this AAL5 VCC at the interface associated with an AAL5 entity.
aal5OverSizedSDUs [Aal5 Over Sized SDUs] (aal5VccOverSizedSDUs)	long	The number of AAL5 CPCS PDUs discarded on this AAL5 VCC at the interface associated with an AAL5 entity because the AAL5 SDUs were too large.
aal5SarTimeOuts [Aal5 Sar Time Outs] (aal5VccSarTimeOuts)	long	The number of partially re-assembled AAL5 CPCS PDUs which were discarded on this AAL5 VCC at the interface associated with an AAL5 entity because they were not fully re-assembled within the required time period. If the re-assembly timer is not supported, then this object contains a zero value.

totalBytesRxd [Total Bytes Rxd] (tAtmVclStatsTotalBytesRxd)	java. math. BigInteger	The value of tAtmVclStatsTotalBytesRxd indicates the number of bytes received by this Vcl. This is the number of tAtmVclStatsTotalCellsRxd multiplied by 53.
totalBytesTxd [Total Bytes Txd] (tAtmVclStatsTotalBytesTxd)	java. math. BigInteger	The value of tAtmVclStatsTotalBytesTxd indicates the number of bytes transmitted by this Vcl. This is the number of tAtmVclStatsTotalCellsTxd multiplied by 53.
totalPacketsRxd [Total Packets Rxd] (tAtmVclStatsTotalCellsRxd)	java. math. BigInteger	The value of tAtmVclStatsTotalCellsRxd indicates the number of valid ATM cells received by the VCL including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.
totalPacketsTxd [Total Packets Txd] (tAtmVclStatsTotalCellsTxd)	java. math. BigInteger	The value of tAtmVclStatsTotalCellsTxd indicates the number of valid ATM cells transmitted by the VCL including both CLP=0 and CLP=1 cells. If traffic policing is implemented, then cells are counted prior to the application of traffic policing.

Table 245 atm statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>TCStats</p> <p>MIB entry name: atmInterfaceTCEntry</p> <p>Entry description: This list contains TC Sublayer parameters and state variables at the ATM interface and is indexed by the ifIndex value of the ATM interface.</p> <p>Table description (for atmInterfaceTCTable): This table contains ATM interface TC Sublayer parameters and state variables, one entry per ATM interface port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: atm.Interface</p>		
ocdEvents [Ocd Events] (atmInterfaceOCDEvents)	long	The number of times the Out of Cell Delineation (OCD) events occur. If seven consecutive ATM cells have Header Error Control (HEC) violations, an OCD event occurs. A high number of OCD events may indicate a problem with the TC Sublayer.
<p>TCSubLayerStats</p> <p>MIB entry name: tAtmTCSublayerEntry</p> <p>Entry description: An entry in the tAtmTCSublayerEntry containing additional management information about the Transmission Coverage Sublayer.</p> <p>Table description (for tAtmTCSublayerTable): The tAtmTCSublayerTable contains the Transmission Convergence Sublayer data.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: atm.Interface</p>		
hecErrors [Hec Errors] (tAtmTCSublayerHecErrors)	long	The value of tAtmTCSublayerHecErrors indicates the number of cells with uncorrectable HEC Errors on this interface.
hecErrorsFixed [Hec Errors Fixed] (tAtmTCSublayerHecErrorsFixed)	long	The value of tAtmTCSublayerHecErrorsFixed indicates the number of cells with correctable HEC Errors on this interface.

Table 246 bgp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>PeerAdditionalStats</p> <p>MIB entry name: bgpPeerEntry</p> <p>Entry description: Entry containing information about the connection with a BGP peer.</p> <p>Table description (for bgpPeerTable): BGP peer table. This table contains, one entry per BGP peer, information about the connections with BGP peers.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
fsmEstablishedTime [Fsm Established Time] (bgpPeerFsmEstablishedTime)	long	This timer indicates how long (in seconds) this peer has been in the established state or how long since this peer was last in the established state. It is set to zero when a new peer is configured or when the router is booted.
<p>PeerRouteTargetStats</p> <p>MIB entry name: tBgpPeerNgOperEntry</p> <p>Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable.</p> <p>Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
rtActivePfxs [Rt Active Pfxs] (tBgpPeerNgOperRtTgtActivePfxs)	long	The value of tBgpPeerNgOperRtTgtActivePfxs indicates the number of active route target prefixes from this peer.
rtRecvPfxs [Rt Recv Pfxs] (tBgpPeerNgOperRtTgtRecvPfxs)	long	The value of tBgpPeerNgOperRtTgtRecvPfxs indicates the number of route target prefixes received from this peer.

Table 246 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
rtSentPfxs [Rt Sent Pfxs] (tBgpPeerNgOperRtTgtSentPfxs)	long	The value of tBgpPeerNgOperRtTgtSentPfxs indicates the number of route target prefixes transmitted to this peer.
rtSuppPfxDamp [Rt Supp Pfx Damp] (tBgpPeerNgOperRtTgtSuppPfxDamp)	long	The value of tBgpPeerNgOperRtTgtSuppPfxDamp indicates the number of route target prefixes from this peer, which have been suppressed by damping.
<p>PeerStats MIB entry name: tBgpPeerNgOperEntry Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable. Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information. Supports realtime plotting Supports scheduled collection Monitored class: bgp.Peer</p>		
bgpLsActivePfxs [Bgp Ls Active Pfxs] (tBgpPeerNgOperBgpLsActivePfxs)	long	The value of tBgpPeerNgOperBgpLsActivePfxs indicates the number of active bgp-ls prefixes from this peer.
bgpLsRecvPfxs [Bgp Ls Recv Pfxs] (tBgpPeerNgOperBgpLsRecvPfxs)	long	The value of tBgpPeerNgOperBgpLsRecvPfxs indicates the number of bgp-ls prefixes received from this peer.
bgpLsRejPfxs [Bgp Ls Rej Pfxs] (tBgpPeerNgOperBgpLsRejPfxs)	long	The value of tBgpPeerNgOperBgpLsRejPfxs indicates the number of bgp-ls prefixes rejected from this peer.
bgpLsSentPfxs [Bgp Ls Sent Pfxs] (tBgpPeerNgOperBgpLsSentPfxs)	long	The value of tBgpPeerNgOperBgpLsSentPfxs indicates the number of bgp-ls prefixes transmitted to this peer.

Table 246 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
bgpLsSupPfxDamp [Bgp Ls Sup Pfx Damp] (tBgpPeerNgOperBgpLsSupPfxDamp)	long	The value of tBgpPeerNgOperBgpLsSupPfxDamp indicates the number of bgp-ls prefixes from this peer, which have been suppressed by damping
flaps [Flaps] (tBgpPeerNgOperFlaps)	long	The value of tBgpPeerNgOperFlaps indicates the number of flaps of updates from this peer.
inputQueueMessages [Input Queue Messages] (tBgpPeerNgOperInputQueueMsgs)	long	The value of tBgpPeerNgOperInputQueueMsgs indicates the number of unprocessed messages in the queue, from this peer.
I2VpnActivePfxs [L2 Vpn Active Pfxs] (tBgpPeerNgOperI2VpnActivePfxs)	long	The value of tBgpPeerNgOperI2VpnActivePfxs indicates the number of active L2VPN prefixes from this peer.
I2VpnRecvPfxs [L2 Vpn Recv Pfxs] (tBgpPeerNgOperI2VpnRecvPfxs)	long	The value of tBgpPeerNgOperI2VpnRecvPfxs indicates the number L2VPN prefixes received from this peer.
I2VpnSentPfxs [L2 Vpn Sent Pfxs] (tBgpPeerNgOperI2VpnSentPfxs)	long	The value of tBgpPeerNgOperI2VpnSentPfxs indicates the number of L2VPN prefixes transmitted to this peer.
I2VpnSuppPfxDamp [L2 Vpn Supp Pfx Damp] (tBgpPeerNgOperI2VpnSuppPfxDamp)	long	The value of tBgpPeerNgOperI2VpnSuppPfxDamp indicates the number of L2VPN prefixes from this peer, which have been suppressed by damping.
labelV4ActivePfxs [Label V4 Active Pfxs] (tBgpPeerNgOperLabelV4ActivePfxs)	long	The value of tBgpPeerNgOperLabelV4ActivePfxs indicates the number of active label-ipv4 prefixes from this peer.
labelV4BackupPfxs [Label V4 Backup Pfxs] (tBgpPeerNgOperLabelV4BackupPfxs)	long	The value of tBgpPeerNgOperLabelV4BackupPfxs indicates the number of label-ipv4 routes selected as backup from this peer.

Table 246 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
labelV4RecvPfxs [Label V4 Recv Pfxs] (tBgpPeerNgOperLabelV4RecvPfxs)	long	The value of tBgpPeerNgOperLabelV4RecvPfxs indicates the number of label-ipv4 prefixes received from this peer.
labelV4RejPfxs [Label V4 Rej Pfxs] (tBgpPeerNgOperLabelV4RejPfxs)	long	The value of tBgpPeerNgOperLabelV4RejPfxs indicates the number of label-ipv4 prefixes rejected from this peer.
labelV4SentPfxs [Label V4 Sent Pfxs] (tBgpPeerNgOperLabelV4SentPfxs)	long	The value of tBgpPeerNgOperLabelV4SentPfxs indicates the number of label-ipv4 prefixes transmitted to this peer.
labelV4SupPfxDamp [Label V4 Sup Pfx Damp] (tBgpPeerNgOperLabelV4SupPfxDamp)	long	The value of tBgpPeerNgOperLabelV4SupPfxDamp indicates the number of label-ipv4 prefixes from this peer, which have been suppressed by damping.
labelV6ActivePfxs [Label V6 Active Pfxs] (tBgpPeerNgOperLabelV6ActivePfxs)	long	The value of tBgpPeerNgOperLabelV6ActivePfxs indicates the number of active label-ipv6 prefixes from this peer.
labelV6BackupPfxs [Label V6 Backup Pfxs] (tBgpPeerNgOperLabelV6BackupPfxs)	long	The value of tBgpPeerNgOperLabelV6BackupPfxs indicates the number of label-ipv6 routes selected as backup from this peer.
labelV6RecvPfxs [Label V6 Recv Pfxs] (tBgpPeerNgOperLabelV6RecvPfxs)	long	The value of tBgpPeerNgOperLabelV6RecvPfxs indicates the number of label-ipv6 prefixes received from this peer.
labelV6RejPfxs [Label V6 Rej Pfxs] (tBgpPeerNgOperLabelV6RejPfxs)	long	The value of tBgpPeerNgOperLabelV6RejPfxs indicates the number of label-ipv6 prefixes rejected from this peer.
labelV6SentPfxs [Label V6 Sent Pfxs] (tBgpPeerNgOperLabelV6SentPfxs)	long	The value of tBgpPeerNgOperLabelV6SentPfxs indicates the number of label-ipv6 prefixes transmitted to this peer.

Table 246 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
labelV6SupPfxDamp [Label V6 Sup Pfx Damp] (tBgpPeerNgOperLabelV6SupPfxDamp)	long	The value of tBgpPeerNgOperLabelV6SupPfxDamp indicates the number of label-ipv6 prefixes from this peer, which have been suppressed by damping.
lastEvent [Last Event] (tBgpPeerNgOperLastEvent)	long	The value of tBgpPeerNgOperLastEvent indicates the last BGP event of this peer.
lastRestartTime [Last Restart Time] (tBgpPeerNgOperLastRestartTime)	long	The value of tBgpPeerNgOperLastRestartTime indicates the last time the peer attempted restart.
lastState [Last State] (tBgpPeerNgOperLastState)	long	The value of tBgpPeerNgOperLastState indicates the last BGP state of this peer.
mcastActivePrefixes [Mcast Active Prefixes] (tBgpPeerNgOperMCastV4ActivePfxs)	long	The value of tBgpPeerNgOperMCastV4ActivePfxs indicates the number of active IPv4 multicast prefixes from this peer.
mcastPrefixesSuppressedByDamping [Mcast Prefixes Suppressed By Damping] (tBgpPeerNgOperMCastV4SupPfxDamp)	long	The value of tBgpPeerNgOperMCastV4SupPfxDamp indicates the number of IPv4 multicast prefixes from this peer, which have been suppressed by damping.
mcastReceivedPrefixes [Mcast Received Prefixes] (tBgpPeerNgOperMCastV4RecvPfxs)	long	The value of tBgpPeerNgOperMCastV4RecvPfxs indicates the number of IPv4 multicast prefixes received from this peer.
mcastSentPrefixes [Mcast Sent Prefixes] (tBgpPeerNgOperMCastV4SentPfxs)	long	The value of tBgpPeerNgOperMCastV4SentPfxs indicates the number of IPv4 multicast prefixes transmitted to this peer.
mdtSafiActivePrefixes [Mdt Safi Active Prefixes] (tBgpPeerNgOperMdtSafiActivePfxs)	long	The value of tBgpPeerNgOperMdtSafiActivePfxs indicates the number of active MDT-SAFI prefixes from this peer.

Table 246 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mdtSafiPrefixesSuppressedByDamping [Mdt Safi Prefixes Suppressed By Damping] (tBgpPeerNgOperMdtSafiSuppPfxDamp)	long	The value of tBgpPeerNgOperMdtSafiSuppPfxDamp indicates the number of MDT-SAFI prefixes from this peer, which have been suppressed by damping.
mdtSafiReceivedPrefixes [Mdt Safi Received Prefixes] (tBgpPeerNgOperMdtSafiRecvPfxs)	long	The value of tBgpPeerNgOperMdtSafiRecvPfxs indicates the number of MDT-SAFI prefixes received from this peer.
mdtSafiSentPrefixes [Mdt Safi Sent Prefixes] (tBgpPeerNgOperMdtSafiSentPfxs)	long	The value of tBgpPeerNgOperMdtSafiSentPfxs indicates the number of MDT-SAFI prefixes transmitted to this peer.
messageOctetsReceived [Message Octets Received] (tBgpPeerNgOperMsgOctetsRcvd)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsRcvd indicates the number of octets received from this peer.
messageOctetsSent [Message Octets Sent] (tBgpPeerNgOperMsgOctetsSent)	java. math. BigInteger	The value of tBgpPeerNgOperMsgOctetsSent indicates the number of octets transmitted to this peer.
numberOfRestarts [Number Of Restarts] (tBgpPeerNgOperNumRestarts)	long	The value of tBgpPeerNgOperNumRestarts indicates the number of times the peer has attempted restart.
outputQueueMessages [Output Queue Messages] (tBgpPeerNgOperOutputQueueMsgs)	long	The value of tBgpPeerNgOperOutputQueueMsgs indicates the number of untransmitted messages in the queue, to this peer.
pathsReceived [Paths Received] (tBgpPeerNgOperReceivedPaths)	long	The value of tBgpPeerNgOperReceivedPaths indicates the number of paths received from this peer.

Table 246 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
prefixesActive [Prefixes Active] (tBgpPeerNgOperActivePrefixes)	long	The value of tBgpPeerNgOperActivePrefixes indicates the number of active prefixes from this peer.
prefixesReceived [Prefixes Received] (tBgpPeerNgOperReceivedPrefixes)	long	The value of tBgpPeerNgOperReceivedPrefixes indicates the number of prefixes received from this peer.
prefixesSent [Prefixes Sent] (tBgpPeerNgOperSentPrefixes)	long	The value of tBgpPeerNgOperSentPrefixes indicates the number of prefixes transmitted to this peer.
prefixesSuppressedByDamping [Prefixes Suppressed By Damping] (tBgpPeerNgOperV4SuppPfxDamp)	long	The value of tBgpPeerNgOperV4SuppPfxDamp indicates the number of IPv6 prefixes from this peer, which have been suppressed by damping.
v6ActivePrefixes [V6 Active Prefixes] (tBgpPeerNgOperV6ActivePrefixes)	long	The value of tBgpPeerNgOperV6ActivePrefixes indicates the number of active IPv6 prefixes from this peer.
v6PrefixesSuppressedByDamping [V6 Prefixes Suppressed By Damping] (tBgpPeerNgOperV6SuppPfxDamp)	long	The value of tBgpPeerNgOperV6SuppPfxDamp indicates the number of IPv6 prefixes from this peer, which have been suppressed by damping.
v6ReceivedPrefixes [V6 Received Prefixes] (tBgpPeerNgOperV6ReceivedPrefixes)	long	The value of tBgpPeerNgOperV6ReceivedPrefixes indicates the number of IPv6 prefixes received from this peer.
v6SentPrefixes [V6 Sent Prefixes] (tBgpPeerNgOperV6SentPrefixes)	long	The value of tBgpPeerNgOperV6SentPrefixes indicates the number of IPv6 prefixes transmitted to this peer.
vpnActivePrefixes [Vpn Active Prefixes] (tBgpPeerNgOperVpnActivePrefixes)	long	The value of tBgpPeerNgOperVpnActivePrefixes indicates the number of active VPN prefixes from this BGP peer.

Table 246 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vpnPrefixesSuppressedByDamping [Vpn Prefixes Suppressed By Damping] (tBgpPeerNgOperVpnSuppPfxDamp)	long	The value of tBgpPeerNgOperVpnSuppPfxDamp indicates the number of VPN IPv4 prefixes from this peer, which have been suppressed by damping.
vpnReceivedPrefixes [Vpn Received Prefixes] (tBgpPeerNgOperVpnRecvPrefixes)	long	The value of tBgpPeerNgOperVpnRecvPrefixes indicates the number of received VPN prefixes.
vpnSentPrefixes [Vpn Sent Prefixes] (tBgpPeerNgOperVpnSentPrefixes)	long	The value of tBgpPeerNgOperVpnSentPrefixes indicates the number of transmitted VPN prefixes.
<p>PeerVprnlpv6Stats</p> <p>MIB entry name: tBgpPeerNgOperEntry</p> <p>Entry description: Defines an entry (conceptual row) in the tBgpPeerNgOperTable. Entries in tBgpPeerNgOperTable are created when entries are created in tBgpPeerNgTable.</p> <p>Table description (for tBgpPeerNgOperTable): The tBgpPeerNgOperTable is the list of configured BGP Peers and their operational status information.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bgp.Peer</p>		
vpnIpv6ActivePfxs [Vpn Ipv 6 Active Pfxs] (tBgpPeerNgOperVpnIpv6ActivePfxs)	long	The value of tBgpPeerNgOperVpnIpv6ActivePfxs indicates the number of active VPN IPv6 prefixes from this peer.
vpnIpv6RecvPfxs [Vpn Ipv 6 Recv Pfxs] (tBgpPeerNgOperVpnIpv6RecvPfxs)	long	The value of tBgpPeerNgOperVpnIpv6RecvPfxs indicates the number of VPN IPv6 prefixes received from this peer.
vpnIpv6SentPfxs [Vpn Ipv 6 Sent Pfxs] (tBgpPeerNgOperVpnIpv6SentPfxs)	long	The value of tBgpPeerNgOperVpnIpv6SentPfxs indicates the number of VPN IPv6 prefixes transmitted to this peer.

Table 246 bgp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
vpnIpv6SuppPfxDamp [Vpn Ipv 6 Supp Pfx Damp] (tBgpPeerNgOperVpnIpv6SuppPfxDamp)	long	The value of tBgpPeerNgOperVpnIpv6SuppPfxDamp indicates the number of VPN IPv6 prefixes from this peer, which have been suppressed by damping.

Table 247 bundle statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>BundleStats</p> <p>MIB entry name: tmnxBundleEntry</p> <p>Entry description: Each row entry represents a multilink bundle on a MDA. Entries can be created and deleted via SNMP SET operations using the tmnxBundleRowStatus object. The tmnxBundleBundleID will contain the bundle number encoded in it. The bundle number is unique for a MDA. For each tmnxBundleEntry, there will be a corresponding entry in the tmnxPortTable and the ifTable.</p> <p>Table description (for tmnxBundleTable): The tmnxBundleTable has an entry for a bundle created on the system.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bundle.Interface</p>		
inputDiscards [Input Discards] (tmnxBundleInputDiscards)	long	tmnxBundleInputDiscards indicates the number of LCP packets that were discarded. This object is only supported for a tmnxBundleType value of mlppp.
upTime [Up Time] (tmnxBundleUpTime)	long	tmnxBundleUpTime indicates the time since the bundle is operationally 'inService'.
<p>MultiClassMlpppStats</p> <p>MIB entry name: tmnxMcMlpppStatsEntry</p> <p>Entry description: Defines an entry in tmnxMcMlpppStatsTable. Entries are created and deleted by the system depending on the number of classes being used by a given MLPPP bundle.</p> <p>Table description (for tmnxMcMlpppStatsTable): Defines the Nokia SROS series Multiclass MLPPP statistics table for providing the capability of retrieving the traffic statistics for the physical queues being used for a class of a multiclass MLPPP bundle to forward the traffic.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: bundle.MultiClassMlpppSpecifics</p>		

Table 247 bundle statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
mcMlpppStatsEgressErrPkt [Mc Mlppp Stats Egress Err Pkt] (tmnxMcMlpppStatsEgressErrPkt)	long	The value of tmnxMcMlpppStatsEgressErrPkt indicates the total number of packets discarded due to segmentation errors on the bundle for the given class on egress.
mcMlpppStatsEgressOct [Mc Mlppp Stats Egress Oct] (tmnxMcMlpppStatsEgressOct)	long	The value of tmnxMcMlpppStatsEgressOct indicates the total number of octets in all packets received on the bundle for the given class on egress before segmentation.
mcMlpppStatsEgressPkt [Mc Mlppp Stats Egress Pkt] (tmnxMcMlpppStatsEgressPkt)	long	The value of tmnxMcMlpppStatsEgressPkt indicates the total number of packets forwarded on the bundle for the given class on egress towards the line.
mcMlpppStatsIngressErrPkt [Mc Mlppp Stats Ingress Err Pkt] (tmnxMcMlpppStatsIngressErrPkt)	long	The value of tmnxMcMlpppStatsIngressErrPkt indicates the total number of packets discarded due to reassembly errors on the bundle for the given class on ingress.
mcMlpppStatsIngressOct [Mc Mlppp Stats Ingress Oct] (tmnxMcMlpppStatsIngressOct)	long	The value of tmnxMcMlpppStatsIngressOct indicates the total number of octets in all packets received on the bundle for the given class on ingress before reassembly.
mcMlpppStatsIngressPkt [Mc Mlppp Stats Ingress Pkt] (tmnxMcMlpppStatsIngressPkt)	long	The value of tmnxMcMlpppStatsIngressPkt indicates the total number of packets forwarded on the bundle for the given class on ingress towards higher layer protocols.

Table 248 cflowd statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AAGroupCflowdDirExpAddrStats</p> <p>MIB entry name: tmnxBsxCflowdDirExpStatEntry</p> <p>Entry description: Each tmnxBsxCflowdDirExpStatEntry contains the statistics for an Application Assurance Cflowd direct export collector within an Application Assurance group.</p> <p>Table description (for tmnxBsxCflowdDirExpStatTable): The tmnxBsxCflowdDirExpStatTable contains statistics on the Application Assurance Cflowd direct export collectors within an Application Assurance group. Rows in this table are automatically created and destroyed when collectors are created or destroyed in the tmnxBsxCflowdDirExpAddrTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.AAGroupCflowdDirExpAddr</p>		
discontinueTime [Discontinue Time] (tmnxBsxCflowdDirExpStatDscntTime)	long	The value of tmnxBsxCflowdDirExpStatDscntTime indicates discontinuity time. This is the SNMPv2-MIB::sysUpTime (hundredths of a second) when the direct export collector last changed status.
recordSent [Record Sent] (tmnxBsxCflowdDirExpStatRecSent)	java.math.BigInteger	The value of tmnxBsxCflowdDirExpStatRecSent indicates the total number of flow records sent to the remote Cflowd direct export collector.
<p>AAGroupCflowdStats</p> <p>MIB entry name: tmnxBsxCflowdStatusEntry</p> <p>Entry description: Each tmnxBsxCflowdStatusEntry contains the Cflowd status information for a particular group, Cflowd export type and ISA-AA MDA. An index with a valid tmnxBsxIsaAaGroupIndex and a valid tmnxBsxCflowdExpType, tmnxChassisIndex set to one, and a zero value for each of the tmnxBsxCardSlotNum/tmnxMDASlotNum indices will return the summarized per group status.</p> <p>Table description (for tmnxBsxCflowdStatusTable): The tmnxBsxCflowdStatusTable contains an entry for each ISA-AA MDA and Group in the system. Each row contains the Cflowd status information per group and Cflowd export type for an ISA-AA MDA uniquely identified by the tmnxChassisIndex, tmnxBsxCardSlotNum, and the tmnxMDASlotNum.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.AAGroupCflowd</p>		

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
activeFlowCurrent [Active Flow Current] (tmnxBsxCflowdStatusActFlowsCurr)	long	The value of tmnxBsxCflowdStatusActFlowsCurr indicates the number of active flows currently marked for export using Cflowd in the ISA-AA MDA(s).
activeRateCurrent [Active Rate Current] (tmnxBsxCflowdStatusRecRateCurr)	long	The value of tmnxBsxCflowdStatusRecRateCurr indicates the number of flow records per second being exported using Cflowd from the ISA-AA MDA(s). The calculation is based on the number of flow records inserted into Cflowd packets within the last 10 seconds.
discontinueTime [Discontinue Time] (tmnxBsxCflowdStatusDiscontTime)	long	The value of tmnxBsxCflowdStatusDiscontTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when the ISA-AA MDA within the group has last changed status.
expType [Exp Type] (tmnxBsxCflowdExpType)	int	The value of tmnxBsxCflowdExpType specifies the type of the Application Assurance statistic exported using Cflowd.
flowExported [Flow Exported] (tmnxBsxCflowdStatusFlowsNoRes)	long	The value of tmnxBsxCflowdStatusFlowsNoRes indicates the total number of flows that were selected for export but failed to obtain Cflows resources in the ISA-AA MDA(s).
hcFlowExported [Hc Flow Exported] (tmnxBsxCflowdStatusHCFlowsNoRes)	java. math. BigInteger	The value of tmnxBsxCflowdStatusHCFlowsNoRes indicates the total number of flows that were selected for export but failed to obtain Cflows resources in the ISA-AA MDA(s). This object is the 64-bit version of tmnxBsxCflowdStatusFlowsNoRes.
hcPacketsSent [Hc Packets Sent] (tmnxBsxCflowdStatusHCPktsSent)	java. math. BigInteger	The value of tmnxBsxCflowdStatusHCPktsSent indicates the total number of Cflowd packets sent from the ISA-AA MDA(s). This object is the 64-bit version of tmnxBsxCflowdStatusPktsSent.
hcRecDropped [Hc Rec Dropped] (tmnxBsxCflowdStatusHCRcDropped)	java. math. BigInteger	The value of tmnxBsxCflowdStatusHCRcDropped indicates the total number of flow records dropped in the ISA-AA MDA(s). This object is the 64-bit version of tmnxBsxCflowdStatusRecDropped.

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
hcRecReported [Hc Rec Reported] (tmnxBsxCflowdStatusHCRecReported)	java. math. BigInteger	The value of tmnxBsxCflowdStatusHCRecReported indicates the total number of flow records reported from the ISA-AA MDA(s). This object is the 64-bit version of tmnxBsxCflowdStatusRecReported.
packetRateCurrent [Packet Rate Current] (tmnxBsxCflowdStatusPktRateCurr)	long	The value of tmnxBsxCflowdStatusPktRateCurr indicates the number of Cflowd packets per second being exported from the ISA-AA MDA(s). The calculation is based on the number of Cflowd packets generated within the last 10 seconds.
packetsSent [Packets Sent] (tmnxBsxCflowdStatusPktsSent)	long	The value of tmnxBsxCflowdStatusPktsSent indicates the total number of Cflowd packets sent from the ISA-AA MDA(s).
recDropped [Rec Dropped] (tmnxBsxCflowdStatusRecDropped)	long	The value of tmnxBsxCflowdStatusRecDropped indicates the total number of flow records dropped in the ISA-AA MDA(s).
recReported [Rec Reported] (tmnxBsxCflowdStatusRecReported)	long	The value of tmnxBsxCflowdStatusRecReported indicates the total number of flow records reported from the ISA-AA MDA(s).
<p>AAGroupCollectorStats</p> <p>MIB entry name: tmnxBsxCflowdCollStatEntry</p> <p>Entry description: Each tmnxBsxCflowdCollStatEntry contains the statistics for an Application Assurance Cflowd collector within an Application Assurance group.</p> <p>Table description (for tmnxBsxCflowdCollStatTable): The tmnxBsxCflowdCollStatTable contains statistics on the Application Assurance Cflowd collectors within an Application Assurance group.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.AAGroupCollector</p>		
discontinueTime [Discontinue Time] (tmnxBsxCflowdCollStatDiscontTime)	long	The value of tmnxBsxCflowdCollStatDiscontTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when the Cflowd collector has last changed status.

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
hcRecordSent [Hc Record Sent] (tmnxBsxCflowdCollStatHCRecSent)	java. math. BigInteger	The value of tmnxBsxCflowdCollStatHCRecSent indicates the total number of flow records sent to the remote Cflowd collector. This object is the 64-bit version of tmnxBsxCflowdCollStatRecSent.
recordSent [Record Sent] (tmnxBsxCflowdCollStatRecSent)	long	The value of tmnxBsxCflowdCollStatRecSent indicates the total number of flow records sent to the remote Cflowd collector.
CflowdGeneralStats MIB entry name: tmnxCflowdGeneralObjs Supports realtime plotting Supports scheduled collection Monitored class: cflowd.NeCflowd		
activeFlows [Active Flows] (tmnxCflowdActiveFlows)	long	The value of tmnxCflowdActiveFlows is a gauge that indicates the current number of active flows being collected.
droppedFlows [Dropped Flows] (tmnxCflowdGenDroppedFlows)	long	The value of tmnxCflowdGenDroppedFlows indicates the number of times a flow was dropped. Data from dropped flows are not reported to any collector.
genAggrFlowsCreated [Gen Aggr Flows Created] (tmnxCflowdGenAggrFlowsCreated)	long	The value of tmnxCflowdGenAggrFlowsCreated indicates the number of aggregate flows created by system.
genAggrFlowsFlushed [Gen Aggr Flows Flushed] (tmnxCflowdGenAggrFlowsFlushed)	long	The value of tmnxCflowdGenAggrFlowsFlushed indicates the number of aggregate flows flushed.
genAggrFlowsMatched [Gen Aggr Flows Matched] (tmnxCflowdGenAggrFlowsMatched)	long	The value of tmnxCflowdGenAggrFlowsMatched indicates the number of packets matched to an existing aggregate flow.

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
genRawFlowsCreated [Gen Raw Flows Created] (tmnxCflowdGenRawFlowsCreated)	long	The value of tmnxCflowdGenRawFlowsCreated indicates the number of raw flows created by system.
genRawFlowsFlushed [Gen Raw Flows Flushed] (tmnxCflowdGenRawFlowsFlushed)	long	The value of tmnxCflowdGenRawFlowsFlushed indicates the number of raw flows flushed.
genRawFlowsMatched [Gen Raw Flows Matched] (tmnxCflowdGenRawFlowsMatched)	long	The value of tmnxCflowdGenRawFlowsMatched indicates the number of raw packets matched to an existing raw flow.
overflowEvents [Overflow Events] (tmnxCflowdGenOverflowEvents)	long	The value of tmnxCflowdGenOverflowEvents indicates the number of times the flow cache has entered the overflow state.
totalPktsDropped [Total Pkts Dropped] (tmnxCflowdTotalPktsDropped)	long	The value of tmnxCflowdTotalPktsDropped indicates the total number of packets dropped for Cflowd.
totalPktsRcvd [Total Pkts Rcvd] (tmnxCflowdTotalPktsRcvd)	long	The value of tmnxCflowdTotalPktsRcvd indicates the total number of packets received for Cflowd.
<p>CflowdPerfExpStats</p> <p>MIB entry name: tmnxBsxCflowdExpStatEntry</p> <p>Entry description: Each tmnxBsxCflowdExpStatEntry contains the statistics on the Cflowd export of Application Assurance per-flow volume, performance, or comprehensive records for an Application Assurance group and partition.</p> <p>Table description (for tmnxBsxCflowdExpStatTable): The tmnxBsxCflowdExpStatTable contains statistics on the Cflowd export of Application Assurance per-flow volume, performance, or comprehensive records within an Application Assurance group and partition.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.CflowdPerfExp</p>		

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
discontinueTime [Discontinue Time] (tmnxBsxCflowdExpStatDiscontTime)	long	The value of tmnxBsxCflowdExpStatDiscontTime indicates the SNMPv2-MIB::sysUpTime (hundredths of a second) when the export of cflowd records has last changed status.
expType [Exp Type] (tmnxBsxCflowdExpType)	int	The value of tmnxBsxCflowdExpType specifies the type of the Application Assurance statistic exported using Cflowd.
flowExported [Flow Exported] (tmnxBsxCflowdExpStatFlowsNoRes)	long	The value of tmnxBsxCflowdExpStatFlowsNoRes indicates the total number of flows that were selected for export but failed to obtain Cflowd resources.
hcFlowExported [Hc Flow Exported] (tmnxBsxCflowdExpStatHCFlowsNoRes)	java. math. BigInteger	The value of tmnxBsxCflowdExpStatHCFlowsNoRes indicates the total number of flows that were selected for export but failed to obtain Cflowd resources. This object is the 64-bit version of tmnxBsxCflowdExpStatFlowsNoRes.
hcRecDropped [Hc Rec Dropped] (tmnxBsxCflowdExpStatHCRecDropped)	java. math. BigInteger	The value of tmnxBsxCflowdExpStatHCRecDropped indicates the total number of Cflowd flow records dropped. This object is the 64-bit version of tmnxBsxCflowdExpStatRecDropped.
hcRecReport [Hc Rec Report] (tmnxBsxCflowdExpStatHCRecReport)	java. math. BigInteger	The value of tmnxBsxCflowdExpStatHCRecReport indicates the total number of flow records reported. This object is the 64-bit version of tmnxBsxCflowdExpStatRecReport.
recDropped [Rec Dropped] (tmnxBsxCflowdExpStatRecDropped)	long	The value of tmnxBsxCflowdExpStatRecDropped indicates the total number of flow records dropped.
recReport [Rec Report] (tmnxBsxCflowdExpStatRecReport)	long	The value of tmnxBsxCflowdExpStatRecReport indicates the total number of flow records reported.

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>NeCflowdStats</p> <p>MIB entry name: tmnxCflowdVersionStatsEntry</p> <p>Entry description: The tmnxCflowdVersionStatsEntry contains the information pertaining to the system wide statistics for the specified version index.</p> <p>Table description (for tmnxCflowdVersionStatsTable): The tmnxCflowdVersionStatsTable consists of the overall statistics based on collector version.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.NeCollector</p>		
packetErrors [Packet Errors] (tmnxCflowdVersionErrors)	long	The value of tmnxCflowdVersionErrors indicates the number of errored packets for the specified version.
packetsOpen [Packets Open] (tmnxCflowdVersionOpen)	long	The value of tmnxCflowdVersionOpen indicates the number of open packets pending for the specified version.
packetsSent [Packets Sent] (tmnxCflowdVersionSent)	long	The value of tmnxCflowdVersionSent indicates the number of packets transmitted for the specified version.
version [Version] (tmnxCflowdVersionIndex)	long	The value of tmnxCflowdVersionIndex specifies the row in the tmnxCflowdVersionStatsTable that pertains to the cflowd collector version.
versionStatus [Version Status] (tmnxCflowdVersionStatus)	int	The value of tmnxCflowdVersionStatus indicates whether or not the version is in use in the system.

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>NeCollectorV10Stats</p> <p>MIB entry name: tmnxCFHostCollTemplStatsEntry</p> <p>Entry description: The tmnxCFHostCollTemplStatsEntry contains the information pertaining to the remote collector host statistics for the specified template index.</p> <p>Table description (for tmnxCFHostCollTemplStatsTable): The tmnxCFHostCollTemplStatsTable consists of the overall statistics based on template flows for a specified remote collector host entry. This table replaces the tmnxCflowdTemplateStatsTable as it includes support for IPv6 addresses.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.NeCollector</p>		
templateErrors [Template Errors] (tmnxCFHostCollTemplErrorPackets)	long	The value of tmnxCFHostCollTemplErrorPackets indicates the number of errored packets for the specified Template type.
templateFlowIndex [Template Flow Index] (tmnxCFHostCollTemplFlowIndex)	int	The value of tmnxCFHostCollTemplFlowIndex specifies the row in the tmnxCflowdTemplateStatsTable that pertains to the cflowd collector Template type. Values: ipv4 (1) - IPv4 unicast/multicast sampling mpls (2) - MPLS ipv6 (3) - IPv6 unicast/multicast sampling I2 (4) - Layer 2
templateOpen [Template Open] (tmnxCFHostCollTemplOpenPackets)	long	The value of tmnxCFHostCollTemplOpenPackets indicates the number of open packets pending for the specified Template type.
templateSent [Template Sent] (tmnxCFHostCollTemplSentPackets)	long	The value of tmnxCFHostCollTemplSentPackets indicates the number of packets transmitted for the specified Template type.
transmitTime [Transmit Time] (tmnxCFHostCollTemplLastTxTime)	long	The value of tmnxCFHostCollTemplLastTxTime indicates the time, since system startup, when the specified template was last transmitted.

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>NeCollectorV5Stats</p> <p>MIB entry name: tmnxCFHostCollV5StatsEntry</p> <p>Entry description: The tmnxCFHostCollV5StatsEntry contains the statistics information pertaining to the specified remote collector host.</p> <p>Table description (for tmnxCFHostCollV5StatsTable): The tmnxCFHostCollV5StatsTable consists of the version 5 statistics for a particular remote collector host. This table replaces tmnxCflowdV5StatsTable as it includes support for IPv6 addresses.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.NeCollector</p>		
v5PacketErrors [V5 Packet Errors] (tmnxCFHostCollV5ErrorPackets)	long	The value of tmnxCFHostCollV5ErrorPackets indicates the number of errored packets for the specified remote collector host.
v5PacketOpen [V5 Packet Open] (tmnxCFHostCollV5OpenPackets)	long	The value of tmnxCFHostCollV5OpenPackets indicates the number of open packets pending for the specified remote collector host.
v5PacketSent [V5 Packet Sent] (tmnxCFHostCollV5SentPackets)	long	The value of tmnxCFHostCollV5SentPackets indicates the number of packets transmitted for the specified remote collector host.
<p>NeCollectorV8Stats</p> <p>MIB entry name: tmnxCFHostCollAggrStatsEntry</p> <p>Entry description: The tmnxCFHostCollAggrStatsEntry contains the information pertaining to the remote collector host statistics for the specified aggregation index.</p> <p>Table description (for tmnxCFHostCollAggrStatsTable): The tmnxCFHostCollAggrStatsTable consists of the overall statistics for a remote collector host based on aggregation type. This table replaces tmnxCflowdAggregationStatsTable as it includes support for IPv6 addresses.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.NeCollector</p>		

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aggPacketErrors [Agg Packet Errors] (tmnxCFHostCollAggrErrorPackets)	long	The value of tmnxCFHostCollAggrErrorPackets indicates the number of errored packets for the specified aggregation type.
aggPacketOpen [Agg Packet Open] (tmnxCFHostCollAggrOpenPackets)	long	The value of tmnxCFHostCollAggrOpenPackets indicates the number of open packets pending for the specified aggregation type.
aggPacketSent [Agg Packet Sent] (tmnxCFHostCollAggrSentPackets)	long	The value of tmnxCFHostCollAggrSentPackets indicates the number of packets transmitted for the specified aggregation type.
aggregationIndex [Aggregation Index] (tmnxCFHostCollAggrIndex)	int	The value of tmnxCFHostCollAggrIndex specifies the row in the tmnxCFHostCollAggrStatsTable that pertains to the cflowd collector aggregation type.
aggregationStatus [Aggregation Status] (tmnxCFHostCollAggrStatus)	int	The value of tmnxCFHostCollAggrStatus indicates whether or not the aggregation is in use in the remote collector host entry.
<p>NeCollectorV9Stats</p> <p>MIB entry name: tmnxCFHostCollTemplStatsEntry</p> <p>Entry description: The tmnxCFHostCollTemplStatsEntry contains the information pertaining to the remote collector host statistics for the specified template index.</p> <p>Table description (for tmnxCFHostCollTemplStatsTable): The tmnxCFHostCollTemplStatsTable consists of the overall statistics based on template flows for a specified remote collector host entry. This table replaces the tmnxCflowdTemplateStatsTable as it includes support for IPv6 addresses.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: cflowd.NeCollector</p>		
templateErrors [Template Errors] (tmnxCFHostCollTemplErrorPackets)	long	The value of tmnxCFHostCollTemplErrorPackets indicates the number of errored packets for the specified Template type.

Table 248 cflowd statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
templateFlowIndex [Template Flow Index] (tmnxCFHostCollTemplFlowIndex)	int	The value of tmnxCFHostCollTemplFlowIndex specifies the row in the tmnxCflowdTemplateStatsTable that pertains to the cflowd collector Template type. Values: ipv4 (1) - IPv4 unicast/multicast sampling mpls (2) - MPLS ipv6 (3) - IPv6 unicast/multicast sampling l2 (4) - Layer 2
templateOpen [Template Open] (tmnxCFHostCollTemplOpenPackets)	long	The value of tmnxCFHostCollTemplOpenPackets indicates the number of open packets pending for the specified Template type.
templateSent [Template Sent] (tmnxCFHostCollTemplSentPackets)	long	The value of tmnxCFHostCollTemplSentPackets indicates the number of packets transmitted for the specified Template type.
transmitTime [Transmit Time] (tmnxCFHostCollTemplLastTxTime)	long	The value of tmnxCFHostCollTemplLastTxTime indicates the time, since system startup, when the specified template was last transmitted.

Table 249 dhcp statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>AddressPoolMinFreeThresholdStats</p> <p>MIB entry name: tmnxDhcpsPITHStats6Entry</p> <p>Entry description: Each row entry in the tmnxDhcpsPITHStats6Entry represents additional columns of threshold statistics for a pool that belongs to the specified DHCPv6 server instance.</p> <p>Table description (for tmnxDhcpsPITHStats6Table): The table tmnxDhcpsPITHStats6Table contains the threshold statistics for each pool belonging to the specified DHCPv6 instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: dhcp.AddressPoolMinFreeThreshold</p>		
currFreeBlks [Curr Free Blks] (tmnxDhcpsPITHCurrFreeBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPITHCurrFreeBlksLw indicates the lower 64-bits word of the number of used blocks in this pool with a prefix length defined by the value of tmnxDhcpsPIMinFreePrefixLen. The value of this object reflects the part of the address space in this pool that is actually in use by this server instance. If the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)' and the value of the object tmnxDhcpsFoState of this server is equal to 'partnerDown (5)', or the value of the object tmnxDhcpsPoolFoAdminState of this pool is equal to 'inService (2)' and the value of the object tmnxDhcpsPoolFoState of this pool is equal to 'partnerDown (5)', the value of this object is the sum of the corresponding local and remote objects. Otherwise the value of this object equals the value of corresponding local object only.
currFreeDepleted [Curr Free Depleted] (tmnxDhcpsPITHCurrFreeDepleted)	boolean	The value of the object tmnxDhcpsPITHCurrFreeDepleted equals '1' if there are no more prefixes with the minimum free threshold length available in the pool. Otherwise the value equals '2'.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
currFreePct [Curr Free Pct] (tmnxDhcpsPIThCurrFreePct)	long	The value of the object tmnxDhcpsPIThCurrFreePct indicates the percentage of free prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes. This depends on the current failover state of the DHCP server or pool.
currFreeTooLow [Curr Free Too Low] (tmnxDhcpsPIThCurrFreeTooLow)	boolean	The value of the object tmnxDhcpsPIThCurrFreeTooLow equals '1' if the number of free prefixes with the minimum free threshold length available in the pool is below the configured number of prefixes with the minimum free threshold length. Otherwise the value equals '2'.
currProvBlks [Curr Prov Blks] (tmnxDhcpsPIThCurrProvBlksLw)	java.math.BigInteger	The value of the object tmnxDhcpsPIThCurrProvBlksLw indicates the lower 64-bits word of the number of provisioned blocks in this pool with a prefix length defined by the value of tmnxDhcpsPIMinFreePrefixLen. The value of this object reflects the part of the address space in this pool that is actually in use by this server instance. If the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)' and the value of the object tmnxDhcpsFoState of this server is equal to 'partnerDown (5)', or the value of the object tmnxDhcpsPoolFoAdminState of this pool is equal to 'inService (2)' and the value of the object tmnxDhcpsPoolFoState of this pool is equal to 'partnerDown (5)', the value of this object is the sum of the corresponding local and remote objects. Otherwise the value of this object equals the value of corresponding local object only.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
currUsedBlks [Curr Used Blks] (tmnxDhcpsPIThCurrUsedBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPIThCurrUsedBlksLw indicates the lower 64-bits word of the number of used blocks in this pool with a prefix length defined by the value of tmnxDhcpsPIMinFreePrefixLen. The value of this object reflects the part of the address space in this pool that is actually in use by this server instance. If the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)' and the value of the object tmnxDhcpsFoState of this server is equal to 'partnerDown (5)', or the value of the object tmnxDhcpsPoolFoAdminState of this pool is equal to 'inService (2)' and the value of the object tmnxDhcpsPoolFoState of this pool is equal to 'partnerDown (5)', the value of this object is the sum of the corresponding local and remote objects. Otherwise the value of this object equals the value of corresponding local object only.
currUsedPct [Curr Used Pct] (tmnxDhcpsPIThCurrUsedPct)	long	The value of the object tmnxDhcpsPIThCurrUsedPct indicates the percentage of used prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes. This depends on the current failover state of the DHCP server or pool.
currUsedPeakBlks [Curr Used Peak Blks] (tmnxDhcpsPIThCurrUsedPeakBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPIThCurrUsedPeakBlksLw indicates the lower 64-bits word of the peak value of the number of used blocks in the pool with a prefix length defined by the value of tmnxDhcpsPIMinFreePrefixLen.
currUsedPeakPct [Curr Used Peak Pct] (tmnxDhcpsPIThCurrUsedPeakPct)	long	The value of the object tmnxDhcpsPIThCurrUsedPeakPct indicates the peak value of the number of used prefixes with the minimum free threshold length in the pool as a percentage of the provisioned prefixes. This depends on the current failover state of the DHCP server or pool.
currUsedPeakTime [Curr Used Peak Time] (tmnxDhcpsPIThCurrUsedPeakTime)	long	The value of the object tmnxDhcpsPIThCurrUsedPeakTime indicates the time at which the peak value of the number of used prefixes in the pool was reached.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lclFreeBlks [Lcl Free Blks] (tmnxDhcpsPIThLclFreeBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPIThLclFreeBlksLw indicates the lower 64-bits word of the number of free prefixes with the minimum free threshold length local in the pool.
lclProvBlks [Lcl Prov Blks] (tmnxDhcpsPIThLclProvBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPIThLclProvBlksLw indicates the lower 64-bits word of the number of provisioned prefixes with the minimum free threshold length local in the pool.
lclUsedBlks [Lcl Used Blks] (tmnxDhcpsPIThLclUsedBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPIThLclUsedBlksLw indicates the lower 64-bits word of the number of used prefixes with the minimum free threshold length local in the pool.
lclUsedPeakBlks [Lcl Used Peak Blks] (tmnxDhcpsPIThLclUsedPeakBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPIThLclUsedPeakBlksLw indicates the lower 64-bits word of the peak value of the number of used prefixes with the minimum free threshold length local in the pool.
lclUsedPeakPct [Lcl Used Peak Pct] (tmnxDhcpsPIThLclUsedPeakPct)	long	The value of the object tmnxDhcpsPIThLclUsedPeakPct indicates the peak value of the number of used prefixes with the minimum free threshold length local in the pool as a percentage of the provisioned prefixes.
lclUsedPeakTime [Lcl Used Peak Time] (tmnxDhcpsPIThLclUsedPeakTime)	long	The value of the object tmnxDhcpsPIThLclUsedPeakTime indicates the time at which the peak value of the number of used prefixes local in the pool was reached.
peakResetTime [Peak Reset Time] (tmnxDhcpsPIThPeakResetTime)	long	The value of the object tmnxDhcpsPIThPeakResetTime indicates the time at which the peak values have been reset.
remFreeBlks [Rem Free Blks] (tmnxDhcpsPIThRemFreeBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPIThRemFreeBlksLw indicates the lower 64-bits word of the number of free prefixes with the minimum free threshold length remote in the pool.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remProvBlks [Rem Prov Blks] (tmnxDhcpsPITHRemProvBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPITHRemProvBlksLw indicates the lower 64-bits word of the number of provisioned prefixes with the minimum free threshold length remote in the pool.
remUsedBlks [Rem Used Blks] (tmnxDhcpsPITHRemUsedBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPITHRemUsedBlksLw indicates the lower 64-bits word of the number of used prefixes with the minimum free threshold length remote in the pool.
remUsedPeakBlks [Rem Used Peak Blks] (tmnxDhcpsPITHRemUsedPeakBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPITHRemUsedPeakBlksLw indicates the lower 64-bits word of the peak value of the number of used prefixes with the minimum free threshold length remote in the pool.
remUsedPeakPct [Rem Used Peak Pct] (tmnxDhcpsPITHRemUsedPeakPct)	long	The value of the object tmnxDhcpsPITHRemUsedPeakPct indicates the peak value of the number of used prefixes with the minimum free threshold length remote in the pool as a percentage of the provisioned prefixes.
remUsedPeakTime [Rem Used Peak Time] (tmnxDhcpsPITHRemUsedPeakTime)	long	The value of the object tmnxDhcpsPITHRemUsedPeakTime indicates the time at which the peak value of the number of used prefixes remote in the pool was reached.
validData [Valid Data] (tmnxDhcpsPITHValidData)	boolean	The value of the object tmnxDhcpsPITHValidData indicates the actual status of the threshold statistics data of the pool. '1' means that the data is up to date and may be used. '2' means that the data is being recalculated in the background and isn't stable for further use.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>LocalDhcp6ServerPoolStats</p> <p>MIB entry name: tmnxDhcpsPoolStats6Entry</p> <p>Entry description: Each row entry in the tmnxDhcpsPoolStats6Table represents additional columns of operational data for a pool that belongs to the specified DHCPv6 server instance. The value of these columns is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.</p> <p>Table description (for tmnxDhcpsPoolStats6Table): The tmnxDhcpsPoolStats6Table has an entry for each pool that belongs to the specified DHCPv6 server instance.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: dhcp.Address6Pool</p>		
advertisedLeases [Advertised Leases] (tmnxDhcpsPoolStats6Advertise)	long	The value of tmnxDhcpsPoolStats6Advertise indicates the number of local leases in this pool that are in state 'advertised'.
extendedStatisticsEnabled [Extended Statistics Enabled] (tmnxDhcpsPoolStats6HasExt)	boolean	The value of tmnxDhcpsPoolStats6HasExt indicates whether the extended statistics collection for this prefix is enabled. These extended statistics are only collected when the length of the configured subnet is between /32 en /64.
freeBlocks [Free Blocks] (tmnxDhcpsPoolStats6FreeBlk)	java.math.BigInteger	The value of tmnxDhcpsPoolStats6FreeBlk indicates the number of provisioned but unused /64 blocks.
highestValAdvertisedLeases [Highest Val Advertised Leases] (tmnxDhcpsPoolStats6AdvertP)	long	The value of tmnxDhcpsPoolStats6AdvertP indicates the highest value of tmnxDhcpsPoolStats6Advertise since the last reset of the extended statistics.
highestValPctBlocksInUse [Highest Val Pct Blocks In Use] (tmnxDhcpsPoolStats6UsedPctP)	int	The value of tmnxDhcpsPoolStats6UsedPctP indicates the highest value of tmnxDhcpsPoolStats6UsedPct since the last reset of the extended statistics.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
highestValRemoteAdvertisedLeases [Highest Val Remote Advertised Leases] (tmnxDhcpsPoolStats6FoAdvertP)	long	The value of tmnxDhcpsPoolStats6FoAdvertP indicates the highest value of tmnxDhcpsPoolStats6FoAdvertise since the last reset of the extended statistics.
highestValRemotePctBlocksInUse [Highest Val Remote Pct Blocks In Use] (tmnxDhcpsPoolStats6FoUsedPctP)	int	The value of tmnxDhcpsPoolStats6FoUsedPctP indicates the highest value of tmnxDhcpsPoolStats6FoUsedPct since the last reset of the extended statistics.
highestValRemoteStableLeases [Highest Val Remote Stable Leases] (tmnxDhcpsPoolStats6FoStableP)	long	The value of tmnxDhcpsPoolStats6FoStableP indicates the highest value of tmnxDhcpsPoolStats6FoStable since the last reset of the extended statistics.
highestValStableLeases [Highest Val Stable Leases] (tmnxDhcpsPoolStats6StableP)	long	The value of tmnxDhcpsPoolStats6StableP indicates the highest value of tmnxDhcpsPoolStats6Stable since the last reset of the extended statistics.
lowestValOfFreeBlocks [Lowest Val Of Free Blocks] (tmnxDhcpsPoolStats6FreeBlkP)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6FreeBlkP indicates the lowest value of tmnxDhcpsPoolStats6FreeBlk since the last reset of the extended statistics.
lowestValOfUnusedBlocks [Lowest Val Of Unused Blocks] (tmnxDhcpsPoolStats6UsedBlkP)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6UsedBlkP indicates the lowest value of tmnxDhcpsPoolStats6UsedBlk since the last reset of the extended statistics.
lowestValPctBlocksUnused [Lowest Val Pct Blocks Unused] (tmnxDhcpsPoolStats6FreePctP)	int	The value of tmnxDhcpsPoolStats6FreePctP indicates the lowest value of tmnxDhcpsPoolStats6FreePct since the last reset of the extended statistics.
lowestValRemoteFreeBlocks [Lowest Val Remote Free Blocks] (tmnxDhcpsPoolStats6FoFreeBlkP)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6FoFreeBlkP indicates the lowest value of tmnxDhcpsPoolStats6FoFreeBlk since the last reset of the extended statistics.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lowestValRemotePctBlocksUnused [Lowest Val Remote Pct Blocks Unused] (tmnxDhcpsPoolStats6FoFreePctP)	int	The value of tmnxDhcpsPoolStats6FoFreePctP indicates the lowest value of tmnxDhcpsPoolStats6FoFreePct since the last reset of the extended statistics.
lowestValRemoteUnusedBlocks [Lowest Val Remote Unused Blocks] (tmnxDhcpsPoolStats6FoUsedBlkP)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6FoUsedBlkP indicates the lowest value of tmnxDhcpsPoolStats6FoUsedBlk since the last reset of the extended statistics.
pctBlocksInUse [Pct Blocks In Use] (tmnxDhcpsPoolStats6UsedPct)	int	The value of tmnxDhcpsPoolStats6UsedPct indicates the percentage of /64 blocks currently in use.
pctBlocksUnused [Pct Blocks Unused] (tmnxDhcpsPoolStats6FreePct)	int	The value of tmnxDhcpsPoolStats6FreePct indicates the percentage of /64 blocks currently unused.
provisionedBlocks [Provisioned Blocks] (tmnxDhcpsPoolStats6ProvBlk)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6ProvBlk indicates the number of provisioned /64 blocks.
remoteAdvertisedLeases [Remote Advertised Leases] (tmnxDhcpsPoolStats6FoAdvertise)	long	The value of tmnxDhcpsPoolStats6FoAdvertise indicates the number of remote leases in this pool that are in state 'advertised'.
remoteFreeBlocks [Remote Free Blocks] (tmnxDhcpsPoolStats6FoFreeBlk)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6FoFreeBlk indicates the remote number of provisioned but unused /64 blocks.
remotePctBlocksInUse [Remote Pct Blocks In Use] (tmnxDhcpsPoolStats6FoUsedPct)	int	The value of tmnxDhcpsPoolStats6FoUsedPct indicates the percentage of remote /64 blocks currently in use.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remotePctBlocksUnused [Remote Pct Blocks Unused] (tmnxDhcpsPoolStats6FoFreePct)	int	The value of tmnxDhcpsPoolStats6FoFreePct indicates the percentage of remote /64 blocks currently unused.
remoteProvisionedBlocks [Remote Provisioned Blocks] (tmnxDhcpsPoolStats6FoProvBlk)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6FoProvBlk indicates the remote number of provisioned /64 blocks.
remoteStableLeases [Remote Stable Leases] (tmnxDhcpsPoolStats6FoStable)	long	The value of tmnxDhcpsPoolStats6FoStable indicates the number of remote leases in this pool that are in state 'stable'.
remoteUnusedBlocks [Remote Unused Blocks] (tmnxDhcpsPoolStats6FoUsedBlk)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6FoUsedBlk indicates the remote number of provisioned but unused /64 blocks.
slaacPrefixInternalRequests [Slaac Prefix Internal Requests] (tmnxDhcpsPoolStats6IntNoPfxSlaa)	long	The value of tmnxDhcpsPoolStats6IntNoPfxSlaa indicates the number of times the following event occurred: an internal request for a SLAAC prefix (IA_PD (Identity Association for Prefix Delegation)) fails because the pool does not have a subnet available where the value of tmnxDhcpSvrSubnetPrefixType is equal to 'wan-host'. An internal request is triggered by some packet received by this system and translated into an internal API (Application Program Interface) request to the local DHCP server.
stableLeases [Stable Leases] (tmnxDhcpsPoolStats6Stable)	long	The value of tmnxDhcpsPoolStats6Stable indicates the number of leases in this pool that are in state 'stable'.
timeSinceExtendedReset [Time Since Extended Reset] (tmnxDhcpsPoolStats6ExtResetT)	long	The value of tmnxDhcpsPoolStats6ExtResetT indicates the sysUpTime at the last reset of the extended statistics.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastAdvertisedLeases [Time Since Last Advertised Leases] (tmnxDhcpsPoolStats6AdvertPT)	long	The value of tmnxDhcpsPoolStats6AdvertPT indicates the sysUpTime at the last change of tmnxDhcpsPoolStats6AdvertPT.
timeSinceLastFreeBlocks [Time Since Last Free Blocks] (tmnxDhcpsPoolStats6FreeBlkPT)	long	The value of tmnxDhcpsPoolStats6FreeBlkPT indicates the sysUpTime at the last change of tmnxDhcpsPoolStats6FreeBlkP.
timeSinceLastRemoteAdvertisedLeases [Time Since Last Remote Advertised Leases] (tmnxDhcpsPoolStats6FoAdvertPT)	long	The value of tmnxDhcpsPoolStats6FoAdvertPT indicates the sysUpTime at the last change of tmnxDhcpsPoolStats6FoAdvertP.
timeSinceLastRemoteFreeBlocks [Time Since Last Remote Free Blocks] (tmnxDhcpsPoolStats6FoFreeBlkPT)	long	The value of tmnxDhcpsPoolStats6FoFreeBlkPT indicates the sysUpTime at the last change of tmnxDhcpsPoolStats6FoFreeBlkP.
timeSinceLastRemoteStableLeases [Time Since Last Remote Stable Leases] (tmnxDhcpsPoolStats6FoStablePT)	long	The value of tmnxDhcpsPoolStats6FoStablePT indicates the sysUpTime at the last change of tmnxDhcpsPoolStats6FoStableP.
timeSinceLastStableLeases [Time Since Last Stable Leases] (tmnxDhcpsPoolStats6StablePT)	long	The value of tmnxDhcpsPoolStats6StablePT indicates the sysUpTime at the last change of tmnxDhcpsPoolStats6StableP.
unusedBlocks [Unused Blocks] (tmnxDhcpsPoolStats6UsedBlk)	java. math. BigInteger	The value of tmnxDhcpsPoolStats6UsedBlk indicates the number of provisioned but unused /64 blocks.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
wanAddressInternalRequests [Wan Address Internal Requests] (tmnxDhcpsPoolStats6IntNoPfxWan)	long	The value of tmnxDhcpsPoolStats6IntNoPfxWan indicates the number of times the following event occurred: an internal request for a WAN address (IA_NA (Identity association for non-temporary addresses)) fails because the pool does not have a subnet available where the value of tmnxDhcpSvrSubnetPrefixType is equal to 'wan-host'. An internal request is triggered by some packet received by this system and translated into an internal API (Application Program Interface) request to the local DHCP server.
<p>LocalDhcp6ServerPrefixStats</p> <p>MIB entry name: tmnxDhcpSvrSubnetStats6Entry</p> <p>Entry description: Each row entry in the tmnxDhcpSvrSubnetStats6Table represents additional columns of operational data for a subnet that belongs to the specified DHCPv6 server instance and pool.</p> <p>Table description (for tmnxDhcpSvrSubnetStats6Table): The tmnxDhcpSvrSubnetStats6Table has an entry for each subnet that belongs to the specified DHCPv6 server instance and pool.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: dhcp.Dhcp6AddressPrefix</p>		
advertisedLeases [Advertised Leases] (tmnxDhcpSvrSubnetStats6Advertise)	long	The value of tmnxDhcpSvrSubnetStats6Advertise indicates the number of leases in this subnet that are in state 'advertised'.
declinedAddresses [Declined Addresses] (tmnxDhcpSvrSubnetStats6Declined)	long	The value of tmnxDhcpSvrSubnetStats6Declined indicates the number of addresses in this subnet that are declined.
extendedStatisticsEnabled [Extended Statistics Enabled] (tmnxDhcpSvrSubnetStats6HasExt)	boolean	The value of tmnxDhcpSvrSubnetStats6HasExt indicates whether the extended statistics collection for this prefix is enabled. These extended statistics are only collected when the length of the configured subnet is between /32 en /64.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
freeBlocks [Free Blocks] (tmnxDhcpSvrSubnetStats6FreeBlk)	java. math. BigInteger	The value of tmnxDhcpSvrSubnetStats6FreeBlk indicates the number of provisioned but unused /64 blocks.
highestValAdvertisedLeases [Highest Val Advertised Leases] (tmnxDhcpSvrSubnetStats6AdvertP)	long	The value of tmnxDhcpSvrSubnetStats6AdvertP indicates the highest value of tmnxDhcpSvrSubnetStats6Advertise since the last reset of the extended statistics.
highestValPctBlocksInUse [Highest Val Pct Blocks In Use] (tmnxDhcpSvrSubnetStats6UsedPctP)	int	The value of tmnxDhcpSvrSubnetStats6UsedPctP indicates the highest value of tmnxDhcpSvrSubnetStats6UsedPct since the last reset of the extended statistics.
highestValStableLeases [Highest Val Stable Leases] (tmnxDhcpSvrSubnetStats6StableP)	long	The value of tmnxDhcpSvrSubnetStats6StableP indicates the highest value of tmnxDhcpSvrSubnetStats6Stable since the last reset of the extended statistics.
lowestValOfFreeBlocks [Lowest Val Of Free Blocks] (tmnxDhcpSvrSubnetStats6FreeBlkP)	java. math. BigInteger	The value of tmnxDhcpSvrSubnetStats6FreeBlkP indicates the lowest value of unused /64 blocks since the last reset of the extended statistics.
lowestValOfUnusedBlocks [Lowest Val Of Unused Blocks] (tmnxDhcpSvrSubnetStats6UsedBlkP)	java. math. BigInteger	The value of tmnxDhcpSvrSubnetStats6UsedBlkP indicates the lowest value of unused /64 blocks since the last reset of the extended statistics.
lowestValPctBlocksUnused [Lowest Val Pct Blocks Unused] (tmnxDhcpSvrSubnetStats6FreePctP)	int	The value of tmnxDhcpSvrSubnetStats6FreePctP indicates the lowest value of tmnxDhcpSvrSubnetStats6FreePct since the last reset of the extended statistics.
pctBlocksInUse [Pct Blocks In Use] (tmnxDhcpSvrSubnetStats6UsedPct)	int	The value of tmnxDhcpSvrSubnetStats6UsedPct indicates the percentage of /64 blocks currently in use.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
pctBlocksUnused [Pct Blocks Unused] (tmnxDhcpSvrSubnetStats6FreePct)	int	The value of tmnxDhcpSvrSubnetStats6FreePct indicates the percentage of /64 blocks currently unused.
provisionedBlocks [Provisioned Blocks] (tmnxDhcpSvrSubnetStats6ProvBlk)	java. math. BigInteger	The value of tmnxDhcpSvrSubnetStats6ProvBlk indicates the number of provisioned /64 blocks.
reconfigurePendingLeases [Reconfigure Pending Leases] (tmnxDhcpSvrSubnetStats6RCPending)	long	The value of tmnxDhcpSvrSubnetStats6RCPending indicates the number of leases in this subnet that are in state 'reconfigurePending'.
removePendingLeases [Remove Pending Leases] (tmnxDhcpSvrSubnetStats6RmPending)	long	The value of tmnxDhcpSvrSubnetStats6RmPending indicates the number of leases in this subnet that are in state 'removePending'.
stableLeases [Stable Leases] (tmnxDhcpSvrSubnetStats6Stable)	long	The value of tmnxDhcpSvrSubnetStats6Stable indicates the number of leases in this subnet that are in state 'stable'.
timeSinceExtendedReset [Time Since Extended Reset] (tmnxDhcpSvrSubnetStats6ExtResetT)	long	The value of tmnxDhcpSvrSubnetStats6ExtResetT indicates the sysUpTime at the last reset of the extended statistics.
timeSinceLastAdvertisedLeases [Time Since Last Advertised Leases] (tmnxDhcpSvrSubnetStats6AdvertPT)	long	The value of tmnxDhcpSvrSubnetStats6AdvertPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStats6AdvertP.
timeSinceLastFreeBlocks [Time Since Last Free Blocks] (tmnxDhcpSvrSubnetStats6FreeBlkPT)	long	The value of tmnxDhcpSvrSubnetStats6FreeBlkPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStats6FreeBlkP.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastPctBlocksInUse [Time Since Last Pct Blocks In Use] (tmnxDhcpSvrSubnetStats6UsedPctPT)	long	The value of tmnxDhcpSvrSubnetStats6UsedPctPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStats6UsedPctP.
timeSinceLastPctBlocksUnused [Time Since Last Pct Blocks Unused] (tmnxDhcpSvrSubnetStats6FreePctPT)	long	The value of tmnxDhcpSvrSubnetStats6FreePctPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStats6FreePctP.
timeSinceLastStableLeases [Time Since Last Stable Leases] (tmnxDhcpSvrSubnetStats6StablePT)	long	The value of tmnxDhcpSvrSubnetStats6StablePT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStats6StableP.
timeSinceLastUnusedBlocks [Time Since Last Unused Blocks] (tmnxDhcpSvrSubnetStats6UsedBlkPT)	long	The value of tmnxDhcpSvrSubnetStats6UsedBlkPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStats6UsedBlkP.
unusedBlocks [Unused Blocks] (tmnxDhcpSvrSubnetStats6UsedBlk)	java. math. BigInteger	The value of tmnxDhcpSvrSubnetStats6UsedBlk indicates the number of provisioned but unused /64 blocks.
<p>LocalDhcp6ServerStats</p> <p>MIB entry name: tmnxDhcpServerStats6Entry</p> <p>Entry description: Each row entry contains basic statistics about a particular DHCP server instance.</p> <p>Table description (for tmnxDhcpServerStats6Table): The tmnxDhcpServerStats6Table contains basic statistics about the DHCPv6 server instances.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: dhcp.LocalDhcp6Server</p>		
clientIgnoredOffers [Client Ignored Offers] (tmnxDhcpSvrStats6OffersIgnore)	long	The value of tmnxDhcpSvrStats6OffersIgnore indicates the number of DHCP OFFER (option 52 with value 2) packets sent by the DHCP server instance that were ignored by the clients.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dhcpSvrStats6DropAudit [Dhcp Svr Stats 6 Drop Audit] (tmnxDhcpSvrStats6DropAudit)	java. math. BigInteger	The value of tmnxDhcpSvrStats6DropAudit indicates the number of DHCP requests dropped by the server instance because this server instance is busy with the primary audit.
dhcpSvrStats6DropLqNotAllowed [Dhcp Svr Stats 6 Drop Lq Not Allow] (tmnxDhcpSvrStats6DropLqNotAllowed)	long	The value of tmnxDhcpSvrStats6DropLqNotAllowed indicates the number of DHCP leasequery packets dropped by the server instance because the server is configured not to allow leasequery packets.
dhcpSvrStats6RxLeaseQueries [Dhcp Svr Stats 6 Rx Lease Queries] (tmnxDhcpSvrStats6RxLeasequeries)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxLeasequeries indicates the number of leasequery messages received by the DHCP server instance.
dhcpSvrStats6TxLqReplies [Dhcp Svr Stats 6 Tx Lq Replies] (tmnxDhcpSvrStats6TxLqReplies)	java. math. BigInteger	The value of tmnxDhcpSvrStats6TxLqReplies indicates the number of leasequery-reply messages sent by the DHCP server instance.
droppedBadPacket [Dropped Bad Packet] (tmnxDhcpSvrStats6DropBadPackets)	long	The value of tmnxDhcpSvrStats6DropBadPackets indicates the number of DHCP packets received which were corrupt.
droppedDestinedToOther [Dropped Destined To Other] (tmnxDhcpSvrStats6DropDestOther)	long	The value of tmnxDhcpSvrStats6DropDestOther indicates the number of DHCP requests dropped by the server instance because the (broadcast) request was not destined to this server.
droppedGenericError [Dropped Generic Error] (tmnxDhcpSvrStats6DropGenError)	long	The value of tmnxDhcpSvrStats6DropGenError indicates the number of DHCP packets dropped by the server instance because of a generic error.
droppedInternalConflicts [Dropped Internal Conflicts] (tmnxDhcpSvrStats6DropIntWConflict)	long	The value of tmnxDhcpSvrStats6DropIntWConflict indicates a DHCP host is trying to acquire an IP address that was handed through the local address assignment infrastructure, or the local address assignment infrastructure tries to use an IP address that was handed out to a DHCP client.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
droppedInternalFailover [Dropped Internal Failover] (tmnxDhcpSvrStats6DropIntWfo)	long	The value of tmnxDhcpSvrStats6DropIntWfo indicates the number of internal calls from the local address assignment infrastructure dropped by the DHCP server instance because failover is enabled for the server instance.
droppedInternalIntIdMap [Dropped Internal Int Id Map] (tmnxDhcpSvrStats6DropIntWifldMap)	long	The value of tmnxDhcpSvrStats6DropIntWifldMap indicates the number of internal calls from the local address assignment infrastructure dropped by the DHCP server instance because interface ID mapping is enabled for the server instance.
droppedInternalUserIdent [Dropped Internal User Ident] (tmnxDhcpSvrStats6DropIntWuserId)	long	The value of tmnxDhcpSvrStats6DropIntWuserId indicates the number of internal calls from the local address assignment infrastructure dropped by the DHCP server instance because tmnxDhcpServerCfgUserIdent is not set to duid (2) for the server instance.
droppedInvalidType [Dropped Invalid Type] (tmnxDhcpSvrStats6DropInvldTypes)	long	The value of tmnxDhcpSvrStats6DropInvldTypes indicates the number of DHCP packets received which had an invalid message type.
droppedLeaseNotReady [Dropped Lease Not Ready] (tmnxDhcpSvrStats6DropLseNotReady)	long	The value of tmnxDhcpSvrStats6DropLseNotReady indicates the number of DHCP packets dropped by the server instance before the lease database was ready.
droppedMaxLeasesReached [Dropped Max Leases Reached] (tmnxDhcpSvrStats6DropMaxReached)	long	The value of tmnxDhcpSvrStats6DropMaxReached indicates the number of DHCP packets dropped by the server instance because the maximum number of leases was reached. The maximum number of leases is indicated by the value of the object tmnxDhcpSvrMaxLeases.
droppedNotServingPool [Dropped Not Serving Pool] (tmnxDhcpSvrStats6DropNoSrvngPool)	long	The value of tmnxDhcpSvrStats6DropNoSrvngPool indicates the number of DHCP packets dropped by the server instance because there were no more free addresses in the pool.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
droppedOverload [Dropped Overload] (tmnxDhcpSvrStats6DropOverload)	long	The value of tmnxDhcpSvrStats6DropOverload indicates the number of DHCP packets dropped by the server instance because they were received in excess of what the server instance can handle.
droppedPersistenceOverload [Dropped Persistence Overload] (tmnxDhcpSvrStats6DropPerOverload)	long	The value of tmnxDhcpSvrStats6DropPerOverload indicates the number of DHCP packets dropped by the server instance because they were received in excess of what the DHCP persistence system can handle. If this occurs, only releases and declines are still processed.
droppedServerShutdown [Dropped Server Shutdown] (tmnxDhcpSvrStats6DropSvrDown)	long	The value of tmnxDhcpSvrStats6DropSvrDown indicates the number of DHCP packets dropped by the server instance during server instance shutdown (while the value of the object tmnxDhcpServerCfgAdminState in the corresponding row was set equal to 'outOfService').
duplicateRequestDropped [Duplicate Request Dropped] (tmnxDhcpSvrStats6DropDuplDiffRly)	long	The value of tmnxDhcpSvrStats6DropDuplDiffRly indicates the number of DHCP requests dropped by the server instance because they were received from a different Relay IP address within a timeframe of 10 seconds after a previous DHCPREQUEST.
leasesTimedOut [Leases Timed Out] (tmnxDhcpSvrStats6LeasesExpired)	long	The value of tmnxDhcpSvrStats6LeasesExpired indicates the number of DHCP leases that were expired (because no release was received).
receivedConfirmPackets [Received Confirm Packets] (tmnxDhcpSvrStats6RxConfirms)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxConfirms indicates the number of confirm messages received by the DHCP server instance.
receivedDeclinePackets [Received Decline Packets] (tmnxDhcpSvrStats6RxDeclines)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxDeclines indicates the number of decline messages received by the DHCP server instance.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedInformationRequestPackets [Received Information Request Packets] (tmnxDhcpSvrStats6RxInfRequests)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxInfRequests indicates the number of information-request messages received by the DHCP server instance.
receivedIntIpoeWanRequests [Received Int Ipoe Wan Requests] (tmnxDhcpSvrStats6RxIntReqIpoeWan)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxIntReqIpoeWan indicates the number of internal request calls received by the DHCP server instance from the local address assignment infrastructure for IPoE.
receivedIntPppSlaacRequests [Received Int Ppp Slaac Requests] (tmnxDhcpSvrStats6RxIntPppSlaac)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxIntPppSlaac indicates the number of internal request calls received by the DHCP server instance from the local address assignment infrastructure for PPP SLAAC (stateless autoconfiguration).
receivedInternalReleases [Received Internal Releases] (tmnxDhcpSvrStats6RxIntReleases)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxIntReleases indicates the number of internal release calls received by the DHCP server instance from the local address assignment infrastructure.
receivedIpoeSlaacRequests [Received Ipoe Slaac Requests] (tmnxDhcpSvrStats6RxIntIpoeSlaac)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxIntIpoeSlaac indicates the number of internal request calls received by the DHCP server instance from the local address assignment infrastructure for IPoE SLAAC (stateless autoconfiguration).
receivedRebindPackets [Received Rebind Packets] (tmnxDhcpSvrStats6RxRebinds)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxRebinds indicates the number of rebind messages received by the DHCP server instance.
receivedReleasePackets [Received Release Packets] (tmnxDhcpSvrStats6RxReleases)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxReleases indicates the number of release messages received by the DHCP server instance.
receivedRenewPackets [Received Renew Packets] (tmnxDhcpSvrStats6RxRenews)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxRenews indicates the number of renew messages received by the DHCP server instance.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedRequestPackets [Received Request Packets] (tmnxDhcpSvrStats6RxRequests)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxRequests indicates the number of request messages received by the DHCP server instance.
receivedSolicitPackets [Received Solicit Packets] (tmnxDhcpSvrStats6RxSolicits)	java. math. BigInteger	The value of tmnxDhcpSvrStats6RxSolicits indicates the number of solicit messages received by the DHCP server instance.
sentAdvertisePackets [Sent Advertise Packets] (tmnxDhcpSvrStats6TxAdvertises)	java. math. BigInteger	The value of tmnxDhcpSvrStats6TxAdvertises indicates the number of advertise messages sent by the DHCP server instance.
sentReconfigurePackets [Sent Reconfigure Packets] (tmnxDhcpSvrStats6TxReconfigures)	java. math. BigInteger	The value of tmnxDhcpSvrStats6TxReconfigures indicates the number of reconfigure messages sent by the DHCP server instance.
sentReplyPackets [Sent Reply Packets] (tmnxDhcpSvrStats6TxReplies)	java. math. BigInteger	The value of tmnxDhcpSvrStats6TxReplies indicates the number of reply messages sent by the DHCP server instance.
<p>LocalDhcpPoolFailoverStats</p> <p>MIB entry name: tmnxDhcpsPoolFoStatsEntry</p> <p>Entry description: Each row entry contains statistics about the failover facility of a specific DHCP Address Pool instance. Rows are created or removed automatically by the system.</p> <p>Table description (for tmnxDhcpsPoolFoStatsTable): The tmnxDhcpsPoolFoStatsTable contains statistics about the DHCP Address Pool failover facility.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: dhcp.LocalDhcpPoolFailover</p>		

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
addressConflictPkts [Address Conflict Pkts] (tmnxDhcpsPoolFoStatsAddrConflict)	long	The value of tmnxDhcpsPoolFoStatsAddrConflict indicates how many BNDUPD 'add' packets were dropped because this DHCP server instance has already leased another address to this host.
dropInvalidPkts [Drop Invalid Pkts] (tmnxDhcpsPoolFoStatsDropInvPkts)	long	The value of tmnxDhcpsPoolFoStatsDropInvPkts indicates how many BNDUPD packets were dropped because the packet was malformed.
hostConflictPkts [Host Conflict Pkts] (tmnxDhcpsPoolFoStatsHostConflict)	long	The value of tmnxDhcpsPoolFoStatsHostConflict indicates how many BNDUPD 'add' packets were dropped because this DHCP server instance has already leased this address to another host.
leaseExpiredPkts [Lease Expired Pkts] (tmnxDhcpsPoolFoStatsExpired)	long	The value of tmnxDhcpsPoolFoStatsExpired indicates how many BNDUPD 'add' packets were dropped because the corresponding lease has expired. This may indicate that the clock of the failover peer is not in sync with the clock of this system.
leaseNotFoundPkts [Lease Not Found Pkts] (tmnxDhcpsPoolFoStatsLeaseNotFound)	long	The value of tmnxDhcpsPoolFoStatsLeaseNotFound indicates how many Binding Database Update (BNDUPD) 'remove' packets were dropped because the corresponding lease could not be found.
maxLeasePkts [Max Lease Pkts] (tmnxDhcpsPoolFoStatsMaxReached)	long	The value of tmnxDhcpsPoolFoStatsMaxReached indicates how many BNDUPD 'add' packets were dropped because the maximum number of leases was reached. The maximum number of leases is indicated by the value of the object tmnxDhcpSvrMaxLeases.
peerConflictPkts [Peer Conflict Pkts] (tmnxDhcpsPoolFoStatsPeerConflict)	long	The value of tmnxDhcpsPoolFoStatsPeerConflict indicates how many BNDUPD 'add' packets were dropped because the failover peer has leased an address within a subnet range of which the failover control is set to 'local' on this local DHCP Address Pool instance.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
persistCongestPkts [Persist Congest Pkts] (tmnxDhcpsPoolFoStatsPersistCong)	long	The value of tmnxDhcpsPoolFoStatsPersistCong indicates how many BNDUPD packets were dropped because of persistence congestion on this DHCP Address Pool instance.
rangeNotFoundPkts [Range Not Found Pkts] (tmnxDhcpsPoolFoStatsRangeNFound)	long	The value of tmnxDhcpsPoolFoStatsRangeNFound indicates how many BNDUPD 'add' packets were dropped because a valid include range could not be found for the lease.
shutdownPkts [Shutdown Pkts] (tmnxDhcpsPoolFoStatsFoShutdown)	long	The value of tmnxDhcpsPoolFoStatsFoShutdown indicates how many BNDUPD packets were dropped because the failover state if the DHCP Server instance is 'shutdown'.
subnetNotFoundPkts [Subnet Not Found Pkts] (tmnxDhcpsPoolFoStatsSubnetNFound)	long	The value of tmnxDhcpsPoolFoStatsSubnetNFound indicates how many BNDUPD 'add' packets were dropped because a valid subnet could not be found for the lease.
<p>LocalDhcpServerFailoverStats MIB entry name: tmnxDhcpsFoStatsEntry Entry description: Each row entry contains statistics about the failover facility of a specific DHCP Server instance. Rows are created or removed automatically by the system. Table description (for tmnxDhcpsFoStatsTable): The tmnxDhcpsFoStatsTable contains statistics about the DHCP failover facility. The tmnxDhcpsFoStatsTable has an entry for each DHCP server instance. Supports realtime plotting Supports scheduled collection Monitored class: dhcp.LocalDhcpServerFailover</p>		
addressConflictPkts [Address Conflict Pkts] (tmnxDhcpsFoStatsAddressConflict)	long	The value of tmnxDhcpsFoStatsAddressConflict indicates how many BNDUPD 'add' packets were dropped because this DHCP server instance has already leased another address to this host.
dropInvalidPkts [Drop Invalid Pkts] (tmnxDhcpsFoStatsDropInvalidPkts)	long	The value of tmnxDhcpsFoStatsDropInvalidPkts indicates how many BNDUPD packets were dropped because the packet was malformed.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
hostConflictPkts [Host Conflict Pkts] (tmnxDhcpsFoStatsHostConflict)	long	The value of tmnxDhcpsFoStatsHostConflict indicates how many BNDUPD 'add' packets were dropped because this DHCP server instance has already leased this address to another host.
leaseExpiredPkts [Lease Expired Pkts] (tmnxDhcpsFoStatsExpired)	long	The value of tmnxDhcpsFoStatsExpired indicates how many BNDUPD 'add' packets were dropped because the corresponding lease has expired. This may indicate that the clock of the failover peer is not in sync with the clock of this system.
leaseNotFoundPkts [Lease Not Found Pkts] (tmnxDhcpsFoStatsLeaseNotFound)	long	The value of tmnxDhcpsFoStatsLeaseNotFound indicates how many Binding Database Update (BNDUPD) 'remove' packets were dropped because the corresponding lease could not be found.
maxLeasePkts [Max Lease Pkts] (tmnxDhcpsFoStatsMaxReached)	long	The value of tmnxDhcpsFoStatsMaxReached indicates how many BNDUPD 'add' packets were dropped because the maximum number of leases was reached. The maximum number of leases is indicated by the value of the object tmnxDhcpSvrMaxLeases.
peerConflictPkts [Peer Conflict Pkts] (tmnxDhcpsFoStatsPeerConflict)	long	The value of tmnxDhcpsFoStatsPeerConflict indicates how many BNDUPD 'add' packets were dropped because the failover peer has leased an address within a subnet range of which the failover control is set to 'local' on this local DHCP server instance.
persistCongestPkts [Persist Congest Pkts] (tmnxDhcpsFoStatsPersistCongest)	long	The value of tmnxDhcpsFoStatsPersistCongest indicates how many BNDUPD packets were dropped because of persistence congestion on this DHCP server instance.
rangeNotFoundPkts [Range Not Found Pkts] (tmnxDhcpsFoStatsRangeNotFound)	long	The value of tmnxDhcpsFoStatsRangeNotFound indicates how many BNDUPD 'add' packets were dropped because a valid include range could not be found for the lease.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
shutdownPkts [Shutdown Pkts] (tmnxDhcpsFoStatsFoShutdown)	long	The value of tmnxDhcpsFoStatsFoShutdown indicates how many BNDUPD packets were dropped because the failover state if the DHCP Server instance is 'shutdown'.
subnetNotFoundPkts [Subnet Not Found Pkts] (tmnxDhcpsFoStatsSubnetNotFound)	long	The value of tmnxDhcpsFoStatsSubnetNotFound indicates how many BNDUPD 'add' packets were dropped because a valid subnet could not be found for the lease.
<p>LocalDhcpServerPoolStats MIB entry name: tmnxDhcpSvrPoolStatsEntry Entry description: Each row entry in the tmnxDhcpSvrPoolStatsTable represents additional columns of operational data for a pool that belongs to the specified DHCP server instance. Table description (for tmnxDhcpSvrPoolStatsTable): The tmnxDhcpSvrPoolStatsTable has an entry for each pool that belongs to the specified DHCP server instance. Supports realtime plotting Supports scheduled collection Monitored class: dhcp.AddressPool</p>		
declinedAddresses [Declined Addresses] (tmnxDhcpSvrPoolStatsDeclined)	long	The value of tmnxDhcpSvrPoolStatsDeclined indicates the number of addresses in this pool that are declined.
extendedStatisticsEnabled [Extended Statistics Enabled] (tmnxDhcpSvrPoolStatsHasExt)	boolean	The value of tmnxDhcpSvrPoolStatsHasExt indicates whether the extended statistics collection for this pool is enabled.
forceRenewPendingLeases [Force Renew Pending Leases] (tmnxDhcpSvrPoolStatsFRPending)	long	The value of tmnxDhcpSvrPoolStatsFRPending indicates the number of leases in this pool that are in state 'forceRenewPending'.
freeAddresses [Free Addresses] (tmnxDhcpSvrPoolStatsFree)	long	The value of tmnxDhcpSvrPoolStatsFree indicates the number of addresses in this pool that are free.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
highestValOfferedLeases [Highest Val Offered Leases] (tmnxDhcpSvrPoolStatsOfferP)	long	The value of tmnxDhcpSvrPoolStatsOfferP indicates the highest value of tmnxDhcpSvrPoolStatsOffered since the last reset of the extended statistics.
highestValPctRemoteUsedAddresses [Highest Val Pct Remote Used Addresses] (tmnxDhcpSvrPoolStatsFoUsdPctP)	int	The value of tmnxDhcpSvrPoolStatsFoUsdPctP indicates the highest value of tmnxDhcpSvrPoolStatsFoUsdPct since the last reset of the extended statistics.
highestValPctUsedAddresses [Highest Val Pct Used Addresses] (tmnxDhcpSvrPoolStatsUsedPctP)	int	The value of tmnxDhcpSvrPoolStatsUsedPctP indicates the highest value of tmnxDhcpSvrPoolStatsUsedPct since the last reset of the extended statistics.
highestValRemoteOfferedLeases [Highest Val Remote Offered Leases] (tmnxDhcpSvrPoolStatsFoOfferP)	long	The value of tmnxDhcpSvrPoolStatsFoOfferP indicates the highest value of tmnxDhcpSvrPoolStatsFoOffered since the last reset of the extended statistics.
highestValRemoteStableLeases [Highest Val Remote Stable Leases] (tmnxDhcpSvrPoolStatsFoStableP)	long	The value of tmnxDhcpSvrPoolStatsFoStableP indicates the highest value of tmnxDhcpSvrPoolStatsFoStable since the last reset of the extended statistics.
highestValStableLeases [Highest Val Stable Leases] (tmnxDhcpSvrPoolStatsStableP)	long	The value of tmnxDhcpSvrPoolStatsStableP indicates the highest value of tmnxDhcpSvrPoolStatsStable since the last reset of the extended statistics.
localProvisionedAddresses [Local Provisioned Addresses] (tmnxDhcpSvrPoolStatsProv)	long	The value of tmnxDhcpSvrPoolStatsProv indicates the total number of local addresses in this pool that are provisioned.
lowestValPctFreeAddresses [Lowest Val Pct Free Addresses] (tmnxDhcpSvrPoolStatsFreePctP)	int	The value of tmnxDhcpSvrPoolStatsFreePctP indicates the lowest value of tmnxDhcpSvrPoolStatsFreePct since the last reset of the extended statistics.
lowestValPctRemoteFreeAddresses [Lowest Val Pct Remote Free Addresses] (tmnxDhcpSvrPoolStatsFoFrePctP)	int	The value of tmnxDhcpSvrPoolStatsFoFrePctP indicates the lowest value of tmnxDhcpSvrPoolStatsFoFrePct since the last reset of the extended statistics.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lowestValRemoteUsedLeases [Lowest Val Remote Used Leases] (tmnxDhcpSvrPoolStatsFoUsedP)	long	The value of tmnxDhcpSvrPoolStatsFoUsedP indicates the lowest value of unused subnets since the last reset of the extended statistics.
lowestValUsedLeases [Lowest Val Used Leases] (tmnxDhcpSvrPoolStatsUsedP)	long	The value of tmnxDhcpSvrPoolStatsUsedP indicates the lowest value of unused subnets since the last reset of the extended statistics.
offeredLeases [Offered Leases] (tmnxDhcpSvrPoolStatsOffered)	long	The value of tmnxDhcpSvrPoolStatsOffered indicates the number of leases in this pool that are in state 'offered'.
pctFreeAddresses [Pct Free Addresses] (tmnxDhcpSvrPoolStatsFreePct)	int	The value of tmnxDhcpSvrPoolStatsFreePct indicates the percentage of subnets currently unused.
pctRemoteFreeAddresses [Pct Remote Free Addresses] (tmnxDhcpSvrPoolStatsFoFrePct)	int	The value of tmnxDhcpSvrPoolStatsFoFrePct indicates the percentage of remote subnets currently unused.
pctRemoteUsedAddresses [Pct Remote Used Addresses] (tmnxDhcpSvrPoolStatsFoUsdPct)	int	The value of tmnxDhcpSvrPoolStatsFoUsdPct indicates the percentage of remote subnets currently in use.
pctUsedAddresses [Pct Used Addresses] (tmnxDhcpSvrPoolStatsUsedPct)	int	The value of tmnxDhcpSvrPoolStatsUsedPct indicates the percentage of subnets currently in use.
peakNumberFreeAddresses [Peak Number Free Addresses] (tmnxDhcpSvrPoolStatsFreeP)	long	The value of tmnxDhcpSvrPoolStatsFreeP indicates the lowest value of unused subnets since the last reset of the extended statistics.
peakNumberRemoteFreeAddresses [Peak Number Remote Free Addresses] (tmnxDhcpSvrPoolStatsFoFreeP)	long	The value of tmnxDhcpSvrPoolStatsFoFreeP indicates the lowest value of unused subnets since the last reset of the extended statistics.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remoteDeclinedAddresses [Remote Declined Addresses] (tmnxDhcpSvrPoolStatsFoDeclined)	long	The value of tmnxDhcpSvrPoolStatsFoDeclined indicates the number of remote addresses in this pool that are declined. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
remoteForceRenewPendingLeases [Remote Force Renew Pending Leases] (tmnxDhcpSvrPoolStatsFoFRPend)	long	The value of tmnxDhcpSvrPoolStatsFoFRPend indicates the number of remote leases in this pool that are in state 'forceRenewPending'. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
remoteFreeAddresses [Remote Free Addresses] (tmnxDhcpSvrPoolStatsFoFree)	long	The value of tmnxDhcpSvrPoolStatsFoFree indicates the number of remote addresses in this pool that are free. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
remoteOfferedLeases [Remote Offered Leases] (tmnxDhcpSvrPoolStatsFoOffered)	long	The value of tmnxDhcpSvrPoolStatsFoOffered indicates the number of remote leases in this pool that are in state 'offered'. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
remoteProvisionedAddresses [Remote Provisioned Addresses] (tmnxDhcpSvrPoolStatsFoProv)	long	The value of tmnxDhcpSvrPoolStatsFoProv indicates the total number of remote addresses in this pool that are provisioned. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)' and the value of the object tmnxDhcpsFoState of this server is equal to 'partnerDown (5)'.
remoteRemovePendingLeases [Remote Remove Pending Leases] (tmnxDhcpSvrPoolStatsFoRemPend)	long	The value of tmnxDhcpSvrPoolStatsFoRemPend indicates the number of remote leases in this pool that are in state 'removePending'. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remoteStableLeases [Remote Stable Leases] (tmnxDhcpSvrPoolStatsFoStable)	long	The value of tmnxDhcpSvrPoolStatsFoStable indicates the number of remote leases in this pool that are in state 'stable'. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
removePendingLeases [Remove Pending Leases] (tmnxDhcpSvrPoolStatsRemPending)	long	The value of tmnxDhcpSvrPoolStatsRemPending indicates the number of leases in this pool that are in state 'removePending'.
stableLeases [Stable Leases] (tmnxDhcpSvrPoolStatsStable)	long	The value of tmnxDhcpSvrPoolStatsStable indicates the number of leases in this pool that are in state 'stable'.
timeSinceExtendedReset [Time Since Extended Reset] (tmnxDhcpSvrPoolStatsExtResetT)	long	The value of tmnxDhcpSvrPoolStatsExtResetT indicates the sysUpTime at the last reset of the extended statistics.
timeSinceLastFreeAddresses [Time Since Last Free Addresses] (tmnxDhcpSvrPoolStatsFreePT)	long	The value of tmnxDhcpSvrPoolStatsFreePT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsFreeP.
timeSinceLastOfferedLeases [Time Since Last Offered Leases] (tmnxDhcpSvrPoolStatsOfferPT)	long	The value of tmnxDhcpSvrPoolStatsOfferPT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsOfferP.
timeSinceLastPctFreeAddresses [Time Since Last Pct Free Addresses] (tmnxDhcpSvrPoolStatsFreePctPT)	long	The value of tmnxDhcpSvrPoolStatsFreePctPT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsFreePctP.
timeSinceLastPctRemoteFreeAddresses [Time Since Last Pct Remote Free Addresses] (tmnxDhcpSvrPoolStatsFoFrePctPT)	long	The value of tmnxDhcpSvrPoolStatsFoFrePctPT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsFoFrePctP.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastPctRemoteUsedAddresses [Time Since Last Pct Remote Used Addresses] (tmnxDhcpSvrPoolStatsFoUsdPctPT)	long	The value of tmnxDhcpSvrPoolStatsFoUsdPctPT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsFoUsdPctP.
timeSinceLastPctUsedAddresses [Time Since Last Pct Used Addresses] (tmnxDhcpSvrPoolStatsUsedPctPT)	long	The value of tmnxDhcpSvrPoolStatsUsedPctPT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsUsedPctP.
timeSinceLastRemoteFreeAddresses [Time Since Last Remote Free Addresses] (tmnxDhcpSvrPoolStatsFoFreePT)	long	The value of tmnxDhcpSvrPoolStatsFoFreePT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsFoFreeP.
timeSinceLastRemoteOfferedLeases [Time Since Last Remote Offered Leases] (tmnxDhcpSvrPoolStatsFoOfferPT)	long	The value of tmnxDhcpSvrPoolStatsFoOfferPT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsFoOfferP.
timeSinceLastRemoteStableLeases [Time Since Last Remote Stable Leases] (tmnxDhcpSvrPoolStatsFoStablePT)	long	The value of tmnxDhcpSvrPoolStatsFoStablePT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsFoStableP.
timeSinceLastRemoteUsedLeases [Time Since Last Remote Used Leases] (tmnxDhcpSvrPoolStatsFoUsedPT)	long	The value of tmnxDhcpSvrPoolStatsFoUsedPT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsFoUsedP.
timeSinceLastUsedLeases [Time Since Last Used Leases] (tmnxDhcpSvrPoolStatsUsedPT)	long	The value of tmnxDhcpSvrPoolStatsUsedPT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsUsedP.
timeSinceStableLeases [Time Since Stable Leases] (tmnxDhcpSvrPoolStatsStablePT)	long	The value of tmnxDhcpSvrPoolStatsStablePT indicates the sysUpTime at the last change of tmnxDhcpSvrPoolStatsStableP.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
usedLeases [Used Leases] (tmnxDhcpSvrPoolStatsUsed)	long	The value of tmnxDhcpSvrPoolStatsUsed indicates the number of provisioned and used subnets.
usedRemoteLeases [Used Remote Leases] (tmnxDhcpSvrPoolStatsFoUsed)	long	The value of tmnxDhcpSvrPoolStatsFoUsed indicates the number of provisioned and used remote subnets.
<p>LocalDhcpServerStats MIB entry name: tmnxDhcpServerStatsEntry Entry description: Each row entry contains basic statistics about a particular DHCP server instance. Table description (for tmnxDhcpServerStatsTable): The tmnxDhcpServerStatsTable contains basic statistics about the DHCP server instances. Supports realtime plotting Supports scheduled collection Monitored class: dhcp.LocalDhcpServer</p>		
addressUnavailableDropped [Address Unavailable Dropped] (tmnxDhcpSvrStatsDropAddrUnavail)	long	The value of tmnxDhcpSvrStatsDropAddrUnavail indicates the number of DHCP requests dropped by the server instance because the requested address is not available.
corruptedPacketsDropped [Corrupted Packets Dropped] (tmnxDhcpSvrStatsDropBadPackets)	long	The value of tmnxDhcpSvrStatsDropBadPackets indicates the number of DHCP packets received which were corrupt.
destinedToOtherDropped [Destined To Other Dropped] (tmnxDhcpSvrStatsDropDestOther)	long	The value of tmnxDhcpSvrStatsDropDestOther indicates the number of DHCP requests dropped by the server instance because the (broadcast) request was not destined to this server.
dropAudit [Drop Audit] (tmnxDhcpSvrStatsDropAudit)	long	The value of tmnxDhcpSvrStatsDropAudit indicates the number of DHCP requests dropped by the server instance because this server instance is busy with the primary audit.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
dropIntConflicts [Drop Int Conflicts] (tmnxDhcpSvrStatsDropIntConflicts)	long	The value of tmnxDhcpSvrStatsDropIntConflicts indicates a DHCP host is trying to acquire an IP address that was handed through the local address assignment infrastructure, or the local address assignment infrastructure tries to use an IP address that was handed out to a DHCP client.
dropMaxReached [Drop Max Reached] (tmnxDhcpSvrStatsDropMaxReached)	long	The value of tmnxDhcpSvrStatsDropMaxReached indicates the number of DHCP packets dropped by the server instance because the maximum number of leases was reached. The maximum number of leases is indicated by the value of the object tmnxDhcpSvrMaxLeases.
dropNoSubnet [Drop No Subnet] (tmnxDhcpSvrStatsDropNoSubnet)	long	The value of tmnxDhcpSvrStatsDropNoSubnet indicates the number of DHCP packets dropped by the server instance for user-db hosts with a fixed address because the subnet to which the address belongs is not configured.
dropSvrDown [Drop Svr Down] (tmnxDhcpSvrStatsDropSvrDown)	long	The value of tmnxDhcpSvrStatsDropSvrDown indicates the number of DHCP packets dropped by the server instance during server instance shutdown (while the value of the object tmnxDhcpServerCfgAdminState in the corresponding row was set equal to 'outOfService').
dropTxFailed [Drop Tx Failed] (tmnxDhcpSvrStatsDropTxFailed)	long	The value of tmnxDhcpSvrStatsDropTxFailed indicates the number of DHCP responses dropped because this server instance could not transmit it.
droppedDhcpReqDiffGatewayIP [Dropped Dhcp Req Diff Gateway IP] (tmnxDhcpSvrStatsDropDuplDiffGi)	long	The value of tmnxDhcpSvrStatsDropDuplDiffGi indicates the number of DHCP requests dropped by the server instance because they were received from a different Gateway IP address within a timeframe of 10 seconds after a previous DHCPREQUEST.
genericErrorDropped [Generic Error Dropped] (tmnxDhcpSvrStatsDropGenError)	long	The value of tmnxDhcpSvrStatsDropGenError indicates the number of DHCP packets dropped by the server instance because of a generic error.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
internalCallsFailoverDropped [Internal Calls Failover Dropped] (tmnxDhcpSvrStatsDropIntWithFo)	long	The value of tmnxDhcpSvrStatsDropIntWithFo indicates the number of internal calls from the local address assignment infrastructure dropped by the DHCP server instance because failover is enabled for the server instance.
internalCallsLocalUserDbDropped [Internal Calls Local User Db Dropped] (tmnxDhcpSvrStatsDropIntWithLudb)	long	The value of tmnxDhcpSvrStatsDropIntWithLudb indicates the number of internal calls from the local address assignment infrastructure dropped by the DHCP server instance because a local user database is attached to the server instance.
invalidMessageTypesDropped [Invalid Message Types Dropped] (tmnxDhcpSvrStatsDropInvalidTypes)	long	The value of tmnxDhcpSvrStatsDropInvalidTypes indicates the number of DHCP packets received which had an invalid message type (option 53).
invalidUserDropped [Invalid User Dropped] (tmnxDhcpSvrStatsDropInvalidUsr)	long	The value of tmnxDhcpSvrStatsDropInvalidUsr indicates the number of DHCP packets dropped by the server instance because the MAC address of the sender or the option 82 didn't match the host lease state.
leaseNotFoundDropped [Lease Not Found Dropped] (tmnxDhcpSvrStatsDropNoLeaseFound)	long	The value of tmnxDhcpSvrStatsDropNoLeaseFound indicates the number of DHCP packets dropped by the server instance because no (valid) lease was found.
leaseNotReadyDropped [Lease Not Ready Dropped] (tmnxDhcpSvrStatsDropLseNotReady)	long	The value of tmnxDhcpSvrStatsDropLseNotReady indicates the number of DHCP packets dropped by the server instance before the lease database was ready.
leasesExpired [Leases Expired] (tmnxDhcpSvrStatsLeasesExpired)	long	The value of tmnxDhcpSvrStatsLeasesExpired indicates the number of DHCP leases that were expired (because no release was received).
localUserDbNotFoundDropped [Local User Db Not Found Dropped] (tmnxDhcpSvrStatsDropNoUsrDbFound)	long	The value of tmnxDhcpSvrStatsDropNoUsrDbFound indicates the number of DHCP packets dropped because the value of the object tmnxDhcpServerCfgUserDatabase of this server instance is not equal to the default value and a local user database with that name could not be found.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
noFreeAddressesInPoolDropped [No Free Addresses In Pool Dropped] (tmnxDhcpSvrStatsDropNotSrvngPool)	long	The value of tmnxDhcpSvrStatsDropNotSrvngPool indicates the number of DHCP packets dropped by the server instance because there were no more free addresses in the pool.
offersIgnored [Offers Ignored] (tmnxDhcpSvrStatsOffersIgnore)	long	The value of tmnxDhcpSvrStatsOffersIgnore indicates the number of DHCPOFFER (option 52 with value 2) packets sent by the DHCP server instance that were ignored by the clients.
overloadDropped [Overload Dropped] (tmnxDhcpSvrStatsDropOverload)	long	The value of tmnxDhcpSvrStatsDropOverload indicates the number of DHCP packets dropped by the server instance because they were received in excess of what the server instance can handle.
persistenceOverloadDropped [Persistence Overload Dropped] (tmnxDhcpSvrStatsDropPersOverload)	long	The value of tmnxDhcpSvrStatsDropPersOverload indicates the number of DHCP packets dropped by the server instance because they were received in excess of what the DHCP persistence system can handle. If this occurs, only releases and declines are still processed.
receivedDhcpDeclines [Received Dhcp Declines] (tmnxDhcpSvrStatsRxDeclines)	java. math. BigInteger	The value of tmnxDhcpSvrStatsRxDeclines indicates the number of DHCPDECLINE (option 53 with value 4) packets received by the DHCP server instance.
receivedDhcpDiscovers [Received Dhcp Discovers] (tmnxDhcpSvrStatsRxDiscovers)	java. math. BigInteger	The value of tmnxDhcpSvrStatsRxDiscovers indicates the number of DHCPDISCOVER (option 53 with value 1) packets received by the DHCP server instance.
receivedDhcpInforms [Received Dhcp Informs] (tmnxDhcpSvrStatsRxInforms)	java. math. BigInteger	The value of tmnxDhcpSvrStatsRxInforms indicates the number of DHCPINFORM (option 53 with value 8) packets received by the DHCP server instance.
receivedDhcpInternalReleases [Received Dhcp Internal Releases] (tmnxDhcpSvrStatsRxIntReleases)	java. math. BigInteger	The value of tmnxDhcpSvrStatsRxIntReleases indicates the number of internal release calls received by the DHCP server instance from the local address assignment infrastructure.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
receivedDhcpInternalRequests [Received Dhcp Internal Requests] (tmnxDhcpSvrStatsRxIntRequests)	java. math. BigInteger	The value of tmnxDhcpSvrStatsRxIntRequests indicates the number of internal request calls received by the DHCP server instance from the local address assignment infrastructure.
receivedDhcpReleases [Received Dhcp Releases] (tmnxDhcpSvrStatsRxReleases)	java. math. BigInteger	The value of tmnxDhcpSvrStatsRxReleases indicates the number of DHCPRELEASE (option 53 with value 7) packets received by the DHCP server instance.
receivedDhcpRequests [Received Dhcp Requests] (tmnxDhcpSvrStatsRxRequests)	java. math. BigInteger	The value of tmnxDhcpSvrStatsRxRequests indicates the number of DHCPREQUEST (option 53 with value 3) packets received by the DHCP server instance.
sentDhcpAcks [Sent Dhcp Acks] (tmnxDhcpSvrStatsTxAcks)	java. math. BigInteger	The value of tmnxDhcpSvrStatsTxAcks indicates the number of DHCPACK (option 53 with value 5) packets sent by the DHCP server instance.
sentDhcpForceRenews [Sent Dhcp Force Renews] (tmnxDhcpSvrStatsTxForceRenews)	java. math. BigInteger	The value of tmnxDhcpSvrStatsTxForceRenews indicates the number of DHCPFORCERENEW (option 53 with value 9) packets sent by the DHCP server instance.
sentDhcpNaks [Sent Dhcp Naks] (tmnxDhcpSvrStatsTxNaks)	java. math. BigInteger	The value of tmnxDhcpSvrStatsTxNaks indicates the number of DHCPNAK (option 53 with value 6) packets sent by the DHCP server instance.
sentDhcpOffers [Sent Dhcp Offers] (tmnxDhcpSvrStatsTxOffers)	java. math. BigInteger	The value of tmnxDhcpSvrStatsTxOffers indicates the number of DHCPOFFER (option 53 with value 2) packets sent by the DHCP server instance.
unknownHostsDropped [Unknown Hosts Dropped] (tmnxDhcpSvrStatsDropUnknownHosts)	long	The value of tmnxDhcpSvrStatsDropUnknownHosts indicates the number of DHCP packets dropped from hosts which were not found in the user database when tmnxDhcpServerCfgUse-GiAddress was disabled.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
userNotAllowedDropped [User Not Allowed Dropped] (tmnxDhcpSvrStatsDropUserNotAllow)	long	The value of tmnxDhcpSvrStatsDropUserNotAllow indicates the number of DHCP packets dropped from hosts which are found in the user database, but which have no address or pool specified, nor has tmnxDhcpServerCfgUseGiAddress set to 'true'.
<p>LocalDhcpServerSubnetStats</p> <p>MIB entry name: tmnxDhcpSvrSubnetStatsEntry</p> <p>Entry description: Each row entry in the tmnxDhcpSvrSubnetStatsTable represents additional columns of operational data for a subnet that belongs to the specified DHCP server instance and pool.</p> <p>Table description (for tmnxDhcpSvrSubnetStatsTable): The tmnxDhcpSvrSubnetStatsTable has an entry for each subnet that belongs to the specified DHCP server instance and pool.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: dhcp.Subnet</p>		
declinedAddresses [Declined Addresses] (tmnxDhcpSvrSubnetStatsDeclined)	long	The value of tmnxDhcpSvrSubnetStatsDeclined indicates the number of addresses in this subnet that are declined.
forceRenewPendingLeases [Force Renew Pending Leases] (tmnxDhcpSvrSubnetStatsFRPending)	long	The value of tmnxDhcpSvrSubnetStatsFRPending indicates the number of leases in this subnet that are in state 'forceRenewPending'.
freeAddresses [Free Addresses] (tmnxDhcpSvrSubnetStatsFree)	long	The value of tmnxDhcpSvrSubnetStatsFree indicates the number of addresses in this subnet that are free.
highestValOfferedLeases [Highest Val Offered Leases] (tmnxDhcpSvrSubnetStatsOfferP)	long	The value of tmnxDhcpSvrSubnetStatsOfferP indicates the highest value of tmnxDhcpSvrSubnetStatsOffered since the last reset of the extended statistics.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
highestValPctRemoteUsedAddresses [Highest Val Pct Remote Used Addresses] (tmnxDhcpSvrSubnetStatsFoUsdPctP)	int	The value of tmnxDhcpSvrSubnetStatsFoUsdPctP indicates the highest value of tmnxDhcpSvrSubnetStatsFoUsdPct since the last reset of the extended statistics.
highestValPctUsedAddresses [Highest Val Pct Used Addresses] (tmnxDhcpSvrSubnetStatsUsedPctP)	int	The value of tmnxDhcpSvrSubnetStatsUsedPctP indicates the highest value of tmnxDhcpSvrSubnetStatsUsedPct since the last reset of the extended statistics.
highestValRemoteOfferedLeases [Highest Val Remote Offered Leases] (tmnxDhcpSvrSubnetStatsFoOfferP)	long	The value of tmnxDhcpSvrSubnetStatsFoOfferP indicates the highest value of tmnxDhcpSvrSubnetStatsFoOffered since the last reset of the extended statistics.
highestValRemoteStableLeases [Highest Val Remote Stable Leases] (tmnxDhcpSvrSubnetStatsFoStableP)	long	The value of tmnxDhcpSvrSubnetStatsFoStableP indicates the highest value of tmnxDhcpSvrSubnetStatsFoStable since the last reset of the extended statistics.
highestValStableLeases [Highest Val Stable Leases] (tmnxDhcpSvrSubnetStatsStableP)	long	The value of tmnxDhcpSvrSubnetStatsStableP indicates the highest value of tmnxDhcpSvrSubnetStatsStable since the last reset of the extended statistics.
localProvisionedAddresses [Local Provisioned Addresses] (tmnxDhcpSvrSubnetStatsProv)	long	The value of tmnxDhcpSvrSubnetStatsProv indicates the total number of local addresses in this subnet that are provisioned.
lowestValPctFreeAddresses [Lowest Val Pct Free Addresses] (tmnxDhcpSvrSubnetStatsFreePctP)	int	The value of tmnxDhcpSvrSubnetStatsFreePctP indicates the lowest value of tmnxDhcpSvrSubnetStatsFreePct since the last reset of the extended statistics.
lowestValPctRemoteFreeAddresses [Lowest Val Pct Remote Free Addresses] (tmnxDhcpSvrSubnetStatsFoFrePctP)	int	The value of tmnxDhcpSvrSubnetStatsFoFrePctP indicates the lowest value of tmnxDhcpSvrSubnetStatsFoFrePct since the last reset of the extended statistics.
lowestValRemoteUsedLeases [Lowest Val Remote Used Leases] (tmnxDhcpSvrSubnetStatsFoUsedP)	long	The value of tmnxDhcpSvrSubnetStatsFoUsedP indicates the lowest value of tmnxDhcpSvrSubnetStatsFoUsed since the last reset of the extended statistics.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
lowestValUsedLeases [Lowest Val Used Leases] (tmnxDhcpSvrSubnetStatsUsedP)	long	The value of tmnxDhcpSvrSubnetStatsUsedP indicates the lowest value of tmnxDhcpSvrSubnetStatsUsed since the last reset of the extended statistics.
offeredLeases [Offered Leases] (tmnxDhcpSvrSubnetStatsOffered)	long	The value of tmnxDhcpSvrSubnetStatsOffered indicates the number of leases in this subnet that are in state 'offered'.
pctFreeAddresses [Pct Free Addresses] (tmnxDhcpSvrSubnetStatsFreePct)	int	The value of tmnxDhcpSvrSubnetStatsFreePct indicates the percentage of addresses in this subnet currently unused.
pctRemoteFreeAddresses [Pct Remote Free Addresses] (tmnxDhcpSvrSubnetStatsFoFrePct)	int	The value of tmnxDhcpSvrSubnetStatsFoFrePct indicates the percentage of remote addresses in this subnet that are currently unused.
pctRemoteUsedAddresses [Pct Remote Used Addresses] (tmnxDhcpSvrSubnetStatsFoUsdPct)	int	The value of tmnxDhcpSvrSubnetStatsFoUsdPct indicates the percentage of remote addresses in this subnet that are in use.
pctUsedAddresses [Pct Used Addresses] (tmnxDhcpSvrSubnetStatsUsedPct)	int	The value of tmnxDhcpSvrSubnetStatsUsedPct indicates the percentage of addresses in this subnet in use.
peakNumberFreeAddresses [Peak Number Free Addresses] (tmnxDhcpSvrSubnetStatsFreeP)	long	The value of tmnxDhcpSvrSubnetStatsFreeP indicates the peak number of addresses in this subnet that are free since the last reset of the extended statistics.
peakNumberRemoteFreeAddresses [Peak Number Remote Free Addresses] (tmnxDhcpSvrSubnetStatsFoFreeP)	long	The value of tmnxDhcpSvrSubnetStatsFoFreeP indicates the peak number of remote addresses in this subnet that are free since the last reset of the extended statistics.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remoteDeclinedAddresses [Remote Declined Addresses] (tmnxDhcpSvrSubnetStatsFoDeclined)	long	The value of tmnxDhcpSvrSubnetStatsFoDeclined indicates the number of remote addresses in this subnet that are declined. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
remoteForceRenewPendingLeases [Remote Force Renew Pending Leases] (tmnxDhcpSvrSubnetStatsFoFRPend)	long	The value of tmnxDhcpSvrSubnetStatsFoFRPend indicates the number of remote leases in this subnet that are in state 'forceRenewPending'. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
remoteFreeAddresses [Remote Free Addresses] (tmnxDhcpSvrSubnetStatsFoFree)	long	The value of tmnxDhcpSvrSubnetStatsFoFree indicates the number of remote addresses in this subnet that are free. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
remoteOfferedLeases [Remote Offered Leases] (tmnxDhcpSvrSubnetStatsFoOffered)	long	The value of tmnxDhcpSvrSubnetStatsFoOffered indicates the number of remote leases in this subnet that are in state 'offered'. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
remoteProvisionedAddresses [Remote Provisioned Addresses] (tmnxDhcpSvrSubnetStatsFoProv)	long	The value of tmnxDhcpSvrSubnetStatsFoProv indicates the total number of remote addresses in this subnet that are provisioned. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)' and the value of the object tmnxDhcpsFoState of this server is equal to 'partnerDown (5)'.
remoteRemovePendingLeases [Remote Remove Pending Leases] (tmnxDhcpSvrSubnetStatsFoRemPend)	long	The value of tmnxDhcpSvrSubnetStatsFoRemPend indicates the number of remote leases in this subnet that are in state 'removePending'. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
remoteStableLeases [Remote Stable Leases] (tmnxDhcpSvrSubnetStatsFoStable)	long	The value of tmnxDhcpSvrSubnetStatsFoStable indicates the number of remote leases in this subnet that are in state 'stable'. The value of this object is only relevant if the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)'.
removePendingLeases [Remove Pending Leases] (tmnxDhcpSvrSubnetStatsRemPending)	long	The value of tmnxDhcpSvrSubnetStatsRemPending indicates the number of leases in this subnet that are in state 'removePending'.
stableLeases [Stable Leases] (tmnxDhcpSvrSubnetStatsStable)	long	The value of tmnxDhcpSvrSubnetStatsStable indicates the number of leases in this subnet that are in state 'stable'.
timeSinceExtendedReset [Time Since Extended Reset] (tmnxDhcpSvrSubnetStatsExtResetT)	long	The value of tmnxDhcpSvrSubnetStatsExtResetT indicates the sysUpTime at the last reset of the extended statistics.
timeSinceLastFreeAddresses [Time Since Last Free Addresses] (tmnxDhcpSvrSubnetStatsFreePT)	long	The value of tmnxDhcpSvrSubnetStatsFreePT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsFreeP.
timeSinceLastOfferedLeases [Time Since Last Offered Leases] (tmnxDhcpSvrSubnetStatsOfferPT)	long	The value of tmnxDhcpSvrSubnetStatsOfferPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsOfferP.
timeSinceLastPctFreeAddresses [Time Since Last Pct Free Addresses] (tmnxDhcpSvrSubnetStatsFreePctPT)	long	The value of tmnxDhcpSvrSubnetStatsFreePctPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsFreePctP.
timeSinceLastPctRemoteFreeAddresses [Time Since Last Pct Remote Free Addresses] (tmnxDhcpSvrSubnetStatsFoFrePctPT)	long	The value of tmnxDhcpSvrSubnetStatsFoFrePctPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsFoFrePctP.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
timeSinceLastPctRemoteUsedAddresses [Time Since Last Pct Remote Used Addresses] (tmnxDhcpSvrSubnetStatsFoUsdPctPT)	long	The value of tmnxDhcpSvrSubnetStatsFoUsdPctPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsFoUsdPctP.
timeSinceLastPctUsedAddresses [Time Since Last Pct Used Addresses] (tmnxDhcpSvrSubnetStatsUsedPctPT)	long	The value of tmnxDhcpSvrSubnetStatsUsedPctPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsUsedPctP.
timeSinceLastRemoteFreeAddresses [Time Since Last Remote Free Addresses] (tmnxDhcpSvrSubnetStatsFoFreePT)	long	The value of tmnxDhcpSvrSubnetStatsFoFreePT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsFoFreeP.
timeSinceLastRemoteOfferedLeases [Time Since Last Remote Offered Leases] (tmnxDhcpSvrSubnetStatsFoOfferPT)	long	The value of tmnxDhcpSvrSubnetStatsFoOfferPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsFoOfferP.
timeSinceLastRemoteStableLeases [Time Since Last Remote Stable Leases] (tmnxDhcpSvrSubnetStatsFoStablePT)	long	The value of tmnxDhcpSvrSubnetStatsFoStablePT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsFoStableP.
timeSinceLastRemoteUsedLeases [Time Since Last Remote Used Leases] (tmnxDhcpSvrSubnetStatsFoUsedPT)	long	The value of tmnxDhcpSvrSubnetStatsFoUsedPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsFoUsedP.
timeSinceLastStableLeases [Time Since Last Stable Leases] (tmnxDhcpSvrSubnetStatsStablePT)	long	The value of tmnxDhcpSvrSubnetStatsStablePT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsStableP.
timeSinceLastUsedLeases [Time Since Last Used Leases] (tmnxDhcpSvrSubnetStatsUsedPT)	long	The value of tmnxDhcpSvrSubnetStatsUsedPT indicates the sysUpTime at the last change of tmnxDhcpSvrSubnetStatsUsedP.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
usedLeases [Used Leases] (tmnxDhcpSvrSubnetStatsUsed)	long	The value of tmnxDhcpSvrSubnetStatsUsed indicates the number of leases in this subnet that are in use.
usedRemoteLeases [Used Remote Leases] (tmnxDhcpSvrSubnetStatsFoUsed)	long	The value of tmnxDhcpSvrSubnetStatsFoUsed indicates the number of remote leases in this subnet that are in use.
<p>PrefixMinFreeThresholdStats MIB entry name: tmnxDhcpsPfxThStats6Entry Entry description: Each row entry in the tmnxDhcpsPfxThStats6Entry represents additional columns of threshold statistics for a prefix that belongs to the specified DHCPv6 server instance Table description (for tmnxDhcpsPfxThStats6Table): The table tmnxDhcpsPfxThStats6Table contains the threshold statistics for each prefix belonging to the specified DHCPv6 instance. Supports realtime plotting Supports scheduled collection Monitored class: dhcp.PrefixMinFreeThreshold</p>		

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
currFreeBlks [Curr Free Blks] (tmnxDhcpsPfxThCurrFreeBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThCurrFreeBlksLw indicates the lower 64-bits word of the number of free blocks in this configured prefix with a prefix length defined by the value of tmnxDhcpsPfxMinFreePrefixLen. The value of this object reflects the part of the address space in this prefix that is actually in use by this server instance. If the value of the object tmnxDhcpSvrSubnetFailCtrl of this prefix equals 'local (1)' or 'access-driven (3)', the value of this object reflects the value of the object tmnxDhcpsPfxThLclFreeBlksLw. If the value of the object tmnxDhcpSvrSubnetFailCtrl of this prefix equals 'remote (2)' and the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)' and the value of the object tmnxDhcpsFoState of this server is equal to 'partnerDown (5)', or the value of the object tmnxDhcpsPoolFoAdminState of this pool is equal to 'inService (2)' and the value of the object tmnxDhcpsPoolFoState of this pool is equal to 'partnerDown (5)', the value of this object reflects the value of the object tmnxDhcpsPfxThRemFreeBlksLw. Otherwise the value of this object is 0.
currFreeDepleted [Curr Free Depleted] (tmnxDhcpsPfxThCurrFreeDepleted)	boolean	The value of the object tmnxDhcpsPfxThCurrFreeDepleted equals '1' if there are no more prefixes with the minimum free threshold length available in the considered prefix. Otherwise the value equals '2'.
currFreePct [Curr Free Pct] (tmnxDhcpsPfxThCurrFreePct)	long	The value of the object tmnxDhcpsPfxThCurrFreePct indicates the percentage of free prefixes with the minimum free threshold length compared to the number of provisioned prefixes. This depends on the current failover state of the DHCP server or pool.
currFreeTooLow [Curr Free Too Low] (tmnxDhcpsPfxThCurrFreeTooLow)	boolean	The value of the object tmnxDhcpsPfxThCurrFreeTooLow equals '1' if the number of free prefixes with the minimum free threshold length available in the considered prefix is below the configured number of prefixes with the minimum free threshold length. Otherwise the value equals '2'.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
currProvBlks [Curr Prov Blks] (tmnxDhcpsPfxThCurrProvBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThCurrProvBlksLw indicates the lower 64-bits word of the number of provisioned blocks in this configured prefix with a prefix length defined by the value of tmnxDhcpsPfxMinFreePrefixLen. The value of this object reflects the part of the address space in this prefix that is actually in use by this server instance. If the value of the object tmnxDhcpSvrSubnetFailCtrl of this prefix equals 'local (1)' or 'access-driven (3)', the value of this object reflects the value of the object tmnxDhcpsPfxThLclProvBlksLw. If the value of the object tmnxDhcpSvrSubnetFailCtrl of this prefix equals 'remote (2)' and the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)' and the value of the object tmnxDhcpsFoState of this server is equal to 'partnerDown (5)', or the value of the object tmnxDhcpsPoolFoAdminState of this pool is equal to 'inService (2)' and the value of the object tmnxDhcpsPoolFoState of this pool is equal to 'partnerDown (5)', the value of this object reflects the value of the object tmnxDhcpsPfxThRemProvBlksLw. Otherwise the value of this object is 0.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
currUsedBlks [Curr Used Blks] (tmnxDhcpsPfxThCurrUsedBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThCurrUsedBlksLw indicates the lower 64-bits word of the number of used blocks in this configured prefix with a prefix length defined by the value of tmnxDhcpsPfxMinFreePrefixLen. The value of this object reflects the part of the address space in this prefix that is actually in use by this server instance. If the value of the object tmnxDhcpSvrSubnetFailCtrl of this prefix equals 'local (1)' or 'access-driven (3)', the value of this object reflects the value of the object tmnxDhcpsPfxThLclUsedBlksLw. If the value of the object tmnxDhcpSvrSubnetFailCtrl of this prefix equals 'remote (2)' and the value of the object tmnxDhcpsFoAdminState of this server is equal to 'inService (2)' and the value of the object tmnxDhcpsFoState of this server is equal to 'partnerDown (5)', or the value of the object tmnxDhcpsPoolFoAdminState of this pool is equal to 'inService (2)' and the value of the object tmnxDhcpsPoolFoState of this pool is equal to 'partnerDown (5)', the value of this object reflects the value of the object tmnxDhcpsPfxThRemUsedBlksLw. Otherwise the value of this object is 0.
currUsedPct [Curr Used Pct] (tmnxDhcpsPfxThCurrUsedPct)	long	The value of the object tmnxDhcpsPfxThCurrUsedPct indicates the percentage of used prefixes with the minimum free threshold length compared to the number of provisioned prefixes. This depends on the current failover state of the DHCP server or pool.
currUsedPeakBlks [Curr Used Peak Blks] (tmnxDhcpsPfxThCurrUsedPeakBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThCurrUsedPeakBlksLw indicates the lower 64-bits word of the peak value of the number of used blocks in the configured prefix with a prefix length defined by the value of tmnxDhcpsPfxMinFreePrefixLen.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
currUsedPeakPct [Curr Used Peak Pct] (tmnxDhcpsPfxThCurrUsedPeakPct)	long	The value of the object tmnxDhcpsPfxThCurrUsedPeakPct indicates the peak value of the number of used prefixes with the minimum free threshold length in the configured prefix as a percentage of the provisioned prefixes. This depends on the current failover state of the DHCP server or pool.
currUsedPeakTime [Curr Used Peak Time] (tmnxDhcpsPfxThCurrUsedPeakTime)	long	The value of the object tmnxDhcpsPfxThCurrUsedPeakTime indicates the time at which the peak value of the number of used prefixes was reached for the configured prefix.
lclFreeBlks [Lcl Free Blks] (tmnxDhcpsPfxThLclFreeBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThLclFreeBlksLw indicates the lower 64-bits word of the number of free prefixes with the minimum free threshold length if the configured prefix is local, otherwise the value is 0.
lclProvBlks [Lcl Prov Blks] (tmnxDhcpsPfxThLclProvBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThLclProvBlksLw indicates the lower 64-bits word of the number of provisioned prefixes with the minimum free threshold length if the configured prefix is local, otherwise the value is 0.
lclUsedBlks [Lcl Used Blks] (tmnxDhcpsPfxThLclUsedBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThLclUsedBlksLw indicates the lower 64-bits word of the number of used prefixes with the minimum free threshold length if the configured prefix is local, otherwise the value is 0.
lclUsedPeakBlks [Lcl Used Peak Blks] (tmnxDhcpsPfxThLclUsedPeakBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThLclUsedPeakBlksLw indicates the lower 64-bits word of the peak value of the number of used prefixes with the minimum free threshold length for the local configured prefix.
lclUsedPeakPct [Lcl Used Peak Pct] (tmnxDhcpsPfxThLclUsedPeakPct)	long	The value of the object tmnxDhcpsPfxThLclUsedPeakPct indicates the peak value of the number of used prefixes with the minimum free threshold length in the local configured prefix as a percentage of the provisioned prefixes.
lclUsedPeakTime [Lcl Used Peak Time] (tmnxDhcpsPfxThLclUsedPeakTime)	long	The value of the object tmnxDhcpsPfxThLclUsedPeakTime indicates the time at which the peak value of the number of used prefixes was reached for the local configured prefix.

Table 249 dhcp statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
peakResetTime [Peak Reset Time] (tmnxDhcpsPfxThPeakResetTime)	long	The value of the object tmnxDhcpsPfxThPeakResetTime indicates the time at which the peak values have been reset.
remFreeBlks [Rem Free Blks] (tmnxDhcpsPfxThRemFreeBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThRemFreeBlksLw indicates the lower 64-bits word of the number of free prefixes with the minimum free threshold length if the configured prefix is remote, otherwise the value is 0.
remProvBlks [Rem Prov Blks] (tmnxDhcpsPfxThRemProvBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThRemProvBlksLw indicates the lower 64-bits word of the number of provisioned prefixes with the minimum free threshold length if the configured prefix is remote, otherwise the value is 0.
remUsedBlks [Rem Used Blks] (tmnxDhcpsPfxThRemUsedBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThRemUsedBlksLw indicates the lower 64-bits word of the number of used prefixes with the minimum free threshold length if the configured prefix is remote, otherwise the value is 0.
remUsedPeakBlks [Rem Used Peak Blks] (tmnxDhcpsPfxThRemUsedPeakBlksLw)	java. math. BigInteger	The value of the object tmnxDhcpsPfxThRemUsedPeakBlksLw indicates the lower 64-bits word of the peak value of the number of used prefixes with the minimum free threshold length for the remote configured prefix.
remUsedPeakPct [Rem Used Peak Pct] (tmnxDhcpsPfxThRemUsedPeakPct)	long	The value of the object tmnxDhcpsPfxThRemUsedPeakPct indicates the peak value of the number of used prefixes with the minimum free threshold length in the remote configured prefix as a percentage of the provisioned prefixes.
remUsedPeakTime [Rem Used Peak Time] (tmnxDhcpsPfxThRemUsedPeakTime)	long	The value of the object tmnxDhcpsPfxThRemUsedPeakTime indicates the time at which the peak value of the number of used prefixes was reached for the remote configured prefix.
validData [Valid Data] (tmnxDhcpsPfxThValidData)	boolean	The value of the object tmnxDhcpsPfxThValidData indicates the actual status of the threshold statistics data of the prefix. '1' means that the data is up to date and may be used. '2' means that the data is being recalculated in the background and isn't stable for further use.

Table 250 diameter statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DiameterPeerClientPeerPsmStateStats</p> <p>MIB entry name: tmnxDiamPpPrxClientEntry</p> <p>Entry description: Each conceptual row represents information about a client-side peer of a Diameter proxy instance. Rows in this table are created and removed automatically by the system</p> <p>Table description (for tmnxDiamPpPrxClientTable): The tmnxDiamPpPrxClientTable contains information about the client-side peers of the Diameter proxy instances.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: diameter.DiameterPeerPolicy</p>		
clientAddress [Client Address] (tmnxDiamPpPrxClientIpAddr)	String	The value of tmnxDiamPpPrxClientIpAddr indicates the source IP address present in Diameter messages received from the peer.
clientAddressType [Client Address Type] (tmnxDiamPpPrxClientIpAddrType)	int	The value of tmnxDiamPpPrxClientIpAddrType indicates the address type of tmnxDiamPpPrxClientIpAddr.
clientPort [Client Port] (tmnxDiamPpPrxClientPort)	long	The value of tmnxDiamPpPrxClientPort indicates the TCP source port present in Diameter messages received from the peer.
pendingTransactions [Pending Transactions] (tmnxDiamPpPrxClientTransactions)	long	The value of tmnxDiamPpPrxClientTransactions indicates the number of pending transactions.
psmState [Psm State] (tmnxDiamPpPrxClientPsmState)	int	The value of tmnxDiamPpPrxClientPsmState indicates the state of the peer's state machine.

Table 250 diameter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DiameterPeerStatistics</p> <p>MIB entry name: tmnxDiamPeerStatsEntry</p> <p>Entry description: Each conceptual row represents statistics information about a Diameter policy peer, or a client-side peer of a Diameter proxy instance. Rows in this table are created and removed automatically by the system.</p> <p>Table description (for tmnxDiamPeerStatsTable): The tmnxDiamPeerStatsTable contains statistics information about the peers defined in a Diameter Policy, and about the client-side peers of the Diameter Proxy instances.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: diameter.DiameterPeer</p>		
peerAddress [Peer Address] (tmnxDiamPeerStatsPeerIpAddr)	String	The value of tmnxDiamPeerStatsPeerIpAddr indicates the source IP address present in DIAMETER messages received from a client-side peer of a DIAMETER proxy instance.
peerAddressType [Peer Address Type] (tmnxDiamPeerStatsPeerIpAddrType)	int	The value of tmnxDiamPeerStatsPeerIpAddrType indicates the address type of tmnxDiamPeerStatsPeerIpAddr.
peerFailedMessages [Peer Failed Messages] (tmnxDiamPeerStatsFailedMessages)	long	The value of tmnxDiamPeerStatsFailedMessages indicates the number of failed messages.
peerName [Peer Name] (tmnxDiamPeerStatsPeerName)	String	The value of tmnxDiamPeerStatsPeerName indicates the name of the peer within a DIAMETER policy, configured in object tmnxDiamPlcyPeerName.
peerPort [Peer Port] (tmnxDiamPeerStatsPeerPort)	long	The value of tmnxDiamPeerStatsPeerPort indicates the TCP source port present in DIAMETER messages received from a client-side peer of a DIAMETER proxy instance.
peerStatsBaseCe [Peer Stats Base Ce] (tmnxDiamPeerStatsBaseCe)	long	The value of tmnxDiamPeerStatsBaseCe indicates the number of Capabilities-Exchange messages.

Table 250 diameter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
peerStatsBaseDp [Peer Stats Base Dp] (tmnxDiamPeerStatsBaseDp)	long	The value of tmnxDiamPeerStatsBaseDp indicates the number of Disconnect-Peer messages.
peerStatsBaseDw [Peer Stats Base Dw] (tmnxDiamPeerStatsBaseDw)	long	The value of tmnxDiamPeerStatsBaseDw indicates the number of Device-Watchdog messages.
peerStatsDirection [Peer Stats Direction] (tmnxDiamPeerStatsDirection)	int	The value of tmnxDiamPeerStatsDirection indicates which direction packets are travelling in the system : rx - Packets are being received by the system. tx - Packets are being transmitted from the system.
peerStatsGxAs [Peer Stats Gx As] (tmnxDiamPeerStatsGxAs)	long	The value of tmnxDiamPeerStatsGxAs indicates the number of DIAMETER Gx Abort-Session messages.
peerStatsGxCcI [Peer Stats Gx Cc I] (tmnxDiamPeerStatsGxCcI)	long	The value of tmnxDiamPeerStatsGxCcI indicates the number of DIAMETER Gx Credit Control messages with CC-Request-Type AVP equal to INITIAL_REQUEST.
peerStatsGxCcT [Peer Stats Gx Cc T] (tmnxDiamPeerStatsGxCcT)	long	The value of tmnxDiamPeerStatsGxCcT indicates the number of DIAMETER Gx Credit Control messages with CC-Request-Type AVP equal to TERMINATION_REQUEST.
peerStatsGxCcU [Peer Stats Gx Cc U] (tmnxDiamPeerStatsGxCcU)	long	The value of tmnxDiamPeerStatsGxCcU indicates the number of DIAMETER Gx Credit Control messages with CC-Request-Type AVP equal to UPDATE_REQUEST.
peerStatsGxRa [Peer Stats Gx Ra] (tmnxDiamPeerStatsGxRa)	long	The value of tmnxDiamPeerStatsGxRa indicates the number of DIAMETER Gx Re-Auth messages.

Table 250 diameter statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
peerStatsGyAs [Peer Stats Gy As] (tmnxDiamPeerStatsGyAs)	long	The value of tmnxDiamPeerStatsGyAs indicates the number of DIAMETER Gy Abort-Session messages.
peerStatsGyCcl [Peer Stats Gy Cc I] (tmnxDiamPeerStatsGyCcl)	long	The value of tmnxDiamPeerStatsGyCcl indicates the number of DIAMETER Gy Credit Control messages with CC-Request-Type AVP equal to INITIAL_REQUEST.
peerStatsGyCcT [Peer Stats Gy Cc T] (tmnxDiamPeerStatsGyCcT)	long	The value of tmnxDiamPeerStatsGyCcT indicates the number of DIAMETER Gy Credit Control messages with CC-Request-Type AVP equal to TERMINATION_REQUEST.
peerStatsGyCcU [Peer Stats Gy Cc U] (tmnxDiamPeerStatsGyCcU)	long	The value of tmnxDiamPeerStatsGyCcU indicates the number of DIAMETER Gy Credit Control messages with CC-Request-Type AVP equal to UPDATE_REQUEST.
peerStatsGyRa [Peer Stats Gy Ra] (tmnxDiamPeerStatsGyRa)	long	The value of tmnxDiamPeerStatsGyRa indicates the number of DIAMETER Gy Re-Auth messages.
peerStatsMessage [Peer Stats Message] (tmnxDiamPeerStatsMessageType)	int	The value of tmnxDiamPeerStatsMessageType indicates whether this message is a Request Message or whether this message is an Answer Message.
peerStatsNqAa [Peer Stats Nq Aa] (tmnxDiamPeerStatsNqAa)	long	The value of tmnxDiamPeerStatsNqAa indicates the number of AA messages.
peerTotalMessages [Peer Total Messages] (tmnxDiamPeerStatsTotalMessages)	long	The value of tmnxDiamPeerStatsTotalMessages indicates the total number of messages.
policyName [Policy Name] (tmnxDiamPlcyName)	String	The value of tmnxDiamPlcyName specifies the name of the DIAMETER policy.

Table 251 dynsvc statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>DynSvcStats</p> <p>MIB entry name: tmnxDynSvcStatsEntry</p> <p>Entry description: Each conceptual row represents a statistic counter. Entries in this table are created and destroyed by the system. Rows are only created where the statistics value is nonzero; this allows faster walking through this table; hence, it is recommended to perform only get-next-request operations to retrieve information from this table.</p> <p>Table description (for tmnxDynSvcStatsTable): The tmnxDynSvcStatsTable shows statistics information of the Dynamic Services.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: dynsvc.DynSvcNeConfig</p>		
statsDescription [Stats Description] (tmnxDynSvcStatsDescr)	String	The value of the object tmnxDynSvcStatsDescr indicates the description of the statistic counter contained in this conceptual row.
statsId [Stats Id] (tmnxDynSvcStatsId)	long	The value of tmnxDynSvcStatsId specifies the number that identifies this conceptual row within the scope of a Dynamic Services.
statsValue [Stats Value] (tmnxDynSvcStatsVal)	long	The value of the object tmnxDynSvcStatsVal indicates the value of the statistics contained in this conceptual row.

Table 252 equipment statistics

NFM-P counter names: XML [displayed] (MIB)	Type	Description
AllocatedMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder		
allocatedMemory [Allocated Memory] (sgiMemoryPoolAllocated)	long	The value of sgiMemoryPoolAllocated indicates the total memory currently allocated in memory-pools on the system. This memory may or may not be currently in use, but is pre-allocated should the software need to use it. If the value is greater than the maximum value reportable by this object then this object reports its maximum value (4,294,967,295) and sgiKbMemoryPoolAllocated must be used to determine the total memory allocated in memory-pools.
AvailableMemoryStats MIB entry name: sysGenInfo Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder		
availableMemory [Available Memory] (sgiMemoryAvailable)	long	The value of sgiMemoryAvailable indicates the amount of free memory in the overall system that is not allocated to memory pools, but is available in case a memory pool needs to grow.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CardResourceStats</p> <p>MIB entry name: tCardResEntry</p> <p>Entry description: The value of tCardResEntry represents card specific system resource information.</p> <p>Table description (for tCardResTable): The value of tCardResTable represents system resource information that are specific to a particular card on a given chassis.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.BaseCard</p>		
fPIngQGrpInstAlloc [FPIng QGrp Inst Alloc] (tCardResFPIngQGrpInstAlloc)	long	The value of tCardResFPIngQGrpInstAlloc represents the total number of forwarding-plane (FP) ingress queue-group instances across all FP on this card including access and network instances that are currently provisioned.
fPIngQGrpInstTotal [FPIng QGrp Inst Total] (tCardResFPIngQGrpInstTotal)	long	The value of tCardResFPIngQGrpInstTotal represents the total number of forwarding-plane (FP) ingress queue-group instances across all FP on this card including access and network instances that are allowed to be provisioned. When the value of tCardResFPIngQGrpInstTotal is zero, it indicates that this resource type is not supported on this card.
hsmdaQOvrAlloc [Hsmda QOvr Alloc] (tCardResHsmdaQOvrAlloc)	long	The value of tCardResHsmdaQOvrAlloc represents the total number of HSMDA queue overrides that are currently allocated on this card.
hsmdaQOvrTotal [Hsmda QOvr Total] (tCardResHsmdaQOvrTotal)	long	The value of tCardResHsmdaQOvrTotal represents the total number of HSMDA queue overrides that are supported on this card. When the value of tCardResHsmdaQOvrTotal is zero, it indicates that this resource type is not supported on this card.
portAccEgrQGrpInstAlloc [Port Acc Egr QGrp Inst Alloc] (tCardResPortAccEgrQGrpInstAlloc)	long	The value of tCardResPortAccEgrQGrpInstAlloc represents the total number of port access egress queue-group instances across all ports on this card that are currently provisioned.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portAccEgrQGrpInstTotal [Port Acc Egr QGrp Inst Total] (tCardResPortAccEgrQGrpInstTotal)	long	The value of tCardResPortAccEgrQGrpInstTotal represents the total number of port access egress queue-group instances across all ports on this card that are allowed to be provisioned. When the value of tCardResPortAccEgrQGrpInstTotal is zero, it indicates that this resource type is not supported on this card.
portEgrQGrpInstAlloc [Port Egr QGrp Inst Alloc] (tCardResPortEgrQGrpInstAlloc)	long	The value of tCardResPortEgrQGrpInstAlloc represents the total number of port egress queue-group instances across all ports on this card including access and network instances that are currently provisioned.
portEgrQGrpInstTotal [Port Egr QGrp Inst Total] (tCardResPortEgrQGrpInstTotal)	long	The value of tCardResPortEgrQGrpInstTotal represents the total number of port egress queue-group instances across all ports on this card including access and network instances that are allowed to be provisioned. When the value of tCardResPortEgrQGrpInstTotal is zero, it indicates that this resource type is not supported on this card.
portEgrUserSchedOvrsAlloc [Port Egr User Sched Ovrs Alloc] (tCardResQosUserSchedOvrsAlloc)	long	The value of tCardResQosUserSchedOvrsAlloc represents the total number of QoS user virtual scheduler overrides that are currently allocated on this card.
portEgrUserSchedOvrsTotal [Port Egr User Sched Ovrs Total] (tCardResQosUserSchedOvrsTotal)	long	The value of tCardResQosUserSchedOvrsTotal represents the total amount of QoS user virtual scheduler overrides that are supported on this card. When the value of tCardResQosUserSchedOvrsTotal is zero, it indicates that this resource type is not supported on this card.
portEgrVPortAlloc [Port Egr VPort Alloc] (tCardResPortEgrVPortAlloc)	long	The value of tCardResPortEgrVPortAlloc represents the total number of egress virtual ports across all ports on this card that are currently provisioned.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
portEgrVPortTotal [Port Egr VPort Total] (tCardResPortEgrVPortTotal)	long	The value of tCardResPortEgrVPortTotal represents the total number of egress virtual ports across all ports on this card that are allowed to be provisioned. When the value of tCardResPortEgrVPortTotal is zero, it indicates that this resource type is not supported on this card.
portNetEgrQGrpInstAlloc [Port Net Egr QGrp Inst Alloc] (tCardResPortNetEgrQGrpInstAlloc)	long	The value of tCardResPortNetEgrQGrpInstAlloc represents the total number of port network egress queue-group instances across all ports on this card that are currently provisioned.
portNetEgrQGrpInstTotal [Port Net Egr QGrp Inst Total] (tCardResPortNetEgrQGrpInstTotal)	long	The value of tCardResPortNetEgrQGrpInstTotal represents the total number of port network egress queue-group instances across all ports on this card that are allowed to be provisioned. When the value of tCardResPortNetEgrQGrpInstTotal is zero, it indicates that this resource type is not supported on this card.
qosUserSchedsAlloc [Qos User Scheds Alloc] (tCardResQosUserSchedsAlloc)	long	The value of tCardResQosUserSchedsAlloc represents the total number of QoS user virtual schedulers that are currently allocated on this card.
qosUserSchedsTotal [Qos User Scheds Total] (tCardResQosUserSchedsTotal)	long	The value of tCardResQosUserSchedsTotal represents the total amount of QoS user virtual schedulers that are supported on this card. When the value of tCardResQosUserSchedsTotal is zero, it indicates that this resource type is not supported on this card.
subSPIQosOvrAlloc [Sub SPIQos Ovr Alloc] (tCardResSubSPIQosOvrAlloc)	long	The value of tCardResSubSPIQosOvrAlloc represents the total number of QoS subscriber sla-profile instance overrides that are currently allocated on this card.
subSPIQosOvrTotal [Sub SPIQos Ovr Total] (tCardResSubSPIQosOvrTotal)	long	The value of tCardResSubSPIQosOvrTotal represents the total number of QoS subscriber sla-profile instance overrides that are supported on this card. When the value of tCardResSubSPIQosOvrTotal is zero, it indicates that this resource type is not supported on this card.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>ChassisResourceStats MIB entry name: tChassisResEntry Entry description: The value of tChassisResEntry represents chassis specific system resource information. Table description (for tChassisResTable): The value of tChassisResTable represents system resource information that are specific to chassis. Supports realtime plotting Supports scheduled collection Monitored class: equipment.SystemStatsHolder</p>		
dynSvcNHEntryAlloc [Dyn Svc NHEntry Alloc] (tChassisResDynSvcNHEntryAlloc)	long	The value of tChassisResDynSvcNHEntryAlloc represents the total number of dynamic service next-hop entries currently in use on this chassis. The value of tChassisResDynSvcNHEntryAlloc will always equal to the sum of tChassisResIpSecNHEntryAlloc and tChassisResSubNHEntryAlloc since IPsec next-hop and subscriber next-hop resources are subsets of dynamic service next-hop entry resources.
dynSvcNHEntryTotal [Dyn Svc NHEntry Total] (tChassisResDynSvcNHEntryTotal)	long	The value of tChassisResDynSvcNHEntryTotal represents the total number of dynamic service next-hop entries supported on this chassis. When the value of tChassisResDynSvcNHEntryTotal is zero, it indicates that this resource type is not supported on this chassis.
egrQGrpTmplAlloc [Egr QGrp Tmpl Alloc] (tChassisResEgrQGrpTmplAlloc)	long	The value of tChassisResEgrQGrpTmplAlloc represents the total number of egress queue-group-templates that are currently provisioned on this chassis.
egrQGrpTmplTotal [Egr QGrp Tmpl Total] (tChassisResEgrQGrpTmplTotal)	long	The value of tChassisResEgrQGrpTmplTotal represents the total number of egress queue-group-templates that are allowed to be provisioned on this chassis. When the value of tChassisResEgrQGrpTmplTotal is zero, it indicates that this resource type is not supported on this chassis.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fPIngQGrpInstAlloc [FPIng QGrp Inst Alloc] (tChassisResFPIngQGrpInstAlloc)	long	The value of tChassisResFPIngQGrpInstAlloc represents the total number of forwarding-plane (FP) ingress queue-group instances across all the FP on this chassis including access and network instances that are allowed to be provisioned.
fPIngQGrpInstTotal [FPIng QGrp Inst Total] (tChassisResFPIngQGrpInstTotal)	long	The value of tChassisResFPIngQGrpInstTotal represents the total number of forwarding-plane (FP) ingress queue-group instances across all the FP on this chassis including access and network instances that are allowed to be provisioned. When the value of tChassisResFPIngQGrpInstTotal is zero, it indicates that this resource type is not supported on this chassis.
ingQGrpTmplAlloc [Ing QGrp Tmpl Alloc] (tChassisResIngQGrpTmplAlloc)	long	The value of tChassisResIngQGrpTmplAlloc represents the total number of ingress queue-group-templates that are currently provisioned on this chassis.
ingQGrpTmplTotal [Ing QGrp Tmpl Total] (tChassisResIngQGrpTmplTotal)	long	The value of tChassisResIngQGrpTmplTotal represents the total number of ingress queue-group-templates that are allowed to be provisioned on this chassis. When the value of tChassisResIngQGrpTmplTotal is zero, it indicates that this resource type is not supported on this chassis.
ipSecNHEntryAlloc [Ip Sec NHEntry Alloc] (tChassisResIpSecNHEntryAlloc)	long	The value of tChassisResIpSecNHEntryAlloc represents the total number of IPsec next-hop entries currently in use on this chassis. The value of tChassisResIpSecNHEntryAlloc will always be less than or equal to tChassisResDynSvcNHEntryAlloc since IPsec next-hop entry resources are a subset of dynamic service next-hop entry resources.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
ipSecNHEntryTotal [Ip Sec NHEntry Total] (tChassisResIpSecNHEntryTotal)	long	The value of tChassisResIpSecNHEntryTotal represents the total number of IPsec next-hop entries supported on this chassis. When the value of tChassisResIpSecNHEntryTotal is zero, it indicates that this resource type is not supported on this chassis. The value of tChassisResIpSecNHEntryTotal will always be less than or equal to tChassisResDynSvcNHEntryTotal since IPsec next-hop entry resources are a subset of dynamic service next-hop entry resources.
portEgrQGrpInstAlloc [Port Egr QGrp Inst Alloc] (tChassisResPortEgrQGrpInstAlloc)	long	The value of tChassisResPortEgrQGrpInstAlloc represents the total number of port egress queue-group instances across all the ports on this chassis including access and network instances that are currently provisioned.
portEgrQGrpInstTotal [Port Egr QGrp Inst Total] (tChassisResPortEgrQGrpInstTotal)	long	The value of tChassisResPortEgrQGrpInstTotal represents the total number of port egress queue-group instances across all the ports on this chassis including access and network instances that are allowed to be provisioned. When the value of tChassisResPortEgrQGrpInstTotal is zero, it indicates that this resource type is not supported on this chassis.
portEgrVPortAlloc [Port Egr VPort Alloc] (tChassisResPortEgrVPortAlloc)	long	The value of tChassisResPortEgrVPortAlloc represents the total number of port virtual ports across all the ports on this chassis that are currently provisioned.
portEgrVPortTotal [Port Egr VPort Total] (tChassisResPortEgrVPortTotal)	long	The value of tChassisResPortEgrVPortTotal represents the total number of egress virtual ports across all the ports on this chassis that are allowed to be provisioned. When the value of tChassisResPortEgrVPortTotal is zero, it indicates that this resource type is not supported on this chassis.
sapEgrQosPolAlloc [Sap Egr Qos Pol Alloc] (tChassisResSapEgrQosPolAlloc)	long	The value of tChassisResSapEgrQosPolAlloc represents the total number of sap-egress QoS policies that are currently provisioned on this chassis.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
sapEgrQosPolTotal [Sap Egr Qos Pol Total] (tChassisResSapEgrQosPolTotal)	long	The value of tChassisResSapEgrQosPolTotal represents the total number of sap-egress QoS policies that are allowed to be provisioned on this chassis. When the value of tChassisResSapEgrQosPolTotal is zero, it indicates that this resource type is not supported on this chassis.
sapIngQosPolAlloc [Sap Ing Qos Pol Alloc] (tChassisResSapIngQosPolAlloc)	long	The value of tChassisResSapIngQosPolAlloc represents the total number of sap-ingress QoS policies that are currently provisioned on this chassis.
sapIngQosPolTotal [Sap Ing Qos Pol Total] (tChassisResSapIngQosPolTotal)	long	The value of tChassisResSapIngQosPolTotal represents the total number of sap-ingress QoS policies that are allowed to be provisioned on this chassis. When the value of tChassisResSapIngQosPolTotal is zero, it indicates that this resource type is not supported on this chassis.
subNHEntryAlloc [Sub NHEntry Alloc] (tChassisResSubNHEntryAlloc)	long	The value of tChassisResSubNHEntryAlloc represents the total number of subscriber next-hop entries currently in use on this chassis. The value of tChassisResSubNHEntryAlloc will always be less than or equal to tChassisResDynSvcNHEntry-Alloc since subscriber next-hop entry resources are a subset of dynamic service next hop entry resources.
subNHEntryTotal [Sub NHEntry Total] (tChassisResSubNHEntryTotal)	long	The value of tChassisResSubNHEntryTotal represents the total number of subscriber next-hop entries supported on this chassis. When the value of tChassisResSubNHEntryTotal is zero, it indicates that this resource type is not supported on this chassis. The value of tChassisResSubNHEntryTotal will always be less than or equal to tChassisResDynSvcNHEntry-Total since subscriber next-hop entry resources are a subset of dynamic service next-hop entry resources.

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>CiscoHDLCStats</p> <p>MIB entry name: tmnxCiscoHDLCStatsEntry</p> <p>Entry description: An entry in the tmnxCiscoHDLCStatsTable.</p> <p>Table description (for tmnxCiscoHDLCStatsTable): The tmnxCiscoHDLCStatsTable has an entry for each port in the system that is configured for Cisco HDLC encapsulation. It contains Cisco HDLC protocol statistics for the particular port.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored classes:</p> <ul style="list-style-type: none"> • tdmequipment.DS0ChannelGroup • tdmequipment.DS3E3Channel 		
discardStatInPkts [Discard Stat In Pkts] (tmnxCiscoHDLCDiscardStatInPkts)	long	tmnxCiscoHDLCDiscardStatInPkts indicates the number of inbound Cisco HDLC packets discarded.
discardStatOutPkts [Discard Stat Out Pkts] (tmnxCiscoHDLCDiscardStatOutPkts)	long	tmnxCiscoHDLCDiscardStatOutPkts indicates the number of outbound Cisco HDLC packets discarded.
statInOctets [Stat In Octets] (tmnxCiscoHDLCStatInOctets)	long	tmnxCiscoHDLCStatInOctets indicates the number of inbound Cisco HDLC octets.
statInPkts [Stat In Pkts] (tmnxCiscoHDLCStatInPkts)	long	tmnxCiscoHDLCStatInPkts indicates the number of inbound Cisco HDLC packets.
statOutOctets [Stat Out Octets] (tmnxCiscoHDLCStatOutOctets)	long	tmnxCiscoHDLCStatOutOctets indicates the number of outbound Cisco HDLC octets.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
statOutPkts [Stat Out Pkts] (tmnxCiscoHDLCStatOutPkts)	long	tmnxCiscoHDLCStatOutPkts indicates the number of outbound Cisco HDLC packets.
<p>CpuUtilizationStats</p> <p>MIB entry name: tmnxCardCpuResMonitorEntry</p> <p>Entry description: The tmnxCardCpuResMonitorEntry contains the card level CPU monitoring statistics over a specified sample-time.</p> <p>Table description (for tmnxCardCpuResMonitorTable): The tmnxCardCpuResMonitorTable details the specified current card's CPU resources. The information described in this table is volatile and dependent on the current environmental conditions, and specified sample-time. Information is only displayed for online cards.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.CardSlot</p>		
busyCoreUtil [Busy Core Util] (tmnxCardCpuResMonBusyCoreUtil)	double	The value of tmnxCardCpuResMonBusyCoreUtil indicates the utilization percentage of the busiest processor core over the specified sample-time. On single core CPUs, this is the overall system utilization percentage over the specified sample-time.
busyGroupName [Busy Group Name] (tmnxCardCpuResMonBusyGroupName)	String	The value of tmnxCardCpuResMonBusyGroupName indicates the name of the group that is running at the highest capacity utilization. Capacity utilization is the CPU utilization relative to the maximum CPU resources available to that group. A group is a set of related applications, services, tasks or protocol handlers that consumes some part of the system CPU resources. The capacity utilization of the busiest group is indicated by tmnxCardCpuResMonBusyGroupUtil.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
busyGroupUtil [Busy Group Util] (tmnxCardCpuResMonBusyGroupUtil)	double	The value of tmnxCardCpuResMonBusyGroupUtil indicates the capacity utilization of the group that is running at the highest capacity utilization. Capacity utilization is the CPU utilization relative to the maximum CPU resources available to that group. A group is a set of related applications, services, tasks or protocol handlers that consumes some part of the system CPU resources. The name of the busiest group is indicated by tmnxCardCpuResMonBusyGroupName.
cardSlotId [Card Slot Id] (tmnxCardResourceSlotNum)	long	The value of tmnxCardResourceSlotNum specifies the slot number of the card to which the resource information is monitored.
cpuldle [Cpu Idle] (tmnxCardCpuResMonCpuldle)	double	The value of tmnxCardCpuResMonCpuldle indicates the overall percentage of CPU idleness over the specified sample-time.
samplingTime [Sampling Time] (tmnxCardCpuResSampleTime)	int	The value of tmnxCardCpuResSampleTime specifies the sample-time used to calculate the utilization results for the row.
<p>DDMStats</p> <p>MIB entry name: tmnxDigitalDiagMonitorEntry</p> <p>Entry description: Each row represents a particular SFF that supports Digital Diagnostic Monitoring. Entries are created and deleted internally by the system.</p> <p>Table description (for tmnxDigitalDiagMonitorTable): The tmnxDigitalDiagMonitorTable has an entry for each SFF in the system that supports Digital Diagnostic Monitoring (DDM). The table is indexed by TmnxPortID. Each row in this table is dynamically added and removed internally by the system based on the presence or absence of DDM capable SFF components.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.DigitalDiagnosticMonitoring</p>		

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aux1 [Aux 1] (tmnxDDMAux1)	float	The value of tmnxDDMAux1 indicates the Manufacturer specific Auxiliary 1 information of the XFP.
aux1Type [Aux 1 Type] (tmnxDDMAux1Type)	int	The value of tmnxDDMAux1Type indicates the measurement type of the Manufacturer specific Auxiliary 1 information of the XFP: none (0) - not specified. adp-bias-voltage (1) - LSB is 10mV. reserved-2 (2) - reserved for future use. tec-current (3) - LSB is 100uA. laser-temp (4) - degrees Celsius(C). laser-wavelength (5) - LSB is 0.05 nm. voltage-50 (6) - 5.0 supply voltage, LSB=100uV. voltage-33 (7) - 3.3 supply voltage, LSB=100uV. voltage-18 (8) - 1.8 supply voltage, LSB=100uV, voltage-52 (9) - -5.2 supply voltage, LSB=100uV. current-50 (10) - 5.0V supply current, LSB=100uA. reserved-11 (11) - reserved for future use. reserved-12 (12) - reserved for future use. current-33 (13) - 3.3V supply current, LSB=100uA. current-18 (14) - 1.8V supply current, LSB=100uA. current-52 (15) - -5.2V supply current, LSB=100uA.
aux2 [Aux 2] (tmnxDDMAux2)	float	The value of tmnxDDMAux2 indicates the Manufacturer specific Auxiliary 2 information of the SFF.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
aux2Type [Aux 2 Type] (tmnxDDMAux2Type)	int	The value of tmnxDDMAux2Type indicates the measurement type of the Manufacturer specific Auxiliary 2 information of the XFP: none (0) - not specified. adp-bias-voltage (1) - LSB is 10mV. reserved-2 (2) - reserved for future use. tec-current (3) - LSB is 100uA. laser-temp (4) - degrees Celsius(C). laser-wavelength (5) - LSB is 0.05 nm. voltage-50 (6) - 5.0 supply voltage, LSB=100uV. voltage-33 (7) - 3.3 supply voltage, LSB=100uV. voltage-18 (8) - 1.8 supply voltage, LSB=100uV, voltage-52 (9) - -5.2 supply voltage, LSB=100uV. current-50 (10) - 5.0V supply current, LSB=100uA. reserved-11 (11) - reserved for future use. reserved-12 (12) - reserved for future use. current-33 (13) - 3.3V supply current, LSB=100uA. current-18 (14) - 1.8V supply current, LSB=100uA. current-52 (15) - -5.2V supply current, LSB=100uA.
rxOpticalPower [Rx Optical Power] (tmnxDDMRxOpticalPower)	float	The value of tmnxDDMRxOpticalPower indicates the current Received Optical Power of the SFF in one tenths of a microwatt (uW). If the SFF is externally calibrated, the objects tmnxDDMExtCalRxPower4, tmnxDDMExtCalRxPower3, tmnxDDMExtCalRxPower2, tmnxDDMExtCalRxPower1 and tmnxDDMExtCalRxPower0 affect the output power calculation. For example (internally calibrated SFF): Using the SNMP value of 790, and using units of tenths of microwatt, 790 becomes 79 microwatts or 0.079 milliwatts. Converting to dBm: $10 \times \log_{10}(0.079) = -11.0$ dBm
rxOpticalPowerType [Rx Optical Power Type] (tmnxDDMRxOpticalPowerType)	int	The value of tmnxDDMRxOpticalPowerType indicates whether the tmnxDDMRxOpticalPower was taken as an average, or as an Optical Modulation Amplitude (OMA).

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
supplyVoltage [Supply Voltage] (tmnxDDMSupplyVoltage)	float	The value of tmnxDDMSupplyVoltage indicates the current supply voltage of the SFF. For 100G MSA Transponder, the supply voltage is in millivolts (mV). For all other types the voltage is in deci-millivolts (1/10th of a millivolt or 100 microvolt units). If the SFF is externally calibrated, the objects tmnxDDMExtCalVoltageSlope and tmnxDDMExtCalVoltageOffset affect the voltage calculation. The formula for translating between the value of tmnxDDMSupplyVoltage and Voltage is: Internally Calibrated only: tmnxDDMSupplyVoltage * conversion_factor Externally Calibrated: (tmnxDDMSupplyVoltage * (tmnxDDMExtCalVoltageSlope / 256) + tmnxDDMExtCalVoltageOffset) * conversion_factor where conversion_factor is 1/1000 for 100G MSA transponders and 1/10000 for all the others. For example (internally calibrated SFF): 1. For 100G MSA transponders, the SNMP value 32851 is 32.851 Volts (V). 2. For all others, the SNMP value 32851 is 3.2851 Volts (V).
temperature [Temperature] (tmnxDDMTemperature)	float	The value of tmnxDDMTemperature indicates the current temperature of the SFF in 1/256th degrees Celsius. If the SFF is externally calibrated, the objects tmnxDDMExtCalTemperatureSlope and tmnxDDMExtCalTemperatureOffset affect the temperature calculation. The formula for translating between the value of tmnxDDMTemperature and degrees Celsius is: Internally Calibrated only: tmnxDDMTemperature / 256 Externally Calibrated: (tmnxDDMTemperature * (tmnxDDMExtCalTemperatureSlope / 256) + tmnxDDMExtCalTemperatureOffset) / 256 For example (internally calibrated SFF): The SNMP value 5734 is 22.4 degrees Celsius.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
txBiasCurrent [Tx Bias Current] (tmnxDDMTxBiasCurrent)	float	The value of tmnxDDMTxBiasCurrent indicates the current Transmit Bias Current of the SFF in 1/500 milliamperes (mA). If the SFF is externally calibrated, the objects tmnxDDMExtCalTxLaserBiasSlope and tmnxDDMExtCalTxLaserBiasOffset affect the ampere calculation. The formula for translating between the value of tmnxDDMTxBiasCurrent and amperes is: Internally Calibrated only: tmnxDDMTxBiasCurrent / 500 Externally Calibrated: (tmnxDDMTxBiasCurrent * (tmnxDDMExtCalTxLaserBiasSlope / 256) + tmnxDDMExtCalTxLaserBiasOffset) / 500 For example (internally calibrated SFF): The SNMP value 2565 is 5.1 milliamperes (mA).
txOutputPower [Tx Output Power] (tmnxDDMTxOutputPower)	float	The value of tmnxDDMTxOutputPower indicates the current Output Power of the SFF in one tenths of a microwatt (uW). If the SFF is externally calibrated, the objects tmnxDDMExtCalTemperatureSlope and tmnxDDMExtCalTemperatureOffset affect the output power calculation. For example (internally calibrated SFF): Using the SNMP value of 790, and using units of tenths of microwatt, 790 becomes 79 microwatts or 0.079 milliwatts. Converting to dBm: $10 \times \log_{10}(0.079) = -11.0$ dBm
<p>EgrSchVPortStats</p> <p>MIB entry name: tPortEgrVPortSchedStatEntry</p> <p>Entry description: Each conceptual row contains detailed statistics information about an egress port scheduler at a vport. Entries in this table are created and removed automatically by the system.</p> <p>Table description (for tPortEgrVPortSchedStatTable): The tPortEgrVPortSchedStatTable contains statistics information about the egress port schedulers at a vport.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.EgrSchVirtualPort</p>		

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egrSchVPortStatsFwdOcts [Egr Sch VPort Stats Fwd Octs] (tPortEgrVPSchedStatFwdOcts)	java. math. BigInteger	The value of tPortEgrVPSchedStatFwdOcts indicates the number of forwarded octets.
egrSchVPortStatsFwdPkts [Egr Sch VPort Stats Fwd Pkts] (tPortEgrVPSchedStatFwdPkts)	java. math. BigInteger	The value of tPortEgrVPSchedStatFwdPkts indicates the number of forwarded packets.
egrSchVPortStatsName [Egr Sch VPort Stats Name] (tPortEgrVPSchedStatName)	String	The value of tPortEgrVPSchedStatName specifies the name of the port scheduler.
portId [Port Id] (tmnxPortPortID)	long	tmnxPortPortID is an index into this table. It maps this port to its entry in the mib-2 interfaces table.
shelfId [Shelf Id] (tmnxChassisIndex)	long	The value of tmnxChassisIndex specifies a system identifier. The value of this object cannot be changed. The only supported value is '1'. Different values of TmnxPhysChassisIndex are used to identify different physical chassis (e.g. in an XRS-40 system) in tmnxPhysChassisTable.
virtualPortName [Virtual Port Name] (tPortEgrVPortName)	String	The value of tPortEgrVPortName is the name of the virtual port on this port.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>EgrVPortAggStats</p> <p>MIB entry name: tPortEgrVPortAggStatsEntry</p> <p>Entry description: Each row in tPortEgrVPortAggStatsEntry represents a particular virtual port at the port egress level specified by tPortEgrVPortName and tPortEgrVPStLvl.</p> <p>Table description (for tPortEgrVPortAggStatsTable): The tPortEgrVPortAggStatsTable contains the statistics of each virtual port at the port egress level configured on this system. Most objects are represented in 64 bit. 32-bit version of the objects are available in tPortEgrVPortAggStatsHLTable.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.EgrSchVirtualPort</p>		
egrVportAggStatsCIRLevelDpdOct [Egr Vport Agg Stats CIRLevel Dpd Oct] (tPortEgrVPStLvlDpdOct)	java. math. BigInteger	The value of tPortEgrVPStLvlDpdOct indicates the number of octets dropped by the virtual port for the priority level specified by tPortEgrVPStLvl.
egrVportAggStatsCIRLevelDpdPkt [Egr Vport Agg Stats CIRLevel Dpd Pkt] (tPortEgrVPStLvlDpdPkt)	java. math. BigInteger	The value of tPortEgrVPStLvlDpdPkt indicates the number of packets dropped by the virtual port for the priority level specified by tPortEgrVPStLvl.
egrVportAggStatsCIRLevelFwdOct [Egr Vport Agg Stats CIRLevel Fwd Oct] (tPortEgrVPStLvlFwdOct)	java. math. BigInteger	The value of tPortEgrVPStLvlFwdOct indicates the number of octets forwarded by the virtual port for the priority level specified by tPortEgrVPStLvl.
egrVportAggStatsCIRLevelFwdPkt [Egr Vport Agg Stats CIRLevel Fwd Pkt] (tPortEgrVPStLvlFwdPkt)	java. math. BigInteger	The value of tPortEgrVPStLvlFwdPkt indicates the number of packets forwarded by the virtual port for the priority level specified by tPortEgrVPStLvl.
egrVportAggStatsCIRLevel [Egr Vport Agg Stats CIRLevel] (tPortEgrVPStLvl)	int	The value of tPortEgrVPStLvl indicates the priority level for the port scheduler to which a subscriber host queue can be port-parented. When the value of tPortEgrVPStLvl is specified as '0xffffffff H', snmp GET on this table returns aggregate statistics.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egrVportAggStatsLastClearTime [Egr Vport Agg Stats Last Clear Time] (tPortEgrVPStLstClrdTime)	long	The value of tPortEgrVPStLstClrdTime indicates the sysUpTime when the counters in this table were last cleared.
<p>EgrVPortMonitorThresholdStats</p> <p>MIB entry name: tPortEgrVPortMonThrEntry</p> <p>Entry description: The value of tPortEgrVPortMonThrEntry represents threshold monitoring information for port scheduler policy specified by tPortEgrVPortQosSchedPolicy for each access egress vport when the value of tPortEgrVPortMonitorPortSched is set to 'enabled (1)'.</p> <p>Table description (for tPortEgrVPortMonThrTable): The value of tPortEgrVPortMonThrTable contains port scheduler policy's threshold monitoring information for each access egress vport when the value of tPortEgrVPortMonitorPortSched is set to 'enabled (1)'.</p> <p>Supports realtime plotting</p> <p>Supports scheduled collection</p> <p>Monitored class: equipment.EgrSchVirtualPort</p>		
egrVPortMonThrEndTime [Egr VPort Mon Thr End Time] (tPortEgrVPortMonThrEndTime)	long	The value of tPortEgrVPortMonThrEndTime represents the end time for threshold monitoring.
egrVPortMonThrGrp1ExceedCnt [Egr VPort Mon Thr Grp 1 Exceed Cnt] (tPortEgrVPortMonThrGrp1ExceedCnt)	long	The value of tPortEgrVPortMonThrGrp1ExceedCnt represents the exceed count for group 1 specified by tPortEgrVPortMonThrGrp1Name.
egrVPortMonThrGrp1Name [Egr VPort Mon Thr Grp 1 Name] (tPortEgrVPortMonThrGrp1Name)	String	The value of tPortEgrVPortMonThrGrp1Name represents port scheduler policy's group name.
egrVPortMonThrGrp2ExceedCnt [Egr VPort Mon Thr Grp 2 Exceed Cnt] (tPortEgrVPortMonThrGrp2ExceedCnt)	long	The value of tPortEgrVPortMonThrGrp2ExceedCnt represents the exceed count for group 2 specified by tPortEgrVPortMonThrGrp2Name.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egrVPortMonThrGrp2Name [Egr VPort Mon Thr Grp 2 Name] (tPortEgrVPortMonThrGrp2Name)	String	The value of tPortEgrVPortMonThrGrp2Name represents port scheduler policy's group name.
egrVPortMonThrGrp3ExceedCnt [Egr VPort Mon Thr Grp 3 Exceed Cnt] (tPortEgrVPortMonThrGrp3ExceedCnt)	long	The value of tPortEgrVPortMonThrGrp3ExceedCnt represents the exceed count for group 3 specified by tPortEgrVPortMonThrGrp3Name.
egrVPortMonThrGrp3Name [Egr VPort Mon Thr Grp 3 Name] (tPortEgrVPortMonThrGrp3Name)	String	The value of tPortEgrVPortMonThrGrp3Name represents port scheduler policy's group name.
egrVPortMonThrGrp4ExceedCnt [Egr VPort Mon Thr Grp 4 Exceed Cnt] (tPortEgrVPortMonThrGrp4ExceedCnt)	long	The value of tPortEgrVPortMonThrGrp4ExceedCnt represents the exceed count for group 4 specified by tPortEgrVPortMonThrGrp4Name.
egrVPortMonThrGrp4Name [Egr VPort Mon Thr Grp 4 Name] (tPortEgrVPortMonThrGrp4Name)	String	The value of tPortEgrVPortMonThrGrp4Name represents port scheduler policy's group name.
egrVPortMonThrGrp5ExceedCnt [Egr VPort Mon Thr Grp 5 Exceed Cnt] (tPortEgrVPortMonThrGrp5ExceedCnt)	long	The value of tPortEgrVPortMonThrGrp5ExceedCnt represents the exceed count for group 5 specified by tPortEgrVPortMonThrGrp5Name.
egrVPortMonThrGrp5Name [Egr VPort Mon Thr Grp 5 Name] (tPortEgrVPortMonThrGrp5Name)	String	The value of tPortEgrVPortMonThrGrp5Name represents port scheduler policy's group name.
egrVPortMonThrGrp6ExceedCnt [Egr VPort Mon Thr Grp 6 Exceed Cnt] (tPortEgrVPortMonThrGrp6ExceedCnt)	long	The value of tPortEgrVPortMonThrGrp6ExceedCnt represents the exceed count for group 6 specified by tPortEgrVPortMonThrGrp6Name.
egrVPortMonThrGrp6Name [Egr VPort Mon Thr Grp 6 Name] (tPortEgrVPortMonThrGrp6Name)	String	The value of tPortEgrVPortMonThrGrp6Name represents port scheduler policy's group name.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egrVPortMonThrGrp7ExceedCnt [Egr VPort Mon Thr Grp 7 Exceed Cnt] (tPortEgrVPortMonThrGrp7ExceedCnt)	long	The value of tPortEgrVPortMonThrGrp7ExceedCnt represents the exceed count for group 7 specified by tPortEgrVPortMonThrGrp7Name.
egrVPortMonThrGrp7Name [Egr VPort Mon Thr Grp 7 Name] (tPortEgrVPortMonThrGrp7Name)	String	The value of tPortEgrVPortMonThrGrp7Name represents port scheduler policy's group name.
egrVPortMonThrGrp8ExceedCnt [Egr VPort Mon Thr Grp 8 Exceed Cnt] (tPortEgrVPortMonThrGrp8ExceedCnt)	long	The value of tPortEgrVPortMonThrGrp8ExceedCnt represents the exceed count for group 8 specified by tPortEgrVPortMonThrGrp8Name.
egrVPortMonThrGrp8Name [Egr VPort Mon Thr Grp 8 Name] (tPortEgrVPortMonThrGrp8Name)	String	The value of tPortEgrVPortMonThrGrp8Name represents port scheduler policy's group name.
egrVPortMonThrLvl1ExceedCnt [Egr VPort Mon Thr Lvl 1 Exceed Cnt] (tPortEgrVPortMonThrLvl1ExceedCnt)	long	The value of tPortEgrVPortMonThrLvl1ExceedCnt represents the exceed count for priority level 1.
egrVPortMonThrLvl2ExceedCnt [Egr VPort Mon Thr Lvl 2 Exceed Cnt] (tPortEgrVPortMonThrLvl2ExceedCnt)	long	The value of tPortEgrVPortMonThrLvl2ExceedCnt represents the exceed count for priority level 2.
egrVPortMonThrLvl3ExceedCnt [Egr VPort Mon Thr Lvl 3 Exceed Cnt] (tPortEgrVPortMonThrLvl3ExceedCnt)	long	The value of tPortEgrVPortMonThrLvl3ExceedCnt represents the exceed count for priority level 3.
egrVPortMonThrLvl4ExceedCnt [Egr VPort Mon Thr Lvl 4 Exceed Cnt] (tPortEgrVPortMonThrLvl4ExceedCnt)	long	The value of tPortEgrVPortMonThrLvl4ExceedCnt represents the exceed count for priority level 4.
egrVPortMonThrLvl5ExceedCnt [Egr VPort Mon Thr Lvl 5 Exceed Cnt] (tPortEgrVPortMonThrLvl5ExceedCnt)	long	The value of tPortEgrVPortMonThrLvl5ExceedCnt represents the exceed count for priority level 5.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
egrVPortMonThrLvl6ExceedCnt [Egr VPort Mon Thr Lvl 6 Exceed Cnt] (tPortEgrVPortMonThrLvl6ExceedCnt)	long	The value of tPortEgrVPortMonThrLvl6ExceedCnt represents the exceed count for priority level 6.
egrVPortMonThrLvl7ExceedCnt [Egr VPort Mon Thr Lvl 7 Exceed Cnt] (tPortEgrVPortMonThrLvl7ExceedCnt)	long	The value of tPortEgrVPortMonThrLvl7ExceedCnt represents the exceed count for priority level 7.
egrVPortMonThrLvl8ExceedCnt [Egr VPort Mon Thr Lvl 8 Exceed Cnt] (tPortEgrVPortMonThrLvl8ExceedCnt)	long	The value of tPortEgrVPortMonThrLvl8ExceedCnt represents the exceed count for priority level 8.
egrVPortMonThrPortExceedCnt [Egr VPort Mon Thr Port Exceed Cnt] (tPortEgrVPortMonThrPortExceedCnt)	long	The value of tPortEgrVPortMonThrPortExceedCnt represents the exceed count for egress port scheduler.
egrVPortMonThrStartTime [Egr VPort Mon Thr Start Time] (tPortEgrVPortMonThrStartTime)	long	The value of tPortEgrVPortMonThrStartTime represents the start time for threshold monitoring.
egrVPortMonThrTotalSamples [Egr VPort Mon Thr Total Samples] (tPortEgrVPortMonThrTotalSamples)	long	The value of tPortEgrVPortMonThrTotalSamples represents total samples collected during the threshold monitoring interval.
FPacclngQGrpArbiterStats MIB entry name: tFPacclngQGrpArbitStatEntry Entry description: The value of tFPacclngQGrpArbitStatEntry defines an entry in the tFPacclngQGrpArbitStatTable. It represents statistics about a specific QoS ingress queue group policer. Table description (for tFPacclngQGrpArbitStatTable): The value of tFPacclngQGrpArbitStatTable contains forwarding-plane ingress QoS queue group policer statistics on access side. Supports realtime plotting Supports scheduled collection Monitored class: equipment.FPacclngQGrpEntry		

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fpAcclngQGrpArbitStatFwdOcts [Fp Acc Ing QGrp Arbit Stat Fwd Octs] (tFPAcclngQGrpArbitStatFwdOcts)	java. math. BigInteger	The value of tFPAcclngQGrpArbitStatFwdOcts indicates the number of forwarded octets by the ingress queue group arbiter Pchip.
fpAcclngQGrpArbitStatFwdOctsH [Fp Acc Ing QGrp Arbit Stat Fwd Octs H] (tFPAcclngQGrpArbitStatFwdOctsH)	long	The value of tFPAcclngQGrpArbitStatFwdOctsH indicates the upper 32 bits of tFPAcclngQGrpArbitStatFwdOcts.
fpAcclngQGrpArbitStatFwdOctsL [Fp Acc Ing QGrp Arbit Stat Fwd Octs L] (tFPAcclngQGrpArbitStatFwdOctsL)	long	The value of tFPAcclngQGrpArbitStatFwdOctsL indicates the lower 32 bits of tFPAcclngQGrpArbitStatFwdOcts.
fpAcclngQGrpArbitStatFwdPkts [Fp Acc Ing QGrp Arbit Stat Fwd Pkts] (tFPAcclngQGrpArbitStatFwdPkts)	java. math. BigInteger	The value of tFPAcclngQGrpArbitStatFwdPkts indicates the number of forwarded packets by the ingress queue group arbiter Pchip.
fpAcclngQGrpArbitStatFwdPktsH [Fp Acc Ing QGrp Arbit Stat Fwd Pkts H] (tFPAcclngQGrpArbitStatFwdPktsH)	long	The value of tFPAcclngQGrpArbitStatFwdPktsH indicates the upper 32 bits of tFPAcclngQGrpArbitStatFwdPkts.
fpAcclngQGrpArbitStatFwdPktsL [Fp Acc Ing QGrp Arbit Stat Fwd Pkts L] (tFPAcclngQGrpArbitStatFwdPktsL)	long	The value of tFPAcclngQGrpArbitStatFwdPktsL indicates the lower 32 bits of tFPAcclngQGrpArbitStatFwdPkts.
fpAcclngQGrpArbitStatName [Fp Acc Ing QGrp Arbit Stat Name] (tFPAcclngQGrpArbitStatName)	String	The value of tFPAcclngQGrpArbitStatName specifies the name of the ingress QoS arbiter of this forwarding-plane queue group on access.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
<p>FPacclngQGrpPolicerStats</p> <p>MIB entry name: tmnxFPacclngQGrpPStatEntry</p> <p>Entry description: The value of tmnxFPacclngQGrpPStatEntry defines an entry in the tmnxFPacclngQGrpPStatTable. It represents statistics about a specific QoS ingress queue group policer.</p> <p>Table description (for tmnxFPacclngQGrpPStatTable): The tmnxFPacclngQGrpPStatTable contains forwarding-plane ingress QoS queue group policer statistics on access side.</p> <p>Supports realtime plotting</p> <p>Does not support scheduled collection</p> <p>Monitored class: equipment.FPacclngQGrpEntry</p>		
fpAcclngQGrpPStatMode [Fp Acc Ing QGrp PStat Mode] (tmnxFPacclngQGrpPStatMode)	int	The value of tmnxFPacclngQGrpPStatMode indicates the stat mode used by this policer.
fpAcclngQGrpPStatPolicerId [Fp Acc Ing QGrp PStat Policer Id] (tmnxFPacclngQGrpPStatPolicerId)	long	The value of tmnxFPacclngQGrpPStatPolicerId specifies the index of the ingress QoS policer of this forwarding-plane queue group on access.
fpAcclngQgPStDrpHPrioOcts [Fp Acc Ing Qg PSt Drp HPrio Octs] (tmnxFPacclngQgPStDrpHPrioOcts)	java. math. BigInteger	The value of tmnxFPacclngQgPStDrpHPrioOcts indicates the number of high priority octets, as determined by the ingress queue group policer, dropped by the Pchip due to: MBS exceeded, buffer pool limit exceeded, etc.
fpAcclngQgPStDrpHPrioOctsH [Fp Acc Ing Qg PSt Drp HPrio Octs H] (tmnxFPacclngQgPStDrpHPrioOctsH)	long	The value of tmnxFPacclngQgPStDrpHPrioOctsH indicates the upper 32 bits of tmnxFPacclngQgPStDrpHPrioOcts.
fpAcclngQgPStDrpHPrioOctsL [Fp Acc Ing Qg PSt Drp HPrio Octs L] (tmnxFPacclngQgPStDrpHPrioOctsL)	long	The value of tmnxFPacclngQgPStDrpHPrioOctsL indicates the lower 32 bits of tmnxFPacclngQgPStDrpHPrioOcts.
fpAcclngQgPStDrpHPrioPkts [Fp Acc Ing Qg PSt Drp HPrio Pkts] (tmnxFPacclngQgPStDrpHPrioPkts)	java. math. BigInteger	The value of tmnxFPacclngQgPStDrpHPrioPkts indicates the number of high priority packets, as determined by the ingress queue group policer, dropped by the Pchip due to: MBS exceeded, buffer pool limit exceeded, etc.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fpAcclngQgPStDrpHPrioPktsH [Fp Acc Ing Qg PSt Drp HPrio Pkts H] (tmnxFPAcclngQgPStDrpHPrioPktsH)	long	The value of tmnxFPAcclngQgPStDrpHPrioPktsH indicates the upper 32 bits of tmnxFPAcclngQgPStDrpHPrioPkts.
fpAcclngQgPStDrpHPrioPktsL [Fp Acc Ing Qg PSt Drp HPrio Pkts L] (tmnxFPAcclngQgPStDrpHPrioPktsL)	long	The value of tmnxFPAcclngQgPStDrpHPrioPktsL indicates the lower 32 bits of tmnxFPAcclngQgPStDrpHPrioPkts.
fpAcclngQgPStDrpLPrioOcts [Fp Acc Ing Qg PSt Drp LPrio Octs] (tmnxFPAcclngQgPStDrpLPrioOcts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStDrpLPrioOcts indicates the number of low priority octets, as determined by the ingress queue group policer, dropped by the Pchip due to: MBS exceeded, buffer pool limit exceeded, etc.
fpAcclngQgPStDrpLPrioOctsH [Fp Acc Ing Qg PSt Drp LPrio Octs H] (tmnxFPAcclngQgPStDrpLPrioOctsH)	long	The value of tmnxFPAcclngQgPStDrpLPrioOctsH indicates the upper 32 bits of tmnxFPAcclngQgPStDrpLPrioOcts.
fpAcclngQgPStDrpLPrioOctsL [Fp Acc Ing Qg PSt Drp LPrio Octs L] (tmnxFPAcclngQgPStDrpLPrioOctsL)	long	The value of tmnxFPAcclngQgPStDrpLPrioOctsL indicates the lower 32 bits of tmnxFPAcclngQgPStDrpLPrioOcts.
fpAcclngQgPStDrpLPrioPkts [Fp Acc Ing Qg PSt Drp LPrio Pkts] (tmnxFPAcclngQgPStDrpLPrioPkts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStDrpLPrioPkts indicates the number of low priority packets, as determined by the ingress queue group policer, dropped by the Pchip due to: MBS exceeded, buffer pool limit exceeded, etc.
fpAcclngQgPStDrpLPrioPktsH [Fp Acc Ing Qg PSt Drp LPrio Pkts H] (tmnxFPAcclngQgPStDrpLPrioPktsH)	long	The value of tmnxFPAcclngQgPStDrpLPrioPktsH indicates the upper 32 bits of tmnxFPAcclngQgPStDrpLPrioPkts.
fpAcclngQgPStDrpLPrioPktsL [Fp Acc Ing Qg PSt Drp LPrio Pkts L] (tmnxFPAcclngQgPStDrpLPrioPktsL)	long	The value of tmnxFPAcclngQgPStDrpLPrioPktsL indicates the lower 32 bits of tmnxFPAcclngQgPStDrpLPrioPkts.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fpAcclngQgPStFwdInProfOcts [Fp Acc Ing Qg PSt Fwd In Prof Octs] (tmnxFPAcclngQgPStFwdInProfOcts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStFwdInProfOcts indicates the number of in-profile octets (rate below CIR) forwarded by the ingress Pchip.
fpAcclngQgPStFwdInProfOctsH [Fp Acc Ing Qg PSt Fwd In Prof Octs H] (tmnxFPAcclngQgPStFwdInProfOctsH)	long	The value of tmnxFPAcclngQgPStFwdInProfOctsH indicates the upper 32 bits of tmnxFPAcclngQgPStFwdInProfOcts.
fpAcclngQgPStFwdInProfOctsL [Fp Acc Ing Qg PSt Fwd In Prof Octs L] (tmnxFPAcclngQgPStFwdInProfOctsL)	long	The value of tmnxFPAcclngQgPStFwdInProfOctsL indicates the lower 32 bits of tmnxFPAcclngQgPStFwdInProfOcts.
fpAcclngQgPStFwdInProfPkts [Fp Acc Ing Qg PSt Fwd In Prof Pkts] (tmnxFPAcclngQgPStFwdInProfPkts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStFwdInProfPkts indicates the number of in-profile packets (rate below CIR) forwarded by the ingress Pchip.
fpAcclngQgPStFwdInProfPktsH [Fp Acc Ing Qg PSt Fwd In Prof Pkts H] (tmnxFPAcclngQgPStFwdInProfPktsH)	long	The value of tmnxFPAcclngQgPStFwdInProfPktsH indicates the upper 32 bits of tmnxFPAcclngQgPStFwdInProfPkts.
fpAcclngQgPStFwdInProfPktsL [Fp Acc Ing Qg PSt Fwd In Prof Pkts L] (tmnxFPAcclngQgPStFwdInProfPktsL)	long	The value of tmnxFPAcclngQgPStFwdInProfPktsL indicates the lower 32 bits of tmnxFPAcclngQgPStFwdInProfPkts.
fpAcclngQgPStFwdOutProfOcts [Fp Acc Ing Qg PSt Fwd Out Prof Octs] (tmnxFPAcclngQgPStFwdOutProfOcts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStFwdOutProfOcts indicates the number of out-of-profile octets (rate above CIR) forwarded by the ingress Pchip.
fpAcclngQgPStFwdOutProfOctsH [Fp Acc Ing Qg PSt Fwd Out Prof Octs H] (tmnxFPAcclngQgPStFwdOutProfOctsH)	long	The value of tmnxFPAcclngQgPStFwdOutProfOctsH indicates the upper 32 bits of tmnxFPAcclngQgPStFwdOutProfOcts.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fpAcclngQgPStFwdOutProfOctsL [Fp Acc Ing Qg PSt Fwd Out Prof Octs L] (tmnxFPAcclngQgPStFwdOutProfOctsL)	long	The value of tmnxFPAcclngQgPStFwdOutProfOctsL indicates the lower 32 bits of tmnxFPAcclngQgPStFwdOutProfOcts.
fpAcclngQgPStFwdOutProfPkts [Fp Acc Ing Qg PSt Fwd Out Prof Pkts] (tmnxFPAcclngQgPStFwdOutProfPkts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStFwdOutProfPkts indicates the number of out-of-profile packets (rate above CIR) forwarded by the ingress Pchip.
fpAcclngQgPStFwdOutProfPktsH [Fp Acc Ing Qg PSt Fwd Out Prof Pkts H] (tmnxFPAcclngQgPStFwdOutProfPktsH)	long	The value of tmnxFPAcclngQgPStFwdOutProfPktsH indicates the upper 32 bits of tmnxFPAcclngQgPStFwdOutProfPkts.
fpAcclngQgPStFwdOutProfPktsL [Fp Acc Ing Qg PSt Fwd Out Prof Pkts L] (tmnxFPAcclngQgPStFwdOutProfPktsL)	long	The value of tmnxFPAcclngQgPStFwdOutProfPktsL indicates the lower 32 bits of tmnxFPAcclngQgPStFwdOutProfPkts.
fpAcclngQgPStOffHPrioOcts [Fp Acc Ing Qg PSt Off HPrio Octs] (tmnxFPAcclngQgPStOffHPrioOcts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStOffHPrioOcts indicates the number of high priority octets, as determined by the ingress queue group policer, offered by the Pchip to the Qchip.
fpAcclngQgPStOffHPrioOctsH [Fp Acc Ing Qg PSt Off HPrio Octs H] (tmnxFPAcclngQgPStOffHPrioOctsH)	long	The value of tmnxFPAcclngQgPStOffHPrioOctsH indicates the upper 32 bits of tmnxFPAcclngQgPStOffHPrioOcts.
fpAcclngQgPStOffHPrioOctsL [Fp Acc Ing Qg PSt Off HPrio Octs L] (tmnxFPAcclngQgPStOffHPrioOctsL)	long	The value of tmnxFPAcclngQgPStOffHPrioOctsL indicates the lower 32 bits of tmnxFPAcclngQgPStOffHPrioOcts.
fpAcclngQgPStOffHPrioPkts [Fp Acc Ing Qg PSt Off HPrio Pkts] (tmnxFPAcclngQgPStOffHPrioPkts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStOffHPrioPkts indicates the number of high priority packets, as determined by the ingress queue group policer, offered by the Pchip to the Qchip.

Table 252 equipment statistics (continued)

NFM-P counter names: XML [displayed] (MIB)	Type	Description
fpAcclngQgPStOffHPrioPktsH [Fp Acc Ing Qg PSt Off HPrio Pkts H] (tmnxFPAcclngQgPStOffHPrioPktsH)	long	The value of tmnxFPAcclngQgPStOffHPrioPktsH indicates the upper 32 bits of tmnxFPAcclngQgPStOffHPrioPkts.
fpAcclngQgPStOffHPrioPktsL [Fp Acc Ing Qg PSt Off HPrio Pkts L] (tmnxFPAcclngQgPStOffHPrioPktsL)	long	The value of tmnxFPAcclngQgPStOffHPrioPktsL indicates the lower 32 bits of tmnxFPAcclngQgPStOffHPrioPkts.
fpAcclngQgPStOffLPrioOcts [Fp Acc Ing Qg PSt Off LPrio Octets] (tmnxFPAcclngQgPStOffLPrioOcts)	java. math. BigInteger	The value of tmnxFPAcclngQgPStOffLPrioOcts indicates the number of low priority octets, as determined by the ingress queue group policer, offered by the Pchip to the Pchip.
